

Load Cell Weigh Modules

FEATURES

- Capacity range: 110 to 45000lb (0.5 to 200kN)
- Checkless design - no stay or check rods required
- Designed to meet ANSI/UBC wind and seismic load requirements
- Insensitive to side loads of up to 100% capacity
- High accuracy: combined error less than 0.05%, repeatability of 0.01%
- FM approved for hazardous locations, meets all NEMA 4 and IP67 requirements

DESCRIPTION

BLH KIS Weigh Modules combine patented KIS force transducers and specially designed mounting hardware to satisfy the challenging requirements of industrial process weighing. The unique KIS design rejects measurement errors caused by side loads, vibration, thermal influences, and occasional overload. Superb accuracy and repeatability make KIS® the ideal transducer for weighing dynamic process vessels.

Strain gage technology measures shear* stress in the cylindrical beam constructed of stainless (0.5 thru 50kN) or alloy (50 thru 200kN) steel. Measuring shear, instead of moment stress, ensures constant beam output regardless of load application point. This allows the module to measure weight and force accurately in applications where vibration or thermal expansion is encountered.

A unique Super Sealing System protects KIS Beam electronics from environmental moisture and caustic washdowns. This multilevel sealing system includes extruded cable, neoprene cable glands, mylar internal wrapping, teflon O rings, and a coated strain gage region. Stainless steel construction of KIS-2 and -3 modules is perfect for food and pharmaceutical installations. The cylindrical beam and single piece mounting base eliminates cracks and crevices where process residue can accumulate.

Simple rugged mounting arrangements, four bolts to the base and two bolts to the vessel gusset or plate, makes installation robust and quick. The sliding yoke design accommodates minor mounting variances without extensive rework.

* Not applicable to 0.5kN beam

APPLICATIONS

- Reactor vessels
- Batch/blend systems
- Mixing tanks
- High value ingredient processing
- Quality critical weighing
- Heated vessels

CONFIGURATION

THE DOUBLE CANTILEVER ADVANTAGE

Double cantilever shear beams measure the shear component of force without errors caused by changing point or moment stresses.

The KIS Weigh Module incorporates an outer sleeve that can be thought of as a second cantilever, rigidly attached to the free end of the first cantilever. Thus the term double cantilever.

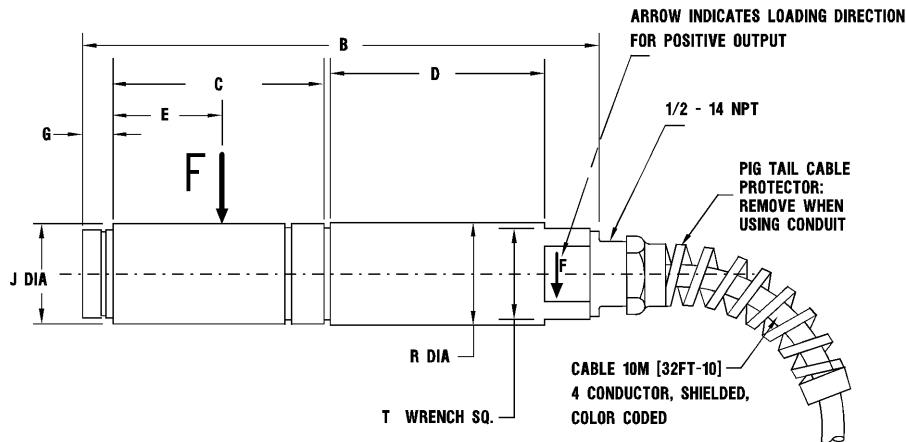

With this design, rather than applying force at the free end of the beam, the point of load application is brought back to a point directly over the gaged area. The result is that bending moment is close to zero across the gaged area. Because a shear beam is designed to measure shear, not bending, any reduction in bending moment stress is desirable. The second cantilever also is effective at isolating load application point stresses from the active element.

Reducing the force due to bending moment in a cantilever beam has a side benefit - a reduction in the beam's strength requirements. By reducing the bending moment induced at the weakest part of the shear beam (section A-A), a double cantilever shear beam can be operated at a stress level well below that of a single cantilever shear beam. The result is a more conservative structural design with high overload capacity and fatigue resistance.

Double cantilever shear beams approach the ideal in load cell design: they measure the desired force while ignoring any extraneous forces that may be present.

NOTES:

BLH supplied retainer-yoke bolts (T) have a minimum tensile strength of 100,000psi
1kN = approx. 225lb

All units are machined and have a two piece 'split-block' retainer yoke assembly. In these units only the lower block is threaded thru. The upper block contains a machined through hole for the bolt to pass through.

NOTE: 1kN = approx. 225lb

BLH is continually seeking to improve product quality and performance. Specifications may change accordingly.

ACCESSORIES

Mounting Plates

Mounting plates are available to provide a larger mounting surface with a square bolt hole pattern. These stainless steel or painted steel plates mount to the top of the yoke and attach with the standard bolts.

Thermal Insulation Kit

Thermal insulation kits (mounting plate and pad) reduce heat conducted from a heated vessel. The pads are made of rigid laminate with extremely low thermal conductivity.

Dummy Beams

Optional dummy beams are solid steel shafts with the same dimensions as the corresponding KIS beam. Dummy beams are used in place of the KIS beams during the installation process. Using dummy beams eliminates the risk of damaging precision KIS beams while welding and/or positioning the weigh vessel.
