## Introduction

Thank you for purchasing the OM-593 ANALOG output module. This document describes the functions and operating method of the OM-593, as well as the precautions to observe when using it. Be sure to read this document before using the OM-593 since improper use may result in accidents. After reading, please retain this document in a safe place for future reference.

## Safety Precautions

### **Warning**

#### **Avoid contact with foreign substances**

- **Do not spill liquid or drop a flammable substance or metal inside the module. Usage under such conditions may result in fire, electrical shock, or malfunction.**

#### **Do not disassemble**

- **Do not attempt to disassemble this module. To avoid the risk of electrical shock or injury to the user, or malfunction of the module, do not open the case or remove/reinstall the internal board.**

## **Caution**

### Handling of the module

- The module consists of precision components ; handle it with extreme care.
- To avoid the risk of electrical shock, injury, or breakdown, do not remove or add a module while the power is on.
- When removing the module, be careful to avoid brushing your hand against the connectors.

### Avoid mechanical shock and impact

- The module is a precision instrument that may be damaged by mechanical shock and impact. Be extremely careful when transporting the module.
- Do not drop the module.

### In case of an abnormality or malfunction

- If an abnormality or malfunction occurs, unplug the power cord and then contact your local dealer or the ASTRODESIGN sales group.

## Concerning the use of this unit

### Notice: Concerning copyrights

- The copying or reproduction in any way of copyrighted materials for purposes other than personal use without the written consent of the holders of the copyrights for the materials and other holders of rights is prohibited by copyright laws and by the stipulations of international treaties. Astrodesign disclaims all liability in the event that this product is used in a manner which fails to observe the above-stated notice concerning copyrights.

## About the OM-593

---

### 2.1 Overview

- The OM-593 is an ANALOG output module that can be installed in the SC-2055 Series (2 inputs, 2 outputs).
- This unit supports HS/VS input and CS input signals for the external reference signals. (75-ohm termination fixed, no through-out facility)
- TTL level H/V and binary CS signals with a 0.3 Vp-p level (or 0.6 Vp-p for tri-level CS signals) are output as the output sync signals, and the same output connector is shared by the HS and CS signals.

## 2.2 Limitations to the specifications

The SC-2055 has certain limitations, which when exceeded may cause the image of the output video signal to appear distorted.

Because there are also some limitations to the functionality, please take appropriate precautions when using the device.

### (1) External Sync Signal

If the external sync signal that is input does not contain a serration pulse, a correct lock will not be achieved, even if the front LED indicates a locked state. If a signal of poor quality, such as from a VTR, is input, a correct lock may not be achieved in some cases.

When 1/2H serration pulses are present in progressive timing signals, locking operations may not be possible depending on the horizontal frequency (75 kHz and up).

Since the signals supplied as the external sync signals are analog signals, an error equivalent to several dots may occur in the output phase with respect to the external sync signals although this will depend on the signals which are input.

If the phase difference between the HSYNC and VSYNC signals which are input is great, the unit may not be able to track the input timing signals, the image on the output screen may be disturbed and the unit may not operate properly in other ways.

### (2) Limitation on locking operations

Locking operations cannot be performed if the horizontal total width of the output timing signals is greater than 4096.

### (3) Lock Range

If the ratio between the input and output vertical frequencies is 1:1, 1:2, 2:5 or 4:5, frame locking operations can be performed. Bear in mind that a phase difference of several H will occur each time a locking operation is undertaken. (This difference can be eliminated by adjusting the locking phase.)

Depending on the timing signals, it may not be possible for the unit to perform locking operations even when the ratio between the input and output vertical frequencies is in the locking range.

# 3

## Names and Functions of Individual Components

### 3.1 OM-593 rear panel view and component names

Fig. 3.1 OM-593 Rear Panel View

Table 3.1 Names of Rear Panel Components

No.	Name of part	Description
	ANALOG Output connectors	These are the analog output connectors (BNC connectors).
	R/Pr/Cr	BNC connector for R/Pr/Cr image output (75-ohm termination fixed)
	G/Y	BNC connector for G/Y image output (75-ohm termination fixed) Use this channel as the reference for OnSYNC.
	B/Pb/Cb	BNC connector for B/Pb/Cb image output (75-ohm termination fixed)
	HS/CS	BNC connector for HS/CS sync output; the CS signal, or the HS signal when separate H and V signals are input, is output from here.
	VS	BNC connector for VS sync output; the VS signal is output from here when separate H and V signals are input.
	HS/CS input connector	This is the HS/CS sync signal input connector (BNC connector).
	VS input connector	This is the VS sync signal input connector (BNC connector)
	Handle	This is used when plugging in or unplugging the modules.

# 4

## Connecting the Module

### 4.1 Connecting the output signal

As shown in the figure, appropriately connect the SD-SDI output signal from the OM-593's SD-SDI output connector to the input of a peripheral device.

Projector

To analog input connector of peripheral equipment

# 5

## Adjustments and Settings

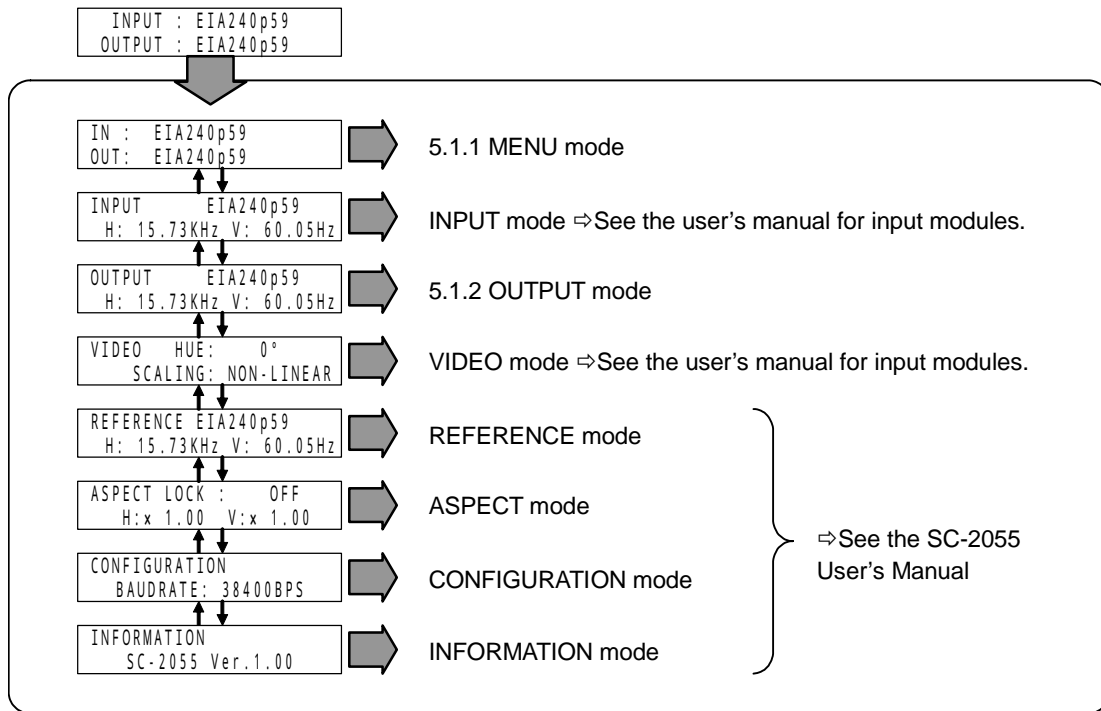

### 5.1 Menu structure

From the default screen, push the rotary encoder to enter the menu structure described below. For the operation method, see the SC-2055 User's Manual.

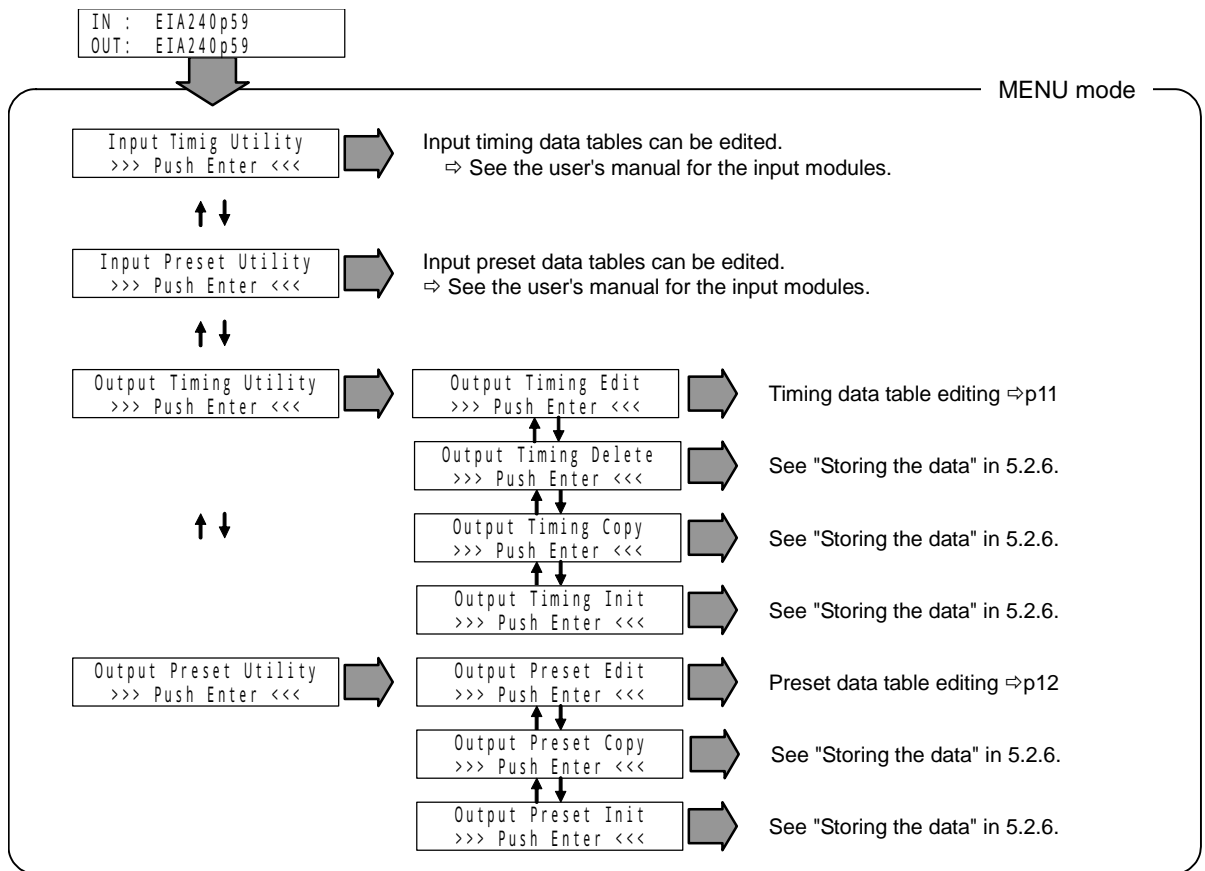

Symbols are defined below.

 	PUSH operation
 	Rotate operation

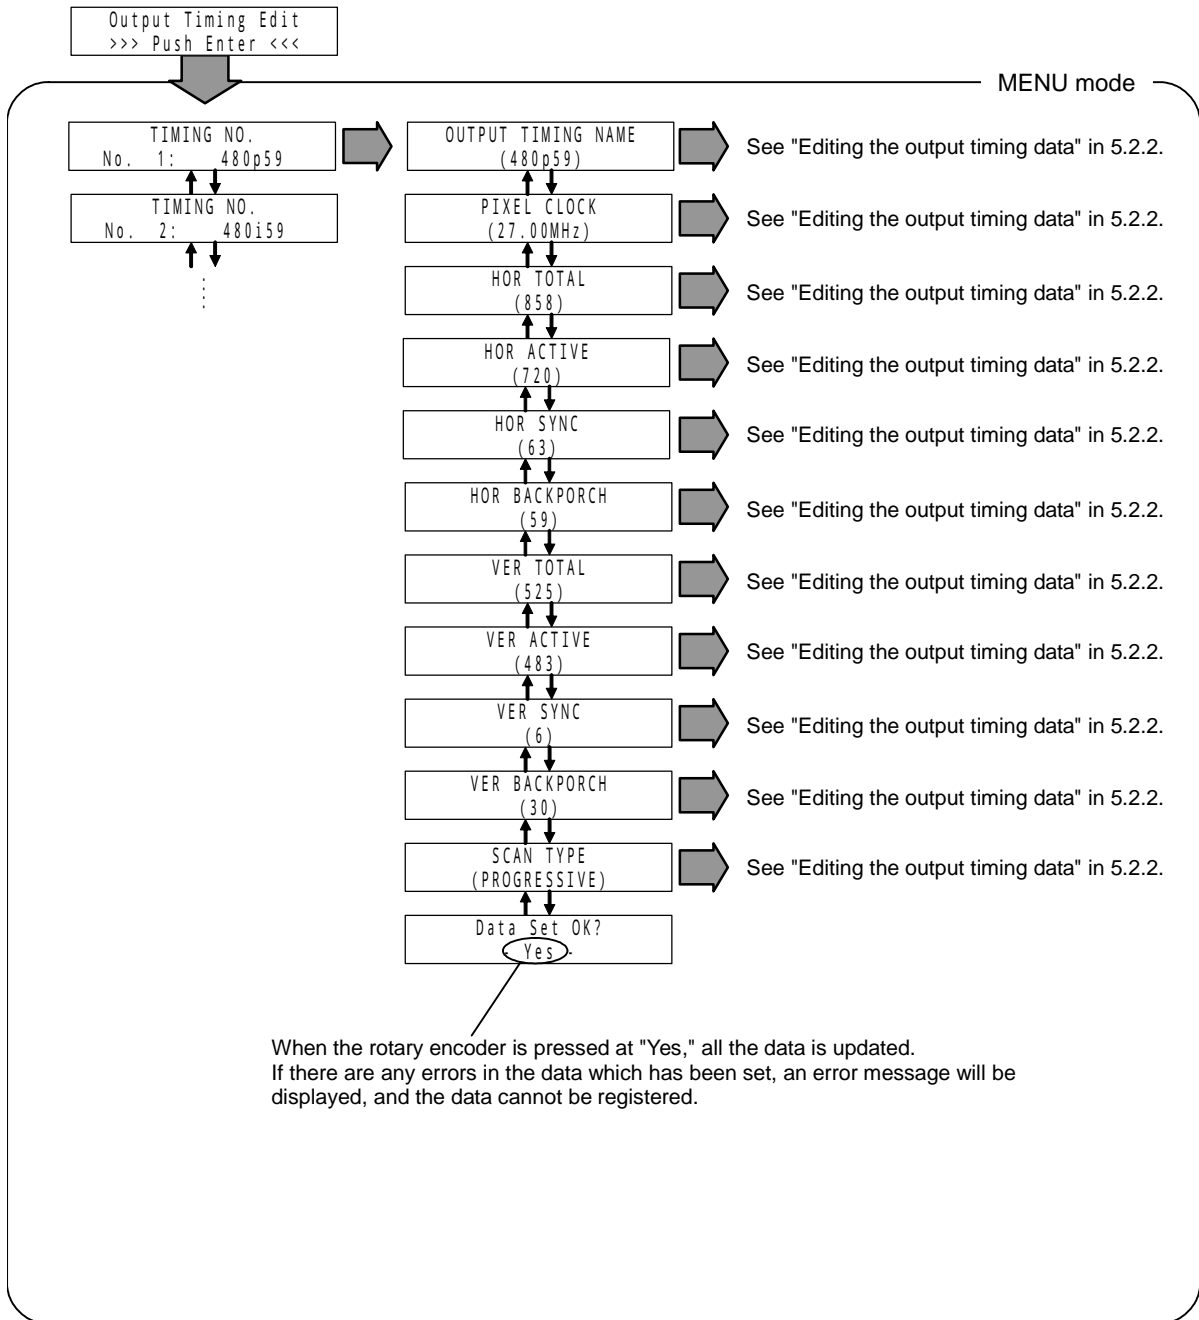

Default screen

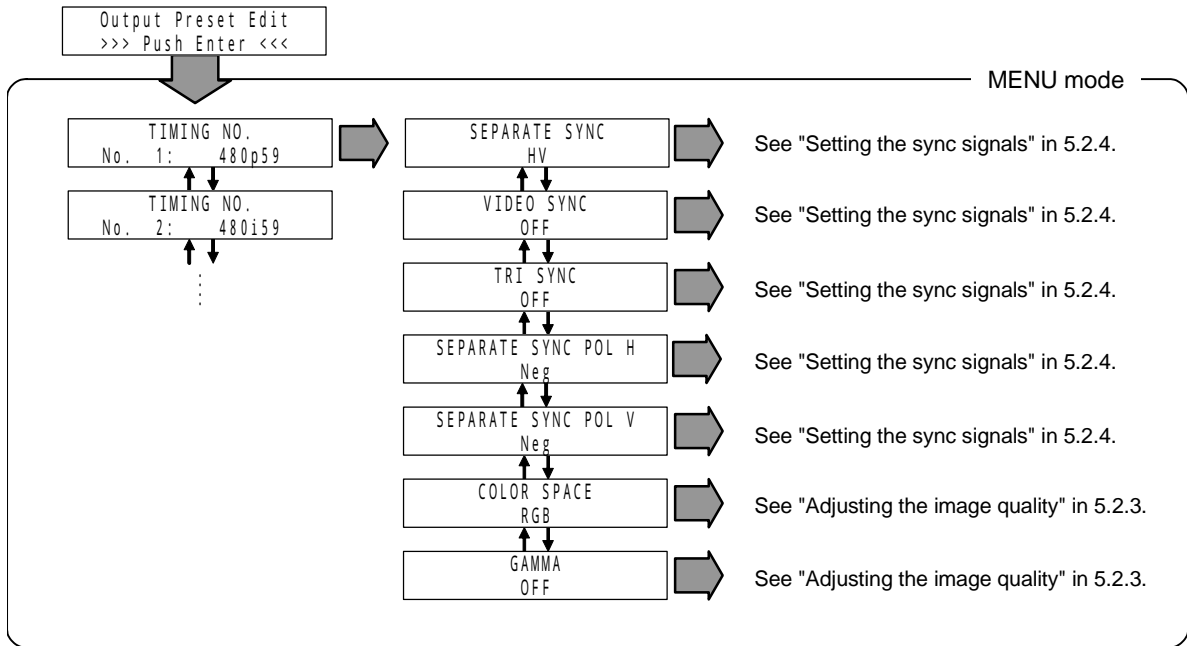

## 5.1.1 MENU mode

Timing data table editing

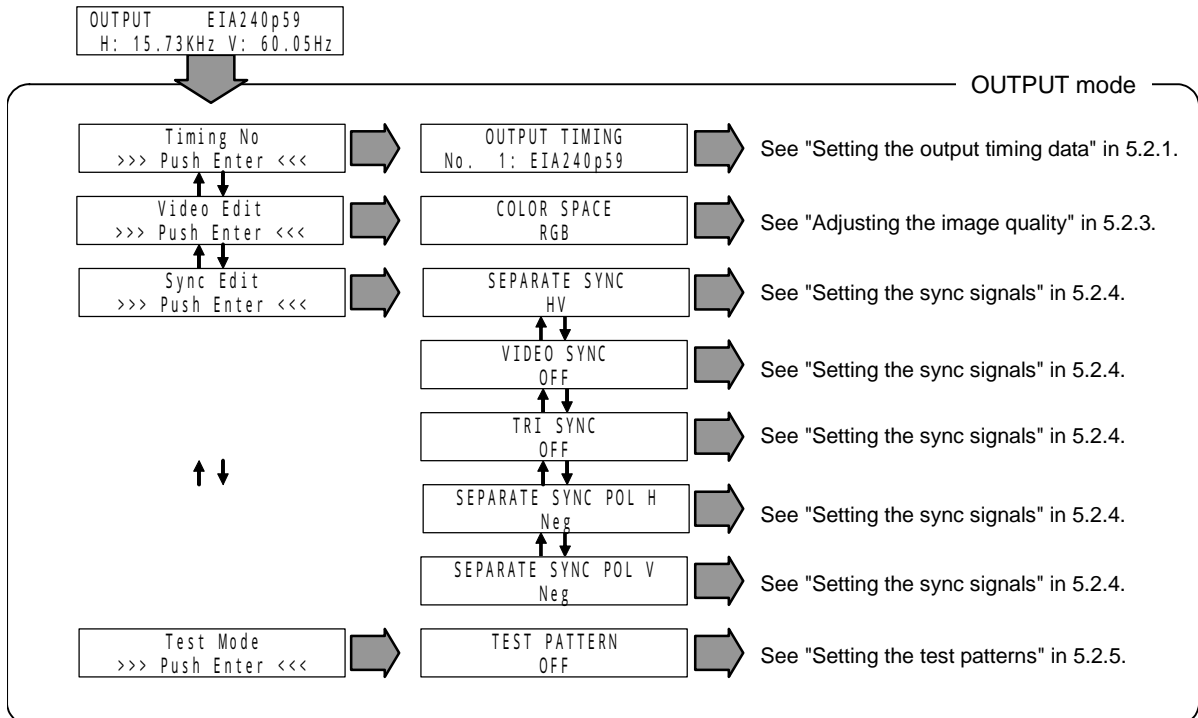

## Preset data table editing

## 5.1.2 OUTPUT mode

The default screen of the OUTPUT mode displays the selected output timing.

## 5.2 Setting parameters

### 5.2.1 Setting the output timing

Sets the output timing.

Parameter	Description	Setting Value	Comments
OUTPUT TIMING	Output timing data	Timing data name *1 SLAVE *2	This parameter is used to select the output timing data.

\*1: The number of timing data names which can be selected differs depending on the type of output module installed.

\*2: When SLAVE is set, the same timing data as the timing data output by the other output channel is output. SLAVE can be selected only when modules have been installed in both output channels. SLAVE cannot be set for both channels at once.

### 5.2.2 Editing the output timing data

The parameters in this section are used to edit the output timing data which has been selected. However, the standard timing data cannot be edited. If data cannot be edited, its setting is enclosed in parentheses.

Setting item	Setting description	Setting value	Remarks
OUTPUT TIMING NAME	Output timing data name	14 characters	This parameter is used to display the name of the selected output timing data.
PIXEL CLOCK	Pixel clock	13.50 - 165.00 (in 10 kHz increments)	This parameter is used to adjust the pixel clock.
HOR TOTAL	Horizontal total width	512 - 4608 (in 1-dot increments)	This parameter is used to adjust the brightness so that it is made uniform throughout if light and dark vertical stripes have appeared on the screen. *1
HOR SYNC	Horizontal sync width	16 - 1024 (in 1-dot increments)	This parameter is used to adjust the sync width when the image is shifted horizontally on the display. *1
HOR BACKPORCH	Horizontal back porch	0 - 2048 (in 1-dot increments)	This parameter is used to adjust the back porch when the image is shifted horizontally on the display. *1
HOR ACTIVE	Horizontal active width	256 - 2560 (in 1-dot increments)	This parameter is used to adjust the horizontal display period (size). *1
VER TOTAL	Vertical total width	256 - 2560 (in 1-line increments)	This parameter is used to adjust the brightness so that it is made uniform throughout if light and dark vertical stripes have appeared on the screen. *2
VER SYNC	Vertical sync width	1 - 64 (in 1-line increments)	This parameter is used to adjust the sync width when the image is shifted vertically on the display.
VER BACKPORCH	Vertical back porch	0 - 1024 (in 1-line increments)	This parameter is used to adjust the back porch when the image is shifted vertically on the display.
VER ACTIVE	Vertical active width	128 - 1580 (in 1-line increments)	This parameter is used to adjust the vertical display period (size).
SCAN TYPE	Scanning system	PROGRESSIVE/ INTERLACE/ SEGMENTFRAME	This parameter is used to select the scanning system.

\*1: Set this parameter in 2-dot increments if the output pixel clock frequency is higher than 74.25 MHz.

\*2: Set this parameter in odd-numbered increments when the interlace system is used.

### 5.2.3 Adjusting the image quality

Adjusts the image quality and sets parameters related to the video display.

Parameter	Description	Setting Value	Comments
COLOR SPACE	Color space setting	RGB/SDTV/HDTV/ HDTV1035	This parameter is used to set the color space system.
GAMMA	Gamma	OFF/ USER1/USER2	This parameter is used to set the gamma mode.

### 5.2.4 Setting the sync signals

The parameters in this section are used to set the sync signals.

Parameter	Description	Setting Value	Comments
SEPARATE SYNC	Output sync setting	OFF/CS/HV	This parameter is used to set the output sync signal.
VIDEO SYNC	Output video sync setting	OFF/G/RGB	This parameter is used to set the output video sync signal.
TRI SYNC	Output tri-level sync setting	OFF/ON	This parameter is used to set the output tri-level sync signal. *1
SEPARATE SYNC POL H	Output sync polarity setting	Neg/Pos	This parameter is used to set the polarity of the horizontal output sync signal.
SEPARATE SYNC POL V	Output sync polarity setting	Neg/Pos	This parameter is used to set the polarity of the vertical output sync signal.

\*1: This parameter can be set only for the HDTV timing data registered as the defaults.

### 5.2.5 Setting the test pattern

Outputs a test pattern. Use this function for adjusting the display device.

Parameter	Description	Comments
TEST PATTERN	OFF	Normal screen display
	BRIGHT	Step-up pattern with black as the reference
	CONTRAST	Step-down pattern with white as the reference
	HUE&COLOR	Color signal RGB pattern in which the white level is attenuated to 75% and the black level is attenuated to 25%
	COLORBAR	100% colorbar display
	CROSSHATCH	1 dot, 1 line crosshatch pattern
	BURST	White/ black horizontal 1-dot repeated pattern
	FRAME	Frame display for the full video display interval
	WHITE	Displays WHITE on the entire screen
	RED	Displays RED on the entire screen
	GREEN	Displays GREEN on the entire screen
BLUE	Displays BLUE on the entire screen	

## 5.2.6 Storing the data

The parameters in this section enable data to be copied, initialized or deleted.

Parameter	Description	Comments
Output Timing Delete	Timing data deletion	This parameter is used to delete the output timing data. However, output timing data or the timing data specified as the external reference sync timing data cannot be deleted.
Output Timing Copy	Timing data copying	This parameter is used to copy output timing data into empty tables. Data cannot be copied if it involves overwriting already existing data in a table.
Output Timing Init	Timing data initialization	This parameter is used to initialize the output timing data to the factory data.

Example: Deleting timing data

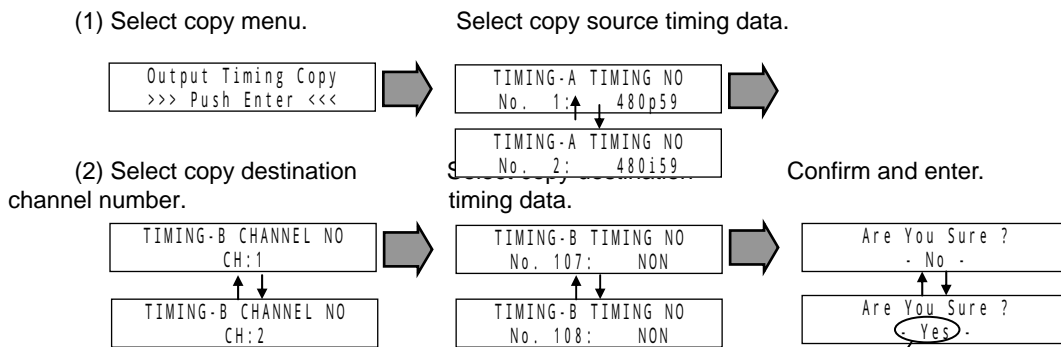

When the rotary encoder is pressed at "Yes," the data is copied.

⇒ See "MENU mode" in 5.1.1 on page 10.

Example: Copying timing data

In this example, the TIMING-A timing data is copied to the TIMING-B timing data.

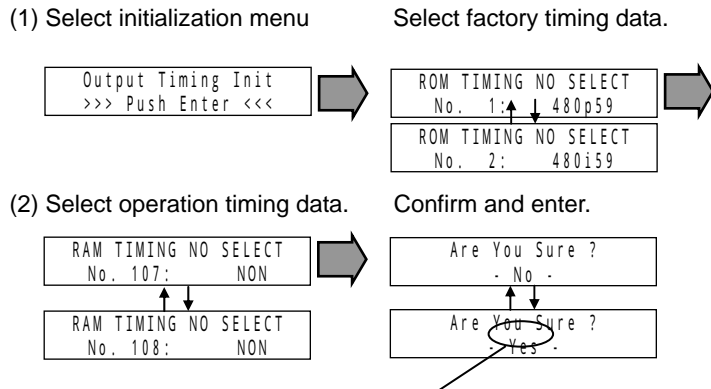

When the rotary encoder is pressed at "Yes," the data is copied.

⇒ See "MENU mode" in 5.1.1 on page 10.

## Example: Initializing timing data

In this example, the RAM timing data is initialized by the ROM timing data.

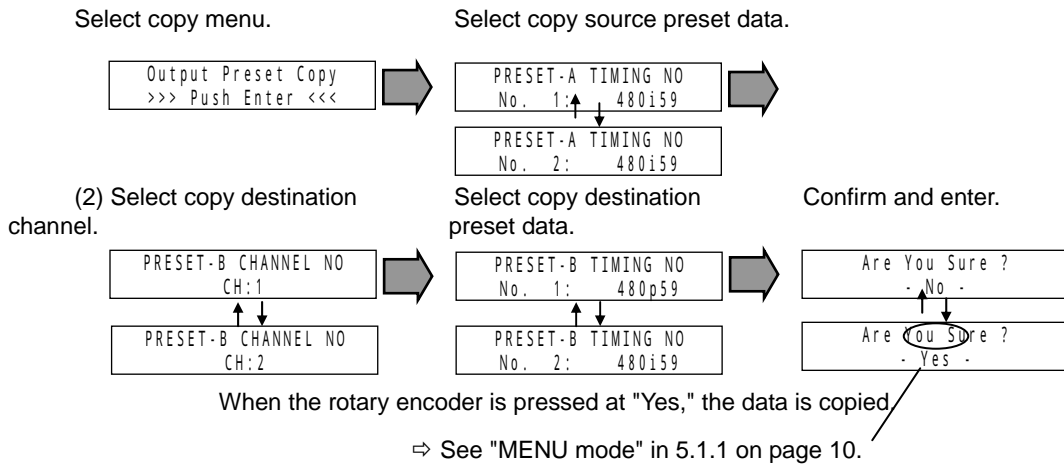

When the rotary encoder is pressed at "Yes," the data is initialized.

⇒ See "MENU mode" in 5.1.1 on page 10.

Parameter	Description	Comments
Output Preset Copy	Preset data copy	This parameter is used to copy preset data into empty tables. Data cannot be copied if it involves overwriting already existing data in a table.
Output Preset Init	Preset data initialization	This parameter is used to initialize the preset data to the factory data.

Example: Copying preset data

# 7

## Main Specifications

### 7.1 Specifications

Table 7.1 OM-593 Specifications

Item		Specifications
Scanning system		Progressive, interlace
A/D conversion frequency		13.5 to 165 MHz (max. 74.25 MHz for interlace)
Horizontal frequency		15 to 150 kHz
Vertical frequency		24 to 150 Hz (differs depending on resolution of input/output)
Video signal	Color format	Analog RGB Analog YPbPr/YCbCr
	Image data resolution	10 bits
	Video level	0.7 Vp-p/75-ohm termination fixed for all signals (excluding sync signals)
	Number of pixels displayed	Max. 2560 x 1580
	Number of channels	1 system (BNC)
Sync signals	G(Y)-ON/OFF RGB(YPbPr)-ON/ OFF	Binary (0.3 Vp-p/75-ohm termination)/tri-level sync ( $\pm 0.3$ Vp-p/75-ohm termination)
	CS	Binary (0.3 Vp-p/75-ohm termination)/tri-level sync ( $\pm 0.3$ Vp-p/75-ohm termination)
	HS/VS	TTL level (negative polarity)
	Number of channels	1 system (BNC)
External sync signals	CS	Binary (0.3 Vp-p/75-ohm termination)/tri-level sync ( $\pm 0.3$ Vp-p/75-ohm termination)
	HS/VS	TTL level (negative polarity/75-ohm termination)
	Number of input channels	1 system (BNC)
	Through-out	None
