TDA4472-A

Video-IF (VIF) with FPLL Demodulation and Quasi Parallel Sound (QPS) Processing

Description

The TDA4472 is an integrated bipolar circuit for video/sound IF (VIF/SIF) signal processing in TV/VCR and multimedia applications.

The circuit processes TV video IF signals with negative modulation (e.g. B/G standard) and the FM/NICAM sound IF signals.

Features

- 5 V supply voltage; low power consumption

- Active carrier generation by FPLL principle (frequency-phase-locked-loop) for true synchronous demodulation

- Very linear video demodulation, good pulse response and excellent intermodulation figures

- VCO circuit is operating on picture carrier frequency

- Alignment-free AFC without external reference circuit

- VIF-AGC with peak sync detection

- Tuner AGC with adjustable take over point

- Alignment-free quasi parallel sound (QPS) mixer for FM/NICAM sound IF signals

- Gain controlled intercarrier output signal (supports digital sound processing systems)

- Separate SIF-AGC with average detection

- Two independent SIF inputs

- Package and pinning is fully compatible with the multistandard version TDA4470, simplifies the design of an universal IF module
Package

28 pin shrink-dual-inline-plastic (SDIP28)

Circuit Description

Vision IF Amplifier

The video IF signal (VIF) is fed through a SAW filter to the differential input (Pin 6-7) of the VIF amplifier. This amplifier consists of three AC-coupled amplifier stages. Each differential amplifier is gain controlled by the automatic gain control (VIF-AGC). Output signal of the VIF amplifier is applied to the FPLL carrier generation and the video demodulator.

Tuner- and VIF-AGC

At Pin 8 the VIF-AGC charges/discharges the AGC capacitor to generate a control voltage for setting gain of VIF amplifier and tuner in order to keep the video output signal at a constant level. Therefore in case of all negative modulated signals the sync level of the demodulated video signal is the criterion for a fast charge/discharge of the AGC capacitor. The control voltage (AGC voltage at Pin 8) is transferred to an internal control signal, and is fed to the tuner AGC to generate the tuner AGC current at Pin 11 (open collector output). Take over point of the tuner AGC can be adjusted at Pin 10 by a potentiometer or an external DC voltage (from interface circuit or microprocessor).

FPLL, VCO and AFC

The FPLL circuit (frequency phase locked loop) consists of a frequency and phase detector to generate control voltage for the VCO tuning. In the locked mode the VCO is controlled by the phase detector and in unlocked mode the frequency detector is superimposed. The VCO operates with an external resonance circuit (L and C parallel) and is controlled by internal varicaps.

The VCO control voltage is also converted to a current and represents the AFC output signal at Pin 22. A practicable VCO alignment of the external coil is the adjustment to zero AFC output current at Pin 22. At centre frequency the AFC output current is equal to zero. The optional potentiometer at Pin 26 allows an offset compensation of the VCO phase for improved sound quality (fine adjustment). Without a potentiometer (open circuit at Pin 26) this offset compensation is not active.

The oscillator signal passes a phase shifter and supplies the in-phase signal (0°C) and the quadrature signal (90°C)of the generated picture carrier.

Video Demodulation and Amplifier

The video IF signal, which is applied from the gain controlled IF amplifier, is multiplied with the inphase component of the VCO signal. The video demodulator is designed for low distortion and large bandwidth. The demodulator output signal passes an integrated low pass filter for attenuation of the residual vision carrier and is fed to the video amplifier. The video amplifier is realized by an operational amplifier with internal feedback and 8 MHz bandwidth (–3 dB). An additional noise clipping is provided. The video signal is fed to VIF-AGC and to the video output buffer. This amplifier with 6 dB gain offers easy adaption of the sound trap. For nominal video IF modulation the video output signal at Pin 12 is 2 V_{pp}.

Sound IF Amplifier and SIF-AGC

The SIF amplifier is nearly identical with the 3-stage VIF amplifier. Merely the first amplifier stage exists twice and is switchable by a control voltage at pin 3. Therefore with a minimal external expense it is possible to switch between two different SAW filters. Both SIF inputs features excellent cross-talk attenuation and an input impedance which is independent from the switching condition.

The SIF-AGC is related to the average level of the FM-carrier and controls the SIF amplifier to provide a constant SIF signal to the QPS mixer.

Quasi-Parallel-Sound (QPS) Mixer

The QPS mixer is realized by a multiplier. The SIF signal (FM or NICAM carrier) is converted to the intercarrier frequency by the regenerated picture carrier (quadrature signal) which is provided from the VCO. The intercarrier signal is fed via an output amplifier to Pin 24.

AFC Switch

The AFC output signal at Pin 22 can be controlled by a switching voltage at Pin 19. It is possible to switch off the AFC.

VCR Mode

For the VCR mode in a TV set (external video source selected) it is recommendable to switch off the IF circuit. With an external switching voltage at Pin 6 or 7 the IF amplifiers are switched off and all signal output levels at Pin 12, 24 are according to the internal DC voltage.

Internal Voltage Stabilizer

The internal bandgap reference ensures constant performance independent of supply voltage and temperature.
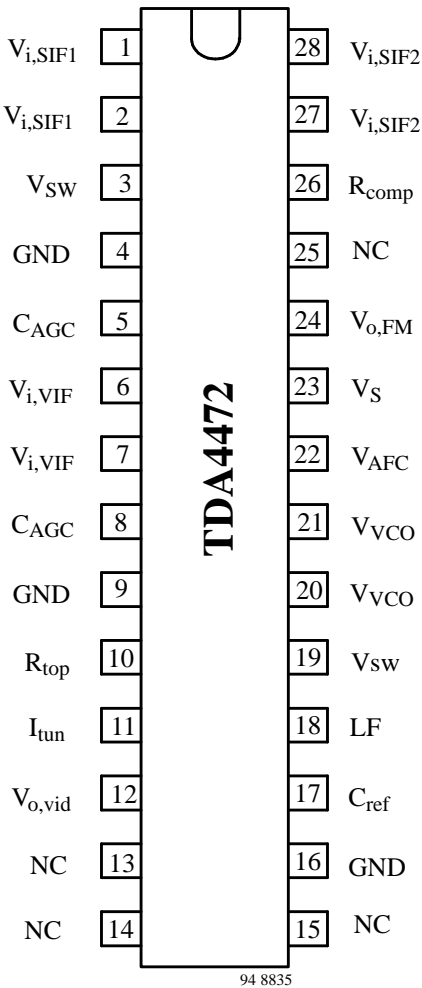

Pin Description

Pin	Symbol	Function
1, 2	$V_{i,\ SIF1}$	SIF1 input (symmetrical)
3	V_{SW}	Ground
4	GND	Input selector switch
5	C_{AGC}	SIF-AGC (time constant)
6, 7	$V_{i,\ VIF}$	VIF input (symmetrical)
8	C_{AGC}	VIF-AGC (time constant)
9	GND	Ground
10	R_{top}	Take over point, tuner AGC
11	I_{tun}	Tuner AGC output current
12	$V_{o,vid}$	Video output
13	NC	Not connected
14	NC	Not connected
15	NC	Not connected
16	GND	Ground
17	C_{ref}	Internal reference voltage
18	LF	Loop filter
19	V_{SW}	AFC switch
20, 21	V_{vco}	VCO circuit
22	V_{AFC}	AFC output
23	V_S	Supply voltage
24	$V_{O,\ FM}$	Intercarrier output
25	NC	Not connected
26	R_{comp}	Offset compensation
27, 28	$V_{i,\ SIF2}$	SIF 2 input (symmetrical)

Pin configuration (left to right):

- 1 — $V_{i,SIF1}$ / 28 — $V_{i,SIF2}$
- 2 — $V_{i,SIF1}$ / 27 — $V_{i,SIF2}$
- 3 — V_{SW} / 26 — R_{comp}
- 4 — GND / 25 — NC
- 5 — C_{AGC} / 24 — $V_{o,FM}$
- 6 — $V_{i,VIF}$ / 23 — V_S
- 7 — $V_{i,VIF}$ / 22 — V_{AFC}
- 8 — C_{AGC} / 21 — V_{VCO}
- 9 — GND / 20 — V_{VCO}

Notes

1. This parameter is given as an application information and not tested during production.

2. In VCR mode the VIF- and SIF path is switched off.

3. Adjustment of turn over point (delayed tuner AGC) with external resistor R_{top} or external voltage V_{top} possible.

4. The oscillator drift is related to the picture carrier frequency, at external temperature-compensated LC circuit.

5. α (1.07) = 20 log (4.43 MHz component/1.07 MHz component); α (1.07) value related to black-white signal input signal conditions:

picture carrier	0 dB
colour carrier	–6 dB
sound carrier	–24 dB

6. Without control voltage at pin 19 the "on" mode is automatically selected.

7. Picture carrier PC = 38.9 MHz; sound carrier SC_1 = 33.4 MHz, SC_2 = 33.16 MHz; PC/SC_1 = 13 dB; PC/SC_2 = 20 dB; PC unmodulated (equivalent to sync peak level).

8. Without control voltage at Pin 3 SIF input 1 is automatically selected.

Ozone Depleting Substances Policy Statement

It is the policy of **TEMIC TELEFUNKEN microelectronic GmbH** to

1. Meet all present and future national and international statutory requirements.

2. Regularly and continuously improve the performance of our products, processes, distribution and operating systems with respect to their impact on the health and safety of our employees and the public, as well as their impact on the environment.

It is particular concern to control or eliminate releases of those substances into the atmosphere which are known as ozone depleting substances (ODSs).

The Montreal Protocol (1987) and its London Amendments (1990) intend to severely restrict the use of ODSs and forbid their use within the next ten years. Various national and international initiatives are pressing for an earlier ban on these substances.

TEMIC TELEFUNKEN microelectronic GmbH semiconductor division has been able to use its policy of continuous improvements to eliminate the use of ODSs listed in the following documents.

1. Annex A, B and list of transitional substances of the Montreal Protocol and the London Amendments respectively

2. Class I and II ozone depleting substances in the Clean Air Act Amendments of 1990 by the Environmental Protection Agency (EPA) in the USA

3. Council Decision 88/540/EEC and 91/690/EEC Annex A, B and C (transitional substances) respectively.

TEMIC can certify that our semiconductors are not manufactured with ozone depleting substances and do not contain such substances.
