The Pure Signal Analyzer

Clear Low-Noise Signals

The new MS2840A synthesizer design is based on Anritsu's 120 year
history of technical excellence to support world-beating,
pure close-in phase noise performance.

For Wireless and Tx Device R&D

The MS2840A (3.6 GHz/6 GHz models) close-in phase noise performance is –123 dBc/Hz
(10 kHz offset) at a measurement frequency of 1 GHz by new designed synthesizer.
And installing a dedicated option (MS2840A-066) takes this already superior
performance to the next level. For example, at a measurement frequency of 150 MHz
with 10 kHz offset, the close-in phase noise performance is an incredible –140 dBc/Hz
(meas.*); at a measurement frequency of 1 GHz with 10 kHz offset, it is –138 dBc/Hz
(meas.*), beating even the performance of top-rank instruments.

The MS2840A (3.6 GHz/6 GHz models) is a spectrum/signal analyzer combining
superior close-in phase noise performance with excellent cost-performance, making it
the perfect measurement solution for both fundamental R&D and manufacturing of
wireless equipment and Tx devices.

Signal Analyzer MS2840A series (3.6 GHz/6 GHz models) Features

Better Than Expected Close-in Phase Noise Performance

Since 2000 most spectrum analyzers have been designed for mobile communications and the phase noise performance has been optimized for offset frequencies of several MHz. Consequently, customers requiring good close-in phase noise performance have been limited to a narrow choice of usable spectrum analyzers, causing problems. This new MS2840A series (3.6 GHz and 6 GHz models) has been designed with emphasis on offering a spectrum analyzer with excellent close-in phase noise performance at offset frequencies of just several kHz. This performance surpasses that of first-generation high-end spectrum analyzers and has sufficient margin for evaluating the close-in spurious of narrowband communications equipment in the short-wave, VHF, and UHF bands. Moreover, installing Low Phase Noise Performance MS2840A-066 option supports excellent phase noise performance surpassing that of current high-end instruments.

The high cost-performance of the MS2840A series (3.6 GHz and 6 GHz models) supporting not only development and production but also fundamental research for wireless and transmission equipment belies its mid-range price.

Spurious Emission

This function splits the frequency range into up to 20 segments for sweeping; the measurement parameters and limit lines can be specified to measure the peak power and margin for each segment. The results are tabulated below the trace and marked PASS/FAIL.

Burst Average Power

The average power for the range specified by two markers is displayed in the time domain. Measurement only requires setting the measurement start and stop positions on the screen. True performance is measured using the noise cancellation function to subtract main-frame noise from the measurement result. Pre-installed templates for each standard support easy parameter setting.

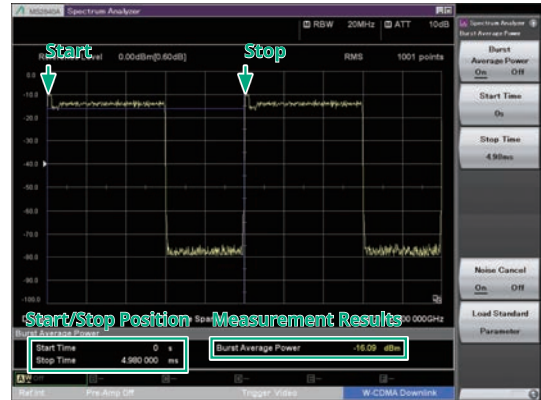

Multi-marker & Marker List

Up to 10 markers can be set for this function. Markers may be either a spot or a zone. Using a zone marker, the peak of a signal with an unstable variable frequency can be tracked and measured. Not only can the 10 markers be listed below the trace but the differences between markers can be calculated and displayed using the delta setting.
Highest 10 Markers

This function sets the threshold level and auto-detects peaks in the X (frequency) and Y (level/time) directions.

Signal Analyzer (Standard)

The MS2840A has a built-in 31.25 MHz bandwidth Fast Fourier Transformation (FFT) analysis function supporting multi-domain analysis of captured measured signals. Since it can capture phenomena such as spectrum transients that cannot be captured by conventional sweep-type spectrum analyzers, it improves the efficiency of troubleshooting. The analysis bandwidth can be expanded to either 62.5 MHz or 125 MHz as options.

Preamplifier (MS2840A-008)

This option is for the 3.6 GHz/6 GHz models (MS2840A-040/041) and the 26.5 GHz/44.5 GHz models (MS2840A-044/046).
The gain of about 20 dB improves the Displayed Average Noise Level (DANL). This preamplifier is used to measure low-level signals such as noise and interference.

Frequency Range
With MS2840A-040: 100 kHz to 3.6 GHz
With MS2840A-041: 100 kHz to 6 GHz

Noise Floor Reduction (MS2840A-051)

The Noise Floor Reduction (NFR) function increases the measurement accuracy for low-level signals. It subtracts the internal noise components (11 dB max. nominal) of the measuring instrument itself from the displayed measurement result.

When the NFR function is used with a connected external mixer (High Performance Waveguide Mixer MA2806A/MA2808A), it measures V- and E-band millimeter waveband applications with high dynamic range.

<Main Applications>
  • Spurious Emission
  • Spectrum Mask
  • Adjacent Channel Leakage Power (ACLR)
  • Power ON/OFF ratio

Measurement times using the NFR function remain unchanged. The NFR function eliminates the procedure of measuring the instrument noise floor each time like using the earlier noise cancelling function. If the noise floor is measured once when an ambient temperature change affects the noise floor level or when an external mixer is connected, the NFR effect can be captured by the same operation as normal measurement, unless there is a change in these conditions.

[Notes]
The NFR function is enabled only by the Spectrum Analyzer function.
The design value is nominal and is not a guaranteed specification.

The MS2840A supports level calibration over a wide range of 300 kHz to 4 GHz using its built-in level calibration oscillator.
The level accuracy standards include frequency characteristics, linearity and attenuator switching error. Consequently, the level including the above three errors can still be measured accurately even when the measurement frequency and built-in attenuator settings are changed.
