TD-SCDMA Measurement

Radio Communication Analyzer MT8820B/MT8820C/MT8821C

Revision History

Ver. No	Date	Contents	Related product software version
1.00	July 2015	MT8820B/20C/21C TD-SCDMA Application Note (Ver 1.00) succeeded MT8820B/C TD-SCDMA Application Note (Ver 4.00). Overall: Changed model name from MT8820B/C to “unit” Added software specification for MT8821C	MX882007C Ver23.01 MX882107C Ver30.00

Contents

1. TD-SCDMA Measurement Software 4

1.1. SPECIFICATIONS 4
1.1.1. For MT8820B/20C 4
1.1.2. For MT8821C 7

1.2. 3GPP MEASUREMENT SPECIFICATION (3GPP TS 34.122 V11.5.0) TABLE 11

1.3. TRX MEASUREMENT (FUNDAMENTAL MEASUREMENT) 14
1.3.1. Test Loop Mode Connection (Single Code) 14
1.3.2. Test Loop Mode Disconnection 14
1.3.3. Switching Channel Coding during Connection 14
1.3.4. Channel Switching by Handover 15
1.3.5. Switching Channel and Channel Coding (Single Code/Multi Code) by Handover 15
1.3.6. Test Item Selection 15
1.3.7. 5.2 User Equipment maximum output power 16
1.3.8. 5.3 UE frequency stability 16
1.3.9. 5.4.2 Minimum output power 17
1.3.10. 5.4.3 Transmit OFF power, 5.4.4 Transmit ON/OFF Time mask 17
1.3.11. 5.5.1 Occupied bandwidth 18
1.3.12. 5.5.2.1 Spectrum emission mask 18
1.3.13. 5.5.2.2 Adjacent Channel Leakage power Ratio (ACLR) 19
1.3.14. 5.7.1 Error Vector Magnitude 19
1.3.15. 5.7.2 Peak code domain error 20
1.3.16. 6.2 Reference sensitivity level 20
1.3.17. Reduction of measurement time by batch processing 21

1.4. OPEN LOOP POWER CONTROL MEASUREMENT 22
1.4.1. 5.4.1 Open Loop Power Control in the Uplink (RX-middle) 22
1.4.2. 5.4.1 Open Loop Power Control in the Uplink (RX Upper dynamic end) 22
1.4.3. 5.4.1 Open Loop Power Control in the Uplink (RX-Sensitivity level) 23
1.4.4. Continuous measurement of Open Loop Power Control 23

1.5. CLOSED LOOP POWER CONTROL MEASUREMENT (AUTOMATIC MEASUREMENT) 24
1.5.1. 5.4.1.4 Closed loop power control 24

1.6. OTHER MEASUREMENT 25
1.6.1. 5.4.5 Out-of-synchronisation handling of output power for continuous transmission 25
1.6.2. 5.4.6 Out-of-synchronisation handling of output power for discontinuous transmission 25
1.6.3. 6.3 Maximum Input Level 26
1.6.4. 6.8 Spurious Emissions 26
1.6.5. 7.2 Demodulation in static propagation conditions 27

1.7. HSDPA MEASUREMENT 28
1.7.1. HSDPA RMC Connection 28
1.7.2. HSDPA RMC Disconnection 28
1.7.3. Switching HSDPA Data Rate during connection. 28
1.7.4. 5.2B User Equipment maximum output power with HS-SICH and DPCH 29
1.7.5. 5.5.2.1B Spectrum emission mask 30
1.7.6. 5.5.2.2B Adjacent Channel Leakage power Ratio (ACLR) with HS-SICH and DPCH 30
1.7.7. 5.7.1B Error Vector Magnitude with HS-SICH and DPCH 31

1.7.8. 6.3A Maximum Input Level for HS-PDSCH Reception (16QAM) 31
1.7.9. 9.3.3 Reporting of HS-DSCH Channel Quality Indicator (2.8 Mbps UE) 32
1.8. HSUPA MEASUREMENT 33
1.8.1. HSUPA RMC Connection 33
1.8.2. HSUPA RMC Disconnection 33
1.8.3. 5.2A User Equipment maximum output power with E-DCH 34
1.8.4. 5.5.2.1A Spectrum emission mask 34
1.8.5. 5.5.2.2A Adjacent Channel Leakage power Ratio (ACLR) with E-DCH 35
1.8.6. 5.7.1A Error Vector Magnitude with E-DCH 16QAM 35
1.8.7. 11.1 Detection of E-DCH HARQ ACK Indicator Channel (E-HICH) 36
1.8.8. 11.2 Demodulation of E-DCH Absolute Grant Channel (E-AGCH) 37
1.9. UE REPORT 37
1.10. OTHERS 38
1.10.1. Calibration 38

1. TD-SCDMA Measurement Software

1.1. Specifications

1.1.1. For MT8820B/20C

Table 1.1.1-1 Specifications for MX882007C TD-SCDMA Measurement Software

Item	Specifications	
Electrical characteristics	Typical values (typ.) are only for reference and are not guaranteed.	
Frequency/Modulation measurement	Frequency	300 to 2700 MHz
	Input level	–40 to +35 dBm (Main)
	Carrier frequency accuracy	±(Set frequency ×Reference oscillator accuracy +10 Hz)
	Modulation accuracy	
	Residual vector error	≤ 2.5% (when Single Code is input)
Amplitude measurement	Frequency	300 to 2700 MHz
	Input level	–70 to +35 dBm (Main)
	Measurement accuracy	MT8820B/MT8815B ±0.5 dB (–25 to +35 dBm), ±0.7 dB (–55 to –25 dBm), ±0.9 dB (–70 to –55 dBm), after calibration MT8820C ±0.5 dB (–25 to +35 dBm), typ. ±0.3 dB (–20 to +35 dBm), ±0.7 dB (–55 to –25 dBm), ±0.9 dB (–60 to –55 dBm), 10 to 40°C after calibration
	Linearity	±0.2 dB (–40 to 0 dB, ≥–55 dBm), ±0.4 dB (–40 to 0 dB, ≥–65 dBm),
	Measurement object	DPCH, UpPCH
Occupied bandwidth	Frequency	300 to 2700 MHz
		Input level –10 to +35 dBm (Main)
Adjacent channel leakage power	Frequency	300 to 2700 MHz
	Input level	–10 to +35 dBm (Main)
	Measurement point	±1.6 MHz, ±3.2 MHz
	Measurement range	≥50 dB (±1.6 MHz), ≥55 dB (±3.2 MHz)
RF signal generator	Output frequency	300 to 2700 MHz (1 Hz steps)
	Channel level (DPCH)	–30.0 to 0.0 dB (0.1 dB steps, Relative level with Ior (Total power))
	Channel level accuracy	±0.2 dB (Relative level accuracy with Ior)
	AWGN level	Off, –20 to +5 dB (0.1 dB steps, Relative level with Ior (Total power))
	AWGN level accuracy	±0.2 dB (Relative level accuracy with Ior)

Table 1.1.1-1 Specifications for MX882007C TD-SCDMA Measurement Software (Cont'd)

Item	Specifications	
Error rate measurement	Function	Applying PN9 or PN15 pattern to DTCH
	Measurement item	BER, BLER
	BER measurement object	Loop Back data applied to uplink DTCH
	BLER measurement object	Loop Back data applied to uplink DTCH
Call processing	Call control	Location registration, call origination, call termination, hand-over, network-side release, UE-side release (Execution of the operation conforming to the 3GPP standard and pass/fail judgement can be performed.)
	UE Control	Output level, loopback (UE control conforming to the 3GPP standard can be performed.)

Table 1.1.1-2 Specifications for MX882007C-011 TD-SCDMA HSDPA Measurement Software

Item	Specifications	
Function	RF tests (Rx measurement) related to HSDPA	
Reference channel	Transferring	RMC 0.5Mbps UE Class (QPSK), RMC 1.1Mbps UE Class (QPSK), RMC 1.1Mbps UE Class (16QAM), RMC 1.6Mbps UE Class (QPSK), RMC 1.6Mbps UE Class (16QAM), RMC 2.2Mbps UE Class (QPSK), RMC 2.2Mbps UE Class (16QAM), RMC 2.8Mbps UE Class (QPSK), and RMC 2.8Mbps UE Class (16QAM)
Throughput measurement	Function	Throughput measurement using RMC
	Measurement item	Throughput
	Measurement object	ACK and NACK applied to HS-SICH
CQI measurement	Measurement object	Periodically reported CQI (RTBS, RMF) value applied to HS-SICH
Call processing	Call control:	Location registration, Call processing using RMC (Execution of the operation conforming to the 3GPP standard and pass/fail judgment can be performed.)
	UE control	Output level (UE control conforming to the 3GPP standard can be performed.)

Table 1.1.1-3 Specifications for MX882007C-012 TD-SCDMA HSDPA Evolution Measurement Software

Item	Specifications	
Function	RF tests (Rx measurement) related to HSDPA Evolution	
Reference channel	Transferring	RMC Category 16-18UE(64QAM), RMC Category 19-21UE(64QAM), RMC Category 22-24UE(64QAM), RMC Category 18 Max, RMC Category 21 Max, and RMC Category 24 Max,
Throughput measurement	Function Measurement item Measurement object	Throughput measurement using RMC Throughput ACK and NACK applied to HS-SICH
CQI measurement	Measurement object	Periodically reported CQI value applied to HS-SICH
Call processing	Call control: UE control	Location registration, Call processing using RMC (Execution of the operation conforming to the 3GPP standard and pass/fail judgment can be performed.) Output level (UE control conforming to the 3GPP standard can be performed.)

Table 1.1.1-4 Specifications for MX882007C-021 TD-SCDMA HSUPA Measurement Software

Item	Specifications	
Function	RF tests (Tx measurement) related to HSUPA	
Modulation measurement	This item depends on the MX882007C's performance.	
Call processing	Call control UE control	Location registration, Call processing using FRC1, FRC2 (Execution of the operation conforming to the 3GPP standard and pass/fail judgment can be performed.) Output level (UE control conforming to the 3GPP standard can be performed.)

1.1.2. For MT8821C

Table 1.1.2-1 Specifications for MX882107C TD-SCDMA Measurement Software

Item	Specifications	
Electrical characteristics	Typical values (typ.) are only for reference and are not guaranteed.	
Frequency/Modulation measurement	Frequency	350 to 2700 MHz For the frequencies below 500 MHz, only the following range meets the specifications: 452.5 to 457.5 MHz (LTE OperatingBand31)
	Input level	–30 to +35 dBm (Main1/2)
	Carrier frequency accuracy	±(Set frequency ×Reference oscillator accuracy +10 Hz)
	Modulation accuracy	
	Residual vector error	≤2.5% (when Single Code is input)
Amplitude measurement	Frequency	350 to 2700 MHz For the frequencies below 500 MHz, only the following range meets the specifications: 452.5 to 457.5 MHz (LTE OperatingBand31)
	Input level	–70 to +35 dBm (Main1/2)
	Measurement accuracy	±0.5 dB (–30 to +35 dBm), typ. ±0.3 dB (–30 to +35 dBm), ±0.7 dB (–55 to –30 dBm), ±0.9 dB (–70 to –55 dBm), 10 to 40°C after calibration
	Linearity	±0.2 dB (–40 to 0 dB, ≥–50 dBm), ±0.4 dB (–40 to 0 dB, ≥–60 dBm), 400 to 6000 MHz
	Measurement object	DPCH, UpPCH
Occupied bandwidth	Frequency	350 to 2700 MHz For the frequencies below 500 MHz, only the following range meets the specifications: 452.5 to 457.5 MHz (LTE OperatingBand31)
	Input level	–10 to +35 dBm (Main1/2)
Adjacent channel leakage power	Frequency	350 to 2700 MHz For the frequencies below 500 MHz, only the following range meets the specifications: 452.5 to 457.5 MHz (LTE OperatingBand31)
	Input level	–10 to +35 dBm (Main1/2)
	Measurement point	±1.6 MHz, ±3.2 MHz
	Measurement range	≥50 dB (±1.6 MHz), ≥55 dB (±3.2 MHz)

Table 1.1.2-1 Specifications for MX882107C TD-SCDMA Measurement Software(Cont'd)

Item	Specifications	
RF signal generator	Output frequency	300 to 2700 MHz (1 Hz steps)
	Channel level (DPCH)	–30.0 to 0.0 dB (0.1 dB steps, Relative level with Ior (Total power))
	Channel level accuracy	±0.2 dB (Relative level accuracy with Ior)
	AWGN level	Off, –20 to +5 dB (0.1 dB steps, Relative level with Ior (Total power))
	AWGN level accuracy	±0.2 dB (Relative level accuracy with Ior)
Error rate measurement	Function	Applying PN9 or PN15 pattern to DTCH
	Measurement item	BER, BLER
	BER measurement object	Loop Back data applied to uplink DTCH
	BLER measurement object	Loop Back data applied to uplink DTCH
Call processing	Call control	Location registration, call origination, call termination, hand-over, network-side release, UE-side release (Execution of the operation conforming to the 3GPP standard and pass/fail judgement can be performed.)
	UE Control	Output level, loopback (UE control conforming to the 3GPP standard can be performed.)

Table 1.1.2-2 Specifications for MX882107C-011 TD-SCDMA HSDPA Measurement Software

Item	Specifications	
Function	RF tests (Rx measurement) related to HSDPA	
Reference channel	Transferring	RMC 0.5Mbps UE Class (QPSK), RMC 1.1Mbps UE Class (QPSK), RMC 1.1Mbps UE Class (16QAM), RMC 1.6Mbps UE Class (QPSK), RMC 1.6Mbps UE Class (16QAM), RMC 2.2Mbps UE Class (QPSK), RMC 2.2Mbps UE Class (16QAM), RMC 2.8Mbps UE Class (QPSK), and RMC 2.8Mbps UE Class (16QAM)
Throughput measurement	Function	Throughput measurement using RMC
	Measurement item	Throughput
	Measurement object	ACK and NACK applied to HS-SICH
CQI measurement	Measurement object	Periodically reported CQI (RTBS, RMF) value applied to HS-SICH
Call processing	Call control:	Location registration, Call processing using RMC (Execution of the operation conforming to the 3GPP standard and pass/fail judgment can be performed.)
	UE control	Output level (UE control conforming to the 3GPP standard can be performed.)

Table 1.1.2-3 Specifications for MX882107C-012 TD-SCDMA HSDPA Evolution Measurement Software

Item	Specifications	
Function	RF tests (Rx measurement) related to HSDPA Evolution	
Reference channel	Transferring	RMC Category 16-18UE(64QAM), RMC Category 19-21UE(64QAM), RMC Category 22-24UE(64QAM), RMC Category 18 Max, RMC Category 21 Max, and RMC Category 24 Max,
Throughput measurement	Function	Throughput measurement using RMC
	Measurement item	Throughput
	Measurement object	ACK and NACK applied to HS-SICH
CQI measurement	Measurement object	Periodically reported CQI (RTBS) value applied to HS-SICH
Call processing	Call control:	Location registration, Call processing using RMC (Execution of the operation conforming to the 3GPP standard and pass/fail judgment can be performed.)
	UE control	Output level (UE control conforming to the 3GPP standard can be performed.)

Table 1.1.2-4 Specifications for MX882107C-021 TD-SCDMA HSUPA Measurement Software

Item	Specifications	
Function	RF tests (Tx measurement) related to HSUPA	
Modulation measurement	This item depends on the MX882107C's performance.	
Call processing	Call control	Location registration, Call processing using FRC1, FRC2 (Execution of the operation conforming to the 3GPP standard and pass/fail judgment can be performed.)
	UE control	Output level (UE control conforming to the 3GPP standard can be performed.)

1.2. 3GPP Measurement Specification (3GPP TS 34.122 V11.5.0) Table

	Item	Comment	
5	**Transmitter Characteristics**		
5.2	User Equipment maximum output power		√√
5.2A	User Equipment maximum output power with E-DCH	MX882007C-021 MX882107C-021	√√
5.2B	User Equipment maximum output power with HS-SICH and DPCH	MX882007C-011 MX882107C-011	√√
5.3	UE frequency stability		√√
5.4	**Output Power Dynamics**		
5.4.1.3	Open loop power control		√√
5.4.1.4	Closed loop power control		√√
5.4.2	Minimum output power		√√
5.4.3	Transmit OFF power		√√
5.4.4	Transmit ON/OFF Time mask		√√
5.4.5	Out-of-synchronisation handling of output power for continuous transmission		√√
5.4.6	Out-of-synchronisation handling of output power for discontinuous transmission		√√
5.5	**Output RF spectrum emissions**		
5.5.1	Occupied bandwidth		√√
5.5.2	Out of band emission		
5.5.2.1	Spectrum emission mask		√√
5.5.2.1A	Spectrum emission mask	MX882007C-021 MX882107C-021	√√
5.5.2.1B	Spectrum emission mask	MX882007C-011 MX882107C-011	√√
5.5.2.2	Adjacent Channel Leakage power Ratio (ACLR)		√√
5.5.2.2A	Adjacent Channel Leakage power Ratio (ACLR) with E-DCH	MX882007C-021 MX882107C-021	√√
5.5.2.2B	Adjacent Channel Leakage power Ratio (ACLR) with HS-SICH and DPCH	MX882007C-011 MX882107C-011	√√
5.5.3	Spurious Emissions	Requires SPA	√
5.6	Transmit Intermodulation	Requires SG and SPA	√
5.7	**Transmit Modulation**		
5.7.1	Error Vector Magnitude		√√
5.7.1A	Error Vector Magnitude with E-DCH 16QAM	MX882007C-021 MX882107C-021	√√
5.7.1B	Error Vector Magnitude with HS-SICH and DPCH	MX882007C-011 MX882107C-011	√√
5.7.2	Peak code domain error		√√
6	**Receiver Characteristics**		
6.2	Reference sensitivity level		√√
6.3	Maximum Input Level		√√
6.3A	Maximum Input Level for HS-PDSCH Reception (16QAM)	MX882007C-011 MX882107C-011	√√
6.4	Adjacent Channel Selectivity (ACS)	Requires SG	√
6.5	Blocking Characteristics	Requires SG	√
6.6	Spurious Response	Requires SG	√
6.7	Intermodulation Characteristics	Requires SG	√
6.8	Spurious Emissions	Requires SPA	√
7	**Performance Requirements**		
7.2	Demodulation in static propagation conditions	Requires SG	√
7.3	Demodulation of DCH in multipath fading conditions		
7.3.1	Multipath fading Case 1	Requires Fading	√

		Simulator and SG	
7.3.2	Multipath fading Case 2	Requires Fading Simulator and SG	√
7.3.3	Multipath fading Case 3	Requires Fading Simulator and SG	√
7.5	Power control in downlink	Requires Fading Simulator and SG	√
9	**Performance requirements for HSDPA**		
9.3	Performance **Requirements** for 1.28 Mcps TDD option		
9.3.1	HS-DSCH Throughput for Fixed Reference Channels		
9.3.1A	HS-DSCH throughput for Fixed Reference Channels 0.5 Mbps UE class QPSK	MX882007C-011 MX882107C-011 Requires Fading Simulator	√
9.3.1B	HS-DSCH throughput for Fixed Reference Channels 1.1 Mbps UE class 16QAM	MX882007C-011 MX882107C-011 Requires Fading Simulator	√
9.3.1C	HS-DSCH throughput for Fixed Reference Channels 1.6 Mbps UE class QPSK/16QAM	MX882007C-011 MX882107C-011 Requires Fading Simulator	√
9.3.1D	HS-DSCH throughput for Fixed Reference Channels 2.2 Mbps UE class QPSK/16QAM	MX882007C-011 MX882107C-011 Requires Fading Simulator	√
9.3.1E	HS-DSCH throughput for Fixed Reference Channels 2.8 Mbps UE class QPSK/16QAM	MX882007C-011 MX882107C-011 Requires Fading Simulator	√
9.3.2	HS-DSCH Throughput for Variable Reference Channels		
9.3.2A	HS-DSCH throughput for Variable Reference Channels 0.5 Mbps UE class	MX882007C-011 MX882107C-011 Requires Fading Simulator	√
9.3.2B	HS-DSCH throughput for Variable Reference Channels 1.1 Mbps UE class	MX882007C-011 MX882107C-011 Requires Fading Simulator	√
9.3.2C	HS-DSCH throughput for Variable Reference Channels 1.6 Mbps UE class	MX882007C-011 MX882107C-011 Requires Fading Simulator	√
9.3.2D	HS-DSCH throughput for Variable Reference Channels 2.2 Mbps UE class	MX882007C-011 MX882107C-011 Requires Fading Simulator	√
9.3.2E	HS-DSCH throughput for Variable Reference Channels 2.8 Mbps UE class	MX882007C-011 MX882107C-011 Requires Fading Simulator	√
9.3.3	Reporting of HS-DSCH Channel Quality Indicator		
9.3.3A	Reporting of HS-DSCH Channel Quality Indicator-0.5 Mbps UE class	MX882007C-011 MX882107C-011 Requires Fading Simulator	√

9.3.3B	Reporting of HS-DSCH Channel Quality Indicator-1.1 Mbps UE class	MX882007C-011 MX882107C-011 Requires Fading Simulator	√
9.3.3C	Reporting of HS-DSCH Channel Quality Indicator-1.6 Mbps UE class	MX882007C-011 MX882107C-011 Requires Fading Simulator	√
9.3.3D	Reporting of HS-DSCH Channel Quality Indicator-2.2 Mbps UE class	MX882007C-011 MX882107C-011 Requires Fading Simulator	√
9.3.3E	Reporting of HS-DSCH Channel Quality Indicator-2.8 Mbps UE class	MX882007C-011 MX882107C-011 Requires Fading Simulator	√
9.3.4	HS-SCCH Detection Performance	MX882007C-011 MX882107C-011 Requires Fading Simulator	√
11	**Performance Requirement (E-DCH)**		
11.1	Detection of E-DCH HARQ ACK Indicator Channel (E-HICH)	MX882007C-021 MX882107C-021 Requires Fading Simulator	√
11.2	Demodulation of E-DCH Absolute Grant Channel (E-AGCH)	MX882007C-021 MX882107C-021 Requires Fading Simulator	√

√√**:** Support | √**:** Requires external equipment (SPA or SG) | F**:** Future Support | –**:** Not Support

1.3. TRX Measurement (Fundamental Measurement)

Hereafter, control software is presupposed created by GPIB. See operation manual for details of GPIB commands and manual operations. GPIB commands are written in red. UE power class is presupposed 2.

1.3.1. Test Loop Mode Connection (Single Code)

Measurement is performed by connecting to Test Loop Mode1. The connection procedures are below. Start from step 4 when location registration is already executed.

1. Execute **PRESET** to set default parameter.
2. Turn on UE power.
3. Execute **CALLSTAT?** and wait until the response becomes 2(=Idle(Regist)).
4. Execute **CALLSA** to connect to Test Loop Mode1.
5. Execute **CALLSTAT?** and wait until the response becomes 7(=Test Loop Mode).

Call Status can be confirmed using CALLSTATIC?.
The confirmation procedures using **CALLSTATIC?** are below.

1. Execute **PRESET** to set default parameter.
2. Turn on UE power.
3. Execute **CALLSTATIC?** to check Call Status. When Call Status will be 2(=Idle(Regist)), the response will be returned.
4. Execute **CALLSA** to connect to Test Loop Mode1.
5. Execute **CALLSTATIC?** to check Call Status. When Call Status will be 7(=Test Loop Mode), the response will be returned.

1.3.2. Test Loop Mode Disconnection

1. Execute **CALLSO** to disconnect from Test Loop Mode1.
2. Execute **CALLSTAT?** and wait until the response becomes 2(=Idle(Regist)).

The confirmation procedures using **CALLSTATIC?** are below.

1. Execute **CALLSO** to disconnect from Test Loop Mode1.
2. Execute **CALLSTATIC?** to check Call Status. When Call Status will be 2(=Idle(Regist)), the response will be returned.

1.3.3. Switching Channel Coding during Connection

Channel Coding can be switched during Connection. The switching procedures are below.

1. Connect to Test Loop Mode1.
2. Execute **CHCODING RMC_SINGLE** to set Channel Coding to RMC (Single Code).
3. Execute TRX measurement.
4. Execute **CHCODING RMC_MULTI** to set Channel Coding to RMC (Multi Code).
5. Execute TRX measurement.

1.3.4. Channel Switching by Handover

Measurement is normally performed at three frequency points (L, M and H). Channel can be switched quickly without reconnection by changing it at handover. Output Level must be set higher to avoid failing handover. Also, the GPIB commands, which transmitted during handover, stand by until the handover ends.

1. Execute TRX measurement at L channel.
2. Execute **CHAN 10087** to handover to M channel.
3. Execute TRX measurement.
4. Execute **CHAN 10121** to handover to H channel.
5. Execute TRX measurement.

1.3.5. Switching Channel and Channel Coding (Single Code/Multi Code) by Handover

Measurement is normally performed at three frequency points (L, M and H) and Channel Coding (Single Code or Multi Code). Channel and Channel Coding can be switched quickly without reconnection by changing it at handover. Output Level must be set higher to avoid failing handover. Also, the GPIB commands, which transmitted during handover, stand by until the handover ends.

1. Execute **HO 10053, RMC_SINGLE** to handover to L channel and Single Code.
2. Execute TRX measurement.
3. Execute **HO 10053, RMC_MULTI** to handover to L channel and Multi Code.
4. Execute TRX measurement.
5. Execute **HO 10087, RMC_SINGLE** to handover to M channel and Single Code.
6. Execute TRX measurement.
7. Execute **HO 10087, RMC_MULTI** to handover to M channel and Multi Code.
8. Execute TRX measurement.
9. Execute **HO 10121, RMC_SINGLE** to handover to H channel and Single Code.
10. Execute TRX measurement.
11. Execute **HO 10121, RMC_MULTI** to handover to H channel and Multi Code.
12. Execute TRX measurement.

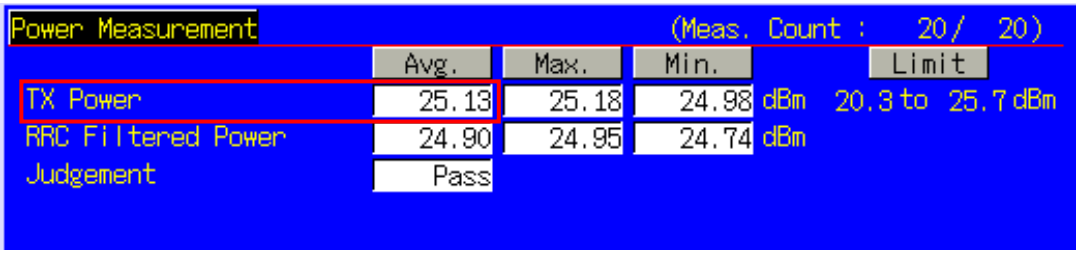
1.3.6. Test Item Selection

All measurement items are turned on in the default setting of this instrument. In order to reduce measurement time, unnecessary items, such as BER and BLER measurements, should be turned off (**BER_MEAS OFF**, **BLER_MEAS OFF**) before measurement.

All measurement items can be turned off when setting **ALLMEASITEMS_OFF**.

1.3.7. 5.2 User Equipment maximum output power

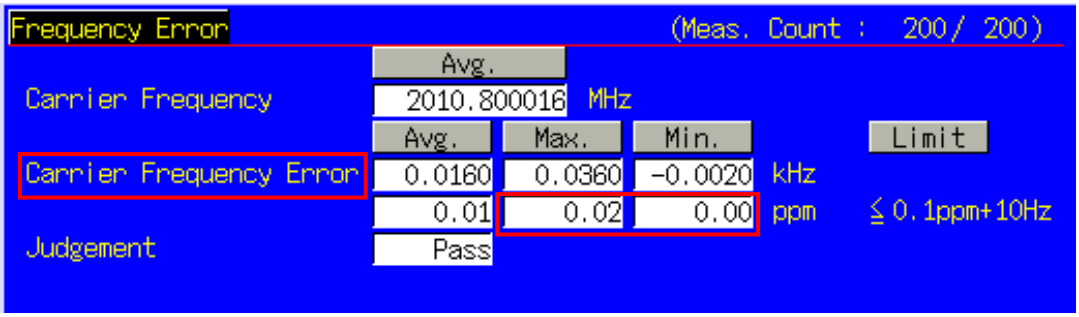
1. Connect to Test Loop Mode1.
2. Execute **CHCODING RMC_SINGLE** to set Channel Coding to RMC (Single Code).
3. Execute **TESTPRM CALL_MAXPWR** to set Test Parameter to Call – Maximum Output Power.
4. Wait until UE power reaches the maximum.
5. Execute **PWR_AVG 20** to set the average count of power measurement at 20 times.
6. Execute **SWP** to perform power measurement.
7. Execute **AVG_POWER?** to read the power measurement result.
8. Check the measurement result is +24 dBm(+1.7 dB/-3.7 dB).
9. Execute **CHCODING RMC_MULTI** to set Channel Coding to RMC (Multi Code).
10. Execute **SWP** to perform power measurement.
11. Execute **AVG_POWER?** to read power measurement result.
12. Check the measurement result is +21 dBm(+1.7 dB/-3.7 dB).



TX Power corresponds to Mean Power (2MHz band).

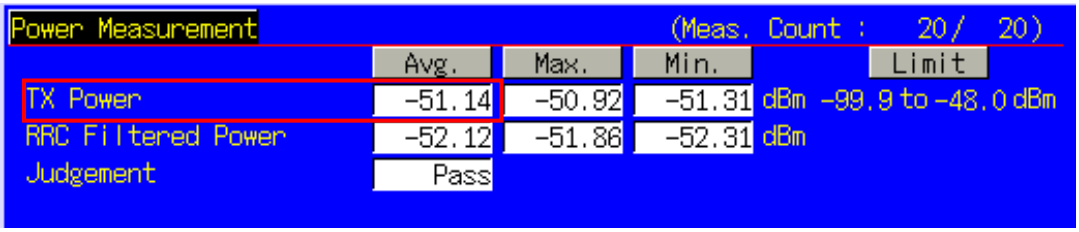
1.3.8. 5.3 UE frequency stability

1. Connect to Test Loop Mode1.
2. Execute **CHCODING RMC_SINGLE** to set Channel Coding to RMC (Single Code).
3. Execute **TESTPRM CALL_BERSENS** to set Test Parameter to Call – BER (Reference Sensitivity Level).
4. Wait until UE power reaches the maximum.
5. Execute **FREQ_AVG 200** to set the average count of Frequency measurement at 200 times.
6. Execute **SWP** to perform Frequency measurement.
7. Execute **MAXABS_CARRFERR? PPM** to read Frequency Error measurement result.
8. Check the measurement result is lower than (0.1 ppm + 10 Hz).



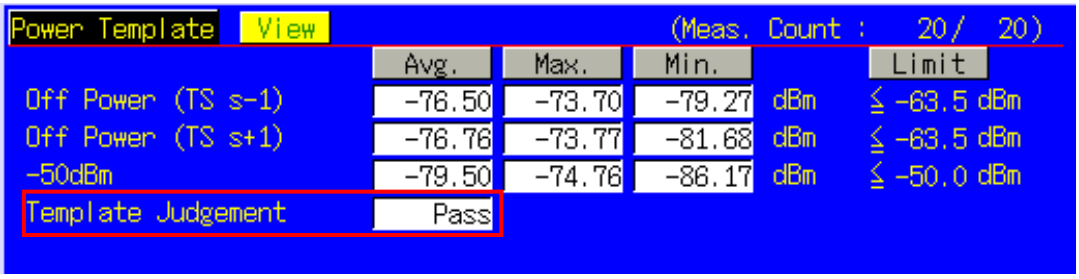
1.3.9. 5.4.2 Minimum output power

1. Connect to Test Loop Mode1.
2. Execute **CHCODING RMC_SINGLE** to set Channel Coding to RMC (Single Code).
3. Execute **TESTPRM CALL_MINPWR** to set Test Parameter to Call – Minimum Output Power.
4. Wait until UE power reaches the minimum.
5. Execute **PWR_AVG 20** to set the average count of power measurement at 20 times.
6. Execute **SWP** to perform Power measurement.
7. Execute **AVG_POWER?** to read the measurement result.
8. Check the measurement result is lower than -48 dBm.



1.3.10. 5.4.3 Transmit OFF power, 5.4.4 Transmit ON/OFF Time mask

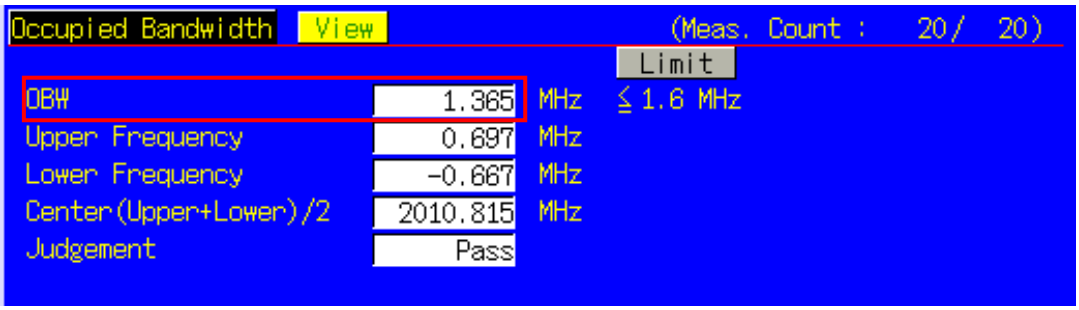
1. Connect to Test Loop Mode1.
2. Execute **CHCODING RMC_SINGLE** to set Channel Coding to RMC (Single Code).
3. Execute **TESTPRM CALL_OFFPWR** to set Test Parameter to Call – Off Power.
4. Wait until UE power reaches the maximum.
5. Execute **PWRTEMP_AVG 20** to set the average count of Power Template measurement at 20 times.
6. Execute **SWP** to perform Power Template measurement.
7. Execute **POWERPASS?** to read Power Template measurement result.
8. Check the measurement result is PASS.



Transmit OFF Power is measured with lower Input Level to avoid the effect of floor noise. Although the measurement status is Level Over, it does not affect the measurement result.

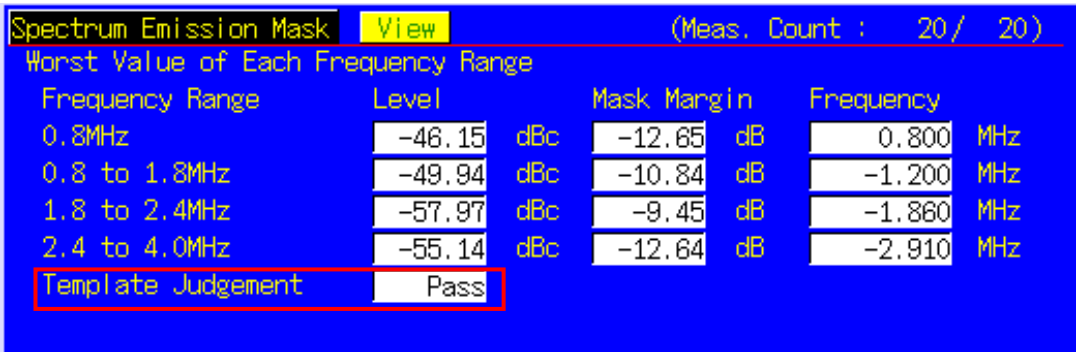
1.3.11. 5.5.1 Occupied bandwidth

1. Connect to Test Loop Mode1.
2. Execute **CHCODING RMC_SINGLE** to set Channel Coding to (Single Code).
3. Execute **TESTPRM CALL_MAXPWR** to set Test Parameter to Call – Maximum Output Power.
4. Wait until UE power reaches the maximum.
5. Execute **OBW_AVG 20** to set the average count of OBW measurement at 20 times.
6. Execute **SWP** to perform OBW measuremen.
7. Execute **OBW?** to read OBW measurement result.
8. Check the measurement result is lower than 1.6MHz.



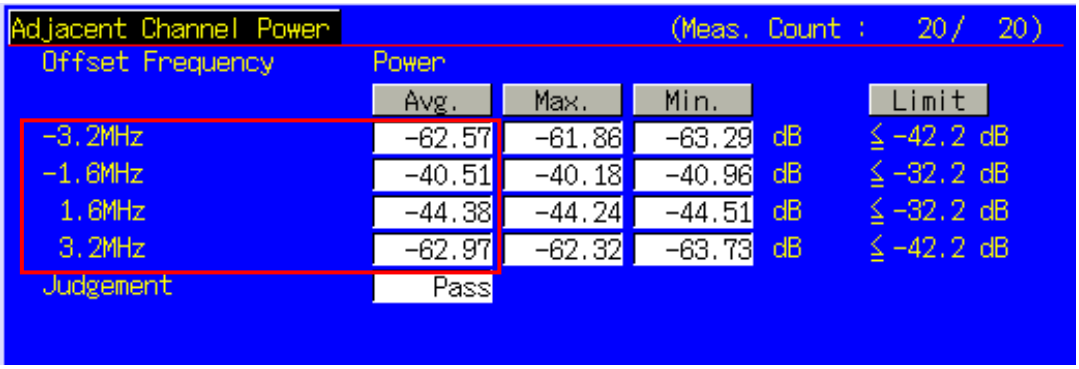
1.3.12. 5.5.2.1 Spectrum emission mask

1. Connect to Test Loop Mode1.
2. Execute **CHCODING RMC_SINGLE** to set Channel Coding to (Single Code).
3. Execute **TESTPRM CALL_MAXPWR** to set Test Parameter to Call – Maximum Output Power.
4. Wait until UE power reaches the maximum.
5. Execute **SMASK_AVG 20** to set the average count of SEM measurement at 20 times.
6. Execute **SWP** to perform SEM measurement.
7. Execute **SMASKPASS?** to read SEM measurement result.
8. Check the measurement result is PASS.



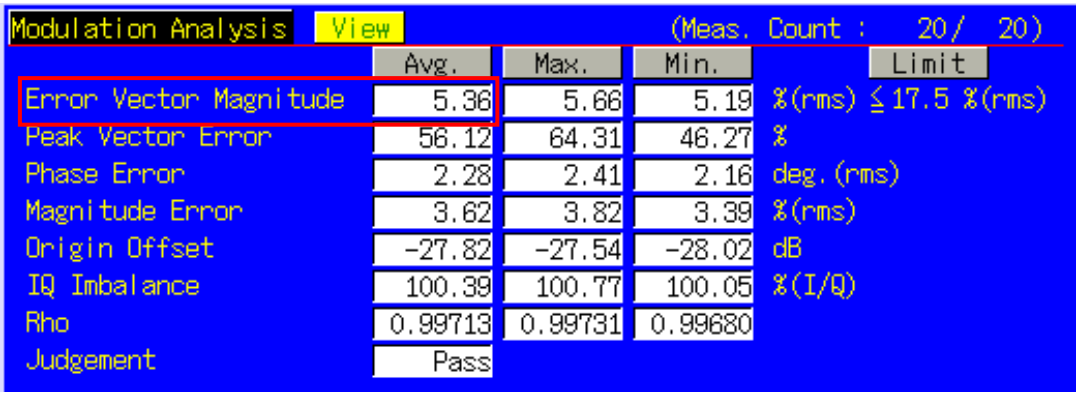
1.3.13. 5.5.2.2 Adjacent Channel Leakage power Ratio (ACLR)

1. Connect to Test Loop Mode1.
2. Execute **CHCODING RMC_SINGLE** to set Channel Coding to (Single Code).
3. Execute **TESTPRM CALL_MAXPWR** to set Test Parameter to Call – Maximum Output Power.
4. Wait until UE power reaches the maximum.
5. Execute **ADJ_AVG 20** to set the average count of ACLR measurement at 20 times.
6. Execute **SWP** to perform ACLR measurement.
7. Execute **AVG_MODPWR? LOW16; AVG_MODPWR? UP16** to read ACLR measurement result.
8. Check the measurement result is lower than -32.2 dB.
9. Execute **AVG_MODPWR? LOW32; AVG_MODPWR? UP32** to read ACLR measurement result.
10. Check the measurement result is lower than -42.2 dB.



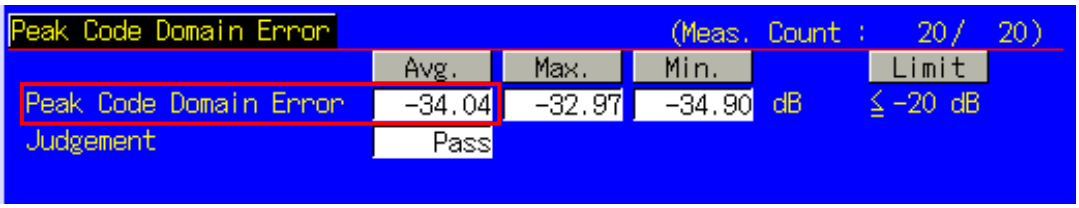
1.3.14. 5.7.1 Error Vector Magnitude

1. Connect to Test Loop Mode1.
2. Execute **CHCODING RMC_SINGLE** to set Channel Coding to (Single Code).
3. Execute **TESTPRM CALL_20DBM** to set Test Parameter to Call – EVM & PCDE@-20 dBm.
4. Wait until UE power reaches -20 dBm.
5. Execute **MOD_AVG 20** to set the average count of Modulation Analysis measurement at 20 times.
6. Execute **SWP** to perform Modulation Analysis measurement.
7. Execute **AVG_EVM?** to read EVM measurement result.
8. Check the measurement result is lower than 17.5%.



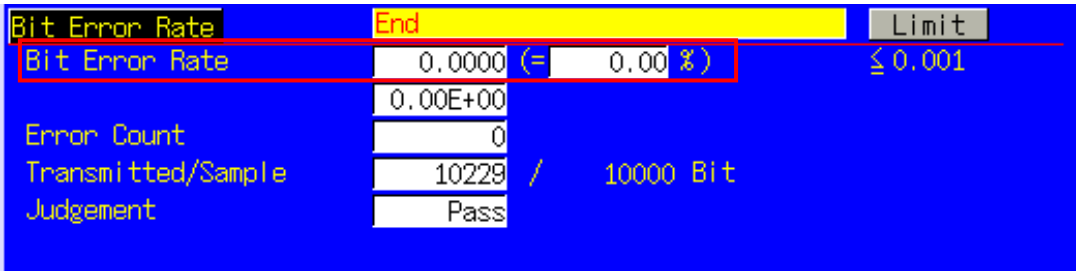
1.3.15. 5.7.2 Peak code domain error

1. Connect to Test Loop Mode1.
2. Execute **CHCODING RMC_MULTI** to set Channel Coding to RMC (Multi Code).
3. Execute **TESTPRM CALL_20DBM** to set Test Parameter to Call – EVM & PCDE@-20 dBm.
4. Wait until UE power reaches -20 dBm.
5. Execute **PCDE_AVG 20** to set the average count of Peak Code Domain Error measurement at 20 times.
6. Execute **SWP** to perform Peak Code Domain Error measurement.
7. Execute **AVG_PCDERR?** to read Peak Code Domain Error measurement result.
8. Check the measurement result is lower than -20 dB.



1.3.16. 6.2 Reference sensitivity level

1. Connect to Test Loop Mode1.
2. Execute **CHCODING RMC_SINGLE** to set Channel Coding to (Single Code).
3. Execute **TESTPRM CALL_BERSENS** to set Test Parameter to Call – BER (Reference Sensitivity Level).
4. Wait until UE power reaches the maximum.
5. Execute **BER_SAMPLE 10000** to set the number of BER measurement samples at 10000 bits.
6. Execute **SWP** to perform BER measurement.
7. Execute **BER?** to read BER measurement result.
8. Check the measurement result is lower than 0.001.



1.3.17. Reduction of measurement time by batch processing

Measuring time can be reduced by measuring same parameter items at once.

[Maximum Output Power, OBW, ACLR, SEM]

1. Connect to Test Loop Mode1.
2. Execute **CHCODING RMC_SINGLE** to set Channel Coding to (Single Code).
3. Execute **ALLMEASITEMS ON,20,ON,20,ON,200,ON,20,ON,20,ON,20,ON,20,ON,20,ON,OFF** to turn on measurements (excluding BLER), to set the average count of Frequency Error measurement at 200 times, to set the average count of other measurements at 20 times.
4. Execute **TESTPRM CALL_MAXPWR** to set Test Parameter to Call – Maximum Output Power.
5. Wait until UE power reaches the maximum.
6. Execute **SWP** to perform measurement.
7. Execute **AVG_POWER?** to read Power measurement result.
8. Execute **OBW?** to read OBW measurement result.
9. Execute **AVG_MODPWR? LOW16; AVG_MODPWR? UP16** to read ACLR measurement result.
10. Execute **AVG_MODPWR? LOW32; AVG_MODPWR? UP32** to read ACLR measurement result.
11. Execute **SMASKPASS?** to read SEM measurement result.

[Frequency Error, BER]

12. Execute **TESTPRM CALL_BERSENS** to set Test Parameter to Call – BER (Reference Sensitivity Level).
13. Execute **BER_SAMPLE 10000** to set the number of BER measurement samples at 10000 bits.
14. Execute **SWP** to perform measurement.
15. Execute **MAXABS_CARRFERR? PPM** to read Frequency Error measurement result.
16. Execute **BER?** to read BER measurement result.

[Transmit ON/OFF Time mask]

17. Execute **TESTPRM CALL_OFFPWR** to set Test Parameter to Call – Off Power.
18. Execute **SWP** to perform measurement.
19. Execute **POWERPASS?** to read Power Template measurement result.

[Minimum Output Power]

20. Execute **TESTPRM CALL_MINPWR** to set Test Parameter to Call – Minimum Output Power.
21. Wait until UE power reaches the minimum.
22. Execute **SWP** to perform measurement.
23. Execute **AVG_POWER?** to read Power measurement result.

[EVM]

24. Execute **TESTPRM CALL_20DBM** to set Test Parameter to Call – EVM & PCDE@-20 dBm.
25. Wait until UE power reaches -20 dBm.
26. Execute **SWP** to perform measurement.
27. Execute **AVG_EVM?** to read EVM measurement result.

[PCDE (Multi Code)]

28. Execute **OLVL –66.0** to set Output Level at -66.0 dBm.
29. Execute **CHCODING RMC_MULTI** to set Channel Coding to RMC(Multi Code).
30. Execute **OLVL -93.0** to set Output Level to –93.0 dBm.
31. Execute **SWP** to perform measurement.
32. Execute **AVG_PCDERR?** to read Peak Code Domain Error measurement result.

[Maximum Output Power (Multi Code)]

33. Execute **TESTPRM CALL_MAXPWR** to set Test Parameter to Call – Maximum Output Power.
34. Wait until UE power reaches the maximum.
35. Execute **SWP** to perform measurement.
36. Execute **AVG_POWER?** to read Power measurement result.

1.4. Open Loop Power Control Measurement

The following measurements are performed by setting Measurement Object of Fundamental Measurement Parameter to Open Loop Power Control.

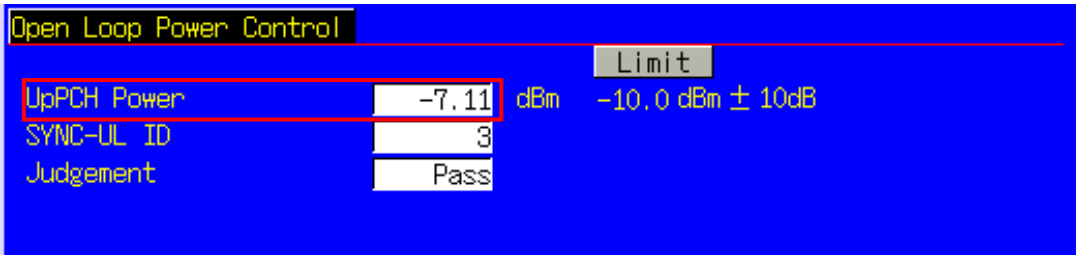
1. Execute **MEASOBJ OLPC** to set Measurement Object to Open Loop Power Control.
2. Execute **MAXULPWR 24** to set Maximum Allowed UL TX Power at 24 dBm.
3. Execute **RABCONNECT OFF** to turn off RAB Connection.

Maximum Allowed UL TX Power is the basic parameter of Cell Selection and Reselection. UE Power Class must be set lower than Maximum Tx Power, so the UE can perform Cell Selection and Reselection using Sensitivity Level. For example, when Power Class is 2, MAXULPWR should be 24.

The call status can be returned to Idle in Test Loop Mode without connecting RAB by turning off RAB Connection so measurement is faster.

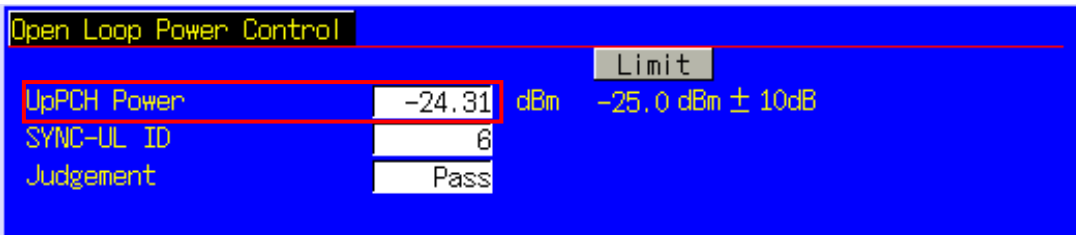
1.4.1. 5.4.1 Open Loop Power Control in the Uplink (RX-middle)

1. Execute **TESTPRM IDLE_MIDDLE** to set Test Parameter to Idle – RX middle.
2. Turn on UE power to perform Registration.
3. Execute **SWPANDPG** to perform UpPCH measurement in Test Loop Mode.
4. Execute **UPPCHPWR?** to read Power measurement result of UpPCH.
5. Check the measurement result is -10 dBm(+/-10 dB).



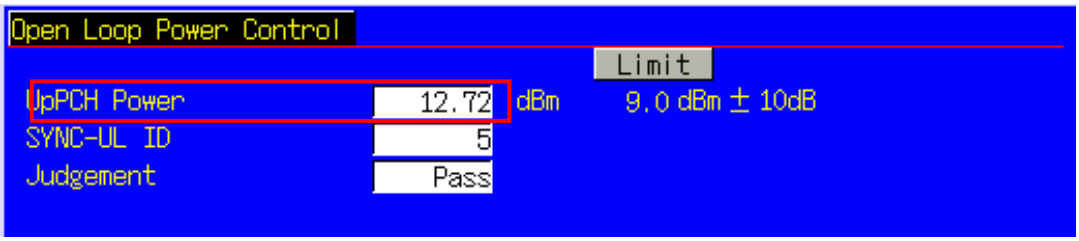
1.4.2. 5.4.1 Open Loop Power Control in the Uplink (RX Upper dynamic end)

1. Execute **TESTPRM IDLE_UPPER** to set Test Parameter to Idle – RX Upper Dynamic End.
2. Turn on UE power to perform Registration.
3. Execute **SWPANDPG** to perform UpPCH measurement in Test Loop Mode.
4. Execute **UPPCHPWR?** to read Power measurement result of UpPCH.
5. Check the measurement result is -25 dBm(+/-10 dB).



1.4.3. 5.4.1 Open Loop Power Control in the Uplink (RX-Sensitivity level)

1. Execute **TESTPRM IDLE_SENS** to set Test Parameter to Idle – RX Sensitivity Level.
2. Turn on UE power to perform Registration.
3. Execute **SWPANDPG** to perform UpPCH measurement in Test Loop Mode.
4. Execute **UPPCHPWR?** to read Power measurement result of UpPCH.
5. Check the measurement result is +9 dBm(±10 dB).



1.4.4. Continuous measurement of Open Loop Power Control

Although Open Loop Power Control measurement is performed by changing Primary CCPCH TX Power and PRXUpPCHdes, these parameters are for broadcast information use and are not reflected at UE side immediately after the change. In order to perform Open Loop Power Control measurement continuously, the parameters must be reflected at UE by any of the following methods.

1) Wait about 5 seconds after changing parameters. When changing parameters, the instrument transmits BCCH modification info to UE with PAGING TYPE1 message. However, it takes about 5 seconds until the parameters are reflected on UE side.

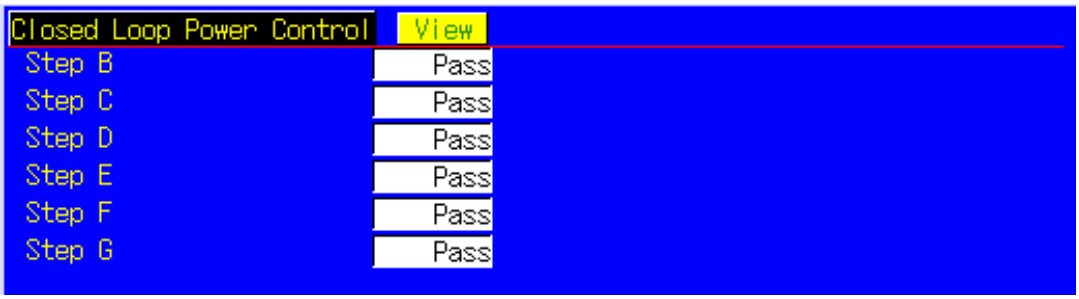
2) After changing parameters, turn on UE power again, and wait until UE performs Registration.

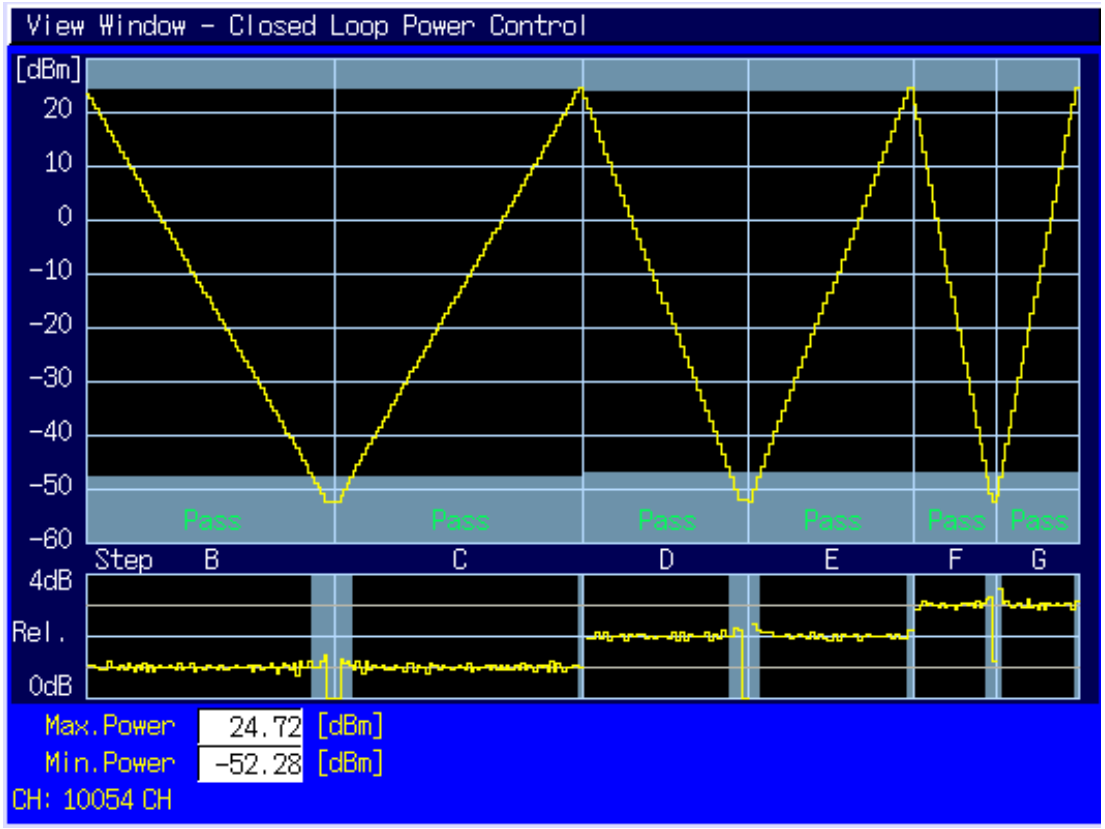
3) Change LAC parameter along with the above parameter, and wait until UE performs Registration.
The LAC value can be incremented when performing LACINC.

1.5. Closed Loop Power Control Measurement (automatic measurement)

1.5.1. 5.4.1.4 Closed loop power control

1. Connect to Test Loop Mode1.
2. Execute **TESTPRM CALL_CLPC** to set Test Parameter to Call – Closed Loop Power Control.
3. Execute **CLPC_MEAS AUTO_ALL** to set CLPC Measurement Method to Auto(Step All).
4. Execute **SWP** to perform measurement.
5. Execute **CLPC_PASS? ALL** and check the measurement result is PASS.

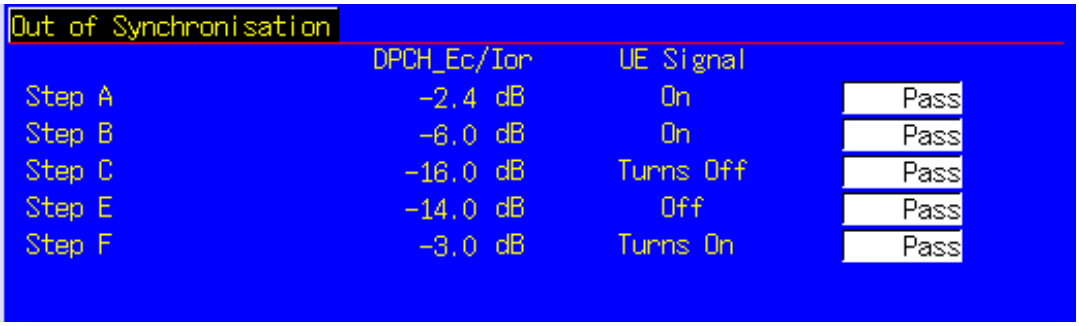




1.6. Other Measurement

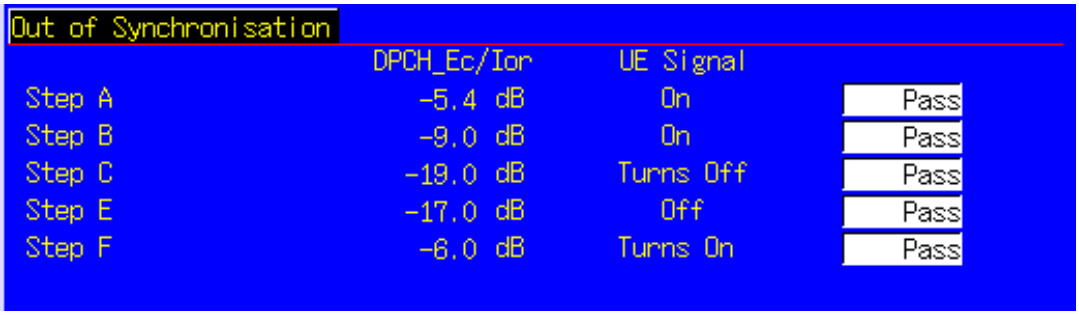
1.6.1. 5.4.5 Out-of-synchronisation handling of output power for continuous transmission

1. Execute **TESTPRM IDLE_OSYNC_SET** to set Test Parameter to Idle – Out-of-Sync. Idle Setting.
2. Turn on UE power to perform Registration.
3. Connect to Test Loop Mode1.
4. Execute **TESTPRM CALL_OSYNC_CONT** to set Test Parameter to Call – Out-of-Sync. Continuous.
5. Execute **SWP** to perform Power measurement.
6. Execute **OUTSYNC_PASS? ALL** and check the measurement result is PASS.



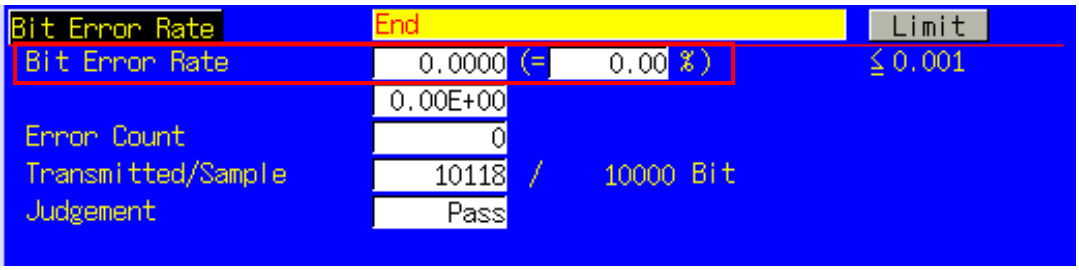
1.6.2. 5.4.6 Out-of-synchronisation handling of output power for discontinuous transmission

1. Execute **TESTPRM IDLE_OSYNC_SET** to set Test Parameter to Idle – Out-of-Sync. Idle Setting.
2. Turn on UE power to perform Registration.
3. Connect to Test Loop Mode1.
4. Execute **TESTPRM CALL_OSYNC_DISC** to set Test Parameter to Call – Out-of-Sync. Discontinuous.
5. Execute **SWP** to perform Power measurement.
6. Execute **OUTSYNC_PASS? ALL** and check the measurement result is PASS.



1.6.3. 6.3 Maximum Input Level

1. Connect to Test Loop Mode1.
2. Execute **TESTPRM CALL_BERMAX** to set Test Parameter to Call – BER (Maximum Input Level).
3. Execute **BER_SAMPLE 10000** to set the number of BER measurement samples at 10000 bit.
4. Execute **SWP** to perform BER measurement.
5. Execute **BER?** to read BER measurement result.
6. Check the measurement result is lower than 0.001.



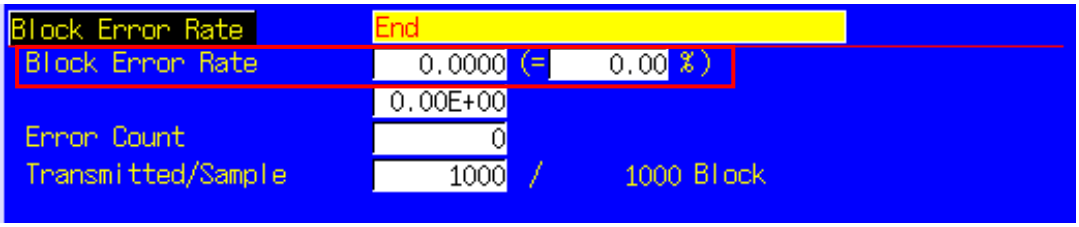
1.6.4. 6.8 Spurious Emissions

1. Execute **RRCSTATE CELLFACH** to set RRC State to CELL_FACH.
2. Execute **SINTRASCHSW ON** to turn on Sintrasearch.
3. Execute **SINTERSCHSW ON** to turn on Sintersearch.
4. Execute **SSCHRATSW ON** to turn on Ssearch,RAT.
5. Execute **MAXULPWR 24** to set Maximum Allowed UL TX Power to 24dBm.
6. Turn on UE power to perform Registration.
7. Execute **OLVL -52.0** to set Output Level to -52.0dBm.
8. Execute **AWGNLVL ON** to turn on AWGN output.
9. Execute **AWGNPWR -9.0** to set Ior/Ioc to 9.0dB.
10. Execute **PCCPCHLVL -3.0** to set PCCPCH Ec/Ior to -3.0dB.
11. Execute **DWPCHLVL 0.0** to set DwPCH Ec/Ior to 0.0dB.
12. Execute **CALLSA**, UE becomes to CELL_FACH state.
13. It is possible to measure Spurious Emissions with an external Spectrum Analyzer.

1.6.5. 7.2 Demodulation in static propagation conditions

[Test1]

1. Execute **TESTMODE MODE2** to set Test Loop Mode to Mode2.
   When UE does not support Test Loop Mode2, execute **TESTMODE MODE1AM** to set Test Loop Mode to Test Mode1(AM).
2. Execute **CHCODING RMC_SINGLE** to set Channel Coding to RMC (Single Code).
3. Connect to Test Loop Mode.
4. Execute **OLVL -56.1** to set Output Level at -56.1 dBm.
5. Execute **AWGNLVL ON** to turn on AWGN output.
6. Execute **AWGNPWR -3.9** to set Ior/Ioc at -3.9 dB.
7. Execute **DDPCHPWR -7.0** to set DPCH_Ec/Ior at -7.0 dB.
8. Execute **ALLMEASITEMS OFF,1,OFF,1,OFF,1,OFF,1,OFF,1,OFF,1,OFF,1,OFF,ON** to turn on only BLER measurement.
9. Execute **BLER_SAMPLE 1000** to set the number of BLER measurement samples at 1000 block.
10. Execute **SWP** to perform BLER measurement.
11. Execute **BLER?** to read BLER measurement result.
12. Check the measurement result is lower than 0.01.



1.7. HSDPA Measurement

Hereafter, control software is assumed to be created by GPIB. See the operation manual for details of GPIB commands and manual operations. GPIB commands are in red.

1.7.1. HSDPA RMC Connection

When connecting with HSDPA, Location registration must be performed using PS. Set Registration Mode to Combined or CS&PS, and connect at HSDPA RMC.

1. Execute **PRESET** to set the default parameters.
2. Execute **REGMODE COMBINED** to set Registration Mode to Combined.
3. Execute **CHCODING HSDPA_RMC** to set Channel Coding to HSDPA RMC.
4. Turn on the UE power.
5. Execute **CALLSTAT?** and wait until the response becomes 2 (= Idle (Regist)).
6. Execute **CALLSA** to perform HSDPA RMC connection.
7. Execute **CALLSTAT?** and wait until the response becomes 6 (= Communication).

Call Status can be confirmed using CALLSTATIC?.
The confirmation procedures using **CALLSTATIC?** are below.

1. Execute **PRESET** to set the default parameters.
2. Execute **REGMODE COMBINED** to set Registration Mode to Combined.
3. Execute **CHCODING HSDPA_RMC** to set Channel Coding to HSDPA RMC.
4. Turn on the UE power.
5. Execute **CALLSTATIC?** to check Call Status. When Call Status becomes 2(=Idle(Regist)), the response is returned.
6. Execute **CALLSA** to perform HSDPA RMC connection.
7. Execute **CALLSTATIC?** to check Call Status. When Call Status becomes 6(=Communication), the response is returned.

1.7.2. HSDPA RMC Disconnection

1. Execute **CALLSO** to disconnect from HSDPA RMC.
2. Execute **CALLSTAT?** and wait until the response becomes 2(=Idle(Regist)).

The confirmation procedures using **CALLSTATIC?** are below.

1. Execute **CALLSO** to disconnect from HSDPA RMC.
2. Execute **CALLSTATIC?** to check Call Status. When Call Status becomes 2(=Idle(Regist)), the response is returned.

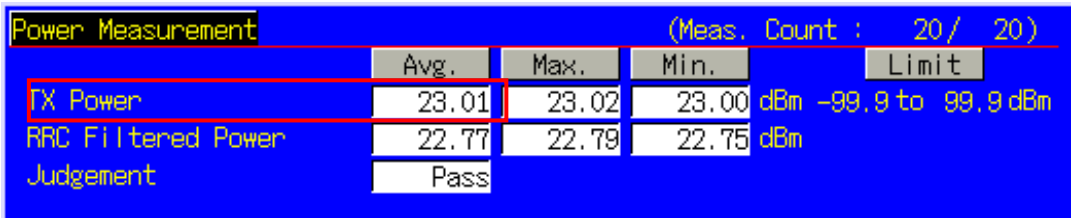
1.7.3. Switching HSDPA Data Rate during connection.

HSDPA Data Rate can be switched during Connection. The switching procedures are below.

1. Connect to HSDPA RMC.
2. Execute **HSRATE 0.5M_QPSK** to set HSDPA Data Rate to 0.5 Mbps UE Class (QPSK).
3. Execute TRX measurement.
4. Execute **HSRATE 1.1M_16QAM** to set HSDPA Data Rate to 1.1 Mbps UE Class (16QAM).
5. Execute TRX measurement.

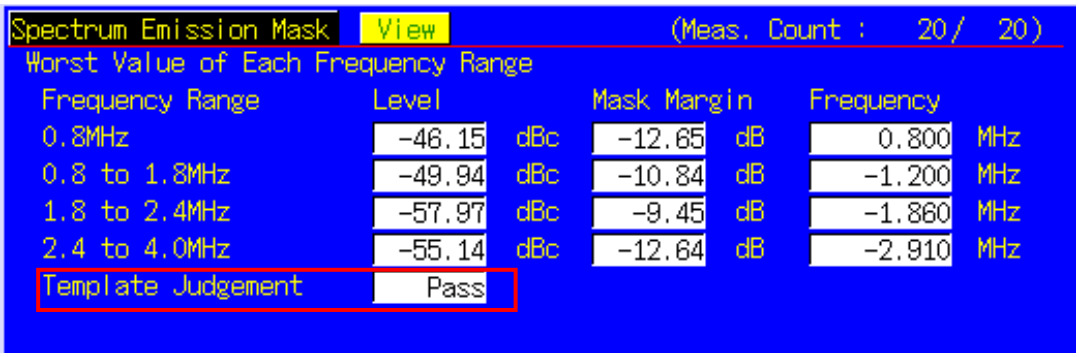
1.7.4. 5.2B User Equipment maximum output power with HS-SICH and DPCH

1. Execute **HSTYPE FRC** and set HSDPA Data Type to FRC.
2. Execute **HSRATE 1.1M_16QAM** and set HSDPA Data Rate to 1.1 Mbps UE Class (16QAM).
3. Execute **TPCPAT ALT** to set TPC Pattern to Alternate.
4. Connect at HSDPA RMC
5. Execute **TPCPAT CLPC** and set TPC Pattern to Closed Loop Power Control.
6. Execute **ILVL 16.2** and set Input Level to 16.2 dBm.
7. Wait about 100ms until UE power reaches 16.2 dBm
8. Execute **TPCPAT ALT** and set TPC Pattern to Alternate
9. Execute **ILVL 25.7** and set Input Level to 25.7 dBm
10. Execute **TPCPAT ALL1** and set TPC Pattern to All 1.
11. Execute **PWR_MEAS ON** to set Power measurement to ON.
12. Execute **PWR_AVG 20** to set the average Power measurement to 20 times.
13. Execute **SWP** to perform Power measurement.
14. Execute **AVG_POWER?** to read the Power measurement result.
15. Check the measurement result is +21.5 dBm (+4.2 dB/-3.7 dB).



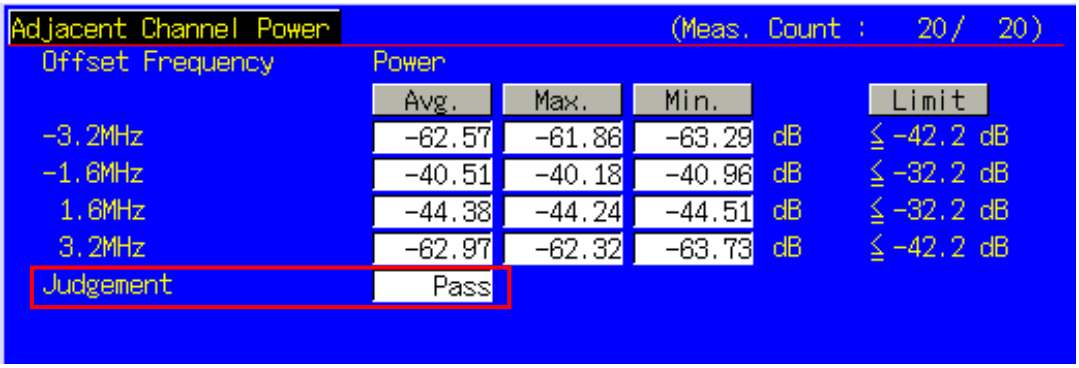
1.7.5. 5.5.2.1B Spectrum emission mask

1. Execute **HSTYPE FRC** to set HSDPA Data Type to FRC.
2. Execute **HSRATE 1.1M_16QAM** to set HSDPA Data Rate to 1.1 Mbps UE Class (16QAM).
3. Perform call connection with HSDPA RMC.
4. Execute **ILVL 30.0** to set Input Level to 30.0 dBm.
5. Execute **TPCPAT ALL1** to set TPC Pattern to All1.
6. Wait until the UE reaches maximum power.
7. Execute **SMASK_MEAS ON** to set SEM measurement to ON.
8. Execute **SMASK_AVG 20** to set the average SEM measurement to 20 times.
9. Execute **SWP** to perform SEM measurement.
10. Execute **SMASKPASS?** to read the SEM measurement result.
11. Check the measurement result is PASS.



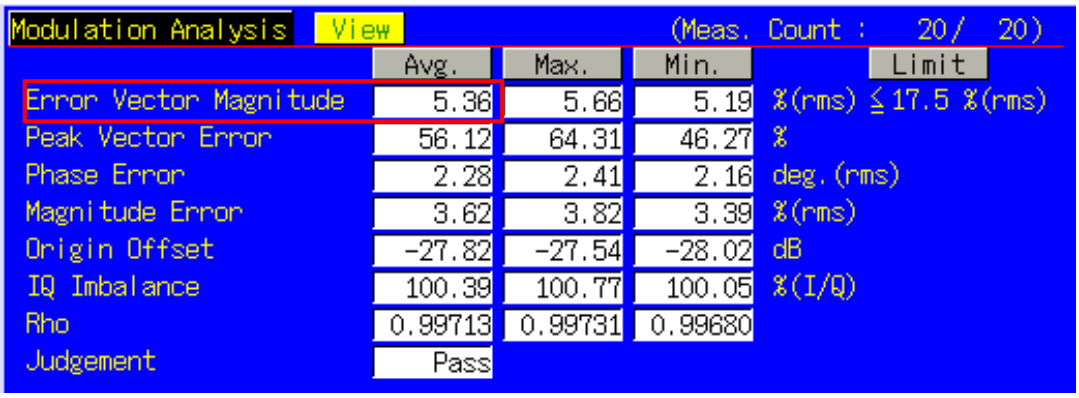
1.7.6. 5.5.2.2B Adjacent Channel Leakage power Ratio (ACLR) with HS-SICH and DPCH

1. Execute **HSTYPE FRC** to set HSDPA Data Type to FRC.
2. Execute **HSRATE 1.1M_16QAM** to set HSDPA Data Rate to 1.1 Mbps UE Class (16QAM).
3. Perform call connection with HSDPA RMC.
4. Execute **ILVL 30.0** to set Input Level to 30.0 dBm.
5. Execute **TPCPAT ALL1** to set TPC Pattern to All1.
6. Wait until the UE reaches maximum power.
7. Execute **ADJ_MEAS ON** to set ACLR measurement to ON.
8. Execute **ADJ_AVG 20** to set the average ACLR measurement to 20 times.
9. Execute **SWP** to perform ACLR measurement.
10. Execute **MODPWRPASS?** to read the Adjacent Channel Power measurement result.
11. Check the measurement result is PASS.



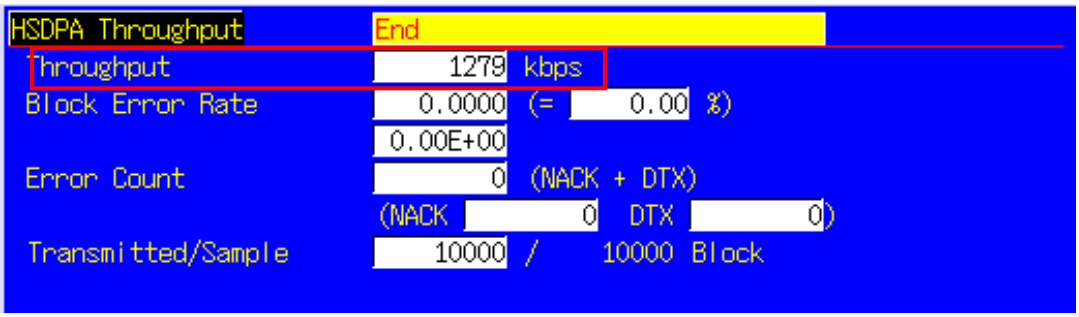
1.7.7. 5.7.1B Error Vector Magnitude with HS-SICH and DPCH

1. Execute **HSTYPE FRC** to set HSDPA Data Type to FRC.
2. Execute **HSRATE 1.1M_16QAM** to set HSDPA Data Rate to 1.1 Mbps UE Class (16QAM).
3. Perform call connection with HSDPA RMC.
4. Execute **ILVL –20.0** to set Input Level to –20.0 dBm.
5. Execute **TPCPAT CLPC** to set TPC Pattern to Closed Loop Power Control.
6. Wait until the UE power becomes –20 dBm.
7. Execute **MOD_MEAS ON** to set Modulation Analysis measurement to ON.
8. Execute **MOD_AVG 20** to set average Modulation Analysis measurement to 20 times.
9. Execute **SWP** to perform Modulation Analysis measurement.
10. Execute **AVG_EVM?** to read the EVM measurement result.
11. Check the measurement result is below 17.5%.



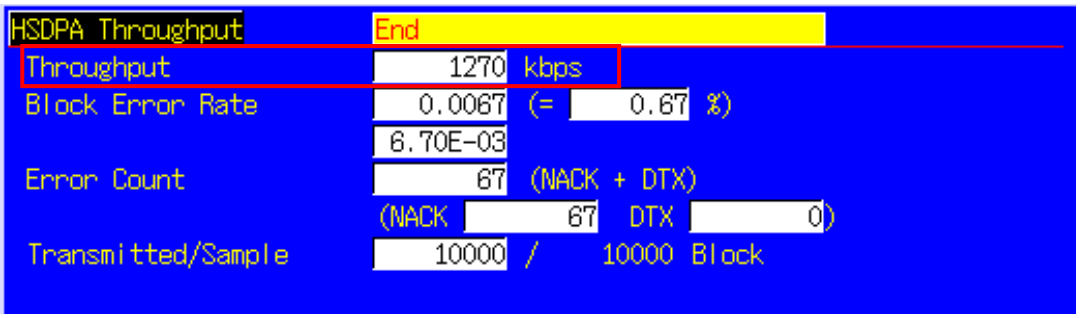
1.7.8. 6.3A Maximum Input Level for HS-PDSCH Reception (16QAM)

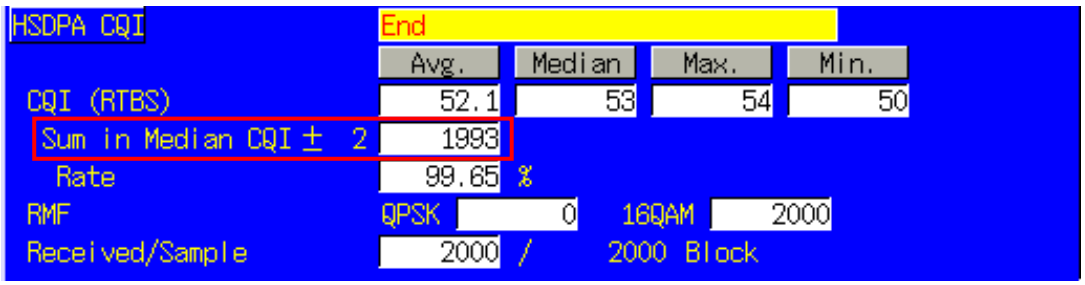
16. Execute **HSTYPE FRC** to set HSDPA Data Type to FRC.
17. Execute **MAXHARQTX 1** to set Maximum number of HARQ transmissions to 1.
18. Execute **RVCODINGALL 6,2,1,5** to set Redundancy and Constellation Version to 6, 2, 1, 5.
19. Connect at HSDPA RMC.
20. Execute **HSRATE 1.1M_16QAM** to set HSDPA Data Rate to 1.1 Mbps UE Class (16QAM).
21. Execute **OLVL -25.0** to set Output Level to –25.0 dBm.
22. Execute **TPUT_MEAS ON** to set HSDPA Throughput measurement to On.
23. Execute **TPUT_TYPE TPUT** to set HSDPA Throughput Measurement Type to Throughput.
24. Execute **TPUT_SAMPLE 10000** to set the number of HSDPA Throughput measurement samples to 10000 blocks.
25. Execute **SWP** to measure HSDPA Throughput.
26. Execute **TPUT?** to read the measured Throughput result.
27. Check the measured result is 500 kbps or more.



1.7.9. 9.3.3 Reporting of HS-DSCH Channel Quality Indicator (2.8 Mbps UE)

1. Execute **HSTYPE VRC** to set HSDPA Data Type to VRC.
2. Execute **MAXHARQTX 1** to set Maximum number of HARQ transmissions to 1.
3. Connect at HSDPA RMC.
4. Execute **HSRATE 2.8M_QPSK** to set HSDPA Data Rate to 2.8 Mbps UE Class (QPSK).
5. Execute **HSPDSCHLVL -10.0** to set HS-PDSCH_Ec/Ior to -10.0dB.
6. Execute **AWGNLVL ON** to set AWGN Output to On.
7. Execute **AWGNPWR -1** to set AWGN Level to -1 dB.
8. Execute **OLVL -59.0** to set Output Level to -59.0 dBm.
9. Wait until UE output is stabilized.
10. Execute **TPUT_MEAS ON** to set HSDPA Throughput measurement to On.
11. Execute **TPUT_TYPE CQI** to set HSDPA Throughput Measurement Type to CQI.
12. Execute **TPUT_SAMPLE 10000** to set the number of HSDPA Throughput measurement samples to 10000 blocks.
13. Execute **CQI_MEAS ON** to set CQI measurement to On.
14. Execute **CQI_SAMPLE 2000** to set the number of CQI measurement samples to 2000 blocks.
15. Execute **CQI_RANGE 2** to set CQI counting range to 2.
16. Execute **SWP** to measure HSDPA Throughput.
17. Execute **TPUT_BLER?** to read the measured Throughput result.
18. Check the measured result is 0.1 or less.
19. Execute **CQI_SUM?** to read the CQI measurement result.
20. Checkt the measured result is 1800 or more.





1.8. HSUPA Measurement

Hereafter, control software is assumed to be created by GPIB. See the operation manual for details of GPIB commands and manual operations. GPIB commands are in red.

1.8.1. HSUPA RMC Connection

When connecting with HSUPA, Location registration must be performed using PS. Set Registration Mode to Combined or CS&PS, and connect at HSUPA RMC.

1. Execute **PRESET** to set the default parameters.
2. Execute **REGMODE COMBINED** to set Registration Mode to Combined.
3. Execute **CHCODING HSUPA_RMC** to set Channel Coding to HSUPA RMC.
4. Turn on the UE power.
5. Execute **CALLSTAT?** and wait until the response becomes 2 (= Idle (Regist)).
6. Execute **CALLSA** to perform HSUPA RMC connection.
7. Execute **CALLSTAT?** and wait until the response becomes 7(=Loop Mode 1).

Call Status can be confirmed using CALLSTATIC?.
The confirmation procedures using **CALLSTATIC?** are below.

1. Execute **PRESET** to set the default parameters.
2. Execute **REGMODE COMBINED** to set Registration Mode to Combined.
3. Execute **CHCODING HSUPA_RMC** to set Channel Coding to HSUPA RMC.
4. Turn on the UE power.
5. Execute **CALLSTATIC?** to check Call Status. When Call Status becomes 2(=Idle(Regist)), the response is returned.
6. Execute **CALLSA** to perform HSUPA RMC connection.
7. Execute **CALLSTATIC?** to check Call Status. When Call Status becomes 7(=Loop Mode 1), the response is returned.

1.8.2. HSUPA RMC Disconnection

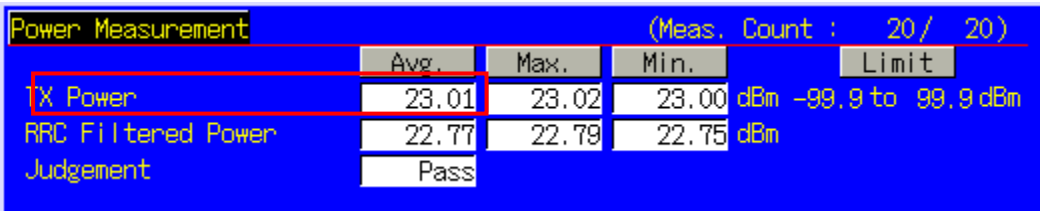
1. Execute **CALLSO** to disconnect from HSUPA RMC.
2. Execute **CALLSTAT?** and wait until the response becomes 2(=Idle(Regist)).

The confirmation procedures using **CALLSTATIC?** are below.

1. Execute **CALLSO** to disconnect from HSUPA RMC.
2. Execute **CALLSTATIC?** to check Call Status. When Call Status becomes 2(=Idle(Regist)), the response is returned.

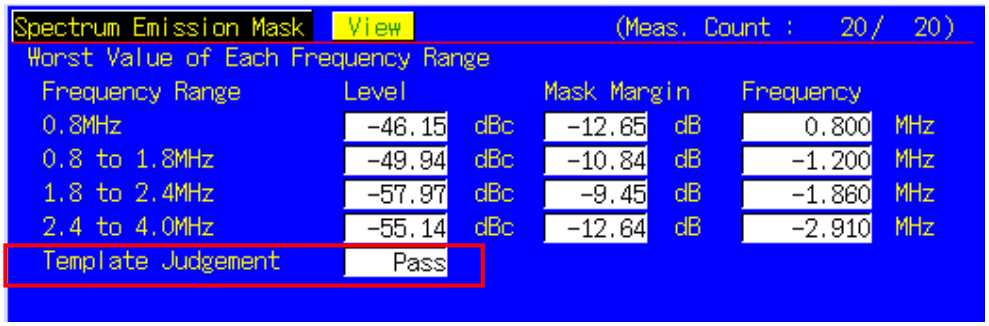
1.8.3. 5.2A User Equipment maximum output power with E-DCH

1. Execute **HSURATE FRC3** to set HSUPA Data Rate to FRC3.
2. Execute **PERFROM_MEAS ON** to set HSUPA Performance to On.
3. Execute **PERFROM_SAMPLE 15** to set HSUPA Performance – Number of Sample to 15.
4. Perform call connection with HSUPA RMC.
5. Execute **TPCPAT CLPC** to set TPC Pattern to Closed Loop Power Control.
6. Execute **ILVL 7.3** to set Input Level to 7.3 dBm.
7. Wait about 150 ms until UE power reaches 7.3 dBm.
8. Execute **TPCPAT ALT** to set TPC Pattern to Alternate.
9. Execute **ILVL 25.7** to set Input Level to 25.7 dBm.
10. Execute **SWP** to perform HSUPA Performance measurement. Check the E-DCH TB Index measurement result is 53.
11. Execute **TPC_CMD_UP** to raise [TxPower] only 1 dB and wait 150 ms.
12. Execute **SWP** to perform HSUPA Performance measurement.
13. Execute **AVE_TBI?** to read the E-DCH TB Index measurement result, and confirm it is 53.
14. Repeat procedures 11 to 13 until the E-DCH TB Index measurement result is not 53.
15. Execute **TPC_CMD_DOWN** to reduce [TxPower] only 1 dB and wait 150 ms.
16. Execute **SWP** to perform HSUPA Performance measurement, and confirm the E-DCH TB Index measurement result is 53.
    (Repeat procedures 15 and 16 if the E-DCH TB Index measurement result is not 53.)
17. Execute **PWR_MEAS ON** to set Power measurement to ON.
18. Execute **PWR_AVG 20** to set average Power measurement to 20 times.
19. Execute **SWP** to perform Power measurement.
20. Execute **AVG_POWER?** to read the Power measurement result.
21. Check the measurement result is +22.5 dBm (+3.2 dB/–5.2 dB).



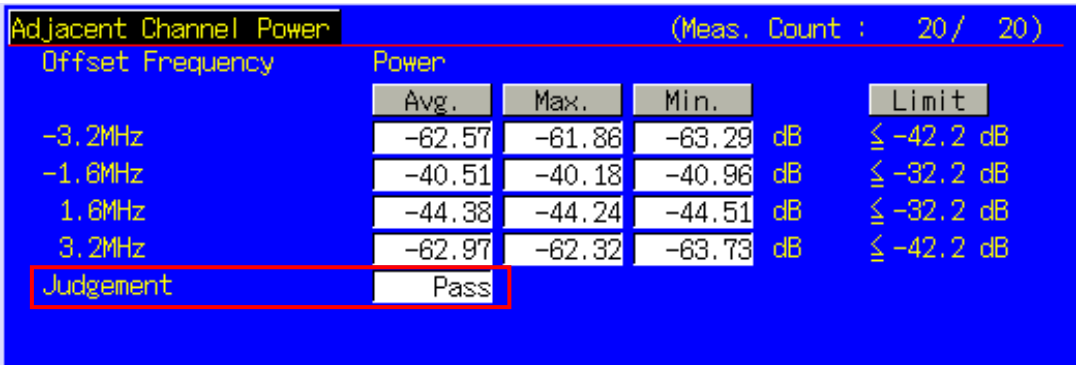
1.8.4. 5.5.2.1A Spectrum emission mask

1. Execute **HSURATE FRC3** to set HSUPA Data Rate to FRC3.
2. Perform call connection with HSUPA RMC.
3. Execute **ILVL 30.0** to set Input Level to 30.0 dBm.
4. Execute **TPCPAT ALL1** to set TPC Pattern to All1.
5. Wait until the UE reaches maximum power.
6. Execute **PWR_MEAS ON** to set Power measurement to ON.
7. Execute **PWR_AVG 20** to set average Power measurement to 20 times.
8. Execute **SWP** to perform Power measurement.
9. Execute **SMASKPASS?** to read the SEM measurement result.
10. Check the measurement result is PASS.



1.8.5. 5.5.2.2A Adjacent Channel Leakage power Ratio (ACLR) with E-DCH

1. Execute **HSURATE FRC3** to set HSUPA Data Rate to FRC3.
2. Perform call connection with HSUPA RMC.
3. Execute **ILVL 30.0** to set Input Level to 30.0 dBm.
4. Execute **TPCPAT ALL1** to set TPC Pattern to All1.
5. Wait until the UE reaches maximum power.
6. Execute **ADJ_MEAS ON** to set ACLR measurement to ON.
7. Execute **ADJ_AVG 20** to set average ACLR measurement to 20 times.
8. Execute **SWP** to perform ACLR measurement.
9. Execute **MODPWRPASS?** to read the Adjacent Channel Power measurement result.
10. Check the measurement result is PASS.

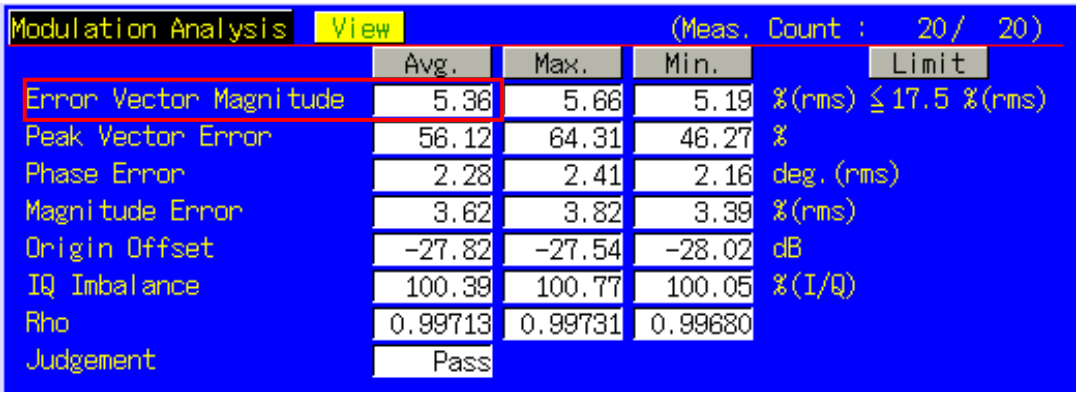


Adjacent Channel Power (Meas. Count : 20/ 20)

Offset Frequency	Power Avg.	Max.	Min.		Limit
-3.2MHz	-62.57	-61.86	-63.29	dB	≦ -42.2 dB
-1.6MHz	-40.51	-40.18	-40.96	dB	≦ -32.2 dB
1.6MHz	-44.38	-44.24	-44.51	dB	≦ -32.2 dB
3.2MHz	-62.97	-62.32	-63.73	dB	≦ -42.2 dB
Judgement	Pass				

1.8.6. 5.7.1A Error Vector Magnitude with E-DCH 16QAM

1. Execute **HSURATE FRC2** to set HSUPA Data Rate to FRC2.
2. Connect to HSUPA RMC.
3. Execute **TESTPRM CALL_20DBM** to set Test Parameter to Call – EVM & PCDE@-20 dBm.
4. Wait until UE power reaches -20 dBm.
5. Execute **MOD_AVG 20** to set the average count of Modulation Analysis measurement to 20 times.
6. Execute **EPUCH_MEAS_SLOT 4** to set E-PUCH Measurement Measurement Slot to 4.
7. Execute **SWP** to perform Modulation Analysis measurement.
8. Execute **AVG_EVM?** to read EVM measurement result.
9. Check the measurement result is lower than 14.0%.



Modulation Analysis View (Meas. Count : 20/ 20)

	Avg.	Max.	Min.		Limit
Error Vector Magnitude	5.36	5.66	5.19	%(rms)	≦ 17.5 %(rms)
Peak Vector Error	56.12	64.31	46.27	%	
Phase Error	2.28	2.41	2.16	deg.(rms)	
Magnitude Error	3.62	3.82	3.39	%(rms)	
Origin Offset	-27.82	-27.54	-28.02	dB	
IQ Imbalance	100.39	100.77	100.05	%(I/Q)	
Rho	0.99713	0.99731	0.99680		
Judgement	Pass				

1.8.7. 11.1 Detection of E-DCH HARQ ACK Indicator Channel (E-HICH)

[Test1]

1. Execute **EHICHPAT NACK** to set E-HICH Pattern to NACK.
2. Execute **OLVL -60.0** to set Output Level to -60.0dBm.
3. Execute **AWGNLVL ON** to turn on AWGN output.
4. Execute **AWGNPWR 0.0** to set Ior/Ioc to 0dB.
5. Execute **EHICHLVL -7.5** to set E-HICH Ec/Ior to -7.5dB.
6. Execute **HSURATE FRC1_CAT3_6** to set HSUPA Data Rate to FRC1 (Category3-6). Execute **HSURATE FRC1_CAT1_2** to set to FRC1 (Category1-2) when UE E-DCH Category is 1 to 2.
7. Perform call connection with HSUPA RMC.
8. Execute **ALLMEASITEMS_OFF** to turn off all measurement items.
9. Execute **PERFORM_MEAS ON** to turn on HSUPA Performance measurement.
10. Execute **PERFORM_SAMPLE 1000** to set the number of HSUPA Performance measurement samples at 1000 block.
11. Execute **SWP** to perform HSUPA Performance measurement.
12. Execute **FALSE_ACK_NACK_PROB? EXP** to read False ACK Probability measurement result.
13. Check the measurement result is lower than 2E-3.

[Test2]

1. Execute **EHICHPAT ACK** to set E-HICH Pattern to ACK.
2. Execute **OLVL –60.0** to set Output Level to -60.0dBm.
3. Execute **AWGNLVL ON** to turn on AWGN output.
4. Execute **AWGNPWR 0.0** to set Ior/Ioc to 0.0dB.
5. Execute **EHICHLVL -7.5** to set E-HICH Ec/Ior to -7.5dB.
6. Execute **HSURATE FRC1_CAT3_6** to set HSUPA Data Rate to FRC1 (Category3-6). Execute **HSURATE FRC1_CAT1_2** to set to FRC1 (Category1-2) when UE E-DCH Category is 1 to 2.
7. Perform call connection with HSUPA RMC.
8. Execute **ALLMEASITEMS_OFF** to turn off all measurement items.
9. Execute **PERFORM_MEAS ON** to turn on HSUPA Performance measurement.
10. Execute **PERFORM_SAMPLE 1000** to set the number of HSUPA Performance measurement samples at 1000 block.
11. Execute **SWP** to perform HSUPA Performance measurement.
12. Execute **FALSE_ACK_NACK_PROB? EXP** to read False NACK Probability measurement result.
13. Check the measurement result is lower than 2E-2.

1.8.8. 11.2 Demodulation of E-DCH Absolute Grant Channel (E-AGCH)

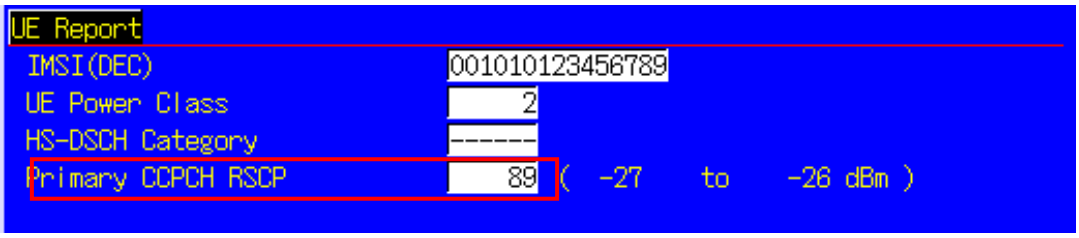
1. Execute **HSURATE FRC1_CAT3_6** to set HSUPA Data Rate to FRC1 (Category3-6).
   When UE does not support FRC1 (Category3-6), execute **HSURATE FRC1_CAT1_2** to set HSUPA Data Rate to FRC1 (Category1-2).
2. Execute **EHICHPAT ACK** to set E-HICH Pattern to ACK.
3. Execute **ABSGNTVAL 31** to set E-AGCH Absolute Grant Value to 31. (*1)
4. Execute **OLVL -51.4** to set Output Level to -51.4dBm.
5. Execute **AWGNLVL ON** to turn on AWGN output.
6. Execute **AWGNPWR -8.6** to set Ior/Ioc to 8.6dB.
7. Execute **EAGCHLVL -3.0** to set E-AGCH Ec/Ior to -3.0dB.
8. Connect to HSUPA RMC.
9. Execute **ALLMEASITEMS_OFF** to turn off all measurement items.
10. Execute **PERFORM_MEAS ON** to turn on HSUPA Performance measurement.
11. Execute **PERFORM_SAMPLE 1000** to set the number of HSUPA Performance measurement samples to 1000 block.
12. Execute **SWP** to perform HSUPA Performance measurement.
13. Execute **MISSED_DTCTN_PROB? EXP** to read Missed E-AGCH Detection Probability measurement result.
14. Check the measurement result is lower than 0.01(1E-2).

(*1): The PPR value is still "To be Defined" in the 3GPP standards but here it is set to 31.

1.9. UE Report

Measurement Report can be sent to UE. The following explains how to acquire the report value of Primary CCPCH RSCP.

1. Connect to Test Loop Mode1.
2. Execute **MEASREP ON** to report Measurement Report to UE.
3. Execute **CALLRFR** to initialize UE Report value.
4. Execute **PCCPCH_RSCP? FLAG**. When response is 1, report is returned.
5. Execute **PCCPCH_RSCP?** to read P-CCPCH Ec/N0 value.
6. When reading Report value again, return to 3.



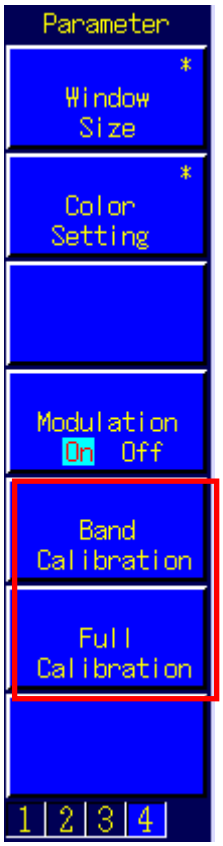
UE Report is updated at regular interval. When using PCCPCH_RSCP? 1 to 10, the latest updated value is returned after UE Report is updated for specified counts.

1. Connect to Test Loop Mode1.
2. Execute **MEASREP ON** to report Measurement Report to UE.
3. Execute **OLVL -90.0** to set Output Level to -90.0 dBm.
4. Execute **PCCPCH_RSCP? 3** to read P-CCPCH Ec/N0 value after UE Report is updated for three times.

1.10. Others

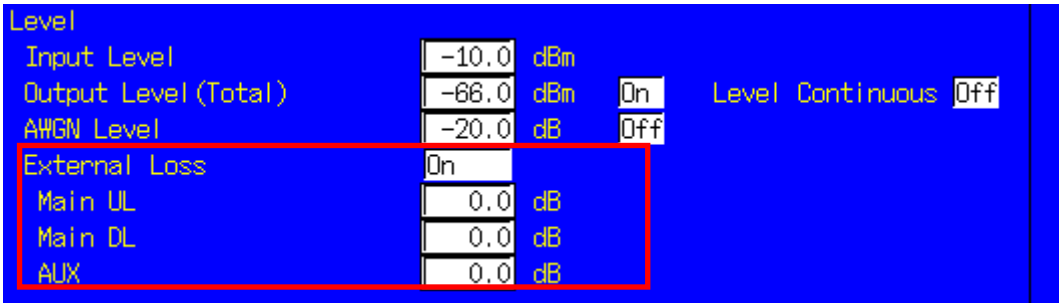
1.10.1. Calibration

By using this function, level accuracy frequency between input level and output level can be set flat, and the level gap caused by internal temperature change can be calibrated.
A single unit supports both Band Calibration (**BANDCAL**) and Full Calibration (**FULLCAL**).
Band Calibration is performed at TD-SCDMA band.
Full Calibration is performed at the input/output band of the unit (30~2700 MHz).
Although Full Calibration includes the contents of the Band Calibration, it takes time. Full Calibration should be executed when the seasonal temperature changes greatly or software version is upgraded. In this case, aging must be executed for about 1 hour before calibration.
Band Calibration should be executed so that calibration is performed without temperature change.



1.10.2. External Loss

The unit supports setting of External Loss (such as cable loss) as offset values.
External Loss is set at Main DL, Main UL and Aux.



An example of how to set Main DL Loss to 3.0 dB and Main UL Loss to 5.0 dB is shown below.

1. Execute **DLEXTLOSSSW ON** to set [External Loss(Main DL)] to [On].
2. Execute **ULEXTLOSSW ON** to set [External Loss(Main UL)] to [On].
3. Execute **DLEXTLOSS 3.0** to set [External Loss(Main DL)] to [3.0] dB.
4. Execute **ULEXTLOSS 5.0** to set [External Loss(Main UL)] to [5.0] dB.

Although the above commands can set only one loss value for all frequencies, up to 100 loss values can be set by using the GPIB and by setting an External Loss Table, which supports both W-CDMA and GSM. In this case, a frequency without a loss value is the table is compensated with next loss value.

An example of how to set a 3.0 dB loss value for the 2140 MHz frequency, and a 5.0 dB loss value for the 1950 MHz frequency is shown below.

1. Execute **DLEXTLOSSW COMMON** to use the Main DL External Loss common table.
2. Execute **ULEXTLOSSW COMMON** to use the Main UL External Loss common table.
3. Execute **LOSSTBLVAL 1950MHz, 0.0, 5.0, 0.0** to set the 1950 MHz Main UL Loss value to 5.0 dB.
4. Execute **LOSSTBLVAL 2140MHz, 3.0, 0.0, 0.0** to set the 2140 MHz Main DL Loss value to 3.0 dB.

The number of frequency points specified in the table is displayed either in the on-screen External Loss Table, or can be read by executing **LOSSTBLSAMPLE?**.
All loss values can be deleted by executing **DELLOSSTBL.**

*The operation when setting External Loss differs according to the version.
Sometimes, the I/O level may be changed unexpectedly when setting parameters at tracking operation.
After setting the measurement conditions (external loss, frequency, etc.), always set the I/O level before starting measurement (W/G, TDS only)
The specifications have been changed for version V20.00 and later so the I/O level does not change when changing the external loss and frequency settings.
