 - If your SCSI card is not bundled with Avision AV360CS, then you can refer to the installation sheet contained in your SCSI card or ask for details from your SCSI card vendor.

2.4 Connecting the Cable

Make sure the power of scanner is off.

Connecting the SCSI cable to the scanner

The AV360CS scanner is provided with an active terminator already. As such, if the scanner is the only (or final) SCSI device connected to your host computer, turn the active terminator to the *on* position, and the scanner will function all right. Do not attach an additional passive terminator to the connection!

If the scanner is linked in a SCSI chain (between the host computer and other devices), turn the active terminator to the *off* position, plug the SCSI cable from other devices into the unused SCSI connector of the scanner, and add a passive terminator to the last device of the SCSI chain (See Figure 2-2).

Connect the power cable and signal cable as shown below.

Figure 2-1 AV360CS scanner cable connection

Figure 2-2 SCSI chain configuration

Figure 2-2 In the SCSI chain configuration, the scanner is connected to the host computer; a second SCSI cable then connects the scanner with other devices.

Setting the SCSI ID

SCSI ID:

If you have several devices on a SCSI chain, you may need to adjust the SCSI ID selector which is located on the back panel of the scanner. This action is to make sure each device match with a unique SCSI ID number. If the ID# you select is duplicate with an existing SCSI device, then please select a different ID#. (See Figure 2-3)

Note: The default SCSI ID number for Avison AV360CS is 6. Usually ID# 0 is assigned to an internal hard disk drive, and ID# 7, to SCSI adapter or host.

Figure 4-3 Scanning Source

4.1 Image Type

Select image type through the mode from the screen of **Avision TWAIN user interface** for your own purpose. Please see Figure 4-4 as below:

Figure 4-4 Image Type

Each image type is described as follows:

Line art

Line art includes only black and white areas. There are no intermediate shades of gray in between.

Halftone

Halftone simulates different shades of gray by varying the threshold value of a matrix.

Gray (256 levels gray scale)

Scanner recognizes each point in the image as a shade of gray (continuous tone). 8-bit gray gives more detailed information about the image.

True Color (16.7 million colors)

Color image have continuous tones along with its color hues.

256 Colors

The 256 colors image provides 256 levels of color hues.

4.2 Resolution Control

A good control of the resolution results a satisfactory detail of an image that scans. The resolution is measured by dots per inch(dpi). Normally, the greater the dpi number, the higher the resolution and the image file size. Be aware that the greater resolution takes more time, memory and disk space, therefore, up to a certain degree of dpi, the resolution will not visually be improved, on the contrary, it makes your files more unmanageable.

Figure 4-5 Resolution Control

4.3 Image Control

Brightness: Adjusts the lightness or darkness of an image. The higher the value, the brighter the image.

Contrast: Adjusts the range between the darkest and the lightest shades in the image. The higher the contrast, the bigger the different gray scales.

Gamma: Adjusts the midtone of the image without losing details of the lightest and the darkest areas.

Highlight: Adjusts the highlight area of the image.

Shadow: Adjusts the darkest area of the image.

Auto Level Automatically adjusts the highlight and shadow areas of the scanned image to give it an optimal effect.

Invert: The invert command reverses the brightness and the color in the image. For color images, each pixel will be changed into its complementary color at the command of *Invert*.

Color Match: Adjusts the color quality of the image so that it comes close to that of the original. This function uses default parameters to adjust the image.

Sharpen: Sharpens the scanned image. Look for more selections under this item.

Descreen: Eliminates the moire patterns commonly found in printed matter.

Before Descreen

After Descreen

4.4 Scanning

Preview: Previews your image to allocate the area to be scanned.

Scan: Scans the area with the parameters you have set.

Exit: Cancels the current job.

As shown in the figure below, in the Preview window, you can define the area to be scanned by dragging the cursor auxiliary lines with the mouse.

If you have any problem with the operation of the scanner, please check the following troubleshooting hints.

6.1 Questions and Answers

- Question:** When I power on the scanner, it makes noise and will not stand ready.
- Answer:** There are two possibilities:
1) You forgot to unlock the scanner. Please unlock the scanner by turning the switch to the "use" position.
2) You did not place the scanner on a level surface. Please settle the scanner on a level surface.
- Question:** The scanner has been powered on, but the lamp does not light up.
- Answer:** The lamp is out of order. In this case, please contact your local dealer to replace the lamp. The life time of the lamp is about 10,000 hours.
- Question:** The system would often hang up during scanning.
- Answer:** Please check
1) If the cable is firmly seated;
2) Only 2 SCSI terminators can be connected to your SCSI daisy chain. One is at the end of the SCSI device, another is already in your host adapter.
- Question:** Why is it the scanned image always comes out too dark?
- Answer:** 1) Modify the Gamma setting to 1.8 for your monitor and, when printing, set Gamma to 2.2 for your printer.
2) Use the Brightness setting of the TWAIN user interface to get a brighter image.
- Question:** Why does Image scanned in line art mode appear to be much coarser than the original?
- Answer:** Use the Brightness or Threshold setting to control the line art image.
