Description

The SD211DE/SST211 series consists of enhancement-mode MOSFETs designed for high speed low-glitch switching in audio, video, and high-frequency applications. The SD211 may be used for ±5-V analog switching or as a high speed driver of the SD214. The SD214 is normally used for ±10-V analog switching. These MOSFETs utilize lateral construction to achieve low capacitance and

ultra-fast switching speeds. An integrated Zener diode provides ESD protection. These devices feature a poly-silicon gate for manufacturing reliability.

For similar products see: quad array—SD5000/5400 series and non-Zener protection—SD210DE/214DE.
