'147, 'LS147

- Encodes 10-Line Decimal to 4-Line BCD
- Applications Include:
  - Keyboard Encoding
  - Range Selection

'148, 'LS148

- Encodes 8 Data Lines to 3-Line Binary (Octal)
- Applications Include:
  - N-Bit Encoding
  - Code Converters and Generators

## description

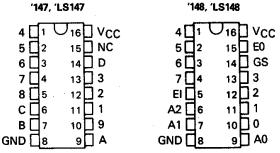

These TTL encoders feature priority decoding of the inputs to ensure that only the highest-order data line is encoded. The '147 and 'LS147 encode nine data lines to four-line (8-4-2-1) BCD. The implied decimal zero condition requires no input condition as zero is encoded when all nine data lines are at a high logic level. The '148 and 'LS148 encode eight data lines to three-line (4-2-1) binary (octal). Cascading circuitry (enable input EI and enable output EO) has been provided to allow octal expansion without the need for external circuitry. For all types, data inputs and outputs are active at the low logic level. All inputs are buffered to represent one normalized Series 54/74 or 54LS/74LS load, respectively.

NOTES: 1. Voltage values, except interemitter voltage, are with respect to network ground terminal.

2. This is the voltage between two emitters of a multiple-emitter transistor. For '148 circuits, this rating applies between any two of the eight data lines, 0 through 7.

## recommended operating conditions

<sup>¶</sup>tpLH ≡ propagation delay time, low-to high-level output

NOTE 4: Load circuits and voltage waveforms are shown in Section 1.

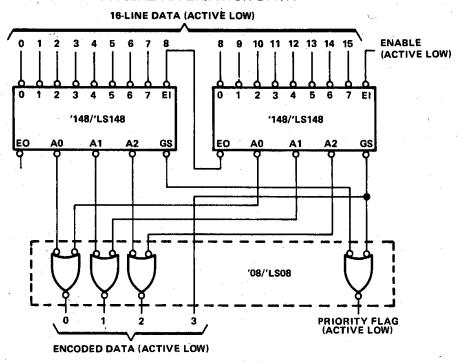

<sup>&</sup>lt;sup>†</sup>For conditions shown as MIN or MAX, use the appropriate value specified under recommended operating conditions.

 $<sup>\</sup>ddagger$ All typical values are at  $V_{CC} = 5 \text{ V, } T_A = 25^{\circ}\text{C.}$ 

Not more than one output should be shorted at a time.

tPHL = propagation delay time, high-to-low-level output

#### TYPICAL APPLICATION DATA

Since the '147/'LS147 and '148/'LS148 are combinational logic circuits, wrong addresses can appear during input transients. Moreover, for the '148/'LS148 a change from high to low at input EI can cause a transient low on the GS output when all inputs are high. This must be considered when strobing the outputs.
