# Ceramic RF-Power Capacitors Ceramic High Voltage Capacitors

## CONTENTS

### General Information, Ceramic RF-Power Capacitors

#### PLATE CAPACITORS

- Plate capacitors with contoured rim - Class 1 ceramic
- Plate capacitors with contoured rim - Class 1 ceramic
- Plate capacitors with flat rim - Class 1 ceramic
- Plate capacitors for higher voltages - Class 1 ceramic
- Plate capacitors with moisture protection - Class 1 ceramic
- Plate capacitors with contoured rim - Class 2 ceramic

#### BARREL STYLE CAPACITORS

- Barrel style capacitors - Class 1
- Barrel style capacitors - Class 1 Ceramic & Class 2 Ceramic
- Barrel style capacitors for higher voltages
- Barrel style capacitors for dielectric heating equipment

#### FEED-THROUGH CAPACITORS

- Feed-through capacitors with conductor rod
- Feed-through capacitors, screw mounting
- Feed-through capacitors, screw and tag mounting
- Feed-through capacitors, tag mounting
- Feed-through capacitors with band conductor
- Feed-through capacitors with conductor rod
- Feed-through capacitors with conductor rod
- Feed-through capacitors with R 16 High Q ceramic

#### TUBULAR CAPACITORS

- Tubular capacitors, tag mounting
- Tubular capacitors, screw and band mounting

#### POT CAPACITORS

- Pot capacitors, tag mounting
- Pot capacitors, tag mounting
- Pot capacitors, tag mounting
- Pot capacitors, tag and flange mounting
- Pot capacitors, tag and flange mounting
- Pot capacitors with R 16 High Q ceramic
- Pot capacitors with R 16 High Q ceramic
- Pot capacitors for coupling purposes
- Pot capacitors for coupling purposes

#### WATERCOOLED POWER RF-CAPACITORS

### General Information, Watercooled Power RF Capacitors

- Watercooled pot capacitors external cooling
- Watercooled power capacitors internal cooling
- Watercooled power capacitors internal cooling

#### STAND-OFF INSULATORS FOR RF-EQUIPMENT

- Stand-off insulators with threaded terminals
- Stand-off insulators with threaded terminals

#### HIGH VOLTAGE CAPACITORS

- Ring style high voltage capacitors
- High voltage disc capacitors, screw mounting
- High voltage disc capacitors, screw mounting
- High voltage capacitors with axial leads
- General Information, Ceramic Capacitor Stacks**
- Capacitors stacks with lead terminals
- Capacitors stacks with solder tags
- Capacitors stacks with solder tags
- Voltage multiplier sets

## Ceramic RF-Power Capacitors

### GENERAL DESCRIPTION:

The Ceramic RF-Power Capacitor can be defined as an electrical device consisting of a ceramic dielectric with conductive noble-metal electrodes, terminations and a protective coating. The spectrum of capacitance values extends from the lower picofarad range up to the nanofarad range. The rated voltages range from 636 V (peak) up to 40,000 V (peak). Typical frequencies of application range from 20KHz to 100MHz. These capacitors can be operated with DC and AC voltage both individually and in combination. The electrical power-handling capacity is largely determined by the three parameters, VOLTAGE, CURRENT and POWER. These parameters essentially depend on the CAPACITANCE, the OPERATING FREQUENCY and the AMBIENT TEMPERATURE.

### APPLICATIONS:

Typical uses for ceramic RF-Power capacitors are:

- INDUCTIVE HEATING EQUIPMENT (Operating frequencies above 20KHz)
- DIELECTRIC HEATING EQUIPMENT (Operating frequencies above 5MHz)
- IMPEDANCE TUNING CIRCUITS
- RF FILTER and PULSE FORMING CIRCUITS
- DC VOLTAGE BLOCKING, RF-VOLTAGE DIVIDERS
- RADIO TRANSMITTING EQUIPMENT
- VOLTAGE MULTIPLIERS (Capacitor stacks)

### ELECTRICAL PARAMETERS:

The electrical performance is determined by four parameters: CAPACITANCE, VOLTAGE, CURRENT and REACTIVE POWER.

### CAPACITANCE:

Rated capacitance  $C_R$  is the nominal capacitance value.

### CAPACITANCE MEASUREMENTS:

The capacitance of all Ceramic RF Power Capacitors - except where deviations are agreed upon in the ordering procedure - are measured under the following conditions:

### MEASURING FREQUENCY:

Class 1-Ceramic dielectric       $(1 \pm 0.2)$  MHz or  $(100 \pm 20)$  kHz  
Class 2-Ceramic dielectric       $(1 \pm 0.2)$  kHz (Field strength max. 3kV<sub>RMS</sub> per millimeter)

### MEASURING VOLTAGE:

Class 1-Ceramic dielectric       $\leq 5.0$ V<sub>RMS</sub>  
Class 2-Ceramic dielectric       $\leq 1.2$ V<sub>RMS</sub>

### CLIMATIC CONDITIONS OF MEASUREMENTS:

Temperature                         $(23 \pm 3)^\circ\text{C}$ , for reference measurements  $(20 \pm 1)^\circ\text{C}$   
Relative humidity                   $\leq 75\%$

### CAPACITANCE TOLERANCE:

#### CLASS 1 - CERAMIC DIELECTRIC

TOLERANCE	$\pm 0.25$ pF	$\pm 0.5$ pF	$\pm 1$ pF	$\pm 2$ pF	$\pm 5\%$	$\pm 10\%$	$\pm 20\%$
CODE LETTER	C	D	F	G	J	K	M
Applicable Nominal Capacitance	< 10pF				$\geq 10$ pF		

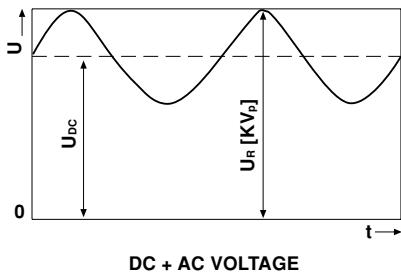

#### CLASS 2 - CERAMIC DIELECTRIC

TOLERANCE	$\pm 5\%$	$\pm 10\%$	$\pm 20\%$	$-20 + 50\%$	$-20 + 80\%$
CODE LETTER	J	K	M	S	Z

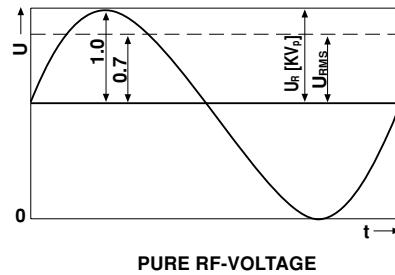

Tolerances other than those stated in this catalog are subject to special agreement.

### RATED VOLTAGE:

The rated voltage  $U_R$  is either the peak value of the approximate sinusoidal AC voltage or the sum of both the DC voltage and the approximate sinusoidal AC voltage for which the capacitor has been designed. The rated voltage is stated in KV<sub>peak</sub> (KV<sub>p</sub>) or V<sub>peak</sub> (V<sub>p</sub>).

DC + AC VOLTAGE

PURE RF-VOLTAGE

If the capacitor is operated above the lower limit frequency  $f_u$ , the rated voltage has to be restricted so the rated power will not be exceeded (see next page).

### RATED CURRENT:

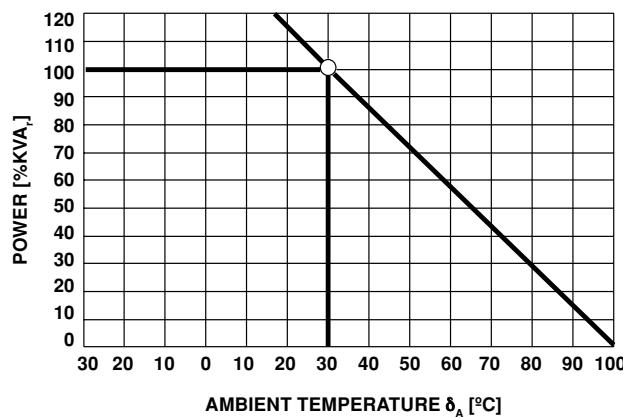

The rated current  $I_R$  is the maximum effective value of the sinusoidal current for which the current paths of the capacitor are designed. This rated current is reached only at the upper frequency limit  $f_o$  (see next page).

### RATED POWER:

The rated power  $Q_R$  is the reactive power for which the capacitor has been designed taking into account its dielectric losses. The rated power  $Q_R$  (KVA<sub>r</sub>) stated in the following charts refers to an ambient temperature of 30°C. When used without forced cooling, above 30°C, the rated power has to be reduced according to the following formula:

$$Q_N (\delta_A > 30^\circ\text{C}) = Q_N (\text{catalog value}) \cdot \frac{100^\circ\text{C} - \delta_A}{70^\circ\text{C}}$$

Reactive power as a function of the ambient temperature:

The following formula can be applied to determine whether a capacitor is operated within the permissible limits of reactive power and rated current:

$$U_{\text{RMS}} \cdot 2 \cdot \pi \cdot f \cdot C \leq I_R$$

$$U_{\text{RMS}}^2 \cdot 2 \cdot \pi \cdot f \cdot C \leq Q_R$$

$U_{\text{RMS}}$  in Volt  
 $f$  in Hertz  
 $C$  in Farad

# General Information

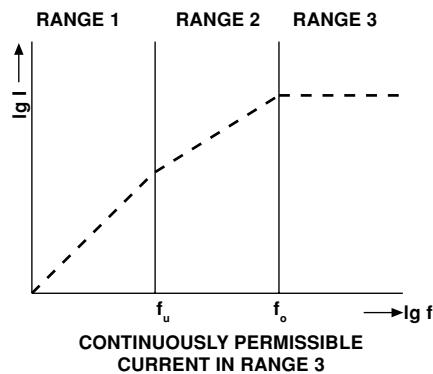

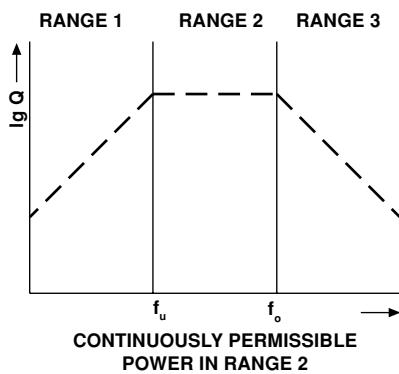

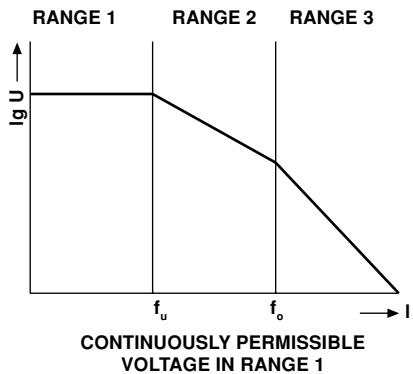

Vishay Draloric

Ceramic RF-Power Capacitors

## FREQUENCY:

The power handling capability of a capacitor with respect to voltage, power and current varies at different frequencies. Three frequency ranges can be defined in terms of the upper ( $f_o$ ) and lower ( $f_u$ ) limit frequencies. In each range one of the electrical parameters limits the maximum wattage of the capacitor.

The limit frequencies  $f_u$  and  $f_o$  can be calculated for each capacitor with the following formula:

$$f_u = \frac{318 \cdot Q_R}{U_R^2 \cdot C}$$

$$f_o = \frac{159 \cdot I_R^2}{Q_R \cdot C}$$

f	in MHz
C	in pF
U	in KV <sub>p</sub>
Q	in KVA <sub>r</sub>
I	in A

For several capacitors series, this can be seen from the diagrams on the individual datasheets. For other capacitors, charts showing the maximum permissible levels of voltage, power and current for continuous operation at 30°C ambient temperature can be provided on request.

## INSULATION RESISTANCE:

The insulation resistance is the DC resistance of a capacitor, resulting under the conditions specified below, from the bulk resistivity of the dielectric material and the surface resistance. Within the range of the permissible operating temperatures, the bulk resistance of ceramic dielectric is extremely high so that mainly the surface resistance is measured.

	CLASS 1 CAPACITORS	CLASS 2 CAPACITORS
Limiting Values of the Insulation Resistance	min. $1 \cdot 10^{10}$ Ohm	min. $5 \cdot 10^9$ Ohm

## INSULATION - RESISTANCE MEASURING CONDITIONS

### MEASURING VOLTAGE:

Class 1- and Class 2-Ceramic dielectric      100V<sub>DC</sub>

DURATION:       $(60 \pm 5)$  s

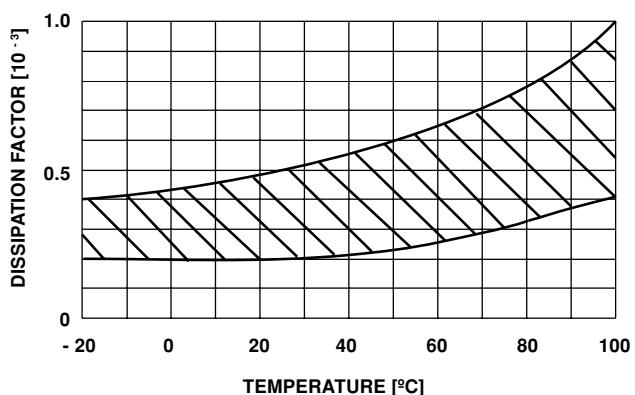

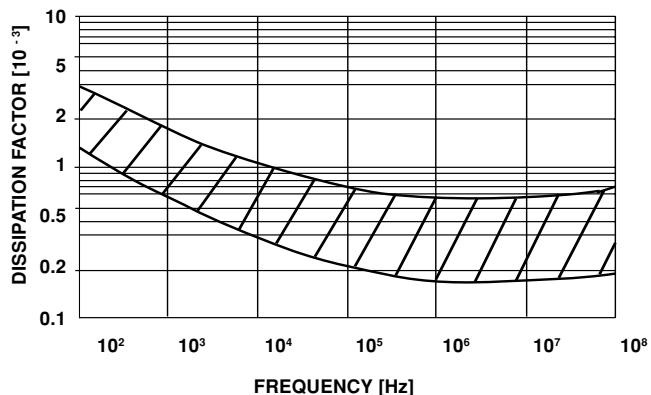

### CLIMATIC CONDITIONS OF MEASUREMENTS:

Temperature       $(23 \pm 3)^\circ\text{C}$ , for reference measurements  $(20 \pm 1)^\circ\text{C}$   
Relative humidity       $\leq 75\%$

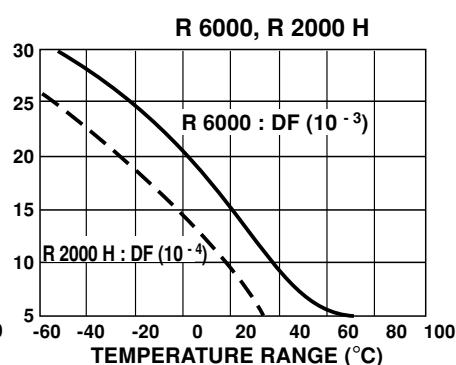

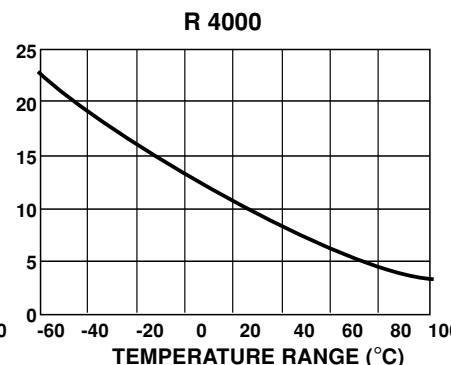

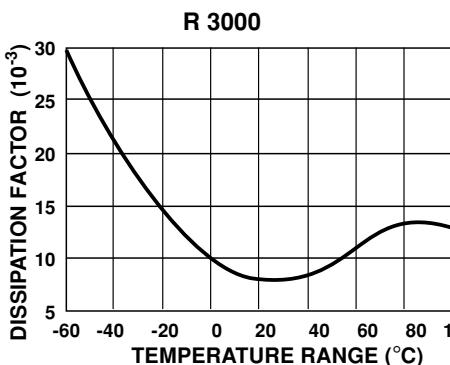

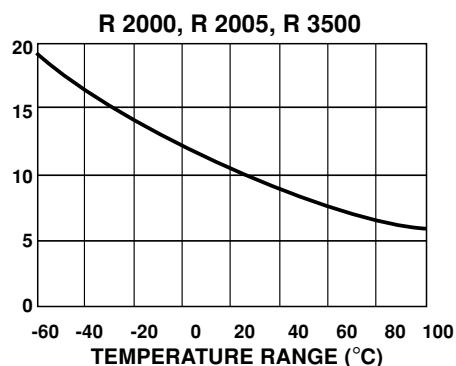

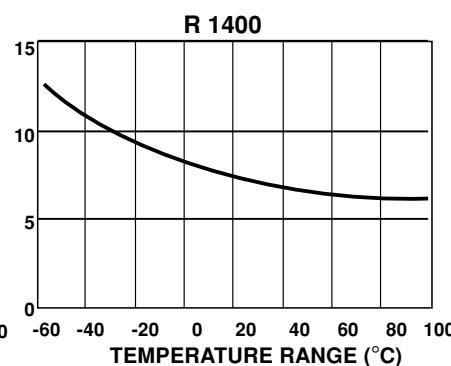

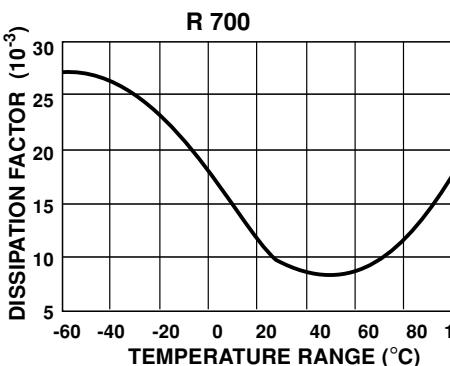

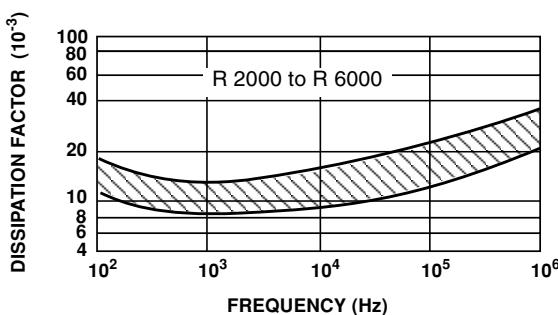

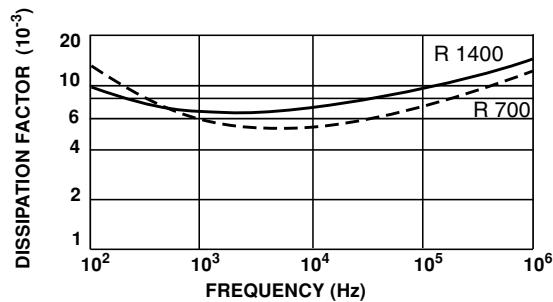

### DISSIPATION FACTOR:

The dissipation factor TAN  $\delta$  is the effective to reactive ratio at a sinusoidal voltage of predetermined frequency. This ratio is dependant upon the dielectric material as well as on temperature and frequency. The curves below show the dissipation factor as a function of frequency and temperature for the preferred ceramic materials.

**CLASS 1-CERAMIC DIELECTRIC (R 7, R 16, R 42 and R 85 typical)**

**CLASS 2-CERAMIC DIELECTRIC**

# General Information

Vishay Draloric

Ceramic RF-Power Capacitors

## DISSIPATION FACTOR - MEASURING CONDITIONS:

The dissipation factor of all Ceramic RF-Power Capacitors - except where deviations are agreed upon in the ordering procedure - are measured under the following conditions.

## MEASURING FREQUENCY:

Class 1-Ceramic dielectric ( $C < 1000\text{pF}$ ):  $(1 \pm 0.2)$  MHz or  $(100 \pm 20)$  KHz

Class 1-Ceramic dielectric ( $C \geq 1000\text{pF}$ ):  $(300 \pm 50)$  KHz

Class 2-Ceramic dielectric:  $(1 \pm 0.2)$  KHz (Field strength max.  $3\text{KV}_{\text{RMS}}$  per millimeter)

## MEASURING VOLTAGE:

Class 1-Ceramic dielectric  $\leq 10\text{V}_{\text{RMS}}$

Class 2-Ceramic dielectric  $\leq 5\text{V}_{\text{RMS}}$

## CLIMATIC CONDITIONS OF MEASUREMENTS:

Temperature  $(23 \pm 3)^\circ\text{C}$ , for reference measurements  $(20 \pm 1)^\circ\text{C}$

Relative humidity  $\leq 75\%$

## CAPACITANCE "AGEING" OF CERAMIC CAPACITORS:

Following the final heat treatment, all Class 2 ceramic capacitors reduce their capacitance value approximately according to a logarithmic law due to their special crystalline construction. This change is called "ageing". If the capacitors are heat treated for example when soldering, the capacity increases again to a higher value and the ageing process begins again. (Note: The level of this de-ageing is dependant on the temperature and the duration of the heat; an almost complete de-ageing is achieved at  $150^\circ\text{C}$  in one hour: These conditions also form the basis for reference measurements when testing). The capacitance change per time decade (ageing constant) differs with the various types of ceramic but typical values can be taken from the table below.

CERAMIC DIELECTRIC	R 700	R 1400	R 2000	R 2000H	R 2005	R 3500	R 4000	R 6000
AGEING CONSTANT(K)	- 1%	- 2%	- 2%	- 3%	- 3%	- 3%	- 4%	- 4%

CERAMIC DIELECTRIC	X7R	Y5U	Z5U
AGEING CONSTANT(K)	- 3%	- 3%	- 5%

$$K = \frac{100 \cdot (C_{t1} - C_{t2})}{C_{t1} \cdot \log_{10} \frac{t_1}{t_2}}$$

$$C_t = C_{1000} \cdot \left(1 - \frac{k}{100} \cdot \log_{10} t\right)$$

$C_t$  = Capacitance after start of aging (pF)  
 $C_{1000}$  = Capacitance 1000 hours after start of aging (pF)  
 $k$  = Ageing constant per decade (%)  
 $t$  = Time passed since start of aging (h)

## REFERENCE MEASUREMENT:

Due to ageing, it is necessary to quote an age for reference measurements which can be related to the capacitance with fixed tolerance. According to EN 130700, this time period is 1000 hours. If the shelf-life of the capacitor is known, the capacitance for  $t = 1000$  hours can be calculated with the ageing constant. In order to avoid the influence of the ageing, it is important to de-age the capacitors before stress-testing.

The following protection is adopted (see also EN 130700):

- De-ageing at  $150^\circ\text{C}$ , 1 hour
- Storage for 24 hours at normal climate temperature
- Initial measurement
- Stress
- De-ageing at  $150^\circ\text{C}$ , 1 hour
- Storage for 24 hours at normal climate temperature
- Final measurement

**OPERATION CONDITIONS:**

The user should ensure that the permissible operating conditions are not exceeded. Concerning the applied maximum voltage the following subjects should be taken in consideration.

- Harmonic modulation and parasitic frequencies
- Transient over-voltages
- Differences in capacitance and distribution of power when capacitors connected in series
- Assymetric HF fields

Concerning over-heating, the following subjects should be taken into consideration:

- Ambient temperature and radiation from other heat sources
- Differences in capacitance and distribution of power when capacitors connected in series
- RF induction fields and parasitic currents
- Humidity, condensation, moisture deposit

**MOUNTING**

The user should take care in the mechanical mounting to ensure that mechanical and thermal stresses are minimized. The connection to one electrode must be flexible in order to prevent the generation of physical forces which could damage the capacitor elements. Such forces are often generated by the dimensional differences resulting from the normal physical tolerances of the components.

The capacitor elements must not be used as a mechanical support for other devices or components. For further mounting guidelines see on the individual datasheets.

**SOLDERING RECOMMENDATIONS (CAPACITORS WITH LEADS)**

Mounting of the component should be achieved using SN 60/40 or silver bearing SN 62/36/2AG solder, whereby solder wire, cream or preforms are acceptable. Only a mildly active, resin flux should be used.

We recommend the use of a heat sink adjacent to the component body, if possible.

As ceramic capacitors are very sensitive to rapid changes in temperature (thermal shock), a pre-heat and post-heat cycle is strongly recommended.

Both the component and ground plate should be heated up to 120°C (Heat must not be applied directly to the ceramic body and the temperature on the component surface should not be allowed to increase faster than 100°C per minute).

After the pre-heat cycle, the mounting plate temperature should be raised to achieve solder flow. The solder flow state should be maintained for a minimum period (recommendation: less than 5s) and the tip temperature should be maintained for a minimum period (recommendation: less than 5s) and the tip temperature should be as low as possible (max. 260°C).

The assembly should be allowed to cool at a rate not exceeding 100°C per minute.

<b>SOLDERING SPECIFICATIONS</b>		
Soldering test for capacitors with wire leads: (according to IEC 60068-2-20, solder bath method)		
	<b>SOLDERABILITY</b>	<b>RESISTANCE TO SOLDERING HEAT</b>
Soldering Temperature	(235 ± 5) C	(260 ± 5) C
Soldering Duration	(2 ± 0.5) sec	(10 ± 1) sec
Distance from Component Body	≥ 2mm	≥ 5mm

**CLEANING**

The components should be cleaned with vapor degreasers, immediately following the soldering operation.

Ceramic RF-Power Capacitors

## CERAMIC MATERIALS:

Ceramic dielectrics are inorganic materials, sintered at temperatures above 1000°C, and developed especially for the manufacture of capacitors.

Ceramic RF-power capacitors are subdivided into two classes, in accordance with recommendations of IEC (International Electrotechnical Commission) with respect to the chemical composition of the dielectric and electrical characteristics.

Class 1 or low-K (NDK) are mainly manufactured of titanium dioxide or magnesium silicate.

Class 2 or high-K capacitors (HDK) contain mostly alkaline earth titanates.

Listed in the tables below are general physical and electrical characteristics of the ceramic dielectric used.

<b>CLASS 1 CERAMIC MATERIALS</b>					
<b>ABBREVIATION FOR DIELECTRIC</b>	<b>R 7</b>	<b>R 16</b>	<b>R 16 HIGH Q</b>	<b>NP 0</b>	<b>R 42</b>
Relative Dielectric Constant [ $\epsilon_r$ ]	~ 7	~ 16	~ 17	~ 32	~ 40
Ceramic Type According to IEC 60672-3	C 221	C 320	C 320	C 320	C 331

# General Information

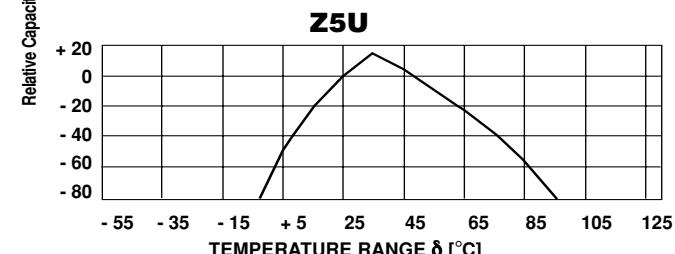

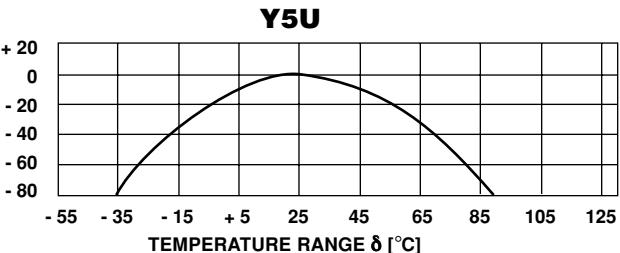

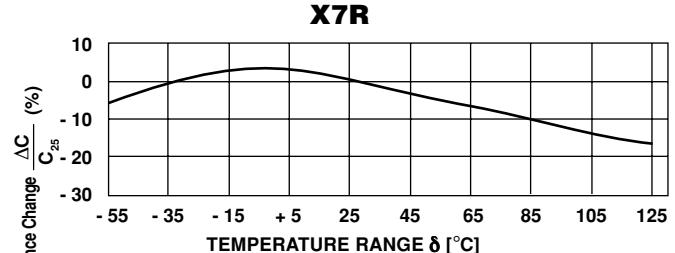

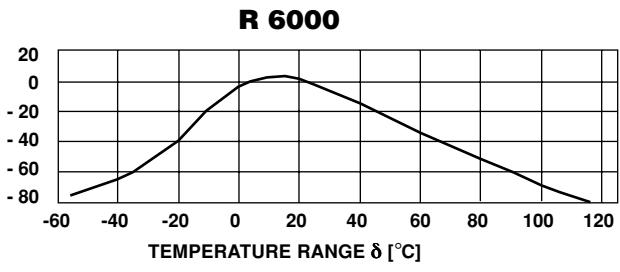

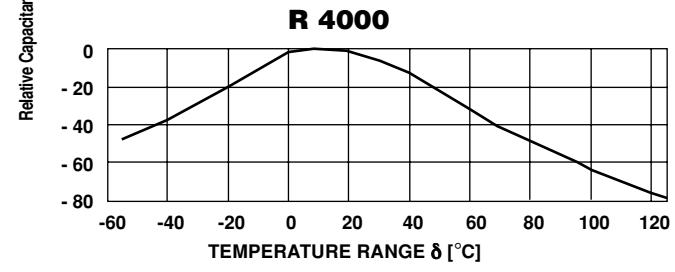

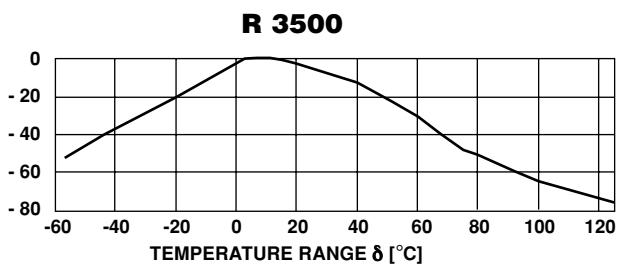

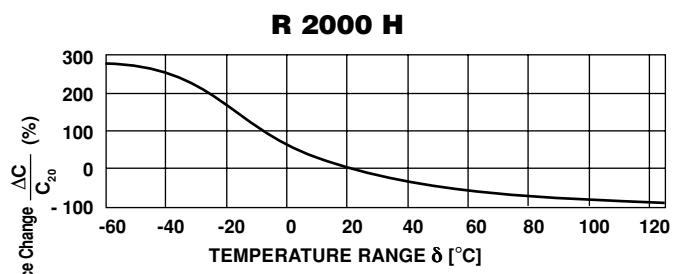

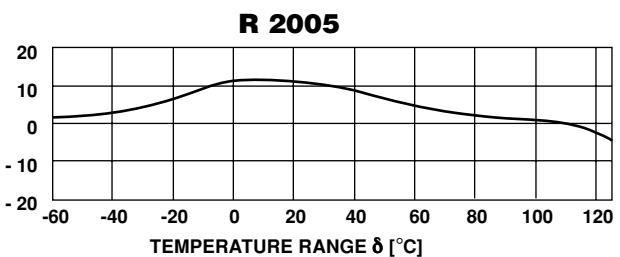

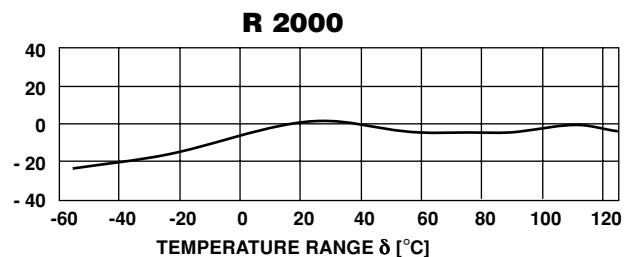

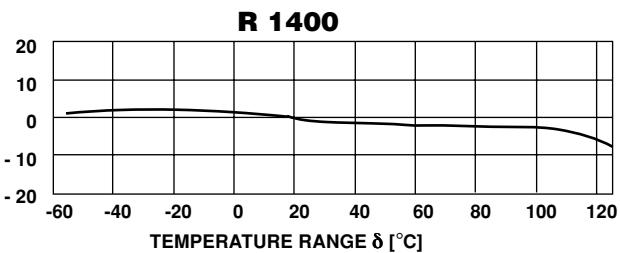

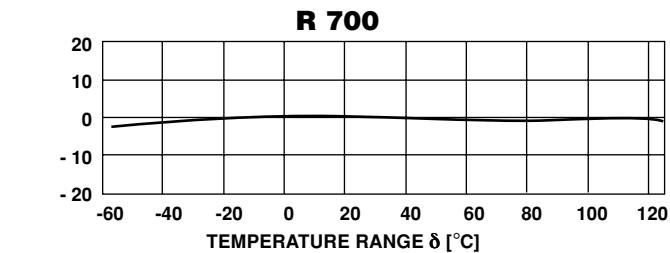

Vishay Draloric

Ceramic RF-Power Capacitors

## TEMPERATURE DEPENDENCY OF THE CAPACITANCE WITH CLASS 2 CAPACITORS

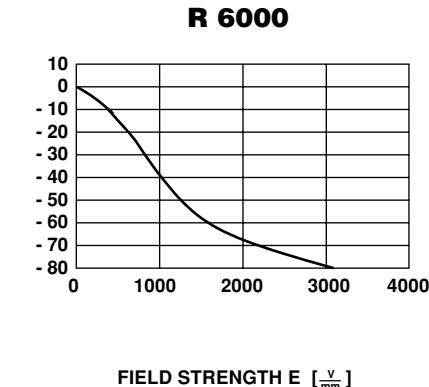

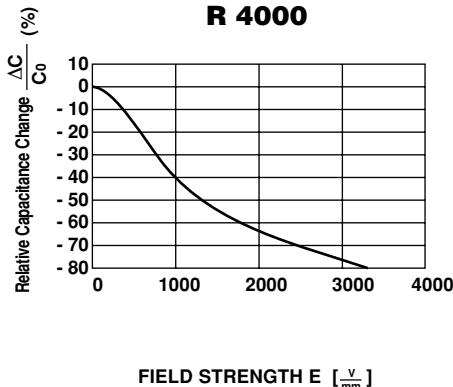

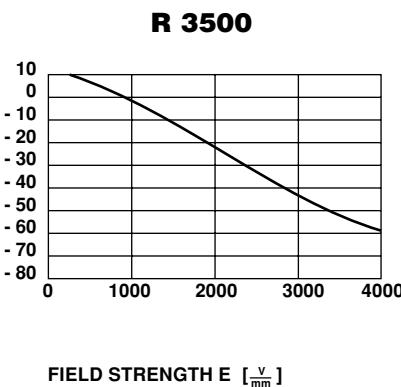

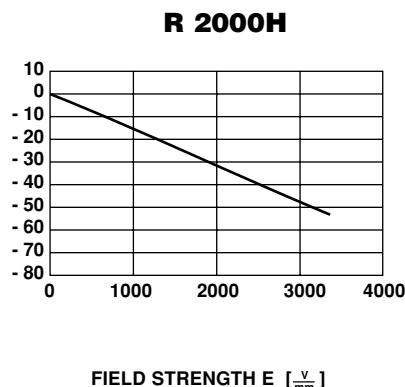

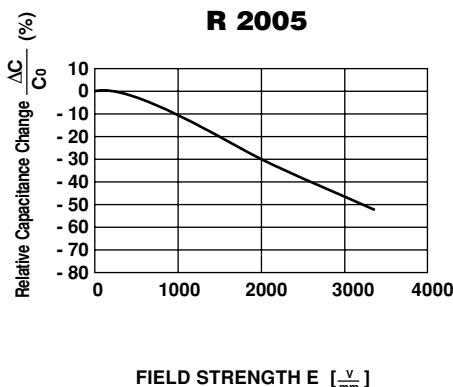

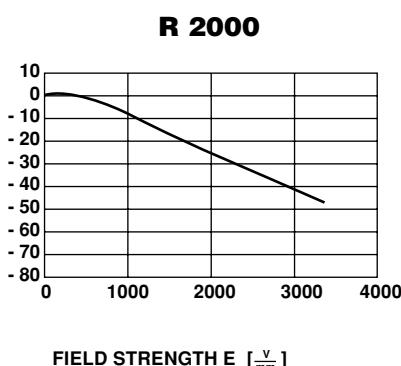

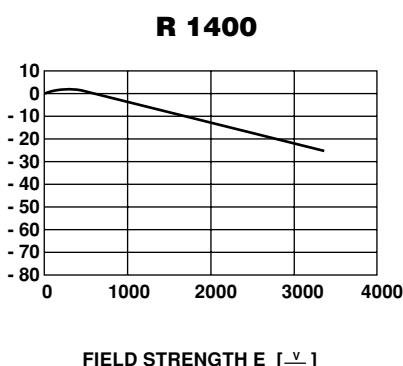

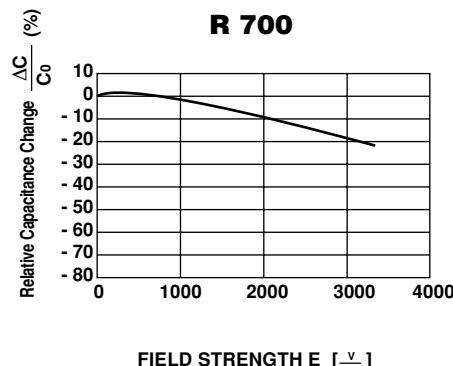

$C_{20}$ : Capacitance at 20°C without DC Measuring frequency: 1KHz Measuring voltage:  $\leq 1.2V_{RMS}$

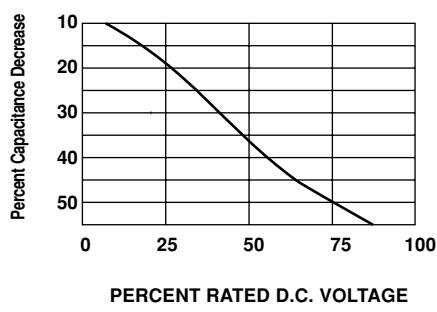

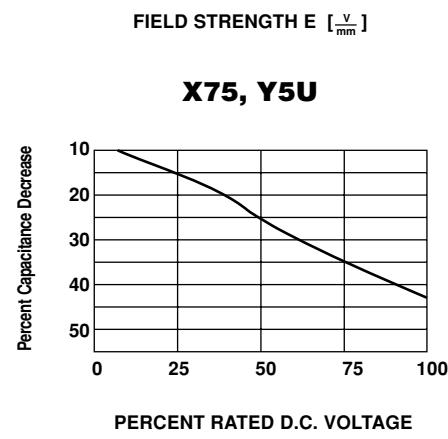

### DC-VOLTAGE DEPENDENCY OF CAPACITANCE (TYPICAL VALUES)

The capacitance of Class 1 capacitors scarcely changes when DC-voltage is applied.

The relative capacitance change of Class 2 ceramic dielectric vs. applied field strength is given in the curves below.

$C_0$ : Capacitance without DC-voltage  
 Measuring frequency: 1KHz  
 Temp. of measurement:  $(23 \pm 3)^\circ\text{C}$   
 Measuring voltage:  $\leq 1.2V_{\text{RMS}}$   
 Capacitance Decrease  
 vs.D-C Voltage Bias

# General Information

Ceramic RF-Power Capacitors

## QUALITY CONTROL AND TESTING:

The quality of our RF-power capacitors is assured by numerous tests carried out at every stage of production. The finished capacitors are subjected to the individual 100% tests given below.

### CAPACITANCE:

Class 1 ceramics at 0.1MHz, with  $20V_{RMS}$ ,  $(25 \pm 5)^\circ C$

Class 2 ceramics at 1KHz, with  $\leq 5V_{RMS}$ ,  $(25 \pm 5)^\circ C$

### DISSIPATION FACTOR:

Class 1 ceramics ( $C_R < 1000\text{pF}$ ) at 1MHz, with  $10V_{RMS}$ ,  $(25 \pm 5)^\circ C$

Class 1 ceramics ( $C_R \geq 1000\text{pF}$ ) at 300KHz, with  $10V_{RMS}$ ,  $(25 \pm 5)^\circ C$

Class 2 ceramics at 1KHz, with  $\leq 5V_{RMS}$ ,  $(25 \pm 5)^\circ C$

### INSULATION RESISTANCE:

at  $100V_{DC}$ ,  $(25 \pm 5)^\circ C$

### DIELECTRIC WITHSTANDING:

Standard test with 200%  $U_R$ , AC 50Hz, 5 minutes. (As repeated test admissible only once with a step-up voltage reduced by 10% for three minutes).

### RF-HEATING TEST

This 100% test is carried out with Watercooled Pot Capacitors, Multilayer Power Capacitors and those components made from R 230 dielectric only.

The units are tested in the tank circuit of a RF-test generator with at least 130% to 150% rated power for 5 to 10 minutes.

For all other types, this RF-power test is subject to special agreement.

For details of Watercooled Capacitors see individual datasheets.

### VISUAL CONTROL AND DIMENSIONS:

#### OUTLINE DRAWINGS:

All dimensions are given in millimeters and inches (in brackets).

As a result of continual efforts to improve mechanical design, components supplied may vary in detail from those described or illustrated in the outline drawings of this catalog.

### STANDARDS AND SPECIFICATIONS:

GENERAL STANDARDS	
IEC 60062	Marking codes for resistors and capacitors
IEC 60068	Basic environmental testing procedures
SPECIAL STANDARDS FOR CERAMIC CAPACITORS	
EN 130600 and IEC 60384-8	Fixed capacitors of ceramic dielectric, Class 1
EN 130700 and IEC 60384-9	Fixed capacitors of ceramic dielectric, Class 2

# Plate Capacitors

#### CAPACITANCE TOLERANCE:

± 10%

#### PROPERTIES AND APPLICATION:

These capacitors feature a Q-Factor of greater than 10,000 which makes them ideal in operating frequency range from 0.1 MHz up to 30 MHz where high voltages and currents are present. The TOSZ model can be used as replacements for fixed vacuum capacitors. The construction gives these capacitors an advantage over fixed vacuum capacitors because there is no possibility of vacuum deterioration.

Model TOSW 118115 also has additional vacuum water-cooling systems. (One separate watercooling circuit at each electrode terminal).

#### MATERIAL:

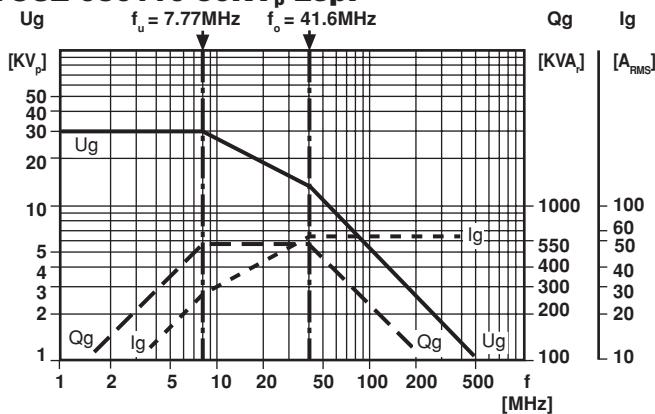

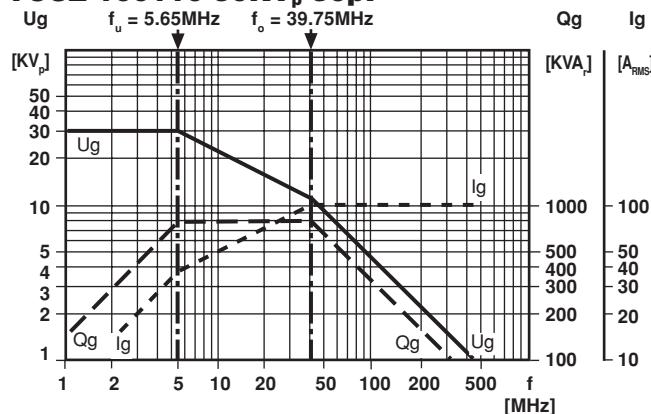

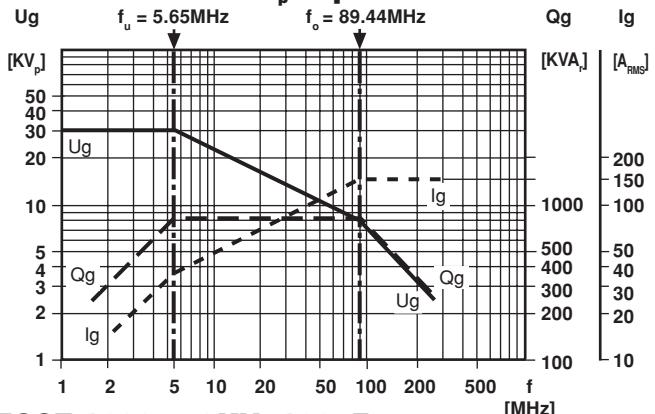

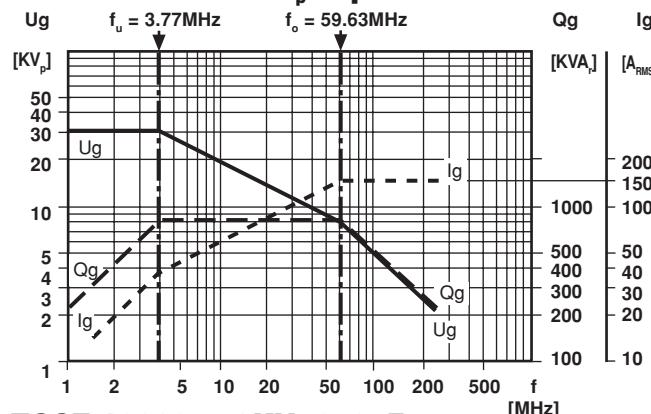

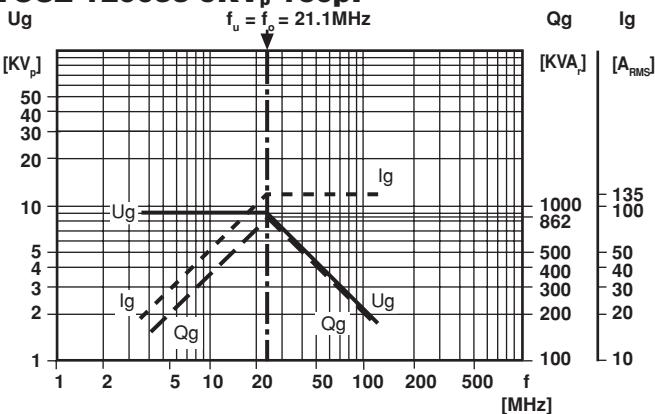

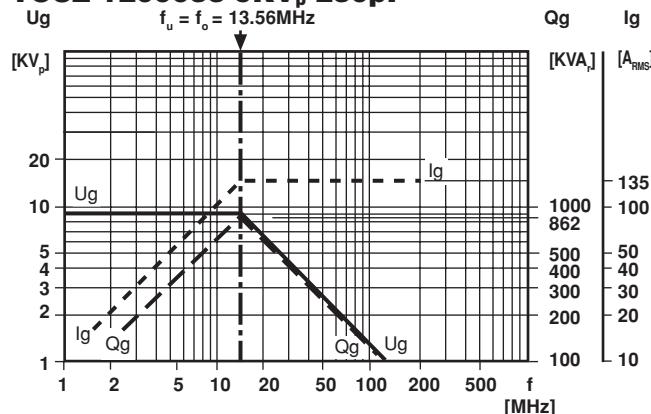

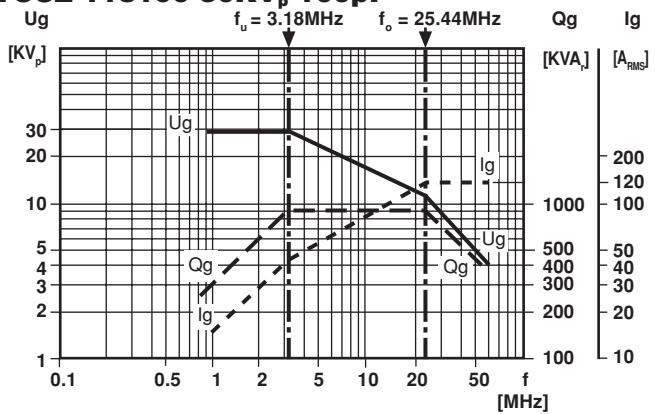

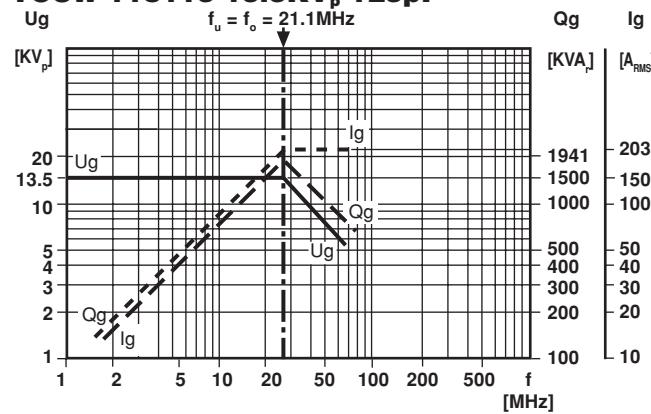

Capacitor elements made from Class 1 "High Q" ceramic dielectric with noble metal electrodes.

Connection Terminals: Copper/brass, silver plated.

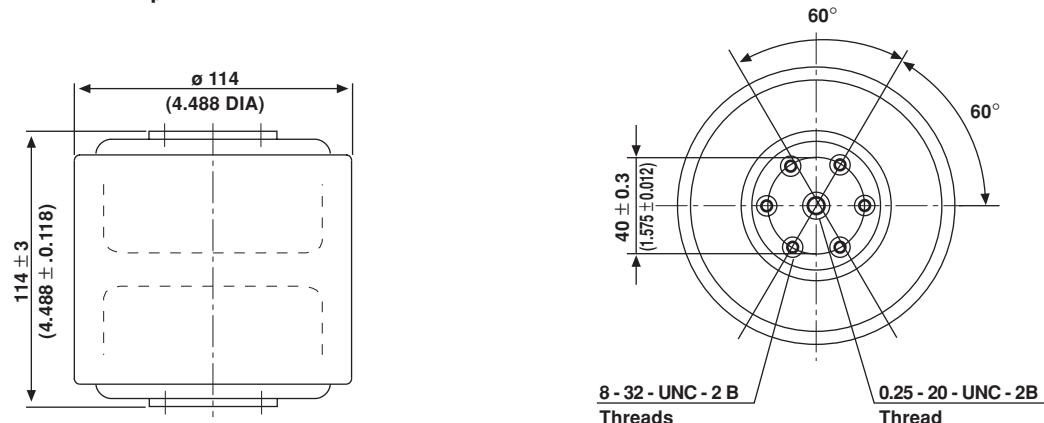

Capacitor body: Completely glazed

#### MARKING:

Type designator, capacitance value and tolerance, Rated voltage (peak value), Production date code, Ceramic material code, DRALORIC Logo, Serial number.

## Tubular Capacitors, Tag Mounting

**RA 020080 4KV<sub>P</sub>**

**RB 020080 4KV<sub>p</sub>**

**RC 020080 4KV<sub>p</sub>**

**RE 020080 4KV<sub>p</sub>**

- Dimensions in millimeters (inches)

## MATERIAL:

Capacitor elements made from Class 1 ceramic dielectrics with noble metal electrodes.

Connection terminals: Copper/brass, silver plated.

## **FINISH:**

Capacitor body completely lacquered.

Insulating ceramic base glazed (Model RC only).

## **MARKING:**

Type designator, Capacitance value and tolerance, Rated voltage (peak value), Production date code, Ceramic material code, DRALORIC Logo

## Pot Capacitors with R 16 High Q Ceramic

**TDZ 045124 18KV<sub>p</sub>****TDZ 050124 18KV<sub>p</sub>**

- Dimensions in millimeters (inches)

**MODEL:**

These capacitors feature a Q-Factor greater than 10,000 which makes them well suited in operating frequency range from 0.1MHz up to 30MHz where high voltages and currents are present.

Solid cylindric brass terminals (20.6 mm/ 0.81" diameter) allow plug-in compatible fuse clip mounting for vacuum capacitor replacement.

**MATERIAL:**

Capacitor elements made from Class 1 "High Q" ceramic dielectric with noble metal electrodes.  
Connection terminals: Copper/brass, silver plated.

**FINISH:**

Noble metal electrodes completely lacquered. Insulating rim glazed.

**MARKING:**

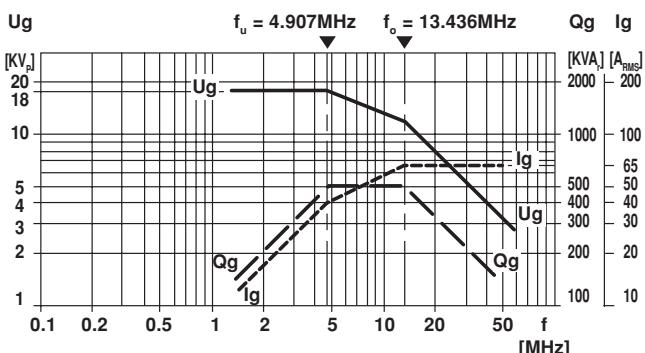

Type designator, Capacitance value and tolerance, Rated voltage (peak value), Production date code, Ceramic material code, DRALORIC Logo

### MODEL:

These capacitors feature a Q-Factor greater than 10,000 which makes them ideal in operating frequency ranges from 0.1MHz up to 30MHz where high voltages and currents are present. Solid cylindric brass terminals (50.8 mm/ 2" diameter) allow plug-in compatible fuse clip mounting for vacuum capacitor replacement. (Model TDFZ 125236).

### MATERIAL:

Capacitor elements made from Class 1 "High Q" ceramic dielectric with noble metal electrodes. Connection terminals: Copper/brass, silver plated.

### FINISH:

Noble metal electrodes completely lacquered. Contoured rim protected with silicone rubber.

### MARKING:

Type designator, Capacitance value and tolerance, Rated voltage (peak value), Production date code, Ceramic material code, DRALORIC Logo, Serial number.

### MODEL:

The ceramic capacitor element is housed in a rugged silver plated copper can. This construction allows additional "Belt-contacting" of the outer electrode terminal over the copper can shaft.

The results are short conduction paths with low impedance and low inductance as well as protection of the outer noble metal electrode.

### FINISH:

Insulating rim protected with silicone rubber.

### MATERIAL:

Capacitor elements made from Class 1 ceramic dielectric with noble metal electrodes.

Connection terminals of the inner electrode and outer electrode's covering can made from copper/brass, silver plated.

### MARKING:

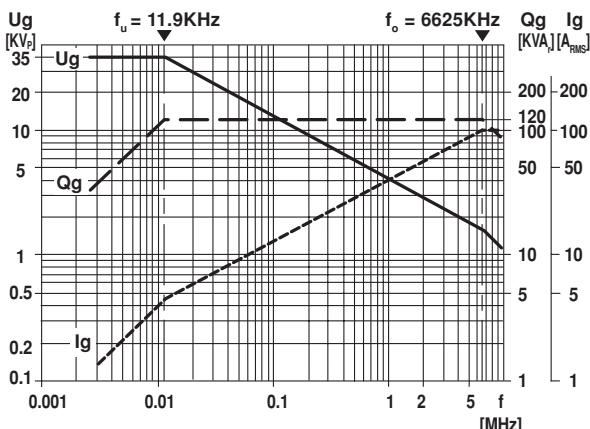

Type designator, Capacitance value and tolerance, Rated voltage (peak value), Production date code, Ceramic material code, DRALORIC Logo, Serial number.

# General Information

Vishay Draloric

## Watercooled Power RF-Capacitors

### 1. PRODUCT DESCRIPTION

Watercooled power RF-capacitors are designed for use in the tank circuit of high power RF equipment. Vishay Draloric's TWX, TWXFZ and TWIF pot-style capacitors dissipate the heat produced under load by means of water flow around the capacitor elements. In order to provide protection from influences of the chemical/physical characteristics of the coolant, a glass passivation layer is applied over the cooled noble metal electrode.

The electrical terminations are made directly to the noble metal electrodes either utilizing special soldering techniques or special clamping fittings. This method of attachment provides a strong, rigid connection of unsurpassed reliability. The TWX model is made with a contoured, glazed insulation rim designed for use in a relatively clean, dry environment. The TWXF, TWXFZ and TWIF models feature an umbrella shaped insulation rim made from silicone rubber to minimize the adverse effects of moisture, dust and other impurities in the working environment.

All watercooled pot capacitors are supplied with the necessary screws/nuts and contact plates to make the connection to the electrode terminals. Ferrules and sleeve nuts for the water supply connections are also included.

### 2. ELECTRICAL DATA AND GUIDELINES

- 2.1. Listed in the tables on the datasheets are the general physical and electrical characteristics of the ceramic dielectric materials used.
- 2.2. The continuous limit values of voltage, current and power given in the derating diagrams must be observed.
- 2.3. The rated voltage given in the tables is the peak value of the sinusoidal a.c. voltage or the sum of the d.c. and peak a.c. voltages for which the capacitor is rated under continuous operation.
- 2.4. The rated current in the tables is the effective value of the sinusoidal current for which the current paths of the capacitor are designed.
- 2.5. If several capacitors are connected in parallel, care should be taken to mount the top electrodes of the capacitor away from the RF-buss bar to minimize the effects of stray electromagnetic fields. Under no circumstances should the inner electrode terminal exceed a temperature of 100°C.
- 2.6. The electrical connection to the inner electrode must be flexible in order to prevent the generation of physical forces which could damage the capacitor elements. Such forces are often generated by the dimensional differences resulting from the normal physical tolerances of the capacitors. The capacitor's inner electrode connector must not be used as a mechanical support for other devices or components.

### 3. INSTALLATION

Watercooled pot capacitors are designed to be installed in a vertical, umbrella-up position (TWX, TWXF, TWIF model) or a vertical, umbrella-down position (TWXFZ model). Other positions may be allowed as shown on the appropriate datasheets. For large generators requiring multiple capacitors connected in parallel, we recommend a circular mounting pattern for optimum circuit performance.

### 4. COOLING

- 4.1. The cooling system is designed to operate at a maximum water pressure of 4 bars (58 psi).
- 4.2. The water outlet of the capacitor must always be located higher than the water inlet in a vertical installation. This allows any air to escape from the unit. Horizontal installations require that both water connections be at the top side of the unit. To preserve the capacitors from frost damages during the transport, we can supply special models with outlet screws for emptying the cooling water from the unit.
- 4.3. The minimum flow rates specified in the tables must be observed. When using antifreeze mixtures, increase the minimum rates given by at least 20%.
- 4.4. The cooling system is designed to have a water temperature increase of < 10°C (Water inlet to water outlet) when the capacitor is operated at full rated power and at the minimum water flow rate.

A water intake temperature of ≤ 30°C is recommended.

If the cooling system for several capacitors is connected in series, the intake temperature of the coolant must not exceed 50°C for any of the capacitors.

The pressure drop in a series connected cooling system is small. The table below illustrates the effects upon water flow rates as a function of the number of series connected TWXF 135285 capacitors in the system with a constant intake water pressure of 3 bars (43.5 psi)

3 bars (43.5 psi) intake water pressure, cooling systems in series	1	2	3	4	5
Water flow rate [Liters/Minute] [US-gal./Minute]	13.0 3.43	10.5 2.77	8.5 2.24	7.3 1.92	6.0 1.58

- 4.5. Intake water temperature fluctuations in excess of 3°C/sec. must be avoided to prevent damage to the capacitor elements.
- 4.6. A coolant temperature rate monitor must provide a fail-safe on/off power control for the RF equipment.
- 4.7. Normal tap water or de-mineralized water may be used for cooling. The water must be reasonably free of Ca CO<sub>3</sub> and clear of foreign particles or milkyess. The pH-value of the coolant should be between 6 and 8.

## 5. ELECTRICAL AND MECHANICAL SCREENING TESTS

All capacitors are subjected to the following tests prior to shipment:

- Capacitance value (0.1MHz, 20V<sub>RMS</sub>, 25 ± 5°C)
- Dissipation factor (0.3 or 1.0MHz, 10V<sub>RMS</sub>, 25 ± 5°C)
- Insulation resistance (100 V<sub>DC</sub>, 25 ± 5°C)
- Dielectric strength (200% rated voltage [peak value], 50Hz, 5 Minutes)
- RF-power test (130% rated power for 10 Minutes in a test generator circuit)
- Pressure test (Standard: 6 bars [87 psi] for 1 Minute, 25± 5°C)
- Control of the cooling system for water flow resistance

## 6. WARRANTY STIPULATION FOR WATERCOOLED CERAMIC POWER RF-CAPACITORS

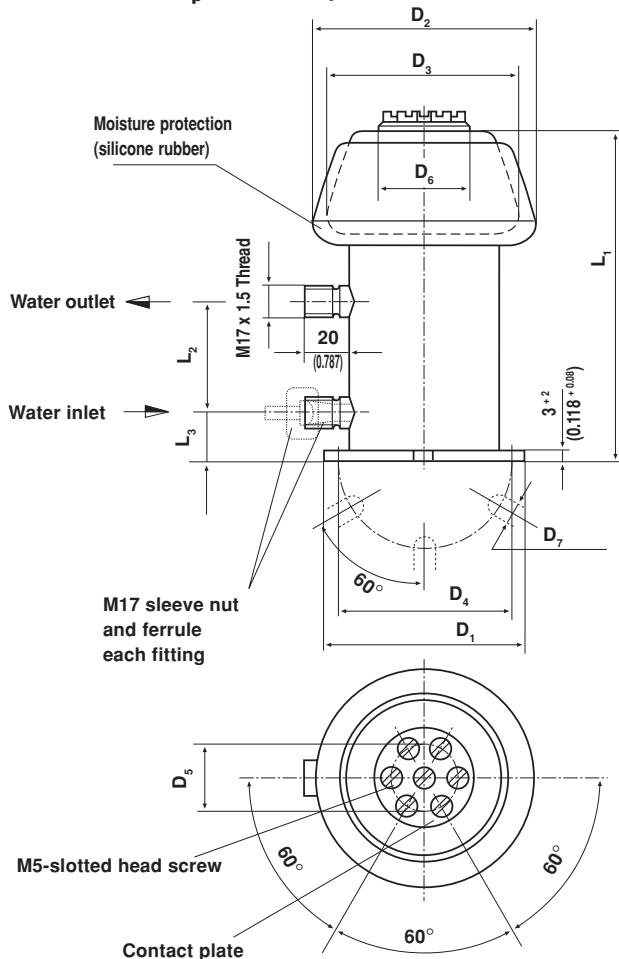

- 6.1. Unless otherwise provided for hereinafter, warranty shall be governed by General Terms of Sale and Delivery.
- 6.2. Warranty is assumed for capacitors which fail to operate owing to faults in material or production, and within the warranty period for capacitors.  
Excluded from warranty are capacitors prematurely rendered unserviceable owing to improper treatment, overloading, circuit errors, as well as capacitors operated without observing the data given in our catalogue. Warranty is also excluded in cases where faults can no longer be recognized on the capacitor owing to third party interferences.  
Warranty is only effectively assumed when meeting the requirements referred to hereinafter.
- 6.3. For claiming warranty, the defective capacitor should be returned to us, if possible in its original packing, within 14 days following the data of failure, being accompanied by the COMPLETELY filled-in and signed Original Guarantee Certificate. The risks of transportation, as well as any shipping costs and other charges shall in any case be borne by the sender.
- 6.4. Warranty can only become effective if the defective capacitor is received by us in the same condition as it was when it happened to fail.
- 6.5. We have the right to inspect any records proving the use of the capacitor.
- 6.6. The decision as to whether we are obliged to assume warranty for the capacitor shall exclusively rest with us.
- 6.7. When acknowledging the warranty claim, any non-repairable capacitor shall remain our property. When refusing a warranty claim the defective capacitor will be returned at the customer's expense only if demanded so explicitly when asserting the warranty claim. In case examination required disassembly of the capacitor no claims for damage can be derived therefrom.
- 6.8. The customer gives us the right to have the system checked in which the capacitor was operated.
- 6.9. When acknowledging a warranty claim, restitution is made by supplying either a repaired and newly tested capacitor, or by supplying a new one.
- 6.10. Warranty shall only extend to the capacitor itself. Any further claims for damages are excluded.

## 7. CONDITIONS OF GUARANTEE

Persuant to the foregoing stipulations we assume warranty for these watercooled pot capacitors up to a period of 5000 hours of operating service. Any claims for warranty, however will extinguish 24 months following the date of delivery.

## Watercooled Power RF-Capacitors (External Cooling)

**TWX 12KV<sub>p</sub> to 20KV<sub>p</sub>**  
**TWXF 10KV<sub>p</sub> to 25KV<sub>p</sub>**

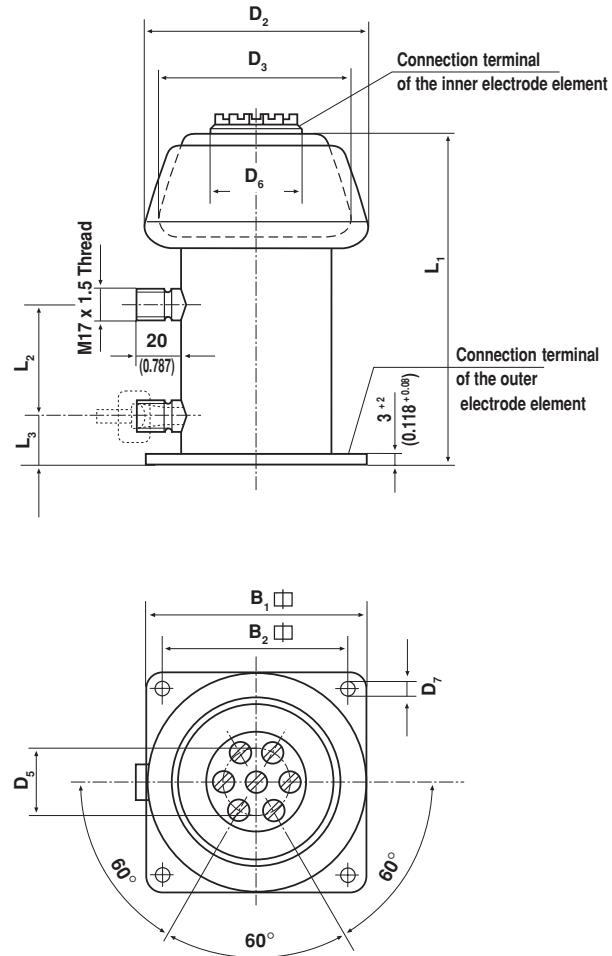

- Dimensions in millimeters (inches)

### MATERIAL:

Capacitor elements made from Class 1 ceramic dielectric with noble metal electrodes.  
 Outer electrode surface completely protected with a glass passivation layer.  
 Connection terminal of the inner electrode and outer electrode's covering copper can made from copper / brass, silver plated.

### FINISH:

Outer electrode's covering copper can completely lacquered (except bottom plate).  
 Contoured rim glazed. TWXF model only has additional moisture protection (silicone rubber) of the rim.

### MARKING:

Type designator, Capacitance value and tolerance, Rated voltage (peak value), Production date code, Ceramic material code, DRALORIC Logo, Serial number.

### ACCESSORIES ADDED:

Contact plate (silvered copper) and seven metric screws for contacting the inner electrode element.  
 Ferrules and sleeve nuts (M17 thread) for mounting the water cooling system with 8 mm copper-tube.

## Watercooled Power RF-Capacitors (Internal Cooling)

**TWIF 085175 14KV<sub>p</sub>**  
**TWIF 085215 14KV<sub>p</sub>**  
**TWIF 085260 14KV<sub>p</sub>**

### MATERIAL:

Capacitor elements made from Class 1 ceramic dielectric with noble metal electrodes. Inner electrode surface completely protected with a glass passivation layer. Connection Terminals: Copper/brass, silver plated.

### FINISH:

Capacitor shaft completely lacquered. Contoured rim protected with silicone rubber.

### MARKING:

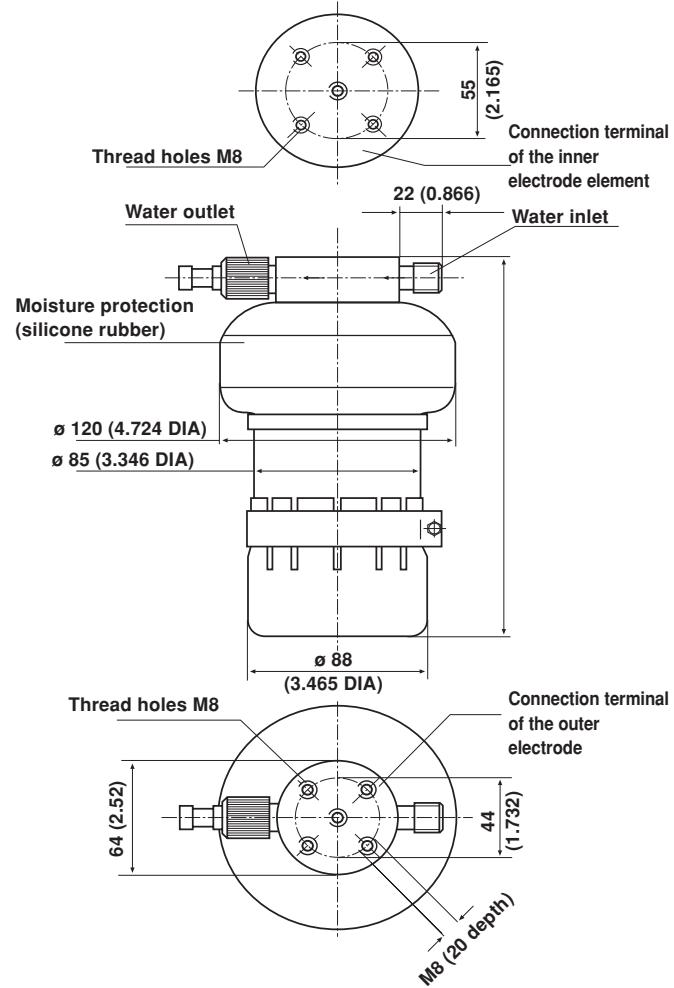

Type designator, Capacitance value and tolerance, Rated voltage, Production date code, Ceramic material code, DRALORIC Logo, serial number.

### ACCESSORIES ADDED:

The capacitor is supplied with 10mm-Tube fittings for the water supply connections.

### INSTALLATION POSITION:

These capacitors are designed to be installed in a vertical position, connection fittings of the water cooling system upside. Horizontal installation position is permissible, whereby the water-outlet must be on top-side.

## Ceramic Capacitor Stacks for Voltage Multiplier Circuits

### PRODUCT DESCRIPTION:

Ceramic capacitor stacks are used mainly in modern high voltage supplies e.g. in X-ray machines for medical applications, industrial radiography (flaw detection, baggage examination, etc.) or in electrostatic powder coating equipment.

A high frequency generator (about 20KHz) supplies the input a.c. voltage via a ferrite transformer to the multiplier circuit.

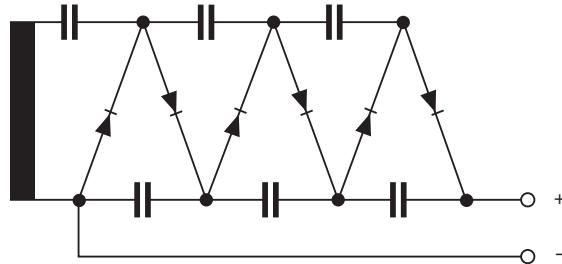

Output in excess of 100KV<sub>DC</sub> can be produced depending on the number of switching steps.

VISHAY DRALORIC can supply the capacitor stacks for the voltage multiplier circuits to customers specified designs and requirements. The capacitor stacks and associated high voltage diodes are usually operated in high insulation environments such as oil or inert gas (sulphur hexafluoride SF6) or are embedded in epoxy resin.

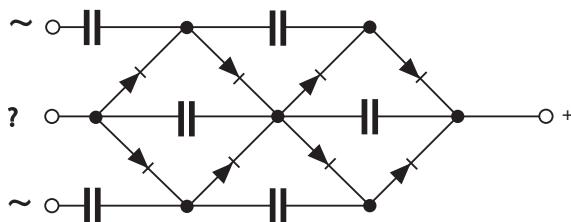

The number of individual capacitors in each stack and certain technical parameters can be varied to meet customer requirements within specified limits.

### TYPICAL SCHEMATIC DIAGRAM

Half-wave-multiplier

Full-wave-multiplier

## Ceramic Capacitor Stacks

### DESIGN:

Ceramic capacitor stacks with leads

### RATED VOLTAGE $U_R$ :

see table below

### DIELECTRIC STRENGTH:

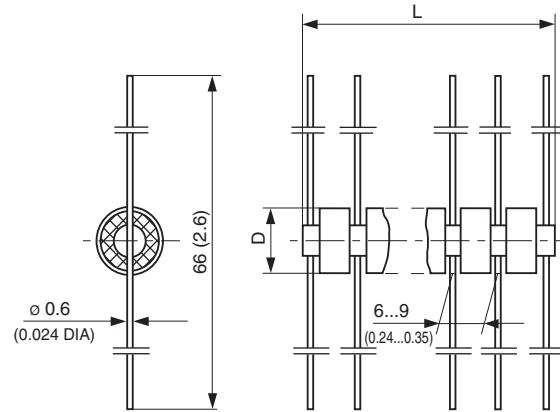

see table below (Test voltage between leads)

### DISSIPATION FACTOR $\tan \delta$ :

$\leq 25 \cdot 10^{-3}$

### INSULATION RESISTANCE $R_{is}$ :

$\geq 1 \cdot 10^{11} \Omega$  (R 2000, R 3000)  
 $\geq 1 \cdot 10^{10} \Omega$  (R 2005, R 6000)

### CATEGORY TEMPERATURE RANGE $\theta_A$ :

\* Dimensions in mm

(- 10 to + 85)°C

MODEL	CAPACITANCE (pF)	TOLERANCE	RATED VOLTAGE* (kV <sub>p</sub> )	TEST VOLTAGE** (kV <sub>DC</sub> )	CERAMIC DIELECTRIC	NO. OF DISCS IN SERIES	LENGTH L (mm/inches)	ØD (mm/inches)

## Voltage Multiplier Sets

### VOLTAGE MULTIPLIER SETS

Vishay Draloric have the facilities to produce custom style Voltage Multiplier Sets:

- build up from two or more stacks
- completely soldered with diodes and resistors

The RHK... Cascade above, shows an example of 2 stacks complete with diode.

If you have an application with a non-standard requirement, contact us and our design team will work with you to find a solution.
