Multipurpose Optical Measuring Instruments Supporting Reference Light Sources

MT9810B Optical Test Set

Today, as we turn to photonic communications, a variety of optical communication networks, from core to access, are about to be realized. For this reason, there are a wide variety of performance requirements demanded of optical components and optical communications systems making up these rapidly developing optical communication networks.
And the performance and specifications of the sought after evaluation systems vary depending on the field (development, manufacturing, inspection, maintenance) in which these are developed, supplied and implemented.
The MT9810B Optical Test Set is the most fundamental optical measurement instrument with a complete line-up of light sources (DFB-LD, FP-LD, SLD) and optical sensors (high-speed, general-purpose, high-power).
The evaluation system can be configured to fit the users needs. In addition, by combining the optical test set with peripheral devices such as the optical directional coupler and the optical channel selector, the user can construct even more diverse evaluation systems.
The MT9810B is a highly accurate and reliable evaluation system that will respond with flexibility to future diverse measurement needs.

Light Source

The DFB-LD complies with ITU-T recommended wavelengths and highly stable 1.31 µm band, 1.55 µm band FP-LD's are also offered. In addition, an SLD light source with a center wavelength of 1.55 µm and an approximately 40 nm wavelength band is provided.

Optical Sensors

There are three optical sensors: high-sensitivity, general-purpose and high-power. Each has sensor head and plug-in models.

Measurement Conditions Saving Function

Up to 10 sets of measurement conditions can be saved for each channel, permitting the repetition of measurements.

Clone Function

When the same types of units are mounted in Channels 1 and 2, the measurement conditions for one side can be copied onto the other side.

Measurement of Max., Min. and Variation of Optical Power

By mounting an optical sensor, the maximum and minimum values of optical power and the variations in its value can be always displayed, eliminating the need for saving the measured optical power various in the memory. Light source stability and PDL (polarization dependent loss) characteristics can be evaluated in real time.

Recording Measured Optical Power Values

By mounting an optical sensor, a maximum of 1000 power measurement values can be saved per channel. The saved measurement values can be read by remote control, permitting various analyses and processings.

Variable Optical Power Measurement Interval

By mounting an optical sensor, the optimum measurement interval can be set according to the applications (1 ms to 99 h 59 min 59 s); for example, a long interval for a long-duration measurement, and a short interval for high-speed measurement.

Variable Optical Power Measurement Bandwidth

By mounting an optical sensor, the bandwidth can be set according to the measured item; for example, the average pulse optical power can be measured by widening the bandwidth, and the variations in optical power at an optical switch can be measured by narrowing the bandwidth. The setting range is between 0.1 Hz to 100 kHz (MU931311A) or 10 kHz (MU931421A/931422A).

Relative Measurement

By mounting an optical sensor, 0 dB is displayed as the measured value on the display when the relative key (Rel) is pressed. It allows the difference from the reference value to be read directly in the loss measurement of an optical fiber or device.

Reference Measurement

By mounting an optical sensor, a relative value based on a reference value (reference) entered using the keys can be displayed. When the light is incident at a distant location in the loss measurement of an optical fiber, the fiber loss can be read directly by entering the reference value of incident light as a reference.

Controlling Optical Channel Selector

The MN96xxA Optical Channel Selector can be controlled from the MT9810B Optical Test Set by connecting the two via a dedicated cable. It facilitates the measurement if the optical test set and the optical channel selector are at a distance from each other due to the configuration of the measurement system. The cable lengths are available in the range from 1 to 10 m.

GPIB and RS-232C I/F as Standard

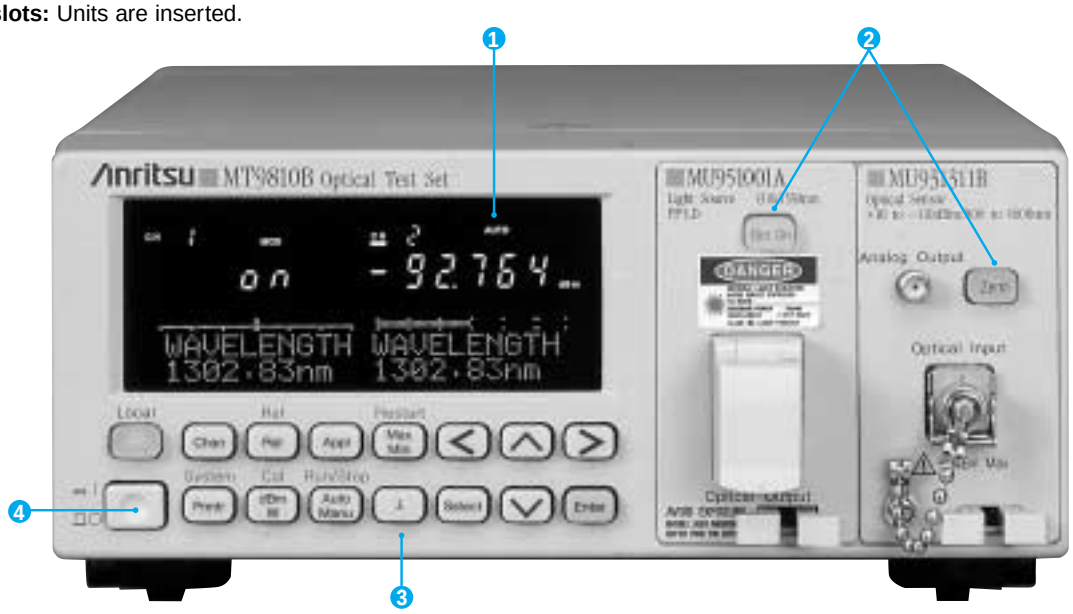
GPIB and RS-232C interfaces are provided as standard, permitting remote control of the measurements via a PC.
In addition, the LabVIEW® software driver for remote control is provided as standard, enhancing the construction of a remote measurement system.

1 **Display:** Displays the measured and set values. Use of a fluorescent character display tube facilitates the reading of the values.

2 **Plug-in slots:** Units are inserted.

3 **Key switches:** Used to set the measurement conditions

4 **Power switch**



5 **GPIB interface**

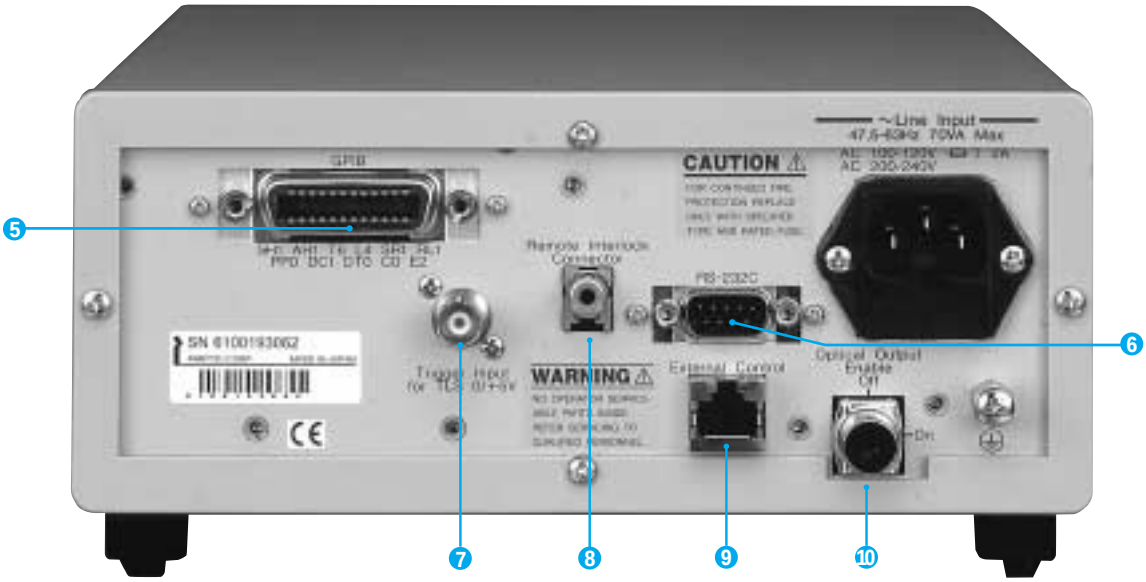
6 **RS-232C interface**

7 **Trigger input:** Connect to a MG9541A Tunable Laser Source of ME7984A Component Tester.

8 **Remote interlock:** An optical safety mechanism is adopted. There is no light output as long as the remote interlock is open even if the optical output switch of the light source unit is turned on. (short pin: short-circuits remote interlock enabling light output)

9 **External device control:** Controls the external devices by connecting an optical channel selector using a dedicated cable

10 **Optical output control key:** A key used for the optical safety mechanism. No light output occurs as long as it is off even if the optical output switch on the front panel is on (Light is outputted only when both ⑧ and ⑩ are set as output state.)



MT9812B Multi Channel Box

The MT9812B is a mainframe supporting devices such as DFB-LD multiple light sources and multi-channel device evaluation systems. A maximum of 9 MT9810B compatible light sources (DFB-LD, FP-LD, SLD) and optical sensor units can be inserted. In addition to being able to set and verify setting conditions for each unit on the front panel, a remotely controlled measurement system can be supported as GPIB and RS-232C interfaces are standard equipment.

Light Source Units (for MT9810B/9812B)

■DFB-LD Light Source Unit

MU952500A/952600A series are 97 wavelengths supporting WDM. The unit is equipped with a high-output and high-stability DFB-LD light source.

Conforms to Wavelengths complying with ITU-T

The unit incorporates a DFB-LD light source that supports D-WDM and complies with ITU-T. Frequencies from 186.3 to 195.9 THz (1609.19 to 1530.33 nm) over a 100 GHz interval are available.

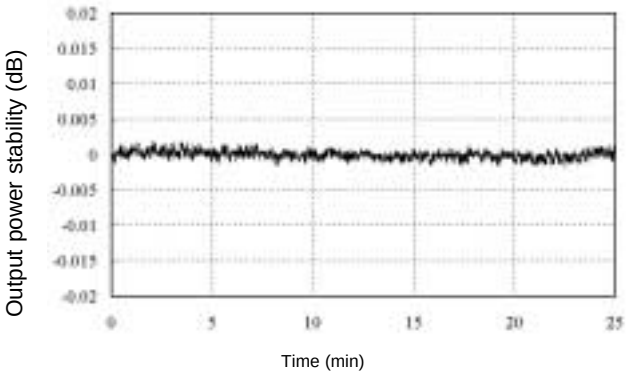
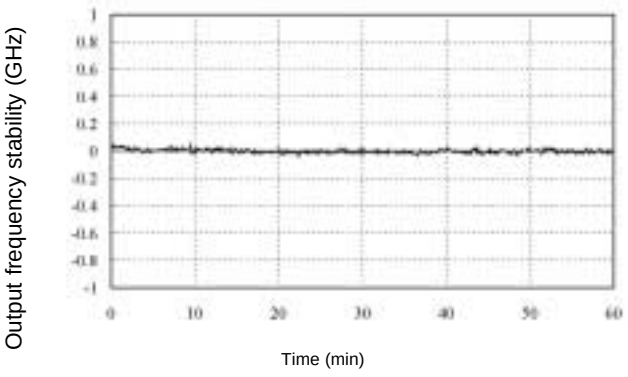
High-Power, High-Stability

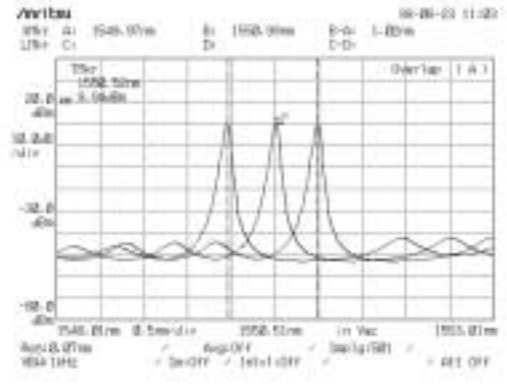
High Power of +10 dBm and high stability of better than or equal to ±0.005 dB are provided. In addition, high stability of better than or equal to ±2 GHz can be achieved for the center frequency (MU952501A/952502A/952503A/952504A/952505A).





Variable Optical Frequency

The center frequency of the light source can be varied in the maximum range of ±60 GHz (approx. ±0.5 nm). Moreover, the frequency can be displayed in either frequency or wavelength units. This function allows a required frequency to be set between reference grids.



■ FP-LD Light Source Units

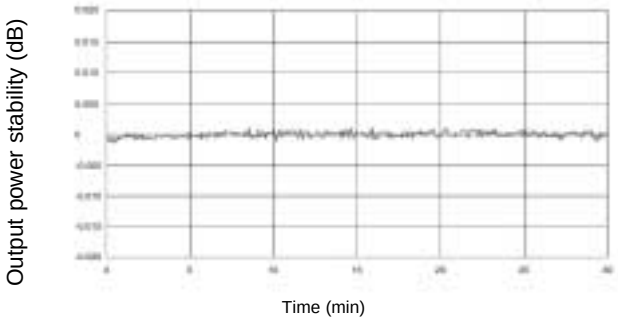
The MU951301A and MU951501A have a wavelength of 1.31 µm and 1.55 µm, respectively. The MU951001A allows the wavelength to be selected as either 1.31 or 1.55 µm.

High-Power

The units are general-purpose light sources with a high output of +7 dBm, making them ideal for performing measurements over a high dynamic range.

High-Stability

The units provide high output-power stability of better than or equal to ±0.002 dB. They are suitable as light sources for measurements in which high accuracy is required(MU951301A/951501A).



■ SLD Light Source Unit

This light source has a center wavelength of 1550 nm and an approximate wavelength band of 40 nm. Optical output power is –3 dBm. The output level is higher than LED light source.
A measurement system of MS9710B/C Optical Spectrum Analyzer and SLD light source unit achieves more dynamic range.
On the other hand, when combined with the MN9604C/D Optical Directional Coupler, highly stable reflectance measurements can be performed because of low interference to use SLD light source.

Optical Sensor Units

High-sensitivity, general-purpose or high-power optical sensors are available. A remote sensor head model and a plug-in model are also provided. Furthermore, besides supporting all optical connectors, the optical input method (connection method) for optical sensors supports bare fiber connection and free-space optical input. The user can select the optical sensor that meets his use environment and purpose.

■ General-Purpose Optical Sensor (MU931421A/MU931422A/MA9332A)

MU931421A and MU931422A with measurement ranges of +10 to –80 dBm and MA9332A with a measurement range of +7 to –80 dBm, are highly accurate optical sensors that achieve a measurement accuracy of ±2% and linearity of ±0.01 dB. MU931422A and MA9332A can be used in measuring fiber with an APC connector, GI fiber and bare fiber. MU931422A is a plug-in model and MA9332A, a sensor head model.

✻When using MA9332A, MU931001A or MU931002A sensor adapter is necessary.

■ High-power Optical Sensor (MA9331A/MU931431A)

High-power optical sensors MA9331A and MU931431A have maximum measurement optical inputs of +35 dBm and +33 dBm, respectively. These sensors have NPL (National Physical Laboratory) traceability in conducting calibration at +30 dBm, and are able to measure “high-power” with an even higher level of confidence than conventional high-power optical sensors. And of course all types of corresponding connectors also support fiber with an APC connector, GI fiber and bare fiber. MU931431A is a plug-in model and MA9331A, a sensor head model.

✻When using MA9331A, MU931001A sensor adapter is necessary.

Large diameter PD	MA9333A	Sensor head	√	√	√

✻1: MU931421A/MU931311A does not correspond to MU connector, LC connector, and APC connector.

■ High-sensitivity Optical Sensor (MU931311A)

The MU931311A has an optical power range of +10 to –110 dBm and measures high-level to extremely low-level light. It achieves measurement uncertainty of ±2% and linearity of ±0.01 dB. Optical power can be measured with a high degree of accuracy. And of course, this optical sensor is compatible with all connectors.

■ Large Diameter PD Sensor (MA9333A)

This is a sensor head-model optical sensor that has low noise characteristics, and uses an internal photo acceptance unit with a ±5 mm- InGaAs-PD. In addition to SM, GI and POF (plastic fiber), a collimated spatial beam can also be measured directly. This optical sensor also supports bare fiber.

✻When using MA9333A, MU931002A Sensor Adapter is necessary.

■ MA9901A/B Fiber Adapter

Setting can be accomplished without touching the cut fiber edge by using the clamping method, which catches and then fixes the fiber at both ends.

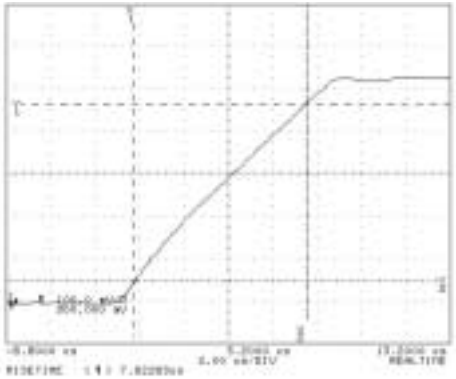
Fiber can also be easily attached and removed by pinching the clamp, making this adapter perfect for extended work.

High-Resolution Optical Power Measurement

The MT9810B has a panel of high resolution of 1/1000 dB. In addition, the optical power can be measured at a high resolution of 1/10000 dB via GPIB or RS-232C interface.

High-Speed Analog Output

The MU931311A Optical Sensor can send a signal to an analog output terminal with a response speed of approx. 10 µs (The response speed of other optical sensors is approx. 100 µs).



■Configuration Example

Each unit supports various types of optical fibers by changing the repleacable optical connector and connector adapter.

MN9662A/9672A/9664A/9674A Optical Channel Selector

The optical channel selector is a switching device used for outputting the light that is inputted to the common channels to any channel. The above devices are equipped with eight (for MN9662A/9672A) and sixteen (for MN9664A/9674A) channels, making them ideal for the evaluation of devices for WDM and various optical transmission devices*.
They possess excellent switching repeatability of 0.003 dB (typical value) and low polarization dependent loss of 0.03 dBp-p (MN9662A/9664A). Cleanable and replaceable optical adapters (FC, SC, ST, DIN and HMS-10/A) are also available as applications. Moreover, in addition to the control by the MT9810B Optical Test Set, GPIB and RS-232C interfaces are provided as standards, allowing the above devices to be used as components of an automatic measurement system.

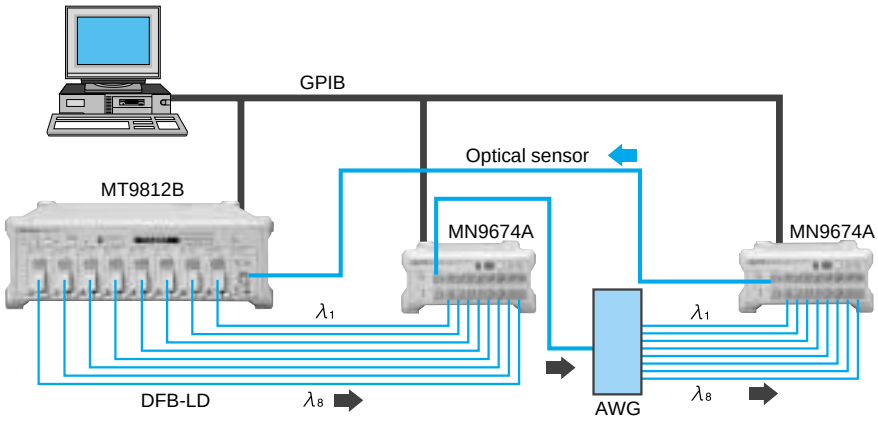
11. **Box number setting switch:** Sets a number identified by the MT9810B when the optical channel selector is controlled by the MT9810B
12. **GPIB/RS-232C setting:** Sets the communication conditions of RS-232C interface or an address of GPIB interface
13. **External control:** The MT9810B Optical Test Set or an optical channel selector is connected.

Applications

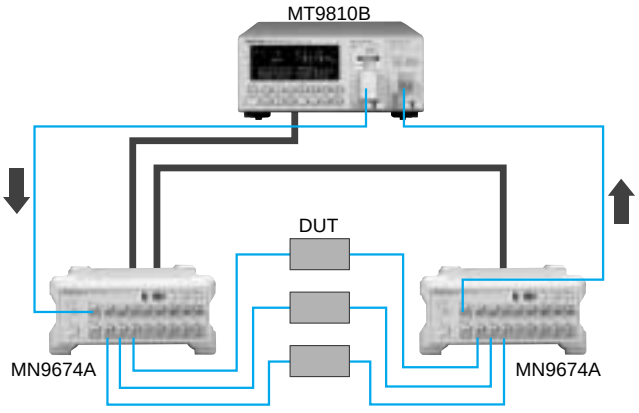
AWG Device Measurement

The insertion loss characteristics and crosstalk of AWG (multi-demultiplexer), a key device for WDM, can be measured easily. DFB-LD provides a line-up of 97 grid wavelengths that comply with ITU-T. In addition, automatic measurements can be performed by connecting the MT9812B Multi Channel Box and an optical channel selector with a PC via GPIB cables.



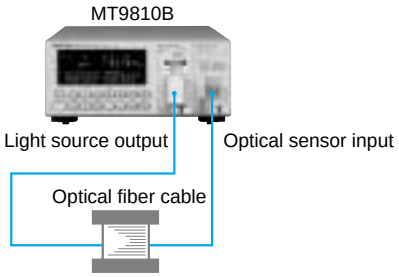
Measurement of Insertion Loss Characteristics of the Optical Device

By combining the MT9810B Optical Test Set with optical channel selectors, insertion loss of multiple DUTs can be measured easily. Connecting the optical test set and optical channel selectors via dedicated cables allows the optical test set to switch the optical channel selector. A single optical test set can control up to nine optical channel selectors.



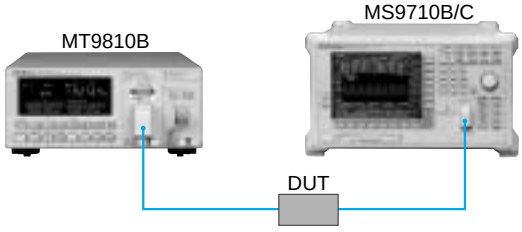
Optical Fiber Loss Measurement

By combining the light source with the optical sensor unit, the optical fiber loss can be measured. Fiber loss can be read directly using the reference function.



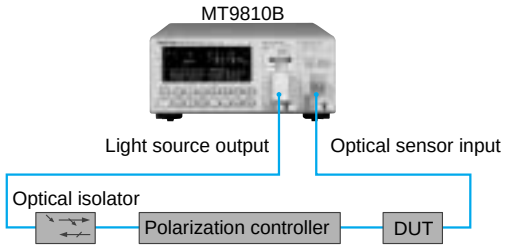
Evaluate Optical Components

A System that is composed from MU954501A SLD Light Source unit and MS9710B/C Optical Spectrum Analyzer can measure wavelength characteristics of optical component.



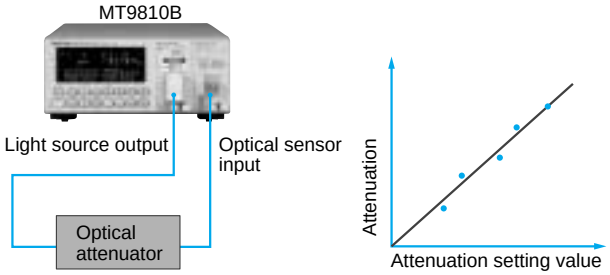
Polarization Dependent Loss (PDL) Measurement of the Optical Device

The PDL value can be read directly using the function for reading the maximum and minimum values of the optical sensor by inputting an optical signal scrambled by a polarization controller to the DUT.



Evaluation of the Attenuation of the Optical Attenuator

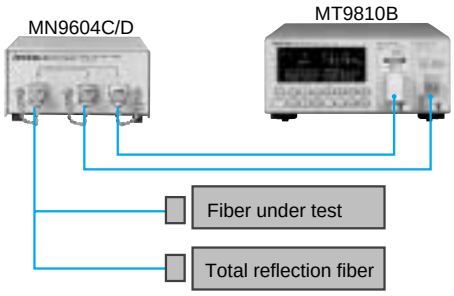
The optical sensors, MU931311A/931421A, possess a high linearity of ±0.01 dB, permitting high-accurate attenuation measurements of devices including attenuators.



Return Loss Measurement

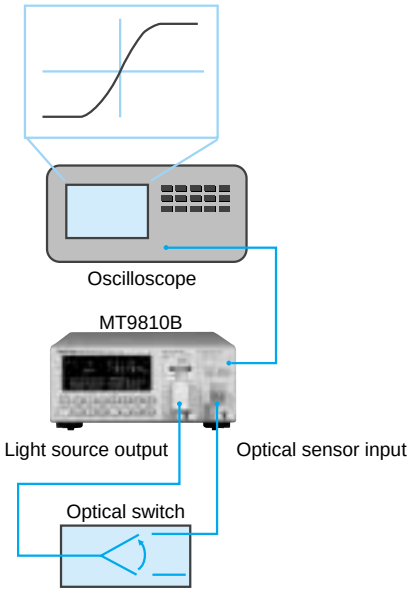
In combination with the MN9604C/D Optical Directional Coupler, measurements of up to 50 dB return loss are possible. Attach the total reflection fiber to Port A on the directional coupler and use the measured value as the reference value. Next, the user can measure the return loss by replacing the total reflection fiber on Port A with the device to be measured. By using the MU954501A SLD Light Source, interference from the measurement system is suppressed, allowing measurement of up to 60 dB return loss*.

* MN9604D Optical Directional Coupler and MU931311A Sensor or MA9333A Sensor are necessary.



Measurement of Optical Switching Characteristics

The analog output from the optical sensor part has a maximum bandwidth of 100 kHz, permitting the evaluation of transit time of devices including optical switches at a response speed of about 10 µs (0.5 V output).



Pulse Light Average Power Measurement

The average pulse light power can be measured by narrowing the band of the optical sensor to less than the pulse cycle. In addition, if the pulse duty is known, the peak power can be calculated using the following formula; P (peak) = P (average value)/Duty ratio.

*1 Specify an optical frequency (wavelength) and model name when ordering.
*2 When ordering, the option specified connector is supplied as standard.
Specified the option number after the light source or optical sensor model number.
If a connector is not specified, a FC (Option 37) connector is supplied as standard.
These are applied to DFB-LD unit, FP-LD unit, SLD unit and optical sensor.
However, MU and LC connecter option are only apply to MU931422A, MA9331A, MA9332A and MA9333A.
*3 Number differs according to model
MN9662A: 9 pcs; MN9672A: 10 pcs; MN9664A: 17 pcs; MN9674A: 18 pcs
*4 Standard connector for specified option. If not specified, FC-PC connector (Option 37) supplied as standard.
