MP1764D Error Detector Operation Manual (GPIB Programming)

First Edition

- Read this manual before using the equipment.
- To ensure that the equipment is used safely, read the "For Safety" in the MP1764D Error Detector Operation Manual first.
- Keep this manual with the equipment.

ANRITSU CORPORATION

Document No.: M-W2342AE-1.0

Safety Symbols

To prevent the risk of personal injury or loss related to equipment malfunction, Anritsu Corporation uses the following safety symbols to indicate safety-related information. Insure that you clearly understand the meanings of the symbols BEFORE using the equipment. Some or all of the following five symbols may not be used on all Anritsu equipment. In addition, there may be other labels attached to products which are not shown in the diagrams in this manual.

Symbols used in manual

DANGER 1

This indicates a very dangerous procedure that could result in serious injury or death if not performed properly.

WARNING This indicates a hazardous procedure that could result in serious injury or death if not performed properly.

CAUTION /

This indicates a hazardous procedure or danger that could result in light-to-severe injury, or loss related to equipment malfunction, if proper precautions are not taken.

Safety Symbols Used on Equipment and in Manual

The following safety symbols are used inside or on the equipment near operation locations to provide information and take the necessary precautions BEFORE using the equipment.

This indicates a prohibited operation. The prohibited operation is indicated symbolically in or near the barred circle.

This indicates an obligatory safety precaution. The obligatory operation is indicated symbolically in or near the circle.

This indicates warning or caution. The contents are indicated symbolically in or near the triangle.

These indicate that the marked part should be recycled.

Equipment Certificate

Anritsu guarantees that this equipment was inspected at shipment and meets the published specifications.

Anritsu Warranty

- During the warranty period, Anritsu will repair or exchange this software free-of-charge at the company's own discretion if it proves defective when used as described in the operation manual.
- The warranty period is 1 year from the purchase date.
- The warranty period after repair or exchange will remain 1 year from the original purchase date, or 30 days from the date of repair or exchange, depending on whichever is longer.
- This warranty does not cover damage to this software caused by Acts of God, natural disasters, and misuse or mishandling by the customer.

In addition, this warranty is valid only for the original equipment purchaser. It is not transferable if the equipment is resold.

Anritsu Corporation will not accept liability for equipment faults due to unforeseen and unusual circumstances, nor for faults due to mishandling by the customer.

Anritsu Corporation Contact

If this equipment develops a fault, contact Anritsu Service and Sales offices at the address at the end of paper-edition manual or the separate file of CD-edition manual.

Notes On Export Management

This product and its manuals may require an Export License/Approval by the Government of the product's country of origin for re-export from your country.

Before re-exporting the product or manuals, please contact us to confirm whether they are export-controlled items or not.

When you dispose of export-controlled items, the products/manuals are needed to be broken/shredded so as not to be unlawfully used for military purpose.

Trademark and Registered Trademark

'HP Basic' is a registered trademark of the Hewlett-Packard Corporation.

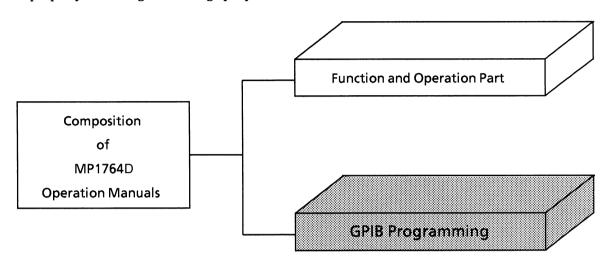

'HP' is a registered trademark of the Hewlett-Packard Company.

'MS-DOS' is a registered trademark of the Microsoft Corporation.

'Quick Basic' is a registered trademark of the Microsoft Corporation.

Composition of MP1764D Operation Manuals

The MP1764D Error Detector operation manuals are composed of the following two documents. Use them properly according to the usage purpose.

Function and Operation Part

These outline the MP1764D, and describes the preparations before use, the panels, specifications, performances, functions, and operation procedures.

GPIB Programming:

The MP1764D GPIB conforms to IEEE488.2. Remote control by GPIB is explained based on IEEE488.2. An application program example using the ANRITSU PACKET V series of personal computers, HP9000 series HP-BASIC and Quick Basic of Microsoft Corporation are also provided.

SECTION 1 GENERAL

This section outlines the histotrical development of the GPIB standard and gives a general description of GPIB functions of the MP1764D Error Detector.

TABLE OF CONTENTS

1.1	Develo	pment of the GPIB Standard	1-3
1.2	MP176	4DGPIB Functions	1-4
	1.2.1	Overviews of 2-port GPIB functions	1-4

(Blank)

1.1 Development of the GPIB Standard

The MP1764D, when combined with an external controller in a system bus automates measurements on radio communications. For this purpose it is provided with a GPIB interface bus (IEEE std. 488.2-1987) as a standard feature. The GPIB (General Puropose Interrace Bus) was established by the IEEE (Institute of Electric and Electronics Engineers) in 1975 as a standard digital interface bus for programmable measuring instruments. The original version was announced in 1975 under the name IEEE std. 488-1975.

A revised version, called IEEE std. 488-1978, was issued in 1978. As this version only stipulated hardware specifications for the interface side, IEEE std. 728-1982, which stipulated software specifications for the device side, was added in 1982.

Though IEEE std. 728-1982 standardized the formats for sending device messages, it was lacking in its concept of software sharing on the user side. So, in 1987, the IEEE std. 488. 2-1987 (hereafter IEEE 488.2) version, which aimed to overcome the shortcomings, was introduced. This version strengthened the standardization of message exchange protocol, message date code, device input/output formats and common commands.

With the introduction of IEEE 488.2, the name of IEEE std. 488-1978 (hereafter IEEE 488) was changed to IEEE std. 488. 1-1987 (hereafter IEEE 488.1). The table below summarizes the development of the GPIB standard.

Object of standard	Former standard	New standard	Remarks
Hardware	IEEE 488	IEEE 488.1	IEEE 488.1 is indentical to IEEE 488
Software	IEEE 728	IEEE 488.2	IEEE 488.2 is the revised version of IEEE 728

Devices which support IEEE 488.2 must also have compatibility with IEEE 488.1; however, devices which support IEEE 488.1 (IEEE 488) are not guaranteed to be compatible to IEEE 488.2.

1.2 MP1764D GPIB Functions

The MP1764D has the following GPIB functions.

- (1) Apart from the power switch and some LOCAL keys, all functions can be controlled.
- (2) Readout of all setting conditions
- (3) Interrupt function and serial poll operation
- (4) Automatic measuring systems can be constructed by combining the MP1764D with a personal computer and other measuring instruments.
- (5) GPIB is composed of two ports; GPIB 1 and GPIB 2.

For the last feature (5), see the following description as well as examples.

1.2.1 Overviews of 2-port GPIB functions

MP1764D is provided with two GPIB ports. The port on the GPIB 1 side primarily carries out, as the first interface, MP1764D's remote control through an external host computer; on the other hand, the port on the GPIB 2 side primarily controls, as the second interface, output of measurement data to an external printer. Thus an efficient system makeup can be enabled by means of using the GPIB 1 side as a device port and the GPIB 2 side as a system controller port.

(1) Functions of GPIB 1

GPIB 1 can be handled similarly to conventional measuring instrument having 1-port GPIB. It functions as a device port when it is in ordinary measurement condition; or it functions as a system controller port to control the MP1763B/C Pulse Pattern Generator by the system controller's settings in tracking operating.

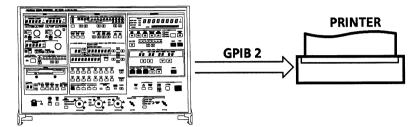

(2) Functions of GPIB 2

GPIB 2 is used, independent of the GPIB 1 port, as a device control port of individual devices connected to the GPIB 2 port. Thus GPIB 2 always functions as a system controller port, but not as a device port.

1.2.2 Examples of system makeup using GPIB 1 / GPIB 2

(1) Stand-alone type (1) ... Panel operation

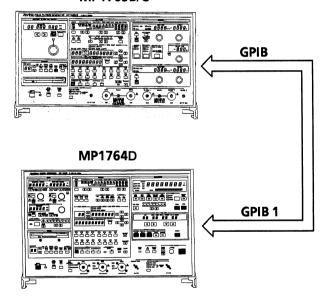

MP1764D

Outputs data measured with MP1764D to the printer through panel operation.

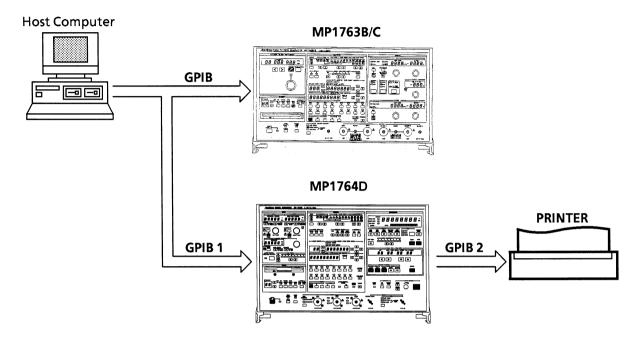

(2) Stand-alone type (2) ... Tracking operation

MP1763B/C

- ① Some settings for the transmitter are synchronized with the settings for the receiver. During this tracking operation, no external controller can be connected.
- ② Some settings for the receiver are synchronized with the settings for the transmitter. During this tracking operation, no external controller can be connected.
- ※ In the tracking operation, either MP1763B/C or MP1764D can be a master (controller).

(3) Control by the host computer

By means of controlling MP1763B/C and MP1764D using the host computer via GPIB 1 port, data can be output to the printer via GPIB 2 port.

SECTION 2 SPECIFICATIONS

In this section, interface functions of the MP1764D GPIB specifications are explained. For the device message, see SECTION 9.

TABLE OF CONTENTS

2.1	Interfa	ce Functions	2-3
2.2	Device	Message List	2-5
	2.2.1	IEEE 488.2 common commands and MP1764D supported commands	2-6
	2.2.2	Status messages	2-8
	2.2.3	MP1764D device mesages	2-10

(Blank)

2.1 Interface Functions

IEEE 488.2 sets down a minimum requirement for subsets of the GPIB interface functions specified in IEEE 488.1 that must be provided by measuring intruments used in a GPIB system. The MP1764D GPIB 1 and GPIB 2 provide the subsets listed in the code columns of the tables below.

GPIB 1 Interface Functions

Code	Interface function	IEEE 488.2 standard
SH1	All source handshake functions are provided. Synchronizes the timing of data transmission.	All functions provided as standard. The device must have a complete set of source handshake functions.
AH1	All acceptor handshake functions are provided. Synchoronizes the timing for receiving data.	All functions provided as standard. The device must have a complete set of acceptor handshake functions.
Т6	Basic talker functions are provided. The serial poll function is provided. The talk-only function is not provided. The talker can be canceled by MLA.	Davices must have one of the T5, T6, TE5 or TE6 subsets. The talk-only function is out of the scope of the IEEE 488.2 standard.
L4	Basic listener functions are provided. The listen-only function is not provided. The listener can be canceled by MTA.	Devices must have one of the L3, L4, LE3 or LE4 subsets. The listen-only function is out of the scope of the IEEE 488.2 standard.
SR1	All service request and status byte functions are provided.	All functions are provided as standard.
RL1	All remote / local functions are provided. The local lockout function is provided.	RL0 (functions not provided) or RL1 (all functions provided)
PP0	Parallel poll functions are not provided.	PP0 (functions not provided) or PP1 (all functions provided)
DC1	All device clear functions are provided.	All functions provided as standard.
DT1	Device trigger functions are provided.	DT0 (functions not provided) or DT1 (all functions provided)
C1,C2 C3,C4, C7	Controller functions are provided. Can be used as controller only for tracking operation.	C0 (functions not provided) or C4 and C5 or any of C7, C9, C11

GPIB 2 Interface Functions

Code	Interface fnction	
SH1	All source handshake functions are provided. Synchronizes the timing of data transmission.	
AH1	All acceptor handshake functions are provided. Synchronizes the timing for receiving data.	
Т6	Basic talker functions are provided. Serial poll functions are provided. The talk-only function is not provided. A talker can be canceled by MLA.	
Basic listener functions are provided. The listen-only function is not provided. A listender can be canceled by MTA.		
SR0	SRO Service request and status byte functions are not provided.	
REMOTE / local functions are not provided. Local lockout functions are not provided.		
PPO Parallel poll functions are not provided.		
DC0 Device clear functions are not provided.		
DT0	Device trigger functions are not provided.	
C1,C2,C3,C4, C28	Controller functrions are provided.	

2.2 Device Message List

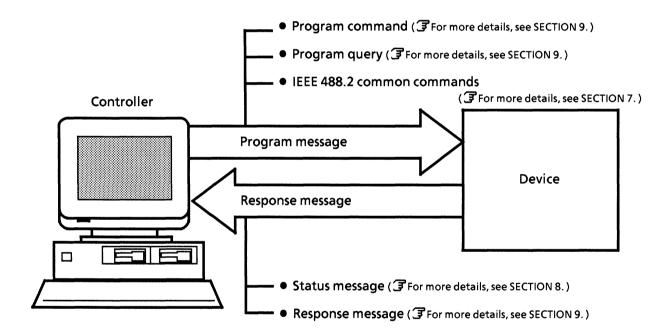

Device messages are message that are transmitted between the controller and the device via the system interface in the bus mode, i.e. when the ATN line, is false. There are two types: program messages and response messages.

Program messages are ASCII data message transferred from controller to device. There are two types of program message: program commands and program queries.

Program commands consist of commands specific to devices which are used exclusively for the control of the MP1764D and IEEE 488.2 common commands. The latter are common commands used for, in addition to the MP1764D, any measuring instrument conforming to the IEEE 488.2 standard.

Program queries are commands used to elecit are response message from a devoice. A program query is transferred from the controller to the device so that the controller can receive a response message from the controller later on.

Reponse messages are ASCII data messages sent from device to controller. Status messages and response messages for program queries are listed on the following pages.

The messages described above are transferred via the input and output buffers of the device. The output buffer is also referred to as an output queue. The following table gives a brief explanation of input and output buffers.

Input buffer	Output buffer
A FIFO (First In First Out) memory area where DAB (program messages or query messages), whose syntax has been analyzed, are temporarily stored before they are executed. The size of the MP1764D is input buffer is 256 bytes.	A FIFO-type queue memory area. All DAB (response messages) output to a device from the controller are all stored in this area until the controller has read each of them. The size of the MP1764D output queue is 256 bytes.

2.2.1 IEEE 488.2 common commands and MP1764D supported commands

The table below lists 39 types of common commands specified in the IEEE 488.2 standard. IEEE 488.2 common commands which are supported by the MP1764D are indicated with \odot symbol in the table.

Mnemonic	Command name	IEEE488.2 Standard	MP1764C supported commands
*AAD	Accept Address Command	Optional	
*CAL?	Calibration Query	Optional	
*CLS	Clear Status Command	Mandatory	0
*DDT	Define Device Trigger Command	Optional	
*DDT?	Define Device Trigger Query	Optional	
*DLF	Disable Listener Function Command	Optional	
*DMC	Define Macro Command	Optional	
*EMC	Enable Macro Command	Optional	
*EMC?	Enable Macro Query	Optional	
*ESE	Standard Event Status Enable Command	Mandatory	0
*ESE?	Standard Event Status Enable Query	Mandatory	0
*ESR?	Standard Event Status Register Query	Mandatory	0
*GMC?	Get Macro Contents Query	Optional	
*IDN?	Identification Query	Mandatory	0
*IST?	Individual Status Query	Optional	
*LMC?	Learn Macro Query	Optional	i.
*LRN?	Learn Device Setup Query	Optional	
*OPC	Operation Complete Command	Mandatory	0
*OPC?	Operation Complete Query	Mandatory	0
*OPT?	Option Identification Query	Optional	0
*PCB	Pass Control Back Command	Mandatory if other than CO	
*PMC	Purge Macro Command	Optional	
*PRE	Parallel Poll Register Enable Command	Optional	
*PRE?	Parallel Poll Register Enable Query	Optional	
*PSC	Power On Status Clear Command	Optional	0
*PSC?	Power On Status Clear Query	Optional	0
*PUD	Protected User Data Command	Optional	
*PUD?	Protected User Data Query	Optional	
*RCL	Recall Command	Optional	
*RDT	Resource Description Transfer Command	Optional	
*RDT?	Resource Description Transfer Query	Optional	
*RST	Reset Command	Mandatory	0
*SAV	Save Command	Optional	
*SRE	Service Request Enable Command	Mandatory	0
*SRE?	Service Request Enable Query	Mandatory	0

Mnemonic	Command name	IEEE488.2 Standard	MP1764C supported commands
*STB?	Read Status Byte Query	Mandatory	0
*TRG	Trigger Command	Mandatory if DT1	
*TST?	Self Test Query Wait to Continue Command	Mandatory	©
*WAI		Mandatory	©

The IEEE 488.2 common commands are always begin with "*" For more details, see SECTION 7.

2.2.2 Status messages

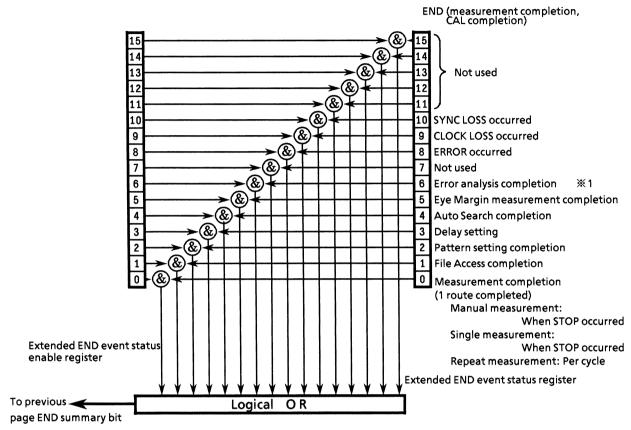

The diagram below shows the structure of service-request summary messages for the status byte register used with the MP1764D.

Bit Bit 7 Bit 6 Bit 5 Bit 4 Bit 3 Bit 1 Bit 0 Bit 2 **DIO8 DIO7 DIO6 DIO4** DIO3 DIO2 **DIO1** Line **DIO5** Summary message bit **ESB** MAV **ERROR END** Not used Not used Not used M Q S S bits $0 \sim 5$, 7 Summary bit from Service Request next page ESB Generation (END) Summary bit from & of each next page ESB (ERROR) correspond) ing bit . Data MAV summary bit Data indicating that the output queue is not empty Service Request i Data Message Available (MAV) Enable Request bits $0 \sim 5$, 7 Event Summary Bit (ESB) Data Data Logical OR Data Output queue Power on 6 6 Not used 5 5 Command error 4 4 Error during execution 3 3 Device-dependent error 2 2 Query error 1 1 Not used 0 0 End of operation

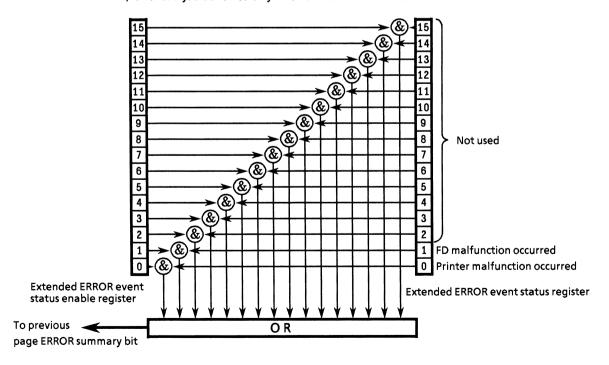

Status Byte Register Summary Bit Composition

Note: (&) means logical AND operation.

Standard event status enable register

※1) Error analysis is allowed only when OPTION-01 is installed.

2.2.3 MP1764D device messages

The device messages consist of fixed program commands of the MP1764D queries and response messages. The device messages list and description are shown in Section 9.

SECTION 3 CONNECTING THE BUS AND SETTING ADDRESS

The remote control of devices connected to the GPIB system interface begins with referring to their addresses as control procedure parameters. This section describes the GPIB cable connections and setting of addresses that must be performed before using the GPIB interface.

TABLE OF CONTENTS

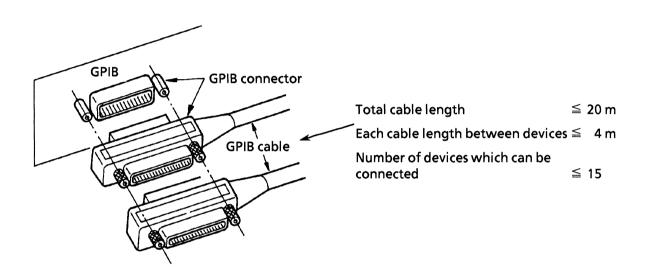

3.1	Conne	ting Devices with GPIB Cables	3-3
3.2	Procedure for Setting the Address and Checking it		3-4
	3.2.1	Address setting	3-5
	3.2.2	Connection with MP1763B/C during the tracking operation	3-6
	3.2.3	Connection with external printer	3-9

(Blank)

3.1 Connecting Devices with GPIB Cables

The rear panel has connectors for connecting GPIB cables. The cables must be connected before the power is switched on.

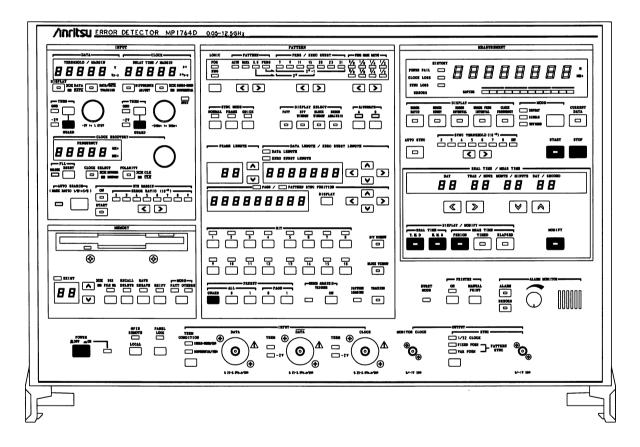

A maximum of 15 devices, including the controller, can be connected to one system. The restrictions indicated at the right of the diagram below should be observed when connecting many devices to one system.

3.2 Procedures for Setting the Address and Checking it

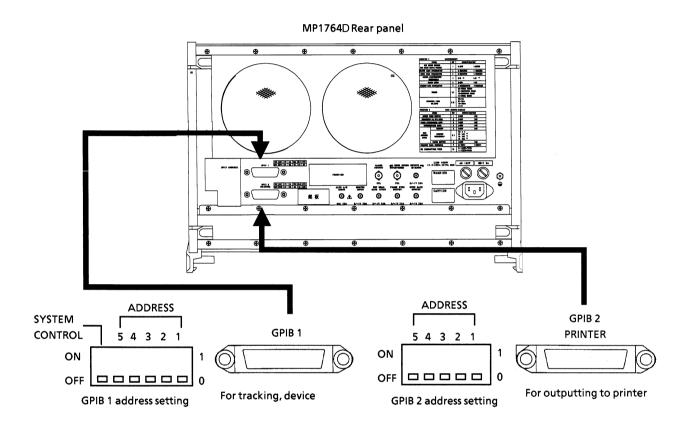

Set the GPIB address for the MP1764D after or before turning on the power. The GPIB 1 address (for device) is factory-set to 0. The address is preset with the GPIB ADDRESS switch on the rear panel. There is no need to set the address if using the default address. To change the address, put the MP1764D in the local state and input the address using the GPIB ADDRESS switch on the rear panel. Devices connected to the GPIB are normally in the local state when the power is turned on.

- **Note:** 1) The system always checks the GPIB "ADDRESS" switch settings when the power is turned on and determines its own address. So, changing the address is always allowed unless the system is in remote state.
 - 2) To control the system as a device from an external controller, set "SYSTEM CONTROL" of the GPIB 1 address switch to OFF(0).

3.2.1 Address setting

The GPIB addresses for two GPIB ports of MP1764D are set with the DIP switch on the rear panel, respectively.

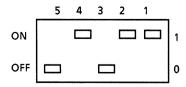

The GPIB 1's and GPIB 2's addresses can be set 0 to 30, respectively. Five switches are weighed differently: "5", "4", "3", "2" and "1" are respectively weighed to 16, 8, 4, 2 and 1.

To set the address to 11, for example, the operation is as follows: Since

$$11 = 8 + 2 + 1$$
,

set switches "4", "2" and "1" to ON as shown below.

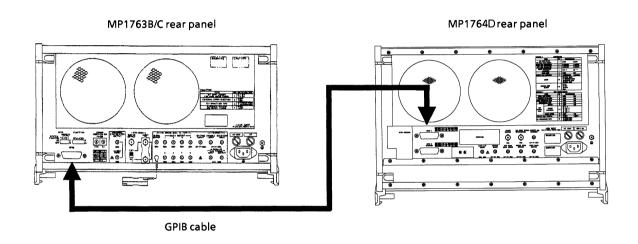

However, address 31, where all the switches are set to ON, is assumed to be address 0.

3.2.2 Connection with MP1763B/C during the tracking operation

Tracking operation is a function that pattern settings are made to be synchronized with each other between MP1763B/C and MP1764D. Either MP1763B/C or MP1764D is made to be a Master and the other is made to be a Slave, and the settings for the Slave are synchronized with those for the Master.

(1) If MP1763B/C is a Master and controls MP1764D:

When the settings for MP1763B/C are set to MP1764D via GPIB, the setting and connection are as follows:

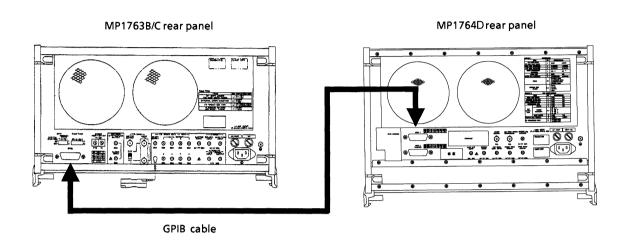

- a) Like the diagram above, the GPIB connector on the MP1763B/C's rear panel is connected with the GPIB 1 connector on the MP1764D via the GPIB cable (included).
- b) Set "SYSTEM CONTROL" of the GPIB address switch on the MP1763B/C' rear panel to ON (1).
- c) Set the value of the GPIB 1 address switch on the MP1764D's rear panel to that of MP1763B/C's GPIB address + 2.
- d) Turn on the MP1763B/C power again.
- e) Set the TRACKING key on the MP1763B/C's front panel to ON.

By now, you are ready to perform pattern-tracking.

(2) If MP1764D is a Master and controls MP1763B/C:

When the settings for MP1764D are set for MP1763B/C via GPIB, the setting and connection are as follows:

- a) Like the diagram above, the GPIB 1 connector on the MP1764D's rear panel is connected with the GPIB connector on the MP1763B/C via the GPIB cable (included).
- b) Set "SYSTEM CONTROL" of the GPIB 1 address switch on the MP1764D's rear panel to ON (1).
- c) Set the value of the GPIB address switch on the MP1763B/C's rear panel to that of MP1764D's GPIB 1 address + 2.
- d) Turn on the MP1764D power again.
- e) Set the TRACKING key on the MP1764D's front panel to ON.

By now, you are ready to perform pattern-tracking.

(3) Items to be tracked between MP1763B/C and MP1764D

The setting items to be tracked using pattern-tracking function are as follows:

PATTERN SYNC MODE DISPLAY SELECT BIT BLOCK ERROR WINDOW MINLYSIS HORMAL FRAME QUICK BIT WINDOW BLOCK WINDOW FERRÓR MALYSIS PATTERN TRACKING GUARD ОH LOADING 0

Pattern-setting area on the MP1764D's front panel

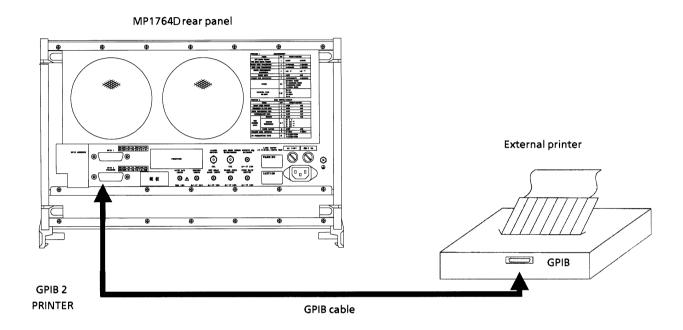

Items to be tracked are pattern-settings for the shaded area shown on the above diagram.

Within the shaded area shown above, however, the area where a setting for MP1763B/C does not coincide with that for MP1764D (such as error analysis data) cannot be pattern-tracked.

For more information on the setting items to be pattern-tracked, see "APPENDIX D Tracking Items List."

3.2.3 Connection with external printer

The MP1764D is provided with the GPIB port for outputting measured data to an external printer. When the measured data is output to an external printer, the connection and address setting are as follows:

- a) Like the diagram above, the GPIB 2, PRINTER connector on the MP1764D's rear panel is connected with the GPIB connector on an external printer via the GPIB cable.
- b) Set the GPIB 2, PRINTER address switch on the MP1764D's rear panel.
- c) Set the address on an external printer to the MP1764D's GPIB 2, PRINTER address set in b) +2.
- d) Set the "PRINTER ON" or "MANUAL PRINT" key on the MP1764D's front panel to ON.

By now, measured data is ready for being output.

If measured data is non-available (e.g., during measurement halt), however, it is not output.

(Blank)

SECTION 4 INITIAL SETTINGS

There are 3 levels of initialization for the GPIB interface system. The first level is bus initialization in which the system bus is in the idle state. The second level is initialization for message exchange in which devices are able to receive program message. The third level is device initialization in which device functions are initialized. These levels of initialization prepare a device for operation.

TABLE OF CONTENTS

4.1	Bus Initialization by the IFC Statement	4-4
4.2	Initialization for Message Exchange by DCL and SDC Bus Commands	4-6
4.3	Device Initialization by the *RST Command	4-8
4.4	Device Initialization by the INI Command	4-10
4.5	Device Status at Power-on	4-11

(Blank)

The IEEE 488.1 standard stipulates the following two levels for the initialization of the GPIB system.

• Bus initialization

All interface functions connected to the bus are initialized by IFC messages from the controller.

• Device initialization

The DCL GPIB bus command returns all devices to their initial states while the SDC GPIB bus command returns designated devices only to their stipulated initial states.

In the IEEE 488.2 standard the initialization levels are divided into three, with bus initialization as the highest level. The second level is initialization for message exchange and third device initialization. This standard also stipulates that a device must be set to a known state when the power is turned on. The above details are summarized in the table below.

Level	Initialization type	Description	
1	Bus initialization	All interface functions connected to the bus are initialized by IFC messages from the controller	
2	Initialization for the exchange of messages	The DCL and SDC GPIB bus commands perform initialization for message exchange for all devices and designated devices, respectively, as well as nullifying the function to report the end of operation to the controller.	
3	Device initialization	The *RST or INI reset command resets only specified devices, from among the connected to the GPIB, to their known states regardless of the conditions und which they were previously being used	

For levels 1, 2 and 3, see the following description that focuses the instructions for executing these initializations and their results which mean the items to be initialized. Also, the known states to be set at power-on are described.

IFC @

4.1 Bus Initialization by the IFC Statement

■ Syntax	
	IFC△@ select code

■ Example

IFC @1

■ Explanation

The IFC line of the GPIB in the stipulated select code is kept active for approximately 100 μ s (electrically low level state).

When IFC@ is executed, the interface functions of all devices connected to the bus line of the GPIB in the select code are initialized. Only the system controller can send this command.

The initialization of interface functions involves erasing the settings made by the controller and resetting them to their initial states. In the table below, \bigcirc indicates the functions which are initialized; \triangle indicates the functions which are partially initialized.

No	Function	Symbol	Initialization by IFC
1	Source handshake	SH	0
2	Acceptor handshake	AH	0
3	Talker or extended talker	T or TE	0
4	Listener or extended listener	L or LT	0
5	Service request	SR	Δ
6	Remote / local	RL	
7	Parallel poll	PP	
8	Device clear	DC	
9	Device trigger	DT	
10	Controller	С	0

Even if the IFC statement is True (the level of the IFC line is set to low by execution of the IFC@ statement), levels 2 and 3 initialization are not performed, so, it does not affect devicer operating conditions (parameter setting, LEDs ON / OFF, etc.).

The following lists the effect of the **IFC** statement on some device functions taken from the table above.

① Talker / listener	All talkers and listeners are put in the idle state (TIDS, LIDS) within $100 \mu s$.
② Controller	The controller is put in the idle state (CIDS — Controller Idle State) within $100\mu s$ if it is not active (SACS — System Control Active State).
③ Return of control	If the system controller (the device on the GPIB initially designated as controller) has given up its control function to another device, executing IFC@ returns the control function to the system controller. The system controller's RESET key causes it to output an IFC message.
(4) Service request devices	The IFC statement has no effect on a device sending an SRQ message to the controller (the SRQ line in the figure below is set to low level by the device), but it does clear the condition that the controller has put all devices connected to the system bus into serial poll mode.
⑤ Devices in the remote state	The IFC statement has no effect on devices in the remote state.

DCL @

4.2 Initialization for Message Exchange by DCL and SDC Bus Commands

Syntax	
	$DCL\triangle @ \ select\ code\ [primary\ address][secondary\ address]$

Example

DCL @1 Initializes all devices under the bus for message exchange (sending DCL).
 DCL @103 Initializes only the device whose address is 3 for message exchange (sending SDC).

■ Explanation

This statement carries out the initialization for message exchange for all devices on the GPIB of the specified select code or that for specified devices only.

The purpose of initialization for message exchange is to prepare devices to receive new commands from the controller when the sections of devices used for the exchange of messages are in an inappropriate state to be controlled by the controller as the result of the execution of other programs, etc. There is no need to change the panel settings, however.

■ When only the select code is specified

This carries out the initialization for message exchange of all devices on the GPIB of the specified select code. **DCL**@ sends a **DCL** (Device Clear) bus command to the GPIB.

■ When the address is specified

Performs initialization for message exchange for the specified device. After clearing the listeners on the GPIB of the specified select code, the specified device only is set to listener and an **SDC** (Selected Device Clear) bus command is output.

■ Items to be initialized for message exchange

① Input buffer and output queue	Cleared
② Parser, execution controller and response formatt	er . Reset
③ Device commands including *RST	All commands that interfere with the execution of these commands are cleared.
① Coupled-parameter program messages	All commands (in the execution pending sections and queries) are discarded because they are coupled parameters.
⑤ Processing the *OPC command	Puts a device in OCIS (Operation Complete Idle State). As a result, the operation complete bit cannot be set in the standard event status register.

⑥ Processing the * OPC? query	Puts a device in OQIS (Operation Complete Query Idle State). As a result, the operation complete bit cannot be set in the output queue. The MAV bit is cleared.
Automation of system construction	The *ADD and *DLF common commands are nullified. (These commands are not supported on the MP1764D)
® Device functions	Functions for message exchange are put in the idle state. The device continues to wait for a message from the controller.

CAUTION

Device clear is prohibited from carrying out the followings.

- ① Changing the current device settings or stored data.
- ② Interrupting front panel I I O
- ③ Changing any other status bit except clearing the MAV bit, when clearing the output queue.
- **4** Interrupting or having any effect on the device that is currently operating.

■ Transmission sequence of GPIB bus commands by the DCL@ statement.

The transmission sequence of the DCL and SDC GPIB bus commands by the **DCL@** statement is shown in the table below.

Statement	Bus command transmission sequence (at ATN line "LOW")	Data (at ATN LINE "HIGH")
DCL@ select code	UNL, DCL	
DCL@ device number	UNL, LISTEN address, [secondary address], SDC	

*RST

4.3 Device Initialization by the *RST Command

■ Syntax	
	*RST

Example

WRITE @103: "*RST" Initializes only the device of the address 3 with level 3.

■ Explanation

The ***RST** (Reset) is an IEEE 488.2 common command which resets a device with level 3.

Normally devices are set to various states using the commands specific to each device (device messages). The ***RST** command is one of these and is used to reset a device to a specific known state. The function of nullifying of the end of operation is the same as for level 2.

■ Specifying device number in WRITE@ statement

The device with the specified address is initialized with level 3.

After clearing the listeners on the GPIB of the specified select code while the ATN line is active, only the specified device is set to listener.

When the ATN line is false, the ***RST** command is sent.

■ Device Initialization Items

① Device-dependent functions and states	A device is returned to a known state regardless of its current condition. (See the next page for the list.)
② Processing of the *OPC command	The device is put into OCIS (Operation Complete Idle State). As a result, the operation complete bit cannot be set in the standard event status register.
③ Processing the *OPC? query	The device is put into OQIS (Operation Complete Query Idle State). As a result, the operation complete bit cannot be set in the output queue. The MAV bit is cleared.
Macro commands	Disables macro operations and puts a device in a mode in which it cannot receive macro commands. Also, the definition of macros is returned to the state specified by the system designer.

Note: The *RST command does not affect the items listed below.

- ① IEEE 488.1 interface state
- 2 Device address
- 3 Output queue
- **4** Service Request Enable Register
- **5** Standard Event Status Enable Register
- 6 Power-on-status-clear flag setting
- Calibration data affecting device specification
- ® Macros defined by the DMC (Define Macro Contents) command
- Response messages for the PUD (Protect User Data) query
- @ Response messages for the RDT (Resource Description Transfer) query

There are also preset parameters, etc specific to the MP1764D for the control of external devices, etc. (Refer to SECTION 8 for items ③, ④ and ⑤. The MP1764D does not support items ⑧ to ⑩.)

The table below shows the initial settings proper to the MP1764D for the functions and status.

Initial Settings

Group	Initial Settings	Notes
Setting States	Initialized	See Appendix C Initial Value List for Initial Values.
GPIB Address	Not initialized	
Time & Date	Not initialized	

INI

4.4 Device Initialization by the INI Command

■ Syntax		
	INI	
		· · · · · · · · · · · · · · · · · · ·

Example (program message)

WRITE @103:"INI" Initializing only the device assigned address 3 with level 3.

Description

The INI command is one of the device messages proper to MP1764D; this command is sent as a program message to the device from the controller to reset the device with level 3.

This command functions the same as the ***RST** command.

■ Specifying a device number in the WRITE@ statement

Initializes the device assigned a specified address with level 3.

The sequence of sending out commands is as follows; listener(s) is(are) released by the GPIB having a specified selection code while the ATN line is true, then only specified device(s) is(are) set to listener(s). When the ATN line turns to false, the **INI** command is output to the specified listener(s) as a program message.

■ Device's items to be initialized

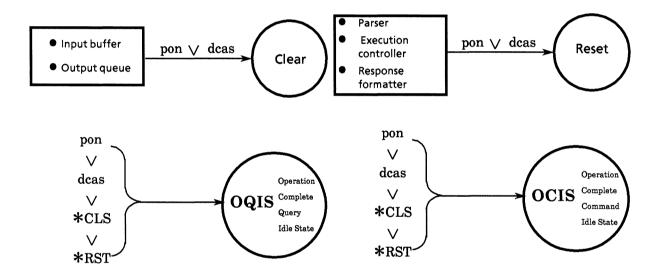

The device's items to be initialized are the same as those of the ***RST** command.

4.5 Device Status at Power-on

When the power is switched on:

- ① The device status is the one when the power was last switched off.
- ② The input buffer and output queue are cleared.
- 3 The parser, execution control and response formatter are reset.
- ① The device is put into the OCIS (Operation Complete Command Idle State).
- ⑤ The device is put into the OQIS (Operation Complete Query Idle State).
- ⑥ The MP1764D supports the ***PSC** command. Therefore, when the PSC flag is true and all event status enable registers are cleared. Events can be recorded after the registers have been cleared.

As a special case for 1, the settings are the same as the ones in the Initial Settings Table (in C-1) the first time the MP1764D is switched on after delivery. The diagram below shows the transition states of items 2 to 5.

■ Items which do not change at power-on

- ① Address
- ② Related calibration data (The MP1764D has no calibration data.)
- 3 Data or states which are changed by responses to the common queries listed below.

*IDN?

*OPT?

*PSC?

*PUD? (Not supported by the MP1764D)

*RDT? (Not supported by the MP1764D)

■ Items related to power-on-status-clear (PSC) flag

The PSC flag has no effect on the Service Request Enable Register, Standard Event Status Enable Register or Extended Event Status Enable Register when it is false. These registers are cleared when it is true or the ***PSC** command is not being executed.

■ Items which change at power on

- ① Current device function state
- 2 Status information
- 3 *SAV / *RCL registers
- Marco-definition defined by the ★DDT command (not supported by the MP1764D)
- (not supported by *DMC command (not supported by the MP1764D)
- ⑥ Macros enabled by the **★EMC** command (not supported by the MP1764D)
- Addresses received by the ★PCB command (not supported by the MP1764D)

SECTION 5 LISTENER INPUT FORMAT

Two types of data message are transmitted between the controller and a device via the system interface when the bus is in the data mode (i.e. the ATN line is false): program messages and response messages. This section describes the format of program messages received by the listener.

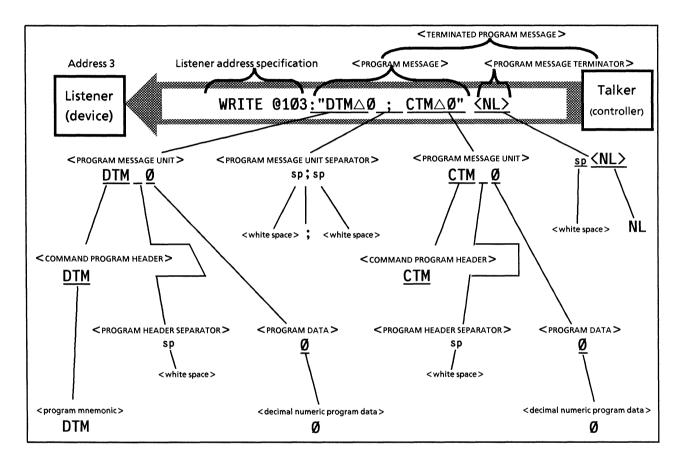

TABLE OF CONTENTS

5.1	Listener Input Program Message Syntax Notation				
	5.1.1	Separators, terminators and spaces before headers	5-4		
	5.1.2	General format for program command messages	5-6		
	5.1.3	General format for query messages	5-7		
5.2	Functional Elements of Program Messages5				
	5.2.1	<terminated message="" program=""></terminated>	5-8		
	5.2.2	<program message="" terminator=""></program>	5-9		
	5.2.3	<white space=""></white>	5-10		
	5.2.4	<program message=""></program>	5-10		
	5.2.5	<program message="" separator="" unit=""></program>	5-11		
	5.2.6	<program message="" unit=""></program>	5-11		
	5.2.7	< COMMAND MESSAGE UNIT > and < QUERY MESSAGE UNIT >	5-12		
	5.2.8	<command header="" program=""/>	5-13		
	5.2.9	<query header="" program=""></query>	5-15		
	5.2.10	<program header="" separator=""></program>	5-16		
	5.2.11	<program data="" separator=""></program>	5-16		
5.3	Program Data Format				
	5.3.1	< DECIMAL NUMERIC PROGRAM DATA >	5-18		
	5.3.2	<non-decimal data="" numeric="" program=""></non-decimal>	5-20		

(Blank)

Program messages comprise a sequence of program message units which are either program commands or program queries.

In the diagram below, in which the data input and clock input termination voltage is set to GND, the controller sends a program message, composed of two program units $DTM \triangle \mathcal{O}$ and $CTM \triangle \mathcal{O}$ linked by a program-message unit separator to a device.

The program message format is a sequence of functional elements which are the minimum requirement for indicating a function. The groups of upper-case alphabetic characters enclosed by < > in the diagram above are examples of functional elements. Functional elements can be further divided into "encoded elements". The groups of lower-case alphabetic characters enclosed by < > in the diagram above are examples of encoded elements.

A diagram indicating the selection of functional elements on a specific path is called a functional syntax diagram, while a diagram indicating the selection of encoded elements on a specific path is called an encoded syntax diagram. The following pages explain program message format using these two diagrams.

Encoded elements represent encoded elements of the actual bus required to send functional element data bytes to a device. Listeners (which receive the functional element data bytes) determine whether they conform to the rules for encoding. If they do not, the listener does not recognize them as functional elements and generates a command error.

5.1 Listener Input Program Message Syntax Notation

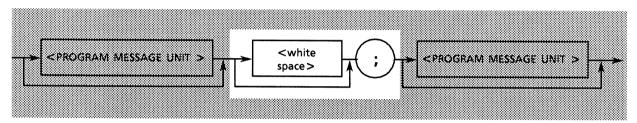

The following explains program message functional element and program data formats (Compound and common commands have been omitted)

5.1.1 Separators, terminators and spaces before headers

(1) Program message unit separators

The format for separating program message units is optional space(s) + semicolon.

Example 1: General format for separating two program message units

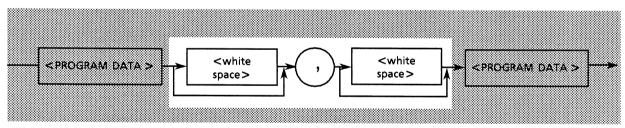

Example 2: 1 space + semicolon

DTM $\emptyset \triangle$; CTM \emptyset

(2) Program data separators

The format for separating program data items is optional space(s) + comma + optional space(s).

Example 1: General format for separating 2 items of program data

Example 2: Comma only

WRT 1,Ø

Example 3: Comma + 1 space

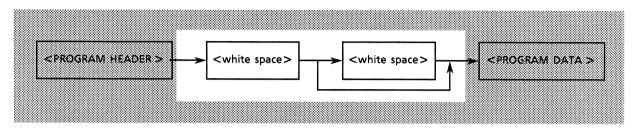

WRT $1,\triangle\emptyset$

(3) Program header separators

The format for separating a program header from program data is:

1 space + optional space(s).

Example 1: General format for single command program header

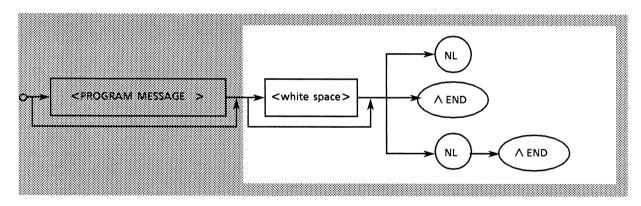

Example 2: 1 space

 $DTM\triangle \emptyset$

(4) Program message terminators

The format for the terminator at the end of a program message is: optional space(s) + any of NL, EOI or NL + EOI

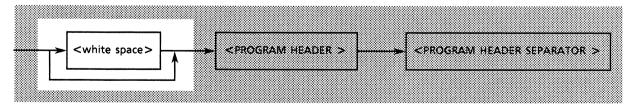

General format:

(5) Spaces before headers

An optional space may be placed before a program header.

General format:

Example: 1 space is placed before the second program header SPF.

DTM Ø;△CTM Ø

5.1.2 General format for program command messages

(1) Messages not accompanied by data

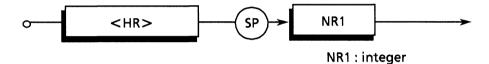

HR: COMMAND PROGRAM HEADER

Examples:

INI Initializes setting

(2) Messages accompanied by integer data

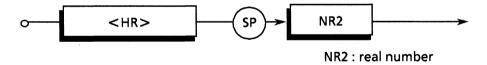

Example:

DMS△Ø Sets Error measurement display unit Ratio DMS\(\triangle 1 \) Sets Error measurement display unit Count DMS\(\triangle 2\) Sets Error measurement display unit EI DMS△3 Sets Error measurement display unit % EF1

DMS△4 Sets Error measurement display unit CLOCK FREQUENCY

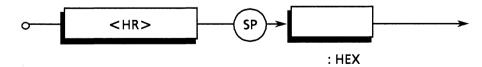

(3) Messages accompanied by real numbers

Example:

DTH△-3.000 Sets input data threshould level.

(4) Messages accompanied by HEX (hexadecimal)

Example:

BIT△#H FFFF

(5) Messages accompanied by multiple program data items

Example:

PRD \$\triangle 99,23,59,59\$ Sets measurement time to 99 days 23 hours 59 minutes 59 seconds.

5.1.3 General format for query messages

A query program header is indicated by placing a? at the end of a command program header.

(1) Messages not accompanied by query data

Example:

DTM? Requests data input termination voltage data

(2) Messages accompanied by query data

Example:

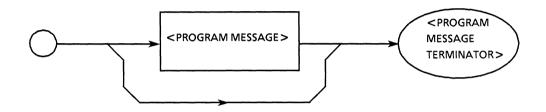

FSH? 1 Requests file information whose file No. is from 51 in the files saving measurement conditions in a floppy disk.

5.2 Functional Elements of Program Messages

A device accepts a program message by detecting the terminator at the end of it. The functional elements of program messages are explained below.

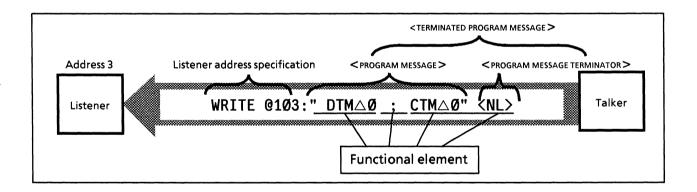

5.2.1 < TERMINATED PROGRAM MESSAGE >

A < TERMINATED PROGRAM MESSAGE > is defined as follows.

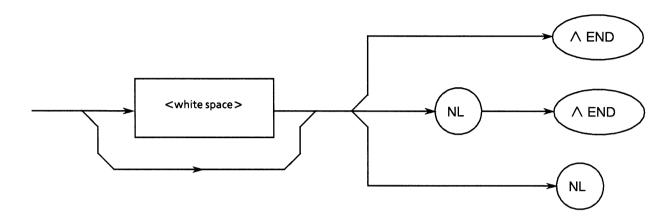

A <TERMINATED PROGRAM MESSAGE > is a data message which has all the functional elements required for transmission from the controller to a listener device. A <PROGRAM MESSAGE TERMINATOR > is attached to the end of a <PROGRAM MESSAGE > to terminate its transmission.

Example: < TERMINATED PROGRAM MESSAGE> which sends 2 commands with a WRITE statement.

5.2.2 < PROGRAM MESSAGE TERMINATOR >

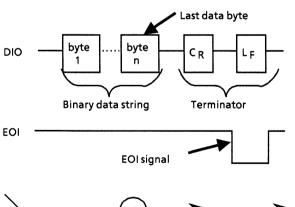

A < PROGRAM MESSAGE TERMINATOR > is defined as follows

A <PROGRAM MESSAGE TERMINATOR> terminates a sequence of one or more <PROGRAM MESSAGE UNIT> elements of a fixed length.

NL: NL is defined as a single ASCII code byte (decimal 10), i.e. the ASCII control code LF (Line Feed) used to return the carriage and bring the print position to the beginning of the next line. It is also called NL (New Line). When a < PROGRAM MESSAGE > is sent by a WRITE@ statement, there is no need to write the generation of CR.LF code into programs because it is automatically sent by this statement. To generate LF code only, the following statement is executed at the beginning of a program: TERM IS CHR\$ (10)

END: The EOI signal can be generated by making the EOI line (one of GPIB management bus lines) true (low level).

LF

EOI ON / OFF is one statement for controlling the EOI line. The default is EOI OFF which means that the EOI line is not controlled. Specifying EOI ON causes an EOI signal to be transmitted at the same time as terminator LF when the last data byte of the WRITE@ statement is transmitted.

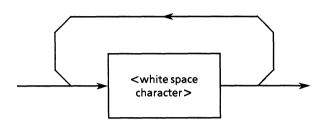

A <PROGRAM MESSAGE > may also be terminated, without sending LF, by using an END signal only.

Note:

CR returns the carriage to the beginning of the same line, but is generally ignored on the listener side. However, because there is a lot of equipment already on the market which uses CR and LF code, most controllers are designed to output LF code following CR code.

5.2.3 < white space >

A < white space > is defined as follows.

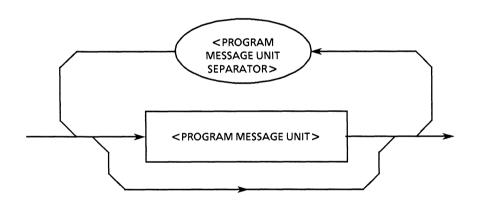

A < white space character > is defined as a single ASCII code byte in the range 00 to 09, 0B to 20 (decimal 0 to 9, 11 to 32).

This range includes ASCII control signals and space signal except new line. A device either treats them as ASCII control signals but as spaces, or skips over them.

5.2.4 < PROGRAM MESSAGE >

A < PROGRAM MESSAGE > is defined as follows.

A <PROGRAM MESSAGE > consists of zeros, or a sequence of one or several <PROGRAM MESSAGE UNIT > elements. <PROGRAM MESSAGE UNIT > elements are either programming commands or data sent from the controller to devices. The <PROGRAM MESSAGE UNIT SEPARATOR > element is used to separate <PROGRAM MESSAGE UNITS >.

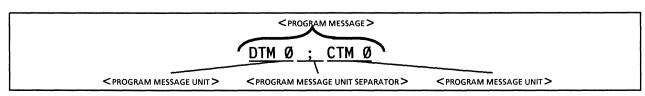

Example 1:

The program message which sets the data input termination voltage to GND.

DTM Ø

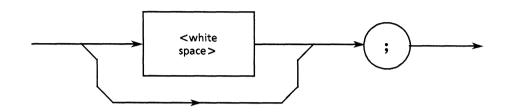

Example 2:

The program message which sets as same as the Example 1, and then sets the clock input termination voltage to GND.

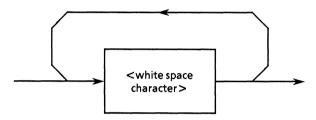

5.2.5 < PROGRAM MESSAGE UNIT SEPARATOR >

A < PROGRAM MESSAGE UNIT SEPARATOR > is defined as follows.

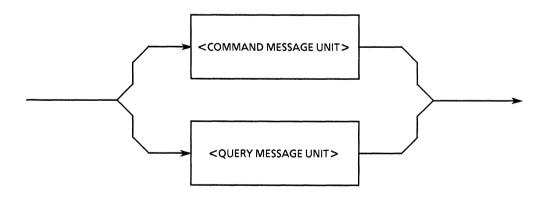

<white space>is defined as follows.

The <PROGRAM MESSAGE UNIT SEPARATOR> separates the <PROGRAM MESSAGE UNIT> elements in a <PROGRAM MESSAGE>. A device interprets a semicolon as the separator of <PROGRAM MESSAGE UNIT> elements so, it skips the <white space characters> before and after the semicolon. <white space characters> make a program easy to read. If there is one after a semicolon, it is the <white space> for the next program header.

5.2.6 < PROGRAM MESSAGE UNIT >

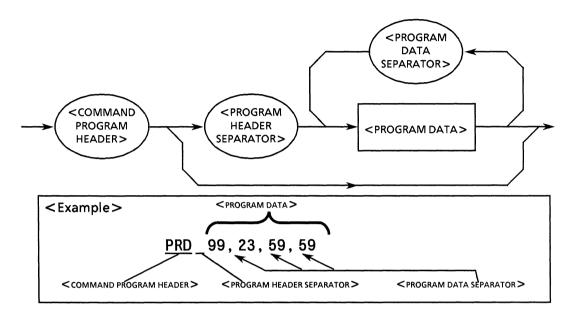

A < PROGRAM MESSAGE UNIT > is defined as follows.

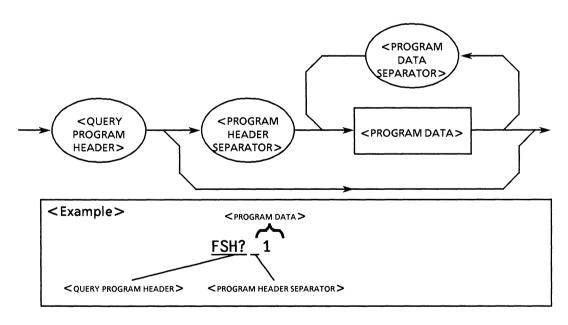

A <PROGRAM MESSAGE UNIT> is either the <COMMAND MESSAGE UNIT> or <QUERY MESSAGE UNIT> received by a device. <COMMAND MESSAGE UNITS> and <QUERY MESSAGE UNITS> are explained in detail on the next page.

5.2.7 < COMMAND MESSAGE UNIT > and < QUERY MESSAGE UNIT >

1) A < COMMAND MESSAGE UNIT > is defined as follows.

2) A < QUERY MESSAGE UNIT > is defined as follows.

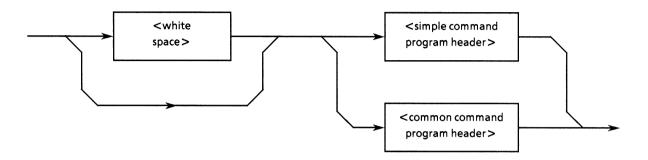

For both < COMMAND MESSAGE UNITS > and < QUERY MESSAGE UNITS >, a space must be inserted between the program header and any program data immediately following it. The application, function and operation of the program data can be seen from the program header. If there is no program data; the application, function or operation to be performed by a device is indicated by the header alone.

The <COMMAND PROGRAM HEADER> is a command by which the controller controls a device. <QUERY PROGRAM HEADER> is a command used for sending a query from the controller to a device so that the controller can receive a response message from it.

The special feature of the header is that a question mark is always tagged on at the end to indicate that it is a query.

5.2.8 < COMMAND PROGRAM HEADER >

 $A < COMMAND\ PROGRAM\ HEADER >$ is defined as follows. $A < white\ space > may\ be\ placed\ in\ front\ of\ each\ header.$

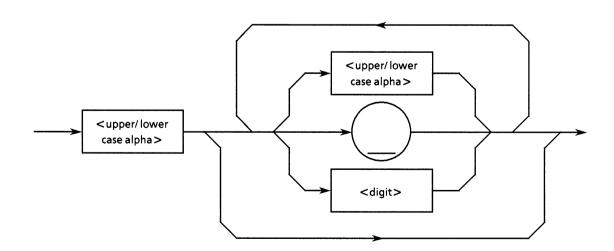

1) A < simple command program header > is defined as follows.

2) A < common command program header > is defined as follows.

<COMMAND PROGRAM HEADER>

Indicates the application, function and operation of a program to be executed by a device. If there is no program data; the application, function and operation to be executed by the device are indicated in the header itself. This is expressed in ASCII code characters by a program mnemonic>, usually called just mnemonic.

The following explains items 1), 2) and 3) above and the definition of mnemonics.

A mnemonic must begin with upper-case or lower-case alphabetic characters. Following that, upper-case alphabetic characters from A to Z, lower-case alphabetic characters, the underline and numbers from 1 to 9 can be used in any combination. The maximum length of a mnemonic is 12 characters but they usually consist of 3 to 4 upper-case alphabetic characters. There are no spaces between characters.

• <upper / lower-case alpha>

Defined as a single ASCII code byte in the range 41 to 5A, 61 to 7A (decimal 65 to 90, 97 to 122 = A to Z, a to z).

• <digit>

Digits are defined as single ASCII code byte in the range 30 to 39 (decimal 48 to 57 = numeric 0 to 9).

• (_)

The underline is defined as the single ASCII code byte 5F (decimal 95).

<simple command program header>

The above definition for program mnemonic> is used as it is.

<common command program header>

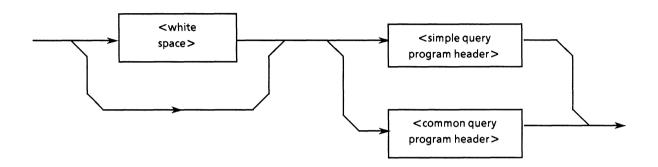

Example

The operation (of the device with address 3 connected to the select code 1 GPIB interface) is terminated and it is put in the idle state; then each device is reset to the initial state stipulated for it.

WRITE @103:"*RST": *RST is the common IEEE 488.2 command which executes the above.

5.2.9 < QUERY PROGRAM HEADER>

 $A <\! QUERY\ PROGRAM\ HEADER\! >$ is defined as follows. A $<\! white\ space\! >$ is placed before each header.

1) A < simple query program header > is defined as follows.

2) A < common query program header > is defined as follows.

■ <QUERY PROGRAM HEADER>

A < QUERY PROGRAM HEADER > is a command for sending a query from the controller to a device so that the controller can receive a response message from it. A? is always added at the end of the header to indicate a query.

F Except for the ? after it, the format of the <QUERY PROGRAM HEADER > is identical to that of the <COMMAND PROGRAM HEADER >.

5.2.10 < PROGRAM HEADER SEPARATOR >

A < PROGRAM HEADER SEPARATOR > is defined as follows.

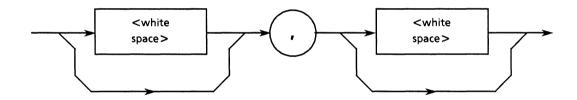

A <PROGRAM HEADER SEPARATOR> is used to separate a <COMMAND PROGRAM HEADER> or <QUERY PROGRAM HEADER> from <PROGRAM DATA>. When there is more than one <white space character> between a program header and program data, the first is interpreted as the separator and the rest are skipped. <white space character> are used to make a program easy to read.

So, there must always be one header separator between the header and the data to indicate the end of the program header and the start of the program data.

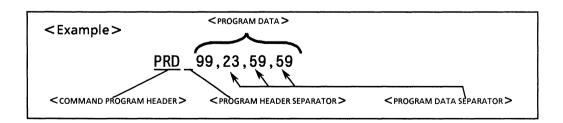

5.2.11 < PROGRAM DATA SEPARATOR >

A < PROGRAM DATA SEPARATOR > is defined as follows.

When a < COMMAND PROGRAM HEADER> or < QUERY PROGRAM HEADER> has many parameters, A < PROGRAM DATA SEPARATOR> is used to separate them.

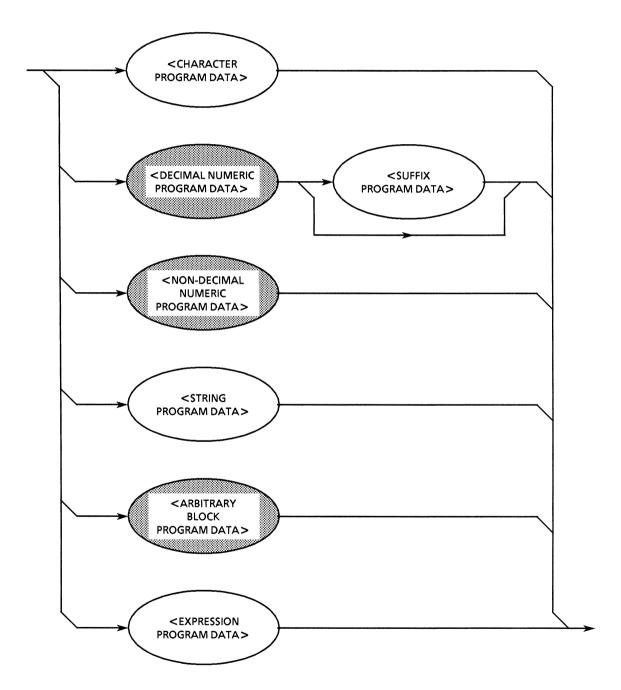

A comma must be used with a <PROGRAM DATA SEPARATOR>, but a white space does not always have to be used. A white space before or after the comma is skipped. They are used to make a program easier to read.

5.3 Program Data Format

The following describes the format of < PROGRAM DATA >.

<PROGRAM DATA > functional elements are used in sending various types of parameter related to the program header. The diagram below shows the different types of program data. The MP1764D accepts the data types in the shaded ovals.

5.3.1 < DECIMAL NUMERIC PROGRAM DATA >

< DECIMAL NUMERIC PROGRAM DATA > is program data for sending numeric contents expressed in decimal notation. There are 3 formats for expressing decimal numbers: integer format, fixed point format and floating point format. The MP1764D does not use the floating point format.

The program data transmission in the integer or fixed point formt used in the MP1764D is described.

Note: The data will processed at any data format in the manner described below.

• Rounding off of numeric elements

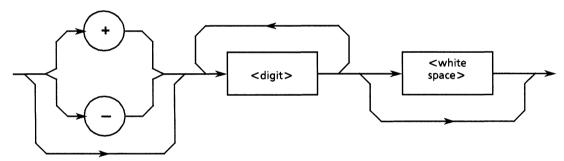

When a device receives < DECIMAL NUMERIC PROGRAM DATA > elements with more digits than it can handle, it ignores the sign and rounds it off to the nearest whole number.

• Outside-range data

When a < DECIMAL NUMERIC PROGRAM DATA > element is outside the permissible range for the program header, execution error is reported.

(1) Integer format - NR1 transmission

In the diagram below, an integer NR1, i.e. a decimal number which does not contain a floating point or exponential expression, is transmitted.

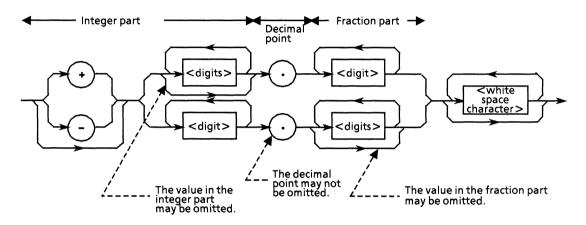

- Zeros can be inserted at the beginning. $\rightarrow 005$, +000045
- Spaces cannot be inserted between a + or sign and a number \rightarrow +5, + \triangle 5 (X)

X: not allowable

- Spaces can be inserted after a number. $\rightarrow +5\triangle\triangle\triangle$
- The + sign is optional. \rightarrow +5, 5
- Commas may not be used to separate digits \rightarrow 1,234,567 (X)

(2) Fixed point format - NR2 transmission

The example below shows the transmission of NR2, a real number with no integer or exponential expressions having digits after the decimal point. The syntax diagram consists of an integer part, the decimal point and a fraction part.

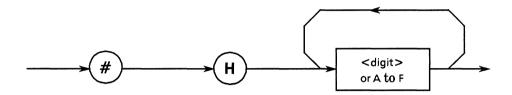

- The numeric expression of the integer format is applied to the integer part.
- No spaces may be inserted between numbers and the decimal point $\rightarrow +753 \triangle .123$ (X)

X: not allowable

- Spaces may be inserted after the fraction part $\rightarrow +753.123 \triangle \triangle \triangle \triangle$
- There need not be any numbers before the decimal point $\rightarrow .05$
- A + or sign can be inserted before the decimal point \rightarrow +.05, -.05
- A number can end in a decimal point \rightarrow 12.

5.3.2 < NON-DECIMAL NUMERIC PROGRAM DATA >

<NON-DECIMAL NUMERIC PROGRAM DATA > is program data for sending hexadecimal value data as non-decimal numeric data. The non-decimal data always begins from the # mark. The non-decimal data is defined as a coded syntax diagram shown in the below. When strings except for a specified character string is sent, a command error generates.

Characters followed by #H are received at the device as an unsigned hexadecimal numeric. Characters in the () means corresponding decimal numbers.

Example:

The program message which sets the data input timing voltage to GND.

#HABCD (43, 981 D)

SECTION 6 TALKER OUTPUT FORMAT

Two types of data messages are transmitted between the controller and a device via the system interface when the bus is in the data mode, i.e. when the ATN line is false: program messages and response messages. This section describes the format of the response messages sent by a talker device to the controller.

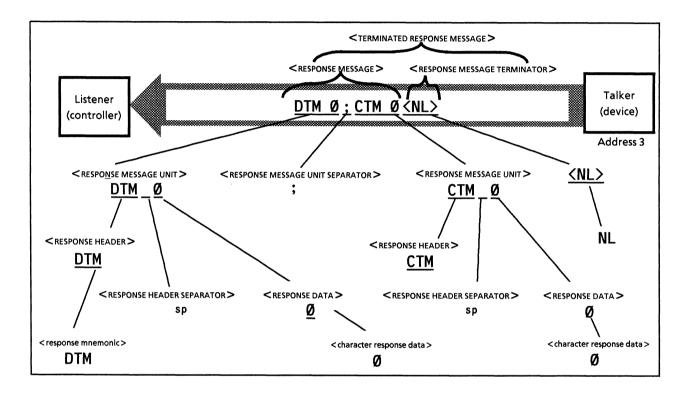

TABLE OF CONTENTS

6.1	Syntax	Differences Between Formats of Listener Input and Talker Output	6-4
6.2	Functional Elements of Response Message		
	6.2.1	<terminated message="" response=""></terminated>	6-5
	6.2.2	< RESPONSE MESSAGE TERMINATOR >	6-6
	6.2.3	<response message=""></response>	6-7
	6.2.4	< RESPONSE MESSAGE UNIT SEPARATOR >	6-8
	6.2.5	< RESPONSE MESSAGE UNIT >	6-8
	6.2.6	< RESPONSE HEADER SEPARATOR >	6-9
	6.2.7	<response data="" separator=""></response>	6-9
	6.2.8	<response header=""></response>	6-9
	629	< RESPONSE DATA >	6-11

(Blank)

Response messages convey measured results, setting conditions and status information. Some response messages have a header, and others not.

The diagram below, as an example, shows each response message is sent from a device to a controller as an ASCII character string with a header for a data input termination voltage query message unit **DTM?** and a clock input termination voltage query message unit **CTM?**.

The program for the above would be as follows:

100 WRITE @103:"DTM? "! Data input termination voltage query message request
 110 READ @103:A\$! When the terminator NL is detected, the response message DTM△Ø is read into A\$.
 120 WRITE @103:"CTM? "! Clock input termination voltage query message request
 130 READ @103:B\$! Clock input termination volgage response message CTM△Ø

As for program messages, response messages are made up of a sequence of functional elements which are the minimum unit capable of expressing function. The upper-case alphabetic character items inside < > in the diagram above are examples of functional elements. Functional elements can be further subdivided into coded elements. The lower-case alphabetic character items inside < > in the diagram above are examples of coded elements. Thus, the way of expressing items on functional syntax diagrams is the same for talker and listener.

The following pages explain the talker device output format focussing on the differences between it and the listener device input format.

6.1 Syntax Differences Between Formats of Listener Input and Talker Output

The differences in syntax between listener device input and talker device output formats are:

• Listener format

There is flexibility in writing programs to make program messages (from the controller) easy to receive by the listener. Consequently, program messages can perform the same function despite differences in message description between them. For example, the free insertion of < white spaces > in separators and terminators makes programs easy to read.

• Talker format

Strict rules govern the syntax of response messages sent from device to controller to make them easy to receive. Thus, in contrast to the listener format, there is only one notation for each function in the talker format.

The table below summarizes the differences between the listener and talker formats. Space in the table means < white space >.

Item	Listener-input program message syntax	Talker-output response message syntax
Characteristics	(Flexible)	(Strict)
Alphabetic characters	Either upper or lower-case characters can be used. Only upper-case for header.	Upper-case only
Before / after E in NR3 exponent	Optional space(s) + E/e + optional space(s) Not supported by the MS2802A.	Upper-case E only
+ sign in NR3 exponent	Can be omitted. Not supported by the MS2802A.	Cannot be omitted
<white space=""></white>	Two or more spaces can be placed before or after a separtor and before a temrinator.	Not used
Message unit	Header with program data Header without program data	Data with headerData without header
Unit separator	Optional space(s) + semicolon	Semicolon only
Space before header	Optional space(s) + header	Header only
Header spearator	Header + 1 or more spaces	Header + one \$20*
Data separator	Optional space(s) + comma + optional space(s)	Comma only
Terminator	Optional space(s) + any of NL, EOI or NL + EOI	NL + EOI

^{*} ASCII code byte 20 (decimal 32 = ASCII character SP: space)

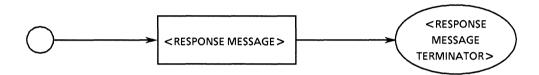

6.2 Functional Elements of Response Message

Response messages output by the talker are accepted by the controller once they have been terminated by the NL END signal. The following describes the functional elements of the response message.

As the rules for syntax diagram notation are the same as for program messages, refer to Section 5 for the details. The explanation of functional elements and encoded elements has been omitted where it would overlap with that for program messages. Refer to Section 5 as required.

6.2.1 <TERMINATED RESPONSE MESSAGE>

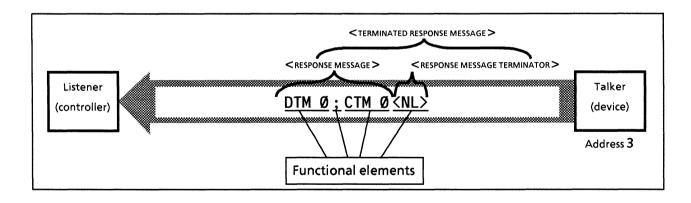

A < TERMINATED RESPONSE MESSAGE > is defined as follows:

A < TERMINATED RESPONSE MESSAGE > is a data message, containing all the functional elements required for transmission, sent from a talker device to the controller.

A < RESPONSE MESSAGE TERMINATOR > is attached to the end of a < RESPONSE MESSAGE > to terminate its transmission.

Example: A < TERMINATED RESPONSE MESSAGE > comprising 2 message units

6.2.2 < RESPONSE MESSAGE TERMINATOR >

A < RESPONSE MESSAGE TERMINATOR > is defined as follows.

A <RESPONSE MESSAGE TERMINATOR> is placed after the last <RESPONSE MESSAGE UNIT> to terminate a fixed length sequence consisting of one or more <RESPONSE MESSAGE UNIT> elements.

Executing the following statements listed below for **NL** and **END** at the start of a program outputs terminator LF together with the EOI signal, to indicate the END, when the last data byte is transmitted.

• For NL(LF): TERM IS CHR\$(10)

• For END (EOI): EOI ON

Example: To read the current center frequency setting

10 LET ADR=101

20 TERM IS CHR\$(10)! LF (new line) is assigned as the terminator code.

3Ø EOI ON! When the last data byte is transmitted, the EOI signal is sent which makes the EOI line

true

40 WRITE @ADR: "DTM?"! Query to read the data input termination voltage

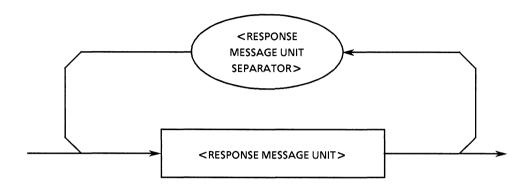

50 READ @ADR: A\$! EOI signal terminates the reading of response data

60 PRINT A\$

7Ø END

6.2.3 < RESPONSE MESSAGE >

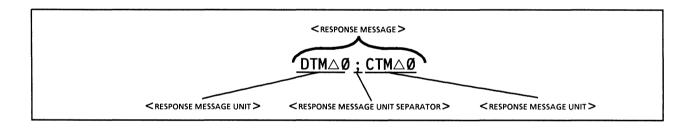

A < RESPONSE MESSAGE > is defined as follows.

A <RESPONSE MESSAGE > consists of one <RESPONSE MESSAGE UNIT > element or a sequence of many <RESPONSE MESSAGE UNIT > elements. A <RESPONSE MESSAGE UNIT > element is a single message sent from a device to the controller. A <RESPONSE MESSAGE UNIT SEPARATOR > element is used to separate <RESPONSE MESSAGE UNIT > elements.

Example:

Attaches the DTM and CTM headers to the data input termination voltage and clock input termination voltage, and transmits them in 1- character fixed format.

6.2.4 < RESPONSE MESSAGE UNIT SEPARATOR >

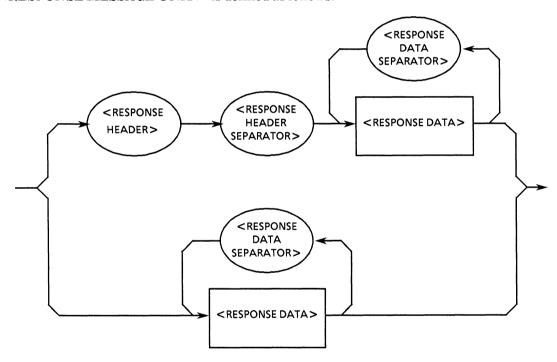

A < RESPONSE MESSAGE UNIT SEPARATOR > is defined as follows.

A semicolon (;) is used as the <RESPONSE MESSAGE SEPARATOR> to separate a sequence of <RESPONSE MESSAGE UNIT> elements that is to be transmitted as one message.

6.2.5 < RESPONSE MESSAGE UNIT >

A < RESPONSE MESSAGE UNIT > is defined as follows.

A <RESPONSE MESSAGE UNIT > consists of 2 basic types of syntax. The first is a response message with a header which returns the results of processing data on settings made by program messages. The second is a response message unit without a header which returns only measured results.

6.2.6 < RESPONSE HEADER SEPARATOR >

A < RESPONSE HEADER SEPARATOR > is defined as follows:

The <RESPONSE HEADER SEPARATOR> is a space after the <RESPONSE HEADER> to separate it from <RESPONSE DATA>. The space, SP, is ASCII code byte 20 (decimal 32).

There is always one space to separate the header from the data in a response message with a header. This space indicates the end of the header and the start of the data.

6.2.7 < RESPONSE DATA SEPARATOR >

A < RESPONSE DATA SEPARATOR > is defined as follows:

A < RESPONSE DATA SEPARATOR > is used to separate < RESPONSE DATA > items when more than one is output.

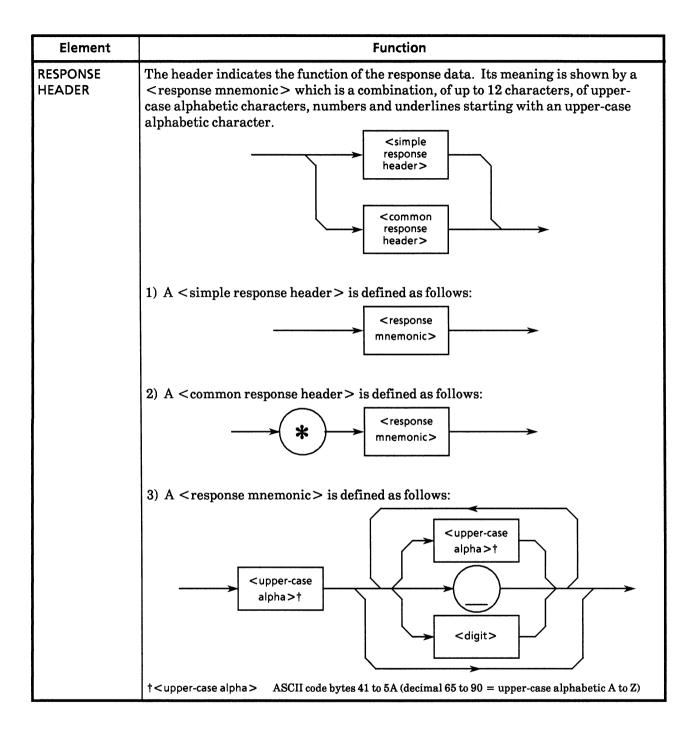

6.2.8 < RESPONSE HEADER >

With the exception of the following three points, the format of the <RESPONSE HEADER> is the same as that described for the <COMMAND PROGRAM HEADER> in paragraph 5.2.8.

- ② Spaces can be placed in front of a program header but cannot be placed in front of a response header.
- 3 More than one space may be placed after a program header but only one may be placed after a response header.

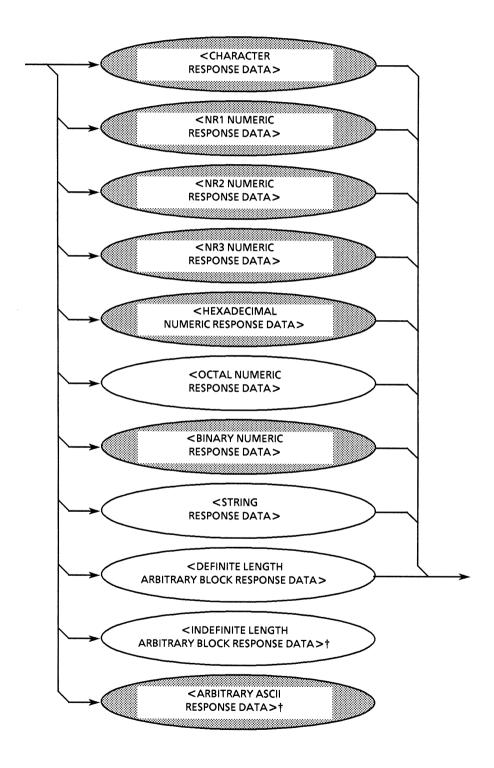

All aspects of the <RESPONSE HEADER> up to the <response mnemonic> are shown on the next page.

For characters used in <response mnemonic>, alphabetic characters are always upper-case characters and other characters are used in the same manner as <response mnemonic>.)

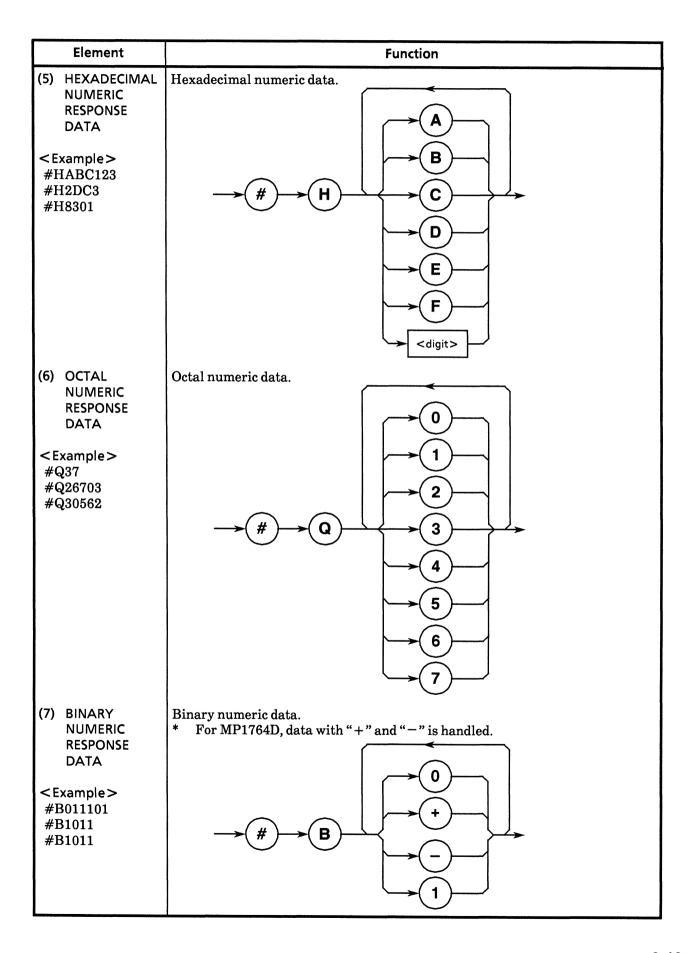

6.2.9 < RESPONSE DATA >

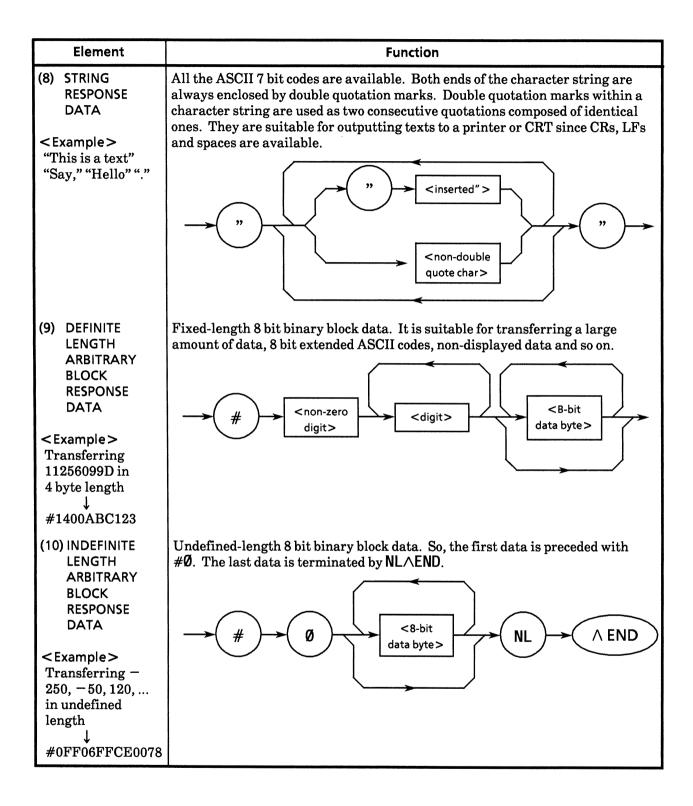

The diagram below shows the 11 types of response data. The MP1764D supports the response data in the shaded ovals below. The type of response data to be returned is determined by the query message.

[†] Both <INDEFINITE LENGTH ARBITRARY BLOCK RESPONSE DATA > and <ARBITRARY ASCII RESPONSE DATA > are terminated by an NL^END in their own last data byte.

Element	Function
(1) CHARACTER RESPONSE DATA <example> AAT2_AUTO AAT2_MANUAL</example>	Data composed of character strings common with <response mnemonic="">. Thus the beginning of the character string is always an upper-case alphabetic character and the character string length is limited to 12 characters. Numeric parameters are not suitable for being used.</response>
(2) NR1 NUMERIC RESPONSE DATA <example> 123 + 123 - 1234</example>	Integer data, i.e. decimal values without a decimal point or exponents.
(3) NR2 NUMERIC RESPONSE DATA <example> 12.3 + 12.34 - 12.345</example>	Fixed-point data, i.e. decimal values without integers or exponents.
(4) NR3 NUMERIC RESPONSE DATA <example> 12.3E + 4 +12.34E - 5 -12.345 E + 6 No lower-case character is allowed for E. Spaces before and after E are not allowed. "+" in exponent part cannot be omitted. "+" in mantissa part can be omitted.</example>	Floating-point data, i.e. decimal values with exponent digits.

Element	Function
(11) ARBITRARY ASCII RESPONSE DATA <example1> <ascii byte=""> <ascii byte=""> NL∧END</ascii></ascii></example1>	ASCII data bytes (excluding NL characters) sent without separating them; so, the last data is terminated by NL \(END. \)
<example2> NL∧END</example2>	

(Blank)

SECTION 7 COMMON COMMANDS

This section describes the common commands and common query commands specified in the IEEE 488.2 standard. These common commands are not the bus commands used in interface messages. Like device messages, common commands are a type of data message used in the bus data mode, i.e. when the ATN line is false. They can be used for all measuring instruments, including those made by other companies, as long as they conform to the IEEE 488.2 standard. IEEE 488.2 common commands must start with an *.

TABLE OF CONTENTS

7.1	Classification by Function of Common Commands Supported by the MP1764D	7-3
7.2	The Classification of Commands Supported and the Reference	7-4

(Blank)

7.1 Classification by Function of Common Commands Supported by the MP1764D

The table below shows the classification by function of the IEEE 488.2 common commands supported by the MP1764D. Supported commands are listed on the following pages in alphabetical order.

7.2 The Classification of Commands Supported and the Reference

Commands to be supported for MP1764D shown on the previous page are described for each function group in the table below. Each command is described in alphabetic order from the next page.

Group	Function	Mnemonic
System data	Data specific to each device connected to the GPIB system, e.g. manufacturer, model, serial number, etc.	*IDN?
Internal operation	Device internal control: ① Resetting device in level 3 (See Section 4) ② Device self testing and error detection	*RST *TST?
Synchronization	Synchronization of device to controller by: ① Waiting for a service request ② Waiting for a response from the device output queue ③ Performed by forcing sequential execution.	*OPC *OPC? *WAI
Status and event	A status byte consists of a status summary message. The summary bits of the message are supplied by the standard event register, the output queue and the extended event register or extended queue. Four commands and five queries are available to set or clear the data in the registers and queues, to enable or disable them and to obtain the settings status of the registers.	*CLS *ESE *ESE? *ESR? *PSC *PSC? *SRE *SRE? *STB?
Device trigger	Defines the commands to be executed when the IEEE 488.2 GET bus command is received by a device.	*TRG
Optional Information	Outputs information on installed options.	*0PT?

***CLS** Clear Status Command

(Clear status byte register)

■ Syntax -----

*CLS

Example

3Ø WRITE @1Ø3:"*CLS"

4Ø WRITE @1Ø3:"DTM△Ø;CTM△Ø;*CLS"

■ Explanation

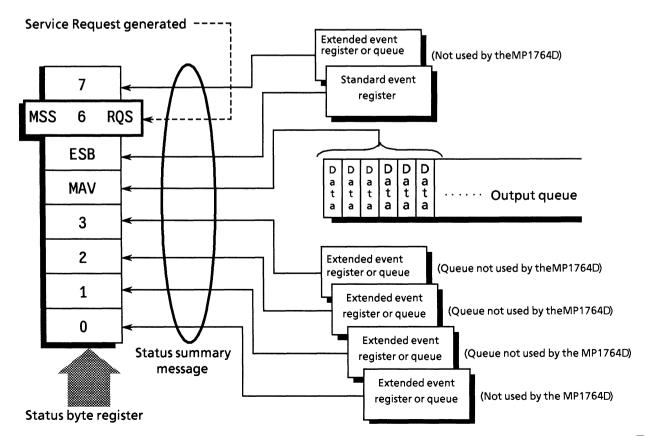

The ***CLS** common command clears all status data structures (i.e their event registers and queues) except for the output queue and its **MAV** summary messages. It also clears the summary messages corresponding to these structures.

In the example below, the output queue and its MAV summary messages are also cleared.

3Ø WRITE @1Ø3:"DTM△Ø;CTM△Ø" 4Ø WRITE @1Ø3:"*CLS;DTM?"

That is to say, if a ***CLS** command is sent after a <PROGRAM MESSAGE TERMINATOR> or before <QUERY MESSAGE UNIT> elements, all status bytes are cleared. This command also clears all unread messages in the output queue.

***CLS** has no effect on settings in enable registers.

***ESE** Standard Event Status Enable Command

(Sets or clears the standard event status enable register)

■ Syntax

***ESE** < HEADER SEPARATOR > < DECIMAL NUMERIC PROGRAM DATA >

In this format:

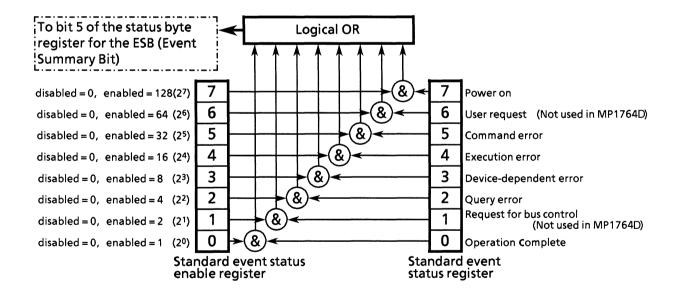

<DECIMAL NUMERIC PROGRAM DATA> = Value rounded to an integer from 0 to 255 (Binary weighted with a base value of 2)

■ Example

WRITE @103: "*ESE 20"! Sets bits 2 and 4 of enable register

■ Explanation

The program data is the sum of weighted bit-digit values when the weighted value for bits to be enabled are selected from among the values $2^0 = 1$, $2^1 = 2$, $2^2 = 4$, $2^3 = 8$, $2^4 = 16$, $2^5 = 32$, $2^6 = 64$ or $2^7 = 128$; corresponding to the enable register bits 0, 1, 2, 3, 4, 5, 6 or 7. The value of bits to be disabled is 0.

***ESE?** Standard Event Status Enable Query (Returns current value of standard event status enable register)

■ Syntax -

*ESE?

■ Example

20 is the response if *ESE? is sent after executing *ESE 20

■ Explanation

Returns NR1, the value of the standard event status enable register

■ Response message

NR1 = 0 to 255

***ESR?: Standard Event Status Register Query**

(Returns the current value in the standard event status register)

Syntax

*ESR?

■ Example

3Ø WRITE @1Ø3:"*ESR?"

40 READ @103:STEVET

50 PRINT STEVET

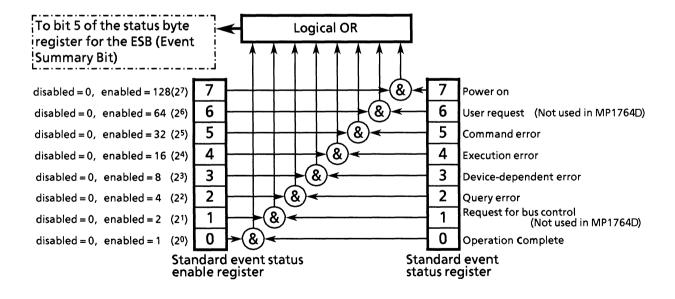

■ Response Message

NR1 = 0 to 255

■ Explanation

The current value of the standard event status register is returned by NR1. NR1 is the total of weighted bit-digit values of bits (enabled by the standard event status enable register) which are selected from amongs the values $2^0 = 1$, $2^1 = 2$, $2^2 = 4$, $2^3 = 8$, $2^4 = 16$, $2^5 = 32$, $2^6 = 64$ or $2^7 = 128$: corresponding to the standard event status register bits 0, 1, 2, 3, 4, 5, 6 or 7.

This register is cleared when the response is read (e.g. line 40).

***IDN?** Identification Query

(Returns the manufacturer name, model name etc. of the product.)

■ Syntax -

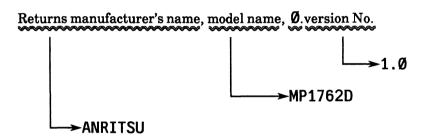

*IDN?

Example

30 WRITE @103:"*IDN?"
40 READ @103:IDEN\$!

Stores names of manufacturer, model, etc.

■ Explanation

If an ***IDN?** common query is sent to a device when the manufacturer is Anritsu, the model is MP1764D, and the firmware version is 1; a response message comprising the four fields shown above is returned.

① Field 1 Manufacturer's name (Anritsu)

② Field 2 Model name (MP1762D)

3 Field 3 (usually \emptyset)

4 Field 4 Version No.

Response message

A Response message comprising the four fields above separated by commas is sent by <ARBITRARY ASCII RESPONSE DATA>.

<field 1>, <field 2>, <field 3>, <field 4>

For the example above,

ANRITSU, MP1762D, Ø, 1. Ø

The total length of a response message is ≤ 72 characters

Note

Even if the real model name is MP1764D, the response message is MP1762D.

***OPC** Operation Complete Command

(Sets the status of bit 0 of the standard event status register when device operation is completed)

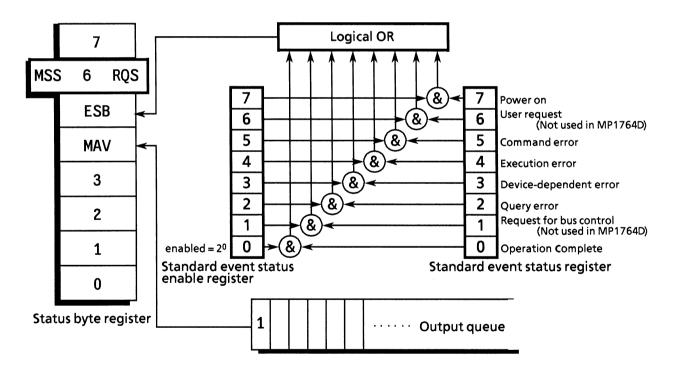

■ Syntax	
	*OPC

■ Example

WRITE @1Ø3:"*OPC"

■ Explanation

Sets the status of bit 0, i.e. the <u>operation complete bit</u>, of the standard event status register when all pending operations of the selected device have been completed.

***OPC?** Operation Complete Query

(Sets 1 in the output queue to generate a MAV summary message when device operation has been completed)

■ Syntax -----

*OPC?

■ Example

WRITE @1Ø3:"*OPC?"

■ Explanation

When all pending operations of the selected device have been completed, sets 1 in the output queue and waits for the MAV summary message to be generated.

■ Response message

A 1 is returned by <NR1 NUMERIC RESPONSE DATA>.

***OPT?** Option Query

(Outputs information on installed options.)

■ Syntax ·

***OPT?**

■ Example

3Ø WRITE @1Ø3:"*OPT?" 4Ø READ:OPTI

■ Explanation

***OPT** query outputs information on the installed options.

■ Response message

<ARBITRARY ASCII RESPONSE DATA>

Returns characters corresponding to installed options while separating items with commas.

: No installed option

OPTØ1 : MP1764D-01 Error Analysis

*PSC Power-on Status Clear Command

(Specifies whether status enable registers are cleared at power-on, or not.)

■ Syntax ·

*PSC <HEADER SEPARATOR><DECIMAL NUMERIC PROGRAM DATA>

In this format:

<DECIMAL NUMERIC PROGRAM DATA $> = \emptyset$: not cleared Numbers in range of -32767 to 32767 : cleared

■ Example

WRITE @103:"*PSC 0; *SRE 32; *ESE 128"! not cleared and SRQ is on

■ Explanation

The ***PSC** command specifies whether the three enable registers of service request, standard event status, and parallel poll in status are cleared at power-on, or not.

A value in the <DECIMAL NUMERIC PROGRAM DATA> field controls the logical state of the power-on status flag. When it is rounded to 0, the flag is set to false, so the enable registers are not cleared. When the *PSC Ø is issued, it enables the device to generate the SRQ at power-on. In the above example, the power-on event is reported to the controller.

When the value in the <DECIMAL NUMERIC PROGRAM DATA> field is rounded to an integer other than 0 that is in range of -32767 to 32767, the flag is set to true, so the enable registers are cleared. When the *PSC 1 is issued, it enables the device to clear the registers but not to generate the SRQ.

When the value in the <DECIMAL NUMERIC PROGRAM DATA > field is rounded to an integer that is out of range of -32767 to 32767, the execution error is generated.

***PSC?** Power-on Status Clear Query

(Returns the power-on status flag state)

■ Syntax -

*PSC?

■ Example

3Ø WRITE @1Ø3:"*PSC?" 4Ø READ:POWF

■ Explanation

When the ***PSC?** common query is issued, **1** is returned when the power-on status flag is true, and \emptyset is returned when it is false.

■ Response message

NR1 = 1 (Power-on status flag is true.) \emptyset (Power-on status flag is false.)

*RST Reset Command

(Resets (initializes) device in level 3)

■ Syntax

*RST

Example

WRITE @103:"*RST" Resets devices in level 3

■ Explanation

The ***RST** command resets a device in level 3. (See Section 4)

The items that are reset in level 3 are as follows.

- ① The functions and conditions specific to a device are reset to a known initial state regardless of the settings up to that point. (See Section 4 for MP1764D initial states)
- ② Macro operation is inhibited and the device can no longer receive macros. And, macro definition is reset to the state designated by the system designer.
- ③ The device is put into OCIS (Operation Complete Command Idle State). As a result, the operation complete (end) bit cannot be set in the standard event status register.
- ① The device is put into OQIS (Operation Complete Query Idle State). As a result, the operation complete bit cannot be set in the output queue. The MAV bit is cleared.

The ***RST** command has no effect on the following.

- 1 The state of the IEEE 488.1 interface
- 2 Device address
- 3 Output queue
- Service request enable register
- (5) Standard event status enable register
- 6 Power-on-status-clear flag setting

***SRE** Service Request Enable Command

(Sets status of bits in the service request enable register)

Syntax

*SRE < HEADER SEPARATOR > < DECIMAL NUMERIC PROGRAM DATA >

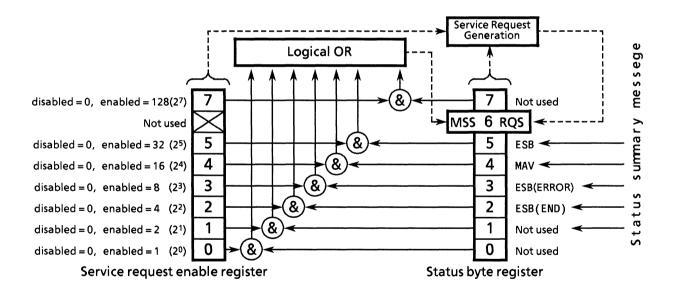

<DECIMAL NUMERIC PROGRAM DATA> = Values rounded to an integer from 0 to 255 (binary weighted with a base value of 2)

■ Example

WRITE @103:"*SRE 16"! Sets bit 4 of the enable register

■ Explanation

The program data is the sum of weighted bit-digit values when the weighted value for bits to be enabled are selected from among the values $2^0 = 1$, $2^1 = 2$, $2^2 = 4$, $2^3 = 8$, $2^4 = 16$, $2^5 = 32$ or $2^7 = 128$: corresponding to the service request enable register bits 0, 1, 2, 3, 4, 5, 6 or 7. The value of bits to be disabled is 0.

***SRE?** Service Request Enable Query (Returns the current value of the service request enable register)

■ Syntax -

*SRE?

■ Example

A 16 is sent in response if *SRE? is sent after executing *SRE 16.

■ Explanation

NR1, the value of the service request enable register, is returned.

■ Response message

As NR1 (bit 6: RQS bit) cannot be set, NR1 = 0 to 63 or 128 to 191)

***STB?** Read Status Byte Command

(Returns the current values of status bytes including MSS bits)

■ Syntax ·

*STB?

■ Example

3Ø WRITE @1Ø3:"*STB?"

4Ø READ @103:STBV

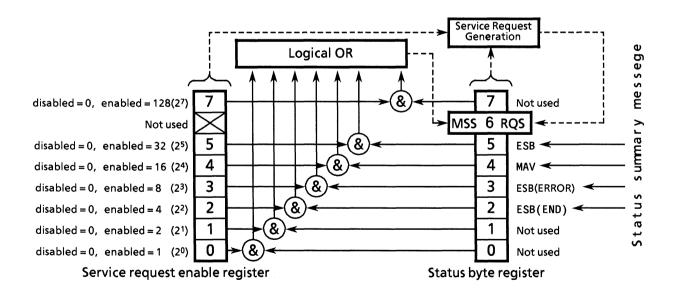

50 PRINT STBV

■ Explanation

The ***STB?** query returns the total of the binary weighted values of the status byte register and of the MSS summary message with <NR1 NUMERIC RESPONSE DATA>.

■ Response message

The response message is a <NR1 NUMERIC RESPONSE DATA > integer in the range 0 to 255 representing the total of the binary weighted values of the bits in the status byte register. Status byte register bits 0 to 5 and 7 are weighted to 1, 2, 4, 8, 16, 32 and 128, respectively, and the MSS (Master Summary Status) bit to 64. MSS message indicates that a request has at least one cause.

The table below shows the conditions for the MP1764D's status byte register.

Bit	Bit weight	Bit name	Status-byte-register conditions		
7	128		0 = Not used		
6	64	MSS	0 = Service not requested	1 = Service requested	
5	32	ESB	0 = Event status not generated	1 = Event status generated	
4	16	MAV	0 = No data in output queue	1 = Data in output queue	
3	8	ESB(ERROR)	0 = Event status not generated	1 = Event status generated	
2	4	ESB(END)	0 = Event status not generated	1 = Event status generated	
1	2		0 = Not used		
0	1		0 = Not used		

SECTION 7 COMMON COMMANDS

*TRG

Trigger Command (The same function as that of IEEE 488.1 GET-Group Execute Trigger-bus command)

■ Syntax -

*TRG?

■ Example

WRITE @103:"*TRG"

■ Explanation

The *TRG common command has the same function as the IEEE 488.1 GET - Group Execute Trigger-bus command. The MP1764D does not support the *DDT command.

With the MP1764D, a measurement is started by executing the ***TRG** common command.

WRITE @103:"*TRG"

***TST?** Self-test Query

(Returns the results of error present/absent in the self-test)

■ Syntax -

*TST?

■ Example

3Ø WRITE @1Ø3:"*TST?"

4Ø READ @1Ø3:TEST

5Ø PRINT TEST

■ Explanation

The ***TST?** query executes the self-test of the internal cirucit in device(s). The test result is set in the output queue. Data in the output queue indicates whether or not the test has been completed without error occurrence. Opeator intervention is not required to execute the self-test.

When the power is turned on, the MP1764D reports the self-test result.

■ Response message

The response message is sent by <NR1 NUMERIC RESPONSE DATA>. The data range is - 32767 to 32767.

 $NR1 = \emptyset$ Indicates no errors

 $NR1 \neq \emptyset$ Indicates that errors have occurred

***WAI** Wait-Continue Command

(Forces the next command to wait while the device is executing a command)

=			
Syntax	 	 	

*WAI

■ Example

WRITE @1Ø3:"*WAI"

■ Explanation

The *WAI common command executes a overlap command as a sequential command.

The overlap command is a command or query that is sent by the controller and allows the next command to be executed even while the device is executing something.

While the device is executing a command, executing the ***WAI** common command after an overlap command forces the next command to wait and allows it to be executed after the current command has been executed. This action is the same as that of sequential command.

SECTION 8 STATUS STRUCTURE

This section describes device status reports and their data structure as defined in the IEEE 488.2 standard and explains the techniques for synchronizing the controller and devices.

In order to obtain more detailed status information, the IEEE 488.2 standard has more common commands and common queries than the IEEE 488.1 standard.

Refer to Section 7 for a detailed explanation of these common commands and queries.

	873	Wait for a service request	8-25		

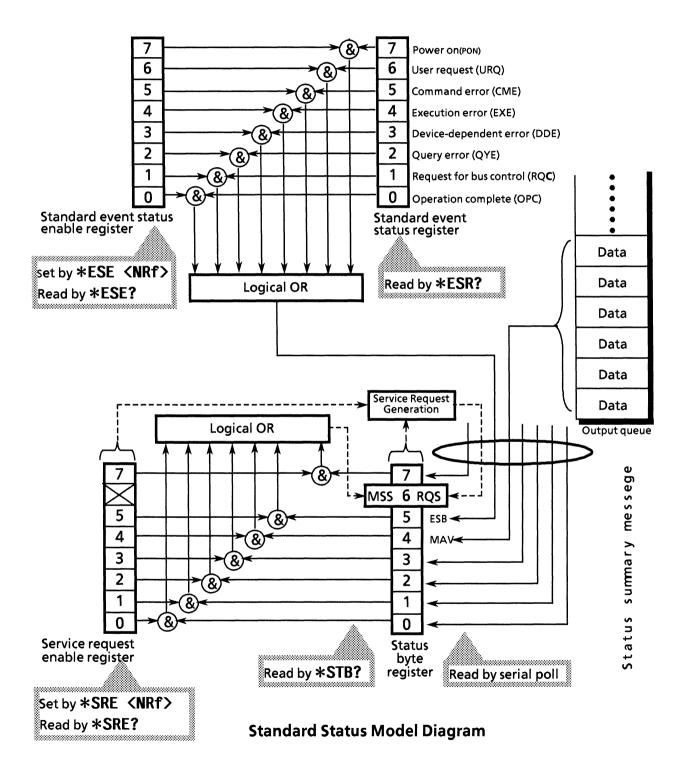

(Blank)

The Status Byte (SB) sent by the controller is based on the IEEE 488.1 standard. The bits comprising it are called a status summary message because they represent a summary of the current data contained in registers and queues.

The following pages explain the status summary message and the structure of the status data that constitutes the status summary message bits as well as techniques for synchronizing the devices and controller, which use these status messages.

8.1 IEEE 488.2 Standard Status Model

The diagram below shows the standard model for the status data structure stipulated in the IEEE 488.2 standard.

The IEEE 488.1 status byte is used in the status model. This status byte is composed of 7 summary message bits given from the status data structure. For creating the summary message bits, there are 2 models for the data structure - the register model and the queue model.

Register model	Queue model
The register model consists of the two registers used for recording events and conditions encountered by a device. These two registers are the Event Status Register and Event Status Enable Register. When the results of the AND operation of both register contents is not 0, the corresponding bit of the status bit becomes 1. In other cases, it becomes 0. And, when the result of their Logical OR is 1, the summary message bit becomes also 1. If the Logical OR result is 0, the summary message bit becomes 0 too.	The queue in the queue model is for sequentially recording the waiting status values and data. The queue structure is such that the relevant bit is set to 1 when there is data in it and 0 when it is empty.

In IEEE 488.2, there are 3 standard models for status data structure - 2 register models and 1 queue model - based on the register model and queue model explained above. They are:

- ① Standard Event Status Register and Standard Event Status Enable Register
- ② Status Byte Register and Service Request Enable Register
- 3 Output queue

Standard Event Status Register	Status Byte Register	Output Queue
The Standard Event Status Register has the structure of the previously described register model. In this register, bits are set for 8 types of standard event encountered by a device, viz. ① Power on, ② User request, ③ Command error, ④ Execution error, ⑤ Device-dependent error, ⑥ Query error, ⑦ Request for bus control and ⑧ Operation complete. The Logical OR output bit is represented by Status Byte Register bit 5 (DIO6) as a summary message for the Event Status Bit (ESB).	The Status Byte Register is a register in which the RQS bit and the 7 summary message bits from the status data structure can be set. It is used together with the Service Request Enable Register. When the results of the OR operation of both register contents is not 0, SRQ becomes ON. To indicate this, bit 6 of the Status Byte Register (DIO7) is reserved by the system as the RQS bit which means that there is a service request for the external controller. The mechanism of SRQ conforms to the IEEE 488.1 standard.	The Output Queue has the structure of the queue model mentioned above. Status Byte Register bit 4 (DIO5) is set as a summary message for Message Available (MAV) to indicate that there is data in the output queue.

8.2 Status Byte (STB) Register

The STB register consists of device STB and RQS (or MSS) messages. The IEEE 488.1 standard defines the method of reporting STB and RQS messages but not the setting and clearing protocols or the meaning of STB. The IEEE 488.2 standard defines the device status summary message and the Master Summary Status (MSS) which is sent to bit 6 together with STB in response to an *STB? common query.

8.2.1 ESB and MAV summary messages

The following is a description of the ESB and MAV summary messages.

(1) ESB summary messages

The ESB (Event Summary Bit) summary message is a message defined by IEEE 488.2, which is represented by bit 5 of the STB register. This bit indicates whether at least one of the events defined in IEEE 488.2 has occurred or not when the service request enable register is set so that events are enabled after the final reading or clearing of the standard event status register. The ESB summary message bit becomes true when the setting permits events to occur if any one of the events recorded in standard event status register is true. Conversely, it is false if none of the recorded events occurs even if events are set to occur.

(2) MAV summary messages

The MAV summary message is a message defined in IEEE 488.2 and represented by bit 4 in the STB register. This bit indicates whether the output queue is empty or not. The MAV summary message bit is set to 1 (true) when a device is ready to receive a request for a response message from the controller and to 0 (false) when the output queue is empty. This message is used to synchronize the exchange of information with the controller. For example, it can be used get the controller to wait till MAV is true after it has sent a query command to a device. While the controller is waiting for a response from the device, it can process other jobs.

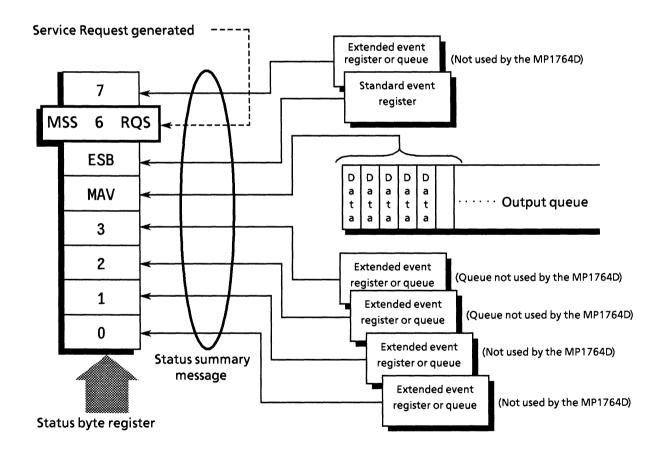

Reading the output queue without first checking MAV will cause all system bus operations to be delayed until the device responds.

8.2.2 Device-dependent summary messages

The IEEE 488.2 standard does not specify whether bits 7 (DIO8) and 3 (DIO4) to 0 (DIO1) of the status byte register are used as status register summary bits, or used to indicate that there is data in a queue. These bits can be used as device-dependent summary messages.

Device-dependent summary messages have the respective status data structures of the register model or the queue model. Thus, the status data structure may be either the register to report events and status in parallel or the queue to report conditions and status in sequence. The summary bit represents a summary of the current status of the corresponding data structure. In the case of the register model, the summary bit is true when there is an event set to permit the occurrence of more than one true; while in the case of the queue model, it is true if the queue is not empty.

As shown below, the MP1764D does not use bits 0, 1 and 7. As it uses bits 2 and 3 as the summary bits of the status register, it has 5 register model types (, where 3 types extended) and one queue model type - an output queue with no extension.

8.2.3 Reading and clearing the STB register

Serial poll or the ***STB?** common query are used to read the contents of STB register. STB messages conforming to IEEE 488.1 can be read by either method, but the value sent to bit 6 is different for each of them.

The STB register can be cleared using the ***CLS** command.

(1) Reading by serial poll

When using the serial poll conforming to IEEE 488.1, the device must return a 7-bit status byte and an RQS message bit which conforms to IEEE 488.1.

According to IEEE 488.1, the **RQS** message indicates whether the device sent **SRQ** as true or not. The value of the status byte is not changed by serial poll. The device must set the RQS message to false immediately after being polled. As a result, if the device is again polled before there is a new cause for a service request, the **RQS** message is false.

(2) Reading by the *STB? common query

The ***STB?** common query requires the device to send the contents of the STB register and one <NR1 NUMERIC RESPONSE DATA > from the **MSS** (Master Summary Status) summary message. The response represents the total binary weighted value of the STB register and the **MSS** summary message. The STB-register bits 0 to 5 and 7 are weighted to 1, 2, 4, 8, 16, 32, and 128; and the MSS to 64, respectively. Thus, excepting the fact that bit 6 represents the MSS summary message instead of the **RQS** message, the response to ***STB?** is identical to that for serial poll.

(3) Definition of MSS (Master Summary Status)

MSS indicates that there is at least one cause for a service request. The MSS message is represented at bit 6 in a device response to the ***STB?** query but it is not produced as a response to serial poll. In addition, it is not part of the status byte specified by IEEE 488.1. **MSS** is produced by the logical OR operation of STB register with SRQ enable (SRE) register. In concrete terms, MSS is defined as follows.

(STB Register bit0 AND SRE Register bit0)

OR

(STB Register bit1 AND SRE Register bit1)

OR

:

.

(STB Register bit5 AND SRE Register bit5)

OR

(STB Register bit7 AND SRE Register bit7)

As bit-6 status of the STB and SRQ enable registers are ignored in the definition of MSS, it can be considered that bit-6 status are always being 0 when calculating the value of MSS.

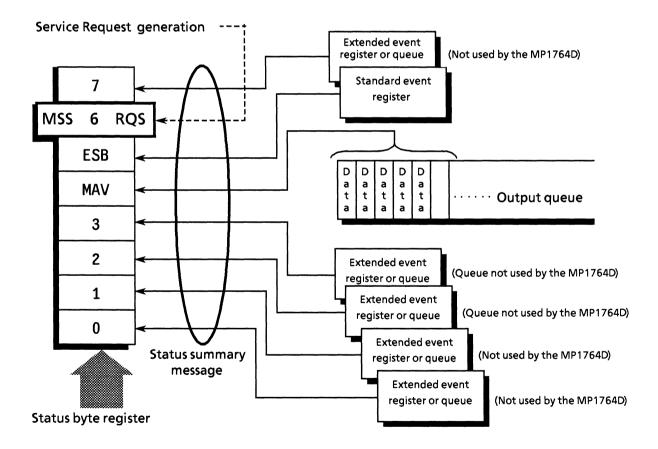

(4) Clearing the STB register by the *CLS common command

With the exception of the output queue and its MAV summary message, the *CLS common command clears all status data structures (status event registers and queues) as well as the summary messages corresponding to them.

In the following case, the output queue and its MAV summary message are both cleared.

3Ø WRITE @1Ø3:"DTM△Ø;CTM△Ø" 4Ø WRITE @1Ø3:"*CLS;DTM?"

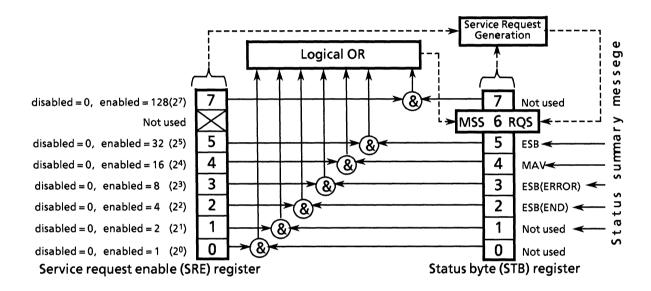

That is to say, sending a ***CLS** command (after a <PROGRAM MESSAGE TERMINATOR> or before <QUERY MESSAGE UNIT> elements) clears all status bytes. This clears all unread messages in the output queue and sets the **MAV** message to false. The **MSS** message is also set to false when a response is made to ***STB?**. The ***CLS** command does not affect settings in the enable registers.

8.3 Enabling SRQ

All types of summary message in the STB register can be enabled or disabled for service requests by using the SRQ enable function. The service request enable (SRE) register is used for this function to select summary messages as shown in the diagram below.

Bits in the service request enable register correspond to bits in the status byte register. If a bit in the status byte corresponding to an enabled bit in the service request enable register is set to 1, a device makes a service request to the controller with the RQS bit set to 1. For example, if bit 4 (MAV) in the service request enable register is enabled, the device makes a request for service to the controller each time the MAV bit is set to 1 when there is data in the output queue.

(1) Reading the SRE register

The contents of the SRE register are read using the ***SRE?** common query. The response message to this query is a <NR1 NUMERIC RESPONSE DATA > integer from 0 to 255 which is the sum of the bit digit weighted values in the SRE register. SRE register bits 0 to 5 and 7 are respectively weighted to 1, 2, 4, 8, 16, 32 and 128. The unused bit 6 must always be set to 0.

(2) Updating the SRE register

The SRE register is written to using the ***SRE** common command. <DECIMAL NUMERIC PROGRAM DATA> elements follow the ***SRE** common command. <DECIMAL NUMERIC PROGRAM DATA> is a rounded integer expressed in binary which represents the sum of the binary weighted value of each bit of SRE register. A bit value of 1 indicates enabled and a bit value of 0 disabled. The value of bit 6 must always be ignored.

(3) Clearing the SRE register

The SRE register can be cleared by executing the *SRE common command or turn the power off and it on again.

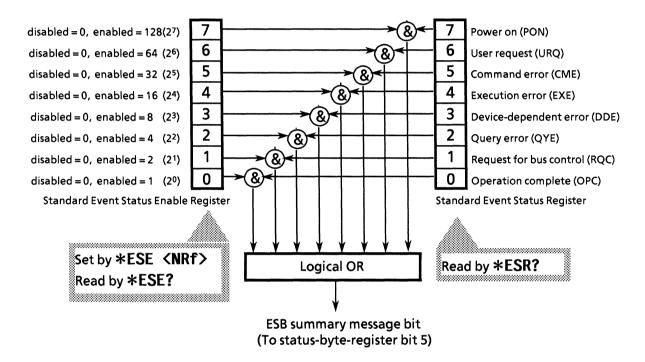

Using the ***SRE** common command, the SRE register is cleared by setting the value of the <DECIMAL NUMERIC PROGRAM DATA> element to 0. Clearing the register stops status information from generating rsv local messages, and service requests are no longer generated.

The MP1764D has the ***PSC** command. Therefore, if the PSC flag is ture when power is turned on, the SRE register is cleared.

8.4 Standard Event Status Register

8.4.1 Bit definition

The standard event status register must be available on all devices conforming to the IEEE 488.2 standard. The diagram below shows the operation of the standard event status register model. Because the operation of the model is the same as that for the other models explained up till now, the following only explains the meaning of each bit in the standard event status register as defined in the IEEE 488.2 standard.

SECTION 8 STATUS STRUCTURE

Bit	Event name	Description
7	PON - Power on	The power is turned to on
6	URQ-User Request	Request for local control (rtl). This bit is produced regardless of whether a device is in remote or local mode. It is not used for the MP1764D so, it is always set to 0.
5	CME - Command Error	An illegal program message, a misspelt command or a GET command within a program is received. (Syntax error in header or parameter, or missing or too many parameters)
4	EXE - Execution Error	A legal program message, which cannot be executed, is received (Out of range for the parameter)
3	DDE — Device-dependent Error	An error caused by other than CME, EXE or QYE occurred. (The current device status cannot accept the request.)
2	QYE – Query Error	An attempt is made to read data in the output queue though there is none there, or data is lost from the output queue due to any reason, e.g. overflow etc
1	RQC - Request Control	A device is requesting control of the bus. This bit is not used on the MP1764D so, it is always set to 0
0	OPC - Operation Complete	A device has completed operations which were pending and is ready to receive new commands. This bit is only set in response to the *OPC command.

8.4.2 Query error details

No.	Item	Description
1	Incomplete program messages	If a device receives an MTA from the controller before it receives the terminator of the program message it is receiving, it aborts the incomplete program message and waits for the next one. In order to abort the incomplete message, the device clears its input buffer and output queue, reports a query error and sets bit 2 in the standard status register to indicate the query error.
2	Interruption of response message	If a device receives an MLA from the controller before it has sent the terminator of the response message it is sending, it automatically interrupts the response message and waits for the next program message. In order to interrupt the response message, the device clears its output queue, reports a query error and sets bit 2 in the standard status register to indicate the query error.
3	Sending the next program message without reading the previous response message	When a device becomes unable to send a response message because the controller has sent another program message immediately following a program or query message, the device aborts the response message and waits for the next program message. It then reports a query error as in No. 2 above.
4	Output queue overflow	When several program and query messages are executed in succession, there may be too many response messages for the output queue (256 bytes). If further query messages are received when the output queue is full, the output queue cannot send responses to them because an overflow situation exists in it. If there is an overflow in the output queue, the device clears it and resets the section where response messages are created. Then it sets bit 2 in the standard event status register to indicate a query error.

8.4.3 Reading, writing to and clearing the standard event status register

Reading	The register is destructively read by the *ESR? common query, i.e. it is cleared after being read. The response message is an NR1 value obtained by binary weighting the event bit and converting it to a decimal number.
Writing	With the exception of clearing, writing operations cannot be performed externally.
Clearing	The register is only cleared in the following cases. ① A *CLS command is received ② The power is turned on when the power-on-status-clear flag is true. ③ An event is read for the *ESR? query command

8.4.4 Reading, writing to and clearing the standard event status enable register

Reading	The register is non-destructively read by the *ESE? common query, i.e. it is not cleared after being read. The response message is returned by NR1 after having been binary weighted and converted to decimal.
Writing	The register is written to by the *ESE common command. As bits 0 to 7 of the register are respectively binary weighted to 1, 2, 4, 8, 16, 32, 64 and 128; data to be written is sent by <decimal data="" numeric="" program=""></decimal> which is the digit total of the bits selected from these bits.
Clearing	The register is cleared in the following cases. ① A *ESE command with a data value of 0 is received ② The power is turned on when the power-on-status-clear flag is true. The event status enable register is not affected by the following. ① Changes of the status of the IEEE 488.1 device clear function ② A *RST common command is received ③ A *CLS common command is received

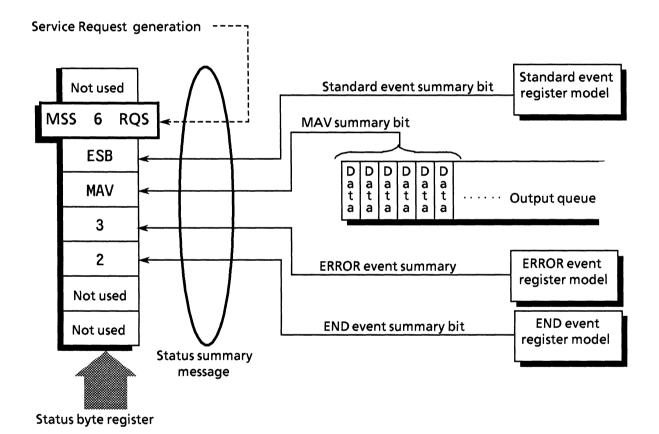

8.5 Extended Event Status Register

The register models of the status byte register, standard event status register and enable registers are mandatory for equipment conforming to the IEEE 488.2 standard.

In IEEE 488.2, status-byte-register bits 7 (DIO8), 3 (DIO4) to 0 (DIO1) are assigned to status-summary bits supplied by the extended-register and extended-queue models.

For the MP1764D, as shown in the diagram below, bits 0, 1 and 7 are unused and bits 2 and 3 are assigned to the END and ERROR summary bits as the status-summary bits supplied by the extended register model.

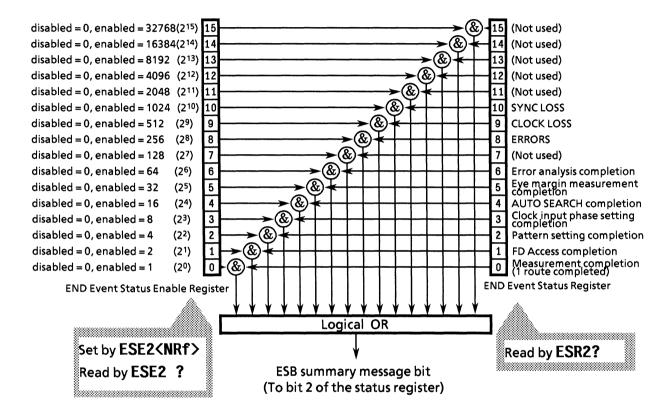

As the queue model is not extended, there is only one type of queue - the output queue.

The following pages describe bit definition, the reading, writing to and clearing of registers for the END and ERROR extended event register models.

8.5.1 Bit definition of END event status register

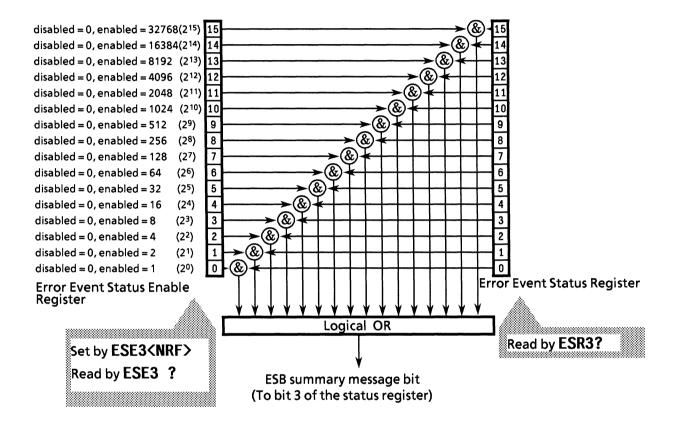

The following describes the operation of the END event status register model, the naming of its event bits and what they mean.

Bit	Event name	Description
15	(Not used)	(Not used)
14	(Not used)	(Not used)
13	(Not used)	(Not used)
12	(Not used)	(Not used)
11	(Not used)	(Not used)
10	SYNC LOSS	Synchronous loss has been occurred, or recovered.
9	CLOCK LOSS	Clock breakdown has been occurred, or recovered.
8	ERRORS	Error has been detected from error-free state.
7	(Not used)	(Not used)
6	Error analysis completion	Error analysis has been completed (only when OPTION-01 is installed).
5	Eye margin measurement completion	Eye margin measurement has been completed.
4	AUTO SEARCH completion	Auto search has been completed.
3	Clock input phase setting completion	The servo circuit used for setting clock input phase has been turned from BUSY to READY state.
2	Pattern setting completion	Programmable pattern setting has been completed.
1	FD Access completion	Accessing the floppy disk has been completed.
0	Measurement completion	When manual measurement, at operator stop. When single measurement, at measurement completion. When repeat measurement, at every measurement completion.

8.5.2 Bit definition of ERROR event status register

The following describes the operation of the ERROR event status register model, the naming of its event bits and what they mean.

Bit	Event name	Description
15	(Not used)	(Not used)
14	(Not used)	(Not used)
13	(Not used)	(Not used)
12	(Not used)	(Not used)
11	(Not used)	(Not used)
10	(Not used)	(Not used)
9	(Not used)	(Not used)
8	(Not used)	(Not used)
7	(Not used)	(Not used)
6	(Not used)	(Not used)
5	(Not used)	(Not used)
4	(Not used)	(Not used)
3	(Not used)	(Not used)
2	(Not used)	(Not used)
1	FD malfunction occurred	FD abnormal status has occurred.
0	Printer malfunction occurred	Printer abnormal status has occurred.

8.5.3 Reading, writing to and clearing the extended event status register

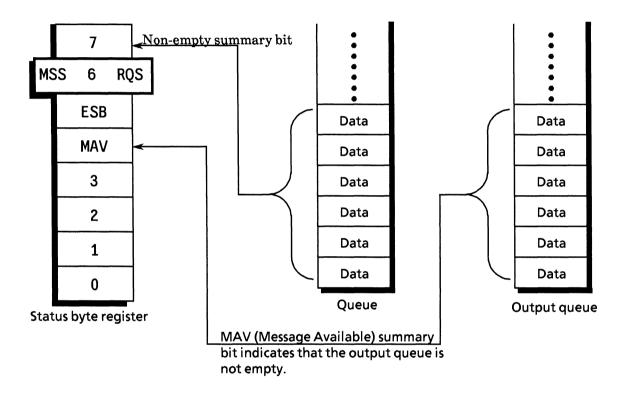

Reading	The register is destructively read by the a query, i.e. it is cleared after being read. The END and ERROR event status registers are read by the ESR2? and ESR3? queries. The read value, <nr1>, is obtained by binary weighting the event bit and converting it to decimal.</nr1>
Writing	With the exception of clearing, writing operations cannot be performed externally.
Clearing	The register is cleared in the following cases. ① A *CLS command is received ② The power is turned on when the power-on-status-clear flag is true. ③ An event is read for a query command

8.5.4 Reading, writing to and clearing the extended event status enable register

Reading	The register is non-destructively read by a query, i.e. it is not cleared after being read. The END and ERROR event status enable registers are read by the ESE2? and ESE3? queries. The read value, returned by $<$ NR1 $>$, is obtained by binary weighting the event bit and converting it to decimal.
Writing	The END and ERROR event status enable registers are written to by the ESE2 and ESE3 program commands. As bits 0 to 7 of the registers are respectively binary weighted to 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, 1024, 2048, 4096, 8192, 16384, and 32768 data to be written is sent by < DECIMAL NUMERIC PROGRAM DATA > , the digit total weighted value of the bits selected from among them.
Clearing	The register is cleared in the following cases. ① ESE2 and ESE3 program commands with a data values of 0 are received by the END and ERROR event status enable registers. ② The power is turned on when the power-on-status-clear flag is true. The extended event status enable register is not affected by the followings: ① Changes of the status of the IEEE 488.1 device clear function ② A *RST common command is received ③ A *CLS common command is received

8.6 Queue Model

The status-data-structure queue model is shown at the right of the diagram below. A queue is data structure including data lists arranged in sequence which provides a means of reporting sequential status and other information. The existence of such information in the queue is indicated by summary messages. The queue contents are read by the handshake when a device is in TACS (Talker Active State).

The output queue, which is mandatory, is the queue that outputs the MAV summary message to bit 4 of the status byte. A queue (which can output the MAV summary message to any of bits 0 to 3 or 7 of the status byte register) is an option and is simply called a "queue".

As the summary messages from the register model can also be connected to bits 0 to 3 or 7 of the status byte register, the types of summary messages vary with the device.

Though Anritsu assigns bit 7 of the status byte register for the use of summary message bits from "queues", it is not used when the output queue is sufficient.

The output queue is compared with an ordinary queue on the next page.

Comparison of Output and Ordinary Queues

Item	Output queue	Ordinary Queue
Data input / output operation	FIFO (First-In First-Out)	Need not always be FIFO
Read	Can only be read through the protocol defined in SECTION 6. The type of response message unit read is determined by the query.	Read by device-dependent query commands. The response messages read must be of the same type.
Writing	<program message=""> elements cannot be written directly to the output queue. They can only be sent to or from the system interface by the protocol specified by IEEE 488.2 message exchange.</program>	<program message=""> elements cannot be written directly to a queue. They indicate encoded device information.</program>
Summary message	Is true (1) when the output queue is not empty and false (0) when the output queue is empty. The MAV summary message is used to synchronize the exchange of information between a device and the controller.	Is true (1) when the queue is not empty and false (0) when the queue is empty.
Clearing	The output queue is cleared in the following cases: ① All items in it have been read ② A DCL bus command is received to initialize message exchange ③ PON is true at power on	A queue is cleared in the following cases: ① All items in it have been read ② A *CLS command is received ③ Other device-dependent methods are used

8.7 Techniques for Synchronizing Devices with the Controller

There are 2 ways of synchronizing devices with the controller.

① Enforcing the sequential execution: (Using the *WAI? command)

2 Wait for a response from the device's output queue: (Using the ***OPC?** query)

③ Wait for a service request: (Using the ***OPC** command / ***OPC?** query)

8.7.1 Enforcing the sequential execution

There are two types of commands specific to devices: sequential commands and overlap commands.

• Sequential command

This is a command or query that is sent by the controller and does not allow the next command to be executed while the device is executing something.

Overlap command

This is a command or query that is sent by the controller and allows the next command to be executed even while the device is executing something.

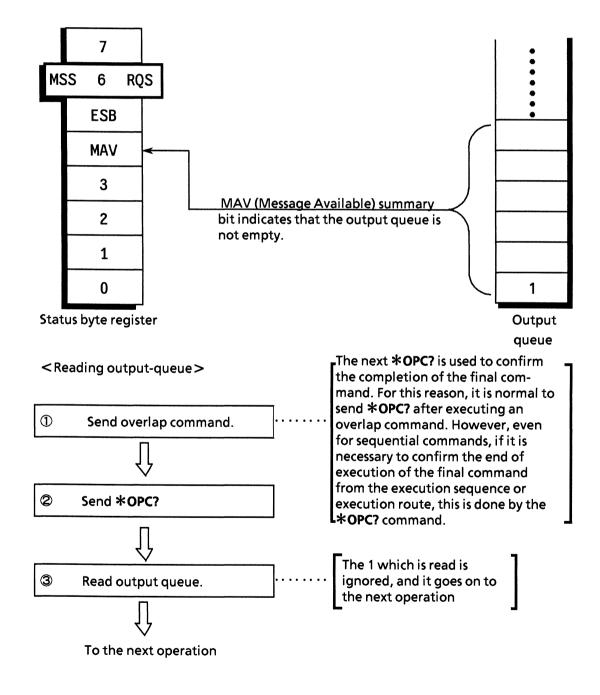

Enforcing the sequential execution is a synchronizing technique used to enforce a command that natively acts as an overlap command to be executed sequentially and not to perform the next process until one process has been completed. In this technique, the ***WAI** command is used.

8.7.2 Wait for a response from the output queue

Executing the ***OPC?** query sets a 1 in the output queue to generate a MAV summary message when a device has completed all of its pending operations.

In this technique, a device is synchronized with the controller by reading the 1 set in the output queue as described above or the MAV summary message bit.

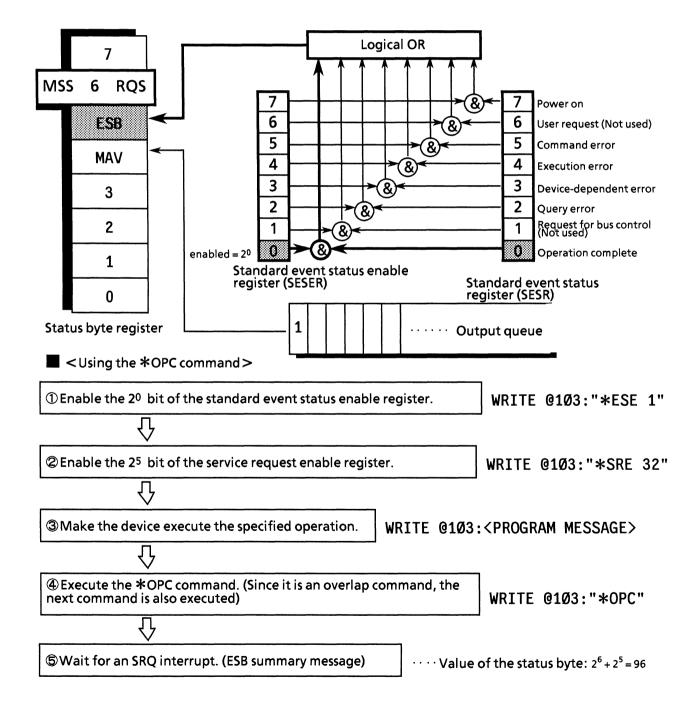

As the MAV summary message bit is used in the "wait for a service request" technique, it will be explained in the next paragraph. The following explains synchronization by reading the output queue.

8.7.3 Wait for a service request

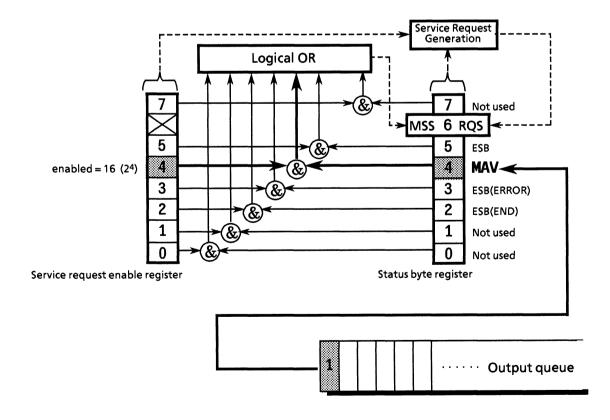

In this technique, the controller is momentarily interrupted by an SRQ signal from a device to process a status message from the device.

In a normal interrupt, the device would make a request to the controller at any time regardless of what the controller is doing. However, in using it as a technique for synchronizing the device with the controller, the controller sends an *OPC command or an *OPC? query to the device to check whether the device's operation has been completed or not. While waiting for the SRQ signal from the operation complete event, the controller carries on with some other useful task, and when it detects the operation complete event, the controller processes the designated task.

■ <Using the *OPC? query> ⑤ Enable the 2⁴ bit of the service request enable register. Ø Make the device execute the specified operation. ⑥ WRITE @1Ø3: **PROGRAM MESSAGE> ⑤ Send the *OPC? query. (Wait until the operation in @ has been completed) Ø Read the ASCII character 1 in the output queue and discard it. ⑥ Wait for the SRQ interrupt (MAV summary message) Value of the status byte: 2⁶ + 2⁴ = 80

To the next operation

SECTION 9 DETAILS OF DEVICE MESSAGES

This section explains the details of the device messages in the table.

 $Formats\ and\ usage\ example\ in\ this\ section\ are\ explained\ in\ the\ HP-BASIC\ of\ the\ Hewlett-Packard\ HP9000\ Series.$

TABLE OF CONTENTS

9.1	Table o	Table of Device Messages		
	9.1.1	Table of Device Messages (in the Alphabetic order)	9-3	
	9.1.2	Device Messages (Panel correspondence)	9-9	
	913	Detailed Explanation of Device Messages	9-24	

(Blank)

This section explains each device message by group. Each group is corresponded to the front and rear panel of MP1764D. Groups are specified according to the setting or request contents.

9.1 Table of Device Messages

Control messages and data request messages that are stipulated in the MP1764D specifications are explained in the listing order.

Check the details of each command by referring to the page numbers listed in the last column of the table under "Device message details".

9.1.1 Table of Device Messages (in the Alphabetic order)

An alphabetic list of each control message and data request message is shown in Table 9-1.

• Other section

(Front panel)

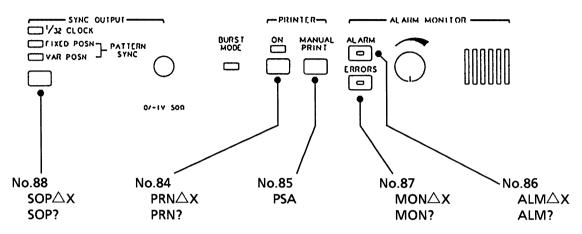

Fig. 9-1-(5) Other section (Front panel)

(Rear panel)

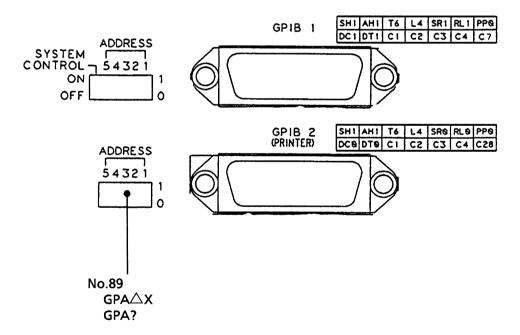

Fig. 9-1-(6) Other section (Rear panel, GPIB)

Notes

There are two setting methods for the GPIB 2 address; one is set via GPIB, and other is set by setting address SW on the rear panel.

When an address is set via GPIB using the GPA command, the set content is held while the mainframe is in remote status. (Except when one of the initialize commands, INI, or *RST, is issued.)

However, if a local state has been made, an address SW status on the rear panel has priority, so the set contents of the remote status become invalid.

Table 9-2-(5) Table of Device Messagess (Other section: front panel)

Function		Control message		Device message details	
	Header part	Numeric data part	Header part	ltem No.	Page

Other section (rear panel GPIB)					
GPIB2 address	GPA	NR1 format	GPA?	89	P9-133

(Rear panel function SW)

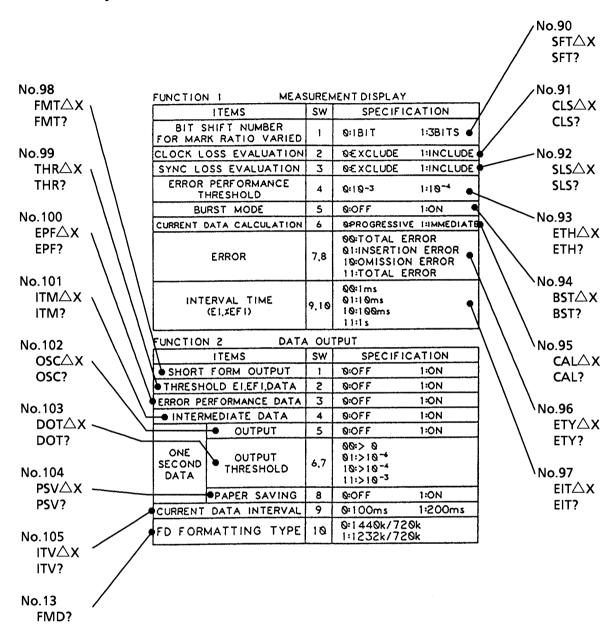

Fig. 9-1-(7) Other section (rear panel function SW)

NOTE

When the rear function SW value differs from that set in the remote status, the processing is done as follows:

• The values set in remote mode are maintained while the mainframe is in the remote status. (When an initialize command INI, or *RST is issued, this is initialized.)

However, if the mainframe becomes local state, function SW status on the rear panel has priority, so the set contents of the remote status become invalid.

9.1.3 Detailed Explanation of Device Messages

MP1764D control messages and data request messages are explained in this section.

 $The \ explanation \ below \ is \ already \ described \ in \ HP-BASIC \ of \ the \ Hewlett-Packard \ HP9000 \ Series.$

• INPUT section

Each control message in the INPUT section is explained in the following pages. The triangle marks (\triangle) indicates a spece.

1) DTH Data input threshold voltage (Data THreshold)

Function Setting of data input threshold voltages.

Set resolution is 0.001 V.

Header	Program	Query	Response	(Number of characters)
DTH	DTH△m	DTH?	DTH△m	(FIX 6)

Value of m The range of the data input threshold voltages is set 1.875 to -3.000 V.

Range of numeric values: Max. 1.875

Min. -3.000 Step 0.001

■ Command type Sequential command

■ Usage restrictions The command is invalid in the following conditions.

Program: During automatic phase threshold search (AUTO SEARCH)

is ON

While Eye margin measurement is being executed

When a floppy disk is being accessed

Query: None

■ Usage example Program: When setting the data input threshold voltage to -3.000 V:

OUTPUT△7ØØ; "DTH△-3"

Query: When the data input threshold voltage is 1.000 V:

OUTPUT△7ØØ; "DTH?"

ENTER△7ØØ;B\$

PRINT△B\$

4

DTH \triangle 1.000 (CR/LF) is output.

When the data input threshold voltage is -3.000 V:

OUTPUT△7ØØ; "DTH?"

ENTER \triangle 700; B\$

PRINT△B\$

1

DTH \triangle -3.000 (CR/LF) is output.

2) THM? Eye margin measurement result (threshold)

(THreshold Margin?)

Function A threshold margin measurement result is output from the Eye-margin

measurement results data.

Measured resolution is 0.001 Vp-p.

Header	Program	Query	Response	(Number of characters)
THM	None	THM?	THM△m	(FIX 6)

■ Value of m The value of the Eye margin from 0.000 Vp-p to 4.875 Vp-p is output.

Range of numeric values: Max. 4.875

Min. 0.000 Resolution 0.001

Here, if there is no Eye margin result, the following data is output.

-9.999

■ Command type Sequential command

Usage restrictions The command is invalid in the following conditions.

Query: None

■ Usage example Query: When the Eye margin measurement result is 1.875 Vp-p:

OUTPUT△7ØØ: "THM?"

ENTER△7ØØ:B\$

PRINT△B\$

THM $\triangle \triangle 1.875$ (CR/LF) is output.

If there is no Eye margin measurement result:

OUTPUT△7ØØ; "THM?"

ENTER△7ØØ;B\$

PRINT△B\$

 $THM \triangle -9.999$ (CR/LF) is output.

■ Note The Eye margin measurement result becomes the object for non-battery

back up. Therefore, care must be taken because the measurement data

is erased at power OFF.

3) CPA

Clock input phase (delay) (Clock Phase Adjust)

■ Function

Clock phase to be input is specified.

The setting resolution is 1 ps.

Header	Program	Query	Response	(Number of characters)
СРА	CPA△m	CPA?	CPA△m	(FIX 4)

■ Value of m

The range of clock input phase voltages from -500 ps to 500 ps is set.

Range of numeric values: Max. 500

Min. -500 Step 1

Command type

Sequential command

Usage restrictions

The command is invalid in the following conditions.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Query: None

Usage example

Program: When the clock input phase is set to 0 ps:

OUTPUT△7ØØ; "CPA△Ø"

Query:

When the clock input phase is 0 ps:

OUTPUT△7ØØ; "CPA?"

ENTER△7ØØ;B\$

PRINT△B\$

Ţ

 $CPA \triangle \triangle \triangle \emptyset$ (CR/LF) is output.

When the the clock input phase is -20 ps:

OUTPUT△7ØØ; "CPA?"

ENTER△7ØØ;B\$

PRINT△B\$

Ţ

 $CPA\triangle\triangle-2\emptyset$ (CR/LF) is output.

4) PHM? Eye margin measurement result (phase) (PHase Margin?)

Function Phase margin measurement result is output from Eye margin

measurement data.

The measured resolution is 1 psp-p.

Header	Program	Query	Response	(Number of characters)
PHM	None	PHM?	PHM△m	(FIX 6)

■ Value of m The value of the Eye margin measurement result from 0 to 1000 psp-p is

output.

Range of numeric values: Max. 1000

Min. 0 Resolution 1

Here, if there is no Eye margin result, the following data is output.

-9999

■ Command type Sequential command

■ Usage restrictions The command is invalid in the following condition:

Query: None

Usage example Query: When the Eye margin measurement result is 100 psp-p:

OUTPUT△7ØØ; "PHM?"

ENTER△7ØØ:B\$

PRINT△B\$

₩

 $PHM \triangle \triangle \triangle 100$ (CR/LF) is output.

If there is no Eye margin measurement result:

OUTPUT△7ØØ; "PHM?"

ENTER△700; **B**\$

PRINT△**B**\$

1

 $PHM \triangle -9999$ (CR/LF) is output.

Note The Eye margin measurement result becomes the object for non-battery

back up. Therefore, care must be taken because the measurement data

is erased at power OFF.

5) DTM Data input termination voltage (Data TerMination)

■ Function Data input termination voltage is specified.

Header	Program	Query	Response	(Number of characters)
DTM	DTM△m	DTM?	DTM△m	(FIX 1)

■ Value of m Ø : GND

1: -2V

Command type Sequential command

Usage restrictions The command is invalid in the following conditions.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Query: None

Usage example Program: When data input termination voltage is set to GND:

OUTPUT△7ØØ; "DTM△Ø"

Query: When data input termination voltage is set to -2 V:

OUTPUT△7ØØ; "DTM?"

ENTER△7ØØ;B\$

PRINT△B\$

1

 $DTM \triangle 1$ (CR/LF) is output.

CAUTION A

If the data input termination voltage is set to GND/-2 V, differ from the data signal conditions input, the mainframe and any equipment under test will be damaged. Care must be taken to set it correctly.

6) CTM Clock input termination voltage

(<u>C</u>lock <u>T</u>er<u>M</u>ination)

Header	Program	Query	Response	(Number of characters)
СТМ	CTM△m	CTM?	CTM△m	(FIX 1)

Clock input termination voltage is set.

■ Value of m Ø: GND

Function

1: -2V

■ Command type Sequential command

Usage restrictions The command is invalid in the following conditions:

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Query: None

Usage example Program: When clock input termination voltage is set to GND

OUTPUT△7ØØ; "CTM△Ø"

Query: When the set value of clock input termination voltage is -2

V

OUTPUT△7ØØ; "CTM?"

ENTER△7ØØ;B\$

PRINT△B\$

1

 $CTM \triangle 1$ (CR/LF) is output.

CAUTION

If the data input termination voltage is set to GND/-2 V, differ from the data signal conditions input, the mainframe and any equipment under test will be damaged. Care must be taken to set it correctly.

7) DLY? Delay status (<u>D</u>e<u>L</u>a<u>Y?</u>)

Function Operation status of the servo motor used to set clock input phases is

output.

Header	Program	Query	Response	(Number of characters)
DLY	None	DLY?	DLY△m	(FIX 1)

■ Value of m Ø: READY status

1: BUSY status

Command type Sequential command

Usage restrictions The command is invalid in the following condition.

Query: None

Usage example Query: When the servo motor used to set the clock input phase is not

operating:

OUTPUT△7ØØ; "DLY?"

ENTER△7ØØ;B\$

PRINT△B\$

4

 $DLY \triangle \emptyset$ (CR/LF) is output.

Note READY means the servo motor used to set the clock input phase is not

operating.

BUSY means the servo motor used to sest the clock input phase is

operating.

Therefore, the mainframe sets the clock input phase in BUSY status.

8) SRH

Automatic phase threshold search function (auto SeaRcH)

Function

Phases between clock / data input phase and threshold voltages are set to a suitable status.

Header	Program	Query	Response	(Number of characters)
SRH	SRH△m	SRH?	SRH△m	(FIX 1)

■ Value of m Ø: Automatic phase threshold search OFF

1: Automatic phase threshold search ON

2: Failure in automatic phase threshold search

Item 2 above is effective only in response to a query

Command type

Sequential command

Usage restrictions

The command is invalid in the following conditions:

Program: When the automatic synchronous function is OFF

If the mark ratio of the measurement pattern is not within

1/8 to 7/8

When clock loss occurs

When a floppy disk is being accessed

During automatic phase threshold search operation

When ON is set during the automatic phase threshold search

failure status

While Eye margin measurement is being executed

Query: None

Usage example

Program: When setting ON the automatic phase threshold search:

OUTPUT; "SRH△1"

Query: If an automatic phase threshold search function failed

OUTPUT△7ØØ; "SRH?"

ENTER△7ØØ;B\$

PRINT△B\$

1

 $SRH\triangle 2$ (CR/LF) is output.

■ Note

- ① Automatic phase threshold search judges the following cases as failures and blinks the AUTO SEARCH key LED on the front panel. The status then becomes SRH△2.
 - (1) When a clock loss occurs during operation
 - (2) When synchronous operation cannot be accessed under the search setting status.
- ② In order to clear the failure of the automatic phase threshold search, set to OFF.

The automatic phase threshold search function cannot set to ON again under failed status.

9) CPL Clock input polarity (Clock PoLarity)

■ Function Clock input polarity is set.

Header	Program	Query	Response	(Number of characters)
CPL	CPL△m	CPL?	CPL△m	(FIX 1)

Value of m Ø: CLOCK

1 : CLOCK

■ Command type Sequential command

■ Usage restrictionss The command is invalid in the following conditions:

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Query: None

Usage example Program: When clock input polarity is set to CLOCK

OUTPUT△7ØØ; "CPL△Ø"

Query: When clock input polarity set value is CLOCK

OUTPUT△7ØØ; "CPL?"

ENTER△**700**; **B**\$

PRINT△B\$

 $CPL\triangle 1$ (CR/LF) is output.

10) EME Eye margin measurement display switching (Eye Margin Enable)

Function Contents of 7seg display for clocks and INPUT section data are switched.

Header	Program	Query	Response	(Number of characters)
EME	EME△m	EME?	EME△m	(FIX 1)

Value of m

Ø: The display values of the 7seg display denote the set values of data input threshold voltage and clock input phase.?

1: The display values of the 7seg display denote the Eye margin measurement results.

Command type

Sequential command

Usage restrictions

The command is invalid in the following conditions:

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Query: None

Usage example

Program: When the display values of the 7 seg-display are setting

values of data input threshold voltage set values or clock

input phase values

OUTPUT△7ØØ; "EME△Ø"

Query: When the values in the 7seg display is the Eye margin

measurement result

OUTPUT△7ØØ; "EME?"

ENTER△7ØØ;B\$

PRINT△B\$

1

 $EME \triangle 1$ (CR/LF) is output.

Note

This setting is for effective Eye margin measurement during panel operation.

When the Eye margin measurement is controlled through GPIB command, settings and queries can be made without regard to the eye margin measurement display.

11) EST Eye margin measurement start (Eye margin STart)

■ Function Eye margin start and stop is set.

Header	Program	Query	Response	(Number of characters)
EST	EST△m	EST?	EST△m	(FIX 1)

■ Value of m Ø: Eye margin measurement stop

1 : Eye margin measurement start2 : Eye margin measurement failure

2 is effective only in response to a query.

■ Command type Sequential command

Usage restrictions The command is invalid in the following conditions.

Program: When the automatic synchronous function is OFF

If the mark ratio of the measurement pattern is not within

1/8 to 7/8

When clock loss occurs

When a floppy disk is being accessed

During automatic phase threshold search operation When ON is set during Eye margin measurement failure

status

While Eye margin measurement is being executed

Query: None

Usage example Program: When setting the Eye margin measurement to OFF

OUTPUT; "EST△Ø"

Query: When the Eye margin measurement has failed:

OUTPUT△7ØØ: "EST?"

ENTER△7ØØ;B\$

PRINT△B\$

1

 $EST \triangle 2$ (CR/LF) is output.

Note

Eye margin measurement function judges the following cases as failures and blinks the EYE MARGIN START key LED on the front panel. The status then becomes EST△2.

- (1) When a clock loss occurs during operation.
- (2) When synchronous operation cannot be accessed under the Eye margin setting status.

The Eye margin cannot start again under failed status.

To clear the Eye margin failure status, specify OFF setting.

Eye margin measurment cannot restart in the failure status.

12) EYT

Eye margin measurement (error ratio selection)

(EYe margin Threshold)

Function The Eye margin measurement range can be specified by error ratio.

The Eye margin can be measured within the specified error ratio.

Header	Program	Query	Response	(Number of characters)
EYT	EYT△m	EYT?	EYT△m	(FIX 1)

Value of m \emptyset : $\leq 1.0 \text{E}-2$

 $\begin{array}{lll} \mathbf{1} & : & \leqq 1.0 \text{E-3} \\ \mathbf{2} & : & \leqq 1.0 \text{E-4} \\ \mathbf{3} & : & \leqq 1.0 \text{E-5} \\ \mathbf{4} & : & \leqq 1.0 \text{E-6} \\ \mathbf{5} & : & \leqq 1.0 \text{E-7} \\ \mathbf{6} & : & \leqq 1.0 \text{E-8} \\ \mathbf{7} & : & \leqq 1.0 \text{E-9} \end{array}$

■ Command type Sequential command

Usage restrictions The command is invalid in the following conditions:

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Query: None

Usage example Program: When the eye margin measurement error ratio is $\leq 1.0E-5$:

OUTPUT; "EYT△3"

Query: When the eye margin measurement error ratio is $\leq 1.0E-7$:

OUTPUT△7ØØ; "EYT?"

ENTER△7ØØ;B\$

PRINT△B\$

¥

EYT \triangle 5 (CR/LF) is output.

SECTION 9 DETAILS OF DEVICE MESSAGES

• MEMORY section

Each control message in the MEMORY SECTION is described in the following pages. (\triangle) indicates a space.

13) FMD? Memory FD mode (memory Fd MoDe?)

■ Function Floppy disk format type is output.

Header	Program	Query	Response	(Number of characters)
FMD	None	FMD?	FMD△m	(FIX 1)

■ Value of m Ø: 1440 k

Note

1: 720 k 2: 1232 k 3: 640 k

■ Command type Sequential command

Usage restrictions The command is invalid in the following condition:

Query: None

■ Usage example Query: When the inserted FD is 2DD and is 1440 kB / 720 k

formatted:

OUTPUT△△7ØØ; "FMD?"

ENTER△7ØØ; B\$

PRINT△**B**\$

FMD \(\frac{1}{2} \) (CR / LF) is output.

Selecting MS-DOS format is done at the rear FUNCTION2 SW10. Since this setting is decided at the power on status, it cannot be changed after that.

• When FUNCTION2 SW10 is 'OFF'

Capacity at the time of formatting	Sector length [byte/sector]	Number of sectors [sector / track]	Number of tracks [track / site]
1440 kB	512	18	80
720 kB	512	9	80

• When FUNCTION2 is 'ON'

Capacity at the time of formatting	Sector length [byte / sector]	Number of sectors [sector / track]	Number of tracks [track / site]
1232 kB	1024	8	77
640 kB	512	8	80

When this Query is executed without inserting a floppy disk, data item 1440 kB or 1232 kB is output according to the current FDD conditions (FUNCTION2 SW10).

14) FSH?

File contents search (File SearcH?)

Function

Data information saved in a floppy disk is output.

There are three types of objective file names as shown below:

TT**.PTN

RR**.PTN

RR**.OTH

Program	Query	Response	(Number of characters)
None	FSH?△m1	FSH△m2,m3,r	m4,m5,
		m2 m3 m4 m5	(FIX 7) (FIX 7) (FIX 2) (each FIX 2)
]			None FSH?△m1 FSH△m2,m3,r m2 m3 m4

Value of m

m1: Selection of first half of a file number.

0 : First half (No. 0 to 49)

1 : Last half (No. 50 to 99)

m2: Unused size

m3: Used size

m4: Number of files

m5: File number of the first half or last half (Only for the objective

file name)

Command type

Sequential command

Usage restrictions

This command is invalid in the following set condition:

Query:

None

Usage example

Query:

When there are file numbers from 1 to 10 in the floppy disk

(unused size and used size is an example)

OUTPUT△7ØØ; "FSH?△Ø"

ENTER△7ØØ:B\$

PRINT△B\$

1

 $FSH \triangle \triangle 72294, \triangle \triangle 18132, 10, 01, 02, 03, 04, 05,$

06,07,08,09,10 (CR/LF) is output.

When the file cannoot be found on the floppy disk

OUTPUT△7ØØ; "FSH?△Ø"

ENTER△7ØØ;B\$

PRINT△B\$

J

FSH $\triangle \triangle 723968$, $\triangle \triangle \triangle 6144$, $\triangle \emptyset$, --(CR/LF) is output.

Note

File contents are searched according to the setting status of the memory mode switching (PATTERN / OTHERS).

- (1) When the memory mode swtiching is PATT TT**.PTN or RR**.PTN file is searched.
- (2) When the memory mode switching is OTHERS RR**.OTH file is searched.

If a PATT file saved by MP1763B/C and a PATT file saved by MP1764D are stored in a floppy disk, the file saved by MP1764D is output prior to the other one.

Searching file contents is output from the nearest directory. This mainframe does not have an insertion detection function for a floppy, so previous directory information cannot be updated at floppy disk exchange.

Therefore, when inserting or changing floppy disks, always update directory information by selecting the DIR mode.

15) FIL

File No. and directory mode switching

(FILe no. / directory mode)

Function

Sets swtiching between file No. mode, and directory mode.

Header	Program	Query	Response	(Number of characters)
FIL	FIL△m	FIL?	FIL△m	(FIX 1)

Value of m

Ø: File No. mode

1: DIR mode

Command type

Sequential command

Usage restrictions

The command is invalid in the following set conditions.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Query:

None

Usage example

Program: When DIR mode is set

OUTPUT△7ØØ; "FIL△1"

The inserted floppy disk is accessed and the DIR information

(No. 23)

is saved in internal memory.

Query:

When File No. mode is selected

OUTPUT△7ØØ: "FIL?"

ENTER△7ØØ;B\$

PRINT△B\$

FD format

FIL△Ø (CR/LF) is output.

Note

If any errors occur during file accessing, the error nformation is

displayed on the MEMORY INDICATOR.

This error indication is cleared by the following settings.

File No. / directory mode switching (No. 15) Floppy data recall (No. 16) Floppy data delete (No. 17) Floppy data save (No. 18) Floppy data recall (No. 19) Memory mode switching (No. 20)

9-42

16) RCL

Floppy data recall (ReCaLI)

Function

Sets the contents of a floppy disk for this system.

Header	Program	Query	Response	(Number of characters)
RCL	RCL△m	None	None	

Value of m File names are set within the range 0 to 99.

Range of numeric values: Max.

Min. 0 1 Step

Command type Sequential command

Usage restrictions The command is invalid in the following conditions.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Usage example Program: When the contents of file number 9 are specified

OUTPUT△7ØØ; "RCL△9"

Note If the specified file cannot be found, an error occurs and the error

information is displayed on the MEMORY INDICATOR.

This error indication is cleared by the following settings.

File No. / directory mode switching (No. 15)

Floppy data recall (No. 16) Floppy data delete (No. 17) Floppy data save (No. 18) Floppy data recall (No. 19) (No. 20) Memory mode switching FD format (No. 23)

Also, when an error occurs, Expansion event status resister ESR3

(ERROR) bit 1 is raised as an FD error occurrence bit.

The following files are read according to the memory mode setting status.

PATT mode: RR**.PTN or TT**.PTN

17) DEL

Floppy data delete (**DELete**)

Function

A specified file is deleted in a floppy disk.

Header	Program	Query	Response	(Number of characters)
DEL	DEL△m	None	None	

Value of m

File names are set within the range 0 to 99.

Range of values:

Max. 99

Min. 0

1 Step

Command type

Sequential command

Usage restrictions

The command is invalid in the following set conditions.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Usage example

Program: When the contents of file number 9 are specified

OUTPUT△7ØØ; "DEL△9"

Note

If there is no specified file, an error occurs and the error information is displayed on the MEMORY INDICATOR.

This error indication is cleared by the following setting.

① File No. / directory mode switching (No. 15)

Floppy data recall (No. 16) Floppy data delete (No. 17) Floppy data save (No. 18) (No. 19) Floppy data recall (No. 20) Memory mode switching FD format (No. 23)

Also, when an error occurs, Expansion event status resister ESR3 (ERROR) bit1 is raised as a FD error occurrence bit.

Files saved using MP1763B/C cannot be deleted by this equipment.

The following files are read according to the memory mode setting status.

PATT mode:

RR**.PTN

18) SAV Floppy data save (SAVe)

Function Setting contents for this equipment are saved to a floppy disk.

Header	Program	Query	Response	(Number of characters)
SAV	SAV△m	None	None	

■ Value of m File names are set within the range 0 to 99.

Range of numeric values: Max. 99

Min. 0 Step 1

■ Command type Sequential command

Usage restrictions The command is invalid in the following conditions.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Usage example Program: When saving the setting contents of this equipment using file

number 9

OUTPUT△7ØØ; "SAV△9"

Note If the specified file cannot be found, an error occurs and error

information is displayed on the MEMORY INDICATOR.

This error indication is cleared by the following settings.

File No. / directory mode switching (No. 15)
Floppy data recall (No. 16)
Floppy data delete (No. 17)
Floppy data save (No. 18)
Floppy data recall (No. 19)
Memory mode switching (No. 20)

FD format (No. 23)

Also, when an error occurs, expansion event status resister ESR3 (ERROR) bit1 is raised as an FD error occurrence bit.

The following files are saved according to the memory mode setting status.

PATT mode: RR**.PTN or TT**.PTN

19) RSV

Floppy data resave (ReSaVe)

Function

The contents of a floppy disk are specified into the mainframe.

Header	Program	Query	Response	(Number of characters)
RSV	RSV△m	None	None	

■ Value of m File names are set within the range 0 to 99.

Range of numeric values: Max. 99

Min. 0 Step 1

Command type
Sequential command

Usage restrictions The command is invalid in the following set conditions.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Usage example Program: When overwriting the contents of file No. 9

OUTPUT△7ØØ; "RSV△9"

Note If the specified file cannot be found, an error occurs and error

information is displayed on the MEMORY INDICATOR.

This error indication is cleared in the following setting.

File No. / directory mode switching (No. 15)
Floppy data recall (No. 16)
Floppy data delete (No. 17)
Floppy data save (No. 18)
Floppy data recall (No. 19)
Memory mode switching (No. 20)
FD format (No. 23)

Also, when an error occurs, expansion event status resister ESR3

(ERROR) bit1 is raised as an FD error occurrence bit.

The following files are resaved according to the memory mode setting status.

PATT mode: RR**.PTN or TT**.PTN

20) MEM

Memory function switching (MEMory mode)

Function

PATT/OTHERS switching is specified.

Header	Program	Query	Response	(Number of characters)
MEM	MEM△m	MEM?	MEM△m	(FIX 1)

■ Value of m

Ø: PATT mode

1: OTHERS mode

Command type

Sequential command

Usage restrictions

The command is invalid in the following condition.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Query: None

Usage example

Program: When memory mode PATT is specified

OUTPUT△7ØØ; "MEM△Ø"

Query:

When memory mode OTHERS is specified

OUTPUT△7ØØ: "MEM?"

ENTER△7ØØ;B\$

PRINT△B\$

1

 $MEM \triangle 1$ (CR/LF) is output.

■ Note

PATT mode denotes PATTern mode.

In this case, the objective content is the contents of the PATTERN section.

OTHERS MODE includes contents other than measurement data in PATTERN mode.

If any errors occur during the file accessing, error information is displayed on the MEMORY INDICATOR.

This error indication is cleared by the following settings.

File No. / directory mode switching (No. 15) Floppy data recall (No. 16)

Floppy data recall (No. 17)
Floppy data save (No. 18)
Floppy data recall (No. 19)
Memory mode switching (No. 20)
FD format (No. 23)

Also, when an error occurs, expansion event status resister ESR3 (ERROR) bit 1 is raised as an FD error occurrence bit.

SECTION 9 DETAILS OF DEVICE MESSAGES

The following files are resaved according to the memory mode setting status.

PATT mode: RR**.PTN or TT**.PTN

21) MAC? Floppy disk access status (Memory Access Condition?)

Floppy disk access condition is output.

Header	Program	Query	Response	(Number of characters)
MAC	None	MAC?	MAC△m	(FIX 1)
İ				

■ Value of m Ø: Non access condition

1: Access condition

Command type Sequential command

■ Usage restrictions The command is invalid in the following condition.

Query: None

■ Usage example Query: When a floppy disk is not accessed

OUTPUT△7ØØ; "MAC?"

ENTER△7ØØ;B\$

PRINT△B\$

1

 $MAC \triangle \emptyset$ (CR / LF) is output.

22) FDE? FD error message (FD Error message?)

Function FD error information is output.

Header	Program	Query	Response	(Number of characters)
FDE	None	FDE?	FDE△m	(FIX 2)

■ Value of m Error message

Ø: E0 (Error due to wrong format)

1 : E1 (An attempt was made to write to a write-protected file)

2 : E2 (Insufficient write area)

3 : E3 (The file name specified for reading could not be found)
4 : E4 (Saving was attempted with a file name already in use)

5 : E5 (Write error)6 : E6 (Read error)

7 : E7 (DMA transfer error)

8 : E8 (Other error)

9 : E9 (Hardware trouble error)

10 : No error

■ Command type Sequential command

Usage restrictions The command is invalid in the following condition.

Query: None

Usage example Query: When a hardware trouble error occurs

OUTPUT△7ØØ; "FDE?"

ENTER△7ØØ;B\$

PRINT△B\$

FDE \(\triangle 9 \) (CR / LF) is output.

Note This error indication is cleared in the following settings.

File No. / directory mode switching (No. 15)

Floppy data recall (No. 16)
Floppy data delete (No. 17)
Floppy data save (No. 18)
Floppy data recall (No. 19)
Memory mode switching (No. 20)
FD format (No. 23)

Also, when an error occurs, expansion event status register $\ensuremath{\mathsf{ESR3}}$

(ERROR) bit 1 is raised as an FD error occurrence bit.

23) FDF FD format (FD Format)

Function Floppy disk is formatted.

Select the formatting type with the FUNCTION2 SW10 on the rear

panel.

2HD or 2DD is decided automatically according to the FD inserted.

Header	Program	Query	Response (Number of characters)
FDF	FDF	None	None

■ Value of m None

■ Command type Sequential command

Usage restrictions The command is invalid in the following condition.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

When the directory mode is switched, from File No. /

Directory Mode.

Usage example Program: Floppy disk can be formatted.

OUTPUT△7ØØ; "FDF"

Note If any errors occur during file accessing, error information is displayed

on the MEMORY INDICATOR.

This error indication is cleared by the following settings.

File No. / directory mode switching (No. 15)
Floppy data recall (No. 16)
Floppy data delete (No. 17)
Floppy data save (No. 18)
Floppy data recall (No. 19)
Memory mode switching (No. 20)
FD format (No. 23)

Also, when an error occurs, expansion event status register ESR3

(ERROR) bit 1 is raised as a FD error occurrence bit.

• PATTERN section

Each control message in the PATTERN section is explained on the following pages.

The triangle marks (\triangle) indicates a space.

24) LGC Pattern logic (LoGiC mode)

Function Data logic is specified.

The relationship between logical data output and actual data output is different in the ALTERNATE / DATA / ZERO SUBST and in PRBS.

(Refer to the Function and Operation Instruction Manual)

Header	Program	Query	Response	(Number of characters)
LGC	LGC△m	LGC?	LGC△m	(FIX 1)

■ Value of m Ø: Positive

1: Negative

■ Command type Sequential command

Usage restrictions The command is invalid in the following condition.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Query: None

Usage example Program: When the positive logic is specified

OUTPUT△7ØØ; "LGC△Ø"

Query: When the negative logic is specified

OUTPUT△7ØØ;"LGC?"

ENTER△7ØØ;B\$

PRINT△B\$

· ·

LGC \triangle **1** (CR/LF) is output.

When a pattern logic is specified in PRBS mode, the pattern mark ratio is switched corresponding to the logic.

• Positive logic 0/8, 1/8, 1/4, 1/2

• Negative logic 8/8, 7/8, 3/4, 1/2

25) PTS Measurement pattern (PaTtern Select)

Function Measurement pattern is specified.

Header	Program	Query	Response	(Number of characters)
PTS	PTS△m	PTS?	PTS△m	(FIX 1)

■ Value of m Ø: ALTERNATE

1: DATA

2: ZERO SUBST

3: PRBS

Command type Sequential command

Usage restrictions The command is invalid in the following condition.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Query: None

Usage example Program: When measurement pattern is specified as alternate

OUTPUT△7ØØ; "PTS△Ø"

Query: When the measurement pattern is specified as Data

OUTPUT△7ØØ; "PTS?"

ENTER△7ØØ;B\$

PRINT△B\$

 $PTS\triangle 1$ (CR/LF) is output.

■ Note When the measurement pattern is switched, the previous setting status

is returned.

For example, when the PRBS pattern is specified, the step numbers and

pattern mark ratio of the PRBS pattern is returned.

26) PTNZERO SUBST / PRBS step numbers
(zero subst / prbs PaTterN mode)

■ Function ZERO SUBST / PRBS pattern is specified.

Header	Program	Query	Response	(Number of characters)
PTN	PTN△m	PTN?	PTN△m	(FIX 1)

Value of m	ZERO SU 2 : 2 ⁷ 3 : 2 ⁹ 5 : 2 ¹ 6 : 2 ¹	1	3 : 5 : 6 : 7 : 8 :	$2^{7}-1$ $2^{9}-1$ $2^{11}-1$ $2^{15}-1$ $2^{20}-1$ $2^{23}-1$ $2^{31}-1$
Command type	Sequentia	al command		
Usage restrictions	The comm	nand is invalid i	n the fo	llowing conditions.
	Program:	While Eye mar When a floppy	gin mea disk is b	se threshold search operation asurement is being executed being accessed nt pattern is Alternate.Data
	Query:	_		d, and ERR (CR / LF) is output. nt patterns are Alternate, Data
Usage example	Program:	When the meas		nt pattern is specified as PRBS $2^7 - 1$
	Query:	When the meast $2^{31}-1$ OUTPUT \triangle 700 ENTER \triangle 700 PRINT \triangle B\$	Ø;"PTN ;B\$ ↓	
	:	When the meas OUTPUT△700 ENTER△700; PRINT△B\$	ð;"PTN	nt pattern is specified as DATA ?"

ERR (CR/LF) is output.

27) MRK

Pattern mark ratio (MaRK ratio mode)

Function

The mark ratio for the PRBS pattern is specified.

Header	Program	Query	Response	(Number of characters)
MRK	MRK△m	MRK?	MRK△m	(FIX 1)

Value of m	Positive logic	Negative logic
	Ø: 0/8	8/8
	1: 1/8	7/8
	2:1/4	3/4
	3: 1/2	$\overline{1/2}$

Command type

Sequential command

Usage restrictions

The command is invalid in the following condition.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

When measurement patterns are Alternate, Data, Zero subst

Query: The following case is invalid and ERR (CR/LF) is output.

When measurement patterns are Alternate, Data, Zero subst

Usage example

Program; When the pattern mark ratio is specified as 0/8

OUTPUT△7ØØ; "MRK△Ø"

Query: When the pattern mark ratio is specified as 1/8

OUTPUT△7ØØ; "MRK?"

ENTER△7ØØ;B\$

PRINTAB\$

Ţ

 $MRK \triangle 1$ (CR/LF) is output.

: When the measurement pattern is specified as DATA

OUTPUT△7ØØ; "MRK?"

ENTER△7ØØ; B\$

PRINT△B\$

Ţ

ERR (CR / LF) is output.

28) SYM Synchronous method (<u>SYnc Mode</u>)

Function Synchronous method is specified.

Header	Program	Query	Response	(Number of characters)
SYM	SYM△m	SYM?	SYM△m	(FIX 1)

■ Value of m Ø: NORMAL

1 : FRAME 2 : QUICK

Command type
Sequential command

Usage restrictions The command is invalid in the following condition.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

The FRAME is invalid in the following case

When measurement pattern is DATA, and data length is 127

or less

QUICK selection in the ALTERNATE measurement pattern

Query: The following case is invalid, and ERR (CR/LF) is output:

When the measurement patter is PRBS

■ Usage example Program: When NORMAL synchronous mode is specified

OUTPUT△7ØØ; "SYM△Ø"

Query: When synchronous mode is specified as FRAME

OUTPUT△7ØØ; "SYM?"

ENTER△7ØØ;B\$

PRINT△B\$

- 1

 $SYM \triangle 1$ (CR/LF) is output.

: When measurement pattern is specified as PRBS

OUTPUT△7ØØ; "SYM?"

ENTER△7ØØ;B\$

PRINT△B\$

1

ERR (CR/LF) is output.

29) DSP Display switching (DiSPlay select)

Function Pattern part display switching is specified.

Header	Program	Query	Response	(Number of characters)
DSP	DSP△m	DSP?	DSP△m	(FIX 1)

■ Value of m Ø: PATTERN

1 : BIT WINDOW2 : BLOCK WINDOW3 : ERROR ANALYSIS

Command type
Sequential command

Usage restrictions The command is invalid in the following condition.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

The BLOCK WINDOW is invalid in the following cases:

When the measurement pattern is PRBS

When the measurement pattern is DATA, and the bit

length is not multiple of 32

When the synchronous mode is QUICK

The ERROR ANALYSIS is invalid in the following cases:

When no OPTION-01 is mounted

When the measurement pattern is ALTERNATE

When the synchronous mode is QUICK

Query: None

■ Usage example Program: When display switching is specified as PATTERN

OUTPUT△7ØØ; "DSP△Ø"

Query: When display switching is specified as BIT WINDOW

OUTPUT△7ØØ; "DSP?"

ENTER△7ØØ; B\$

PRINT△B\$

 $DSP \triangle 1$ (CR/LF) is output.

30) ALT

Alternate pattern A / B display switching
(ALTernate a / b)

Function The alternate pattern time for A / B display switching is specified.

Header	Program	Query	Response	(Number of characters)
ALT	ALT△m	ALT?	ALT△m	(FIX 1)
i				

■ Value of m Ø: Pattern A

1: Pattern B

■ Command type Sequential command

Usage restrictions The command is invalid in the following condition.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

When the measurement patterns are DATA, ZERO SUBST,

and PRBS

Query: The following case is invalid and ERR (CR/LF) is output.

When the measurement patterns are DATA, ZERO SUBST

and PRBS

■ Usage example Program: When the alternate display is switched to pattern A

OUTPUT△7ØØ; "ALT△Ø"

Query: When the alternate display is switched to pattern A

OUTPUT△7ØØ; "ALT?"

ENTER△7ØØ;B\$

PRINT△B\$

•

 $ALT \triangle 1$ (CR/LF) is output.

: When the measurement pattern is specified as PRBS

OUTPUT△7ØØ; "ALT?"

ENTER△7ØØ;B\$

PRINT△B\$

1

ERR (CR / LF) is output.

31) FLN

FRAME length (Frame LeNgth)

Function

Frame length is specified.

Header	Program	Query	Response	(Number of characters)
FLN	FLN△m	FLN?	FLN△m	(FIX 2)

Value of m

Frame bit length values are specified within the range 4 to 32 bits.

Max.: 32 Min.: 4 Step: 4

Command type

Sequential command

Usage restrictions

The command is invalid in the following condition.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed When measurement pattern is PRBS

When a synchronous mode is NORMAL or QUICK

When a frame bit length is not in steps of 4

Query:

In the following cases, the command is invalid and ERR

(CR/LF) is output.

When the measurement pattern is PRBS

When the synchronous mode is NORMAL or QUICK

Usage example

Program: When the frame bit length is set to 4 bits

OUTPUT△7ØØ; "FLN△4"

Query:

When the frame bit length is specified as 32 bits

OUTPUT△7ØØ: "FLN?"

ENTER△7ØØ;B\$

PRINT△B\$

1

 $FLN\triangle 32$ (CR/LF) is output.

: When the measurement pattern is specified as PRBS

OUTPUT△7ØØ; "FLN?"

ENTER△7ØØ;B\$

PRINT△B\$

J

ERR (CR/LF) is output.

32) DLN

Measurement data length (Data LeNgth)

Function

Measurement data length is specified when the measurement pattern is ALTERNATE or DATA.

Header	Program	Query	Response	(Number of characters)
DLN	DLN△m	DLN?	DLN△m	(FIX 7)

Value of m

Data length is specified in the following range.

Alternate pattern

• Data pattern

Max.: 8388608

Max.: 4194304

Max.. 000000

Min.: 128

Min.: 2

Step: 128

Step: The following are classified

according to the data length.

Data length

2 ~ 65536 bits/step 1 bit

65536 ~ 131072 bits / step 2 bits

131072 ~ 262144 bits / step 4 bits

262144 ~ 524288 bits / step 8 bits

524288 ~ 1048576 bits / step 16 bits

1048576 ~ 2097152 bits/step 32 bits

2097152 ~ 4194304 bits / step 64 bits

4194304 ~ 8388608 bits / step 128 bits

Command type

Sequential command

Usage restrictions

The command is invalid in the following conditions.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

When the measurement patterns are ZERO SUBST or PRBS

Query: The following case is invalid, and ERR (CR/LF) is output

When a measurement pattern is ZERO SUBST or PRBS

SECTION 9 DETAILS OF DEVICE MESSAGES

Usage example

Program: When the data length is specified as 4 bits

OUTPUT△7ØØ; "DLN△4"

Query:

When the data length was specified as 32 bits

OUTPUT△7ØØ; "DLN?"

ENTER△7ØØ;B\$

PRINT△B\$

 $DLN \triangle \triangle \triangle \triangle \triangle \triangle 32$ (CR/LF) is output.

: When the measurement pattern was specified as PRBS

OUTPUT△7ØØ; "DLN?"

ENTER△7ØØ:B\$

PRINT△B\$

ERR (CR/LF) is output.

Note

When no data value is specified, the value is optimized in the following way.

The input value is rounded down to the nearest value.

Example) • Data length input

Data length to be specified

131075

131072

33) ZLN ZERO SUBST length (Zero subst LeNgth)

■ Function Zero substitution bit length is specified when the measurement pattern is ZERO SUBST.

Header	Program	Query	Response	(Number of characters)
ZLN	ZLN△m	ZLN?	ZLN△m	(FIX 5)

Value of m Zero substitution bit length can be specified within the following range.

Maximum value: The range is decided according to the number of steps ZERO SUBST.

 2^{7} : 127 2^{9} : 511 2^{11} : 2047 2^{15} : 32767

Minimum value: 1 Step: 1

■ Command type Sequential command

Usage restrictions The command is invalid in the following conditions.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

When the measurement pattern is ALTERNATE, DATA, or

PRBS

When synchronous mode is QUICK

Query: The following case is invalid and ERR (CR/LF) is output.

When the measurement pattern is ALTERNATE, DATA, or

PRBS

When synchronous mode is QUICK

■ Usage example Program: When ZERO SUBST length is specified as 1 bit

OUTPUT△7ØØ; "ZLN△1"

Query: When ZERO SUBST length has been specified as 127 bits

OUTPUT△7ØØ; "ZLN?"

ENTER△7ØØ:B\$

PRINT△**B**\$

ZLN $\triangle \triangle \triangle$ 127 (CR/LF) is output.

: When the measurement pattern was specified as PRBS

OUTPUT△7ØØ; "ZLN?"

ENTER△7ØØ:B\$

PRINT△B\$

.

ERR (CR/LF) is output.

34) ADR PAG Number of pages (ADdRess / PAGe)

Function

Number of pages is specified.

Header	Program	Query	Response	(Number of characters)
ADR	ADR△m	ADR?	ADR△m	(FIX 9)
PAG	PAG△m	PAG?	PAG△m	(FIX 9)

■ Value of m Number of pages is specified within the following range.

Maximum value: 1342177278

Minimum value: 1 Step: 1

■ Command type Sequential command

Usage restrictions The command is invalid in the following condition.

Program: During automatic phase threshold search operation

While Eve margin measurement is being executed

When a floppy disk is being accessed

Query: None

■ Usage example Program: When the a page number is specified as 1

OUTPUT△7ØØ; "PAG△1"

Query: When number of pages has been specified as 16000

OUTPUT△7ØØ: "PAG?"

ENTER△7ØØ;B\$

PRINT△B\$

Ţ

 $PAG \triangle \triangle \triangle \triangle \triangle 16000$ (CR/LF) is output.

Note There are two commands; "ADR" and "PAG", which have the same

function.

However, the maximum settable page numbers differ according to the specified values of the measurement pattern and data length.

Also, when a settable maximum page number is specified within the above maximum value of 1342177278, then, this becomes the maximum value at that time.

Example) The data length is 32, number of pages displayed is 1, and maximum page numbers is 2, so if PAG \triangle 3 is input, the number of pages becomes 2.

The maximum page value is the value in which the data length is divided by 16, and if there is any remainder, 1 is added to the quotient.

35) BIT Pattern bit (pattern BIT)

■ Function Bit pattern is specified.

Header	Program	Query	Response (Number of characters)
BIT	 NR1 format BIT△m HEX format BIT△#Hm 	BIT?	Bit contents of 8 pages max. can be output in the following format until the maximum pattern specified pages is reached. PAG△********** BIT△#H****, #H****,, #H**** Bit pattern is indicated in HEX notation together with output head page. Maximum 8 pages (by FIX 4)

■ Value of m Bit pattern is specified in the following range.

• NR1 format • HEX format

Maximum value:65535Maximum value:FFFFMinimum value:0Minimum value:0Step:1Step:1

Command type Sequential command

■ Usage restrictions The command is invalid in the following condition.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessedWhen measurement

pattern is ZERO SUBST, or PRBS When synchronous mode is QUICK

Query: The command is invalid in the following case and ERR

(CR/LF) is output.

When the synchronous mode is QUICK

Usage example

Program: When three pages of bit pattern are specified from the current specified page

OUTPUT△7ØØ; "BIT△1Ø, 2Ø, 3Ø"

OUTPUT \$\triangle 700; "BIT \$\triangle #\triangle #\triangle FFF, #\triangle 1000, #\triangle 2000"

The pattern bit of a continuation page can be specified by separating the data and data space with a comma.

After specifying page numbers once, if a 4 page pattern bit is to be specified from that specified page

OUTPUT 700; "PAG△10; BIT△10,20,30,40" OUTPUT 700; "PAG△10; BIT△#HFFFF,#H1000, #H2000,#H3000"

Query:

When the display page is 1 and maximum settable pages are 10, the data from page 1 to 8 is read.

OUTPUT \$\triangle 700; "BIT?" ENTER \$\triangle 700; B\$

PRINT△B\$

 $PAG \triangle \triangle \triangle \triangle \triangle \triangle \triangle \triangle 1$; $BIT \triangle #H0000, #H00000$,

#H0000,#H0000,#H0000, #H0000,#H0000,#H0000

(CR/LF) is output.

 $: \quad When \ the \ synchronous \ mode \ is \ QUICK$

OUTPUT△7ØØ; "BIT?"

ENTER△7ØØ;B\$

PRINT△B\$

Ţ

ERR (CR/LF) is output.

Note

Continuation page pattern bits can be specified by separating with comma (,) between data and data space of NR1 or HEX part. (8 pages max.)

By setting bit1 of the bit indicator to LSB, and bit16 to MSB, response is performed.

For example, if 32768 is specified, the upper bit (bit16) becomes 1.

36) CHMBIT WINDOW patter bit

(bit window <u>CH Mask pattern</u>)

■ Function BIT WINDOW pattern is specified.

Header	Program	Query	Response (Number of characters)
СНМ	 NR1 format CHM△m HEX format CHM△#Hm 	CHM?	Bit contents of 8 pages max.can be output in the following format until the maximum pattern specified pages is reached. MSKA*; CHMA#H****, #H**** Bit pattern is indicated in HEX notation together with header page. Maximum 2 pages (by FIX 4)

■ Value of m BIT WINDOW pattern is specified within the following range.

NR1 format
 HEX format

Maximum value:65535Maximum value:FFFFMinimum value:0Minimum value:0Step:1Step:1

Command type Sequential command

Usage restrictions The command is invalid in the following conditions.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Query: None

■ Usage example Program: When bit patters for 2 pages is specified while the current

specified page is 1

OUTPUT△7ØØ; "CHM△1Ø,2Ø"

OUTPUT \$\triangle 700; "CHM \$\triangle #HFFFF, #H1000"

The pattern bit of a continuation page can be specified by separating the data and data space with a comma.

After specifying page numbers once, if a pattern bit of the maximum numbers of pages is specified from the specified pages

OUTPUT 7ØØ; "MSK△1; CHM△1Ø, 2Ø"

OUTPUT 7ØØ; "MSK△1; CHM△#HFFFF, #H1ØØØ"

SECTION 9 DETAILS OF DEVICE MESSAGES

Query: When the display page is specified as 1

Data of page 1 and page 2 are read.

OUTPUT△7ØØ; "CHM?"

ENTER△7ØØ;B\$

PRINT△B\$

1

 $MSK\triangle1$; $CHM\triangle\#H0000$, #H00000 (CR / LF) is output.

Note

Continuation page pattern bits can be specified by separating with commas (,) between data and data space of NR1 or HEX. (Maximum 2 pages)

37) MSK

BIT WINDOW page (bit window MaSK page)

Function

Page numbers and pattern synchronous position are specified.

Header	Program	Query	Response	(Number of characters)
MSK	MSK△m	MSK?	MSK△m	(FIX 10)
MSK	MSK△m	MSK?	MSK△m	(FIX

Value of m

Page number are specified within the following range.

Maximum: 2 Minimum: 1 Step: 1

Command type

Sequential command

Usage restrictions

The command is invalid in the following condition.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Query: None

Usage example

Program: When page 1 is specified

OUTPUT△7ØØ; "MSK△1"

Query: When 2 pa

When 2 pages have been specified

OUTPUT△7ØØ; "MSK?"

ENTER△7ØØ;B\$

PRINT△B\$

1

 $MSK \triangle 2$ (CR/LF) is output.

38) MGB BLOCK WINDOW pattern bit

(block window Mask Gate pattern Bit)

■ Function BLOCK WINDOW patter bit is specified.

Header	Program	Query	Response (Number of characters)
MGB	 NR1 format MGB△m HEX format MGB△#Hm 	MGB?	Bit contents of 8 pages max. can be output in the following format until the maximum pattern specified pages is reached. PAG△********** MGB△#H**** Bit pattern is indicated in HEX notation together with header page. Maximum 8 pages (FIX 4 each)

■ Value of m Bit pattern is specified in the following range.

 NR1 format 		HEX format		
Maximum:	65535	Maximum:	FFFF	
Minimum:	0	Minimum:	0	
Step:	1	Step:	1	

When 1 to 655356 is specified, measurement range is MASKed in 32bit units.

Command type

Sequential command

■ Usage restrictions

The command is invalid in the following condition.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed
When the measurement pattern is PRBS
When the synchronous format is QUICK
When the data length is not a multiple of 32

Query: The following cases are invalid and ERR (CR/LF) is output.

When the measurement pattern is PRBS When the synchronous format is QUICK When the data length is not a multiple of 32 Usage example

Program: When a bit pattern of 3 pages is specified from the current specified pages

OUTPUT△7ØØ; "MGB△ØØ, Ø1, ØØ"

OUTPUT \$\triangle 700; "MGB \$\triangle #HFFFF, #H1000, #H2000"

Continuation page pattern bits can be specified by separating with commas (,) between data and data spaces.

After specifying page numbers once, if a pattern bit of 4 pages is specified from the specified pages

OUTPUT 700; "PAG△10; MGB△10,20,30,40" OUTPUT 700; "PAG△10; MGB△#HFFFF,#H1000, #H2000,#H3000"

Query: When page is specified as 1

Data from page 1 to 8 is read. OUTPUT \triangle 700; "MGB?"

 $ENTER \triangle 700; B$ \$

PRINT△B\$

#HFFFF, #HFFFF, #HØØØØ, #HØØØØ, #HØØØØ, #HØØØØ,

#HØØØØ

(CR/LF) is output.

■ Note

Continuation page pattern bits can be specified by separating with commas (,) between data and data space of NR1 or HEX. (Maximum 8 pages)

The BLOCK WINDOW pattern is specified in units of 32 bits.

Therefore, data of 32 bits such as page 1 and page 2, page 3 and page 4 is specified with ALL'0s' or ALL'1s'.

For example, 1 to 65535 is specified, 32 bits values are specified by ALL '1' and the measurement range is MASKed.

For ALTERNATE pattern, the A or B BLOCK WINDOW pattern must be specified by using the A/B display switch (No. 30).

39) EAB? Error analysis data (Error Analysis pattern Bit?)

Function Error analysis data results can be read. (Effective only for Option-01)

Header	Program	Query	Response (Number of characters)
None	None	EAB?	The result of analysis of the specified page numbers is output in the following format. EAP \(\times *\ *\ *\ *\ *\ *\ *\ *\ *\ *

■ Value of m Page: Display switching from 1 to 16

Monitor data: Page position from the header of the pattern specified

Error analysis data: Error analysis result

0 or 1: No error

 $+\,$ sign: Inserted error (Changed error from 0 to 1)

- sign: Sending error (Changed error from 1 to 0)

■ Command type Sequential command

Usage restrictions The command is invalid in the following conditions.

Query: The following cases is invalid and ERR (CF / LF) is output.

When the synchronous mode is QUICK When there is no measurement data When the measurement data is invalid

When the measurement pattern is ATTERNATE

Usage example Query: When the error analysis result is as shown below with

display page 10, and 218th monitor page

 $\begin{array}{ccc} \text{bit 1} & \text{bit 16} \\ \textbf{0110110100001001} \end{array}$

Error bit

OUTPUT△7ØØ: "EAB?"

ENTER△7ØØ;B\$

DDINT A DO

PRINT△B\$

 $EAP \triangle 10$; $EAB \triangle \triangle \triangle \triangle \triangle \triangle \triangle 218$,

#B1001000010110+10 (CR/LF) is output.

 Note

Error analysis results are fetched in units of 16 bits. Page setting is not performed automatically. Therefore, when each data page is fetched, the required error analysis page must be specified if necessary. (Pages are specified by the EAP command on the next page)

The error analysis data cannot backed up in the built-in memory. Keep this in mind.

40) EAP

Error analysis page (Error Analysis Page)

■ Function

Error analysis page is switched. (Effective only for option-01)

Header	Program	Query	Response	(Number of characters)
EAP	EAP△m	EAP?	EAP△m	(FIX 2)

■ Value of m

The error analysis result is displayed on the BIT indicator in units of 16

bits.

Range of numeric values: Maximum 16

Minimum 1 Step 1

Command type

Sequential command

Usage restrictions

The command is invalid in the following condition.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

When no error analysis OPTION-01 is mounted

When the synchronous mode is QUICK

Query:

The following case is invalid and ERR (CR/LF) is output.

When the synchronous mode is QUICK

The following case becomes invalid.

When no error analysis OPTION-01 is mounted

Usage example

Program: When error analysis page is specified as 5

OUTPUT△7ØØ; "EAP△5"

Query: When error analysis page has been specified as 1

OUTPUT△7ØØ; "EAP?"

ENTER△7ØØ;B\$

PRINT△B\$

 \downarrow

 $\mathsf{EAP} \triangle \triangle 1 (\mathsf{CR} / \mathsf{LF}) \text{ is output.}$

41) MSE BIT WINDOW ON / OFF (bit window ch MaSk Enable)

■ Function BIT WINDOW ON / OFF is controlled.

Header	Program	Query	Response	(Number of characters)
MSE	MSE△m	MSE?	MSE△m	(FIX 1)
İ				

■ Value of m BIT WINDOW ON / OFF is controlled.

Ø: OFF1: ON

■ Command type Sequential command

Usage restrictions The command is invalid in the following condition.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Query: None

Usage example Program: When the BIT WINDOW is specified as ON

OUTPUT△7ØØ; "MSE△1"

Query: When the BIT WINDOW has been specified as OFF

OUTPUT△7ØØ; "MSE?"

ENTER△7**ØØ**; **B**\$

PRINT△B\$

1

 $MSE \triangle \emptyset$ (CR/LF) is output.

42) MGE BLOCK WINDOW ON / OFF

(block window Meas. Gate Enable)

Function BLOCK WINDOW ON / OFF is controlled.

Header	Program	Query	Response	(Number of characters)
MGE	MGE△m	MGE?	MGE△m	(FIX 1)

■ Value of m BLOCK WINDOW ON / OFF is controlled.

Ø: OFF1: ON

Command type Sequential command

Usage restrictions The command is invalid in the following condition.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed When measurement pattern is PRBS

When the measurement pattern is ALTERNATE or DATA,

and the data length is not a multiple of 32 When the synchronous mode is QUICK

Query: The following cases is invalid, and ERR (CR/LF) is output.

When the measurement pattern is PRBS

When the measurement pattern is ALTN or DATA, and

the data length is not multiple of 32 When the synchronous mode is QUICK

Usage example Program: When the BLOCK WINDOW is specified as ON

OUTPUT△7ØØ; "MGE△1"

Query: When the BLOCK WINDOW has been specified as OFF

OUTPUT△7ØØ; "MGE?"

ENTER△7ØØ;B\$

PRINT△B\$

1

 $MGE \triangle \emptyset$ (CR/LF) is output.

43) EAT Error analysis trigger (Error Analysis Trigger)

Function Error analysis trigger is specified. (Effective only when option-01 is

mounted)

Header	Program	Query	Response	(Number of characters)
EAT	EAT△m	EAT?	EAT△m	(FIX 1)

■ Value of m Error trigger condition is specified.

Ø: OFF (Forced termination)

1: Programing time

START

Query time

AWAITING (trigger wait status)

2: Programming time

Invalid

Query time

TRIGGERED (triggered status)

Command type Sequential command

Usage restrictions The command is invalid in the following condition.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

When the synchronous mode is QUICK

When OPTION-01 is not mounted

When the measurement pattern is ALTERNATE

Query: The following case is invalid, and ERR (CR/LF) is output.

When the synchronous mode is QUICK

The following case is invalid.

OPTION 01 is not mounted.

OPTION-01 is not mounted.

■ Usage example Program: When the error analysis trigger is specified as START

OUTPUT△7ØØ; "EAT△1"

Query: When the error analysis has been triggered

OUTPUT△7ØØ; "EAT?"

ENTER△7ØØ;B\$

PRINT△B\$

- 1

EAT \triangle 2 (CR/LF) is output.

44) WRT Number of pattern data input bytes

(pattern data WRiTe)

Function Number of bytes of pattern data to be DMA transferred and start

address of the pattern data.

Header	Program	Query	Response	(Number of characters)
WRT	WRT△m1,m2	None	None	

■ Value of m m1: Number of pattern transfer bytes

Range of numeric values: Maximum 1048376

Minimum 1 Step 1

m2: Pattern input head address

Range of numeric values: Maximum 524287

Minimum 0 Step 1

Command type Sequential command

■ Usage restrictions The command is invalid in the following condition.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed When the synchronous mode is QUICK

Usage example Program: When the measurement pattern is DATA, and data from

pages 1 to 10 is specified

 $DIM\triangle B(9)$ READ $\triangle B(*)$

DATA \(\triangle 1, 2, 4, 8, 16, 32, 64, 128, 256, 512 \)

OUTPUT△7ØØ; "WRT△2Ø,Ø"

OUTPUT△700△USING△"W";B(*)

Data from page 1 to 10 is specified.

Note

This equipment specify necessary byte numbers and input header address of pattern data to transfer them in the DMA mode, and also specifies DMA switching and internal RAM area storage.

The relationship between the pattern header address and actual pages becomes as below:

(Pattern header address + 1) = Actual page numbers

When pattern data sending is complete, the DMDA mode is cleared. For DMA transfer of pattern data, see appendix "Pattern Data DMA Sending".

The settable number of the bytes is decided by the data length and header address. However, when the data over the settable range are transferred, the data become invalid.

45) RED? Number of bytes of pattern data output

(pattern data REaD?)

■ Function Number of bytes and start address of the DMA transferred pattern data

are specified.

Header	Program	Query	Response (Number of characte	ers)
RED	None	RED?△m1,m2	Data pattern string (by	n1)

■ Value of m m1: Number of pattern sending bytes

Range of numeric values: Maximum 1048376

Minimum 1 Step 1

m2: Pattern output head address

Range of numeric value: Maximum 524287

Minimum 0 Step 1

When the measurement pattern is ALTERNATE, the maximum value becomes half of the above maximum value.

Command type Sequential command

Usage restrictions The command is invalid in the following condition and ERR (CR/LF) is

output.

Query: When the synchronous mode is QUICK

Measurement patterns is ZERO SUBST or PRBS

Usage example Query: When the measurement pattern is DATA, and data from

page 1 to 10 is specified

 $DIM\triangleB(9)$

OUTPUT \triangle 700; "RED? \triangle 20,0" ENTER \triangle 700 \triangle USING \triangle "W"; B(*)

 $PRINT \triangle B(*)$

Data from page 1 to 10 is printed.

Note This equipment specify necessary byte numbers and input header

address of pattern data to transfer them in the DMA mode, and also

specifies DMA switching and internal RAM area storage.

The relationship between the pattern header address and actual pages becomes as below:

(Pattern header address + 1) = Actual page numbers

When pattern data sending is complete, the DMA mode is cleared. For DMA transfer of pattern data, see appendix "Pattern Data DMA

Sending".

The number of the bytes to be output is decided by the data length and header address. However, when a query over the valid number of the data is performed, only the valid number of the bytes is output.

46) MWT Number of BLOCK WINDOW data input bytes

(block window Meas. gate pattern data WriTe)

■ Function Number of bytes to be DMA transferred and the start address of the

BLOCK WINDOW pattern data are specified

Header	Program	Query	Response	(Number of characters)
MWT	MWT△m1,m2	None	None	

■ Value of m m1

m1: Number of sending bytes of the BLOCK WINDOW pattern

(32-page data)

Range of numeric values: Maximum 32768

Minimum 1 Step 1

m2: Input header address of the BLOCK WINDOW PATTERN

Range of numeric values: Maximum 16383

Minimum 0 Step 1

When the measurement pattern is ALTERNATE, the maximum value

becomes half of the above maximum value.

Command type
Sequential command

Usage restrictions The command is invalid in the following condition.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed When the synchronous mode is QUICK

Usage example Program: When the measurement pattern is DATA and data from page

1 to 32 is specified

 $DIM\triangle B(\hat{\emptyset})$ $READ\triangle B(*)$ $DATA\triangle 1$

OUTPUT△7ØØ; "MWT△2,Ø"

OUTPUT \triangle 700 \triangle USING \triangle "W";B(*)

Data from page 1 to 32 is specified. (Page 17 and 18 are

masked)

Note

This equipment specify necessary byte numbers and input header address of pattern data to transfer them in the DMA mode, and also specifies DMA switching and internal RAM area storage.

The relationship between the pattern head address and actual pages becomes as below:

(Pattern head address \times 32 + 1) = Actual page numbers

When pattern data sending is complete, the DMDA mode is cleared. For DMA transfer of pattern data, see Appendix "Pattern Data DMA Sending".

Since the BLOCK WINDOW data is in units of 32 bits, when the DMA transfer is carried out, 32 bits are handled as 1 bit.

When the setting value of each bit is 0, this bit becomes the object block for measurement, and when 1, then this is masked.

The significance of the setting values is as follows:

Setting value	BLOCK WINDOW setting page
	(For head address is 0)
1	17, 18
2	19, 20
4	21, 22
8	23, 24
16	25, 26
32	27, 28
64	29, 30
128	31,32
256	1, 2
512	3, 4
1024	5, 6
2048	7,8
4096	9, 10
8192	11, 12
16384	13, 14
32768	15, 16

If the header address is assumed to be N, the page setting becomes the above page value + (32 \times N).

For ALTERNATE pattern, pattern A or B can be obtained using the ALTERNATE switching.

The settable number of the bytes is decided by the data length and header address. However, when the data over the settable range are transferred, the data become invalid.

47) MRD? Number of output bytes of BLOCK WINDOW data

(block window Meas. gate pattern data ReaD?)

Function Number of bytes and start address of the DMA transferred BLOCK

WINDOW pattern data can be specified.

Header	Program	Query	Response	(Number of characters)
MRD	None	MRD?△m1,m2	Data pattern strir	ng (by m1)

■ Value of m m1: Number of transfer bytes of BLOCK WINDOW pattern

Range of numeric values: Maximum 32768

Minimum 1 Step 1

m2: Head address of the BLOCK WINDOW pattern output

Range of numeric value: Maximum 16383

Minimum 0 Step 1

When the measurement pattern is ALTERNATE, the maximum value

becomes half of the above maximum value.

Command type Sequential command

Usage restrictions The command is invalid in the following conditions.

Query: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed When the synchronous mode is QUICK When the measurement pattern is PRBS

When the measurement pattern is ALTERNATE or DATA,

and the datalength is not a multiple of 32

Usage example Query: When the measurement pattern is DATA and the data from

page 1 to 32 is read

 $DIM\triangleB(\emptyset)$

OUTPUT△700; "MRD?△2,0" ENTER△700△USING△"W"; B(*)

 $PRINT \triangle B(*)$

Data from page 1 to 32 is printed.

Note

This equipment specify necessary byte numbers and input header address of pattern data to transfer them in the DMA mode, and also specifies DMA switching and internal RAM area storage.

The relationship between the pattern header address and actual pages becomes as below:

(Pattern header address \times 32 + 1) = Actual page numbers

When pattern data sending is complete, the DMDA mode is cleared. For DMA transfer of pattern data, see Appendix "Pattern Data DMA Sending".

Since the BLOCK WINDOW data is in units of 32 bits, when the DMA transfer is carried out, 32 bits are handled as 1 bit.

When the setting value of each bit is 0, this bit becomes the object block for measurement, and when 1, then this is masked.

Significance of the setting values is as follows:

Setting value	BLOCK WINDOW setting page
	(For head address is 0)
1	17, 18
2	19, 20
4	21, 22
8	23, 24
16	25, 26
32	27, 28
64	29, 30
128	31, 32
256	1, 2
512	3, 4
1024	5, 6
2048	7,8
4096	9, 10
8192	11, 12
16384	13, 14
32768	15, 16

When the header address is assumed to be N, the page setting becomes the above page value + ($32 \times N$).

For ALTERNATE pattern, pattern A or B can be obtained using the ALTERNATE switching.

The number of the bytes to be output are decided by the data length and header address. However, when a query over the valid number of the data is performed, only the valid number of the bytes is output.

48) ALL

Pattern data preset (All pages, all bits) (preset ALL)

Function

All pages and all bits of the pattern data are set to 0 or 1.

Header	Program	Query	Response	(Number of characters)
ALL	ALL△m1	None	None	

■ Value of m m1:

0 : All pages clear1 : All page set

Command type Sequential command

Usage restrictions The command is invalid in the following condition.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed When the synchronous mode is QUICK

When the measurement pattern is ZERO SUBST or PRBS

Usage example Program: When the measurement pattern is DATA, and all pages are

cleared

OUTPUT△7ØØ; "ALL△Ø"

The data from all pages are cleared.

Note For ALTERNATE pattern, pattern A or B can be preset according to the

A/B display switching condition (No. 30).

For example, if this command is executed when pattern A is displayed,

then only pattern A is preset.

49) PST Pattern data preset (1 page, all bits) (PreSeT)

Function All bits of 1 pattern data page are specified to 0 or 1.

Header	Program	Query	Response	(Number of characters)
PST	PST△m1	None	None	

■ Value of m m1:

0: 1 page clear 1: 1 page set

Command type Sequential command

Usage restrictions The command is invalid in the following condition.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

When the synchronous mode is QUICKWhen the measurement pattern is ZERO SUBST or PRBS

Usage example Program: When the measurement pattern is DATA and 1 page is

cleared

OUTPUT△7ØØ; "PST△Ø"

Data from 1 page is cleared.

Note For ALTERNATE pattern, pattern A or B can be preset according to the

A/B display switching condition (No. 30).

For example, if this command is executed when pattern A is displayed,

then only pattern B is preset.

50) MAL BLOCK WINDOW data preset (All pages, all bits)

(block window Meas. gate pattern preset ALI)

Function All bits of all pages of the BLOCK WINDOW pattern data are specified

to 0 or 1.

Header	Program	Query	Response	(Number of characters)
MAL	MAL△m1	None	None	

■ Value of m m1:

0 : All pages clear1 : All pages set

■ Command type Sequential command

Usage restrictions The command is invalid in the following condition.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed When the synchronous mode is QUICK

When the measurement pattern is ALTERNATE or DATA,

and the data length is not a multiple of 32

Usage example Program: When the measurement pattern is DATA, and the data of all

pages of the BLOCK WINDOW is cleared

OUTPUT△7ØØ; "MAL△Ø"

All the page data is cleared.

Note For ALTERNATE pattern, pattern A or B can be preset according to the

A/B display switching condition (No. 30).

For example, if this command is executed when pattern A is displayed,

then only pattern A is preset.

51) MPS

BLOCK WINDOW data preset (1 page, all bits) (block window Meas. gate pattern PreSet)

Function

All bits of 1 page of the BLOCK WINDOW pattern data are specified to 0 or 1.

Header	Program	Query	Response	(Number of characters)
MPS	MPS△m1	None	None	

Value of m

m1:

0: 1 page clear
1: 1 page set

Command type

Sequential command

Usage restrictions

The command is invalid in the following condition.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed
When the synchronous mode is QUICK

When measurement pattern is ALTERNATE or DATA, and

the data length is not a multiple of 32

Usage example

Program: When the measurement pattern is DATA and data of 1 page

of the BLOCK WINDOW is cleared

OUTPUT△7ØØ; "MPS△Ø"

Data of 1 page is cleared.

Note

For ALTERNATE pattern, pattern A or B can be preset according to the

A / B display switching condition (No. 30).

For example, if this command is executed when pattern A is displayed,

then only pattern A is preset.

52) HAL

BIT WINDOW data preset (All pages, all bits)

(bit window cH mask pattern preset ALI)

Function All bits of all pages of BIT WINDOW pattern data are specified to 0 or 1.

Header	Program	Query	Response	(Number of characters)
HAL	HAL△m1	None	None	

■ Value of m m1:

 $\begin{array}{ll} 0 \ : \ All \ pages \ clear \\ 1 \ : \ All \ pages \ set \end{array}$

Command type Sequential command

Usage restrictions The command is invalid in the following condition.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

■ Usage example Program: When the measurement data is DATA and the data from all

pages of the BIT WINDOW data is cleared

OUTPUT△7ØØ; "HAL△Ø"

The data from all pages is cleared.

53) HPS

BIT WINDOW data preset (1 page, all bits) (bit window cH mask pattern PreSet)

Function

All bits on 1 page of BIT WINDOW PATTERN data are set to 0 or 1.

Header	Program	Query	Response	(Number of characters)
HPS	HPS△m1	None	None	

■ Value of m

m1:

0 : 1 page clear1 : 1 page set

Command type

Sequential command

Usage restrictions

The command is invalid in the following condition.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Usage example

Program: When the measurement pattern is DATA and data from l

page of the BIT WINDOW is cleared

OUTPUT△7ØØ; "HPS△Ø"

The data from 1 page is cleared.

54) PSP

Pattern sync trigger position (Pattern Sync Position)

Function

When a pattern sync trigger is Variable, the trigger position is set.

Header	Program	Query	Response	(Number of characters)
PSP	PSP△m	PSP?	PSP△m	(FIX 9)

Value of m

Pattern sync position is set in the range below. State of not lock off

Maximum value: 134217728

Minimum value: 1 Step: 1

Command type

Sequential command

Usage restrictions

The command is invalid in the following condition.

Program: During automatic threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Query: None

Usage example

Program: When the pattern sync trigger position is set to the first page

OUTPUT△7ØØ; "PSP△1"

Query: When the pattern sync trigger position is set to the 16000th

page

OUTPUT△7ØØ; "PSP?"

ENTER△7ØØ;B\$

PRINT△B\$

1

Outputs PSP \(\triangle \triangle \triangle \triangle 16000 (CR/LF).

Note

The maximum page number of the settable pattern sync trigger position depends on the set measurement pattern or data length setting value.

When a page number over the settable maximum page number in the range of less than the maximum value of the above m 134217728 is input, the input page number is changed to the then maximum page number.

Example) If $PSP \triangle 3$ is input when a data length = 32, trigger position = 1, and trigger position maximum number = 2, the trigger position becomes 2.

The maximum value of the trigger position is the quotient of data length \div 16 when the remainder does not exist, and is the quotient + 1 when the remainder exists.

55) PPD

Page pattern sync trigger position display switch (Page / Pattern sync positon Display)

■ Function

Display contents of the 7 segment display are switched to a page and

pattern sync trigger position.

Header	Program	Query	Response	(Number of characters)
PPD	PPD△m	PPD?	PPD△m	(FIX 1)

■ Value of m

Ø: Page number

1: Pattern sync trigger position

Command type

Sequential command

Usage restrictions

The command is invalid in the following condition.

Program: During automatic threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Query: None

Usage example

Program: When the page number is displayed

OUTPUT△7ØØ; "PPD△Ø"

Query:

When the pattern sync trigger position is displayed

OUTPUT△7ØØ; "PPD?"

ENTER△7ØØ;B\$

PRINT△B\$

1

Outputs $PPD \triangle 1$ (CR/LF).

• MEASUREMENT section

Each control message of the MEASUREMENT section is explained on the following pages.

The triangle marks (\triangle) indicates a space.

56) CLI? Clock loss status (Clock Loss Intervals?)

■ Function Clock input status is read.

Header	Program	Query	Response	(Number of characters)
CLI	None	CLI?	CLI△m	(FIX 1)

■ Value of m Ø: Not clock loss status

1: Clock loss status

Command type Sequential command

■ Usage restrictions The command is invalid in the following condition.

Query: None

■ Usage example Query: When status is not clock loss

OUTPUT△7ØØ; "CLI?"

ENTER△7ØØ;B\$

PRINT△B\$

4

CLI△Ø (CR/LF) is output.

57) SLI? Sync loss state (Sync Loss Intervals?)

Function Sync loss status can be read.

Header	Program	Query	Response	(Number of characters)
SLI	None	SLI?	SLI△m	(FIX 1)

■ Value of m Ø: Not sync loss status

1: Sync loss status

■ Command type Sequential command

■ Usage restrictions The command is invalid in the following condition.

Query: None

Usage example Query: When status is not sync loss

OUTPUT△7ØØ; "SLI?"

ENTER△7ØØ;B\$

PRINT△B\$

1

 $SLI \triangle \emptyset$ (CR/LF) is output.

SECTION 9 DETAILS OF DEVICE MESSAGES

58) ERS? Error detection status (ERrorS?)

■ Function Error detection status is read.

Header	Program	Query	Response	(Number of characters)
ERS	None	ERS?	ERS△m	(FIX 1)

■ Value of m Ø: Not error detected status

1: Error detected status

■ Command type Sequential command

Usage restrictions The command is invalid in the following condition.

Query: None

Usage example Query: When status is not error detected status

OUTPUT△7ØØ; "ERS?"

ENTER△7ØØ;B\$

PRINT△B\$

1

 $\mathsf{ERS} \triangle \emptyset$ (CR / LF) is output.

59) DMS

Measurement display mode (Display or MeaSurement)

■ Function

Data to be displayed on the measurement display is selected.

Header	Program	Query	Response	(Number of characters)
DMS	DMS△m	DMS?	DMS△m	(FIX 1)

■ Value of m

Ø: ERROR RATIO

1 : ERROR COUNT

2: ERROR INTERVAL

3: ERROR FREE INTERVAL

4: CLOCK FREQUENCY

Command type

Sequential command

Usage restrictions

The command is invalid in the following condition.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Query: None

Usage example

Program: When the display mode is specified as ERROR RATIO

OUTPUT△7ØØ; "DMS△Ø"

Query: When the display mode has been specified as ERROR

COUNT

OUTPUT△7ØØ; "DMS?"

ENTER△7ØØ;B\$

PRINT△B\$

1

DMS $\triangle 1$ (CR/LF) is output.

60) CUR Intermediate measurement result display function

(CURrent data)

Function Functions for displaying intermediate measurement results are

controlled.

Header	Program	Query	Response	(Number of characters)
CUR	CUR△m	CUR?	CUR△m	(FIX 1)

■ Value of m Ø: OFF

1 : ON

■ Command type Sequential command

■ Usage restrictions The command is invalid in the following condition.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Query: None

Usage example Program: When the intermediate measurement result display is

specified as OFF

OUTPUT△7ØØ; "CUR△Ø"

Query: When the measurement intermediate result display has been

specified as ON

OUTPUT△7ØØ; "CUR?"

ENTER△**700**; **B**\$

PRINT△B\$

 $CUR \triangle 1$ (CR/LF) is output.

61) MOD

Measurement mode (measurement MODe)

Function

Measurement mode is specified.

Header	Program	Query	Response	(Number of characters)
MOD	MOD△m	MOD?	MOD△m	(FIX 1)

■ Value of m

Ø: REPEAT

1 : SINGLE

2: UNTIMED

Command type

Sequential command

Usage restrictions

The command is invalid in the following conditions.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Query: None

Usage example

Program: When the measurement mode is specified as REPEAT

OUTPUT△7ØØ; "MOD△Ø"

Query: When the measurement mode has been specified as SINGLE

OUTPUT△7ØØ; "MOD?"

ENTER△7ØØ;B\$

PRINT△B\$

4

 $MOD \triangle 1$ (CR/LF) is output.

62) STA Measurement start (STArt)

Function Measurement start is specified.

During operation, this becomes the re-start specification.

Header	Program	Query	Response	(Number of characters)
STA	STA	None	None	

■ Command type Sequential command

Usage restrictions The command is invalid in the following condition.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

■ Usage example Program: When measurement start or restart is specified

OUTPUT△7ØØ; "STA"

63) STO Measurement end (STOp)

Function Measurement termination or stop is specified.

Header	Program	Query	Response	(Number of characters)
ST0	ST0	None	None	

■ Command type Sequential command

Usage restrictions The command is invalid in the following condition.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

■ Usage example Program: When measurement termination or stop is specified

OUTPUT△7ØØ; "STO"

64) MSR? Measurement status

(MeaSuRement in progress or stop?)

Function Measurement status (during measurement or measurement stop) can

be read.

Header	Program	Query	Response	(Number of characters)
MSR	None	MSR?	MSR△m	(FIX 1)

■ Value of m Ø: Measurement stopped

1: During measurement

Command type Sequential command

Usage restrictions The command is invalid in the following condition.

Query: None

Usage example Query: When measurement is stopped

OUTPUT△7ØØ; "MSR?"

ENTER△7ØØ;B\$

PRINT△B\$

•

 $MSR \triangle \emptyset$ (CR / LF) is output.

65) SYN

Automatic synchronization (auto <u>SYN</u>c)

Function

Automatic synchronous function is controlled.

Header	Program	Query	Response	(Number of characters)
SYN	SYN△m	SYN?	SYN△m	(FIX 1)

■ Value of m Ø: OFF

1 : ON

■ Command type Sequential command

■ Usage restrictions The command is invalid in the following condition.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Query: None

Usage example Program: When the automatic synchronous function is specified as

OFF

OUTPUT△7ØØ; "SYN△Ø"

Query: When the automatic synchronous function has been specified

as ON

OUTPUT△7ØØ: "SYN?"

ENTER△7ØØ;B\$

PRINT△B\$

↓

 $SYN \triangle 1(CR/LF)$ is output.

Automatic synchronous threshold

(auto <u>SY</u>nc thr<u>E</u>shold)

Function Automatic synchronous threshold is specified.

Header	Program	Query	Response	(Number of characters)
SYE	SYE△m	SYE?	SYE△m	(FIX 1)

Value of m Ø: 1E-2

1: 1E-3

2: 1E-4

3: 1E-5

4: 1E-6

5 : 1E-7

6: 1E-8 8: INT

Command type Sequenti

Sequential command

Usage restrictions

The command is invalid in the following condition.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Query: None

Usage example

Program: When the automatic synchronous threshold is specified as

1E-2

OUTPUT△7ØØ; "SYE△Ø"

Query: When the automatic synchronous threshold has been

specified as 1E-3

OUTPUT△7ØØ: "SYE?"

ENTER△7ØØ;B\$

PRINT△B\$

1

 $SYE \triangle 1$ (CR/LF) is output.

■ Note For the setting values of the automatic synchronous threshold, refer to

the separate "Instruction Manual" booklet.

67) TIM Real time / measurement time display switching

(real <u>TIM</u>e measurement time)

■ Function Display contents of the time display is switched.

Header	Program	Query	Response	(Number of characters)
TIM	TIM△m	TIM?	TIM△m	(FIX 1)

■ Value of m Ø: Y. M. D

1: H. M. S 2: PERIOD 3: TIMED 4: ELAPSED

Command type Sequential command

Usage restrictions The command is invalid in the following condition.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Query: None

Usage example Program: When the display items are specified to Y. M. D (year.

month. day)

OUTPUT△7ØØ; "TIM△Ø"

Query: When the display items has been specified as H. M. S (hour.

minute. second)

OUTPUT△7ØØ; "TIM?"

ENTER△7**ØØ**; **B**\$

PRINT△B\$

 $TIM \triangle 1$ (CR/LF) is output.

1

68) RTM Built-in timer setting (Real TiMe setting)

Function Built-in timer is set.

Header	Program	Query	Response (Number of characters)
RTM	RTM△m1,m2,m3,m4,m5,m6	RTM?	RTM△m1,m2,m3,m4,m5,m6 (each FIX 2)

■ Value of m m1: Year 0-99

m2: Month 1-12

m3: Day 1-31 (a maximum value of the day varies according to

the month.)

m4: Hour 0-23m5: Minute 0-59m6: Second 0-59

■ Command type Sequential command

Usage restrictions The command is invalid in the following condition.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Query: None

Usage example Program: When the built-in timer is set to 59 seconds, 59 minutes, 13

hours, 27 days, January, and 1995 years

OUTPUT \$\triangle 700; "RTM \$\triangle 95,01,27,13,59,59"

Query: When the built-in timer has been set to 0 seconds, 0 minutes,

14 hours, 27 days, January, and 1995 years

OUTPUT△7ØØ; "RTM?"

ENTER△7ØØ;B\$

PRINT△B\$

1

 $RTM \triangle 95, 01, 27, 14, 00, 00$ (CR/LF) is output.

Note The NR1 part of m1 to m6 set in the program cannot be omitted.

69) PRD

Measurement Period Setting (measurement PeRioD)

Function

Measurement period is specified.

Header	Program	Query	Response (1	Number of characters)
PRD	PRD△m1,m2,m3,m4	PRD?	PRD△m1,m2,m3,	m4 (each FIX 2)

■ Value of m m1: Day 0-99

m2: Hour 0-23 m3: Minute 0-59 m4: Second 0-59

Here, all zeros cannot specified.

Command type

Sequential command

Usage restrictions

The command is invalid in the following condition.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

When the measurement mode is UNTIME

Query: None

Usage example

Program: When the measurement period is specified as 99 days, 13

hours, 59 minutes, and 59 seconds

OUTPUT \$\triangle 700; "PRD \$\triangle 99, 13, 59, 59"

Query: When the measurement period has been specified to 99 days,

14 hours, 0 minute, 0 second

OUTPUT△7ØØ; "PRD?"

ENTER△7ØØ;B\$
PRINT△B\$

1

 $PRD\triangle 99$, 14,00,00 (CR/LF) is output.

Note

NR1 values such as **m1** to **m4** set in the program cannot be omitted.

70) ER?

Error ratio measurement result (ERror ratio?)

■ Function

Error ratio measurement result is output according to the output format.

However, the value of the error measurement ratio output here is the one displayed on the 7-segment display unit (End data or current data).

Header	Program	Query	Response (Number of characters)
ER	None	ER?	ER△△*.****E-** (FIX 10) ER△△*.****E-* (FIX 9) * denotes error ratio, 4th decimal place with exponent. Exponent is 2 digits or 1 digit.

Command type

Sequential command

Usage restrictions

The command is invalid in the following condition.

Query:

When the error display unit displays '-', the following value

is output.

 $ER \triangle \triangle \emptyset. \emptyset \emptyset \emptyset \emptyset E - \emptyset \emptyset$

Usage example

Query:

When the error ratio measurement result is 1.05×10^{-6}

OUTPUT△7ØØ; "ER?"

ENTER△7ØØ;B\$

PRINT△B\$

↓ ~=

 $ER \triangle \triangle 1.0500E - 6 (CR/LF)$ is output.

: When the error ratio measurement result is 1.05×10^{-10}

OUTPUT△7ØØ; "ER?"

ENTER△7ØØ;B\$

PRINT△B\$

1

 $ER \triangle \triangle 1.0500E - 10$ (CR/LF) is output.

: When the error ratio measurement result is "-"

OUTPUT△7ØØ; "ER?"

ENTER△7ØØ:B\$

PRINT△B\$

1

 $ER\triangle\triangle\emptyset$. $\emptyset\emptyset\emptyset\emptysetE-\emptyset\emptyset$ (CR / LF) is output.

71) EC?

Error count measurement result (Error Count?)

Function

Error ratio measurement result is output according to the output format.

However, the number output here is the one displayed on the 7-segment display unit (End data or current data).

Header	Program	Query	Response (Number of characters)
EC	None	EC?	 When the number of errors are less than 1E+8 (FIX 10) EC△△△********** * denotes error numbers with 8 digits fixed length. • When the number of errors 1E+8 or more EC△△*.****E** * denotes error numbers and 4th decimal place with fixed length exponent.

■ Command type Sequential command

Usage restrictions

The command is invalid in the following condition.

Query:

When the error display unit displays '-', the following value

is output.

 $EC\triangle\triangle1.0000E-99$ (11 characters)

Usage example

Query:

When the error numbers measurement result is 1.05×10^6

OUTPUT△7ØØ; "EC?" ENTER△7ØØ; B\$

PRINT△B\$

704

 $EC \triangle \triangle \triangle \triangle 1050000$ (CR/LF) is output.

: When the error numbers measurement result is 1.05×10^9

OUTPUT△7ØØ; "EC?"

ENTER△7ØØ;B\$

PRINT△B\$

. ↓

 $EC \triangle \triangle 1.0500E09$ (CR/LF) is output.

: When the error numbers measurement result is "-"

OUTPUT△7ØØ; "EC?"

ENTER \triangle 700; B\$

PRINT△B\$

↓

 $EC\triangle\triangle1.0000E-99$ (CR/LF) is output.

72) CC?

Measurement result for clock count (Clock Count?)

Function

Clock ratio measurement result is output according to the output format.

Header	Program	Query	Response (Number of characters)
СС	None	CC?	 When the number of clocks are less than 1E+8 (FIX 10) CC△△△********** ★ denotes clock numbers with 8 digits fixed length. When the number of clocks 1E+8 or more CC△△*.****E** ★ denotes clock numbers and 4th decimal place with fixed length exponent.

■ Command type Sequential command

Usage restrictions The command is invalid in the following condition.

Query: Outputs the following value when no measurement data

exists.

 $CC\triangle\triangle1.0000E-99$ (11 characters)

Usage example Query: When the clock numbers measurement result is 1.05×10^6

OUTPUT△7ØØ: "CC?"

ENTER△7ØØ:B\$

PRINT△B\$

 $CC \triangle \triangle \triangle \triangle 1050000$ (CR/LF) is output.

: When the clock numbers measurement result is 1.05×10^9

OUTPUT△7ØØ; "CC?"

ENTER△7ØØ;B\$

PRINT△B\$

 $CC\triangle\triangle 1.0500E09$ (CR / LF) is output.

: When the clock numbers measurement result is "-"

OUTPUT△7ØØ; "CC?"

ENTER△7ØØ;B\$

PRINT△B\$

 $CC \triangle \triangle 1.0000E - 99 (CR / LF)$ is output.

73) EI?

El measurement result (Error Interval?)

Function

Error interval numbers measurement result is output according to the output format.

However, the error number output here is the one displayed on the 7-segment display unit (End data or current data).

Header	Program	Query	Response (Number of characters)
EI	None	EI?	 When the number of errors are less than 1E + 8 (FIX 10) EI△△△******** * denotes number of EIs with 8 digits fixed length. When the number of EIs is 1E + 8 or more EI△△*.****E** * denotes the number of EIs and 4th decimal place with fixed length exponent.

■ Command type Sequential command

Usage restrictions

The command is invalid in the following condition.

Query:

When the error display unit displays '-', the following value

is output.

 $EI \triangle \triangle 1.0000E - 99$ (11 characters)

Usage example

Query:

When the EI numbers measurement result is 1.05×10^6

OUTPUT△7ØØ; "EI?"

ENTER△700; B\$

PRINT△B\$

↓ 350

 $EI \triangle \triangle \triangle \triangle 1050000$ (CR / LF) is output.

: When the EI numbers measurement result is 1.05×10^9

OUTPUT△7ØØ; "EI?"

ENTER△7ØØ:B\$

PRINT△B\$

. .aar

 $EI \triangle \triangle 1.0500E09$ (CR/LF) is output.

: When the error measurement result is "-"

OUTPUT△7ØØ; "EI?"

ENTER△7ØØ;B\$

PRINT△B\$

 $EI \triangle \triangle 1.0000E - 99~(CR/LF)$ is output.

74) EFI?

Error free interval ratio measurement results

(Error Free Interval?)

Function

Error free interval ratio measurement result is output according to the output format.

However, the error number output here is the one displayed on the 7-segment display unit (End data or current data).

Header	Program	Query	Response	(Number of characters)
EFI	None	EFI?	EFI△△△*** * denotes %EF with fixed leng	I, and 4th decimal place

Command type

Sequential command

Usage restrictions

The command is invalid in the following condition.

Query:

When the error display unit displays '-', the following value

is output.

 $EFI \triangle \triangle \triangle 999.9999 (CR/LF)$

Usage example

Query:

When the EFI measurement result is 99.01%

OUTPUT△7ØØ; "EFI?"

ENTER△7**ØØ**;**B\$**

PRINT△B\$

1

 $EFI \triangle \triangle \triangle 99.0100$ (CR/LF) is output.

: When the EFI measurement result is '-'

OUTPUT△7ØØ; "EFI?"

ENTER△7ØØ;B\$

PRINT△B\$

1

 $EFI \triangle \triangle 999.9999$ (CR/LF) is output.

75) FRQ? Clock frequency measurement result (clock FReQuency?)

Function Clock frequency measurement result is output according to the output

format.

However, the error numbers output here is the one displayed on the 7-

segment display unit (End data or current data).

Header	Program	Query	Response (Number of characters)
FRQ	None	FRQ?	FRQ△△******* (FIX 10) * denotes clock frequency and 3rd decimal place fixed length (MHz)

■ Command type Sequential command

Usage restrictions The command is invalid in the following condition.

Query: When clock off occurs, the following value is output.

 $FRQ \triangle \triangle \triangle \triangle \triangle \triangle \emptyset$. ØØØ (CR/LF)

■ Usage example Query: When the clock frequency is 50 MHz

OUTPUT△7ØØ; "FRQ?"

ENTER△7ØØ;B\$

PRINT△B\$

FRQ \triangle \triangle \triangle 50.000 (CR/LF) is output.

: When clock off occurs

OUTPUT△7ØØ; "FRQ?"

ENTER△7ØØ;B\$

PRINT△B\$

FRQ \triangle \triangle \triangle \triangle \triangle 0.000 (CR/LF) is output.

76) OSD?

1-second data measurement result (One-Second Data?)

Function

One-second measurement result is output according to the output format.

Header	Program	Query	Response (Number of characters)
OSD	None	OSD?	•When 1-second error number is less than 1E + 8
			OSD A: *****E-**, Average 1-second A****** error ratio Number of 1-second errors
			●When the 1-second error number is 1E + 8 or more
			OSD△*.****E-**, *.****E** (FIX 19 or 20)

Command type

Sequential command

Usage restrictions

The command is invalid in the following condition, and ERR (CR / LF) is output.

When the 1-second data print function is OFF Query:

The data written in the example below is assumed to be none, and data the same as in the '-' value in ER? or EC? is output.

Query: No measurement data

Usage example

Query: When the 1-second error ratio is 1.0E-4, and the 1-second

> error number is 1000 OUTPUT△7ØØ; "OSD?" ENTER△7ØØ;B\$

PRINT△B\$

 $OSD \triangle 1.00000E-4$, $\triangle \triangle \triangle \triangle \triangle 1000$ (CR/LF) is output.

: When the 1-second error ratio is 1.0E-10, and the 1-second error number is 1

OUTPUT△7ØØ: "OSD?"

ENTER△7ØØ;B\$

PRINT△B\$

 $OSD \triangle 1.00000E - 10$, $\triangle \triangle \triangle \triangle \triangle \triangle \triangle \triangle \triangle 1$ (CR/LF) is output.

When EFI ratio measurement result is '-'

OUTPUT△7ØØ; "OSD?"

ENTER△7ØØ;B\$

PRINT△B\$

 $OSD \triangle \emptyset$. $\emptyset \emptyset \emptyset \emptyset E - \emptyset \emptyset$, 1. $\emptyset \emptyset \emptyset \emptyset E - 99$ (CR/LF) is output.

77) AMD?

Alarm measurement result (AlarM Data?)

Function

Alarm measurement data is output according to the output format.

Header	Program	Query	Response (Number of characters)
AMD	None	AMD?m	See the following description.

■ Value of m

m: Select alarm measurement items.

Ø: all items 1 to 6 below are output

1: Power fail time

2: Power fail recovery time

3: Clock loss time

4: Clock loss recovery time

5: Sync loss time

6: Sync loss recover time

Output format

When all items are output: **-**-***

Year Day Minute

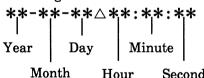

Month Hour Second

The above is output from items 1 to 6 in this order by punctuating with commas (,).

When items 1 to 6 are output separately:

The each item of data is output in the

following format.

Command type

Sequential command

Usage restrictions

The command is invalid in the following condition, and

 $99-99-99 \triangle 99:99:99$ (CR/LF) is output.

Query:

Alarm occurrence and recovery time when no alarms occur Alarm recovery time when the alarm is not recovered Alarm occurrence and recovery time which occurred when measurement stopped

Usage example

Query:

When requesting the power fail time

OUTPUT△7ØØ; "AMD?△1"

ENTER△7ØØ;B\$

PRINT△B\$

J

 $95-01-28 \triangle 13:52:59 (CR/LF)$ is output.

When requesting in invalid condition

OUTPUT△7ØØ; "AMD?△2"

ENTER△7ØØ;B\$

PRINT△B\$

↓

 $99\text{-}99\text{-}99 \triangle 99:99:00$ (CR/LF) is output.

78) EDS Storing measurement end data in buffer (End-Data buffer Store)

Function Measurement end data is stored in buffer.

Header	Program	Query	Response	(Number of characters)
EDS	EDS	None	None	

■ Command type Sequential command

■ Usage restrictions The command is invalid in the following conditions.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed When measurement is not executed

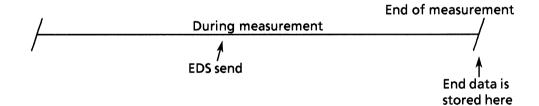

Usage example Program: When measurement end data is stored in buffer

OUTPUT△7ØØ; "EDS"

Note The measurement end data is stored at the time that the current

measurement data is terminated.

Before storing the measurement data, clear a buffer area.

79) EDC Clearing buffer of measurement end data

(End-Data buffer Clear)

Function The measurement end data buffer is cleared.

Header	Program	Query	Response	(Number of characters)
EDC	EDC	None	None	

■ Command type Sequential command

Usage restrictions The command is invalid in the following conditions.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Usage example Program: When the measurement end data buffer is cleared

OUTPUT△7ØØ; "EDC"

■ Note By executing EDC, all the data stored by the EDS operation is erased.

80) END?

Measurement end data read (END-data buffer read?)

Function

Measurement end data is read.

Header	Program	Query	Response	(Number of characters)
END	None	END?m1,m2	Measurement en	nd data is output following output format.

■ Value of m

m1: Data type

0: Time data

Error measurement data
 Alarm measurement data
 Threshold EI, EFI data
 Error performance data

m2: Output numbers

0: All items output

= > 1: 1 data item output (See the output format below)

■ Output format

m1 = 0: Time data	
m2=1: Measurement start time	(FORM 1)
2 : Measurement end time	(FORM 1)
3 : Measurement period	(FORM 1)
f 4: Measurement timed time	(FORM 1)
m1 = 1 : Alarm measurement data	
m2=1: POWER FAIL intervals	(FORM 2)
2 : CLOCK LOSS intervals	(FORM 2)
3 : SYNC LOSS intervals	(FORM 2)
m1 = 2 : Error measurement data	
m2=1: ERROR RATIO	(FORM 3)
2 : ERROR COUNT	(FORM 4)
3 : CLOCK COUNT	(FORM 4)
4 : EI	(FORM 4)
5 : %EFI	(FORM 5)
m1= 3 : Threshold EI, EFI data	
$m2=1 : >10^{-3}$	(FORM 6)
$2 : > 10^{-4}$	(FORM 6)
$3 : > 10^{-5}$	(FORM 6)
$4: > 10^{-6}$	(FORM 6)
$5: > 10^{-7}$	(FORM 6)
$6: > 10^{-8}$	(FORM 6)
$7 : <= 10^{-8}$	(FORM 6)

SECTION 9 DETAILS OF DEVICE MESSAGES

m1 = 4 : Error performance data m2=1 : ES (FORM 5) 2 : EFS (FORM 5) 3 : SES (FORM 5) 4 : DM (FORM 5) 5 : US (FORM 5) (FORM 1) Time data type (No. of chars. 17) Day Month Second (FORM 2) Numerical value data type ****** (No. of chars. 10) (FORM 3) Exponent data type *.***E-** (No. of chars. 10) *.***E-* (No. of chars. 9) (FORM 4) Numeric value and exponent data type • Less than 1E + 8 **△********* (No. of chars. 9) • 1E + 8 or more *.***E** (No. of chars. 9) (FORM 5) %data type ***.*** (No. of chars. 8) (FORM 6) Mixed data type • Less than 1E + 8 △********** (No. of chars. 18) • 1E + 8 or more *.****E**,***** (No. of chars. 18) Command type Sequential command Usage restrictions The following condition is invalid and ERR (CR/LF) is output. When no data is in buffer Query:

Usage example

Query: When only the measurement start time of the time data is

read from measurement end data OUTPUT \triangle 700; "END? \triangle 0,1"

ENTER△7ØØ;B\$

PRINT△B\$

 $95-01-30 \triangle 15:24:59$ (CR/LF) is output.

81) IMS Storing measurement intermediate data to buffer

(InterMediate-data buffer Store)

Function Intermediate measurement data is stored in buffer.

Header	Program	Query	Response	(Number of characters)
IMS	IMS	None	None	
i				

■ Command type Sequential command

Usage restrictions The command is invalid in the following conditions.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed When measurement is not executed

■ Usage example Program: When intermediate measurement data is stored in buffer

OUTPUT△7ØØ; "IMS"

82) IMC Clearing the buffer for measurement intermediate data

(InterMediate-data buffer Clear)

Function Intermediate measurement buffer is cleared of data.

Header	Program	Query	Response	(Number of characters)
IMC	IMC	None	None	

■ Command type Sequential command

Usage restrictions The command is invalid in the following conditions.

Program: During automatic phase threshold search operation
While Eye margin measurement is being executed

When a floppy disk is being accessed

Usage example Program: When an intermediate measurement data buffer is cleared

OUTPUT△7ØØ; "IMC"

Note By clearing the buffer, measurement data stored by the IMS operation

is erased.

83) IMD?

Reading intermediate measurement data (InterMediate-Data buffer read?)

Function

Intermediate measurement data is read.

Header	Program	Query	Response (Number of characters)
IMD	None	IMD?m1,m2	Intermediate measurement data is output
1			according to the output format below.

Value of m

m1: Data type

0: Time data

Alarm measurement data
 Error measurement data
 Threshold EI, EFI data
 Error performance data

m2: Output numbers

0: All items output

= > 1: 1 item data output (See the output format below)

Output format

m1 = 0:	Time data	
m2 = 1	: Measurement start time	(FORM 1)
2	: Measurement intermediate time	(FORM 1)
3	: Measurement elapsed time	(FORM 1)
4	: Measurement timed time	(FORM 1)
m1 = 1:	Alarm measurement data	
m2 = 1	: POWER FAIL intervals	(FORM 2)
2	: CLOCK LOSS intervals	(FORM 2)
3	: SYNC LOSS intervals	(FORM 2)
m1=2:	Error measurement data	
m2 = 1	: ERROR RATIO	(FORM 3)
2	: ERROR COUNT	(FORM 4)
3	: CLOCK COUNT	(FORM 4)
4	: EI	(FORM 4)
5	: %EFI	(FORM 5)

		△****** ,***.***	(No. of chars. 18)
		• 1E + 8 or more	
		*.****E**,***.***	(No. of chars. 18)
Command type	Sequentia	l command	
Usage restrictions	The follow	ring condition is invalid and $ERR(CR/LF)$ i	s output.
	Query:	When no data is in buffer If measurement period is 1 minute, intermedenerated.	ediate data is not

m1=4: Error performance data

SECTION 9 DETAILS OF DEVICE MESSAGES

Usage example Query: When only the measurement start time of the time data is

read from intermediate measurement data

OUTPUT△7ØØ; "IMD?△Ø,1"

ENTER△7ØØ;B\$

PRINT△B\$

Ţ

 $95-01-30 \triangle 15:24:59 (CR/LF)$ is output.

• Other section

Each control message in the OTHER section is explained in the following pages.

The triangle marks (\triangle) indicates a spaces.

Note

When remote mode is selected, the contents of command specification have priority; when local mode is selected, then the rear panel function switching in this section is selected.

Keep in mind this.

84) PRN Printer function (PRiNter enable)

Function Printer output ON / OFF is controlled.

nse (Number of characters)
(FIX 1)

■ Value of m Ø: OFF

1 : ON

■ Command type Sequential command

■ Usage restrictions The command is invalid in the following conditions.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Query: None

■ Usage example Program: When a printer is set to OFF

OUTPUT△7ØØ; "PRN△Ø"

Query: When a printer was set to ON

OUTPUT△7ØØ; "PRN?"

ENTER△7ØØ;B\$

PRINT△B\$

4

 $PRN \triangle 1$ (CR/LF) is output.

85) PSA Manual print (Printer StArt)

Function Manual printing start is specified.

Header	Program	Query	Response	(Number of characters)
PSA	PSA	None	None	

■ Command type Sequential command

Usage restrictions The command is invalid in the following conditions.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

In the first 1 second after measurement start

When measurement is stopped When the printer function is OFF

■ Usage example Program: When manual printing starts

OUTPUT△7ØØ; "PSA"

86) ALM

Alarm monitor function (ALarm Monitor on / off)

■ Function

Alarm monitoring ON / OFF is controlled.

Header	Program	Query	Response	(Number of characters)
ALM	ALM△m	ALM?	ALM△m	(FIX 1)

■ Value of m

 \emptyset : OFF

1 : ON

Command type

Sequential command

Usage restrictions

The command is invalid in the following conditions.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Query: None

Usage example

Program: When alarm monitor function is set to OFF

OUTPUT△7ØØ; "ALM△Ø"

Query:

When alarm monitor function was set to ON

OUTPUT△7ØØ; "ALM?"

ENTER△7ØØ;B\$

PRINT△B\$

Ţ

 $ALM \triangle 1$ (CR/LF) is output.

87) MON Error monitor function (error MONitor on / off)

Function Error monitor function ON / OFF is controlled.

Header	Program	Query	Response	(Number of characters)
MON	MON△m	MON?	MON△m	(FIX 1)

■ Value of m Ø: OFF

1 : ON

■ Command type Sequential command

Usage restrictions The command is invalid in the following conditions.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Query: None

Usage example Program: When error monitor function is specified as OFF

OUTPUT△7ØØ; "MON△Ø"

Query: When error monitor function was specified as ON

OUTPUT△7ØØ; "MON?"

ENTER△700; **B**\$

PRINT△B\$

 $MON \triangle 1$ (CR/LF) is output.

88) SOP Synchronous signal output selection (Sync OutPut)

Function Synchronous signal output is controlled.

Header	Program	Query	Response	(Number of characters)
SOP	SOP△m	SOP?	SOP△m	(FIX 1)

■ Value of m Ø: 1/32 CLOCK

1: PATTERN SYNC (FIXED)

2 : PATTERN SYNC (VARIABLE)

Command type Sequential command

Usage restrictions The command is invalid in the following conditions.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Query: None

Usage example Program: When synchronous signal output is specified as 1/32 CLOCK

OUTPUT△7ØØ; "SOP△Ø"

Query: When synchronous signal output was specified as PATTERN

SYNC(FIXED)

OUTPUT△7ØØ; "SOP?"

ENTER△7ØØ;B\$

PRINT△B\$

¥

 $SOP \triangle 1$ (CR/LF) is output.

89) GPA GPIB address (GPIB 2 Address)

Function GPIB 2 (output port exclusively used for printer) address is specified.

Header	Program	Query	Response	(Number of characters)
GPA	GPA△m	GPA?	GPA△m	(FIX 2)

■ Value of m GPIB 2 address 1 to 30 is specified.

Range of numeric values Maximum: 30

Minimum: 0 Step: 1

■ Command type Sequential command

Usage restrictions The command is invalid in the following conditions.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Query: None

■ Usage example Program: When GPIB 2 address is specified as 0

OUTPUT△7ØØ; "GPA△Ø"

Query: When GPIB 2 address was specified as 1

OUTPUT△7ØØ; "GPA?"

ENTER△7ØØ;B\$

PRINT△B\$

•

 $GPA \triangle \triangle 1$ (CR/LF) is output.

90) SFT

Number of shifts for mark ratio AND bit (mark ratio and bit ShiFT)

Function

The number of shifts of the PRBS mark ratio AND bit is specified.

Header	Program	Query	Response	(Number of characters)
SFT	SFT△m	SFT?	SFT△m	(FIX 1)

■ Value of m Ø: 1 bit shift

1: 3 bits shift

Command type

Sequential command

Usage restrictions

The command is invalid in the following conditions.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

When measurement pattern is ALTERNATE, DATA, or

ZERO SUBST

Query: In the following case the command is invalid and ERR

(CR/LF) is output.

When the measurement pattern is ALTERNATE, DATA, or

ZERO SUBST

Usage example

Program: When the number of shifts for the mark ratio AND bit is

specified as 1 bit

OUTPUT△7ØØ; "SFT△Ø"

Query: When the number of shifts for the mark ratio AND bit was

specified as 1 bit

OUTPUT△7ØØ; "SFT?"

ENTER△7ØØ;B\$

PRINT△B\$

1

 $SFT \triangle 1$ (CR/LF) is output.

: When the measurement patter was specified as

ALTERNATE, DATA, or ZERO SUBST

OUTPUT△7ØØ; "SFT?"

ENTER△7ØØ:B\$

PRINT△B\$

1

ERR (CR/LF) is output.

91) CLS Clock loss processing function (CLock loss)

■ Function Clock loss processing function is selected.

Header	Program	Query	Response	(Number of characters)
CLS	CLS△m	CLS?	CLS△m	(FIX 1)

■ Value of m Ø: EXCLUDE

1: INCLUDE

■ Command type Sequential command

Usage restrictions The command is invalid in the following conditions.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Query: None

Usage example Program: When the clock loss status is to be excluded from calculation

OUTPUT△7ØØ; "CLS△Ø"

Query: When the clock loss status is to be included in calculation

OUTPUT△7ØØ; "CLS?"

ENTER△7ØØ;B\$

PRINT△B\$

 $CLS \triangle 1$ (CR/LF) is output.

Note EXCLUDE means the clock loss is executed from the calculation.

INCLUDE means the clock loss is included in the calculation.

92) SLS

Sync loss processing (Sync LoSs)

Function

Sync loss processing function is selected.

Header	Program	Query	Response	(Number of characters)
SLS	SLS△m	SLS?	SLS△m	(FIX 1)

Value of m

Ø: EXCLUDE

1: INCLUDE

Command type

Sequential command

Usage restrictions

The command is invalid in the following conditions.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Query: None

Usage example

Program: When a sync loss is to be excluded from calculation

OUTPUT△7ØØ; "SLS△Ø"

Query:

When a sync loss is to be included in calculation

OUTPUT△7ØØ; "SLS?"

ENTER△7ØØ:B\$

PRINT△B\$

Ţ

 $SLS \triangle 1$ (CR / LF) is output.

Note

 $\label{eq:excluded} \textbf{EXCLUDE} \ \textbf{means} \ \textbf{the sync loss is excluded from calculation}.$

INCLUDE means the sync loss is included in calculation.

93) ETH Error performance threshold selection function

(Error performance THreshold)

Function Print threshold for the error performance data is specified.

Header	Program	Query	Response	(Number of characters)
ETH	ETH△m	ETH?	ETH△m	(FIX 1)

■ Value of m Ø:1.0E-3

1:1.0E-4

Command type Sequential command

Usage restrictions The command is invalid in the following conditions.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Query: None

Usage example Program: When a print threshold for an error performance is specified

as 1.0E-3

OUTPUT△7ØØ; "ETH△Ø"

Query: When a print threshold for an error performance was

specified as 1.0E-4

OUTPUT△7ØØ; "ETH?"

ENTER△7ØØ;B\$

PRINT△B\$

↓

 $ETH \triangle 1$ (CR/LF) is output.

94) BST

BURST measurement mode (BurST mode)

Function

BURST measurement mode is specified.

Header	Program	Query	Response	(Number of characters)
BST	BST△m	BST?	BST△m	(FIX 1)

Value of m

Ø : OFF

1 : ON

Command type

Sequential command

Usage restrictions

The command is invalid in the following conditions.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Query: None

Usage example

Program: When a BURST mode is specified as OFF

OUTPUT△7ØØ; "BST△Ø"

Query:

When a BURST mode was specified as OFF

OUTPUT△7ØØ; "BST?"

ENTER△7ØØ;B\$

PRINT△B\$

1

 $BST \triangle 1$ (CR/LF) is output.

Note

When the BURST mode is ON, the alarm monitor method is changed as follows.

• Clock loss:

When no clock is input for 100 msecs, clock loss

occurs.

Clock loss does not occur in other cases.

• Sync loss:

This cannot be detected.

95) CAL

Intermediate measurement data calculation function (current data CALculation)

Function

Intermediate measurement data (current data) calculation is specified.

Header	Program	Query	Response	(Number of characters)
CAL	CAL△m	CAL?	CAL△m	(FIX 1)

Value of m Ø: Cumulative data

1: Immediate data

■ Command type Sequential command

Usage restrictions The command is invalid in the following conditions.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Query: None

Usage example

Program: When a intermediate measurement data is calculated in the

cumulative data

OUTPUT△7ØØ; "CAL△Ø"

Query: When intermediate measurement data calculation was

specified as the immediate calculation data

OUTPUT△7ØØ; "CAL?"

ENTER△7ØØ:B\$

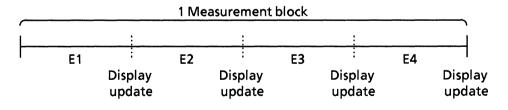

PRINT△B\$

↓

CAL△1 (CR/LF) is output.

Note

Cumulative data is added according to the current data updating period (100 msec / 200 msec).

• Cumulative data = $E1 + E2 + E3 + E4 + \cdots$

• Immediate data = E1 E2

E3

E4

Immediate data is the measurement data at the display update period (100 msec / 200 msec) block. (Data is not added.)

96) ETY Error detection mode selection (Error TYpe)

Function Error monitor mode is selected.

Header	Program	Query	Response	(Number of characters)
ETY	ETY△m	ETY?	ETY△m	(FIX 1)

■ Value of m Ø : Total error

1 : Insertion error2 : Omission error

Command type Sequential command

Usage restrictions The command is invalid in the following conditions.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Query: None

Usage example Program: When the error monitor mode is specified as total error

OUTPUT△7ØØ; "ETY△Ø"

Query: When the error monitor mode was specified as insertion error

OUTPUT△7ØØ; "ETY?"

ENTER△7ØØ;B\$

PRINT△B\$

4

 $ETY \triangle 1$ (CR/LF) is output.

97) EIT

EI / % EFI interval time (Ei, % efi Interval Time)

Function

EI, %EFI interval time is specified.

Header	Program	Query	Response	(Number of characters)
EIT	EIT△m	EIT?	EIT△m	(FIX 1)

Value of m

Ø: 1 msec

1: 10 msec 2: 100 msec

3: 1 sec

Command type

Sequential command

Usage restrictions

The command is invalid in the following conditions.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Query: None

Usage example

Program: When an interval time is specified as 1 msec

OUTPUT△7ØØ; "EIT△Ø"

Query: When an interval time was specified as 10 msec

OUTPUT△7ØØ; "EIT?"

ENTER△7ØØ;B\$

PRINT△B\$

Ų.

 $EIT \triangle 1$ (CR / LF) is output.

98) FMT

Data print format (output data ForMaT)

Function

Printing format is specified.

Header	Program	Query	Response	(Number of characters)
FMT	FMT△m	FMT?	FMT△m	(FIX 1)

■ Value of m Ø : Standard format

1: Abridged (short) format

■ Command type Sequential command

■ Usage restrictions The command is invalid in the following conditions.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Query: None

Usage example Program: When a print format is specified as standard format

OUTPUT△7ØØ; "FMT△Ø"

Query: When a print format is specified as Abridged (short) format

OUTPUT△7ØØ; "FMT?"

ENTER△7ØØ;B\$

PRINT△B\$

4

 $FMT \triangle \, 1 \, (CR \, / \, LF)$ is output.

99) THR

Threshold EI, %EFI data print selection
(THReshold ei / %efi data output)

Function Printing for threshold EI, %EFI data is specified.

Header	Program	Query	Response	(Number of characters)
THR	THR△m	THR?	THR△m	(FIX 1)

■ Value of m Ø: Do not print

1: Print

Command type Sequential command

Usage restrictions The command is invalid in the following conditions.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Query: None

■ Usage example Program: When threshold EI, %EFI data is not printed

OUTPUT△7ØØ; "THR△Ø"

Query: When threshold EI, %EFI data is printed

OUTPUT△7ØØ; "THR?"

ENTER△7ØØ;B\$

PRINT△B\$

1

 $\mathsf{THR} \triangle 1 (\mathsf{CR} / \mathsf{LF})$ is output.

100) EPF

Error performance data print selection (Error PerFormance data output)

Function

Printing of error performance data is specified.

Header	Program	Query	Response	(Number of characters)
EPF	EPF△m	EPF?	EPF△m	(FIX 1)
1				

■ Value of m Ø: Do not print

1: Print

■ Command type Sequential command

Usage restrictions The command is invalid in the following conditions.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Query: None

Usage example Program: When error performance data is not printed

OUTPUT△7ØØ; "EPF△Ø"

Query: When error performance data is printed

OUTPUT△7ØØ; "EPF?"

ENTER△7ØØ;B\$ PRINT△B\$

 $\mathsf{EPF} \triangle 1$ (CR/LF) is output.

101) ITM Intermediate data print selection (InTerMediate data output)

Function Intermediate data printing is specified.

Header	Program	Query	Response	(Number of characters)
ITM	ITM△m	ITM?	ITM△m	(FIX 1)

■ Value of m Ø : Do not print

1: Print

Command type Sequential command

Usage restrictions The command is invalid in the following conditions.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Query: None

■ Usage example Program: When intermediate data is not printed

OUTPUT△7ØØ; "ITM△Ø"

Query: When intermediate data is printed

OUTPUT△7ØØ; "ITM?"

ENTER△7ØØ; B\$

PRINT△B\$

ITM $\triangle 1$ (CR/LF) is output.

102) OSC 1-second data print selection (One-SeCond data output)

Function 1-second data printing is specified.

Header	Program	Query	Response	(Number of characters)
osc	OSC△m	OSC?	OSC△m	(FIX 1)

■ Value of m Ø : Do not print

1: Print

Command type Sequential command

Usage restrictions The command is invalid in the following conditions.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Query: None

Usage example Program: When 1-second data is not printed

OUTPUT△7ØØ; "OSC△Ø"

Query: When 1-second data is printed

OUTPUT△7ØØ; "OSC?"

ENTER△7ØØ;B\$

PRINT△B\$

1

 $OSC \triangle 1$ (CR/LF) is output.

103) DOT 1-second data print threshold selection

(<u>Data Output Threshold</u>)

Function 1-second data threshold is selected.

Header	Program	Query	Response	(Number of characters)
DOT DO	OT△m	DOT?	DOT△m	(FIX 1)

■ Value of m Ø : Error > 0

1 : Error>1.0E-6 2 : Error>1.0E-4 3 : Error>1.0E-3

■ Command type Sequential command

Usage restrictions The command is invalid in the following conditions.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Query: None

Usage example Program: When a 1-second data print threshold is specified as error > 0

OUTPUT△7ØØ; "DOT△Ø"

Query: When a 1-second data print threshold was specified as

error>1.0E-6

OUTPUT△7ØØ; "DOT?"

ENTER△7ØØ;B\$

PRINT△B\$

•

 $DOT \triangle 1$ (CR/LF) is output.

104) PSV Paper saving function (Paper SaVe)

■ Function Paper saving function is selected.

Header	Program	Query	Response	(Number of characters)
PSV	PSV△m	PSV?	PSV△m	(FIX 1)

■ Value of m Ø: OFF

1 : ON

■ Command type Sequential command

Usage restrictions The command is invalid in the following conditions.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Query: None

Usage example Program: When the paper saving function is specified as OFF

OUTPUT△7ØØ; "PSV△Ø"

Query: When the paper saving function was specified as ON

OUTPUT△7ØØ; "PSV?"

ENTER△7ØØ;B\$

PRINT△B\$

1

 $PSV \triangle 1$ (CR/LF) is output.

105) ITV Measurement interval time

(measurement InTerVal time)

Function Measurement interval time is selected.

Header	Program	Query	Response	(Number of characters)
ITV	ITV△m	ITV?	ITV△m	(FIX 1)

■ Value of m Ø: 100 msec

1: 200 msec

Command type Sequential command

Usage restrictions The command is invalid in the following conditions.

Program: During automatic phase threshold search operation

While Eye margin measurement is being executed

When a floppy disk is being accessed

Query: None

Usage example Program: When a measurement interval time is specified as 100 msec

OUTPUT△7ØØ; "ITV△Ø"

Query: When a measurement interval time was specified as 200

msec

OUTPUT△7ØØ:"ITV?"

ENTER△7ØØ;B\$

PRINT△B\$

1

ITV $\triangle 1$ (CR/LF) is output.

106) TRM

Termination code selection (TeRMination select)

Function

Selects the response data termination code for the data request

command.

Header	Program	Query	Response	(Number of characters)
TRM	TRM△m	TRM?	TRM△m	(FIX 1)

■ Value of m Ø: LF+EOI

1 : CR + LF + EOI

*TRM is set to 0 on activation at initialization or power-on.

■ Command type Sequential command

Usage restrictions The command is invalid in the following conditions.

Program: When a floppy disk is being accessed

Query: None

Usage example Program: When setting the termination code for the response data to

LF+EOI,

OUTPUT△7ØØ; "TRM△Ø"

Query: When the termination code for the response data is set to

CR + LF + EOI,

OUTPUT△7ØØ; "LGC?"

ENTER△ **700**; **B**\$

PRINT△**B**\$

Ţ

 $\mathsf{TRM} \triangle 1$ (CR + LF + EOI) is output.

107) DSL Input data select (<u>Data SeLect</u>)

The input signal is switched between Data and \overline{\text{Data}}.

Header	Program	Query	Response	(Number of characters)
DSL	DSLΔm	DCD?	DCDΔm1,m2,m3,n m1 m2 m3 m4	(FIX1) (FIX1) (FIX1) (FIX1)

■ Value of m 0: DATA

1: NDATA

* Starting up with DSL= 0 at initialization or power application.

■ Command type Sequential command

■ Usage restrictions The command is invalid under the following conditions.

(1) During Auto search

(2) During Eye margin measurement

(3) During FD access

■ Usage example Program: When selecting Data for the input signal:

OUTPUTA700;"DSLA0"

Query: When Data is selected for the input signal:

OUTPUTA700;"DCD?"

ENTERΔ700;B\$

PRINTΔB\$

 \downarrow

DCD\Delta0,0,0,0 is output.

The response parameters to a query are as follows:

DCD Δ m1,m2,m3,m4

m1: DATA/NDATA (0: DATA, 1: NDATA)

m2: Tracking/Adjust

(0: Tracking/Adjust OFF, 1: Tracking ON, 2: Adjust ON, -1: Invalid)

m3: Single/Differential (0:Single, 1:Differential)

m4: Term. Condition (0:Single/50 Ω , 1:Differential/100 Ω)

108) DAC

DATA•DATA tracking/Difference adjust control select (<u>Data tracking/Adjust Control</u>)

Function

The Tracking and Adjust operations for the input signal (Data, Data) are controlled.

Header	Program	Query	Response	(Number of characters)
DAC	DACΔm	DCD?	DCDΔm1,m2,m3,m m1 m2 m3 m4	(FIX1) (FIX1) (FIX1) (FIX1)

Value of m

0: Tracking/Adjust OFF

1: Tracking ON (Adjust OFF)

2: Adjust ON (Tracking OFF)

* Starting up with DAC = 1 at initialization or power application.

Command type

Sequential command

Usage restrictions

The command is invalid under the following conditions.

(1) During Auto search

(2) During Eye margin measurement

(3) During FD access

Usage example

Program:

When setting Tracking/Adjust OFF for input signal operation:

Ο Ο ΤΡυτά 700; "DAC Δ0"

Query:

When Tracking/Adjust OFF is set for input signal operation:

OUTPUTA700;"DCD?"

ENTERΔ700;B\$

PRINTAB\$

 \downarrow

 $DCD\Delta0,0,0,0$ is output.

The response parameters to a query are as follows:

 $DCD\Delta m1, m2, m3, m4$

m1: DATA/NDATA (0: DATA, 1: NDATA)

m2: Tracking/Adjust

(0: Tracking/Adjust OFF, 1: Tracking ON, 2: Adjust ON, -1: Invalid)

m3: Single/Differential (0: Single, 1: Differential)

m4: Term. Condition (0:Single/50 Ω , 1:Differential/100 Ω)

109) DSD Single-ended/Differential select (<u>Data Single/Differential</u> select)

■ Function The number of target input signals (Single/Differential) is selected.

Header	Program	Query	Response	(Number of characters)
DSD	DSDΔm	DCD?	DCDΔm1,m2,m3,n m1 m2 m3 m4	(FIX1) (FIX1) (FIX1) (FIX1)

■ Value of m 0: Single

1: Differential

* Starting up with DSD = 1 at initialization or power application.

■ Command type Sequential command

■ Usage restrictions The command is invalid under the following conditions.

(1) During Auto search

(2) During Eye margin measurement

(3) During FD access

■ Usage example Program: When setting Single for the target input signal:

OUTPUTA700;"DSD△0"

Query: When Single is set for the target input signal:

OUTPUTA700;"DCD?"

ENTERΔ700;B\$

PRINTΔB\$

1

DCD\(\D0,**0**,**0**,**0** is output.

The response parameters to a query are as follows:

 $DCD\Delta m1, m2, m3, m4$

m1: DATA/NDATA (0: DATA, 1: NDATA)

m2: Tracking/Adjust

(0: Tracking/Adjust OFF, 1: Tracking ON, 2: Adjust ON, -1: Invalid)

m3: Single/Differential (0: Single, 1: Differential)

m4: Term. Condition (0:Single/50 Ω , 1:Differential/100 Ω)

110) RRC Clock select (external/RecoveRy Clock select)

■ Function The clock supply source (External/Recovery) is selected.

Header	Program	Query	Response	(Number of characters)
RRC	RRCΔm	DRC?	DRCΔm1,m2 m1 m2	(FIX1) (FIX1)

■ Value of m 0: External

1: Recovery

* Starting up with RRC = 0 at initialization or power application.

■ Command type Sequential command

■ Usage restrictions The command is invalid under the following conditions.

(1) During Auto search

(2) During Eye margin measurement

(3) During FD access

■ Usage example Program: When setting External for the clock supply source:

OUTPUTΔ700;"RRCΔ0"

Query: When External is set for the clock supply source:

OUTPUTA700;"DRC?"

ENTERΔ700;B\$

PRINTAB\$

 \downarrow

DRC∆0,0 is output.

The response parameters to a query are as follows:

DRC∆m1,m2

m1: External/Recovery (0: External, 1: Recovery)

m2: Recovery Frequency (0 to 637, -1: Invalid)

111) RPL PLL reset (Recovery PLL reset)

■ Function PLL reset is executed.

Header	Program	Query	Response	(Number of characters)
RPL	RPL	RPL?	RPLΔm	(FIX1)

■ Command type Sequential command

■ Usage restrictions The command is invalid under the following conditions.

(1) During Auto search

(2) During Eye margin measurement

(3) During FD access

■ Usage example Program: When executing PLL reset:

OUTPUTΔ700;"RPL"

Query: When querying the PLL status:

OUTPUTA700;"RPL?"

ENTER∆700;B\$

PRINT∆B\$

 \downarrow

RPL∆0 is output.

The response parameters to a query are as follows:

RPL∆m (0: Lock, 1: Unlock, -1: Invalid)

SECTION 9 DETAILS OF DEVICE MESSAGES

112) RFQ Recovery frequency (Recovery FreQuency)

■ Function The Recovery frequency is set.

Header	Program	Query	Response	(Number of characters)
RFQ	RFQΔm	DRC?	DRCΔm1,m2 m1 m2	(FIX1) (FIX1)

- Value of m
- 0: 62.5 MHz/3 G CR

- 34: 3.000 GHz/3G CR

SECTION 9 DETAILS OF DEVICE MESSAGES

35: 3.200 GHz/3G CR (Default value when 3G unit is maximum)

36: 4.250 GHz/4G CR (Default value when 4G unit is maximum)

37: 9.900 GHz/10G CR (Default value when 10G unit is maximum)

38 to 637: Increasing in 2 MHz steps up to 11.1 GHz

* Starting up with the default value shown above (35, 36 or 37) at initialization or power application.

■ Command type Sequential command

■ Usage restrictions The command is invalid under the following conditions.

(1) During Auto search

(2) During Eye margin measurement

(3) During FD access

■ Usage example Program: When setting 62.5 MHz for the Recovery frequency:

OUTPUT∆700;"RFQ△0"

Query: When the Recovery frequency is set to 62.5 MHz:

OUTPUTA700;"DRC?"

ENTER∆700;B\$

PRINT∆B\$

 \downarrow

DRCΔ1,0 is output.

The response parameters to a query are as follows:

DRC\(\Delta\mu\)1,m2

m1: External/Recovery (0: External, 1: Recovery)

m2: Recovery Frequency (0 to 637, -1: Invalid)

113) DTC Data input termination condition (<u>Data Term. Condition</u>)

Function The termination condition (Single/50 Ω /Differential/100 Ω) is selected.

Header	Program	Query	Response	(Number of characters)
DTC	DTCΔm	DCD?	DCDΔm1,m2,m3,n m1 m2 m3 m4	(FIX1) (FIX1) (FIX1) (FIX1)

■ Value of m 0: Single/50 Ω

1: Differential/100 Ω

* Starting up with DTC= 0 at initialization or power application.

■ Command type Sequential command

■ Usage restrictions The command is invalid under the following conditions.

(1) During Auto search

(2) During Eye margin measurement

(3) During FD access

Usage example Program: When selecting Single/50 Ω for termination:

OUTPUT∆700;"DTC△0"

Query: When Single/50 Ω is selected for termination:

OUTPUTA700;"DCD?"

ENTERΔ700;B\$

PRINT∆B\$

 \downarrow

 $DCD\Delta0,0,0,0$ is output.

The response parameters to a query are as follows:

DCD Δ m1,m2,m3,m4

m1: DATA/NDATA (0: DATA, 1: NDATA)

m2: Tracking/Adjust

(0: Tracking/Adjust OFF, 1: Tracking ON, 2: Adjust ON, -1: Invalid)

m3: Single/Differential (0:Single, 1:Differential)

m4: Term. Condition (0:Single/50 Ω , 1:Differential/100 Ω)

SECTION 10 EXAMPLE OF PROGRAM CREATION

TABLE OF CONTENTS

10.1	Example of Program creation Using HP9000	 10-0
10.2	Example of Program creation Using DECpc	 10-7

(Blank)

This section describes examples of how to create MP1764D GPIB programs.

The sample programs which appear in this section were written for the HP9000 series computer of Hewlett-Packard and for a PC-compatible computer with GPIB interface card of National Instruments (N.I).

The program for the HP9000 were written in HP-BASIC while those for IBM-PC-compatible were written in Microsoft QUICK BASIC Version 4.50.

The programs were verified by running them on the HP9000-200 / 300 using HP-BASIC V5.12 and DECpc computer with GPIB interface card of N.I, using Microsoft QUICK-BASIC Version 4.50.

The program examples described here are:

- (1) Input signal setting
- (2) Automatic threshold search (Auto search) setting
- (3) Eye margin measurement
- (4) Measurement pattern, BIT WINDOW, and BLOCK WINDOW setting
- (5) Error analysis
- (6) Measurement result display (displayed using serial polling)
- (7) Measurement result display (displayed using request command)
- (8) Intermediate measurement data display
- (9) Reading file information from floppy disk
- (10) Floppy disk operation
- (11) Status byte checking
- (12) DMA transfer for pattern data
- (13) DMA transfer for BLOCK WINDOW

Table 10-1 shows the preparations that must be made for each controller prior to sample program execution.

Table 10-1 Preparation for Sample Program Execution (1/2)

Controller	Preparation for program execution	1
НР9000	 Set the GPIB address of MP1764D as "1". Set the GPIB address of MP1763B/C as "2". Connects the MP1764D, MP1763B/C, and HP9000 w 	rith GPIB cables.
DEC pc	 Set the GPIB address of MP1764D as "1". Set the GPIB address of MP1763B/C as "2". Set IBCONF as follows. ① <board characteristics=""></board>	0 NONE 1000 sec Yes Yes 7-Bit ØAH Yes Yes No 500 nsec off Default Yes Ø2cØh 11 5 Demand

Table 10-1 Preparation for Sample Program Execution (2 / 2)

Controller	Preparation for program execution		
DEC pc	② < Device Characteristics >		
	Device: ED (Defines device name as "ED")		
	Primary GPIB Address	1	
	Secondary GPIB Address	NONE	
	Timeout setting	$1000\mathrm{sec}$	
	Serial Poll Timeout	1 sec	
	Terminate Read on EOS	Yes	
	Set EOI with EOS on Writes	Yes	
	Type of compare on EOS	7-Bit	
	EOS byte	Ø Ah	
	Send EOI at end of Write	Yes	
	Enable Repeat Addressing	No	
	③ < Device Characteristics >		
	Device: PPG (Defines device name as "PPG	")	
	Primary GPIB Address	2	
	Secondary GPIB Address	NONE	
	Timeout setting	1000 sec	
	Serial Poll Timeout	1 sec	
	Terminate Read on EOS	Yes	
	Set EOI with EOS on Writes	Yes	
	Type of compare on EOS	7-Bit	
	EOS byte	Ø Ah	
	Send EOI at end of Write	Yes	
	Enable Repeat Addressing	No	
	Devices ② and ③ are connected to the GPIBI	$oldsymbol{oldsymbol{\emptyset}}$ of device $\textcircled{1}$ using	
	GPIB Device Map.		

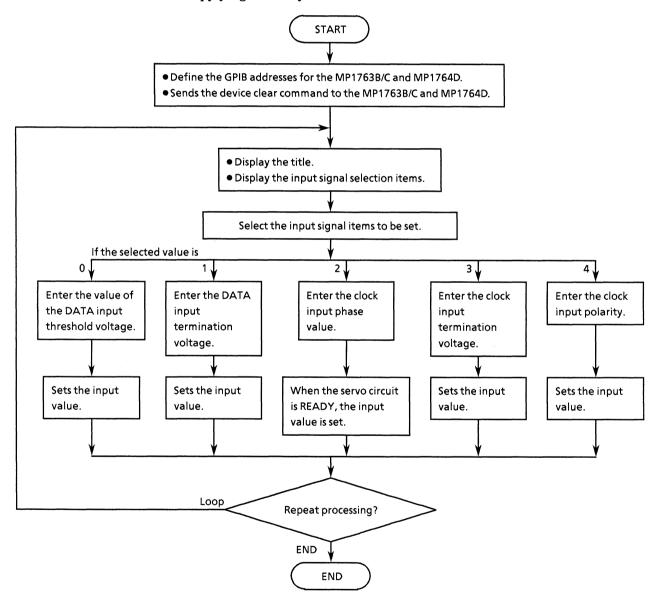

10.1 Example of Program creation Using HP9000

(1) Setting input signals

This program controls input signal conventions and characteristics.

Input signals (DATA, CLOCK voltage, phase, polarity, etc.) are selected according to a message, and are set in the MP1764D.

Note that when setting the clock input phase, the program enters a delay state to ensure that the instrument is READY before applying the delay value.

(2) Automatic input threshold search (Auto search) setting

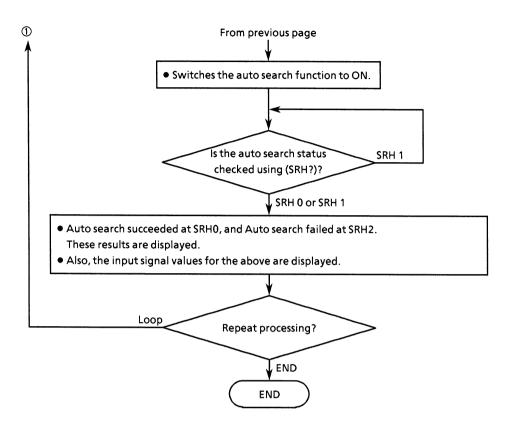

This program executes "auto search" after the MP1764D has been connected to the MP1763B/C.

First, establish the conditions required to execute Auto search in the MP1764D and MP1763B/C.

Next, confirm that the clock is not lost because the Auto search becomes invalid if the clock is lost.

Then, turn the Auto search function switch ON. Read using the request command (SRH?), and check whether the Auto search operation succeeded. Then, display the data. The values of the input signals at that time are displayed.

*1 The MP1763B/C internal clock frequency setting is effective only when the MP1763B/C OPTION-01 internal synthesizer is installed.

```

(3) Eye margin measurement

This program executes "eye margin measurement" after the MP1764D has been connected to the MP1763B/C.

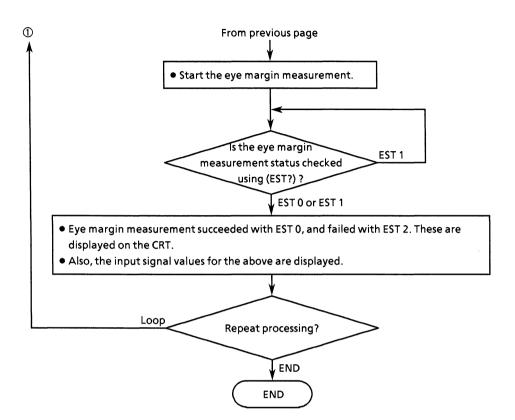

First, establish the conditions for eye margin measurement in the MP1764D and MP1763B/C.

Next, confirm that the clock is not lost, then start the eye margin measurement. Read by using the request command (EST?) to check if the eye margin measurement succeeded, and display the data.

The values of the input signals at that time are also displayed.

SECTON 10 EXAMPLE OF PROGRAM CREATION

*1 The MP1763B/C internal clock frequency setting is effective only when the MP1763B/C OPTION-01 internal synthesizer is installed.

(4) Measurement pattern, BIT WINDOW, and BLOCK WINDOW setting

This program is used to control the characteristics and features of measurement patterns, BIT WINDOW and BLOCK WINDOW.

Select the pattern logic and measurement pattern, then set the settings for the selected pattern.

(5) Error analysis

This program executes the error analysis function.

Confirm that the clock is not lost because error analysis becomes invalid if the clock is lost. Start the error analysis.

Read by using the request command (EAT?) to check if the error analysis is being executed, and display them on the CRT.

Display the error analysis results on the CRT.

(10) Floppy disk operation

This program executes save, recall, resave, delete, and format operations for the floppy disk.

The floppy disk access status is checked by either serial polling or the request command (MAC?).

(11) Status byte checking

This program checks the CME, EXE, DDE, and QYE bit of the standard event status byte and displays whether the input GPIB command is correct. The data is displayed on the CRT.

If abnormal, the meaning of the error is displayed.

Also, the GPIB status byte is checked using serial polling, and the status of the standard event status register is checked by the data request command.

(12) DMA transfer for pattern data

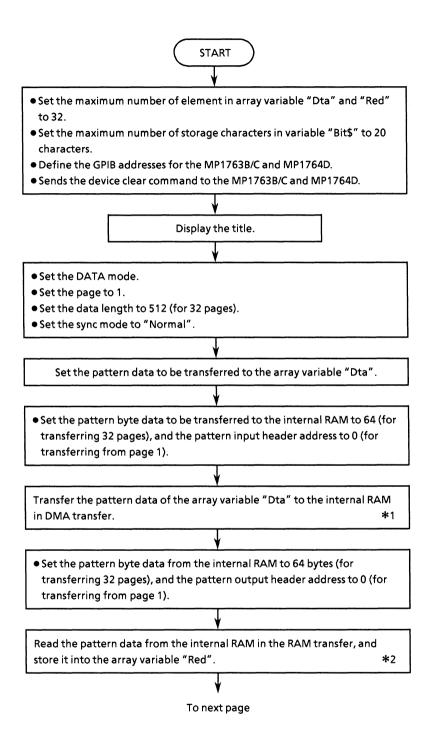

This program transfers pattern data to and from an HP9000 series computer, which is used as a controller, by DMA.

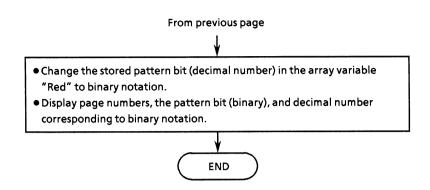

The output transferred using DMA to the MP1764D is then retransmitted using DMA.

The results of actual execution are shown below, and the relationship between each array variable data and the values to be set to these array variables (decimal notation, binary notation, hexadecimal notation) are shown in Table 12-1. The relationship differs depending on the controller used.

Table 12-1 Relationship between array variable and setting value

Array	Setting value	Binary numbers and BIT LED No.										Hexa- decimal	Page reference						
variable	(decimal)	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	number	number
Dta (0)	1	0	0	_	_		_	_				_	_				-	4 7 7	-

(13) DMA transfer for BLOCK WINDOW

This program transfers the BLOCK WINDOW pattern to an HP9000 series computer, which is used as a controller, by DMA.

The BLOCK WINDOW pattern data transferred to the MP1764D is output using the request command (MGB?).

The execution results are shown below and the relationship between each array "Dta" and numeric value to be set (decimal, hexadecimal) is shown in Fig. 13-1. This relationship differs depending on the controller used.

The corresponding page number in the table assumes the header address of the DMA transfer is 0. (See Appendix B.)

Table 13-1 Relationship between Array variable and setting value

Array	Setting value in	The corr	Setting value in hexa-							
variable	decimal notation	1	8	9	16	17	24	25	32	decimal notation

- Set the maximum number of element in array variable "Dta" to 32.
- Set the maximum number of element in array variable Bit\$ to 4, and the maximum characters for storage to 255 charactors.
- Set the maximum characters of variable Page\$ to 255 charactors.
- Define the GPIB addresses for the MP1763B/C and MP1764D.
- Sends the device clear command to the MP1763B/C and MP1764D.

Display the title.

- Set the DATA mode.
- Set the page to 1.
- Set the sync mode to "Normal".
- Set the data length to 512.

The BLOCK WINDOW pattern to be transferred is specified as array variable "Dta".

- Repeat the following processing until the maximum number of elements of the array variable "Dta" is reached.
- (1) Set the BLOCK WINDOW pattern of the internal RAM to 2 bytes, and the pattern input header address to 0.
- (2) Transfer the BLOCK WINDOW pattern data of the array variable "Dta" to internal RAM.
- (3) Read in 32 pages of the BLOCK WINDOW data (bit\$) using the request command (MGB?).
- (4) Convert the read BLOCK WINDOW pattern data into page units and display it on the CRT.

10.2 Example of Program creation Using DECpc

< Explanation of common section of the program >

The following sample programs are created using Microsoft Quick Basic Ver 4.50 and the GPIB interface card of National Instrument. (3 Refer to the instruction manuals of Quick Basic and GPIB driver for details.)

The necessary common functions in the sample program are summarized in the two programs below.

- COMMON.BAS
- ACS_ GPIB.BAS

These two programs must be prepared when the sample programs are executed.

Also, only the necessary functions may be prepared.

The two kinds of common functions are described the following pages.

<COMMON.BAS>

COMMON.BAS consists of seven types of functions.

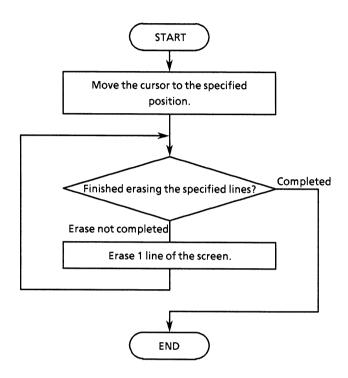

Table 10-2 Table of COMMON.BAS Functions

Module No.	Function	Processing
1.1	SUB ClearDisp (p%, l%)	Erases screen in units of line. p%: Start line number for erase l%: Number of lines to be erased
1.2	SUB Connect (ttl\$)	Displays the connection diagram ttl\$: Character string of title which is displayed together with connection diagram.
1.3	FUNC Exchange% (i%)	The upper and lower bytes of data having a bit pattern of a single precision integer are exchanged in byte units. i%: Bit pattern data
1.4	FUNC itob\$ (1%, v%)	Single precision integer is converted into a binary character string of bit length which is specified by LSB. However, output character length is fixed at 16 characters. 1%: Binary character string length v%: Conversion data
1.5	SUB SelItem (dist\$())	Performs key enter processing for selected measurement item. dist\$ (): Argument character array (output)
1.6	SUB Disp1 ()	Displays the data which has been read by the command set by SelItem ().
1.7	SUB waidly (tim)	Waits for the specified period of time. tim: Specified time (seconds) (input)

Each functions and its flowchart are shown on the following pages.

(1.1) SUB ClearDisp (p%, 1%): Erases screen.

• Flowchart

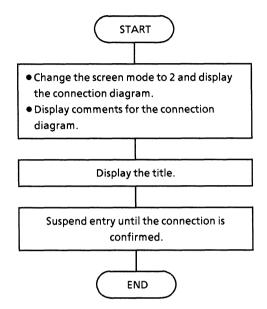

```
' ---- Procedure for Clear display ----
' in p%:Location line number
' l%:clear line count

SUB ClearDisp (p%, 1%)
   LOCATE p%, 1
   FOR i% = 0 TO (1% - 1)
        PRINT "

   NEXT i%
END SUB
```

(1.2) SUB Connect (tt1\$): Displays the title and connection diagram.

Flowchart

```
---- Connection layout ----
               ttl$:Title message for method
   This is drawing connection line layout for MP1764D with other PPG.
SUB Connect (ttl$)
       CLS

END SUB
```

(1.3) FUNCTION Exchange (i%): Swaps 16-bit integer data in units of byte.

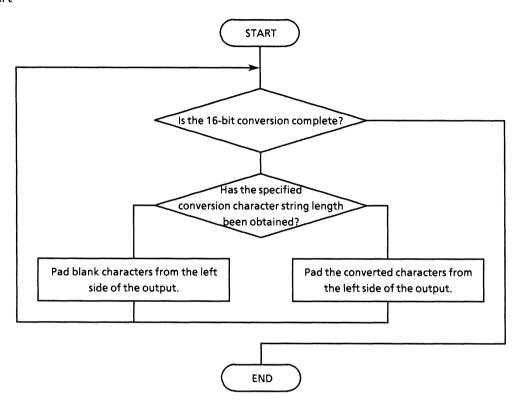

Flowchart

```
---- Exchange 16-bits pattern data ----
 In
       1%:16bits pattern data (used integer)
 Procedure for swap of low byte and high byte .
 This program is bit manipulation of integer value. Why this program used
  real value because one is overflow detect on bit manipulation of integer
  value, another one is internal manipulation by real value although input
  parameter is integer. And integer declear value is same operation.
FUNCTION Exchange% (i%)
    h = i% AND &HFF
1 = i% AND &HFF00
    IF h < 0 THEN
        h = 0
    END IF
    a = INT(h * 256) + ((1 ¥ 256) AND &HFF)
IF a >= 32768 THEN
b = a - 32768
        a = -32768 + b
    END IF
    Exchange% = a
END FUNCTION
```

(1.4) itob\$ (I%, v%): Converts integers into binary character strings.

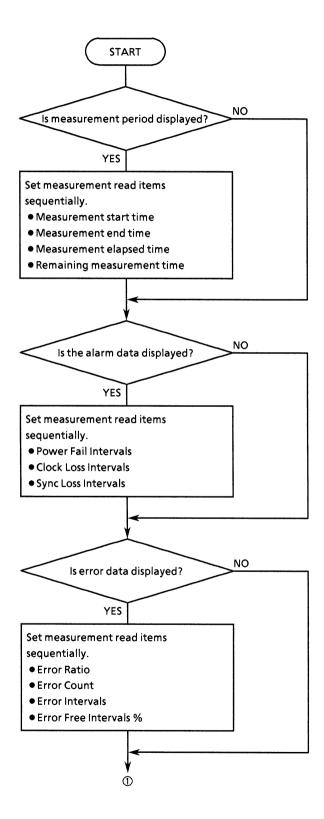

• Flowchart

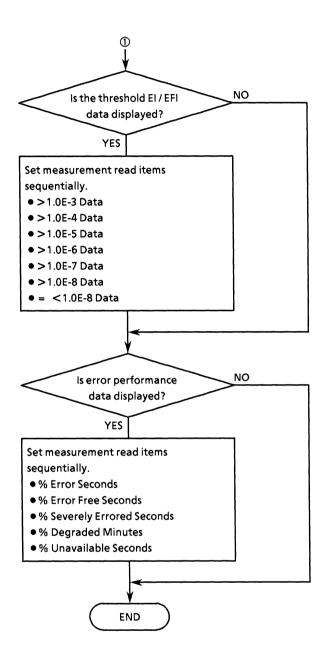

(1.5) Selltem (dst\$):

Read outs measurement results, and sets command arguments.

Flowchart

```

< Explanation of ACS_GPIB.BAS >

ACS_PGIB.BAS consists of the following 15 types of functions.

Table 10-3 ACS__GPIB.BAS Functions

(1/2)

Module number	Function	Processing
2.1	SUB wrtcmd1 (w\$)	Send commands to PPG. w\$: Command character string to be sent (input)
2.2	SUB wrtcmd2(w\$)	Send commands to ED. w\$: Command character string to be sent (input)
2.3	FUNC readcmd2\$	Reads messages from ED. readcmd2\$: Message character string (returned value)
2.4	SUB dmawrt (w%(), i%)	Transfers in DMA to ED. w% (): Integer array of pattern data to be transferred i%: Number of elements of integer array
2.5	SUB EndPoll()	Performs polling of the END bit of the MSS status register.
2.6	SUB SRQPoll()	Performs polling of the ERROR bit and SRQ bit of the MSS status register.
2.7	SUB StatusMask (sre%, ese%, ese2%, ese3%)	Sets the mask pattern for the status, event, and expansion registers. sre%: Mask pattern for status register ese%: Mask pattern for standard event register ese2%: Mask pattern for expansion event register 2 ese3%: Mask pattern for expansion event register 3
2.8	SUB StatusDisp (stb%, esr%, esr2%, esr3%)	Displays the setting status of the status, event, and expansion registers. The read data is specified as an argument and sent to the calling side. stb%: Pattern of status register setting status esr%: Pattern of standard event register setting status esr2%: Pattern of expansion event register 2 setting status esr3%: Pattern of expansion event register3 setting status
2.9	SUB MeasStart()	Starts measurement.
2.10	SUB MeasStop()	Stops or terminates measurement.
2.11	SUB ChecClk()	Judges the CLOCK LOSS and holds the processing until recovery.

Table 10-3 ACS GPIB.BAS Functions (2/2)

Module number	Function	Processing
2.12	FUNC AutoSrc%()	Executes the Auto Search operation and returns the results as function values. 0 (False): GPIB initialization failed due to wrong setting. 1 (True): Either one or both ED and PPG completed initialization.
2.13	FUNC gpinit%()	Executes GPIB initialization and returns the initialization as function values. 0 (False): Error in setting. Initialization failed. 1 (True): ED or PPG, or both completed initialization.
2.14	SUB trap()	Processes system errors.
2.15	SUB gpiberr()	Processes internal errors included in the GPIB sample program provided by National Instruments, displays status information.

Flowcharts of each function and program lists are described in the following pages.

The following must be entered at the header of the module:

Item \odot loads the NI-488 function definition using the GPIB driver of National Instruments.

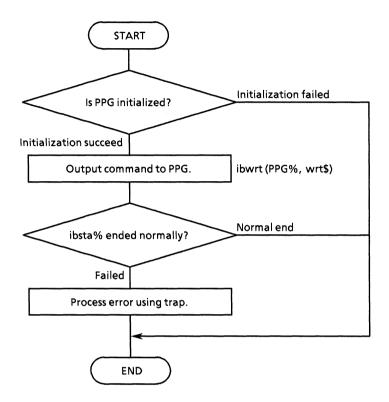

In actual use, specify a directory including 'qbdecl.bas'.

Item ② is a Quick Basic statement which defines the common variables between multiple modules.

■ Note: For item ①, note that the GPIB varies with the environment used.

(2.1) SUB wrtcmd1 (w\$): Sends commands to PPG.

<Program start>

The procedures used to process the above common functions and to start the sample programs (1) to (13) are described below.

- (Procedure 1): Open File from the menu bar and select "Load File. . . . ". Next, load the common function file name COMMON.BAS.
- (Procedure 2): Load ACS_GPIB.BAS in the same way as in procedure 1.
- (Procedure 3): Load the sample program in the same way as in procedure 1.
- (Procedure 4): Open Run from the menu bar, and select "Set Main Module", then make the sample program loaded in procedure 3 the main module.
- (Procedure 5): Open Run from the menu bar and execute "Start".
- (Refer to the Quick Basic Instruction Manual for details.)

(1) Input signal setting

This program for the MP1764D GPIB controls the input signals that are single-ended data.

APPENDIX A COMPATIBILITY WITH CONVENTIONAL INSTRUMENTS

When the mainframe uses programs generated by conventional instruments (MP1702A / MP1609A / MP1653A), some additional editing is required for programming.

(1) Status common command structure

MP1764D supports some of the common commands that conform to 488.2, but these commands are expressed without * in MP1702A.

Command	MP1702A	MP1764C
Service request	STB?	*STB?
Service request enable register	SRQ	*SRE
Standard event status register	ESR?	*ESR?
Standard event status enable register	ESE	*ESE
Expansion event status register	EER?	ESR2? ESR3?
Expansion event status enable register	EES	ESE2? ESE3?

See "Section 8: STATUS STRUCTURE" for other common commands and statuses.

(2) Measurement data calculation and read out

Read commands for MP1764D measurement data are output in response form for data request messages.

Also, data saved in the internal buffer is output as measurement results data.

Re-edit programming for measurement data calculation.

(3) Other GPIB commands

Appendix table A-1 shows a the correspondence between GPIB and MP1702A commands.

Re-edit programming by referring to the GPIB instruction manuals for each instrument.

O: Commands common with MP1702A

×: Commands not common with MP1702A

APPENDIX B PATTERN DMA TRANSFER

DMA, Direct Memory Access, transfers large amounts of data at high speed.

This mainframe has 4 types of DMA transfer commands. These are explained below.

(1) Pattern data DMA transfer command (WRT)

When the measurement pattern is ALTERNATE or DATA, this command transfers the contents of the program pattern DMA transfer in advance.

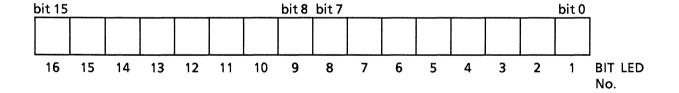

This command is used to notify the following information to the mainframe using WRT.

- 1: How many data bytes are transferred?
- 2: In which address in the mainframe internal RAM area, is the transferred pattern data stored?

1) How many data bytes are transferred?

The mainframe construction is 16 bit pattern. Therefore, a display of 1 page (16 bits) of the BIT display unit is normally transferred in 2 bytes.

The correspondence between pattern data and bit is as follows.

When an odd byte is transferred, only the upper bits (bit 15 to bit 8) are specified.

APPENDIX B

2) In which address in the mainframe internal RAM area, is the transferred pattern data stored? The RAM address of the mainframe is:

When DATA: 1 to 524287 When ALTERNATE: 0 to 262143

ALTERNATE has pattern A and pattern B so the internal RAM area is divided in half. (A or B pattern is selected according to the switch status of the A/B display switching).

The following shows the relationship between the address and the actual numbers of pages.

Pattern input address		Internal RAM area		Number of display pages
0	→		→	1
. 1	→		→	2
2	→		→	3
3	→		→	4
4	→		→	5
:				:
:		!		:
:		į	į	:
:		İ	Ì	:
:				:
524286	→		→	524287
524287	→		→	524288

(2) Pattern data DMA transfer command (RED?)

When the measurement pattern is ALTERNATE or DATA, this command transfers the contents of the program pattern DMA transfer in advance.

This command is used to notify the following information to the mainframe using WRT.

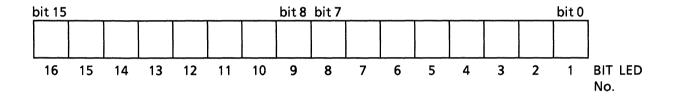

1: How many data bytes are transferred?

2: In which address in the mainframe internal RAM area, is the transferred pattern data stored?

1) How many data bytes are transferred?

The mainframe construction is 16 bit pattern. Therefore, a display of 1 page (16 bits) of the BIT display unit is normally transferred in 2 bytes.

The correspondence between pattern data and bit is as follows.

When an odd byte is transferred, only the upper bits (bit 15 to bit 8) are specified.

APPENDIX B

2) In which address in the mainframe internal RAM area, is the transferred pattern data stored? The RAM address of the mainframe is:

When DATA: 0 to 524287 When ALTERNATE: 0 to 262143

ALTERNATE has pattern A and pattern B, so the internal RAM area is divided in half. (A or B pattern is selected according to the switch status of the A / B display switching).

The following shows the relationship between the address and the actual numbers of pages.

Pattern input address		Internal RAM area		Number of display pages
0	←		←	1
1	←		←	2
2	←		←	3
3	←		←	4
4	←		_ ←	5
:				:
:		<u> </u>	į	;
:		į	į	:
:		i	i	:
:				:
524286	←		←	524287
524287	←		_ ←	524288

(3) BLOCK WINDOW data DMA transfer command (MWT)

For BLOCK WINDOW data, this command transfers the contents of the BLOCK WINDOW pattern DMA transfer in advance.

This command is used to notify the following information to the mainframe using MWT.

- 1: How many data bytes are transferred?
- 2: In which address in the mainframe internal RAM area, is the transferred pattern data stored?

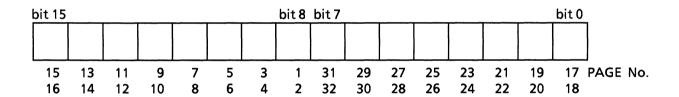

1) How many data bytes are transferred?

The BLOCK WINDOW data is in 32-bit units, so 32 bits (2 pages) of the BIT display data is saved in the internal RAM area.

Therefore, in contrast with (1) and (2) previously, the specified 1 bit expresses 32 bits of mainframe BLOCK WINDOW DATA.

The correspondence between pattern data and bit is as follows.

The above are the page values when the header address is assumed to be zero (0). So add 32 every time the above page address increases by 1.

When an odd byte is transferred, only the upper bits (bit 15 to bit 8) are specified.

APPENDIX B

2) In which address in the mainframe internal RAM area, is the transferred pattern data stored? The RAM address of the mainframe is:

When DATA: 0 to 16383 When ALTERNATE: 0 to 8192

ALTERNATE has pattern A and pattern B, so the internal RAM area is divided in half. (A or B pattern is selected according to the switch status of the A / B display switching).

The following shows the relationship between the address and the actual numbers of pages.

Pattern output address		Internal RAM area		Number of d	splay pages
0	→		→	1 to	32 pages
1	→		} →	33 to	64 pages
2	→		→	65 to	96 pages
3	→		} →	97 to	128 pages
4	→] →	129 to	160 pages
:					:
:		[]	[]		
:		 	1	1	
:	1		1		:
:					
16382	→] →	524225 to 5	24256 pages
16383	→] →	524257 to 52	24288 pages

(4) DMA transfer command for BLOCK WINDOW data (MRD?)

For BLOCK WINDOW data, this command transfers the contents of the BLOCK WINDOW pattern DMA transfer of in advance.

This command is used to notify the following information to the mainframe using MRD.

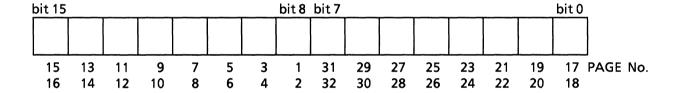

- 1: How many data bytes are transferred?
- 2: In which address in the mainframe internal RAM area, is the transferred pattern data stored?

1) How many data bytes are transferred?

The BLOCK WINDOW data is in 32-bit units, so 32 bits (2 pages) data of the BIT display data is saved in the internal RAM area.

Therefore, in contrast with (1) and (2) previously, the specified 1 bit expresses 32 bits of mainframe BLOCK WINDOW data.

The correspondence between pattern data and bit is as follows.

The above are the page values when the header address is assumed to be zero (0). So add 32 every time the above page address increases by 1.

When an odd byte is transferred, only the upper bit (bit 15 to bit 8) are specified.

APPENDIX B

2) In which address in the mainframe internal RAM area, is the transferred pattern data stored? The RAM address of the mainframe is:

When DATA: 0 to 16383 When ALTERNATE: 0 to 8192

ALTERNATE has pattern A and pattern B, so the internal RAM area is divided in half. (A or B pattern is selected according to the switch status of the A/B display switching).

The following shows the relationship between the address and the actual numbers of pages.

Pattern output address		Internal RAM area		Number of di	splay pages
0	\rightarrow		→	1 to	32 pages
1	→		→	33 to	64 pages
2	\rightarrow		→	65 to	96 pages
3	\rightarrow		→	97 to	128 pages
4	→		→	129 to	160 pages
:				:	
:		<u> </u>	[:	
:] 	! }	:	
:			1	:	
:			ļ	:	
16382	→		→	524225 to 5	24256 pages
16383	→		→	524257 to 52	24288 pages

APPENDIX C TABLES OF INITIAL VALUES

Appendix tables C-1 to C-5 shows initial values of MP1764D at the time of factory shipment.

Single-ended/Differential select	DSD	Differential	109	P9-153
Clock select	RRC	External	110	P9-154
Recovery frequency	RFQ	9.900 GHz	112	P9-156
Data input termination condition	DTC	Single/50 Ω	113	P9-158

Table C-2 Table of MEMORY Section Initial values

Function	Header	Initial value	Device message details	
	part		Item No.	Page
MEMORY section				
Memory FD mode	FMD	1440 K	13	P9-39
File contents search	FSH	No data	14	P9-40
File No. / directory mode switching	FIL	File No.	15	P9-42
Floppy data recall	RCL	-	16	P9-43
Floppy data delete	DEL	_	17	P9-44
Floppy data save	SAV	_	18	P9-45
Floppy data resave	RSV	-	19	P9-46
Memory mode switching	MEM	PATT	20	P9-47
Floppy access status	MAC	Non access	21	P9-49
FD error message	FDE	No error	22	P9-50
FD format	FDF	-	23	P9-51

Table C-3 Table of PATTERN Section Initial Values

Function	Header part	Initial value	Device message details	
			Item No.	Page
PATTERN section				
Pattern logic	LGC	Positive	24	P9-53
Measurement pattern	PTS	PRBS	25	P9-54
Number of ZERO SUBST and PRBS steps	PTN	PRBS: $2^{15}-1$ Zero: 2^{15}	26	P9-55
PRBS mark ratio	MRK	1/2	27	P9-56
Synchronous mode	SYM	Alternate : Normal Data : Normal Zero sunbst: Normal PRBS : None	28	P9-57
Display selection	DSP	Pattern	29	P9-58
Alternate pattern A / B switching	ALT	Α	30	P9-59
Frame bit length	FLN	32 bits	31	P9-60
Data length	DLN	Alternate : 128 bits Data : 2bits	32	P9-61
ZERO SUBST length	ZLN	1 bit	33	P9-63
Number of pages. Pattern synchronous trigger position	PAG ADR	1 page	34	P9-64
Pattern bit	ВІТ	All bits 0	35	P9-65
Bit window pattern	СНМ	All bits 0	36	P9-67
Bit window page	MSK	1 page	37	P9-69
Block window pattern	MGB	All bits 0	38	P9-70
Error analysis data *1	EAB	No measurement data	39	P9-72
Error analysis page *1	EAP	1 page	40	P9-74
Bit window ON / OFF	MSE	OFF	41	P9-75
Block window ON / OFF	MGE	OFF	42	P9-76
Error analysis trigger *1	EAT	OFF	43	P9-77
PATTERN SYNC POSITION	PSP		54	P9-91
PAGE / PATTERN SYNC POSITION switch	PPD		55	P9-92

Table C-4 Tableof MEASUREMENT Section Initial Values

Function	Header	Initial value	Device message details	
	part		Item No.	Page
MEASUREMENT section				
Measurement result display mode	DMS	ERROR RATIO	59	P9-97
Intermediate result display function	CUR	OFF	60	P9-98
Measurement mode	MOD	Repeat	61	P9-99
Measurement status	MSR	Measurement stop	64	P9-102
Automatic synchronous function	SYN	OFF	65	P9-103
Automatic synchronous threshold	SYE	10^{-2}	66	P9-104
Real time and measurement period display switching	TIM	Period	67	P9-105
Internal timer setting	RTM	Current time	68	P9-106
Measurement period setting	PRD	1 second	69	P9-107

Table C-5 Table of Other Section Initial Values

Function	Header part	Initial value	Device message details	
			Item No.	Page
• Other section (Front panel)				
Printer ON / OFF	PRN	OFF	84	P9-128
Manual print	PSA	Stop	85	P9-129
Alarm monitor (Alarm detection)	ALM	OFF	86	P9-130
Alarm monitor (Error detection)	MON	OFF	87	P9-131
Synchronous signal output	SOP	1 / 32 CLOCK	88	P9-132
• Other section (Rear panel GPIB)				
GPIB 2 address	GPA	0	89	P9-133
Other section (Rear panel FUNCTION switch)				
Number of shifts of mark ratio AND bit	SFT	1 bit shift	90	P9-134
Clock off processing	CLS	Exclude	91	P9-135
Synchronous loss processing	SLS	Exclude	92	P9-136
Error performance data threshold selection	ETH	1.0E-3	93	P9-137
BURST measurement mode	BST	OFF	94	P9-138
Intermediate data calculation function during measurement	CAL	Cumulative calculation data	95	P9-139
Error detection mode	ETY	Total errors	96	P9-140
EI, EFI interval period	EIT	1 msec	97	P9-141
Data print format	FMT	Standard format	98	P9-142
Threshold EI, EFI data print	THR	No print	99	P9-143
Error performance data print	EPF	No print	100	P9-144
Intermediate data print	ITM	No print	101	P9-145
1-second data print	OSC	No print	102	P9-146
1-second data print threshold	DOT	Error>0	103	P9-147
Paper saving function	PSV	OFF	104	P9-148
Measurement interval period	ITV	100 msec	105	P9-149
Memory FD mode	FMD	1440 K / 720 K	13	P9-39
Termination code selection	TRM	LF+EOI	106	P9-150

(Blank)

APPENDIX D TABLE OF TRACKING ITEMS

In this Appendix, MP1764D tracking items are explained.

Tracking denotes a function to send the MP1764D setting conditions to MP1763B/C through GPIB.

See "Section 3 Bus Connections and address setting" for connections.

The trackings are differ according to the measurement patterns.

Table D-1 Table of Tracking Items

Measurement pattern	Tracking Items
Alternate pattern	1: LOGIC 2: Measurement pattern (Alternate) 3: A/B display switching 4: Page setting 5: Pattern bit (DMA transfer, Both A and B transferred)
Data pattern	1 : LOGIC 2 : Measurement pattern (Data) 3 : Data length 4 : Page setting 5 : Pattern bit (DMA transfer)
Zero subst pattern	 1: LOGIC 2: Measurement pattern 3: Zero subst step 4: Zero subst length 5: Page setting
PRBS pattern	1: LOGIC 2: Measurement pattern 3: PRBS step 4: PRBS mark ratio 5: Page setting

(Blank)
