# MX370x series software

MX3701xxA IQproducer

# MX370x Series Software

The MG3700A Vector Signal Generator features a 160 MHz high-speed ARB baseband generator, broadband vector modulation, and large-capacity ARB memory to support digital modulation signals used by most communication systems. Its excellent cost performance offers the ideal solution for generating signals used by the new and growing field of wireless broadband technology, as well as for mobile telecommunications systems and wireless LANs. Because the MG3700A has a built-in ARB generator, signals are output easily just by selecting the waveform pattern matching the required communication system.

The following four categories of waveform patterns are supported:

- Standard waveform patterns
- Waveform patterns generated by optional MX3700xxA Waveform Pattern software
- Waveform patterns generated by optional MX3701xxA IQproducer software
- Waveform patterns converted from data generated by common signal-generation software

Each category contains multiple waveform pattern files each with preset parameters for each system.

These default waveform patterns are saved on the MG3700A hard disk for easy access, but other waveform patterns are supported using the IQproducer waveform generation software.

Parameters for the waveform for the target communication system are set using a GUI to generate a waveform pattern file for the MG3700A. After the generated waveform pattern is downloaded to the MG3700A via LAN or CompactFlash (CF) card, the MG3700A outputs the signal just by choosing the waveform pattern file.

In addition, a user-generated custom IQ sample file in ASCII format created by common EDA (Electronic Design Automation) software such as MATLAB, can be converted into a custom waveform pattern file for the MG3700A.

# MG3700A Vector Signal Generator

**IQproducer is PC application software used for generating waveform pattern files for the MG3700A by editing parameters for the modulation signals matching the target communication system. The generated waveform pattern files are saved in the MG3700A once and then loaded to the waveform memory for use.**

# Additive White Gaussian Noise (AWGN) IQproducer

## Standard accessory

This GUI-based application software is used to generate AWGN waveform pattern files optimized for each communication system for the Dynamic Range Test, etc.

The AWGN waveform pattern file is created by setting the same bandwidth and sampling rate as the combined waveform pattern (Wanted Signal) and a multiplier of the Wanted Signal. Specifying the combined waveform pattern (Wanted Signal) from the waveform pattern for the desired communication method automatically sets the Wanted Signal bandwidth and sampling rate. The resultant AWGN waveform pattern and an existing waveform pattern can be combined, which is useful for measuring base-station dynamic range.

### <Configurable Parameters>

(With Specified Wanted Signal)

AWGN BW/Wanted Signal BW ratio

(With Unspecified Wanted Signal)

Wanted Signal BW,

AWGN BW,

Sampling Rate

### Main Parameter Settings

(1) Wanted Signal BW: Wanted Signal bandwidth  
Setting range: 0.0010 MHz to 120.0000 MHz

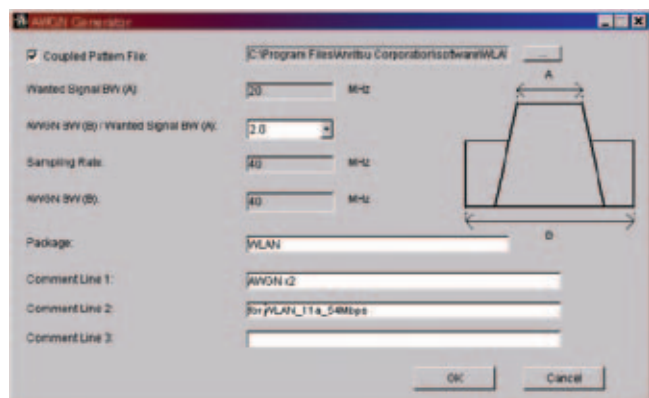

(2) AWGN BW (B)/Wanted Signal BW (A):  
Magnification of AWGN to Wanted Signal  
Setting range: 1.0, 1.5, 2.0, 2.5

(3) Sampling Rate:  
Setting range: 0.0200 MHz to 160.0000 MHz  
Becomes same value as Wanted Signal

(4) AWGN BW (B): Bandwidth of AWGN  
Calculated automatically from (1) and (2) with following limitation:  
Limit range: 0.001 MHz to 20.000 MHz and Sampling rate/2 max.,  
20.001 MHz to 120.000 MHz and Sampling rate max.

AWGN IQproducer Setting Screen

Because the MG3700A internal ARB memory can be partitioned in two, the Wanted Signal can be saved in one partition while the Interference Signal is saved in the other (Fig. A). The two signals are output after combination in the MG3700A internal baseband block. The signal levels can be set independently and the C/N value can be set too (Fig. B). In addition, the frequency offset of the Wanted Signal and Interference Signal can be set on-screen (Fig. C). The built-in Combination function automatically sets the following (Fig. D):

- Set Wanted Signal in Memory A.
- Set Interference Signal in Memory B.
- Set level of Wanted Signal.
- Set Level of Interference Signal.
- Set offset frequency of Wanted Signal and Interfering Signal.

The Combination function supports full auto-setting of parameters for the Wanted Signal, Interference Signal, Level Ratio, and Frequency Offset simply by selecting the Combination File. Each parameter can also be set separately on-screen after auto-setting, if necessary.

Combination files for W-CDMA\_BS, PDC, and PHS are pre-installed on the MG3700A hard disk and the customer can customize these files as necessary using the bundled free tools.

# W-CDMA IQproducer

## Standard accessory

W-CDMA IQproducer is GUI-based, PC application software for generating waveform patterns used in W-CDMA Rx sensitivity measurement. Once created, the waveform pattern file is downloaded to the MG3700A hard drive.

Using the MG3700A, Vector Signal Generator functionality, the files are loaded, selected, and output as a modulated RF signal.

By changing the Scrambling Code Number and Channelization Code Number, waveform patterns can be created that support the evaluation of W-CDMA terminals.

If complete control of all W-CDMA parameters is required, the MX370101A HSDPA/HSUPA IQproducer software (sold separately) can be used. For details, see the MX370101A HSDPA/HSUPA IQproducer section of this document.

### • Downlink Settings

## Optional

This optional GUI-based PC application software is used to set parameters and generate waveform pattern files for CDMA2000 1xEV-DO systems (1xEV-DO forward and 1xEV-DO Reverse). Once created, the waveform pattern file is downloaded to the MG3700A hard drive. Using the MG3700A, Vector Signal Generator functionality, the files are loaded, selected, and output as a modulated RF signal. Forward generates multi-carrier signals for up to nine carriers and Idle and Active mixed signals. Reverse generates multi-user signals with freely adjustable frequency, phase, level, and delay.

# MX370104A Multi-carrier IQproducer

## Optional

This GUI-driven PC application software is used to create a multi-carrier waveform pattern for modulated signals and tone signals of communications systems.

Once created, the waveform pattern file is downloaded to the MG3700A hard drive. Using the MG3700A, Vector Signal Generator functionality, the files are loaded, selected, and output as a multi-carrier RF signal.

W-CDMA downlink multi-carrier signals are supported as well as various types of clipping.

- **Multi-purpose Function**

By using the multi-carrier function, a signal with up to 32 carriers can be converted to a single waveform pattern. While it may not be possible to set 32 carriers due to the frequency offset and the waveform pattern, it is possible to create a waveform pattern with more than 32 carriers by combining multi-carrier waveform patterns.

- **Adjust Rate Function**

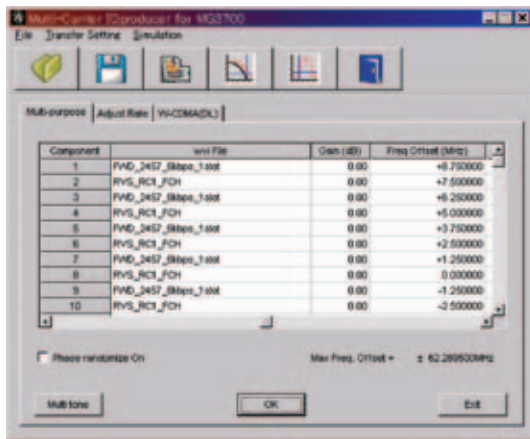

The Adjust Rate function converts two waveform patterns with different sampling rates into two waveforms patterns with the same sampling rate.

By using the MG3700A Two-signal Combining function, combining waveform patterns with different sampling rates causes the bandwidth to change because the waveform pattern in memory B is output at the sampling rate of the waveform pattern in memory

A. Using the Adjust Rate function, it is possible to combine the Wanted Signal and Interference Signal for various communication systems with the same sampling rate.

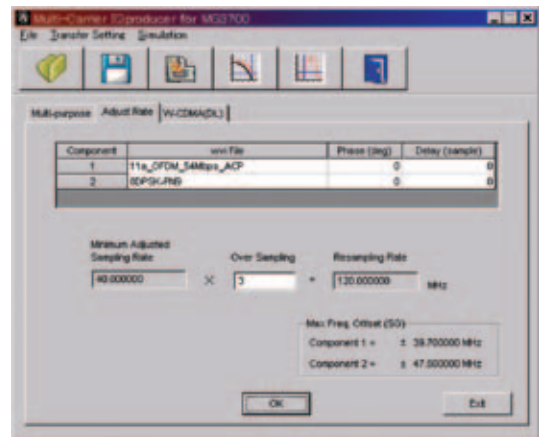

By matching the sampling rates of the two waveform patterns using this function, it is even possible to output a signal for different communication systems using the Two-signal Combining function.

# MX370105A Mobile WiMAX IQproducer

## Optional

This GUI-driven PC application software is used to set parameters and generate waveform patterns based on the IEEE 802.16e-2005 WirelessMAN-OFDMA standard. Signals that comply with this particular specification are also known as mobile WiMAX signals. Once created, the waveform pattern file is downloaded to the MG3700A hard drive. The files are loaded, selected, and output as a modulated WiMAX signal. Permutation zones and user bursts are easy to configure in a frame using drop-and-drag functionality in a user-friendly GUI. Modulation, coding type, and coding rate can be set for each user burst. Most receiver tests described in IEEE 802.16e-2005 (Section 8.4.13, Receiver Requirement) can be performed except those functional tests requiring equipment other than a Signal Generator.

### • Recommended Options

#### MG3700A-021 ARB Memory Upgrade 512 Msamples

The IEEE802.16e Receiver Requirement has an item for checking whether specifications are met by adding an Interference Signal to the Wanted Signal. This check requires two signals but by using the Two-signal Combine function, one MG3700A unit can output both the Wanted and Interference signals. In addition, if the memory is increased, several waveform patterns for different communication methods can be saved in memory for instant recall when required.

#### MG3700A-031 High-Speed BER Test Function

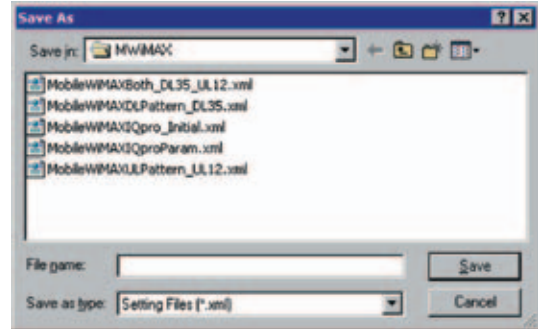

The IEEE802.16e Receiver Requirement has a BER measurement test that uses a Fixed pattern. The optional MG3700A-031 High-Speed BER test function\* supports BER measurement using a Fixed pattern.

\*: The standard BER function does not support Fixed-pattern measurement.

### • Parameter Save/Recall

The numeric values and settings for each item can be saved in a parameter file. Enter the file name in the [File name] field and click the [Save] button to save the parameter file.

A saved parameter file is recalled by selecting it in the file list and clicking the [Open] button.

### • Graphical Simulation Displays

Clipping, filtering, and checking can be performed for created waveform patterns by displaying CCDF, FFT, and Time Domain graphs.

#### CCDF Graph

Up to eight generated waveform patterns can be read and displayed as CCDF graphs.

#### FFT Graph

Up to four generated waveform patterns can be read and displayed as FFT graphs.

#### Time Domain Graph Display

Up to four types of Time Domain graph can be displayed when reading created waveform patterns.

#### Clipping Function

Clipping and filtering can be performed for created waveform patterns.

# MX370106A DVB-T/H IQproducer

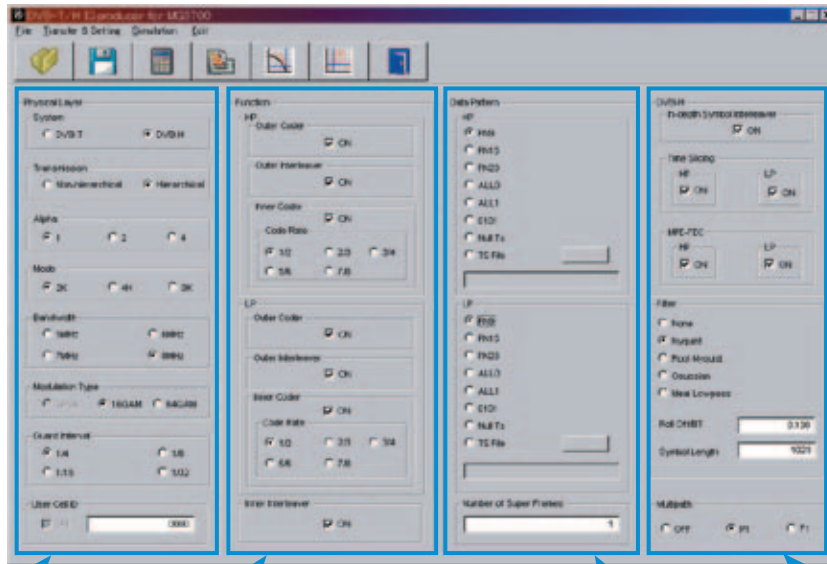

Optional

The MX370106A DVB-T/H IQproducer is GUI-driven PC application software supporting the ETSI EN 300 744 V1.5.1 (2004-11) Physical Layer standard. The generated waveform patterns are downloaded to the MG3700A and used to output DVB-T/H Modulation baseband signals and RF signals using the MG3700A ARB generation function.

This software processes the DVB-T/H Physical Layer shown in the Signal Generation Block Diagram below. When all of Outer Coder, Outer Interleaver, Inner Coder, and Inner Interleaver are ON, the data selected by Data Pattern is input to the MPEG-TS part shown in the figure below. When each function is turned OFF, all the blocks of the front side are turned OFF. The data selected by Data Pattern is inserted by jumping over blocks that are OFF.

# MX370107A Fading IQproducer

Optional

The MX370107A Fading IQproducer is GUI-driven PC application software to set fading parameters and to generate waveform patterns by reading the waveform patterns for the MG3700A. The generated waveform patterns are downloaded to the MG3700A and used to output fading baseband signals and RF signals using the MG3700A ARB generation function. The MX370107A supports the processes inside the dotted line of the following block diagram (fading of each IQ channel, calculation of correlation line, AWGN combination). Either waveform patterns created by another IQproducer or IQ data (ASCII) created by general simulation tools can be selected as the input data file.

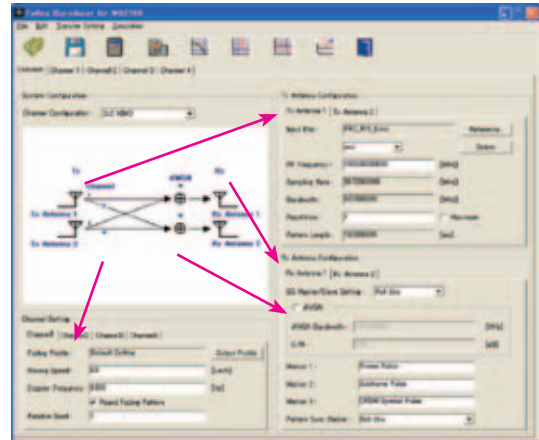

## Recommended Options

**MG3700A-021 ARB Memory Upgrade 512 Msamples**  
 Since the length of the fading waveform pattern is limited by the memory size, we recommend more memory. The standard ARB memory of 1 GB can be extended to 2 GB as an option.

## Fading IQproducer Main Screen

The Tx, Rx, Channel, and AWGN are set at the common screen shown on the right. The channel configuration can be selected from 1×1 SISO to 4×4 MIMO.

Each channel path number (1 to 20), fading type, delay, and power is set at the Channel 1 to Channel 4 tabs.

The power delay profile graph on the channel screen displays delay on the horizontal axis and power on the vertical axis.

# MX370108A LTE IQproducer

## MX370108A-001 LTE-Advanced FDD Option

### Optional

The MX370108A LTE IQproducer is PC application software with a GUI for generating waveform patterns in compliance with the LTE FDD specifications in the 3GPP TS 36.211, TS 36.212, and TS 36.213 standards.

# MX370110A LTE TDD IQproducer

## MX370110A-001 LTE-Advanced TDD Option

### Optional

The MX370110A LTE TDD IQproducer is PC application software with a GUI for generating waveform patterns in compliance with the LTE TDD specifications in the 3GPP TS 36.211, TS 36.212, and TS 36.213 standards.

Generates test model waveform patterns used for LTE base station Tx tests and FRC (Fixed Reference Channel) used for Rx tests. LTE TDD IQproducer supports two setting screens: "Easy Setup Screen" and "Normal Setup Screen".

The MX370110A-001 LTE-Advanced TDD option supports simple generation of carrier aggregation signals added\* by 3GPP Rel. 10. Additionally, clustered SC-FDMA signals can be generated at Uplink.

\*: MBSFN reference signals, UE-specific reference signals, Positioning reference signals, CSI reference signals, Physical Multicast Channel, and Sounding Reference Signal are not supported.

Channels Generated by MX370110A LTE TDD IQproducer

- Downlink
- Cell-specific Reference Signal
  - Primary Synchronization Signal
  - Secondary Synchronization Signal
  - PBCH (Physical Broadcast Channel)
  - PCFICH (Physical Control Format Indicator Channel)
  - PDCCH (Physical Downlink Control Channel)
  - PDSCH (Physical Downlink Shared Channel)
  - PHICH (Physical Hybrid-ARQ Indicator Channel)

- Uplink
- PUCCH (Physical Uplink Control Channel)
  - PUSCH (Physical Uplink Shared Channel)
  - Demodulation Reference Signal for PUCCH/PUSCH
  - PRACH (Physical Random Access Channel)

### ● Easy Setup Screen

Waveform patterns can be generated easily because the main parameters are restricted to the Easy Setup screen. Use "Normal Setup function" for detailed parameter settings.

The image shows the main 'Easy Setup Screen' for generating FRC (UL) waveforms. Several callout windows are shown, each pointing to a specific parameter in the main screen:

- E-UTRA Test Models:** Points to the 'Test Type' dropdown menu.
- System:** Points to the 'System' dropdown menu (set to LTE).
- Bandwidth:** Points to the 'Bandwidth' dropdown menu (set to 10MHz).
- Filter:** Points to the 'Filter' dropdown menu (set to Ideal).
- Data:** Points to the 'Data' section, specifically the 'UL-SCH' dropdown menu.
- Modulation:** Points to the 'Modulation' dropdown menu (set to QPSK).

The main screen shows the following configuration for FRC (UL):

- System: LTE
- Test Type: E-UTRA Test Models
- Bandwidth: 10MHz
- Filter: Ideal
- Data: UL-SCH
- Modulation: QPSK
- Package: LTE\_TDD
- Export File Name: TDD\_FRC\_A1\_1\_09M

# MX370111A WLAN IQproducer MX370111A-001 802.11ac (80 MHz) Option

Optional

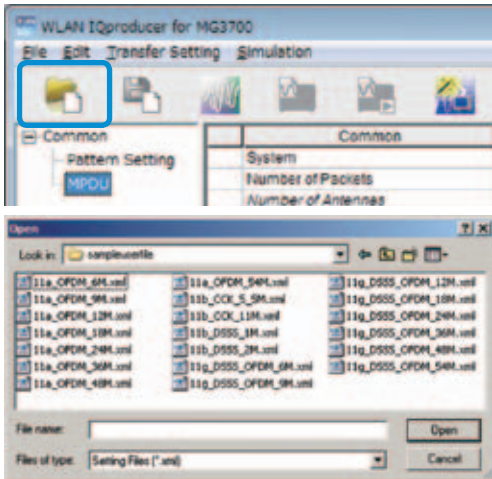

The MX370111A WLAN IQproducer is PC application software with a GUI to generate IEEE Std 802.11-2007, IEEE Std 802.11n-2009 and IEEE802.11ac compliant waveform patterns. Installing the MX370111A-001 802.11ac (80 MHz) option supports output of signals in compliance with IEEE802.11ac standards.

WLAN IQproducer supports two setting screens: “Easy Setup Screen” and “Normal Setup Screen”.

**IQproducer Main Screen**

- **Sample Parameter File**  
MX370111A supports some sample parameter files. First, a sample parameter file is read (Recall), and detailed editing as necessary helps cut the parameter setting workload.

- Easy Setup Screen
- Because it is limited to major parameters, it generates waveform patterns using simple operation.  
Use "Normal Setup function" for detailed parameter settings.

The diagram illustrates the 'Easy Setup Screen (Common Setup Screen)' for the MX370111A WLAN IQproducer. It shows a sequence of four smaller windows on the left that lead into a larger main window on the right. The main window is titled 'Easy Setup (Common)' and contains various configuration fields. Blue callout boxes point to specific areas: 'System' points to the top-left corner; 'Bandwidth (System: 11n)' points to the 'Bandwidth' field; 'Bandwidth (System: 11ac)' points to the 'Bandwidth' field; 'Filter Type' points to the 'Filter Type' dropdown; and two callouts on the right point to the 'Number of Packets' field and the burst timing diagram, with text explaining their functions: 'Sets the number of output times\* (the number of waveform pattern packets)' and 'Sets burst On/Off ratio.'.

Easy Setup Screen (Common Setup Screen)

\*: PER (Packet Error Measurement), the number of waveform pattern packets is generated as [1] and the number of output times from the MG3700A main frame is set.  
Example: Outputting 1000 packets  
Number of Packets: 1  
Repeat Count: 1000

Ex.) System: 11ac

Easy Setup Screen (PHY Setup Screen)

Easy Setup Screen (MAC Setup Screen)

● Normal Setup Screen (IEEE 802.11n/p/a/b/g/j)

Sets system, number of packets in one waveform pattern, On/Off ratio (Duty) and filter at Common sheet. At PER (Packet Error Measurement), the number of waveform pattern packets is generated as [1] and the number of output times from the MG3700A main frame is set.

Example: Outputting 1000 packets  
Number of Packets: 1  
Repeat Count: 1000

The screenshot shows the 'WLAN IQproducer for MG3700' software interface. It is divided into two main panes: 'Common' and 'MPDU'. The 'Common' pane contains system-level parameters like System, Number of Packets, Bandwidth, and Repeat Count. The 'MPDU' pane contains PHY and MAC parameters like PHY Format, MCS, and MAC Address. Callouts provide detailed explanations for these sections.

Parameters displayed as tree. Add and delete A-MPDU. Pattern Setting, MPDU, A-MPDU

PHY/MAC parameter part displays selected MPDU and A-MPDU as tree.

All PHY parameters are the same value with MPDU and A-MPDU. Sets PPDU format, MCS, modulation method and data rate.

Common sets parameters, such as system, bandwidth, On/Off ratio, and filter. Setting pattern output count as "Repeat Count" supports simultaneous generation of sequence file (.wwi) and waveform pattern. This is used to limit number of packets output from SG for PER measurements.

MAC parameter supports different settings with MPDU and A-MPDU. Sets data length, MAC frame, address, etc.

### ● Normal Setup Screen

This screen sets common settings, such as user mode (Single User/Multi User), bandwidth, number of packets in one waveform pattern, On/Off ratio (Duty), filter, and PHY/MAC parameters.

Displays MPDU/A-MPDU in tree for each user#. User/MPDU/A-MPDU can be added and deleted. Pattern Setting, User #0 to #3 MPDU, A-MPDU.

Displays MPDU and A-MPDU for selected user# for PHY/MAC parameter.

Each user# PHY parameter becomes same value at all MPDU, and A-MPDU. Sets MCS, modulation method, etc.

Common sets parameters, such as User Mode (Single User /Multi User), bandwidth, On/Off ratio, and filter. Setting pattern output count as "Repeat Count" supports simultaneous generation of sequence file (.wwi) and waveform pattern. This is used to limit number of packets output from SG for PER measurements.

Different value can be set for each user# MAC parameter at MPDU, A-MPDU. Sets data length, MAC frame, address, etc.
