## Automotive TOGGLE switch

## Description

The bipolar integrated circuit, U 6032 B , is designed as a TOGGLE switch. It controls an electrical load, for
example, fog lamp, high/ low beam or heated windows for automotive applications. It has a defined power-on status.

## Features

- Debounce time: 0.3 ms to 6 s
- RC oscillator determines switching characteristics
- Relay driver with Z-diode
- Debounced input for toggle switch
- Two debounced inputs: ON and OFF
- Load dump protection
- RF interference protected
- Protection according to ISO/TR7637-1 (VDE 0839)

## Cases: DIP 8, SO 8

Figure 1 Block diagram with external circuit

## Pin Configuration

| Pin | Symbol | Function |
| :---: | :---: | :--- |
| 1 | GND | Reference point, ground |
| 2 | RELAY | Relay control output |
| 3 | ON | Switch-on input |
| 4 | OFF | Switch-off input |
| 5 | TOGGLE | Toggle input |
| 6 | OSC | RC oscillator input |
| 7 | $\mathrm{~V}_{\text {stab }}$ | Stabilized voltage |
| 8 | $\mathrm{~V}_{\mathrm{S}}$ | Supply voltage |

## Functional description

## Power supply, Pin 8

For reasons of interference protection and surge immunity, the supply voltage (Pin 8) must be provided with an RC circuit as shown in figure 2 a . Dropper resistor, $\mathrm{R}_{1}$, limits the current in case of overvoltage, whereas $\mathrm{C}_{1}$ smoothes the supply voltage at Pin 8 .

Recommended values are: $\mathrm{R}_{1}=510 \Omega, \mathrm{C}_{1}=47 \mu \mathrm{~F}$.

Figure 2a Basic circuit for 12 V supply and oscillator

The integrated Z-diode ( 14 V ) protects the supply voltage, $\mathrm{V}_{\mathrm{S}}$, therefore, the operation of the IC is possible between 6 V and 16 V , supplied by $\mathrm{V}_{\text {Batt }}$.
However, it is possible to operate the integrated circuit with a 5 V supply, but it should be free of interference voltages. In this case, Pin 7 is connected to Pin 8 as shown in figure $2 b$, and the $R_{1} C_{1}$ circuit is omitted.

Figure 2b Basic circuit for $\mathrm{V}_{\mathrm{S}}=5 \mathrm{~V}$

## Oscillator, Pin 6

Oscillator frequency, f , is determined mainly by the $\mathrm{R}_{2} \mathrm{C}_{2}$ circuit. Resistance, $\mathrm{R}_{2}$, determines the charge time, and the integrated resistance ( $2 \mathrm{k} \Omega$ ) is responsible for discharge time. For the stability of the oscillator frequency, it is recommended that the selected $\mathrm{R}_{2}$ value be much greater than the internal resistance ( $2 \mathrm{k} \Omega$ ), because the temperature response and the tolerances of the integrated resistance are considerably greater than the external resistance value.

Oscillator frequency, f , is calculated as follows:

$$
\mathrm{f}=\frac{1}{\mathrm{t}_{1}+\mathrm{t}_{2}}
$$

where
$\mathrm{t}_{1}=$ charge time $=\alpha_{1} \cdot \mathrm{R}_{2} \cdot \mathrm{C}_{2}$
$\mathrm{t}_{2}=$ discharge time $=\alpha_{2} \cdot 2 \mathrm{k} \Omega \cdot \mathrm{C}_{2}$
$\alpha_{1}$ and $\alpha_{2}$ are constants as such
$\alpha_{1}=0.833$ and $\alpha_{2}=1.551$ when $C_{2}=470 \mathrm{pF}$ to 10 nF
$\alpha_{1}=0.746$ and $\alpha_{2}=1.284$ when $\mathrm{C}_{2}=10 \mathrm{nF}$ to 4700 nF
Debounce time, $\mathrm{t}_{3}$, and the delay time, $\mathrm{t}_{\mathrm{d}}$, depend on the oscillator frequency, f , as follows:

$$
\begin{aligned}
& \mathrm{t}_{3}=6 \cdot \frac{1}{\mathrm{f}} \\
& \mathrm{t}_{\mathrm{d}}=73728 \cdot \frac{1}{\mathrm{f}}
\end{aligned}
$$

Table 1 shows relationships between $t_{3}, t_{d}, C_{2}, R_{2}$ and frequencies from 1 Hz to 20 kHz .

## Relay control output

The relay control output is an open collector Darlington circuit with an integrated 23-V Z-diode for limitation of the inductive cut-off pulse of the relay coil. The maximum static collector current must not exceed 300 mA and saturation voltage is typically $1.1 \mathrm{~V} @ 200 \mathrm{~mA}$.

## Interference voltages and load dump

The 1 C supply is protected by $\mathrm{R}_{1}, \mathrm{C}_{1}$, and an integrated Z-diode, while the inputs are protected by a series resistor, integrated Z-diode and RF capacitor (refer to Figure 6).

The relay control output is protected via the integrated $23-V$ Z-diode in the case of short interference peaks. It is switched to conductive condition for a battery voltage of greater than approx. 40 V in the case of load dump. The output transistor is dimensioned so that it can withstand the current produced.

## Power-on reset

When the operating voltage is switched on, an internal power-on reset pulse (POR) is generated which sets the logic of the circuits to a defined initial condition. The relay output is disabled.

Figure 3 TOGGLE function

## Relay control output behaviour, Pin 2

Time functions (relay output) can be started or interrupted by the three inputs i.e., ON, OFF or TOGGLE (Pins 3, 4 and 5).

The relay becomes active if the time function is triggered, and the relay contact is interrupted after the elapse of delay time, $\mathrm{t}_{\mathrm{d}}$. There are two input possibilities:

## Toggle input, figure 3

When the push-button (TOGGLE) switch, $\mathrm{S}_{1}$, is pressed for the first time, the relay becomes active after the debounce time, $t_{3}$, i.e., the relay output, Pin 2 , is active.

Renewed operation of $S_{1}$ causes the interruption of the relay contact and the relay is disabled. Each operation of the toggle switch, $S_{1}$, changes (alters) the condition of the relay output when the debounce time, $t_{d}$, is exceeded i.e., the TOGGLE function.

If the relay output is not disabled by pressing the switch $S_{1}$, the output is active.

## ON, OFF inputs, Pins 3 and 4, fig. 4

To avoid simultaneous operation of both inputs, Pin 3 (ON) and Pin 4 (OFF), use of two-way contact with centre-off position with spring returns (also known as rocker-actuated switch) is recommended.

Pressing the push-button switch (Pin 3-ON) leads to the activation of the relay after the debounce time, $t_{3}$, whereas the switching of the Pin 4 switch correspondingly leads to the relay being de-energized. If the relay is not de-energized by the push-button switch, the output remains active.

Combined operation, "TOGGLE and ON/OFF" is not possible due to the fact that there is only one debouncing circuit. Debouncing functions on both sides i.e., whenever $\mathrm{S}_{1}$ is ON or OFF.

Figure 5 shows the input circuit of U 6032 B. It has an integrated pull-down resistance ( $20 \mathrm{k} \Omega$ ), RF capacitor $(15 \mathrm{pF})$ and Z-diode ( 7 V ). It reacts to voltages greater than 2 V . The external protective resistor has a value of $20 \mathrm{k} \Omega$ and the push-button switch, $S$, is connected to the battery as shown in the diagram.

Contact current, I, is calculated as follows:

$$
\begin{aligned}
& \mathrm{I}=\frac{\mathrm{V}_{\text {Batt }}-V_{\mathrm{Z}}}{\mathrm{R}(=20 \mathrm{k} \Omega)} \text { where } \mathrm{V}_{\text {Batt }}=12 \mathrm{~V}, \mathrm{~V}_{\mathrm{Z}}=7 \mathrm{~V} \\
& \mathrm{I}=\frac{(12-7) \mathrm{V}}{20 \mathrm{k} \Omega} \approx 0.25 \mathrm{~mA}
\end{aligned}
$$

It can be increased by connecting a $5.6 \mathrm{k} \Omega$ resistor from the push-button switch to ground as shown in figure 6.

## OZONE DEPLETING SUBSTANCES POLICY STATEMENT

It is the policy of TEMIC TELEFUNKEN microelectronic GmbH to

1. Meet all present and future national and international statutory requirements and
2. Regularly and continuously improve the performance of our products, processes, distribution and operating systems with respect to their impact on the health and safety of our employees and the public, as well as their impact on the environment.

Of particular concern is the control or elimination of releases into the atmosphere of those substances which are known as ozone depleting substances (ODSs).

The Montreal Protocol (1987) and its London Amendments (1990) will soon severely restrict the use of ODSs and forbid their use within the next ten years. Various national and international initiatives are pressing for an earlier ban on these substances.

TEMIC TELEFUNKEN microelectronic GmbH semiconductor division has been able to use its policy of continuous improvements to eliminate the use of any ODSs listed in the following documents.

1. Annex A, B and list of transitional substances of the Montreal Protocol and the London Amendments respectively
2. Class I and II ozone depleting substances in the Clean Air Act Amendments of 1990 by the Environmental Protection Agency (EPA) in the USA and
3. Council Decision 88/540/EEC and 91/690/EEC Annex A, B and C (transitional substances) respectively.

TEMIC can certify that our semiconductors are not manufactured with and do not contain ozone depleting substances.
