

ICX058ALB

Diagonal 6mm (Type 1/3) CCD Image Sensor for EIA B/W Camera

Description

The ICX058ALB is an interline transfer CCD solid-state image sensor suitable for EIA B/W video cameras. High sensitiveness and low dark current are achieved through the adoption of HAD (Hole-Accumulation Diode) sensors.

This chip features a field integration read out system and an electronic shutter with variable charge-storage time. Also, this outline is miniaturized by using original package.

Features

- High image, high sensitivity and low dark current
- Consecutive various speed shutter
1/60s (Typ.), 1/100s to 1/10000s
- Low smear
- High antiblooming
- Horizontal register 5V drive
- Reset gate 5V drive

Device Structure

- Image size Diagonal 6mm (Type 1/3)
- Number of effective pixels 768 (H) × 494 (V) Approx. 380k pixels
- Number of total pixels 811 (H) × 508 (V) Approx. 410k pixels
- Interline transfer CCD image sensor
- Chip size 6.00mm (H) × 4.96mm (V)
- Until cell size 6.35 μm (H) × 7.4 μm (V)
- Optical black

Horizontal (H) direction	Front 3 pixels	Rear 40 pixels
Vertical (V) direction	Front 12 pixels	Rear 2 pixels
- Number of dummy bits:

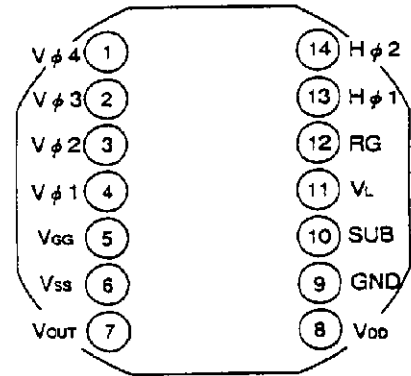

Horizontal	22
Vertical	1 (even field only)
- Board material: N-type silicon

(1) Read out clock waveform

(2) Vertical transfer clock waveform

$$V_{VH} = \frac{V_{VH1} + V_{VH2}}{2}$$

$$V_{VL} = \frac{V_{VL3} + V_{VL4}}{2}$$

$$V_{\phi V} = V_{VHn} - V_{VL1} \quad (n = 1 \text{ to } 4)$$

(3) Horizontal transfer clock waveform diagram

(4) Reset gate clock waveform diagram

V_{RGLH} is the maximum value and V_{RGLL} the minimum value of the coupling waveform in the period from Point A in the diagram above to RG rise.

V_{RGL} is the mean value for V_{RGLH} and V_{RGLL} .

$$V_{RGL} = (V_{RGLH} + V_{RGLL}) / 2$$

V_{RGH} is the minimum value for t_{wh} period.

$$V_{\phi RG} = V_{RGH} - V_{RGL}$$

Image Sensor Characteristics Test Method

◎ **Test conditions**

- ① Through the following tests the substrate voltage and reset gate clock voltage are set to the value displayed on the device, while the device drive conditions are the typical value of the bias and clock voltage conditions.
- ② Through the following tests defects are excluded and, unless otherwise specified, the optical black level (Hence forth referred to as OB) is set as the reference, the values obtained at ① point in the figure of the Drive Circuit are utilized.

◎Definition of standard imaging conditions

- ①Standard imaging condition I : (As imaging device) Use a pattern box (luminance 706 cd/m², color temperature 3200K Halogen source) as a subject. (Pattern for evaluation is not applicable.) Use a testing standard lens with CM500S (t=1.0mm) as IR cut filter and image at F8. At this time, light intensity to sensor receiving surface is defined as standard sensitivity testing light intensity.
- ②Standard imaging condition II : Image a light source (color temperature of 3200K) which uniformity of brightness is within 2% at all angles. Use a testing standard lens with CM500S (t=1.0mm) as IR cut filter. The light intensity is adjusted to the value indicated in each testing item by lens diaphragm.

1. Sensitivity

Set to standard image condition I . After selecting the electronic shutter mode at a 1/250s. shutter speed, measure the signal output (Vs) at the center of the screen and substitute in the following formula.

$$S = V_s \times \frac{250}{60} \text{ [mV]}$$

2. Saturation signal

Set to standard imaging condition II . Adjust light intensity to 10 times that of signal output average value (V_A=200mV), then test signal minimum value.

3. Smear

Set to standard imaging condition II . Adjust light intensity to 500 times that of signal output average value (V_A=200mV) with lens diaphragm at F5.6 to F8. Stop read out clock. When the charge drain executed by the electronic shutter at the respective H blankings takes place, test the maximum value V_{Sm} [mV] of signal output.

$$S_m = \frac{V_{Sm}}{200} \times \frac{1}{500} \times \frac{1}{10} \times 100(\%)(1/10V)$$

4. Video signal shading

Set to standard imaging condition II . Adjust light intensity to signal output average value (V_A=200mV) with lens diaphragm at F5.6 to F8. Then test maximum (V_{max} [mV]) and minimum (V_{min} [mV]) values of signal output.

$$SH = (V_{max} - V_{min}) / 200 \times 100(\%)$$

5. Dark signal

Test signal output average value V_{dt} [mV] when the device ambient temperature is at 60°C and light is obstructed with horizontal idle transfer level as reference.

6. Dark signal shading

Following 5, test maximum (V_{dmax} [mV]) and minimum (V_{dmin} [mV]) values of dark signal output.

$$\Delta V_{dt} = V_{dmax} - V_{dmin} \text{ [mV]}$$

7. Flicker

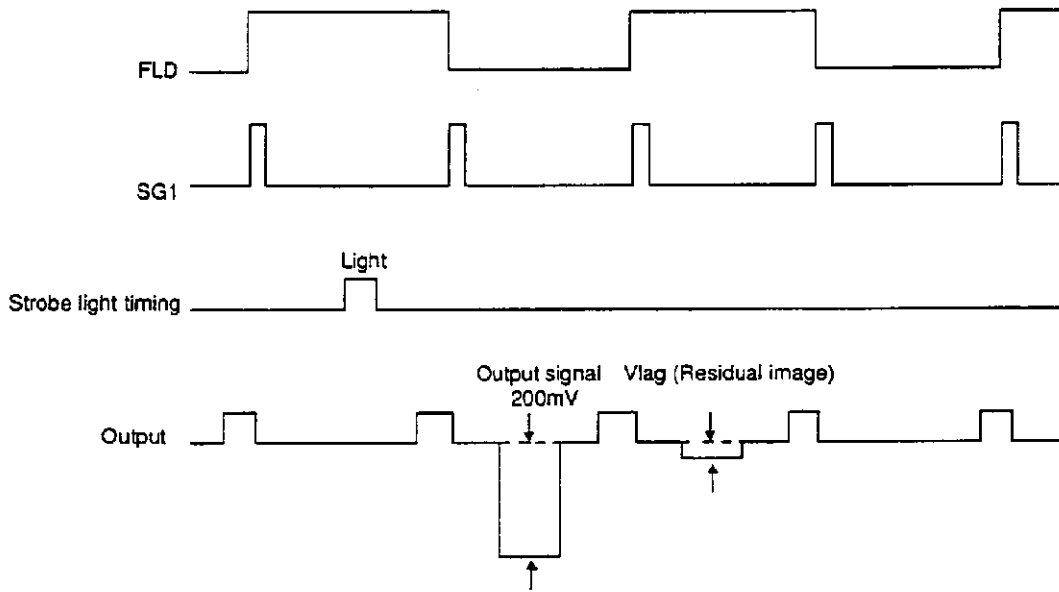

Set to standard imaging condition II . Adjust light intensity to signal output average value($V_A = 200\text{mV}$). Then test the signal difference (ΔV_f [mV]) between even field and odd field.

$$F = (\Delta V_f / 200) \times 100 (\%)$$

8. Residual image

Adjust signal output value by strobe light to 200mV. Then light a stroboscopic tube with the following timing and test the residual image (V_{lag}).

$$\text{Lag} = (V_{lag} / 200) \times 100 (\%)$$

Notes on Handling

1) Static charge prevention

CCD image sensors are easily damaged by static discharge. Before handling be sure to take the following protective measures.

- Either handle bare handed or use non-chargeable gloves, clothes or material.
Also use conductive shoes.
- When handling directly use an earth band.
- Install a conductive mat on the floor or working table to prevent the generation of static electricity.
- Ionized air is recommended for discharge when handling CCD image sensor.
- For the shipment of mounted substrates use boxes treated for the prevention of static charges.

2) Soldering

- Make sure the package temperature does not exceed 80°C.
- Solder dipping in a mounting furnace causes damage to the glass and other defects. Use a grounded 30W soldering iron and solder each pin in less than 2 seconds. For repairs and remount, cool sufficiently.
- To dismount an imaging device do not use a solder suction equipment. When using an electric desoldering tool use a thermal controller of the zero cross On/Off type and connect to ground.

3) Dust and dirt protection

Image sensors are packed and delivered by taking care of protecting its glass plates from harmful dust and dirt. Clean glass plates with the following operation as required, and use them.

- Operate in clean environments (around class 1000 will be appropriate).
- Do not either touch glass plates by hand or have any object come in contact with glass surfaces. Should dirt stick to a glass surface blow it off with an air blow. (For dirt stuck through static electricity ionized air is recommended.)
- Clean with a cotton bud and ethyl alcohol if the glass surface is grease stained. Be careful not to scratch the glass.
- Keep in a case to protect from dust and dirt. To prevent dew condensation, preheat or precool when moving to a room with great temperature differences.
- When a protective tape is applied before shipping, just before use remove the tape applied for electrostatic protection. Do not reuse the tape.

4) Do not expose to strong light (sun rays) for long periods.

For continuous using under cruel condition exceeding the normal using condition, consult our company.

5) Exposure to high temperatures or humidity will affect the characteristics. Accordingly avoid storage or usage in such conditions.

6) CCD image sensor are precise optical equipment that should not be subject to too much mechanical shocks.

7) Eclipse (to get dark around the four corners of the picture) may occur when some object lenses are in the open iris state.
