

AM-Receiver

Description

The U4240B is a bipolar integrated AM receiver circuit. It performs all the active functions and part of the filtering

required of the AM radio receiver. The device is designed for car radio and home receiver applications.

Features

- ESD protected
- IF output for stereo demodulator and stop signal generation
- AF preamplifier with simple filtering
- Controlled RF preamplifier
- Double balanced mixer
- Separate oscillator with amplitude control
- IF amplifier with gain control
- Balanced full-wave detector
- Audio preamplifier
- Internal AGC voltage
- Amplifier for field-strength indication
- Electronic standby ON/ OFF switch

Block Diagram

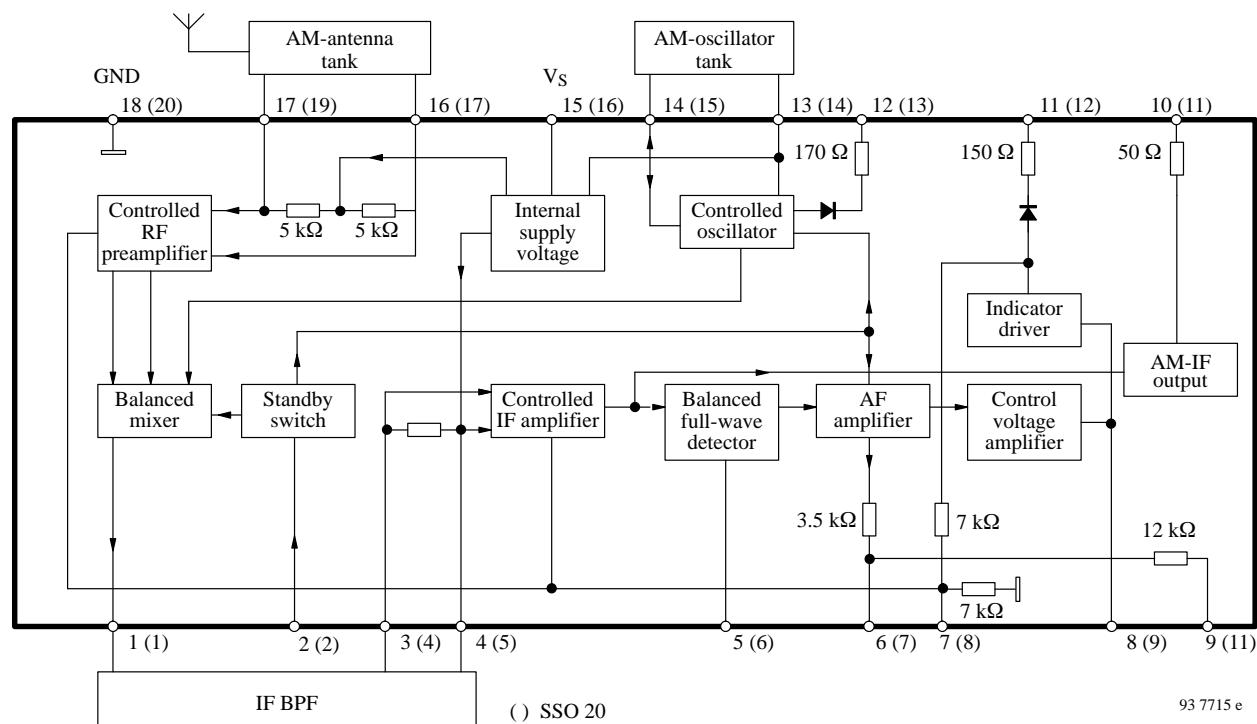

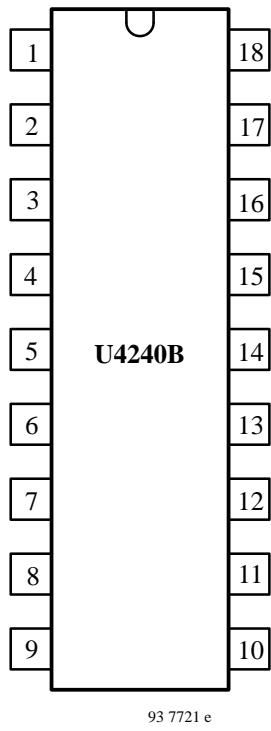

Figure 1.

Pin Description

DIP 18	DIP 20	Function
1	1	Mixer output
2	2	Standby switch
3	4	IF amplifier input
4	5	V_{REF}
5	6	Low pass filtering
6	7	AF output
7, 8	8, 9	AGC time constant
9	10	Low pass filtered AF output
10	11	IF output
11	12	Field strength indicator
12	13	Oscillator output
13	14	Oscillator tank reference output
14	15	Oscillator tank input
15	16	V_S
16, 17	17, 19	RF input
18	20	GND
	3, 18	Not connected

Controlled RF Preamplifier, Pin 7

The RF preamplifier is built up differentially in order to achieve the best possible large signal handling capability. Special care was taken to reduce the input stage noise.

Balanced Mixer, Pin 1

The mixer is a double balanced type with a single ended output.

Controlled Oscillator, Pins 13 and 14

The oscillator employs temperature compensation, simple varicap and coil connection. The amplitude of the oscillator is controlled to low values, in order to support AM varactor diodes. The LO-buffer supports the U428xBM PLL-family.

Controlled IF Amplifier, Pin 3

The IF amplifier consists of two controlled gain cells coupled by capacitive means. Internal band pass filtering reduces higher order products and THD.

AM-IF Output, Pin 10

For AM stereo application and for stop signal generation by IF counting Pin 10 provides a non limited but amplitude controlled IF signal of about 280 mV.

Balanced Full-Wave Detector, Pin 5

The detector consists of a Gilbert cell that multiplies the limited carrier signal with the IF output signal and therefore employs a full wave rectification. Second or higher order products at the output are internally low pass filtered.

AF Amplifier, Pin 6

The AF amplifier has two different outputs. They provide different output resistances for simplifying applications. For a high end application Pin 6 provides a $3.5\text{ k}\Omega$ output resistor to support a second order low pass filter. Pin 9 provides additional $12\text{ k}\Omega$ for a simple first order low pass filter.

AGC, Pin 8

The AGC block generates the AGC voltage that is to be smoothed at Pin 8. The capacitor at Pin 8 defines the time constant. The voltage at Pin 8 is buffered to control the internal gain stages with different delay. The control voltage is available at Pin 11 (field strength indication).

Standby Switch, Pin 2

The whole circuit can be powered down by the standby switch. This mode can be achieved by a dc voltage higher than 3.5 V at Pin 2.

Absolute Maximum Ratings

Reference point Pin 18, unless otherwise specified

Parameters	Symbol	Value	Unit
Supply voltage	V _S	12	V

Ozone Depleting Substances Policy Statement

It is the policy of **TEMIC TELEFUNKEN microelectronic GmbH** to

1. Meet all present and future national and international statutory requirements.
2. Regularly and continuously improve the performance of our products, processes, distribution and operating systems with respect to their impact on the health and safety of our employees and the public, as well as their impact on the environment.

It is particular concern to control or eliminate releases of those substances into the atmosphere which are known as ozone depleting substances (ODSs).

The Montreal Protocol (1987) and its London Amendments (1990) intend to severely restrict the use of ODSs and forbid their use within the next ten years. Various national and international initiatives are pressing for an earlier ban on these substances.

TEMIC TELEFUNKEN microelectronic GmbH semiconductor division has been able to use its policy of continuous improvements to eliminate the use of ODSs listed in the following documents.

1. Annex A, B and list of transitional substances of the Montreal Protocol and the London Amendments respectively
2. Class I and II ozone depleting substances in the Clean Air Act Amendments of 1990 by the Environmental Protection Agency (EPA) in the USA
3. Council Decision 88/540/EEC and 91/690/EEC Annex A, B and C (transitional substances) respectively.

TEMIC can certify that our semiconductors are not manufactured with ozone depleting substances and do not contain such substances.

We reserve the right to make changes to improve technical design and may do so without further notice.

Parameters can vary in different applications. All operating parameters must be validated for each customer application by the customer. Should the buyer use TEMIC products for any unintended or unauthorized application, the buyer shall indemnify TEMIC against all claims, costs, damages, and expenses, arising out of, directly or indirectly, any claim of personal damage, injury or death associated with such unintended or unauthorized use.
