

### SPICE Device Model SiS402DN Vishay Siliconix

## N-Channel 30-V (D-S) MOSFET

#### **CHARACTERISTICS**

- N-Channel Vertical DMOS
- Macro Model (Subcircuit Model)
- Level 3 MOS

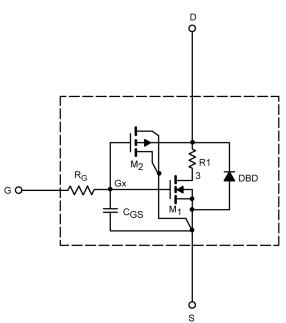

- Apply for both Linear and Switching Application
- Accurate over the 55 °C to 125 °C Temperature Range
- Model the Gate Charge, Transient, and Diode Reverse Recovery Characteristics

#### DESCRIPTION

The attached spice model describes the typical electrical characteristics of the N-channel vertical DMOS. The subcircuit model is extracted and optimized over the - 55  $^{\circ}$ C to 125  $^{\circ}$ C temperature ranges under the pulsed 0 V to 10 V gate drive. The saturated output impedance is best fit at the gate bias near the threshold voltage.

#### SUBCIRCUIT MODEL SCHEMATIC

A novel gate-to-drain feedback capacitance network is used to model the gate charge characteristics while avoiding convergence difficulties of the switched  $C_{gd}$  model. All model parameter values are optimized to provide a best fit to the measured electrical data and are not intended as an exact physical interpretation of the device.

This document is intended as a SPICE modeling guideline and does not constitute a commercial product data sheet. Designers should refer to the appropriate data sheet of the same number for guaranteed specification limits.
