1

CONCERNING THE TERMINAL COMMANDS

1.1 Introduction

The terminal mode is provided for controlling the VG generator from an external computer (such as a personal computer). The commands and data are transmitted and received through the RS-232C serial input/output port or through the LAN port.

By using the terminal mode, it is possible to register program data, execute programs, turn patterns ON or OFF and perform other operations which are virtually identical to their corresponding manual operations. In addition, functions for writing straight lines, circles, dots, etc. are supported with graphic commands.

As in the past, the commands and data are transmitted and received through the RS-232C serial input/output port or through the LAN port.

Although a different communication format is now used, the communication specifications, connection configuration, error statuses and other specifications remain virtually unchanged from before.

This manual describes the terminal commands which are supported by the VG-870, VG-871 and VG-880 generators.

Also described are the terminal command of the VG-848 series (hereafter indicated as the "old VG models").

1.5 Description of terms used

Term	Description
Auto display data	The length of the interval (in seconds) after the patterns have been output until the next program is run as well as the sequence of the numbers of the programs to be run when the VG generator is operated in the auto display mode are set as parameters. The sequence of program numbers can be set in a 3-block format. If, for instance, program numbers 01, 02 and 03 are to be output first followed by program numbers 07, 08 and 09 after which the programs are to be repeated from 01, then 01-03 is set in the first block, 07-09 is set in the second block, and 00-00 is set in the third block.
Pattern select data	This data is for selecting which pattern is to be output if programs are run when the VG generator is operated in the direct display or auto display mode. Bear in mind that "R," "G" and "B" must always be entered in the data: otherwise, the data will be registered without coloring.
Buffer RAM	The VG generator calls one of the programs registered on the CompactFlash card (or internal flash memory) to its execution RAM first, and it then executes the contents of the program. This RAM is called the buffer RAM.
1-program data	This is the increment of the data which is registered on the CompactFlash card (or internal flash memory). The 1-program data consists of the H timing data, V timing data, output condition data, pattern select data and various pattern data.
User character	This refers to the characters which can be created and registered by the user. The size of these characters is 64 by 64 dots.
Character plane	This is the plane on which 1-bit drawing with a single color is accomplished. * It was referred to as the "graphic plane" in the previous terminal commands.
Graphic plane	This is the plane on which drawings with 256 colors are displayed. * It was referred to as the "color plane" in the previous terminal commands.

1.11. Precaution drawing command

Drawing command for graphic plane “in previous terminal command it was referred as color plane” please remind about following issues.

1. Pattern which drawn by graphic plane drawing command is not able to overwrite with other pattern. If you execute the graphic plane drawing command when you are displaying pattern by VG's front panel or remote controller, for example color bar, pattern will be abnormal.
2. Before executing the graphic plane drawing command, please execute the clear command (3.15. GRACLR4 {28H 40H} : Graphic plain clear).
3. Color table for graphic plain drawing command, will be 0 to 255.

2.4 LVT4 [20H 23H]: V timing data readout

Function: This command reads the V timing data of the program whose number has been designated. When the program number is 0, it reads out the data from the buffer RAM. When the program has any number from 1001 to 2000, the command reads out from the fixed data. When the program number is 9999, the command reads the data from the command work RAM.

2.8 LPAR4 [20H 27H]: Parallel data readout

Function: This command reads the parallel data of the program whose number has been designated. When the program number is 0, it reads out the data from the buffer RAM. When the program has any number from 1001 to 2000, the command reads out from the fixed data. When the program number is 9999, the command reads the data from the command work RAM.

2.14 LPT4 [20H 2DH]: Pattern data readout

Function: This command reads the pattern data of the program whose number has been designated. It selects the pattern block to be set as a parameter and receives the corresponding data. When the program number is 0, it reads out the data from the buffer RAM. When the program has any number from 1001 to 2000, the command reads out from the fixed data. When the program number is 9999, the command reads the data from the command work RAM.

* Under the binary format, the "1" parts are what is set.

	Byte 1		Byte 2		Byte 7		Byte 8		
1	0011	0000	0011		0101	0101	1101		
2	0100	1100	0100		0010	1011	1100		
...									
↓ Binary → hexadecimal									
1	1	2	3		14	15	16		
2	3H	0H	3H		5H	5H	DH		
...					2H	BH	CH		
↓ hexadecimal → ASCII code									
1	1	2	3		14	15	16		
2	33H	30H	33H		35H	35H	44H		
...					32H	42H	43H		

Fig. 4-15-2

The data is organized as follows: $8 \text{ bytes} \times 64 = 512 \text{ bytes}$
 $512 \times 2 = 1024 \text{ bytes (ASCII code)}$
 $1024 \text{ bytes} \div 128 \text{ bytes} = 8$

INDIVIDUAL DRAWING COMMAND FORMATS

Execute the drawing commands after having set the sync signals.

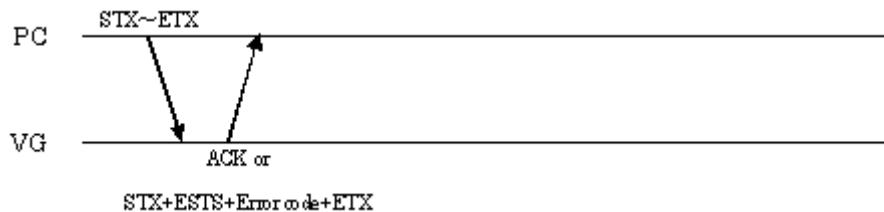

With the VG-848 generator, do not execute drawing commands in combination with pattern drawing using the main unit. If they are executed, the patterns may not be drawn on the screen correctly due to the structure of the video memory.

6.4 Setting and executing the drawing pattern data

Example: If a pattern such as the one shown below is to be drawn, then:

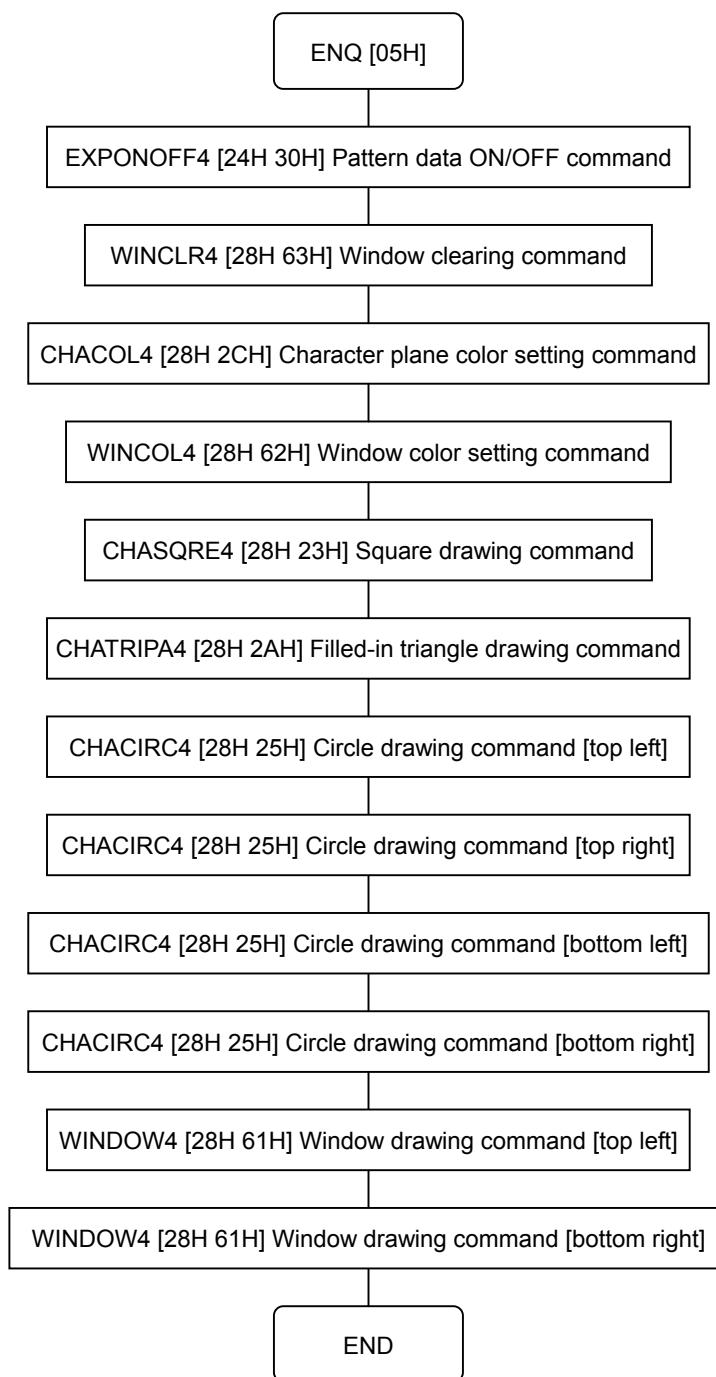

- *1: It is assumed that the timing data in question has been set ahead of time and that internal timing data No.1616 has been set.
- *2: It is also assumed that a 50% gray raster pattern is output as the background pattern.

The drawing functions used are as listed below.
