

FM Pager/FM Multiplex Tuner

Description

The CXA1991N is a tuner IC designed for use in FM pagers and FM multiplex broadcasting. A receiver system can be configured by using the digital data output, in combination with a decoder. It has a battery save function and ultra-low power consumption.

Features

- Ultra-low power consumption
($I_b = 1.2 \text{ mA}$ for FM; $I_b = 0.8 \text{ mA}$ for AM; $V_{cc} = 3 \text{ V}$)
- LED drive circuit for tuning
- Battery save function
- Few external parts

Applications

- Tuners for FM multiplex broadcasting
- FM pagers

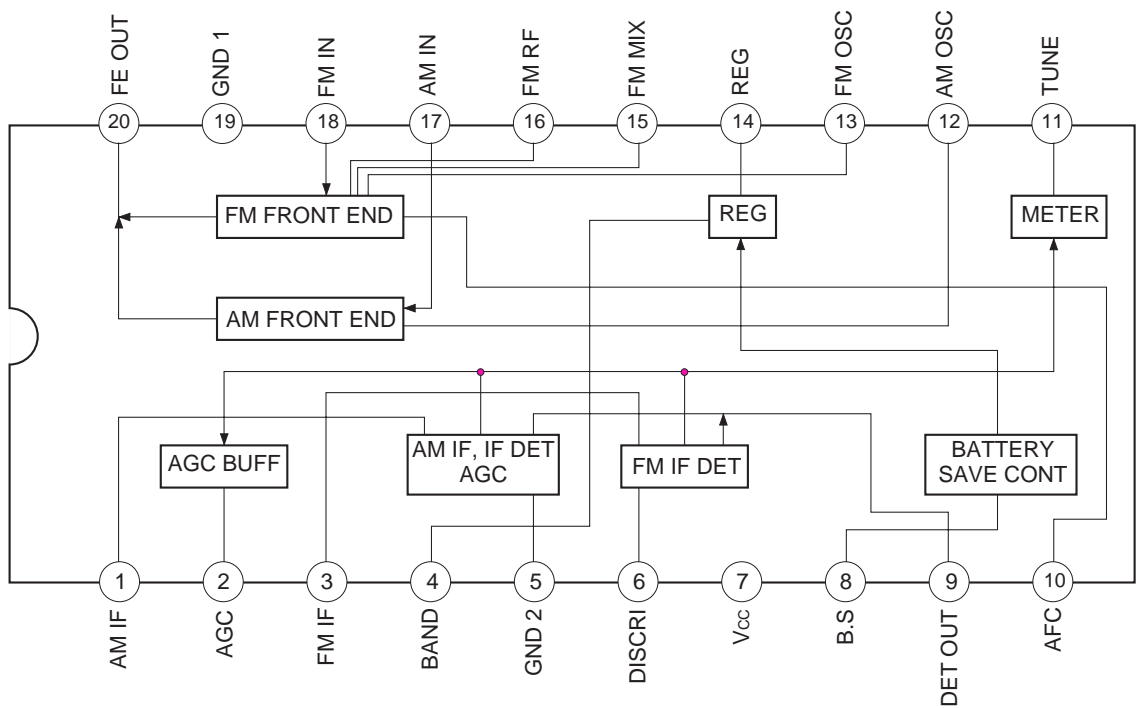

Absolute Maximum Ratings ($T_a = 25^\circ\text{C}$)

• Supply voltage	V_{cc}	14	V
• Operating temperature	T_{opr}	-20 to +75	$^\circ\text{C}$
• Storage temperature	T_{stg}	-65 to +150	$^\circ\text{C}$
• Allowable power dissipation	P_D	400	mW

Operating Conditions

Supply voltage	V_{cc}	1.8 to 4.5	V
----------------	----------	------------	---

Pin Description

(Vcc=3 V, Ta=25 °C)

Pin No.	Symbol	Pin voltage (V)		Equivalent circuit	Description
		FM	AM		
1	AM IF IN	1.1	1.1		AM IF input pin.
2	AGC	0.3	0.4		Connected to a capacitor.
9	DET OUT	0.9	0.7		Detection output pin.
3	FM IF IN	1.1	0		FM IF input pin.
4	BAND	1.1	0		AM/FM band switching pin. AM when grounded, FM when open.
5	GND2	0	0		IF system ground.
6	DISCRI	2.0	2.4		Connected to phase shift circuit and ceramic discriminator.
7	Vcc	3.0	3.0		

Pin No.	Symbol	Pin voltage (V)		Equivalent circuit	Description
		FM	AM		
8	BS				Controls battery save via microcomputer. High = Active, Low = Save
10	AFC	1.0	0.7		AFC varicap pin.
13	FM OSC	1.1	1.1		FM local oscillation circuit.
11	TUNE	1.1	1.1		AM/FM tuning indicator drive circuit.
12	AM OSC	1.1	1.1		AM local oscillation circuit.
14	REG	1.1	1.1		Regulator output pin.

Pin No.	Symbol	Pin voltage (V)		Equivalent circuit	Description
		FM	AM		
15	FM MIX	1.1	1.1		Load for mixer which resonates at 10.7 MHz from internal capacitance and external coil.
16	FM RF	1.1	1.1		FM RF amplifier circuit which is connected to RF tank circuit
18	FM RF IN	2.2	2.4		FM RF amplifier circuit which is FM RF input.
17	AM RF IN	1.1	1.1		AM RF input which is connected to bar antenna.
19	GND1	0	0		Front-end ground.
20	FE OUT	0.6	1.5		AM/FM IF output pin which is connected to IF filter.

V_{CC}=3 V, T_a=25 °C

Electrical Characteristics

Functional block	Measurement No.	Measurement item	Bias and SW conditions							Input point	Input waveform and bias description	Measurement point	Output waveform and measurement method description	MIN Limit

Notes on Operation

1. De-emphasis time constant

Time constants are determined by R4, R5 and C13. The calculation formula is as follows.

$$\{R4 \cdot R5 / (R4 + R5)\} \cdot C13$$

2. FM discriminator

Quadrature detection is used for FM detection. A ceramic resonator is used in the phase shifter so that no adjustment is required. In order to eliminate problems of distortion and offset with IF band center frequency, the CF1 (FM • IF) and FM discrete pair combination should be of the same level.

	CF1 and Discrete fo
A red	10.70 MHz
B blue	10.67 MHz
C orange	10.73 MHz
D black	10.64 MHz
E white	10.76 MHz

3. Battery save function

The battery save function operates when Pin 8 is grounded. Current consumption is 1 μ A or less during battery save. To switch from battery save mode to normal mode, Pin 8 is connected to Vcc. At this time the DET OUT (Pin 9) rise time is affected by the rise time of Pins 4, 10 and 14. For faster rise time, lower the capacitance values of bias capacitors C5, C6 and C8, taking care that characteristics do not deteriorate. Also, decrease or eliminate R3 and C11 time constants and control Pin 10 directly with DC voltage of approximately 1.1 V to improve rise time.

4. Notes on pattern preparation

i) FM antenna, OSC coil configuration

Change the direction 90 degrees in order to avoid M coupling. Also, insert Pin 14 pattern between Pins 13 and 16 and the pattern between the coils. (See "Standard Board Diagram".)

ii) Tuning circuit

The capacitance value of the tuning circuit varies according to the board; investigate the time constants for new boards.

iii) GND pins

Pin 5 is the ground pin for IF and Pin 19 is the ground pin for FE. Use as thick a pattern as possible for the antenna input, BPF and Pin 19 grounds, as they have a significant effect on stability and NF characteristics.

iv) The ground point for by-pass capacitors C5 and C6 connected to Pin 14 should be as close to Pin 14 as possible.

v) When the tuning indicator is not used, connect Pin 11 to ground. This will put the tuning indicator drive circuit into low power consumption mode and current ceases to flow to the indicator. Also, the current consumption Icc is eliminated.

vi) Use the BPF for FM.
