

VM700 Video Measurement Set

VM700

Video Measurement Set

- Automatic Monitoring
- User-Programmable Functions
- Digital Waveform Monitor/Vectorscope
- Hard Copy Capability

The VM700 is a complete video monitoring and measuring instrument which can be used for automatic monitoring, as well as for manual measurements. The user can select a display of numeric values to confirm the quality of the signal path, or may select graphic displays for more detailed analysis.

Automatic Video Measurement Set

The VM700 makes most standard televideo measurements automatically, including those specified in RS-250B/EIA-250C, NTC-7, and RS-170A. These measurements can be compared with user-defined limits and an alarm message generated when these limits are violated. New graphic displays are provided for measurements such as signal-to-noise ratio and group delay, enabling the user to better understand (and improve) the transmission path.

User-Programmable Functions

Any sequence of operations may be identified with a user-defined function. For example, the measurements to be made on a transmitter demodulator output could be identified with a function labeled DEMOD. A technician would simply select this function to make all measurements, including a print-out.

Digital Waveform Monitor/VectorscopeFor more detailed analysis of the waveform, the actual signal may be displayed and additional measurements

In waveform mode, cursors are available to aid in measuring time, frequency and amplitude. These cursors allow a very quick and precise location of the 10%, 50%, or 90% points on any transition.

made manually.

The WAVEFORM DISPLAY can be expanded around any point both vertically and horizontally. Because the data is digitized, the display remains bright at all expansion factors. The axes automatically expand with the waveform, so all units are correct as displayed.

The VECTOR DISPLAY mode provides the normal vectorscope display. The vectors may be rotated or expanded, with the rotation angle and gain values displayed numerically on the screen.

Line Select can be used to quickly specify any line for display or automatic measurement.

Hard Copy

All information on the screen may be printed on printers supporting Epson® or Postscript® graphics via the standard RS-232C interface. Automatic measurement results can be printed on most ASCII printers using the same interface.

Picture Mode

The signal source can be quickly verified using the picture display, and any line may be selected on the picture for viewing in the waveform or vector displays.
