FLIGHT CONTROLS - DESCRIPTION AND OPERATION

1. General

A. Aerodynamic characteristics of the 767 have been tailored to reduce drag and provide high performance. Single leading edge slats and trailing edge flaps are used for high aerodynamic efficiency, functional reliability, and low maintenance requirements. Hydraulically powered conventional flight controls with redundant systems provide fail-safe control throughout the flight envelope.

2. Introduction

A. Primary Flight Controls (Fig. 1)

(1) The primary flight controls of the airplane are the ailerons (inboard and outboard), elevators, and rudder. Each control surface is powered by cable operated power control actuators (PCA's). Each PCA receives hydraulic power from a separate hydraulic system. The primary flight controls use all three hydraulic systems for redundancy. There is no reversion to manual control of the surfaces if hydraulic power fails.

B. Secondary Flight Controls (Fig. 1)

- (1) The secondary flight controls are the spoiler/speedbrakes, horizontal stabilizer, leading edge (LE) slats, and trailing edge (TE) flaps.
- (2) Six spoiler/speedbrakes are installed on each wing. They are hydraulically powered and electronically controlled. The spoiler/speedbrakes receive hydraulic power from all three hydraulic systems.
- (3) Six LE slats are installed on each wing. The slats are powered either hydraulically or electrically. Normally, hydraulic motors rotate drive shafts that drive the rotary actuators. Electric motors power the drive shafts as a backup. The slats receive hydraulic power from the center system.
- (4) Two TE flaps (inboard and outboard) are installed on each wing. The flaps are powered either hydraulically or electrically. Normally, hydraulic motors rotate drive shafts that drive rotary actuators. Electric motors power the drive shafts as a backup. The flaps receive hydraulic power from the center system.

- (5) AIRPLANES WITH STAB TRIM LEVERS ON THE CONTROL STAND; the horizontal stabilizer is hydraulically powered and manually or electrically controlled. The stabilizer receives hydraulic power from the left and center systems.
  - (6) AIRPLANES WITH ALTERNATE STAB TRIM SWITCHES ON THE CONTROL STAND; the horizontal stabilizer is hydraulically powered and electrically controlled. The stabilizer receives hydraulic power from the left and center systems.
- C. Flight Control Actuators, Servos, and Electronics (Fig. 1)
- (1) Three lateral central control actuators (LCCA) provide power boost to the wing control cables. Each LCCA is powered by a separate hydraulic system. The LCCA's have internal servovalves for autopilot inputs. All of the LCCA's have the same part number.
  - (2) The 767 uses a total of twenty-nine power control actuators to move the control surfaces. Each PCA uses one of the three hydraulic systems. There are six different part numbers for the PCA's.
  - (3) Six autopilot servos provide electronic control inputs to the flight control systems. There are three elevator servos and three directional servos. The elevator and directional servos use all three hydraulic systems. Each hydraulic system supplies one elevator servo and one directional servo.
  - (4) Two yaw damper servos provide gust damping inputs to the rudder system. Each servo uses one of two hydraulic systems. The two yaw damper servos have the same part number.
  - (5) The control system electronics unit (CSEU) is a group of power supply and electronic modules used in the flight control system. There are two (left and right) CSEU's installed for redundancy.
- D. Flight Controls - Hydraulic Distribution (Fig. 2)
- (1) Three independent hydraulic systems provide power to the flight controls. Each system uses a combination of pumps to supply power.
  - (2) Flight control redundancy is provided by the use of multiple hydraulic systems. The aileron, elevator, rudder, and spoiler PCA's use all three hydraulic systems. The elevator and directional servos and LCCA's each use one of the three hydraulic systems. The slats, flaps, and rudder ratio changer use a single hydraulic system.
  - (3) The ram air turbine (RAT) is an emergency hydraulic source. The RAT is used in the event of a double engine failure. The RAT is used by the primary flight control system only.

- (4) The wing and tail shutoff valves are used for system isolation. The valves are provided for ground use only. The valves are normally open in flight.
  - (5) Safety harness attachment receptacles are provided on the wing and horizontal stabilizer upper surfaces for use by maintenance personnel working high above ground. For additional information, on Flight Controls Safety Harness Receptacle refer to AMM 20-10-27/201.
- E. Flight Controls - Shear Rivets

(1) Shear rivets provide a means by which normal operation of essential flight systems can be maintained in the event of failure or jamming of related or interconnected secondary systems. Each shear rivet location is marked by a SHEAROUT placard that includes the quantity and part number of the shear rivet. The chart below contains a list of all the shear rivets that are used in the flight control system along with references to the related maintenance manual sections.

MANUAL REFERENCE	PART THAT CONTAINS THE SHEAR RIVET

FLIGHT CONTROLS – MAINTENANCE PRACTICES

1. General

- A. Control cables are thin strands of tinned carbon steel.
- B. A thin film of grease protect the cables from corrosion.
- C. Corrosion occurs where the grease film is not there.
  - (1) This lets moisture get on the cables.

TASK 27-00-00-642-001

2. Corrosion Prevention

A. Procedure

S 162-002

- (1) At regular times, wipe off the grease with a dry, lint-free cloth.

S 212-003

- (2) Examine the cable for corrosion.

S 642-004

- (3) Apply a thin film of grease on the cable (AMM 12-21-31/301).

FLIGHT CONTROLS - DDG MAINTENANCE PROCEDURES

1. General

- A. This procedure has the maintenance tasks that prepare the airplane for flight with certain systems/components deactivated.
- B. It also has the tasks that put the airplane back to its usual condition.
- C. These are the tasks for the components in the flight controls system:
  - (1) DDG 27-03-1 Preparation - FLIGHT CONTROL SHUTOFF Valves Inoperative
  - (2) DDG 27-03-1 Restoration - FLIGHT CONTROL SHUTOFF Valves Inoperative
  - (3) DDG 27-03-2 Preparation - FLIGHT CONTROL SHUTOFF OFF Valve Lights Inoperative
  - (4) DDG 27-03-2 Restoration - FLIGHT CONTROL SHUTOFF OFF Valve Lights Inoperative
  - (5) DDG 27-08-1 Preparation - Control Surface Position Indicating System Inoperative
  - (6) DDG 27-08-1 Restoration - Control Surface Position Indicating System Inoperative
  - (7) DDG 27-11-1 Preparation - Aileron Trim System Inoperative
  - (8) DDG 27-11-1 Restoration - Aileron Trim System Inoperative
  - (9) DDG 27-11-2 Preparation - Outboard Aileron Lockout System Inoperative
  - (10) DDG 27-11-2 Restoration - Outboard Aileron Lockout System Inoperative
  - (11) DDG 27-21-1 Preparation - Rudder Ratio System - Rudder Ratio Light Inoperative
  - (12) DDG 27-21-1 Restoration - Rudder Ratio System - Rudder Ratio Light Inoperative
  - (13) DDG 27-32-1 Preparation - Stall Warning Test Systems Inoperative
  - (14) DDG 27-32-1 Restoration - Stall Warning Test Systems Inoperative
  - (15) DDG 27-41-2 Preparation - Horizontal Stabilizer Primary Trim Channels Inoperative
  - (16) DDG 27-41-2 Restoration - Horizontal Stabilizer Primary Trim Channels Inoperative
  - (17) DDG 27-51-1 Preparation - Automatic Flap Load Relief Retraction Inoperative
  - (18) DDG 27-51-1 Restoration - Automatic Flap Load Relief Retraction Inoperative
  - (19) DDG 27-62-1 Preparation - Auto Speed Brake System Inoperative
  - (20) DDG 27-62-1 Restoration - Auto Speed Brake System Inoperative

- (21) DDG 27-63-1 Preparation - AUTO SPDBRK, SPOILERS, and STAB TRIM Lights Inoperative
- (22) DDG 27-63-1 Restoration - AUTO SPDBRK, SPOILERS, and STAB TRIM Lights Inoperative

TASK 27-00-00-049-001

2. DDG 27-03-1 Preparation - FLT CONTROL SHUTOFF Valves Inoperative

A. General

- (1) This task contains the maintenance instructions to prepare the airplane for operation under DDG requirement 27-03-1, FLT CONTROL SHUTOFF Valves Inoperative.

B. References

- (1) AMM 24-22-00/201, Electrical Power - Control
- (2) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems

C. Access

- (1) Location Zone  
135 Wing Landing Gear Wheel Well, LH

D. Procedure

S 869-202

- (1) Supply electrical power (AMM 24-22-00/201).

S 869-206

- (2) Make sure that the FLT CONTROL SHUTOFF L, R, and C switches on the right side panel, P61 are in the ON positions.

S 869-205

**WARNING:** MAKE SURE THAT PERSONS AND EQUIPMENT ARE CLEAR OF ALL CONTROL SURFACES BEFORE YOU SUPPLY HYDRAULIC POWER. AILERONS, RUDDERS, ELEVATORS, FLAPS, SPOILERS, LANDING GEAR, AND THRUST REVERSERS CAN MOVE QUICKLY WHEN YOU SUPPLY HYDRAULIC POWER. THIS CAN CAUSE INJURY TO PERSONS AND DAMAGE TO EQUIPMENT.

- (3) Pressurize the applicable hydraulic system (AMM 29-11-00/201).

S 869-285

- (4) Do these steps to make sure the applicable valve(s) is open:
  - (a) Move the control column or control wheel, as applicable, and make sure the EICAS display show the applicable indication.

EFFECTIVITY

ALL

27-00-00

01

Page 902  
Dec 10/98

- S 429-218
- (5) Put a 'VALVE INOP' placard on the applicable switch.
- S 049-004
- (6) Remove pressure from the applicable hydraulic system (AMM 29-11-00/201).
- S 869-284
- (7) If electrical power is not necessary, remove electrical power (AMM 24-22-00/201).

TASK 27-00-00-449-277

3. DDG 27-03-1 Restoration - FLT CONTROL SHUTOFF Valves Inoperative

A. General

- (1) This task contains the instructions to put the airplane back to its usual condition after operation under DDG 27-03-1, FLT CONTROL SHUTOFF Valves Inoperative.

B. References

- (1) FIM 27-23-00/101, Rudder and Elevator Shutoff Valves  
(2) AMM 27-13-00/601, Aileron and Spoiler Hydraulic Shutoff Valves  
(3) AMM 27-23-00/501, Rudder and Elevator Shutoff Valves

C. Access

- (1) Location Zone  
135 Wing Landing Gear Wheel Well, LH

D. Procedure

S 819-208

- (1) Do the troubleshooting for the EICAS Message FLT CONT VALS Displayed (FIM 27-23-00/101).

S 729-209

- (2) Do the functional test of the applicable valve:
- (a) Do this task: Aileron and Spoiler Hydraulic Shutoff Valves Inspection/Check (AMM 27-13-00/601).
- (b) Do this task: Rudder and Elevator Shutoff Valves Adjustment/Test (AMM 27-23-00/501).

EFFECTIVITY

- (3) Remove the 'VALVE INOP' placard from the applicable switch.

TASK 27-00-00-049-278

4. DDG 27-03-2 Preparation - FLT CONTROL SHUTOFF OFF Valve Lights Inoperative

A. General

- (1) This task contains the maintenance instructions to prepare the airplane for operation under DDG requirement 27-03-2, FLT CONTROL SHUTOFF OFF Valve Lights Inoperative.

B. References

- (1) AMM 24-22-00/201, Electrical Power - Control
- (2) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems

C. Access

- (1) Location Zone
  - 211 Control Cabin, LH
  - 212 Control Cabin, RH

D. Procedure

S 869-333

- (1) Make sure you can communicate between the flight compartment and ground or an observer. (You can also use EICAS control surface position).

S 869-036

- (2) Supply electrical power (AMM 24-22-00/201).

S 869-320

**WARNING:** MAKE SURE THAT PERSONS AND EQUIPMENT ARE CLEAR OF ALL CONTROL SURFACES BEFORE YOU SUPPLY HYDRAULIC POWER. AILERONS, RUDDERS, ELEVATORS, FLAPS, SPOILERS, LANDING GEAR, AND THRUST REVERSERS CAN MOVE QUICKLY WHEN YOU SUPPLY HYDRAULIC POWER. THIS CAN CAUSE INJURY TO PERSONS AND DAMAGE TO EQUIPMENT.

- (3) Pressurize the hydraulic system (AMM 29-11-00/201) that has the inoperative FLT CONTROL SHUTOFF OFF light.

S 869-213

- (4) Make sure the applicable FLT CONTROL SHUTOFF switches on the P61 Pilot's Overhead Maintenance Panel are ON.

EFFECTIVITY

ALL

Dec 10/98

- S 869-214
- (5) If the FLT CONTROL SHUTOFF OFF light inoperative is the L TAIL light, do these steps:
- (a) Move Control Column full aft, then full forward.
  - (b) Make sure that the elevators move up, then down.
- S 869-268
- (6) If the FLT CONTROL SHUTOFF OFF light inoperative is the L WING light, do these steps:
- (a) Move then hold the control wheel full left.
  - (b) Make sure that the left aileron moves up.
  - (c) Release the control wheel.
- S 869-237
- (7) If the FLT CONTROL SHUTOFF OFF light inoperative is the C TAIL light, do these steps:
- (a) Move the control column full aft, then full forward.
  - (b) Make sure that the elevators move up, then down.
- S 869-238
- (8) If the FLT CONTROL SHUTOFF OFF light inoperative is the C WING light, do these steps:
- (a) Move then hold the control wheel full left.
  - (b) Make sure that the left inboard aileron move up and the right inboard aileron move down.
  - (c) Release the control wheel.
- S 869-215
- (9) If the FLT CONTROL SHUTOFF OFF light inoperative is the R TAIL light, do these steps:
- (a) Move the control column full aft, then full forward.
  - (b) Make sure that the elevators move up, then down.
- S 869-216
- (10) If the FLT CONTROL SHUTOFF OFF light inoperative is the R WING light, do these steps:
- (a) Move and hold control wheel full right.
  - (b) Make sure that the right ailerons move up and the left outboard aileron move down.
- S 869-217
- (11) Remove hydraulic pressure from the applicable system (AMM 29-11-00/201).

TASK 27-00-00-449-039

5. DDG 27-03-2 Restoration - FLT CONTROL SHUTOFF OFF Valve Lights Inoperative

A. General

- (1) This task contains the instructions to put the airplane back to its usual condition after operation under DDG 27-03-2, FLT CONTROL SHUTOFF OFF Valve Lights Inoperative.

B. References

- (1) AMM 27-13-00/601, Aileron and Spoiler Hydraulic Shutoff Valves  
(2) AMM 27-23-00/501, Rudder and Elevator Shutoff Valves

C. Access

- (1) Location Zone  
211 Control Cabin, LH  
212 Control Cabin, RH

D. Procedure

S 969-040

- (1) Replace the applicable indicator switch light.

S 729-041

- (2) Do a test of the applicable indicator light:  
(a) Do this task: Aileron and Spoiler Shutoff Valve - Check (AMM 27-13-00/601).  
(b) Do this task: Rudder and Elevator Shutoff Valve Functional Test (AMM 27-23-00/501).

TASK 27-00-00-049-226

6. DDG 27-08-1 Preparation - Control Surface Position Indicating System Inoperative

A. General

- (1) This task contains the maintenance instructions to prepare the airplane for operation under DDG requirement 27-08-1, Control Surface Position Indicating System Inoperative.

EFFECTIVITY

ALL

27-00-00

C. Access

- (1) Location Zone
  - 211 Control Cabin, LH
  - 212 Control Cabin, RH

D. Procedure

S 429-290

- (1) Put a placard near EICAS screen to indicate which indication is inoperative.

S 869-219

- (2) Supply electrical power (AMM 24-22-00/201).

S 869-220

**WARNING:** MAKE SURE THAT PERSONS AND EQUIPMENT ARE CLEAR OF ALL CONTROL SURFACES BEFORE YOU SUPPLY HYDRAULIC POWER. AILERONS, RUDDERS, ELEVATORS, FLAPS, SPOILERS, LANDING GEAR, AND THRUST REVERSERS CAN MOVE QUICKLY WHEN YOU SUPPLY HYDRAULIC POWER. THIS CAN CAUSE INJURY TO PERSONS AND DAMAGE TO EQUIPMENT.

- (3) Pressurize the left, center, and right hydraulic systems (AMM 29-11-00/201).

S 729-222

- (4) Do these steps to make sure that the spoilers and ailerons are operational:
  - (a) Move then hold the control wheel full left.
    - 1) Make sure that all the left and right wing spoilers extend.

**NOTE:** The two inboard spoilers will extend approximately 20 degree. The four outboard spoilers will extend approximately 45 degrees.

- 2) Make sure the left ailerons move up and the right ailerons move down.

**NOTE:** The inboard aileron will deflect approximately 21 degrees up or down. The outboard ailerons will deflect approximately 30 degrees up and 15 degrees down.

- 3) Release the control wheel.

EFFECTIVITY

ALL

27-00-00

01

Page 907  
Dec 10/98

- (b) Move then hold the control wheel full right.  
1) Make sure that all the left and right wing spoilers extend.

NOTE: The two inboard spoilers will extend approximately 20 degree. The four outboard spoilers will extend approximately 45 degrees.

- 2) Make sure the right ailerons move up and the left ailerons move down.

NOTE: The inboard aileron will deflect approximately 21 degrees up or down. The outboard ailerons will deflect approximately 30 degrees up and 15 degrees down.

- 3) Release the control wheel.

S 729-288

- (5) Do these steps to make sure that the elevators are operational:  
(a) Move Control Column full aft, then full forward.  
(b) Make sure that the elevators move up, then down.

NOTE: The elevator will deflect approximately 28 degree up and 20 degree down.

S 719-334

- (6) Do these steps to make sure that the rudder is operational:  
(a) Push on the rudder pedal full left then full right.  
(b) Make sure that the rudder moves left then right.

NOTE: The rudder will deflect approximately 26 degrees left or right.

S 869-223

- (7) Remove Pressure from the left, center, and right hydraulic systems (AMM 29-11-00/201).

S 869-224

- (8) If electrical power is not necessary, remove electrical power (AMM 24-22-00/201).

TASK 27-00-00-449-225

7. DDG 27-08-1 Restoration - Control Surface Position Indicating System Inoperative

- (4) FIM 27-32-00/101, Stall Warning System

C. Access

- (1) Location Zone
  - 119, 120 Main Equipment Center
  - 211, 212 Control Cabin

D. Procedure

S 429-295

- (1) Put an 'INOP' placard on the stall warning test switch on the P5 panel.

S 869-200

- (2) Supply electrical power (AMM 24-22-00/201).

S 749-201

- (3) AIRPLANES WITH THE ADVANCED STALL WARNING COMPUTERS, (P/N 285T1104-XX);  
Do these steps:
  - (a) Look at the Warning Electronics Unit (WEU) bite module on the P51 panel for a fault indication.

EFFECTIVITY

ALL

27-00-00

01

Page 919  
Dec 10/98

- (b) If a fault code is shown, do the applicable maintenance (FIM 27-32-00/101).
- (c) If board faults or unsatisfactory interactions between computers do not show, the airframe configuration code and option code will be shown.
- (d) If the problem continues and no fault codes show, do the test that follows.

E. Stall Warning Test

S 219-189

- (1) Make sure the trailing edge flaps and leading edge slats are fully retracted and the flap lever is in the zero (flaps up) detent.

S 869-191

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (2) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 869-192

- (3) Move the flap control lever to the 25-unit detent, and make sure the flaps and slats extend.

S 219-193

- (4) Make sure the left and right angle-of-attack vanes are parallel to the ground.

S 869-194

- (5) Pressurize the upper left and upper right pitot-static probes to 150 knots (0.55 psig regulated air pressure) (AMM 34-11-00/201).

S 719-195

- (6) Do these steps to make sure the left stall warning system operates correctly:
  - (a) Open this circuit breaker on the main power distribution panel, P6, and attach a DO-NOT-CLOSE tag:
    - 1) PROBE HEAT AOA L
  - (b) Open this circuit breaker on the overhead panel, P11, and attach a DO-NOT-CLOSE tag:
    - 1) AIR/GND SYS 1
  - (c) Make sure the left AOA vane is sufficiently cool to touch.
    - 1) If not, stop until the vane is cool.
  - (d) Turn the left AOA vane in the counterclockwise direction (the trailing edge of the vane will move up) approximately 20 degrees.
    - 1) Make sure the left stick shaker shakes the control columns.

EFFECTIVITY

ALL

Page 920  
Dec 10/98

- (e) Turn the left AOA vane to the initial position, and make sure the left stick shaker stops the movement.
- (f) Remove the DO-NOT-CLOSE tags and close this circuit breaker on the P6 panel:
  - 1) PROBE HEAT AOA L
- (g) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
  - 1) AIR/GND SYS 1

S 719-196

- (7) Do these steps to make sure the right stall warning system operates correctly:
  - (a) Open this circuit breaker, on the P6 panel, and attach a DO-NOT-CLOSE tag:
    - 1) PROBE HEAT AOA R
  - (b) Open these circuit breakers, on the P11 panel, and attach DO-NOT-CLOSE tags:
    - 1) AIR/GND SYS 2
    - 2) LANDING GEAR POSITION AIR/GND SYS 2 ALTN
  - (c) Make sure the right AOA vane is sufficiently cool to touch.
    - 1) If not, stop until the vane is cool.
  - (d) Turn the right AOA vane in the clockwise direction (the trailing edge of the vane will move up) approximately 20 degrees and do this check:
    - 1) Make sure the right stick shaker shakes the control columns.
  - (e) Turn the right AOA vane to its initial position, and make sure the right stick shaker stops the movement.
  - (f) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P6 panel:
  - (g) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:
    - 1) AIR/GND SYS 2
    - 2) LANDING GEAR POSITION AIR/GND SYS 2 ALTN

S 869-197

- (8) Move the flap control lever to the UP detent and make sure the flaps and slats retract.

S 719-198

- (9) Do these steps to make sure the stick nudger system operates correctly:
  - (a) Open these circuit breakers, on the P6 panel, and attach DO-NOT-CLOSE tags:
    - 1) PROBE HEAT AOA R
    - 2) PROBE HEAT AOA L
  - (b) Open these circuit breakers, on the P11 panel, and attach DO-NOT-CLOSE tags:
    - 1) AIR/GND SYS 1
    - 2) AIR/GND SYS 2
    - 3) LANDING GEAR POSITION AIR/GND SYS 2 ALTN

Dec 10/98

- (c) Make sure the left and right AOA vanes are sufficiently cool to touch.
  - 1) If not, stop until the vane is cool.
- (d) Turn the left AOA vane in the counterclockwise direction and the right AOA vane in the clockwise direction (the trailing edges of the two vanes will move up) approximately 20 degrees, and do these checks:
  - 1) Make sure the control columns move forward and stay in the forward position
  - 2) Make sure the two stick shakers operate.
- (e) Turn the left (or right) AOA vane to its initial position and do these checks:
  - 1) Make sure the two control columns move back to the initial center position
  - 2) Make sure the left (or right) stick shaker stops.
  - 3) Make sure the right (or left) stick shaker continues to shake the two columns.
- (f) Turn the other AOA vane to its initial position and make sure the stick shaker movement stops.
- (g) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P6 panel:
  - 1) PROBE HEAT AOA R
  - 2) PROBE HEAT AOA L
- (h) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:
  - 1) AIR/GND SYS 1
  - 2) AIR/GND SYS 2
  - 3) LANDING GEAR POSITION AIR/GND SYS 2 ALTN

S 869-199

- (10) Put the airplane back to its usual condition.

TASK 27-00-00-449-082

15. DDG 27-32-1 Restoration - Stall Warning Test Systems Inoperative

A. General

- (1) This task contains the instructions necessary to put the airplane back to its usual condition after operation under DDG 27-32-1, Stall Warning Test Systems Inoperative.

B. References

- (1) AMM 27-32-01/401, Stall Warning Module
- (2) FIM 27-32-00/101, Stall Warning System

C. Access

- (1) Location Zone
  - 119, 120 Main Equipment Center
  - 211, 212 Control Cabin

D. Procedure

S 029-083

- (1) Remove the placard 'INOP' from the stall warning test switch on the P5 panel.

EFFECTIVITY

ALL

27-00-00

- (2) Replace the applicable stall warning module (AMM 27-32-01/401).

TASK 27-00-00-049-296

16. DDG 27-41-2 Preparation - Horizontal Stabilizer Primary Trim Channels Inoperative

A. General

- (1) This task contains the maintenance instructions to prepare the airplane for operation under DDG requirement 27-41-2, Horizontal Stabilizer Primary Trim Channels Inoperative.

B. References

- (1) AMM 24-22-00/201, Electrical Power - Control
- (2) AMM 29-11-00/201, Main (Left, Right and Center) Hydraulic Systems

C. Access

- (1) Location Zones
  - 211 Control Cabin, LH
  - 212 Control Cabin, RH

D. Procedure

S 869-297

- (1) Supply electrical power (AMM 24-22-00/201).

S 869-301

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (2) Pressurize the left and center hydraulic systems (AMM 29-11-00/201).

S 869-299

- (3) Make sure that these circuit breakers are closed:
  - (a) On the Overhead Circuit Breaker panel, P11:
    - 1) 11C12, STAB TRIM SHUTOFF L

EFFECTIVITY

ALL

S 729-300

- (4) Do these steps to determine if the L autopilot channel is inoperative.
- (a) Put the L STAB TRIM shutoff valve switch on the control stand in NORM.
  - (b) Put the C STAB TRIM shutoff valve switch on the control stand in CUTOUT.
  - (c) Move either the captain's or first officer's stabilizer trim control switches on the control wheel to APL NOSE UP position.
    - 1) Make sure the stabilizer leading edge moves down.
    - 2) If the stabilizer leading edge does not move down, the left stabilizer trim control module (M211) is inoperative, put the placard "INOP" on the L autopilot channel.
  - (d) Move either the captain's or first officer's stabilizer trim control switches on the control wheel to APL NOSE DN position.
    - 1) Make sure the stabilizer leading edge moves up.
    - 2) If the stabilizer leading edge does not move up, the left stabilizer trim control module (M211) is inoperative, put the placard "INOP" on the L autopilot channel.

S 729-302

- (5) ON AIRPLANES WITH STAB TRIM LEVERS;  
Do these steps to make sure that the horizontal stabilizer trim operates normally using STAB TRIM levers.
- (a) Move both stabilizer manual trim levers on control stand to full forward to APL NOSE DN.
    - 1) Make sure the the stabilizer leading edge moves up.
  - (b) Move both stabilizer manual trim levers on control stand to full aft to APL NOSE UP.
    - 1) Make sure the the stabilizer leading edge moves down.

S 729-303

- (6) ON AIRPLANES WITH ALTN STAB TRIM SWITCHES;  
Do these steps to make sure that the horizontal stabilizer trim operates normally using ALTN STAB TRIM switches.
- (a) Push the ALTN STAB TRIM switch forward to APL NOSE DN.
    - 1) Make sure the the stabilizer leading edge moves up.
  - (b) Push the ALTN STAB TRIM switch aft to APL NOSE UP.
    - 1) Make sure the the stabilizer leading edge moves down.
  - (c) Push the ALTN STAB TRIM switch to neutral position.

S 729-304

- (7) Do these steps to determine if the R autopilot channel is inoperative.
- (a) Put the L STAB TRIM shutoff valve switch on the control stand in CUTOUT.
  - (b) Put the C STAB TRIM shutoff valve switch on the control stand in NORM.

  - 1) Make sure the stabilizer leading edge moves down.
  - 2) If the stabilizer leading edge does not move down, the right stabilizer trim control module (M212) is inoperative, put the placard "INOP" on the R autopilot channel.
- (d) Move either the captain's or first officer's stabilizer trim control switches on the control wheel to APL NOSE DN position.
  - 1) Make sure the stabilizer leading edge moves up.
  - 2) If the stabilizer leading edge does not move up, the right stabilizer trim control module (M212) is inoperative, put the placard "INOP" on the R autopilot channel.

S 729-305

- (8) ON AIRPLANES WITH STAB TRIM LEVERS;  
Do these steps to make sure that the horizontal stabilizer trim operates normally using STAB TRIM levers.
  - (a) Move both stabilizer manual trim levers on control stand to full forward to APL NOSE DN.
    - 1) Make sure the the stabilizer leading edge moves up.
  - (b) Move both stabilizer manual trim levers on control stand to full aft to APL NOSE UP.
    - 1) Make sure the the stabilizer leading edge moves down.
  - (c) Move the levers to the neutral position.

S 729-306

- (9) ON AIRPLANES WITH ALTN STAB TRIM SWITCHES;  
Do these steps to make sure that the horizontal stabilizer trim operates normally using ALTN STAB TRIM switches.
  - (a) Push the ALTN STAB TRIM switch forward to APL NOSE DN.
    - 1) Make sure the the stabilizer leading edge moves up.
  - (b) Push the ALTN STAB TRIM switch aft to APL NOSE UP.
    - 1) Make sure the the stabilizer leading edge moves down.
  - (c) Push the ALTN STAB TRIM switch to neutral position.

S 869-321

- (10) Remove Pressure from the left, center, and right hydraulic systems (AMM 29-11-00/201).

S 869-322

- (11) If electrical power is not necessary, remove electrical power (AMM 24-22-00/201).

TASK 27-00-00-449-307

17. DDG 27-41-2 Restoration - Horizontal Stabilizer Primary Trim Channels

Inoperative

A. General

- (1) This task contains the instructions necessary to put the airplane back to its usual condition after operation under DDG 27-41-2, Horizontal Stabilizer Primary Trim Channels Inoperative.

B. References

- (1) AMM 27-41-05/401, Stabilizer Trim Control Module

C. Access

- (1) Location Zone  
311, 312 Area Aft of Pressure Bulkhead to BS 1725  
211, 212 Control Cabin

D. Procedure

S 429-310

- (1) If the placard 'INOP' was on the L autopilot channel, do these steps to remove and replace the left stabilizer trim control module (M211):  
(a) Remove the "INOP" placard.  
(b) Replace the left Stabilizer Trim Control Module (M211) (AMM 27-41-05/401).

S 429-309

- (2) If the placard 'INOP' was on the R autopilot channel, do these steps to remove and replace the right stabilizer trim control module (M212):  
(a) Remove the "INOP" placard.  
(b) Replace the right Stabilizer Trim Control Module (M212) (AMM 27-41-05/401).

TASK 27-00-00-049-121

18. DDG 27-51-1 Preparation - Automatic Flap Load Relief Retraction Inoperative

A. General

- (1) This task contains the instructions necessary to prepare the airplane for operation under DDG requirement 27-51-1, Automatic Flap Load Relief Retraction Inoperative.

- 7) ON AIRPLANES WITH ALTN STAB TRIM SWITCHES;  
11A36, STAB TRIM ALT

S 869-257

- (5) Move the stabilizer to between 4 and 14 units of trim.

S 869-258

- (6) Move the FLT CONTROL SHUTOFF L and C switches on P61 panel to ON.

S 869-259

- (7) Move the EICAS computer selector on the forward electronics panel to L.

S 729-352

- (8) Do these steps to make sure that the horizontal stabilizer trim and the EICAS message, STAB TRIM, operate normally:
  - (a) Move the C STAB TRIM shutoff valve switch on the control stand to NORM.
  - (b) Move the L STAB TRIM shutoff valve switch on the control stand to CUTOUT.
  - (c) Move either the captain's or first officer's stabilizer trim control switches on the control wheel to APL NOSE DN position.
    - 1) Make sure that the EICAS message, STAB TRIM, shows on the top EICAS display.
  - (d) Move the L STAB TRIM shutoff valve switch on the control stand to NORM.
  - (e) Move either the captain's or first officer's stabilizer trim control switches on the control wheel to APL NOSE DN position.
    - 1) Make sure that the EICAS message, STAB TRIM, does not show on the top EICAS display.

S 869-354

- (9) Move the EICAS computer selector on the forward electronics panel to AUTO.

S 869-357

- (10) Move the stabilizer to the neutral position.

S 869-355

- (11) Remove Pressure from the left and center hydraulic systems (AMM 29-11-00/201).

S 869-356

- (12) If electrical power is not necessary, remove electrical power (AMM 24-22-00/201).

TASK 27-00-00-449-283

23. DDG 27-63-1 Restoration - AUTO SPDBRK, SPOILERS, and STAB TRIM Lights

Inoperative

A. General

- (1) This task contains the instructions necessary to put the airplane back to its usual condition after operations under DDG 27-63-1, AUTO SPDBRK, SPOILERS, and STAB TRIM Lights Inoperative.

B. References

- (1) AMM 22-22-00/501, Automatic Stabilizer Trim System
- (2) AMM 27-61-00/501, Spoiler/Speedbrake Control System
- (3) AMM 27-62-00/501, Auto-Speedbrake Control System

C. Access

- (1) Location Zone  
221, 222 Control Cabin

D. Procedure

S 969-358

- (1) Replace the applicable, AUTO SPDBRK, SPOILER, or STAB TRIM light.

S 729-359

- (2) Do a test of the applicable AUTO SPDBRK, SPOILERS, or STAB TRIM light.
  - (a) Do this task: Operational Test - Spoiler/Speedbrake Control System (AMM 27-61-00/501).
  - (b) Do this task: "Master Dim and It's Interface with the Auto-Speedbrake Warning System - Test" in the Auto-Speedbrake - System Test (AMM 27-62-00/501).
  - (c) Do this task: "Test the STAB TRIM Fault Light Interface" in the System Test - Automatic Stabilizer Trim System (AMM 22-22-00/501).

S 029-360

- (3) Remove the applicable placard "AUTO SPDBRK LIGHT INOP", "SPOILERS LIGHT INOP", or "STAB TRIM LIGHT INOP" from the overhead panel, P5.

FLIGHT CONTROL CABLES – DESCRIPTION AND OPERATION

1. General

- A. The flight control cables transmit the pilots' control inputs to the related control surfaces. A typical control cable system ends at a drum or quadrant using swaged terminals. The cables are tensioned to the proper rigging load by turnbuckles. Long cable runs are supported by idler pulleys. Air seals are used to reduce pressure loss when cables are routed through pressure bulkheads.
- B. Control cable runs are identified by code letter descriptions and identify cable function (Ref Flight Control Cables – Maintenance Practices).

2. Component Details

A. Ailerons

- (1) Aileron control cables are routed from the control wheels to the left and right drum assemblies under the flight deck floor. The dual set of cables separate and run down each side of the fuselage under the main deck floor. The primary cables on the left side stop at the aileron feel, centering and trim assembly. The backup cables on the right side go through the override mechanism and stop at the right aileron control output quadrant.
- (2) The feel, centering, and trim mechanism controls the upper and lower left lateral central control actuators (LCCAs) thru mechanical linkages. The right LCCA is controlled through mechanical linkages and a set of cables from the feel, centering and trim mechanism. If the primary control path fails, the secondary control path drives a cable set between left and right LCCA output quads which operates left side controls. Cable sets in each wing operate the inboard and outboard aileron power control actuators (PCAs).

B. Rudder

- (1) Rudder control cables are routed from the forward quadrants under the flight deck floor, above the main deck ceiling, through the aft bulkhead air pressure seals, up into the vertical stabilizer, ending on the feel, centering and trim aft quadrant.

C. Elevators

- (1) Both control cable sets are able to operate the elevator controls. Override mechanisms at the control columns and aft quadrants allow control with failure in one control path.
- (2) The captains cable set runs from control column quadrant, down the fuselage left side, through aft bulkhead air pressure seals. The cables are routed over the stabilizer wing box to the left aft quadrant. The first officers cables run under the flight deck floor, up into the main deck ceiling. The cables are routed through aft bulkhead air pressure seals, over the stabilizer wing box to the right aft quadrant.

EFFECTIVITY

ALL

27-00-01

01

Page 1  
Dec 10/98

- (3) Input into one aft quadrant operates the elevator PCAs on that side. The opposite side elevator PCAs are operated through a cable backdrive in front of the stabilizer rear spar only under the conditions of a linkage disconnection.

D. Stabilizer Trim

- (1) AIRPLANES WITH STAB TRIM LEVERS ON THE CONTROL STAND;  
Stabilizer trim control cables start from control stand drums. One cable set transmits the control input to the stabilizer hydraulic valves, the other arms the valve. The cables run under the flight deck floor, up into the main deck ceiling. The cable sets separate, run down the left and right ceiling sides, then merge together. Passing through the aft bulkhead air pressure seals, the cables end at the stabilizer trim control module quadrants.
- (2) Three cables connect the stabilizer wing box to the stabilizer trim position transmitter/limit switches. The cables go up from the wing box top to pulleys mounted below the stabilizer trim control modules. The cables run down to the position transmitter/limit switches, then up to the stab wing box bottom.

E. Flaps/Slats

- (1) The flap/slats control cables are routed from the control stand drum below the flight deck floor to the right fuselage side. The cables run below the main deck floor to the lead edge slats aft quadrant. From the leading edge slats aft quadrant, the cables run to the flap aft quadrant.

FLIGHT CONTROL CABLES – MAINTENANCE PRACTICES

1. General

- A. This procedure supplies flight-control cable data for reference only.
- B. For specific airplane cable part number (cable material, cable size and length dimensions) and cable fitting, use the illustrated part catalog (AIPC). The figures that follow supply cable data for the flaps, slats, aileron, rudder, elevator, and horizontal stabilizer control systems. To remove or install a control cable, refer to AMM 20-10-03/401.

**NOTE:** You can mix zinc-only and tin-zinc coated cables but opposite cable segments in the same cable loop must be of the same type (For example, in Fig. 202, cables A1A-4 and A1B-4 must be replaced together with both new cables either zinc-only or tin-zinc.) This will prevent asymmetric cable stretch that can make cable rigging bad.

TASK 27-00-01-702-003

2. Refer to the Figures that Follow for the Cable Data

A. General

- (1) Aileron Control Cables (Fig. 202)
- (2) Rudder Control Cables (Fig. 203)
- (3) Elevator Control Cables (Fig. 204)
- (4) Horizontal Stabilizer Trim Control Cables (Fig. 205)
- (5) Stabilizer Trim Limit Switch and Position Transmitter Module Cables (Fig. 206)
- (6) Flap/Slat Control Cables (Fig. 207)
- (7) Air Pressure Seals (Fig. 208)

FLIGHT CONTROLS LATERAL TRIM CORRECTION – ADJUSTMENT/TEST

1. General

- A. There is no aileron and rudder trim limits for in-service airplanes. This procedure is provided as a guide to check for excessive trims. If there is excessive trim, this procedure provides steps to troubleshoot and decrease the amount of trim needed to maintain a straight and level flight.

**NOTE:** Most operators report less than 1 unit of rudder trim during flight, however some airplanes require up to 2 units of rudder trim.

The rudder and lateral trim is economic issue, not airworthiness issue. You are not required to reduce the trim, but by reducing the trim you will save fuel.

For example, each unit of rudder trim needed during flight will cause fuel to burn approximately 0.3% more.

- B. This procedure changes the number of shims at the forward attach points on the outboard flaps. The installation of more shims will move the trailing edge of the flap down. The removal of shims will move the trailing edge of the flap up.
- C. Make sure the control system components are correctly adjusted when you measure the trim necessary.

TASK 27-01-00-825-001

2. Trailing Edge Flap Adjustment

A. Equipment

- (1) TE Flap PDU Lock – A27009-7
- (2) TE Flap Sling – A27027-53
- (3) Shackles, 3/8 inch.

B. Consumable Materials

- (1) A00247 Sealant BMS 5-95

E. Make Sure the Lateral Trim Error Is Not Caused By Another System

S 225-002

- (1) Make sure these systems are correctly adjusted:
  - (a) Make sure the aileron adjustment is correct (Ref 27-11-00/501).
  - (b) Make sure the spoilers are adjusted correctly (Ref 27-61-00/501).
  - (c) Make sure the inboard and the outboard trailing edge flaps are adjusted correctly (Ref 27-51-00/501).
  - (d) Make sure that all vortex generators on the outboard trailing edge flaps are intact.
  - (e) Inspect the leading edge of the outboard trailing edge flap for any irregularities such as excessive dirt accumulation, chipped or ridged paint, or surface erosion. If any defects are found, restore a smooth aerodynamic surface.

F. Find the Necessary Shim Dimensions

S 755-003

- (1) Do a test flight with these conditions to find the aileron trim and rudder trim input required to maintain a straight and level flight:
  - (a) Flight Speed: Approximately 0.80 mach.
  - (b) Altitude: Approximately 35,000 feet.
  - (c) Fuel Load: Symmetric.
  - (d) Hold wings level with the control wheel.
  - (e) If necessary, apply the aileron trim to maintain wings level.
  - (f) If necessary, apply rudder trim to maintain straight heading.

EFFECTIVITY

ALL

27-01-00

02

Page 502  
Dec 22/06

S 975-040

- (2) Write the rudder trim necessary during the test flight.

S 815-041

- (3) If the amount of rudder trim required is "excessive", you can do the following steps to find and fix the problems:

NOTES: (1) There is no trim limit for in-service airplanes. You have to decide what is "excessive". The following steps are provided as a guide to find the reasons and reduce the rudder trim required if you choose to do so.

(2) Aileron trim at Flaps 25 and Flaps 30 is typically less than 1 unit, but some airplanes may require more than 1 unit. Lateral trim at Flaps 25 and Flaps 30 can be affected by adjustment of the inboard flaps upper bulb seal. Refer to AMM 27-51-03/401.

- (a) Check the yaw damper shearout rivets (AMM 27-21-18 figure 401). If sheared, replace the rivets (SRM 51-40-02/001).
- (b) Check the yaw damper offset torque tube bearings for binding (AMM 27-21-18 figure 401).
- (c) Check the rudder control cables for the correct tension (AMM 27-21-00/501).
- (d) Check the leading edge INBD slat fit and fair (AMM 27-81-01/401).
- (e) Check the leading edge OUTBD slat fit and fair (AMM 27-81-02/501).
- (f) Check the trailing edge INBD flap fit and fair (AMM 27-51-03/401).
- (g) Check the trailing edge OUTBD flap fit and fair (AMM 27-51-20/401).
- (h) Check the aileron inboard droop (AMM 27-11-00/501).
- (i) Check that the elevator system is properly adjusted (AMM 27-31-00/501).
- (j) Check that all flight control surface seals are in good condition.

S 975-004

- (4) Write the aileron trim necessary during the test flight (Fig. 501).

S 975-005

- (5) Use the chart to calculate the total shim thickness necessary to correct the lateral trim error.

S 975-006

- (6) Find the thickness and the location of the shims that you will change:

**NOTE:** The thickness of shims installed on one wing added to the thickness of shims removed from the other wing must be equal to the total shim thickness.

- (a) Flight test condition; Left wing heavy:
- 1) Add approximately 1/2 of the total thickness to the left outboard flap (the maximum installed thickness is 0.5 inch).
  - 2) Remove approximately 1/2 of the total thickness from the right outboard flap.
- (b) Flight test condition; Right wing heavy:
- 1) Add approximately 1/2 of the total thickness to the right outboard flap (the maximum installed thickness is 0.5 inch).
  - 2) Remove approximately 1/2 of the total thickness from the left outboard flap.

G. Prepare to Change the Thickness of the Shims on the Flap

S 865-007

- (1) Supply electrical power (Ref 24-22-00/201).

S 865-008

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. THE AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (2) Supply power to the center hydraulic system (Ref 29-11-00/201).

S 865-009

- (3) Move the flap control lever to the 30-unit position to extend the flaps.

S 865-010

- (4) Remove power from the center hydraulic system (Ref 29-11-00/201).

- (5) Do the deactivation procedure for the TE Flaps (Ref 27-51-00/201).  
H. Change the Thickness of the Shims on the Outboard Flap

S 015-012

- (1) Remove the access panels from the top surface of one outboard flap (Fig. 502) (Ref 06-44-00/201).

S 015-013

- (2) Extend the outboard spoilers No. 1 thru 4 (left wing) or 9 thru 12 (right wing) and install the locks on the spoiler actuators (Ref 27-61-00/201).

S 495-014

- (3) Attach the flap sling to the three attach points on the top surface of the flap (Fig. 503).  
(a) Adjust the center strap of the sling to get the flap attitude in the 30-unit position.  
(b) Add 3/8-inch diameter shackles to the forward inboard cable on the flap sling if it is necessary to get the correct flap dihedral.

S 495-015

- (4) Attach an overhead hoist to the sling and lift the sling to hold the weight of the flap.

**NOTE:** Make sure the hoist can hold the weight of the flap. The flap weighs approximately 422 pounds (191 Kg).

S 035-016

- (5) Remove the two bolts, washers and nuts from the forward fitting of the inboard support beam (Fig. 504).

**NOTE:** Keep a record of the length and location of the bolts for the installation.

FLIGHT CONTROL SURFACES – INSPECTION/CHECK

1. General

- A. This procedure contains tasks that examine the rudder, elevators, and ailerons for too much freeplay. Freeplay is the unwanted movement of a control surface when it is held in position by a fully powered power control actuator (PCA). Freeplay is measured at the trailing edge of the control surface and is caused by wear in the PCA linkages, hinge bearings, and hinge bolts.
- B. Some freeplay in the PCA linkages is permitted, but the wear must be divided equally between the linkage components. If one component is worn more than the other components in the system, it must be repaired.

TASK 27-02-00-736-001

2. Elevator Freeplay – Check

A. Equipment

- (1) Dial Indicator – Accurate to 0.001 inch (0.03 mm) with a minimum range of 1 inch (25 mm).

NOTE: An analog-type dial indicator is recommended.

- (2) Mounting device to hold the dial indicator tightly against the fuselage.

NOTE: A magnetic dial indicator base, and a piece of thin steel plate approximately 3 inches by 3 inches (80 mm by 80 mm) is recommended.

- (3) Dial Indicator – Accurate to 0.001 inch (0.03 mm) with a 0.10 inch (2.5 mm) range.

NOTE: An analog-type dial indicator is recommended.

EFFECTIVITY

ALL

27-02-00

Page 601  
Dec 22/07

- (4) Device to tightly attach the dial indicator to the piston rod of the elevator PCA (Figure 601).

**NOTE:** The mounting device should not damage the finish of the piston rod.

- (5) Spring Force Scale, Push-Type – or transducer with the following specifications:
- (a) Specifications for the device to apply the force to the bottom surface of the elevator.

Range: 0–210 pounds (0–934 newtons), or more

Accuracy: 5% of maximum range, or less

Resolution: 1 pound (4 newtons), or less

- (b) Specifications for the device to apply the force to the top surface of the elevator.

Range: 0–50 pound (0–222 newton), or more

Accuracy: 5% of maximum range, or less

Resolution – 1 pound (4 newtons), or less

**NOTE:** A spring force scale is recommended to measure the force on the top of the elevator. A force transducer and reader is recommended to measure the force on the bottom of the elevator.

- (c) Rig pin E1 or E2 (AMM 20–10–24/201)

**B. References**

D. Prepare for the Inspection

S 016-204

- (1) Open access panels 335EB, 345EB, 335GB, 345GB, 335HB, 345HB, 335AFB, and 345AFB to get access to the elevator PCAs.

S 016-205

- (2) AIRPLANES WITH A THREE-PIECE ELEVATOR SEAL;  
Open access panels 335AGB, 345AGB, 335AHB, and 345 AHB to get access to the elevator PCAs.

S 016-206

- (3) If necessary, the trailing edge beams can be removed to access the elevator PCAs. Open these access panels to access the trailing edge beams: 335ANZ, 345ANZ, 335APZ, 345APZ, 335AQZ, 345AQZ.

S 866-145

- (4) Supply electrical power (AMM 24-22-00/201).

S 866-091

**WARNING:** THE AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. MAKE SURE THAT ALL PERSONS AND EQUIPMENT ARE AWAY FROM THE CONTROL SURFACES BEFORE YOU SUPPLY HYDRAULIC POWER. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR.

- (5) Supply power to the left, center, and right hydraulic systems (AMM 29-11-00/201).

S 866-092

- (6) Use the control wheel switches to move the horizontal stabilizer to approximately 2 units of trim.

S 866-190

- (7) Operate the control column to move the elevators fully up, then fully down. Do this approximately 30 times.

**NOTE:** This step will bleed the air from each hydraulic system for the elevator PCAs. Move the elevators slowly and continuously.

S 866-191

- (8) Move the control column to the neutral position.

S 866-093

- (9) Move the LEFT STAB TRIM SHUTOFF and the CENTER STAB TRIM SHUTOFF switches on the control stand panel, P10, to their CUTOUT positions.

EFFECTIVITY

ALL

27-02-00

02

Page 605  
Dec 22/07

S 866-094

- (10) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
- (a) 11C12, STAB TRIM SHUTOFF LEFT
  - (b) 11C13, STAB TRIM SHUTOFF CENTER

S 866-066

- (11) Remove the power from the left, center, and right hydraulic systems (AMM 29-11-00/201).

S 866-067

- (12) Move the FLT CONTROL SHUTOFF TAIL L, R, and C switches on the right side panel, P61, to OFF. Attach DO-NOT-OPERATE tags and make sure the switch position lights come on.

S 866-068

- (13) Open these circuit breakers on the P11 panel and attach DO-NOT-CLOSE tags:
- (a) 11H17, FLT CONT SHUTOFF TAIL LEFT
  - (b) 11H18, FLT CONT SHUTOFF TAIL CTR
  - (c) 11H27, FLT CONT SHUTOFF TAIL RIGHT

E. Elevator Freeplay - Inspection (Fig. 601)

S 866-146

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (1) Do the applicable group of steps to supply hydraulic power to one of the three PCAs for each elevator. Do only the steps for the PCA that you want to supply power to:

**NOTE:** Measure the freeplay for each of the three PCAs that move the elevator. During the freeplay measurement, make sure only the corresponding hydraulic system (for the elevator PCA that is being measured) has power.

**NOTE:** Each of the two elevators has an inboard and an outboard elevator section. The two elevator sections are permanently connected and act as one flight control surface. Taking freeplay measurements on the inner elevator measures freeplay for the outboard elevator.

- (a) Do these steps to supply hydraulic power to the middle PCAs:
- 1) Supply pressure to the right hydraulic system only (AMM 29-11-00/201).

EFFECTIVITY

ALL

27-02-00

02

Page 606  
Dec 22/07

- 2) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
  - a) 11H27, FLT CONT SHUTOFF TAIL RIGHT
- 3) Remove the DO-NOT-OPERATE tag and move the FLT CONTROL SHUTOFF TAIL R switch on the P61 panel to ON.
- (b) Do these steps to supply hydraulic power to the outboard PCAs:
  - 1) Supply pressure to the left hydraulic system only (AMM 29-11-00/201).
  - 2) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
    - a) 11H17, FLT CONT SHUTOFF TAIL LEFT
  - 3) Remove the DO-NOT-OPERATE tag and move the FLT CONTROL SHUTOFF TAIL L switch on the P61 panel to ON.
- (c) Do these steps to supply hydraulic power to the inboard PCAs:
  - 1) Supply pressure to the center hydraulic system only (AMM 29-11-00/201).
  - 2) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
    - a) 11H18, FLT CONT SHUTOFF TAIL CTR
  - 3) Remove the DO-NOT-OPERATE tag and move the FLT CONT SHUTOFF TAIL C switch on the P61 panel to ON.

S 866-070

- (2) Do these steps to put the control column in its neutral position:
  - (a) Operate the control column to move the elevators fully up.
  - (b) Keep the elevators fully up for 10 seconds.
  - (c) Operate the control column to move the elevators fully down.
  - (d) Keep the elevators fully down for 10 seconds.
  - (e) Move the control column to its neutral position.
  - (f) Attach DO-NOT-OPERATE tags to the control columns.
  - (g) Install rig pin E1 in the torque tube for the Captain's control column.
  - (h) Install rig pin E2 in the torque tube for the First Officer's control column.

S 486-207

- (3) Do these steps to attach a dial indicator to measure the movement of the elevator:
  - (a) Attach a steel mounting plate for the dial indicator against the side of the fuselage above the surface of the elevator trailing edge.
  - (b) Attach the magnetic base to the steel mounting plate.

EFFECTIVITY

ALL

27-02-00

02

Page 607  
Dec 22/07

- (c) Put the dial indicator plunger against the upper surface of the elevator 1.00 +/- 0.25 inch (25.4 +/- 6.4 mm) forward of the elevator trailing edge, and 2.00 +/- 0.25 inch (50.8 +/- 6.4 mm) outboard from the inboard edge of the elevator (Figure 601)

NOTE: At this location, use a dial indicator that has a minimum 1 inch range.

- 1) Make sure the plunger of the dial indicator is aligned to measure the vertical movement of the trailing edge of the elevator.
- 2) Load the plunger so that its depressed no more than 0.2 inches (5 mm).

S 486-208

CAUTION: MAKE SURE THAT THE MOUNTING DEVICE FOR THE DIAL INDICATOR DOES NOT CAUSE DAMAGE TO THE FINISH OF THE PISTON ROD.

- (4) Do these steps to attach a dial indicator to the piston rod of the elevator PCA that has hydraulic power.

CAUTION: USE A DIAL INDICATOR WITH AT LEAST 0.10 INCH (2.5 MM) OF TRAVEL TO PREVENT DAMAGE TO THE INDICATOR.

- (a) Attach a mounting device for a dial indicator to the piston rod (Figure 601).
- (b) Attach a dial indicator to the mounting device.
- (c) Do these steps to align the dial indicator to measure the movement of the piston rod:
  - 1) Put the plunger of the dial indicator against a flat area on the gland or on the manifold of the PCA.
  - 2) Make sure the dial indicator is aligned parallel to the piston rod.
  - 3) Make sure the dial indicator is set to approximately the middle of its travel.
  - 4) Make sure the dial indicator and the mounting device have a clearance of at least 0.10 inch (2.5 mm) to the adjacent structure.

EFFECTIVITY

ALL

27-02-00

02

Page 608  
Dec 22/07

S 226-071

**CAUTION:** USE SUFFICIENT PADDING ON THE FORCE SCALE TO PREVENT DAMAGE TO THE ELEVATOR SURFACE. USE A PAD THAT IS AT LEAST 5 INCHES (130 mm) LONG AND HAS A WIDTH OF AT LEAST 5 INCHES (130 mm).

- (5) Apply a force of approximately 40 pounds (178 newtons) to the top surface of the elevator, down and perpendicular to the ground.  
Apply the force at the appropriate location:
- (a) If the elevator inboard PCA has hydraulic power, apply the force on the rib aft of the inboard PCA, 16.1 +/- 0.5 inches (409 +/- 12 mm) forward of the elevator trailing edge (Figure 601). Use the longitudinal row of fasteners on the elevator skin to identify the location of the rib.
  - (b) If the elevator middle PCA has hydraulic power, apply the force on the rib aft of the middle PCA, 12.6 +/- 0.5 inches (320 +/- 12 mm) forward of the elevator trailing edge (Figure 601). Use the longitudinal row of fasteners on the elevator skin to identify the location of the rib.
  - (c) If the elevator outboard PCA has hydraulic power, apply the force on the rib aft of the outboard PCA, 9.0 +/- 0.5 inches (229 +/- 12 mm) forward of the elevator trailing edge (Figure 601). Use the longitudinal row of fasteners on the elevator skin to identify the location of the rib.

S 226-161

- (6) Keep this force constant for approximately 20 seconds.

**NOTE:** The function of this step is to make sure that the elevator surface moves freely through the hydraulic resistances of the two PCAs that are not hydraulically powered.

S 866-097

- (7) Remove the force from the top of the elevator.

EFFECTIVITY

ALL

27-02-00

02

Page 609  
Dec 22/07

S 226-087

**CAUTION:** USE SUFFICIENT PADDING ON THE FORCE SCALE TO PREVENT DAMAGE TO THE ELEVATOR SURFACE. USE A PAD THAT IS AT LEAST 5 INCHES LONG (130 mm) AND HAS A WIDTH OF AT LEAST 5 INCHES (130 mm).

- (8) Apply a force of 100 +/- 6 pounds (445 +/- 27 newtons) to the bottom surface of the elevator, up and perpendicular to the ground. Do not allow the force to increase to more than 106 pounds (472 newtons). If this occurs, you must release the force, and start the procedure again at the 40 pound (178 newton) force application. Apply the force at the appropriate location:
- (a) If the elevator inboard PCA has hydraulic power, apply the force on the rib aft of the inboard PCA, 16.1 +/- 0.5 inches (409 +/- 12 mm) forward of the elevator trailing edge (Figure 601). Use the longitudinal row of fasteners on the elevator skin to identify the location of the rib.
  - (b) If the elevator middle PCA has hydraulic power, apply the force on the rib aft of the middle PCA, 12.6 +/- 0.5 inches (320 +/- 12 mm) forward of the elevator trailing edge (Figure 601). Use the longitudinal row of fasteners on the elevator skin to identify the location of the rib.
  - (c) If the elevator outboard PCA has hydraulic power, apply the force on the rib aft of the outboard PCA, 9.0 +/- 0.5 inches (229 +/- 12 mm) forward of the elevator trailing edge (Figure 601). Use the longitudinal row of fasteners on the elevator skin to identify the location of the rib.

S 226-192

- (9) Keep the force constant at 100 +/- 6 pounds (445 +/- 27 Newtons) while you do these steps.
- (a) Monitor the value shown on the dial indicator at the elevator trailing edge until it becomes stable.

**NOTE:** Vibrations can cause the dial indicator to show small continual movements. You can continue if the indication average is stable.

- (b) Read the value on the dial indicator at the elevator trailing edge. Record this value as the index point for the elevator.

**NOTE:** You can adjust the dial indicator to zero. If you do this, record the index point as zero.

EFFECTIVITY

ALL

27-02-00

02

Page 610  
Dec 22/07

- (c) Read the value on the dial indicator at the piston rod. Record this value as the index point for the piston rod.

NOTE: You can adjust the dial indicator to zero. If you do this, record the index point as zero.

S 226-193

- (10) Increase the force to 200 +/- 6 pounds (890 +/- 27 newtons). Do not allow the force to increase to more than 206 pounds (917 newtons). If this occurs, you must release the force, and start the procedure again at the 40 pound (178 newton) force application.

S 266-194

- (11) Keep the force constant at 200 +/- 6 pounds (890 +/- 27 newtons) while you do these steps:
  - (a) Monitor the value shown on the dial indicator at the elevator trailing edge until it becomes stable.

NOTE: Vibrations can cause the dial indicator to show small continual movements. You can continue if the indication average is stable.

- (b) Read the value shown on the dial indicator at the elevator trailing edge. Record the distance that the elevator moved up from the recorded index point.

NOTE: This is the distance that you will compare to the applicable freeplay limit.

- (c) Read the value on the dial indicator at the piston rod. Record the distance that the piston rod moved from the recorded index point.

NOTE: This is the value that you will use to find the applicable freeplay limit.

S 226-195

- (12) Remove the force from the elevator.

Page 611  
Dec 22/07

S 226-196

- (13) Using Table 601, find the applicable minimum elevator movement value for the calculated piston rod movement (from the index point).

NOTE: For example, if the piston rod movement was 0.012 inches, the minimum elevator movement is 0.258 inches.

- (a) Make sure that the calculated elevator movement (from the index point) is more than, or equal to, the minimum elevator movement. If the calculated elevator movement is less than the minimum elevator movement, the measurement is not correct.

NOTE: The measurement may be incorrect due to incorrectly installed equipment, or incorrectly followed instructions.

S 226-197

- (14) Using Table 601, find the applicable elevator freeplay limit for the calculated piston rod movement (from the index point).

NOTE: For example, if the piston rod movement was 0.012 inches, the elevator freeplay limit is 0.416 inches.

- (a) Make sure that the calculated elevator movement (from the index point) is less than, or equal to, the elevator freeplay limit. If the calculated elevator movement is more than the elevator freeplay limit, then you must make repairs to the load path connections related to the elevator PCA.

NOTE: Possible causes of excessive freeplay include: worn or loose hanger link, reaction link, PCA rod end, or trunnion connections.

- (b) If you make repairs, you must repeat the freeplay check for the applicable PCA.

S 086-198

**CAUTION:** MAKE SURE THAT YOU REMOVE THE EQUIPMENT YOU ATTACHED TO THE ELEVATOR PCA BEFORE YOU REMOVE HYDRAULIC POWER. DAMAGE TO EQUIPMENT CAN OCCUR.

- (15) Do these steps to make sure that the elevator is clear to move.
- (a) Remove the dial indicator and the mounting device from the elevator PCA.
  - (b) Move the dial indicator and mounting equipment away from the elevator trailing edge.

S 866-081

- (16) Remove the power from the hydraulic system that was pressurized (AMM 29-11-00/201).

ALL

27-02-00

02

Page 615  
Dec 22/07

S 866-089

- (17) Move the applicable FLT CONTROL SHUTOFF L, R, or C switch on the P61 panel to OFF. Attach a DO-NOT-OPERATE tag and make sure the switch position light comes on.

NOTE: Make sure all the switches are in their OFF positions.

S 216-090

- (18) Open these circuit breakers on the P11 panel and attach the DO-NOT-CLOSE tag:
- (a) 11H17, FLT CONT SHUTOFF TAIL LEFT
  - (b) 11H18, FLT CONT SHUTOFF TAIL CTR
  - (c) 11H27, FLT CONT SHUTOFF TAIL RIGHT

S 866-176

- (19) Remove the rig pin E1 from the torque tube for the Captain's control column. Remove the rig pin E2 from the torque tube for the First Officer's control column.

S 736-099

- (20) Do the elevator freeplay check again for each of the remaining PCAs. Make sure only one PCA (for each of the two elevators) is pressurized during the check.

NOTE: Remove the dial indicator and magnetic base before you pressurize a different PCA. The elevator can move when you pressurize the hydraulic system and exceed the travel of the dial indicator.

F. Put the Airplane Back to Its Usual Condition.

S 086-200

- (1) Remove the dial indicators and mounting equipment from the airplane.

S 416-201

- (2) If you removed them, install the trailing edge beams. Close these access panels: 335ANZ, 345ANZ, 335APZ, 345APZ, 335AQZ, and 345AQZ.

S 416-202

- (3) Close access panels 335EB, 345EB, 335GB, 345GB, 335HB, 345HB, 335AFB, and 345AFB.

S 416-203

- (4) AIRPLANES WITH A THREE-PIECE ELEVATOR SEAL;  
Close access panels 335AGB, 345AGB, 335AHB, and 345AHB.

**WARNING:** THE AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. MAKE SURE THAT ALL PERSONS AND EQUIPMENT ARE AWAY FROM THE CONTROL SURFACES BEFORE YOU SUPPLY HYDRAULIC POWER. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR.

- (5) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:
- (a) 11H17, FLT CONT SHUTOFF TAIL LEFT
  - (b) 11H18, FLT CONT SHUTOFF TAIL CTR
  - (c) 11H27, FLT CONT SHUTOFF TAIL RIGHT

S 866-084

- (6) Move the LEFT STAB TRIM SHUTOFF and the CENTER STAB TRIM SHUTOFF switches on the P10 panel to their NORM positions.

S 866-085

- (7) Remove the DO-NOT-OPERATE tags and move the FLT CONTROL SHUTOFF TAIL L, R, and C switches on the P61 panel to ON.

S 866-100

- (8) Remove the DO-NOT-OPERATE tags from the control columns.

S 866-086

- (9) Remove electrical power, if it is not necessary (AMM 24-22-00/201).

TASK 27-02-00-736-025

3. Rudder Freeplay - Inspection

A. General

- (1) During this check, the wind/air velocities at the rudder must be below 4 mph. If it is necessary, perform this check indoors to avoid excessive wind/air velocities.

B. Equipment

- (1) Dial Indicator - Accurate to 0.001 inch (0.03 mm) with a 1 inch (25 mm) range.

**NOTE:** An analog-type dial indicator is recommended.

- (2) Device to hold the dial indicator tightly against the fuselage

**NOTE:** A magnetic indicator base, and a flat piece of steel approximately 3 inches (80 mm) long by 3 inches (80 mm) long is recommended.

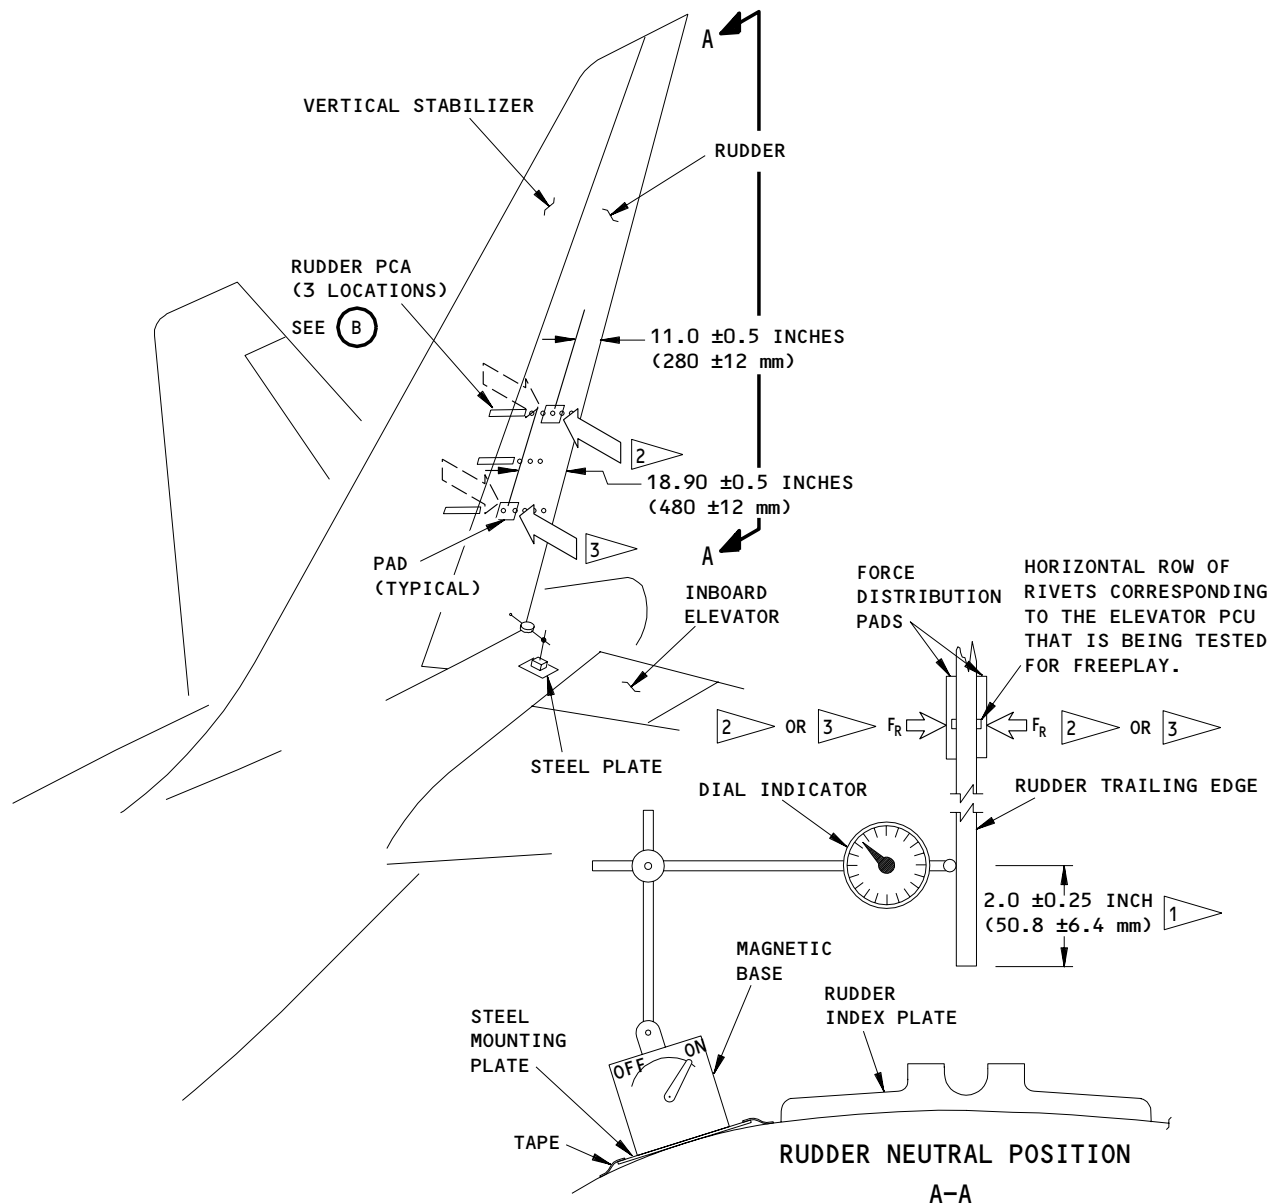

EFFECTIVITY

ALL

27-02-00

S 866-153

- (9) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
- (a) 11C5, RUDDER TRIM
  - (b) 11K17, RUDDER TRIM POS

S 866-031

- (10) Remove the power from the left, center, and right hydraulic systems (AMM 29-11-00/201).

S 866-032

- (11) Move the FLT CONTROL SHUTOFF L, R, and C switches on the right side panel, P61, to OFF. Attach DO-NOT-OPERATE tags and make sure the switch position lights come on.
- (a) Attach DO-NOT-OPERATE tags and make sure the switch position lights come on.

S 866-033

- (12) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
- (a) 11H17, FLT CONT SHUTOFF TAIL LEFT
  - (b) 11H18, FLT CONT SHUTOFF TAIL CTR
  - (c) 11H27, FLT CONT SHUTOFF TAIL RIGHT
- F. Rudder Freeplay - Inspection (Fig. 602)

S 866-148

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (1) Do the applicable group of steps to supply hydraulic power to one of the three PCAs for the rudder. Do only the steps for the PCA that you want to supply power to:

**NOTE:** Measure the freeplay independently for each of the three PCAs that move the rudder. During the measurement, make sure only one of the three rudder PCAs has power at a time.

- (a) Do these steps to supply hydraulic power to the lower PCA:
  - 1) Supply pressure to the right hydraulic system only (AMM 29-11-00/201).

EFFECTIVITY

ALL

27-02-00

02

Page 623  
Apr 22/09

- 2) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
  - a) 11H27, FLT CONT SHUTOFF TAIL RIGHT
- 3) Remove the DO-NOT-OPERATE tag and move the FLT CONTROL SHUTOFF TAIL R switch on the P61 panel to ON.
- (b) Do these steps to supply hydraulic power to the middle PCA:
  - 1) Supply pressure to the left hydraulic system only (AMM 29-11-00/201).
  - 2) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
    - a) 11H17, FLT CONT SHUTOFF TAIL LEFT
  - 3) Remove the DO-NOT-OPERATE tag and move the FLT CONTROL SHUTOFF TAIL L switch on the P61 panel to ON.
- (c) Do these steps to supply hydraulic power to the upper PCA:
  - 1) Supply pressure to the center hydraulic system only (AMM 29-11-00/201).
  - 2) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
    - a) 11H18, FLT CONT SHUTOFF TAIL CTR
  - 3) Remove the DO-NOT-OPERATE tag and move the FLT CONT SHUTOFF TAIL C switch on the P61 panel to ON.

S 866-168

- (2) Do these steps to decrease the remaining pressure in the two rudder PCAs that do not have power.

NOTE: Move the rudder pedals slowly.

- (a) Remove the DO-NOT-OPERATE tags from the rudder pedals.
- (b) Operate the rudder pedals to move the rudder fully right.
- (c) Keep the rudder fully right for 10 seconds.
- (d) Operate the rudder pedals to move the rudder fully left.
- (e) Keep the rudder fully left for 10 seconds.

S 866-169

- (3) Do this check to make sure the rudder is in it's neutral position:
  - (a) Operate the rudder trim switch on the aft electronic control panel, P8, until the rudder trim indicator shows zero units of trim.

EFFECTIVITY

ALL

27-02-00

02

Page 624  
Dec 22/07

- (b) Make sure the rudder pedals are in their neutral positions.
- (c) Make sure the rudder is in it's neutral position.

S 866-170

- (4) Attach DO-NOT-OPERATE tags to the rudder pedals.

S 826-171

- (5) Install rig pin R1 in the captain's rudder pedals. Install rig pin R2 in the first officer's rudder pedals.

S 866-140

- (6) Stop for three minutes to let the rudder position become stable.

S 826-032

**WARNING:** DO NOT MOVE THE RUDDER PEDALS DURING THE RUDDER FREEPLAY MEASUREMENT. THE RUDDER MOVES VERY QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (7) Do the steps that follow to attach a dial indicator next to the rudder lower trailing edge (Fig. 602):

**CAUTION:** USE A DIAL INDICATOR WITH AT LEAST 1-INCH (25 MM) OF TRAVEL TO PREVENT DAMAGE TO THE INDICATOR.

- (a) Use high strength tape (that will not damage painted surfaces when removed) and a steel mounting plate to attach the magnetic base to the fuselage near the rudder trailing edge.
- (b) Use adjustable rods to attach the dial indicator to the fixed rod of the magnetic base.
- (c) Put the indicator plunger approximately 1.00 +/- 0.25 inch (25.4 +/- 6.4 mm) forward of the rudder trailing edge and 2.00 +/- 0.25 inch (50.8 +/- 6.4 mm) above the bottom edge of the rudder (Fig. 602).
- (d) Give a load to the dial indicator plunger until the needle moves approximately to half of it's total travel.

EFFECTIVITY

ALL

27-02-00

02

Page 625  
Dec 22/07

(e) Adjust the dial indicator to zero.

S 486-188

(8) Do these steps to attach a dial indicator to the piston rod of the rudder PCA.

**CAUTION:** USE A DIAL INDICATOR WITH AT LEAST 0.10 INCH (2.5 MM) OF TRAVEL TO PREVENT DAMAGE TO THE INDICATOR.

(a) Attach a mounting device for a dial indicator to the piston rod (Figure 602).

(b) Attach a dial indicator to the mounting device.

(c) Do these steps to align the dial indicator to measure the movement of the piston rod:

- 1) Put the plunger of the dial indicator against a flat area on the gland of the PCA.
- 2) Make sure the dial indicator is aligned parallel to the piston rod.
- 3) Make sure the dial indicator is set to approximately the middle of its travel.
- 4) Make sure the dial indicator and the mounting device have a clearance of at least 0.10 inch (2.5 mm) to the adjacent structure.

S 496-039

**CAUTION:** USE SUFFICIENT PADDING ON THE FORCE SCALE TO PREVENT DAMAGE TO THE RUDDER SURFACE. USE A PAD THAT IS AT LEAST 5 INCHES (130 mm) LONG AND HAS A WIDTH OF AT LEAST 5 INCHES (130 mm), OR MORE.

(9) Use the force scale to apply a 100 +/- 6 pound (445 +/- 27 Newton) force to the left side of the rudder. Apply this force perpendicular to the surface of the rudder, at the appropriate location.

(a) If the upper rudder PCA has hydraulic power, apply the force on the rudder rib aft of the upper rudder PCA, 11.0 +/- 0.5 inches (279 +/- 12 mm) forward of the rudder trailing edge (Fig. 602). Use the horizontal row of fasteners on the rudder skin to identify the location of the rib.

EFFECTIVITY

ALL

27-02-00

01

Page 626  
Dec 22/07

- (b) If the middle or lower rudder PCA has hydraulic power, apply the force on the rudder rib aft of the lower rudder PCA, 18.9 +/- 0.5 inches (480 +/- 12 mm) forward of the rudder trailing edge (Fig. 602). Use the horizontal row of fasteners on the rudder skin to identify the location of the rib.

S 226-040

- (10) Keep the force constant at 100 +/- 6 pounds (445 +/- 27 newtons) until the value indicated on the dial indicator becomes stable.

NOTE: This force should be applied for a minimum of 2.5 minutes. This is to ensure that the rudder moves fully through the hydraulic resistance of the two PCAs that do not have hydraulic power.

S 226-180

- (11) Decrease the force to 30 +/- 3 pounds (133 +/- 13 Newtons). Do not allow the force to decrease to less than 27 pounds (120 Newtons). If this occurs, you must release the force, and start the procedure again at the 100 pound (445 Newton) force application.

S 226-181

- (12) Keep the force constant at 30 +/- 3 pounds (133 +/- 3 Newtons) while you do these steps.

- (a) Monitor the value shown on the dial indicator at the rudder trailing edge until it becomes stable.

NOTE: Vibrations can cause the dial indicator to show small continual movements. You can continue if the indication average is stable.

- (b) Read the value on the dial indicator at the rudder trailing edge. Record this value as the index point for the rudder.

NOTE: You can adjust the dial indicator to zero. If you do this, record the index point as zero.

EFFECTIVITY

- (c) Read the value on the dial indicator at the piston rod. Record this value as the index point for the piston rod.

**NOTE:** You can adjust the dial indicator to zero. If you do this, record the index point as zero.

S 866-102

- (13) Slowly remove the load from the left side of the rudder.

S 226-103

**CAUTION:** USE SUFFICIENT PADDING ON THE FORCE SCALE TO PREVENT DAMAGE TO THE RUDDER SURFACE. USE A PAD THAT IS AT LEAST 5 INCHES LONG (130 MM) AND HAS A WIDTH OF AT LEAST 5 INCHES (130 MM).

- (14) Use the force scale to apply a 60 +/- 3 pound (267 +/- 13 Newton) force to the right side of the rudder. Apply this force perpendicular to the surface of the rudder, at the appropriate location. Do not allow the force to increase to more than 63 pounds (280 Newtons). If this occurs, you must release the force, and start the procedure again at the 100 pound (445 Newton) force application.
- (a) If the upper rudder PCA has hydraulic power, apply the force on the rudder rib aft of the upper rudder PCA, 11.0 +/- 0.5 inches (279 +/- 12 mm) forward of the rudder trailing edge (Fig. 602). Use the horizontal row of fasteners on the rudder skin to identify the location of the rib.
- (b) If the middle or lower rudder PCA has hydraulic power, apply the force on the rudder rib aft of the lower rudder PCA, 18.9 +/- 0.5 inches (480 +/- 12 mm) forward of the rudder trailing edge (Fig. 602). Use the horizontal row of fasteners on the rudder skin to identify the location of the rib.

S 226-189

- (15) Keep the force constant at 60 +/- 3 pounds (267 +/- 13 Newtons) while you do these steps.
- (a) Monitor the value shown on the dial indicator at the rudder trailing edge until it becomes stable.

**NOTE:** Vibrations can cause the dial indicator to show small continual movements. You can continue if the indication average is stable.

MAINTENANCE MANUAL

- (b) Read the value shown on the dial indicator at the rudder trailing edge. Record the distance that the rudder moved to the left of the recorded index point.

NOTE: This is the distance that you will compare to the applicable freeplay limit.

- (c) Read the value on the dial indicator at the piston rod. Calculate the distance and direction that the piston rod moved from the recorded index point.

NOTE: This is the value that you will use to find the applicable freeplay limit.

- 1) If the piston rod retracted (moved forward), the value is positive. If the piston rod extended (moved aft), the value is negative.

S 226-156

- (16) Slowly remove the force from the right side of the rudder.

S 226-182

- (17) Using Table 602, find the applicable minimum rudder movement value for the calculated piston rod movement (from the index point).

NOTE: For example, if the piston rod movement was 0.012 inches, the minimum rudder movement is 0.260 inches.

- (a) Make sure that the calculated rudder movement (from the index point) is more than, or equal to, the minimum rudder movement. If the calculated rudder movement is less than the minimum rudder movement, the measurement is not correct.

NOTE: The measurement may be incorrect due to incorrectly installed equipment, or incorrectly followed instructions.

EFFECTIVITY

ALL

27-02-00

01

Page 629  
Dec 22/07

S 226-183

- (18) Using Table 602, find the applicable rudder freeplay limit for the calculated piston rod movement (from the index point).

NOTE: For example, if the piston rod movement was 0.012 inches, the rudder freeplay limit is 0.470 inches.

- (a) Make sure that the calculated rudder movement (from the index point) is less than, or equal to, the rudder freeplay limit. If the calculated rudder movement is more than the freeplay limit, then you must make repairs to the load path connections for the rudder PCA.

NOTE: Possible causes of excessive freeplay include: worn or loose hanger link, reaction link, PCA rod end, or trunnion connections.

- (b) If you make repairs, you must repeat the freeplay check for the applicable PCA.

ALL

27-02-00

01

Page 634  
Dec 22/07

- (19) Do these steps to make sure that the rudder is clear to move:
- (a) Remove the dial indicator and the mounting device from the rudder PCA piston rod.
  - (b) Move the dial indicator and the mounting equipment away from the rudder trailing edge.
  - (c) Make sure the rudder is clear to move through its full travel.

S 866-106

- (20) Remove the power from the hydraulic system that was pressurized (AMM 29-11-00/201).

S 866-107

- (21) Move the applicable FLT CONTROL SHUTOFF L, R, or C switch on the P61 panel to OFF. Attach a DO-NOT-OPERATE tag and make sure the switch position light comes on.

**NOTE:** Make sure all the switches are in their OFF positions.

S 866-108

- (22) Make sure these circuit breakers on the P11 panel are open:
- (a) 11H17, FLT CONT SHUTOFF TAIL LEFT
  - (b) 11H18, FLT CONT SHUTOFF TAIL CTR
  - (c) 11H27, FLT CONT SHUTOFF TAIL RIGHT

S 866-172

- (23) Remove rig pin R1 from the captain's rudder pedals. Remove rig pin R2 from the first officer's rudder pedals.

S 736-157

**WARNING:** MAKE SURE THAT ALL PERSONS AND EQUIPMENT ARE AWAY FROM THE RUDDER BEFORE YOU CHANGE HYDRAULIC SYSTEMS. RIGGING DIFFERENCES BETWEEN THE PCAs CAN CAUSE THE RUDDER TO MOVE SUDDENLY. INJURY TO PERSONS OR DAMAGE TO THE EQUIPMENT CAN OCCUR.

- (24) Do the rudder freeplay check again for each of the remaining PCAs. Make sure only one PCA (that is to be measured) is pressurized during the check.
- (a) Remove the dial indicator before you pressurize a different PCA.

EFFECTIVITY

ALL

27-02-00

01

FLIGHT CONTROL SYSTEM ELECTRONICS UNIT (CSEU) – DESCRIPTION AND OPERATION

1. General (Fig. 1)

- A. The Control System Electronics Unit (CSEU) is a collection of twelve flight control modules and four power supply modules. The CSEU is energized by its own power supply modules.
- B. The CSEU interfaces with other primary airplane systems to provide the computation and control functions for yaw damping (AMM 22-21-00), stabilizer trim (AMM 27-41-00), aileron lockout (AMM 27-11-00), rudder control authority (AMM 27-21-00), and spoiler deployment (AMM 27-61-00).

LEFT CSEU MODULES  
(RIGHT CSEU SIMILAR)

- YAW DAMPER MODULE L
- RUDDER RATIO CHANGER MODULE L
- STAB TRIM AND AIL LOCKOUT MODULE L
- SPOILER CONTROL MODULE NO.1 L
- SPOILER CONTROL MODULE NO.2 L
- SPOILER CONTROL MODULE NO.3 L
- POWER SUPPLY MODULE NO.1 L
- POWER SUPPLY MODULE NO.2 L

Flight Control System Electronics Unit (CSEU)  
Figure 1

Page 1  
Apr 22/99

- C. The system consists of independent left and right CSEUs which contain eight modules. All modules are line replaceable units (LRU). Equivalent modules can be changed between equivalent shelf positions on the left and right CSEUs.
- D. The left CSEU is on the E1-1 shelf, and the right CSEU is on the E2-1 shelf. These shelves are found in the main equipment center. Access is thru the electronics access door, 119AL, found on the bottom of the fuselage, aft of the nose wheel well.
- E. The CSEU consists of the following modules:
  - (1) Yaw damper module (YDM) (M522 LH, M523 RH)
  - (2) Rudder ratio changer module (RRC) (M528 LH, M529 RH)
  - (3) Stabilizer trim and aileron lockout module (SAM) (M524 LH, M525 RH)
  - (4) Spoiler control module (SCM)  
(M530, M531, M532 LH; M533, M534, M535 RH)
  - (5) Power supply module (PSM) (M536, M537 LH; M538, M539 RH)
- F. The CSEU modules provide the electrical interface between the sensors and the signal sources. These include the air/ground logic sensors, and hydraulic pressure sense signals, the pilot's and first officer's flight control transducers, and the control surfaces transducers and actuators.
- G. Built-In-Test Equipment (BITE) in the CSEU modules supply continuous monitor features specified for the monitor circuits. When the CSEU is powered, the background is continuously monitored for faults, and the inflight failure data is stored.

2. Component Details (Fig. 2)

A. Yaw Damper Module (YDM)

- (1) The YDM receives electrical input information from the Inertial Reference System (IRS) and the Air Data Computing System (ADCS). When the airplane is in the air, the YDM controls the rudder to inhibit dutch roll (yaw combined with roll) oscillation, and to provide turn coordination. Two YDMs are installed. One supplements the other. If one YDM fails, the other YDM takes over all control functions. Refer to AMM 22-21-00 for more information.

(2) 767-300;

The YDM also receives electrical input information from the Modal Suppression Accelerometer.

B. Rudder Ratio Changer (RRC) Module

- (1) The RRC module varies rudder control authority as a function of airplane speed. Two RRCs are installed. One RRC is always in control and the other is on standby. If one RRC fails, the other RRC takes over the control functions. The RRC uses airspeed inputs from the ADCS and the SAMs to control rudder deflection. Refer to AMM 27-21-00 for more information.

C. Stabilizer Trim and Aileron Lockout Module (SAM)

(1) 767-200;

The SAM supplies stabilizer trim control and outboard aileron lockout functions relative to the airspeed, and airspeed output data to the RRC. Two SAMs are installed. One SAM is always in control and the other is on standby. If one SAM fails, the other SAM switches over when the airplane is in the mach trim mode, or if two or more flight control computers (FCC) are engaged.

(2) 767-300;

The SAM supplies stabilizer trim control and outboard aileron lockout functions relative to the airspeed, and the airspeed output data to the RRC. Two SAMs are installed. One SAM is in control, the other SAM is on standby during half-speed autotrim or mach trim operation. If one SAM fails, the other SAM will switch over. The two SAMs must operate simultaneously for full-rate autotrim and full-rate electric trim operations.

(3) The SAM gets ADCS inputs and supplies its outputs to the aileron lockout actuators to engage or disengage the outboard ailerons from aileron control. Electrical information supplied from the FCC, ADCS, flap and stabilizer position modules (FSPM), stabilizer trim control modules (STCM), and captain's and first officer's trim switches, controls the stabilizer trim operation. Refer to AMM 27-41-00 and AMM 27-11-00 for more information.

D. Spoiler Control Module (SCM)

(1) A total of six SCMs are installed. Each SCM controls a symmetrical pair of spoilers, one on the left wing and one on the right wing. The spoilers are deployed during flight or landing to reduce lift and increase drag.

(2) The SCMs are part of the airplane's lateral control and speedbrake systems. Inputs to the pilot's or first officer's control wheel, or the speedbrake handle cause transducers to send electrical signals to the SCMs. The SCMs then send the applicable signals to the spoilers' power control actuators (PCA) for spoiler deployment.

(3) Each SCM must be fully operational. If the first channel of the SCM fails, the SCM switches to its second channel for continued operation.

(4) The SCM uses lateral control, speedbrake, and air/ground sensors for the lateral control and speedbrake operation. Refer to AMM 27-61-00 for more information.

(5) The newer model SCMs have a BITE display on the front panel and will be referred to as the -200 series SCMs. The older model SCMs have faultballs and will be referred to as the -100 series SCMs.

EFFECTIVITY

ALL

27-09-00

04

Page 4  
Aug 22/01

- (6) In an airplane that has both -200 and -100 series SCMs installed, the most effective maintenance occurs when you have at least one -200 series SCM installed on each shelf.
  - (7) A -200 series SCM is recommended for installation at a shelf position where intermittent problems occur, or when it is necessary to replace an SCM during the fault isolation procedure, to make use of its expanded capacity for fault detection and fault isolation.
- E. Power Supply Module (PSM)
- (1) The PSM supplies the CSEU with the necessary dc regulated and ac unregulated power. A total of four PSMs (two for the left CSEU and two for the right CSEU) are installed.
  - (2) The two PSMs in each CSEU use power combining (dc) and power changeover (ac) networks to make sure there is continuity to the CSEU loads if one PSM fails. Either PSM can carry the entire CSEU load. However, there is no power combining between the left CSEU PSMs (M536, M537) and the right CSEU PSMs (M538, M539).
  - (3) The PSMs (M536, M537) for the left CSEU receive the 28-volt dc and 115-volt ac power sources from the dc and ac standby buses. The PSMs (M538, M539) for the right CSEU receive the 28-volt dc and 115-volt ac power sources from the main left and right dc and ac buses.
  - (4) Power generated by the PSMs also supplies the linear variable differential transformers (LVDT), and the rotary variable differential transformers (RVDT), for the position monitor and feedback function of the applicable flight controls and control surfaces. The LVDTs and the RVDTs are frequently referred to as the transducers.

### 3. Operation

#### A. Functional Description

- (1) CSEU power supply module distribution (Fig. 3)
  - (a) Two interchangeable PSMs provide each CSEU with unregulated 26 volt ac for LVDT excitation, the unregulated 28 volt dc for internal power supply monitoring, and the regulated plus and minus 15-volt dc and the plus 5-volt dc for logic card power requirements.
  - (b) Each PSM is equipped to electrically monitor its own outputs and provide power status signals to the warning and control circuits. Three power status discrete signals are PSM FAIL, PSM VALID and PSM RESET.
  - (c) The PSM FAIL discrete monitors the PSM circuits failures. The PSM VALID discrete monitors the regulated dc power supply for out of tolerance conditions. The PSM RESET discrete provides the SAM and YDM with advance warning of the loss of dc voltage regulation.
  - (d) Power Supply Module (PSMs) are powered by the airplane 115v ac, 400 Hz power bus. PSM internal monitor circuitry is powered by the 28v dc bus.
  - (e) The PSMs supply power to these components:
    - 1) Stabilizer Trim/Aileron Lockout Module
    - 2) Spoiler Control Module
    - 3) Yaw Damper Module

- 4) Rudder Ratio Changer Module
- 5) Excitation for LVDTs and RVDTs for LRUs
- (f) Each PSM provides the following outputs:
  - 1)  $\pm 15$ v dc power distribution buses from three separate  $\pm 15$ v dc power regulators.
  - 2) +5v dc power distribution bus from a single +5v dc power regulator.
  - 3) 26v ac power distribution.
- (g) DC power output lines from the PSM on the same shelf are connected in parallel inside each CSEU so that a loss of either PSM will not cause the loss of any CSEU.
- (h) Four AC power output lines from the PSM provide 26v ac to demodulator cards in the SCMs, the YDMs, and the RRCs. These lines also provide 26v ac excitation to the three control wheel RVDTs (3), the speedbrake lever LVDTs (3), the spoiler power control actuators (6), the yaw damper servos (2), and the rudder ratio changers (2).
- (i) One PSM at a time on the same shelf provides 26v ac excitation to the CSEU modules on that shelf. The other PSM is on standby. When the PSM detects a fault in the 26v ac, the change over circuitry in the PSM switches over to the standby PSM to provide uninterrupted 26v ac to the CSEU modules.
- (j) AIRPLANES WITH THE -103 POWER SUPPLY MODULES;  
Internal fuses in each of the two sides of the 26v ac line protect the PSM from shorted components. But an open 26v ac fuse does not set the PSM MODULE faultball to yellow.
- (k) AIRPLANES WITH -104 POWER SUPPLY MODULES;  
Front panel mounted circuit breakers in each of the two sides of the 26v ac line protect the PSM from shorted components and help to troubleshoot these faults. But an open circuit breaker does not set the PSM MODULE faultball to yellow.
- (l) Under normal conditions, the "A" subchannel of the SCM controls the spoiler panels. The 26v ac excitation voltage for the spoiler PCA LVDTs comes from the PSM circuit which supplies the SCMs "A" subchannel. If the SCM makes a "switch" decision, control of the spoiler panels and PCA excitation are switched to the "B" subchannel.
- (2) CSEU air/ground and hydraulic discrete inputs (Fig. 6)
  - (a) Each of the control modules within the left and right CSEUs receives air/ground mode signals and hydraulic pressure sense signals. The module uses these signals to enable or inhibit its own CSEU functions.
  - (b) Four air/ground relays supply an air/ground discrete signal to the CSEU when a proximity switch electronics unit (PSEU) output signal is received (AMM 32-09-02).
  - (c) The air/ground relays energize when the PSEU output signal to the CSEU is a ground, which indicates the main gear truck is not tilted (the airplane is in the ground mode).
  - (d) Examples of the air/ground mode discrete effects on the CSEU operation include the enable of the rudder ratio changer ground tests, and the enable of the speedbrake commands by the SCM.

SB 27-059

CSEU Air/Ground and Hydraulic Discrete Inputs  
Figure 6

EFFECTIVITY

ALL

27-09-00

- (e) Hydraulic pressure sense switches operate from the left, right and center hydraulic systems. These switches provide a high and low pair of logic discrete signals (pressure is valid/pressure is not valid) to the CSEU (AMM 29-11-00).
  - (f) Examples of a valid hydraulic pressure discrete (the system pressure is good) effects on the CSEU operation include the enable of the rudder ratio changer engage relays in the air, and the enable of the monitor of the SCM failures.
  - (g) An invalid air/ground discrete or hydraulic pressure discrete to the CSEU will cause an AIR/GRD, a HYD PRESS, or other applicable faultball (or fault message on modules with BITE displays) to show a failure.
- (3) Stabilizer Trim/Aileron Lockout Module
- (a) Stabilizer Trim System controls the airplane pitch axis during flight by up or down movement of the horizontal stabilizer leading edge. Movement up of the horizontal stabilizer will move the airplane nose down. Movement down of the horizontal stabilizer will move the airplane nose up.
  - (b) Stabilizer Trim System has these trim modes:
    - 1) Manual and Manual Electric Trim Modes - the pilots' commands trim the stabilizer manually.
    - 2) Auto Trim Mode - the autopilot flight control computers (FCC) trim the stabilizer automatically (AMM 22-22-00).
    - 3) Mach Trim Mode - the stabilizer is trimmed as the mach increases. The mach trim system is active when there are no manual, electric, and automatic trim commands present, and the SAM is valid and the flaps are up.
  - (c) Manual mechanical control trim mode:
    - 1) The manual mechanical control trim mode is controlled by inputs to the manual trim levers which bypass the SAM and controls the stabilizer trim control module (STCM) directly. Refer to AMM 27-41-05 for more information on the STCM.
  - (d) Manual electric control trim mode:
    - 1) In manual electric control trim mode, the stabilizer control is from the dual electric trim switches on the control wheels. When you push these switches up or down, you send trim commands to the control and arm solenoid valves in the two STCMs through their respective SAMs. When these STCM valves operate, hydraulic pressure is applied to release the secondary brake to the applicable hydraulic trim motor and to drive the stabilizer jackscrew.
    - 2) The electric trim switches send the necessary signals to the two SAMs to drive the stabilizer at full rate. Stabilizer movement will continue until you release the switches, or until the electrical limit switches operate.
    - 3) Manual electric trim has priority over the mach trim and the single channel auto stabilizer trim modes, except for the multichannel autoland mode (when the autoland mode is selected for two or three FCCs), which inhibits all other electric trim commands.

CSEU Fault Annunciation Schematic  
Figure 7

EFFECTIVITY

ALL

27-09-00

- (a) Fault monitor circuits monitor the electrical networks and supply fault annunciation and warning of failures in each CSEU module. The fault annunciations are the applicable amber lights on the pilots' overhead panel, P5.
  - (b) The Engine Indication and Crew Alerting System (EICAS) display on the pilots' center instrument panel supplies the EICAS messages via the EICAS computers. The applicable module faultballs on the face of the module or the applicable fault indications in the module memory also latch.
- B. CSEU BITE (Fig. 7)
- (1) Each CSEU module faceplate contains faultballs (or a BITE display) as part of the continuous BITE monitor function to identify the fault down to the LRU level, including the intermittent fault, within its system.
  - (2) Faultballs, when unlatched, show the color black for normal system operation, and show yellow, when latched, for a fault indication. When you push the maintenance reset button, you clear (unlatch) the faultball unless the fault is still present.
  - (3) The faultballs, EICAS messages (maintenance, status, advisory or caution), and the amber lights operate in combinations to indicate failures.
  - (4) In addition to faultballs for fault indication, the RRC module contains a BITE test switch. By placing the switch from NORMAL to TEST, hydraulic power is applied to extend the RRC actuator in 15 seconds. The IN TEST light on the module comes on and stays on for 15 seconds. When the switch is returned from TEST to NORMAL, the actuator is retracted and the IN TEST light stays on for 15 seconds. The TEST FAIL faultball latches if the test fails.
  - (5) Power Supply Module (PSM)
    - (a) After power up, the PSM will continuously monitor its outputs for power failures.
    - (b) All PSM outputs are continuously monitored. When an output is out of tolerance, its monitor sets the PSM "MODULE FAULT" and causes EICAS message L(R) FLT CONT ELEC to be displayed.
    - (c) Removal of either PSM activates the EICAS message L(R) FLT CONT ELEC and sets the MODULE fault indication on the remaining PSM.
    - (d) For a  $\pm 5$ v dc output power loss, the internal monitor circuitry will cause the PSM to shut down, set PSM "MODULE" fault, and causes EICAS message L(R) FLT CONT ELEC to be displayed.
    - (e) For a  $\pm 15$ v dc output power loss, the internal monitor circuitry sets PSM "MODULE" fault indication and causes the EICAS message L(R) FLT CONT ELEC to be displayed.
    - (f) For a 26v ac output power loss the internal monitor circuitry will transfer control to standby module, set PSM "MODULE" indication and causes the EICAS message L(R) FLT CONT ELEC to be displayed.
    - (g) Push the reset button on the PSM front panel to reset the monitor circuits and a "MODULE" fault indication.

EFFECTIVITY

ALL

27-09-00

- (6) Stabilizer Trim/Aileron Lockout Module
- (a) The SAMs continuous built-in-test (BITE) monitors enable it to detect abnormal conditions and set the applicable faultball, STAB TRIM message and light indicator. These faultballs are used to identify the internal faults and interfacing line replaceable unit (LRU) faults:
- 1) SAM
    - a) The SAM faultball is set when the SAMs arm, or when the control channels disagree, or when the internal control processing unit fails. The SAM faultball is reset by the RESET switch, and will stay reset if there are no faults.
    - b) When the SAM faultball is set, the other faultballs and fault annunciations are inhibited.
    - c) A SAM fault inhibits these modes:
      - Autotrim
      - Mach Trim
      - Aileron Lockout
      - Rudder Ratio Changer
  - 2) FCC
    - a) The FCC fault is set when the SAMs FCC input monitors detect invalid data. The left SAM monitors inputs from left and center FCCs and the right SAM monitors inputs from right and center FCCs. The FCC faultball is cleared on the ground if valid FCC data is received. FCC faults are cleared in air if valid FCC data is received for two seconds.
  - 3) ADC
    - a) The ADC faultball is set if the primary or secondary computed mach number or computed airspeed from the ADC disagree. ADC fault is cleared on the ground if valid ADC data is received. In the air mode, valid ADC data received for at least 30 seconds will clear the ADC fault.
  - 4) COL TRIM SW
    - a) The COL TRIM SW faultball is set when the input coincidence monitor detected faults in the thumb switch inputs, the ARM and the CONTROL manual trim discrettes disagree.
  - 5) MAN LEVER SW
    - a) The MAN LEVER SW faultball is set when its input monitor detects a fault in the manual stabilizer Trim Lever switch. If the switch is closed or the lever is out of detent for longer than 30 seconds and the hydraulic pressure is high on either system the MAN LEVER SW faultball will be set. This faultball will usually be cleared when you push the RESET switch.

EFFECTIVITY

ALL

27-09-00

03

Page 22  
Apr 22/00

- 6) HYD PRESS SW
    - a) The HYD PRESS SW faultball is set when the hydraulic low discrete and the hydraulic high discrete from the Elec Hyd Pump Press Sw are in the same state (both high or low). This faultball will usually be cleared when you push the RESET switch.
  - 7) STCM
    - a) STCM faultball is set when the STCM secondary brake is released (Brake Pressure Switch S1 closed) for two seconds without a valid trim command or when the secondary brake is not released (Brake Pressure Switch S1 opened) within two seconds of a valid trim command. The STCM monitor is disabled during standby manual trim or column manual trim commands.
  - 8) L(R) AIL. LOCK. ACT.
    - a) The L(R) AIL. LOCK. ACT. faultball is set by a left or right aileron lockout actuator failure. After 30 seconds, the time for normal operation, if the actuator position disagrees with the commanded position, this faultball will set yellow.
  - 9) FSPM
    - a) The FSPM faultball is set if the stabilizer position signal input exceeds the nose up stabilizer travel limit, or an open circuit occurs for longer than 1.5 seconds.
    - b) Faultballs can be reset when you push the RESET switch. On the ground, the FSPM faultball will clear immediately if valid data is received.
  - 10) AIR/GND RELAY
    - a) AIR/GND RELAY faultball is set when the three air/ground inputs to the SAM disagree. This faultball will autoreset with a GND/AIR or AIR/GND transition.
- (b) When any SAM faultball sets, a white EICAS message STAB TRIM also is displayed.
- 1) Push the RESET switch on the front panel of the SAM to clear all faultballs unless the fault is still present.
- (c) The amber STAB TRIM message and light indicator are displayed when the SAM receives a manual electric trim command and only one of the STCM secondary brakes is released (the brake pressure switch remains open). The stabilizer system trims at half rate trim instead of the normal full rate trim.
- (d) The EICAS message UNSCHD STAB TRIM and light indicator are displayed when the SAM unscheduled trim monitor detects the stabilizer moves more than 0.3 degrees in either direction without a valid SAM trim command in the applicable direction.

EFFECTIVITY

ALL

27-09-00

- (7) Fault Indications on the Spoiler Control Module (SCM)
- (a) Fault Isolation in the SCM
- 1) The redundancy management function of the SCM checks the circuitry and input signals for possible fault conditions. It issues "switch" or "switch inhibit" actions as necessary to maintain system operation and to determine first or second fault status. This circuitry also generates applicable panel light and/or EICAS indications and sends the fault data to the maintenance monitor.
  - 2) AIRPLANES WITH -100 SERIES SPOILER CONTROL MODULES;  
The maintenance monitor determines which units are at fault (RVDT, LVDT, PCA, or SCM) and sets the appropriate faultballs on the SCM front panel.
  - 3) AIRPLANES WITH -200 SERIES SPOILER CONTROL MODULES;  
The maintenance monitor detects faults and records the applicable fault message into memory. To identify the defective airplane components, you must operate the BITE display on the SCM front panel to show the fault messages and fault details (Figs. 12, 13). See the SCM front panel for the other items available with the BITE display.
  - 4) Figure 8 is a block diagram of the SCM showing inputs from the control wheel RVDTs and the speed brake LVDTs to each of the three subchannels: active (A), standby (B), and model (C). Subchannel A normally drives the spoiler PCAs. Excitation voltage for the PCA LVDTs comes from subchannel B. When a fault is detected in subchannel A, spoiler control is switched to subchannel B and LVDT excitation comes from subchannel A. Feedback from the PCA is used for nulling the command signal and is also fed to the threshold monitors in the B and C subchannels for comparison with the command signals. The servo amplifiers in subchannel B are also monitored.
  - 5) Redundancy management first checks the servo amplifiers in subchannel B (SAL and SAR). A bad amplifier results in a "switch inhibit" decision since the standby subchannel is inoperative. If the servos check good, the command signals in subchannels B and C are compared with the PCA feedback signals in the threshold monitors (BR, BL, CR, and CL).

- 6) A fault detected in either B or C results in a "switch inhibit" condition. Faults in both B and C subchannels will result in a "switch" decision. In either case, the decision constitutes a "first fault" and generates a SPOILERS message on the EICAS maintenance page.
- 7) AIRPLANES WITH -100 SERIES SPOILER CONTROL MODULES;  
If the detected fault is caused by a bad transducer (input or feedback), the maintenance monitor will determine which transducer is bad. If no fault is detected in the transducers, the fault is in the module itself. Timing for the fault logic is given below:

T0 = 0.0 sec	Starts at the leading edge of the failure logic (SAL+SAR+BL+CL+CR) of the B or C subchannel.
T1 = 0.4 sec	A "switch" or "switch inhibit" decision is made. If "switch inhibit", the maintenance monitor checks for SB or CW transducer failures.
T2 = 2.4 sec	Gives the spoiler panel time to move to the commanded position after a channel switch. If the fault does not clear, a PCA faultball is set. If it does clear, a different applicable faultball will be set (SB or CW XDCR or MODULE FAULT).

- 8) AIRPLANES WITH -200 SERIES SPOILER CONTROL MODULES;  
If the detected fault is caused by one of the inputs to the SCM, a fault message for the input will be stored in the SCM memory. If no input fault is detected, then either the PCA or the SCM module is defective. Timing for the fault logic is given below:

T0 = 0.0 sec	Starts at the leading edge of the failure logic (SAL+SAR+BL+CL+CR) of the B or C subchannel.
T1 = 0.4 sec	A "switch" or "switch inhibit" decision is made.
T2 = 2.4 sec	If a "switch inhibit" decision is made at time T1, a module fault is set. If a "switch" decision is made at time T1 and the spoiler panel does not move to the commanded position, a PCA fault is set or a module fault is set.

Page 26  
Aug 22/01

- 9) An explanation of how the redundancy management and maintenance monitors work will be discussed below using the captain's inputs and a failure of control wheel RVDT #2.
- (b) Redundancy Management
- 1) The captain's control wheel RVDTs 1, 2, and 3 are connected to the active (A), standby (B), and model (C) subchannels in each of the SCMs in the left CSEU as shown in Fig. 9. The captain's speed brake lever LVDTs 1A, 2A, and 3A are connected in a similar arrangement. The first officer's inputs are connected to the SCMs in the right CSEU using the same pattern. In this example, all subchannel B servo amplifiers are assumed to check good. Captain's control wheel RVDT #2 is bad.
  - 2) In SCM 1L, the threshold monitor of subchannel B detects a difference in the command from RVDT #2 and the feedback from the spoiler PCA which has been driven to the correct position by subchannel A (ie, RVDT #1). Thus a "switch inhibit" decision is made by redundancy management. Spoiler control remains with subchannel A.
  - 3) In SCM 2L, the model subchannel, C, receives the bad signal from RVDT #2 and so an error is detected between it and the PCA feedback. A "switch inhibit" decision is made here, also.
  - 4) Module 3L has the bad RVDT #2 signal applied to the active subchannel, A, which drives the spoiler panels to the wrong position. The threshold monitors in both subchannels B and C detect errors between their (good) commands and the (bad) feedback signal. These dual errors result in a "switch" decision by redundancy management. Control of the spoiler panels is switched to subchannel B.
  - 5) At this point, the faulty RVDT has not yet been determined. The threshold monitors only detect a difference in the command and feedback signals. They cannot determine which is in error. That is left to the maintenance monitor.

- 1) The maintenance monitor uses a comparator circuit for transducer inputs to the A and B subchannels of the SCM and a voting logic circuit which uses inputs from all three SCM comparator circuits to determine which transducer is at fault. Identical circuits monitor the RVDTs and the LVDTs (Fig. 10).
- 2) The comparator produces a logic one if the two inputs disagree and a logic zero if they agree. Output (X, Y, and Z in Fig. 10) is fed to all three SCMs. In the example above, SCM 1L compares RVDTs #1 and #2 which produces a logic one at X since the two signals disagree. SCM 2L compares RVDTs #1 and #3. Since both are good, the comparator outputs a logic zero at Y. SCM 3L, comparing RVDTs #2 and #3, produces a logic one at Z since the two do not agree.
- 3) The required input for the voting logic is 1-1-0 on the three leads to the AND gate. The logic used to set the faultball is a VOTE FAIL and a "switch" decision. This condition is met, in the example, only in SCM 3L. Therefore, the RVDT faultball (CW XDCR) is set on this SCM.
- 4) The faultball will always be set on the SCM whose active subchannel, A, is receiving input from the faulty transducer (RVDT or LVDT). Table 1 identifies which control wheel or speedbrake lever transducer is at fault when a given faultball is set.

TABLE 1 CONTROL WHEEL AND SPEEDBRAKE LEVER FAULTBALLS		
SCM With XDCR	Faulty Transducer	
Faultball Set	CW RVDT	SB LVDT
1L	1 (Capt)	1A (Capt)
2L	3 (Capt)	3A (Capt)
3L	2 (Capt)	2A (Capt)
1R	1 (F/O)	1B (F/O)
2R	3 (F/O)	3B (F/O)

- 5) Spoiler PCA feedback RVDT faults require an additional step for detection (Fig. 11). The threshold monitor detects a difference between the command and feedback signals and causes a "switch" decision. This is because both the B and C subchannels detect errors.
  - 6) After the subchannels have been switched, the PCA will receive a signal from a different RVDT. If either the control wheel transducer or the speedbrake lever transducer were at fault, the threshold error would go away after the changeover and the applicable XDCR faultball would be set.
  - 7) If the fault does not go away within 2.0 seconds of the changeover, the PCA feedback RVDT is at fault. The PCA faultball will be set on the SCM which made the "switch" decision. There is no way to tell if the faultball is set from a faulty transducer on the right or the left PCA.
  - 8) The module faultball indicates a problem with the SCM itself and can be set in one of three ways:
    - a) When there is a fault detected in either subchannel B or subchannel C, but not both (a "switch inhibit" decision), no other faults have been detected, and time T1 (0.4 sec) has elapsed.
    - b) When there is a fault detected in B and C subchannels (ie, a "switch" decision), no other faults have been detected, and time T2 (2.4 sec) has elapsed; and
    - c) When an RVDT or LVDT fault is indicated by the comparator circuit and a "switch inhibit" decision has been made (fault in B or C but not both).
- (d) AIRPLANES WITH -200 SERIES SPOILER CONTROL MODULES;  
Maintenance Monitor
- 1) The maintenance monitor reads and compares the three input signals from the captain's control wheel transducers. If one input signal does not agree with the other two signals, the maintenance monitor moves the control away from the defective transducer (Fig. 10A). A CW RVDT FAULT message and fault details are stored in the existing fault memory to identify the defective control wheel RVDT unit (Fig. 13).

(8) AIRPLANES WITH -100 SERIES SPOILER CONTROL MODULES;

Fault Logic Anomalies

- (a) The faultball logic is designed to indicate failures of the units they address. Other failures, however, can cause faultballs to set. Module faultballs can be set by a fault in the Air/Ground system itself or in any of the individual relays that provide air/ground discretes to the SCM. Truck tilt switch failures can also set SCM module faultballs. Breaks in the wiring between any of the transducers (LVDTs and RVDTs) and the SCM can cause module faultballs to set. These problems are addressed in the Control System Electronics Unit Fault Isolation, FIM 27-09-00/101.

C. Control

- (1) The CSEU module operates automatically whenever it is powered; it has no operating controls or adjustments.

FAULT MESSAGE	DISCUSSION
SCM FAULT	THIS FAULT SHOWS WHEN A PROBLEM IS DETECTED IN THE SPOILER CONTROL MODULE (SCM) WITH SHOWS THIS MESSAGE. IF THE SCM SHELF POSITION IS CHANGED, THIS FAULT WILL CONTINUE TO SHOW ON THE SAME SCM.
SCM 1L FAULT SCM 2L FAULT SCM 3L FAULT	SCM 1R FAULT SCM 2R FAULT SCM 3R FAULT THIS FAULT SHOWS WHEN A SCM ON THE SAME SHELF DETECTS: <ul style="list-style-type: none"> <li>• A DIFFERENT SCM THAT IS NOT INSTALLED CORRECTLY</li> <li>• A CIRCUIT BOARD ON THE DIFFERENT SCM THAT IS DISLODGED</li> <li>• A DISCONNECTED INTERCONNECT WIRE BETWEEN THE TWO SCMs.</li> </ul>
26 VAC 27-61-13 26 VAC 27-61-15 26 VAC 27-61-17	26 VAC 27-61-14 26 VAC 27-61-16 26 VAC 27-61-18 THIS FAULT SHOWS WHEN A SCM DETECTS A 26V AC POWER SIGNAL THAT IS LESS THAN 16.5V AC. A DEFECTIVE POWER SUPPLY MODULE (PSM), OR A SHORTED CIRCUIT IN THE SPEEDBRAKE TRANSDUCER, THE CONTROL WHEEL TRANSDUCER, THE SCM, OR THE WIRING BETWEEN THESE COMPONENTS, CAN CAUSE THIS FAULT. THIS FAULT WILL SHOW ON ALL 3 SCMs ON THE SAME SHELF IF THERE IS A DEFECTIVE PSM. ALSO, THE WIRING DIAGRAM MANUAL (WDM) REFERENCE SHOWN IN THE FAULT DETAILS WILL AGREE ON ALL 3 SCMs.
A/G SYS1 FAULT A/G SYS2 FAULT AIR/GND FAULT	EACH SCM HAS 3 AIR/GROUND SENSOR INPUTS. AN OPEN SIGNAL TELLS THE SCM THAT THE AIRPLANE IS IN THE AIR. A GROUND SIGNAL TELLS THE SCM THAT THE AIRPLANE IS ON THE GROUND. THIS FAULT SHOWS WHEN 1 OF THE 3 AIR/GROUND INPUTS DISAGREES FOR 25 SECONDS, WHEN A DISAGREE OCCURS DURING A REDUNDANCY MANAGEMENT OPERATION (A "SWITCH" OR A "SWITCH INHIBIT" ACTION). THIS FAULT CAN SHOW WHEN YOU CHANGE THE AIR/GROUND STATE OF THE AIRPLANE DURING NORMAL MAINTENANCE OPERATIONS.
SB LVDT FAULT	THERE ARE 3 SPEEDBRAKE TRANSDUCERS (LINEAR VARIABLE DIFFERENTIAL TRANSFORMERS OR LVDTs) FOR EACH SHELF. EACH TRANSDUCER SENDS A SIGNAL TO EACH SCM. THIS FAULT SHOWS WHEN 1 OF THE SPEEDBRAKE TRANSDUCER SIGNALS IS OUT OF THE TOLERANCE RANGE OF THE OTHER 2 SIGNALS. FOR A DEFECTIVE LVDT, THIS FAULT WILL SHOW ON ALL 3 SCMs ON THE SAME SHELF. IF THIS FAULT SHOWS TWO TIMES ON THE SAME SCM, THEN ALL 3 OF THE SPEEDBRAKE TRANSDUCER SIGNALS WERE OUT OF THE TOLERANCE RANGE WITH EACH OTHER.
CW RVDT FAULT	THERE ARE 3 CONTROL WHEEL TRANSDUCERS (ROTARY VARIABLE DIFFERENTIAL TRANSFORMERS OR RVDTs) FOR EACH SHELF. EACH TRANSDUCER SENDS A SIGNAL TO EACH SCM. THIS FAULT SHOWS WHEN 1 OF THE CONTROL WHEEL TRANSDUCER SIGNALS IS OUT OF THE TOLERANCE RANGE OF THE OTHER 2 SIGNALS. FOR A DEFECTIVE RVDT, THIS FAULT WILL SHOW ON ALL 3 SCMs ON THE SAME SHELF. IF THIS FAULT SHOWS TWO TIMES ON THE SAME SCM, THEN ALL 3 OF THE CONTROL WHEEL TRANSDUCER SIGNALS WERE OUT OF THE TOLERANCE RANGE WITH EACH OTHER.
L FSPM FAULT R FSPM FAULT C FSPM FAULT	THE SCMs IN SHELF POSITIONS 2R AND 3L CAN GET INPUTS FROM THE SAM MODULE THAT PREVENT CONTROL WHEEL COMMANDS. THESE SIGNALS OCCUR AT HIGH AIRSPEEDS. A GROUND SIGNAL TELLS THE SCM THAT CONTROL WHEEL COMMANDS ARE PREVENTED. AN OPEN SIGNAL TELLS THE SCM THAT CONTROL WHEEL COMMANDS ARE NOT PREVENTED. THIS FAULT SHOWS WHEN 1 OF THE 3 SAM INPUTS DISAGREES FOR 25 SECONDS, OR WHEN A DISAGREE OCCURS DURING A REDUNDANCY MANAGEMENT OPERATION (A "SWITCH" OR A "SWITCH INHIBIT" ACTION).

FAULT MESSAGE	DISCUSSION
SAM FAULT	EACH SCM HAS 3 FLAP POSITION INPUTS. AN OPEN SIGNAL TELLS THE SCM THAT THE FLAPS ARE IN THE RETRACTED POSITION. A GROUND SIGNAL TELLS THE SCM THAT THE FLAPS ARE IN THE EXTENDED POSITION. THIS FAULT SHOWS WHEN 1 OF THE 3 FLAP POSITION INPUTS DISAGREES FOR 25 SECONDS, OR WHEN A DISAGREE OCCURS DURING A REDUNDANCY MANAGEMENT OPERATION (A "SWITCH" OR A "SWITCH INHIBIT" ACTION).
PSM 1 FAULT      PSM 2 FAULT	THIS FAULT SHOWS WHEN A SCM DOES NOT RECEIVE A VALID POWER SIGNAL FROM THE PSM ON THE SAME SHELF. THIS USUALLY OCCURS WHEN THERE IS A DEFECTIVE PSM. FOR A DEFECTIVE PSM, THIS FAULT WILL SHOW ON ALL 3 SCMs ON THE SAME SHELF. THIS FAULT ALSO SHOWS WHEN THERE IS A WIRING FAULT FROM THE PSM TO THE SCM THAT SHOWS THIS FAULT.
PCA 1 FAULT      PCA 7 FAULT PCA 2 FAULT      PCA 8 FAULT PCA 3 FAULT      PCA 9 FAULT PCA 4 FAULT      PCA 10 FAULT PCA 5 FAULT      PCA 11 FAULT PCA 6 FAULT      PCA 12 FAULT	A POWER CONTROL ACTUATOR (PCA) IS THE UNIT AT THE WING WHICH USES THE HYDRAULIC PRESSURE TO RAISE AND LOWER THE SPOILER PANEL. EACH SCM CONTROLS A SYMMETRICAL PAIR OF PCAs, ONE ON THE LEFT WING AND ONE ON THE RIGHT WING. THIS FAULT SHOWS WHEN THE SCM ATTEMPTS TO CONTROL THE POSITION OF THE SPOILER BUT IS NOT ABLE TO. THE PCA NUMBER CAN BE USED TO FIND THE WING LOCATION OF THE POSSIBLE DEFECTIVE COMPONENTS. THE FAULTS "PCA 1" TO "PCA 6" CORRESPOND TO THE SPOILERS 1 (OUTBOARD) TO 6 (INBOARD) ON THE LEFT WING. THE FAULTS "PCA 7" TO "PCA 12" CORRESPOND TO THE SPOILERS 7 (INBOARD) TO 12 (OUTBOARD) ON THE RIGHT WING.
L HYD PRESS SW R HYD PRESS SW C HYD PRESS SW	THE HYDRAULIC SYSTEM PRESSURE SWITCHES SEND VALID HYDRAULIC DISCRETE SIGNALS TO THE SCMs. THESE SIGNALS ARE A PAIR OF HIGH AND LOW LOGIC INPUTS. THIS FAULT SHOWS WHEN THE HYDRAULIC INPUTS TO THE SCM ARE NOT IN THE USUAL CONDITION. THIS FAULT IS USUALLY CAUSED BY A FAILURE OF THE HYDRAULIC PRESSURE SWITCH, AND DOES NOT IMPLY THAT THE HYDRAULIC PRESSURE IS LOW.
L HYD PRESS LO R HYD PRESS LO C HYD PRESS LO	THIS FAULT SHOWS THE SCM DETECTS LOW HYDRAULIC PRESSURE. ONLY ONE OF THESE FAULT MESSAGES CAN SHOW ON A SINGLE SCM. ADDITIONAL AMBER LIGHTS AND EICAS MESSAGES WILL OCCUR IF THE HYDRAULIC PRESSURE STAYS LOW.
SPOILER SHUTDOWN	THIS FAULT SHOWS WHEN THE SCM DOES A SHUTDOWN OF THE SPOILER PANEL IT CONTROLS. A SPOILER SHUTDOWN ALSO SENDS A CAUTION MESSAGE TO THE TOP EICAS DISPLAY.
AMBR DUE TO HYD	THIS FAULT SHOWS WHEN THE SCM SENDS A CAUTION MESSAGE TO THE TOP EICAS DISPLAY WHILE IT DETECTS LOW HYDRAULIC PRESSURE.
27-00-13 WIRING	THIS FAULT SHOWS WHEN THE SCM DETECTS A FAILURE OF THE HYDRAULIC INPUTS, AND THE HYDRAULIC INPUTS ARE WIRED SO THAT THE SCM ALWAYS DETECTS VALID HYDRAULIC PRESSURE.
SCM ERROR	THIS FAULT SHOWS WHEN A SCM MONITOR DETECTS AN ERROR FOR A SCM THAT IS NOT APPLICABLE FOR THAT SHELF POSITION.
NO CSEU POWER	THIS FAULT SHOWS WHEN THE "PSM 1 VALID" AND THE "PSM 2 VALID" LOGICAL SIGNALS SENT TO THE SCM ARE FALSE. THIS FAULT USUALLY OCCURS WHEN THE CIRCUIT BREAKERS FOR THE TWO PSMs ON ONE SHELF ARE NOT CLOSED.

FLIGHT CONTROL SYSTEM ELECTRONICS UNIT (CSEU) – MAINTENANCE PRACTICES

1. General

- A. This procedure gives the removal/installation and the installation test instructions for these flight control system electronics unit (CSEU) modules:
- (1) CSEU Power Supply Module (M536, M537, M538, M539)
  - (2) Spoiler Control Module (M530, M531, M532, M533, M534, M535)
  - (3) Stabilizer Trim/Aileron Lockout Module (M524, M525)
  - (4) Rudder Ratio Changer Module (M528, M529)
- B. The removal and installation of the Yaw Damper Module (M522, M523) is in AMM 22-21-04/401.

TASK 27-09-00-022-003

2. Remove the Component (Fig. 201)

A. General

- (1) The CSEU modules are on the left (E1-1) or the right (E2-1) shelves in the main electronic/electrical equipment center. Each module is mounted on a tray and held in place by two hold-down extractors (self-locking mechanism).

B. References

- (1) AMM 06-41-00/201, Fuselage Access Doors and Panels
- (2) AMM 20-10-01/401, E/E Rack-Mounted Components
- (3) AMM 20-41-01/201, Electro-Static Sensitive Devices
- (4) AMM 27-61-00/201, Spoiler/Speedbrake

C. Prepare for Removal

S 862-001

**WARNING:** DO THE SPOILERS DEACTIVATION PROCEDURE, OR MOVE ALL PERSONS AND EQUIPMENT AWAY FROM THE SPOILER PANELS. THE SPOILERS CAN RETRACT QUICKLY AND CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

**CAUTION:** ALL THE FLIGHT CONTROL MODULES ARE STATIC SENSITIVE. DO NOT HANDLE BEFORE READING PROCEDURE FOR HANDLING ELECTROSTATIC DISCHARGE SENSITIVE DEVICES. ALL FLIGHT CONTROL MODULES CONTAIN DEVICES THAT CAN BE DAMAGED BY STATIC DISCHARGE.

- (1) Do the deactivation procedure for the spoilers (AMM 27-61-00/201) or move all persons and equipment away from the spoiler panels.

EFFECTIVITY

ALL

27-09-00

01

Page 201  
Aug 22/00

S 862-005

- (2) Open these circuit breakers on the overhead circuit breaker panel, P11, and attach DO-NOT-CLOSE tags:
- (a) 11C6, FLT CONT ELEC 1L AC
  - (b) 11C7, FLT CONT ELEC 1L DC
  - (c) 11C8, FLT CONT ELEC 2L AC
  - (d) 11C9, FLT CONT ELEC 2L DC
  - (e) 11G17, FLT CONT ELEC 1R AC
  - (f) 11G18, FLT CONT ELEC 1R DC
  - (g) 11G26, FLT CONT ELEC 2R AC
  - (h) 11G27, FLT CONT ELEC 2R DC

S 862-006

- (3) Open the circuit breakers applicable to the module you want to remove and attach DO-NOT-CLOSE tags:
- (a) When you remove the stabilizer trim/aileron lockout module, open these circuit breakers on the P11 panel and attach DO-NOT-CLOSE tags:
    - 1) 11H11, STAB TRIM CONT LEFT
    - 2) 11H20, STAB TRIM CONT RIGHT
  - (b) When you remove the rudder ratio changer module, open this circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:
    - 1) 11G10, RUDDER RATIO

S 012-063

- (4) Open the electronics access door 119AL (AMM 06-41-00/201).
- D. Procedure

S 862-002

**CAUTION:** DO NOT TOUCH THE RUDDER RATIO CHANGER MODULE OR THE SPOILER CONTROL MODULE BEFORE YOU DO THE PROCEDURE FOR ELECTROSTATIC DISCHARGE SENSITIVE DEVICES. ELECTROSTATIC DISCHARGE CAN CAUSE DAMAGE TO THESE MODULES.

- (1) If you are removing the Rudder Ratio Changer Module or the Spoiler Control Module, do the procedure for electrostatic discharge sensitive devices (AMM 20-41-01/201).

S 022-007

- (2) Remove the module from the shelf (AMM 20-10-01/401).

TASK 27-09-00-422-008

3. Install the Component (Fig. 201)

A. References

- (1) AMM 20-10-01/401, E/E Rack-Mounted Components
- (2) AMM 20-41-01/201, Electro-Static Sensitive Devices
- (3) AMM 27-61-00/201, Spoiler/Speedbrake

B. Access

- (1) Location Zones
  - 119/120 Main Equipment Center
  - 211/212 Flight Compartment
- (2) Access Panel
  - 119AL Main Equipment Center

C. Procedure

S 862-059

**CAUTION:** DO NOT TOUCH THE RUDDER RATIO CHANGER MODULE OR THE SPOILER CONTROL MODULE BEFORE YOU DO THE PROCEDURE FOR ELECTROSTATIC DISCHARGE SENSITIVE DEVICES. ELECTROSTATIC DISCHARGE CAN CAUSE DAMAGE TO THESE MODULES.

- (1) If you are installing the Rudder Ratio Changer Module or the Spoiler Control Module, do the procedure for electrostatic discharge sensitive devices (AMM 20-41-01/201).

S 422-028

- (2) If both the 285T0017-103 and -104 CSEU power supply modules are installed you should do this step. This step will make the best use of the -104 module:
  - (a) Install the -104 modules in the 1L (M536) and 1R (M538) positions. You can move a -103 module from these positions to the 2L (M537) or 2R (M539) positions.

EFFECTIVITY

ALL

27-09-00

01

Page 205  
Dec 10/98

S 812-058

- (3) If you are about to install a spoiler control module in an airplane that has the -200 and the -100 series SCMs installed, the best fault isolation occurs when you have at least one -200 series SCM installed on each shelf.
- (a) When a -200 series SCM is available, it will provide the fastest and best fault isolation for spoiler system troubleshooting.
  - (b) A -200 series SCM is recommended for installation at a shelf position where intermittent problems occur, or when it is necessary to replace a SCM during the fault isolation procedure, to make use of its expanded capacity for fault detection and fault isolation.

S 422-009

- (4) Install the module on the shelf (Ref 20-10-01/401).

S 862-010

- (5) Remove the DO-NOT CLOSE tags and close these circuit breakers on the P11 panel if opened:
- (a) 11C6, FLT CONT ELEC 1L AC
  - (b) 11C7, FLT CONT ELEC 1L DC
  - (c) 11C8, FLT CONT ELEC 2L AC
  - (d) 11C9, FLT CONT ELEC 2L DC
  - (e) 11G10, RUDDER RATIO
  - (f) 11G17, FLT CONT ELEC 1R AC
  - (g) 11G18, FLT CONT ELEC 1R DC
  - (h) 11G26, FLT CONT ELEC 2R AC
  - (i) 11G27, FLT CONT ELEC 2R DC
  - (j) 11H11, STAB TRIM CONT LEFT
  - (k) 11H20, STAB TRIM CONT RIGHT

S 862-004

- (6) Put the system back to its initial condition.

S 862-011

- (7) Do the system test for the module you installed.

TASK 27-09-00-742-064

4. Installation Test of CSEU Module(s)

A. General

- (1) An additional test to verify the interface with the autoflight system is required after the replacement of the Stabilizer Trim/Aileron Lockout Module.

B. References

- (1) AMM 22-00-02/201, Autoflight BITE
- (2) AMM 24-22-00/201, Electrical Power - Control

- (7) AMM 32-09-02/201, Air/Ground Relays

C. Access

- (1) Location Zones
  - 119/120 Main Equipment Center
  - 211/212 Flight Compartment
- (2) Access Panel
  - 119AL Main Equipment Center

D. Prepare to Test

S 862-060

- (1) Supply electrical power (AMM 24-22-00/201).

S 862-061

- (2) Pressurize the left, right, and center hydraulic systems (AMM 29-11-00/201).

E. Do a Test of the Power Supply Module (PSM)

S 282-013

- (1) AIRPLANES WITH -104 POWER SUPPLY MODULES;  
Make sure that all circuit breakers on the front panels of the CSEU Power Supply Modules (1L, 2L, 1R, and 2R) are closed.

S 282-014

- (2) Make sure a failure does not show (a faultball is not latched) on the CSEU power supply module front panel.

**NOTE:** The faultball is yellow if it is latched (indicates a fault) and black if it is unlatched (indicates normal operation).

F. Do a System Test for the Spoiler Control Modules (SCMs)

S 862-029

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. INJURY TO PERSONS AND DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (1) Pressurize the left, right, and center hydraulic systems and reservoirs (AMM 29-11-00/201).

S 282-030

- (2) Make sure the control wheel is in the neutral position.

EFFECTIVITY

ALL

27-09-00

04

Page 207  
Aug 22/00

- S 282-031
- (3) Make sure the speedbrake lever, on the pilot's aft control stand P8, is in the down-and-locked position.
- S 862-032
- (4) Push the ECS MSG button on the EICAS MAINT panel on the right side panel, P61.
- S 862-033
- (5) Open this circuit breaker on the overhead circuit breaker panel, P11, and attach a DO-NOT-CLOSE tag:
- (a) 11G11, AUTO SPEEDBRAKE
- S 862-034
- (6) Push the RESET button on each of the six SCMs.
- S 282-035
- (7) AIRPLANES WITH -200 SERIES SCMs;  
Do the steps that follow to make sure EXISTING FAULTS? shows on the BITE display for each of the -200 series SCMs:
- (a) Push the ON/OFF button on the front panel of each -200 series SCM to the ON position.
- (b) If EXISTING FAULTS? does not show on the BITE display, you must enter the correct shelf position in the display:
- 1) Push the NO button to show the correct shelf position.
- 2) Push the YES button two times to select and confirm the correct shelf position.
- NOTE: EXISTING FAULTS? will now show in the display.
- (c) Push the ON/OFF button on the front panel of each -200 series SCM to the OFF position.
- S 282-036
- (8) Make sure the SPOILERS light is off, and the EICAS message SPOILERS does not show on the top or bottom display.
- S 282-037
- (9) Make sure all persons and equipment are away from all control surfaces.

EFFECTIVITY

ALL

27-09-00

04

Page 208  
Nov 10/94

S 862-038

- (10) Make sure the airplane is in the ground mode (AMM 32-09-02/201).

NOTE: When you change the air/ground state of the airplane, an air/ground system fault will occur if the air/ground signals disagree for more than 25 seconds.

NOTE: Use at least 10 seconds to complete each of the flight control movements that follow. Before you begin the next movement, hold the flight control in its position for 4 seconds.

S 862-039

- (11) Move the speedbrake lever from the down-and-locked position to the full-up position.

S 862-040

- (12) Move the control wheel from the neutral position to the full right position.

S 862-041

- (13) Move the control wheel back to the neutral position.

S 862-042

- (14) Move the control wheel from the neutral position to the full left position.

S 862-043

- (15) Move the control wheel back to the neutral position.

S 862-044

- (16) Move the speedbrake lever from the full-up position to the down-and-locked position.

EFFECTIVITY

ALL

27-09-00

04

Page 209  
Aug 22/99

S 862-045

**WARNING:** OBEY THE PROCEDURE THAT PUTS THE AIRPLANE IN THE AIR MODE. IF YOU DO THE PROCEDURE INCORRECTLY, INJURIES TO PERSONS AND DAMAGE TO EQUIPMENT CAN OCCUR.

(17) Put the air/ground relay system (systems No. 1 and No. 2) in the air mode (AMM 32-09-02/201).

**NOTE:** AIRPLANES WITH -200 SERIES SCMs;  
If you follow an air to ground transition in 10 seconds or less with a full speedbrake command, you will advance the flight leg data stored in the FAULT HISTORY memory. The SCM does not prevent the advance of the flight leg data in the procedure that follows.

S 862-046

(18) Move the speedbrake lever from the down-and-locked position to the full-up position.

S 862-047

(19) Move the control wheel from the neutral position to the full right position.

S 862-048

(20) Move the control wheel back to the neutral position.

S 862-049

(21) Move the control wheel from the neutral position to the full left position.

S 862-050

(22) Move the control wheel back to the neutral position.

S 862-051

(23) Move the speedbrake lever from the full-up position to the down-and-locked position.

S 282-052

(24) Make sure the SPOILERS light does not come on, and the EICAS message SPOILERS does not show on the top or bottom display.

S 282-053

(25) AIRPLANES WITH -100 SERIES SCMs;  
Make sure all faultballs on the front panels of each of the -100 series SCMs do not show yellow.

EFFECTIVITY

ALL

27-09-00

03

Page 210  
Aug 22/99

S 812-054

- (26) If the SPOILERS light does not come on, the EICAS message SPOILERS does not show on the top or bottom display, and no faultballs show yellow on -100 series SCMs, then the spoiler system and the spoiler control modules operate correctly.

S 862-055

- (27) Put the air/ground relay system back to the ground mode (AMM 32-09-02/201).

S 862-056

- (28) Remove hydraulic power if it is not necessary (AMM 29-11-00/201).

S 862-057

- (29) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the overhead circuit breaker panel, P11:  
(a) 11G11, AUTO SPEEDBRAKE

G. Do a Test of the Stabilizer Trim/Aileron Lockout Module (SAM)

S 722-024

- (1) Do MCDP Ground Test-65 STAB TRIM to test the auto stabilizer trim interfaces with the Autopilot/Flight Director (AMM 22-00-02/201).

S 862-025

- (2) Do the outboard aileron lockout test (AMM 27-11-00/501) to test the aileron lockout section of SAM.

H. Do a Test of the Rudder Ratio Changer Module (RRCM)

S 712-062

- (1) Do the procedure to test the left or right RRCM (AMM 27-21-00/501).

NOTE: This procedure is a part of the System Test - Rudder and Rudder Trim Control task in 27-21-00/501.

I. Put the Airplane Back to Its Initial Condition

S 862-026

- (1) Remove hydraulic power if it is not necessary (AMM 29-11-00/201).

S 862-027

- (2) Remove electrical power if it is not necessary (AMM 24-22-00/201).

FLIGHT CONTROLS – MAINTENANCE PRACTICES

1. General

- A. Aileron and Tabs help control aircraft movements and are moved by:
  - (1) Control wheels
  - (2) Cables
  - (3) Boosters
  - (4) Linkages
  - (5) Actuators
- B. Corrosion can occur on the following items:
  - (1) Pilots control wheel bearings.
  - (2) Bearings in the linkage of the power control actuator, outboard aileron lockout mechanism, and aileron control feel mechanism.
  - (3) Springs in the inboard aileron droop mechanism.
  - (4) Wheel well control rod bearings.
  - (5) Bearings in the input linkage of the power control actuators.
- C. The deployment of flight control surfaces exposes portions of the aileron control system to:
  - (1) Ground contaminants, thrust reverser soot, runway dirt, and inclement weather, all of which contributes to corrosion.

TASK 27-10-00-642-001

  - 561/661 RBX Outboard Aileron Lockout Mechanism
  - 561/661 MB Outboard aileron Actuators

C. Procedure

S 202-005

- (1) Inspect control wheel bearings and wheelwell control rod bearings for corrosion (noticeable white deposits, discoloration, and flaking), (Figure 201, 207).

S 202-008

- (2) Inspect Cables, Linkages, Boosters, and Actuators for corrosion (Noticeable white deposits, discoloration, flaking, and scaling).

S 102-006

- (3) For corrosion damage, it is necessary to do rework to the damage area to find the penetration depth of the damage into a structural member before you can establish its classification as allowable damage or damage requiring repair or replacement.

S 142-007

- (4) Remove all corrosion, evaluate damage and repair or replace all discrepant structure areas common to the flight controls. Follow up with an application of protective finishes and corrosion inhibiting compounds to retard future corrosion (SRM 51-10-02).

AILERON AND AILERON TRIM CONTROL SYSTEM – DESCRIPTION AND OPERATION

1. General

- A. The inboard and outboard ailerons and the spoilers (AMM 27-61-00/001), provide lateral control of the airplane (Fig. 1). At cruise speeds (approximately 278 knots), the outboard ailerons are locked in the neutral position to prevent over control. The inboard ailerons droop ten degrees when the flaps are fully extended to change the attitude of the airplane during landings.
- B. Description and operation of the stabilizer trim/aileron lockout module (SAM) is covered in the following paragraphs. Removal and installation of the SAM is covered in AMM 27-09-00/201.

Ailerons  
Figure 1

EFFECTIVITY	ALL
-------------	-----

27-11-00

01

Page 1  
Dec 22/01

- C. The ailerons are controlled by cable systems and powered by hydraulic actuators. Control wheel inputs are transferred by body cables to three lateral central control actuators (LCCAs). The LCCAs drive wing cables to the power control actuators (PCAs) at each aileron surface. Aileron trim switches electrically operate the ailerons.
- D. The autopilot system (AMM 22-11-00/001) provides automatic control of the ailerons. Electrical signals command the LCCA electrohydraulic servo valves to drive the wing cables. The "Control Wheel Steering" mode enables the flight crew to use the control wheels without disconnecting the autopilot system.
- E. The aileron position indicator is displayed on the lower EICAS display unit status page (Fig. 2). For more information on the aileron position indicating system, refer to AMM 27-18-00/001. EICAS will also indicate a failure in the aileron lockout system.

2. Component Locations (Fig. 3)

- A. The aileron drum assemblies are under the flight deck floor aft of the control column bases. The lost motion and load limiter assemblies are part of the first officer's drum. The control wheel force transducer is attached to the captain's drum. A bus rod connects the captain's drum to the first officer's drum. Both drum assemblies have three spoiler RVDTs (AMM 27-61-00/001) attached to them.
- B. The body cables run under the main deck floor along the sides of the fuselage. The primary body cables lie along the left side of the airplane and end in the left wheel well. The backup body cables lie along the right side of the airplane and end in the right wheel well. The wing cables run along the wing rear spars from the LCCA output quadrants to the lockout mechanisms.
- C. Several aileron components are found in the wheel wells and adjacent wing rear spars. The left wheel well area contains the feel, centering, and trim mechanism, the left LCCA torque tube, two LCCAs, and the left LCCA output quadrant. The right wheel well area contains the right aileron control quadrant, the right LCCA torque tube, the aileron control override mechanism, one LCCA, the right LCCA output quadrant, and the right aileron control output quadrant.
- D. The inboard ailerons are attached to the wing trailing edge between the inboard and outboard flaps. The outboard ailerons are attached to the wing trailing edge outboard of the outboard flaps. There are two PCAs attached to the leading edge of each aileron surface. Each aileron surface has one position transmitter. They are located outboard and forward of the PCAs.
- E. The inboard aileron droop mechanisms are on the wing rear spar, just inboard of the inboard ailerons. The aileron lockout mechanisms are on the wing rear spar just inboard of the outboard ailerons.

- F. Three shutoff valves (AMM 27-13-00/001) control hydraulic fluid flow to the aileron and spoiler PCAs. The valves are for ground use only. They are controlled by push-button switches on the right side panel, P61.
- G. The flight control system electronics unit (CSEU) modules are on the top shelf of the main equipment center. The stabilizer trim and aileron lockout modules (SAMs) are part of the CSEU system. The SAM monitors the condition of the aileron lockout mechanism. A failure of either mechanism causes a yellow fault ball to appear on the face of the related SAM. The fault ball is reset by pressing the reset button on the face of the SAM.

3. Component Details

A. Control Wheels (Fig. 4)

- (1) The control wheels on the 767 are similar to those used on other airplanes. Each has four control switches on the outboard horn: stabilizer trim, microphone, interphone, and autopilot disconnect. Mechanical stops limit wheel rotation to 65 degrees in either direction. The control wheel and the column cable quadrant rotate on a common shaft.
- (2) The control columns house the cables that connect the control wheels to the aileron drum assemblies. The cables are attached to the column cable quadrants at the top of the columns and run through the columns and under the flight deck floor.

B. Aileron Drum Assemblies (Fig. 4)

- (1) The drum assemblies are located between the flight deck floor and the nose gear wheel well. Access to the drums is through the main equipment center or flight deck floor access panels.
- (2) The drum assembly consists of two cable drums and a bus crank mounted one above the other on a shaft. The upper drum is attached to the control column cables. The bus crank of each drum assembly is attached to the other by a bus rod. The captain's lower drum is attached to the primary body cables and the first officer's lower drum is attached to the backup body cables. Each drum assembly has a spoiler RVDT unit mounted on the top drum. The control wheel steering force transducer is located between the bus crank and lower drum on the captain's drum assembly. The transducer senses control wheel inputs. Three pounds (1.4 kilograms) of control wheel force produces a transducer signal to the data management unit (DMU).

EFFECTIVITY	ALL
-------------	-----

27-11-00

- (3) The load limiter is attached to the bottom of the bus crank and the vertical shaft of the first officer's drum assembly. The bus crank is bearing mounted to the shaft. The load limiter consists of a spring, a cam, and a cam follower. A twenty six pound (11.8 kilogram) force on the first officer's control wheel rim will unseat the follower from the cam and allow the crank to move.
  - (4) The first officer's lost motion assembly consists of a crank attached to the vertical shaft and two stops on the lower drum. The lower drum is bearing mounted to the shaft. The shaft can rotate three degrees left or right before the crank contacts the stops on the lower drum. This allows LCCA valves to be fully opened without trying to drive the backup cables.
- C. Lateral Control Feel, Centering, and Trim Mechanism (Fig. 5)
- (1) The feel, centering, and trim mechanism is in the left wheel well. The mechanism consists of a quadrant, an actuator, linkage that connects the actuator to a spring-loaded cam follower, and a detented cam on the quadrant shaft.
  - (2) The left wheel well quadrant is mounted on the forward bulkhead. The primary body cables terminate at the quadrant. The aft bus input cables connect the left wheel well quadrant to the right aileron control quadrant. An adjustable control rod connects the quadrant to the left LCCA torque tube. The feel, centering, and trim mechanism is fixed to the left wheel well quadrant.
  - (3) The trim actuator is a 28 volt dc electric motor and acme screw. The actuator case is attached to structure and the output shaft is attached to the trim linkage. The actuator rotates the trim linkage which positions the left wheel well quadrant.
  - (4) The feel, centering, and trim mechanism provides a resistive force in the primary cables when the control wheels are rotated. This gives the flight crew a sense of feel when operating the ailerons. The mechanism returns the control wheels to the neutral or trimmed position when the wheels are released. The aileron system can be trimmed to a new neutral position by operating two aileron trim switches on the aft electronic control panel P8. The two switches energize the trim actuator which rotates the cam follower. As the cam follower and cams rotate, the quadrant backdrives the primary body cables, aft bus input cables, and control wheels. A decal on the control column indicates the amount of trim in the system.
- D. Right Aileron Control Quadrant (Fig. 5)
- (1) The right aileron control quadrant is mounted on the right wheel well forward bulkhead. The aft bus input cable connects the right aileron control quadrant to the left wheel well quadrant. An adjustable control rod links the quadrant to the right LCCA torque tube.

Page 9  
May 10/91

- E. LCCA Torque Tubes (Fig. 5)
- (1) The left LCCA torque tube is attached to the junction of the left wing rear spar and the left wheel well. The torque tube transfers control wheel inputs from the left aft quadrant to the left upper and lower LCCAs through adjustable control rods.
  - (2) The right LCCA torque tube is attached to the junction of the right wing rear spar and the right wheel well. The torque tube transfers control wheel inputs from the right aileron control quadrant to the right LCCA. The torque tube can also be operated by the override mechanism. The torque tube has an input crank, an output crank, and a lost motion device. A shear out at the right LCCA torque tube ensures a left or right cable system override in the unlikely event of an aileron control override mechanism jam.
- F. Aileron Control Override Mechanism (Fig. 5)
- (1) The override mechanism is attached to the right wing rear spar above the right LCCA. The mechanism consists of a cam, a cam follower, two springs, and a control rod. The cam, control rod, and quadrant share the same shaft but the quadrant is free to rotate independent of the shaft. The cam follower is attached to the quadrant and rests in the cam detent.
  - (2) The override mechanism is installed with the backup cable system. If the primary cable system breaks, the override mechanism provides an alternate path for control wheel inputs to the right and left LCCA torque tubes. If the right LCCA torque tube becomes jammed, the override mechanism will allow the backup cable system to operate the right aileron control output quadrant. When the right LCCA torque tube is jammed, the cam and control rod on the mechanism will not move. Backup cable input will rotate the quadrant and force the follower out of the cam detent. This allows the backup body cables to rotate the right aileron control output quadrant and drive the right wing cable system.
- G. Lateral Central Control Actuators (LCCAs) (Fig. 5)
- (1) The LCCAs are located outboard of the LCCA torque tubes. Two LCCAs, one above the other, are on the left wing rear spar, one LCCA is on the right wing rear spar. The left hydraulic system powers the top left side LCCA, the right system powers the bottom left side LCCA, and the center system powers the right side LCCA. The three LCCAs are identical and interchangeable.
  - (2) The LCCA consists of adjustable input and output rods, a control valve, a 25 micron wire mesh filter, two solenoid valves, an electrohydraulic servo valve (ESHV), two pressure regulators, a relief valve, a bypass check valve, an autopilot servo valve, a booster piston, and two linear variable differential transducers (LVDTs).

EFFECTIVITY

ALL

27-11-00

03

Page 10  
Dec 22/99

- (3) The three LCCAs keep control wheel forces to a low value compatible with good airplane control by hydraulically boosting the control wheel inputs to the wing cables. Control wheel inputs are carried by the primary body cables to the left wheel well quadrant. The quadrant drives the left torque tube directly and the right torque tube through the aft power bus cable. The LCCAs receive their inputs from the torque tubes and drive their respective output quadrants and wing cables.
- H. Left LCCA Output Quadrant (Fig. 5)
- (1) The left LCCA output quadrant is attached to the left wing rear spar just outboard of the two left LCCAs. The quadrant has two adjustable control rods connecting it to the left side LCCAs. A connector rod links the input cranks providing a path for either left side LCCA to drive the quadrant. Two sets of cables are attached to the quadrant: the left inboard wing cables and the aft power bus cables. The wing cables drive the droop mechanism. The aft power bus cables connect the left LCCA output quadrant to the right LCCA output quadrant.
- I. Right LCCA Output Quadrant (Fig. 5)
- (1) The right LCCA output quadrant is attached to the right wing rear spar just outboard of the right side LCCA. The aft power bus cables link the quadrant to the left LCCA output quadrant. Adjustable control rods connect the quadrant to the right side LCCA and the right aileron control output quadrant. The quadrant has a breakout assembly to prevent it from jamming the right aileron control output quadrant.
- J. Right Aileron Control Output Quadrant (Fig. 5)
- (1) The right aileron control output quadrant is attached to the right wing rear spar just outboard of the right LCCA output quadrant. The right aileron control output quadrant is connected to the right LCCA output quadrant by a control rod and to the droop mechanism by the wing cable system. The backup body cables terminate at the quadrant.
- K. Aileron Droop Mechanism (Fig. 6)
- (1) The droop mechanism is attached to the wing rear spar inboard of the inboard aileron. The mechanism consists of an inboard quadrant, a summing lever, and an outboard quadrant. The inboard quadrant receives its input through the wing cable system. The quadrant transfers this input to the summing lever and outboard quadrant through control rods. The inboard quadrant has a breakout assembly that prevents the quadrant from jamming if the inboard aileron will not operate.
- (2) The summing lever combines inputs from the inboard quadrant and from the trailing edge flaps through the aileron droop angle gearbox (Ref 27-51-00, Description and Operation). The summing lever transfers these inputs to the inboard PCAs through an adjustable control rod.
- (3) The outboard quadrant is driven by the inboard quadrant. The outboard quadrant transfers input to the outboard wing cables that operate the outboard aileron lockout mechanism. The outboard quadrant has a breakout assembly that prevents the quadrant from jamming if the outboard aileron will not operate.

- L. Inboard Power Control Actuators (PCAs) (Fig. 6)
- (1) There are two PCAs attached to each inboard aileron. The PCAs are accessible through a wing lower surface panel forward of the aileron. The actuators are attached to the wing rear spar by a link assembly and to the aileron surface by a reaction link and the actuator piston. Each actuator is powered by a separate hydraulic system.
  - (2) To find out if a PCA is by-passing, compare the temperature of the PCA's with a PCA that is on a surface that is not quickly drooping. If one of the PCA's is hot to the touch compared to the other PCA, the hot PCA is most likely by-passing fluid and must be removed and inspected/overhauled at the next convenient opportunity where manpower and components are available.
- M. Inboard Aileron (Fig. 6)
- (1) The inboard aileron is made of aluminum ribs and spars covered by graphite-epoxy-nomex core skin panels. The aileron has a removable lower nose panel, an attach point for each PCA, and two hinge bearings. The inboard aileron has no balance weights. Each aileron has a position transmitter mounted on the outboard forward corner (AMM 27-18-00/001).
- N. Outboard Aileron Lockout Mechanism (Fig. 7)
- (1) The lockout mechanism is attached to the wing rear spar just inboard of the outboard aileron PCAs. The lockout mechanism consists of a mechanical linkage and an electric actuator. Inputs to the lockout mechanism come from the wing cable system and the SAM. The mechanism drives the outboard aileron PCAs through an adjustable control rod.
  - (2) The actuator consists of a 28 volt dc motor, a jackscrew output rod, and internal limit switches. The actuator receives its command signals from the SAM as a function of airspeed. At cruise speed, the actuator is extended and the lockout mechanism linkage is positioned to prevent input to the outboard PCAs.
- O. Aileron Lockout Mechanical Operation (Fig. 7)
- (1) The lockout mechanism mechanical linkage consists of an actuator lever, an output crank, an actuator link, a drag link, an idler link, and a quadrant guard. The function of the linkage is to prevent input from the wing cables from being transmitted to the outboard PCAs. The lockout actuator moves the linkage from the unlocked to the locked-out position by extending and retracting its output rod.
  - (2) The actuator output rod is retracted at low speeds. In this position, cable inputs to the quadrant drive the idler link, which drives the drag link. The drag link causes the output crank to rotate, which operates the control rod to the outboard PCAs.

(3) When the actuator extends at cruise speed, the linkage is repositioned. The drag link, idler link, and quadrant guard are now aligned and pivot at the same point. In this position, cable inputs to the quadrant rotate the quadrant and the idler link. Since the drag link and the idler link pivot at the same point, the idler link does not drive the drag link. As long as drag link does not move, there is no movement of the output crank and no input to the outboard PCAs.

P. Outboard Power Control Actuators (PCAs) (Fig. 7)

(1) There are two PCAs attached to each outboard aileron. The PCAs are accessible through a wing lower surface panel forward of the aileron. The actuators are attached to the wing rear spar by a trunnion assembly and to the aileron surface by a reaction link and the actuator rod end. Each actuator is powered by a separate hydraulic system.

Q. Outboard Aileron (Fig. 7)

(1) The outboard aileron is made of a nomex honeycomb core with a graphite-epoxy skin bonded to the core. There are seven aluminum attach fittings for the two PCAs and five hinges. There are seven static dischargers on the trailing edge of the aileron. The outboard ailerons have two adjustable balance weights that stabilize the aileron in flight if both PCAs lose hydraulic power. A position transmitter is fixed to the forward edge of each aileron outboard of the PCAs (AMM 27-18-00/001).

(2) A record should be kept of all painting and repairs done to the outboard ailerons to ensure that the operational balance moment is not exceeded. Outboard aileron surfaces which exceed the operational balance moment may flutter during flight. Refer to the Structural Repair Manual (SRM 51-60-00) for operational balance moment determination.

R. Aileron Fault Indications (Fig. 8 and 13)

(1) An amber warning light and amber EICAS message alert the flight crew to failures in the aileron lockout system. The amber AIL LOCK light on the pilot's overhead panel P5 and the EICAS message AILERON LOCKOUT will appear simultaneously. The warning indicates a failure of either lockout actuator or a failure of the SAM aileron lockout function. Aileron lockout failure annunciation also occurs during the air data computer self test.

(2) The SAMs are located on the top shelf of the main equipment center. The only aileron function in the modules is aileron lockout. A single aileron lockout failure will appear as a fault ball on the SAM face.

4. Operation

A. Functional Description

- (1) Aileron position is displayed on the lower EICAS screen. For more information on the aileron position indicating system, Ref 27-18-00.

- (a) The aileron control wheels provide the input to the lateral control system. The control wheels operate cables inside the control columns. These cables transfer control wheel motion to the aileron drum assemblies. The drum assemblies are linked by a bus rod. Rotating either wheel will provide input to the primary body cables. The primary body cables drive the LCCAs which operate the wing cables to the PCAs.

NOTE: When you pull either control wheel back fast from full input to neutral by hand, you may feel vibrations in the control columns. These vibrations are not an indication of incorrect operation of the aileron system. This condition occurs because the control wheel is returned to neutral at a greater rate than that which the aileron system will automatically return the wheel from full input.

- (b) Control wheel rotation will also initiate spoiler deployment (AMM 27-61-00/001). The spoiler RVDT units mounted on the top of each drum assembly sense control wheel movement. This movement is translated into electrical signals which cause lateral control spoiler assist.
- (3) Control Wheels and Drum Assemblies - Abnormal Operation (Fig. 9)
- (a) The bus rod and load limiter allow either control wheel to operate the system if the other wheel becomes jammed. If the captain's wheel jams, the left drum assembly is fixed and the primary cables cannot be operated. The first officer can break out of the jam through the load limiter and drive the backup body cables. The backup body cables will then operate the right wing cable system through the right aileron control output quadrant.
  - (b) If the first officer's wheel jams, the right drum assembly is fixed. The captain can break out of the jam through the load limiter and drive the control system through the primary body cables.

EFFECTIVITY

ALL

27-11-00

05

Page 26  
Aug 22/01

- (4) Force Transducer Operation (Fig. 9)
  - (a) The force transducer is used by the autopilot system when it is in the control wheel steering mode. When the transducer senses control wheel input, it sends a signal to the selected flight control computer (FCC). The FCC sends a proportional signal to the LCCA servo valve. A lost motion device is designed into the transducer installation. This device assures that the transducer signal precedes the cable inputs to the LCCAs so that there will not be conflicting commands to the LCCA.
- (5) Left Wheel Well Quadrant Operation (Fig. 9)
  - (a) The left wheel well quadrant is driven by the primary body cables during normal operation. The quadrant drives the left LCCAs through the left torque tube and the right LCCA through the right aileron control quadrant. The trim actuator also drives the left quadrant in response to trim inputs. If the primary body cables break or become disconnected from the quadrant, the aft bus input cables from the right aileron control quadrant will backdrive the left wheel well quadrant.
- (6) Right Aileron Control Quadrant Operation (Fig. 9)
  - (a) The right aileron control quadrant receives its input from the left wheel well quadrant during normal operation. The right quadrant then drives the right LCCA torque tube which operates the right LCCA. If the primary body cables break, the backup body cables will drive the right LCCA torque tube through the aileron control override mechanism. The right torque tube will backdrive the right aileron control quadrant, providing input to the left and right LCCAs.
- (7) Feel, Centering, and Trim Mechanism Operation (Fig. 5, 9, and 10)
  - (a) The feel, centering, and trim mechanism provides the feel force during normal operation. As the quadrant is rotated, the cam forces the spring-loaded follower out of the detent. The spring force felt at the control wheels gives the flight crew a sense of feeling that the ailerons deflect. The spring force also returns the control wheels to the neutral position. When the input is removed from the control wheel, the spring-loaded follower forces the cam to rotate the quadrant back to its original position. This backdrives the primary body cables and returns the control wheel to the neutral position.
  - (b) The trim actuator is connected to the spring-loaded follower of the feel and centering assembly. When the actuator extends or retracts, it moves the follower. The follower rotates the cam and the left wheel well quadrant. This provides an input to the LCCAs and backdrives the control wheels. The input to the LCCAs remains steady until the actuator is operated to change the trim.

EFFECTIVITY

ALL

27-11-00

06

Page 27  
Aug 22/01

- (8) LCCA Operation (Fig. 9 and 11)
  - (a) The left and right LCCA output quadrants are bussed together by the aft power bus cable. This allows one LCCA to operate all of the wing cables if one or two LCCAs lose hydraulic power. It also prevents one LCCA from commanding a turn that does not agree with the other two LCCAs. Each LCCA is capable of operating the entire aileron system.
- (9) LCCA Operation - Autopilot Off
  - (a) Assume control wheel inputs rotate the input crank to the right. With the autopilot off, point B and point C rotate clockwise about point A. Point C also pivots about point E. As point C moves left, it moves point D and the control valve to the left. This opens the large side of the booster piston to return and pressure on the small side of the piston forces the piston to the left. As the piston moves left, point E and point D pivot about point C. This moves point D and the control valve to the right until the pressure line to the large side of the piston is closed. At this point the piston is in the commanded position.
  - (b) If the control valve jams, an anti-jam detent in the input linkage breaks out at about 160 in-lbs (18.08nm) allowing the other two LCCAs to continue operating normally.
- (10) LCCA Operation - Autopilot On
  - (a) When the autopilot system is operating, only one autopilot actuator is engaged. The other two are armed but not engaged. The LVDTs on the engaged autopilot supply the FCC with commanded position (actuator LVDT) vs actual position (output LVDT) signals. Any difference between the two becomes an error signal to the EHSV. When the EHSV receives an error signal it repositions the autopilot actuator. This moves point B to a new position which also moves point D. Control valve operation, booster piston movement and cancellation of the input by the linkage is the same as discussed in the autopilot off operation.
- (11) LCCA Operation - Pilot Override, Autopilot On
  - (a) When the autopilot is engaged, the flight crew can still operate the control wheels. This will deflect point B and move the detent piston while the actuator piston maintains the EHSV commanded position. The control valve is repositioned and the booster piston is driven in a direction to cancel out the control valve input. Since the autopilot piston did not move, the autopilot LVDT signal does not agree with output LVDT signal. This disagreement between signals will cause the autopilot to disengage unless the autopilot is in the control wheel steering mode.

EFFECTIVITY

ALL

27-11-00

02

Page 28  
Aug 22/01

- (12) Aileron Droop Operation (Fig. 9 and 14)
- (a) Aileron droop is mechanically controlled by the aileron droop angle gearbox (AMM 27-51-00/001). A cam inside the gearbox operates an output crank as the flaps extend or retract and provides a droop input to the droop summing lever. The droop summing lever is part of the linkage between the inboard droop quadrant and the inboard aileron PCAs. When the gearbox provides a droop input, it turns the droop summing lever and moves the PCA input cranks. This commands the inboard ailerons to move down (droop) as the flaps extend or move up as the flaps retract. Inboard aileron droop does not cause movement of the aileron control cables.
  - (b) Aileron droop, the slow movement of the surface from the neutral position with hydraulic systems depressurized, and without PCA inputs, is a normal condition. Quick droop with hydraulics depressurized, can be caused by an input to the PCA's or possibly high internal leakage (found in past reports due to worn piston rings). If an airplane shows quick drooping surfaces, with hydraulics depressurized and normal surface positions with hydraulics pressurized, the airplane is considered dispatchable. However, if the airplane shows quick surface droop, the PCA's must be inspected/overhauled at the next convenient opportunity where manpower and components are available not to exceed 120 days.
- (13) PCA Functional Description (Fig. 9 and 12)
- (a) The input linkage and actuator piston provide closed-loop operation and control of the PCA. As the piston extends or retracts, the original input through the linkage is nulled out when the piston reaches the commanded position.
  - (b) An overtravel mechanism allows the input linkage to go beyond full control valve displacement. Since the inboard ailerons are fully displaced at 50 percent of control wheel rotation, this mechanism allows the control cables to continue providing inputs to the outboard ailerons and spoilers after full inboard aileron travel has been reached. The PCA control valve is positioned by the input linkage to port hydraulic fluid to the piston. A bias spring in the control valve will force the valve to the retract position if the input linkup breaks loose. The valve will move to command trailing edge down (inboard aileron PCAs retract and outside aileron PCAs extend).

EFFECTIVITY

ALL

27-11-00

02

Page 29  
Aug 22/02

- (c) A compensator acts as an accumulator and relief valve to prevent fluid loss while the PCA is being backdriven. It maintains a small amount of pressurized fluid in the actuator in case the source hydraulic system is depressurized. This small amount of fluid assures correct operation of the anticavitation check valves. One of the three anticavitation check valves is installed in the inlet pressure line. It prevents reverse flow if the source hydraulic system is depressurized. The other two anticavitation check valves are installed in the return line to permit a low resistance fluid path from one side of the piston to the other. This prevents the piston from locking up when it is being backdriven. Two relief valves are installed in the actuator to provide internal pressure relief if the fluid pressure exceeds 3600 psi.
- (14) PCA Operation
  - (a) Assume control wheel operation results in movement of the input linkage to the right. This causes rotation of the overtravel mechanism as shown in the center of the Fig. 12. The control valve is displaced to the right and hydraulic fluid is ported to the right side of the piston causing it to retract. As the piston retracts, the input linkage pivots about the output pivot point. The overtravel mechanism rotates in the opposite direction moving the control valve to the neutral position. When the control wheel is returned to the original position, the process is reversed until the aileron reaches its initial position.
- (15) PCA Abnormal Operation
  - (a) Loss of hydraulic pressure to a single PCA will not affect the operation of the other PCA. The operating PCA will backdrive the depressurized PCA. Hydraulic fluid trapped inside the PCA will flow from one side of the piston to the other through the anticavitation check valves.
  - (b) If the PCA input linkage breaks, or becomes disconnected from one of the PCAs, the bias spring in the control valve will move the valve to command the trailing edge down (inboard aileron PCAs retract and outside aileron PCAs extend). If the command position is the same or above the failed position, the good PCA will command the aileron up, opposing the failed PCA down command. This results in no aileron movement. Movement in the up direction would occur only if forces from the good PCA and airload forces combined produce a pressure in the failed PCA that is higher than the load pressure relief valve setting. If the command position is lower than the failed PCA position, the trailing edge will move to the lower command position.

EFFECTIVITY

ALL

27-11-00

02

Page 30  
Aug 22/02

- (c) To find out if a PCA is by-passing, compare the temperature of the PCA's with a PCA that is on a surface that is not quickly drooping. If one of the PCA's is hot to the touch compared to the other PCA, the hot PCA is most likely by-passing fluid and must be removed and inspected/overhauled at the next convenient opportunity where manpower and components are available.
- (16) Outboard Aileron Lockout Operation (Fig. 7, 9, and 13)
  - (a) The air data computers provide continuous airspeed data to the SAM (Stabilizer Trim/Aileron Lockout Module) which compares this data with reference schedules. The outboard aileron lockout actuator receives its signals from the SAM. The SAM sends an extend or retract signal to the lockout actuator depending on the airspeed. Limit switches in the actuator shut the actuator motor off at extend and retract limits to prevent damage.
- (17) Test Operation of Aileron System/Spoilers and Lateral Control Shutoff Valve Response with Single Hydraulic Source
  - (a) The test of the aileron system/spoilers and lateral control shutoff valve response with single hydraulic source makes sure that the lateral control shutoff valves operate the ailerons and spoilers when each hydraulic system is powered separately. When doing this test, the ailerons will operate correctly as the control wheel is rotated, as do all the spoiler pairs except the inboard pair of the inboard spoilers.
    - 1) Each of the spoiler pairs are supplied by the same hydraulic system except the most inboard pair, spoilers 6 and 7. Spoiler 6 is powered by the left hydraulic system and spoiler 7 is powered by the right hydraulic system. During the test of the aileron system/spoilers and lateral control shutoff valve response with a single hydraulic source, this spoiler pair 6 and 7, which is operated by the same SCM, will try to operate as a symmetrical pair when the control wheel is rotated cw and ccw with only the left or right hydraulic system pressurized.
    - 2) The SCM does not recognize that these spoilers 6 and 7 are powered by different hydraulic systems. A faultball will set on the SCM after 4 seconds when the spoiler pair does not operate symmetrically with control wheel rotation when only the left or right hydraulic system is pressurized. When the control wheel is rotated, it must be held for 4 seconds for the SCM to isolate the fault and set the faultball. The faultball that sets on the SCM will cause the pressurized spoiler not to operate if the control wheel is cycled again.

EFFECTIVITY

ALL

27-11-00

02

Page 31  
Aug 22/02

- (b) Aileron system/spoiler operation with only the left hydraulic system powered will activate spoilers 1, 6, and 12, along with the left and right ailerons. When the control wheel is rotated full ccw, spoilers 1 and 6 will respond along with the left inboard and outboard and right outboard ailerons. When the control wheel is rotated back through neutral to full cw, spoiler 12 will respond along with the left inboard and outboard ailerons. Spoiler 7 will not respond to the cw control wheel movement, even though it is symmetrically opposite to spoiler 6. Since the SCM does not recognize that the spoiler pair is powered by different hydraulic systems, when the control wheel is returned to neutral and cycled again, spoiler 6 will begin to rise but will almost immediately return down because the SCM set a fault when spoiler 7 did not rise with the cw control wheel rotation. The small amount of rise in spoiler 6 is due to residual pressure in the hydraulic lines and not by command from the SCM.
- (c) Aileron system/spoiler operation with only the right hydraulic system powered will activate spoilers 2, 7, and 11, along with the left and right ailerons. When the control wheel is rotated full cw, spoilers 7 and 11 will respond along with the right inboard and outboard and left outboard ailerons. When the control wheel is rotated back through neutral to full ccw, spoiler 2 will respond along with the right inboard and outboard and left outboard ailerons. Spoiler 6 will not respond to the ccw control wheel movement, even though it is symmetrically opposite to spoiler 7. Since the SCM does not recognize that the spoiler pair is powered by different hydraulic systems, when the control wheel is returned to neutral and cycled again, spoiler 7 will begin to rise but will almost immediately return down because the SCM set a fault when spoiler 6 did not rise with the ccw control wheel rotation. The small amount of rise in spoiler 7 is due to residual pressure in the hydraulic lines and not by command from the SCM.
- (d) Aileron system/spoiler operation with only the center hydraulic system powered will activate spoilers 3, 4, 5, 8, 9, and 10 along with the left and right inboard ailerons. The spoilers and ailerons will respond correctly to cw and ccw control wheel movement since, they are all pressurized by the center system which results in their symmetrical operation with no SCM faults.

B. Control

- (1) Provide electrical power (AMM 24-22-00/201).

**WARNING:** TO PREVENT INJURY OR DAMAGE, CLEAR PERSONNEL AND EQUIPMENT FROM CONTROL SURFACES BEFORE PROVIDING HYDRAULIC POWER. ISOLATE ANY SYSTEM NOT INTENDED FOR OPERATION.

- (2) Provide left, center, and right hydraulic system power (AMM 29-11-00/201).

AILERON AND AILERON TRIM CONTROL SYSTEM – ADJUSTMENT/TEST

1. General

- A. This procedure contains these tasks:
- (1) Operational Test – Aileron and Aileron Trim Control System
  - (2) Adjustment – Aileron and Aileron Control System
  - (3) System Test – Aileron and Aileron Trim Control
  - (4) Aileron Response – Test (for Scheduled Maintenance)
- B. Refer to AMM 27-18-00/501 to get adjustment and test data for the aileron position indicating system.

TASK 27-11-00-715-002

2. Operational Test – Aileron and Aileron Trim Control System

A. General

- (1) Be careful because the spoilers will operate when the control wheel is moved.

**NOTE:** A single thumping noise can be heard from a PCA when the ailerons are moved full up or full down. This noise is heard only when the direction of movement of the PCA is changed. It is heard when the snubbing ring moves in the snubbing gland to change the direction of movement of the piston at the end of the stroke.

B. References

- (1) AMM 24-22-00/201, Electrical Power – Control
- (2) AMM 27-51-00/201, Trailing Edge Flap System
- (3) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems

C. Access

- (1) Location Zones
  - 211 Control Cabin (Left)
  - 212 Control Cabin (Right)
  - 556 Inboard Aileron (Left)
  - 656 Inboard Aileron (Right)
  - 567 Outboard Aileron (Left)
  - 667 Outboard Aileron (Right)

D. Prepare for the Test

S 865-001

- (1) Supply electrical power (AMM 24-22-00/201).

E. Aileron Response Test

S 215-006

- (1) Turn one of the two control wheels clockwise and hold it there for 2 seconds. Do the checks that follow:
  - (a) Make sure that the two left ailerons move down and that the two right ailerons move up.

NOTE: The spoiler panels on the right wing will operate when the control wheel is turned.

- (b) Make sure that the ailerons move smoothly from their full down position to their full up position.
- (c) Make sure that the amber SPOILERS light on the P5 panel is OFF.

S 215-007

- (2) Turn one of the two control wheels counterclockwise and do the checks that follow:
  - (a) Make sure that the two left ailerons move up and that the two right ailerons move down.

NOTE: The spoiler panels on the left wing will operate when the control wheel is turned.

- (b) Make sure that the ailerons move smoothly from their full down position to their full up position.
- (c) Make sure that the amber SPOILERS light on the P5 panel is OFF.

F. Aileron System and Lateral Control Shutoff Valve Reponse with Single Hydraulic Source Test

S 865-008

- (1) Make sure that the FLT CONTROL SHUTOFF WING switches L, C, and R on the right side panel, P61, are ON. Make sure that the amber switch-position legend lights are OFF.

S 865-009

- (2) Remove the power from the center and right hydraulic systems (AMM 29-11-00/201).

S 215-010

- (3) Turn the control wheel to its full counterclockwise position and hold it there for at least 4 seconds. Do the checks that follow:
  - (a) Make sure that the two left ailerons and the right outboard aileron operate correctly when the control wheel is moved. Ignore the movement of the right inboard aileron.
  - (b) Make sure that spoilers 1 and 6 operate when the control wheel is moved. Make sure that the other spoilers do not move.

EFFECTIVITY

ALL

27-11-00

01

Page 510  
Aug 22/01

S 215-011

- (4) Turn the control wheel to its full clockwise position, and hold it there for at least 4 seconds. Do the checks that follow:
- (a) Make sure the two left ailerons and the right outboard aileron operate correctly when you move the control wheel.

NOTE: Ignore the movement of the right inboard aileron.

- (b) Make sure that spoiler number 12 operates when the control wheel is moved. Make sure that the other spoilers do not move.

S 825-805

- (5) Move the control wheel to its neutral position.

S 865-015

- (6) Supply pressure to the right hydraulic system (AMM 29-11-00/201).

S 865-016

- (7) Remove the power from the left hydraulic system (AMM 29-11-00/201).

S 215-017

- (8) Turn the control wheel to its full clockwise position and hold it there for at least 4 seconds. Do the checks that follow:
- (a) Make sure that the two right ailerons and the left outboard aileron operate correctly when the control wheel is moved. Ignore the movement of the left inboard aileron.
  - (b) Make sure that spoilers number 7 and 11 operate when the control wheel is moved. Make sure that the other spoilers do not move.

S 215-018

- (9) Turn the control wheel to its full counterclockwise position and hold it there for at least 4 seconds. Do the checks that follow:
- (a) Make sure that the two right ailerons and the left outboard aileron operate correctly when the control wheel is moved. Ignore the movement of the left inboard aileron.
  - (b) Make sure that spoiler number 2 operates when the control wheel is moved. Make sure that all the other spoilers do not move.

Page 511  
Dec 22/04

S 825-801

- (10) Move the control wheel to its neutral position.

S 865-022

- (11) Remove the power from the right hydraulic system (AMM 29-11-00/201).

S 865-023

- (12) Supply pressure to the center hydraulic system (AMM 29-11-00/201).

S 215-024

- (13) Turn the control wheel to its full clockwise position, and hold it there for at least 4 seconds. Do the checks that follow:
- (a) Make sure that the inboard ailerons operate correctly when the control wheel is moved. Ignore the movement of the outboard ailerons.
  - (b) Make sure that spoilers number 8, 9, and 10 operate when the control wheel is moved. Make sure that the other spoilers do not move.

S 215-025

- (14) Turn the control wheel to its full counterclockwise position and hold it there for at least 4 seconds. Do the checks that follow:
- (a) Make sure that the inboard ailerons operate correctly when the control wheel is moved. Ignore the movement of the outboard ailerons.
  - (b) Make sure that spoilers number 3, 4 and 5 operate when the control wheel is moved. Make sure that the other spoilers do not move.

S 825-026

- (15) Move the control wheel to its neutral position.

S 865-027

- (16) Remove the power from the center hydraulic system if it is not necessary (AMM 29-11-00/201).

S 865-028

- (17) Remove electrical power if it is not necessary (AMM 24-22-00/201).

#### G. Aileron Trim Control Test

S 865-029

- (1) Supply electrical power (AMM 24-22-00/201).

EFFECTIVITY

ALL

27-11-00

02

Page 512  
Dec 22/04

S 865-030

- (2) Supply pressure to the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 215-031

- (3) Move the aileron trim switches on the aft electronic control panel, P8, to RIGHT WING DOWN. Hold the switches in this position until the control wheel movement stops. Do the check that follows:
  - (a) Make sure that the control wheels turn clockwise approximately 30 degrees from the neutral position.

S 215-032

- (4) Move the aileron trim switches on the P8 panel to LEFT WING DOWN. Hold the switches in this position until the control wheel movement stops. Do the check that follows:
  - (a) Make sure that the control wheels turn counterclockwise approximately 30 degrees from the neutral position.

S 215-033

- (5) Operate the trim switches until the aileron trim indicator shows zero units of trim.

#### H. Test Aileron Back-up Control

S 865-034

- (1) Turn the captain's control wheel to its full clockwise or counterclockwise position and hold it there.

S 215-035

- (2) Turn the first officer's control wheel to its full clockwise position and then its full counterclockwise position. Do the check that follows:
  - (a) Make sure that the two right ailerons operate when the control wheel is moved.

S 825-036

- (3) Move the control wheel to its neutral position.

**NOTE:** The control wheel can shake when it is moved quickly from full input to its neutral position. This is not an indication of incorrect operation of the aileron system. The control wheel shakes because it is moved to its neutral position faster than usual.

EFFECTIVITY

ALL

27-11-00

01

Page 513  
Aug 22/01

I. Test Inboard Aileron Droop

NOTE: All aileron positions are taken from the faired position (Fig. 508).

S 215-037

- (1) Make sure that the aileron trim is in its neutral position and that the control wheels are in their center position.

S 215-672

- (2) Make sure that the flaps are retracted.

S 865-038

- (3) Do the activation procedure for the trailing edge flaps (AMM 27-51-00/201).

S 215-039

WARNING: TO PREVENT INJURY OR DAMAGE, KEEP ALL PERSONS AND EQUIPMENT AWAY FROM THE CONTROL SURFACES. THE TRAILING EDGE FLAPS AND THE LEADING EDGE SLATS ARE FULLY POWERED. MAKE SURE THAT THE ENGINE STRUT ACCESS DOORS AND THE THRUST REVERSER COWLING ARE CLOSED. THIS WILL PREVENT DAMAGE WHEN THE SLATS ARE OPERATED.

- (4) Make sure that the flap lever on the control stand, P10, is in its zero (FLAPS UP) detent. Do the check that follows:  
(a) Make sure that the inboard ailerons are in the rigged position.

S 215-040

- (5) Move the flap lever to its 5-unit detent position. Do the check that follows:  
(a) Make sure that the left inboard aileron moves to  $10.44 \pm 1.00$  degrees down from the faired position.  
(b) Make sure that the right inboard aileron moves to  $10.81 \pm 1.00$  degrees down from the faired position.

S 215-766

- (6) Move the flap lever to its 30-unit detent position. Do the check that follows (Inboard aileron droop will decrease when flaps are moved to the 30-unit detent position):  
(a) Make sure the two inboard ailerons move at the same time to  $5.50 \pm 0.75$  degrees down from the faired position.

NOTE: Make sure the difference between the left inboard aileron position and the right inboard aileron position is not more than 0.75 degree.

EFFECTIVITY

ALL

27-11-00

06

Page 514  
Aug 22/01

S 215-712

- (7) Move the flap lever to its 15-unit detent position. Do the check that follows:
- (a) Make sure that the left inboard aileron moves to  $10.44 \pm 1.00$  degrees down from the faired position.
  - (b) Make sure that the right inboard aileron moves to  $10.81 \pm 1.00$  degrees down from the faired position.

S 215-043

- (8) Move the flap lever to its zero (FLAPS UP) detent position. Do the check that follows:
- (a) Make sure that the inboard ailerons are in the rigged position.

J. Test Outboard Aileron Lockout Actuator (Fig. 502)

S 215-044

- (1) Make sure that the aileron trim is in its neutral position and that the control wheels are in their center position.

S 215-045

- (2) Push and hold the FUNCTIONAL TEST switch on the left or right air data computer (ADC) module located on the E1-3 or E2-3 equipment shelf, or up and hold the AIR DATA TEST switch on the P61 test module and do the steps that follow:

**NOTE:** The lockout actuators will extend when the switch is pushed. The AIL LOCK light on the P5 panel will come ON. Also, an AILERON LOCKOUT message will come into view on the display.

Do not push the ADC switch when pressure is supplied to the pitot-static system. An incorrect fault condition can occur. To remove the fault, push the ADC test switch with the pitot-static system at ambient pressure.

- (a) Make sure that the outboard ailerons stay in their rigged position.

EFFECTIVITY

ALL

27-11-00

15

Page 515  
Aug 22/01

- (b) Turn one of the two control wheels to its full clockwise position and then to its full counterclockwise position. Do the check that follows:
  - 1) Make sure that the outboard ailerons do not move more than 1 degree up or 1 degree down.
- (c) Move the control wheel to its neutral position.

S 825-046

- (3) Release the FUNCTIONAL TEST switch or AIR DATA TEST switch.

S 215-047

- (4) Turn one of the two control wheels to its full clockwise position and then to its full counterclockwise position. Do the check that follows:
  - (a) Make sure that the outboard ailerons operate correctly when the control wheel is moved.

K. Put the Airplane Back to its Usual Condition

S 865-048

- (1) Remove the power from the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 865-049

- (2) Remove electrical power if it is not necessary (AMM 24-22-00/201).

TASK 27-11-00-835-429

3. Adjustment - Aileron and Aileron Control System

A. General

- (1) SYSTEM ADJUSTMENT SEQUENCE: This task adjusts the aileron control system and its components in the sequence that follows.

**NOTE:** This sequence is recommended for a complete system adjustment (refer to the specific adjustments shown in the next pages of this procedure).

- (a) Prepare for the Adjustments

EFFECTIVITY

ALL

27-11-00

04

Page 516  
Aug 22/03

- (b) Adjustment of the Control Column Cables (A1A, A1B, A2A, and A2B)
- (c) Adjustment of the Aileron Drum Assembly Bus Rod
- (d) Adjustment of the Aileron Primary Control Body Cables (A1A and A1B)
- (e) Adjustment of the Aileron Back-Up Control Body Cables (A2A and A2B)
- (f) Adjustment of the Aft Power Bus Cables (AB3A and AB3B)
- (g) Adjustment of the Aft Bus Input Cables (AB2A and AB2B)
- (h) Adjustment of the Right Wheel Well Components
- (i) Adjustment of the Left LCCA Torque Tube
- (j) Adjustment of the Inboard Left Wing Cables (A3A and A3B)
- (k) Adjustment of the Inboard Right Wing Cables (A4A and A4B)
- (l) Adjustment of the Outboard Left Wing Cables (A3A and A3B)
- (m) Adjustment of the Outboard Right Wing Cables (A4A and A4B)
- (n) A rig pin check of the Aileron Control Cable System
- (o) Adjustment of the Left Inboard Aileron Droop Mechanism
- (p) Adjustment of the Right Inboard Aileron Droop Mechanism
- (q) Adjustment of the LCCAs
- (r) Adjustment of the PCAs for the Left Inboard Aileron
- (s) Adjustment of the PCAs for the Right Inboard Aileron
- (t) Adjustment of the PCAs for the Left Outboard Aileron
- (u) Adjustment of the PCAs for the Right Outboard Aileron

- (2) **OUT OF SEQUENCE ADJUSTMENTS:** It is possible to adjust some components in a different sequence. You must do some other adjustments before the component adjustment and some adjustments after it is done. The necessary adjustments are as follows:

**NOTE:** Prepare for adjustment steps must be done before the out of sequence adjustments that follow.

**NOTE:** When replacing a component between rig pins no adjustment outside of the rig pins is necessary. When replacing a component outside of the rig pins, make sure you do an adjustment for that component and any necessary adjustments before and after that component.

- (a) Adjustment of Control Column Cables does not require other pre/post aileron system adjustments.
- (b) Adjustment of Aileron Drum Assembly Bus rod requires the Control Column Cables to be adjusted first.
- (c) Adjustment of the Aileron Primary Body cables requires the Control Column Cables to be adjusted first.
- (d) Adjustment of Aileron Back-Up Body Cables requires the Control Column Cables to be adjusted first.
- (e) Adjustment of the Aft Power Bus Cables requires:
  - 1) Adjustments of the Aileron Primary Control Body Cables and the Back-Up Body Cables before this adjustment.

MAINTENANCE MANUAL

- 3) Completion of the "Complete the LCCA adjustment" steps after this adjustment.
- 4) A fit check of rig pins A4, A11 and A19 after this adjustment.
- (k) Adjustment of the Inboard Left Wing Cables requires:
  - 1) Adjustments of the Aft Power Bus Cables and of the Right Wheel Well Components before this adjustment.
  - 2) A fit check of rig pins A8, A9 and A11 after this adjustment.
- (l) Adjustment of the Inboard Right Wing Cables requires:
  - 1) Adjustments of the Aileron Back-Up Body Cables and of the Right Wheel Well Components before this adjustment.
  - 2) A fit check of rig pins A10, A11, A14 and A15 after this adjustment.
- (m) Adjustment of the Outboard Left Wing Cables requires:
  - 1) Adjustment of the Inboard Left Wing Cables before this adjustment.
- (n) Adjustment of the Outboard Right Wing Cables requires:
  - 1) Adjustment of the Inboard Right Wing Cables before this adjustment.
- (o) Adjustment of the Left Inboard Aileron Droop requires:
  - 1) Adjustment of the Inboard Left Wing Cable before this adjustment.
  - 2) A fit check of rig pins A7 and A17 after this adjustment.
- (p) Adjustment of the Right Inboard Aileron Droop requires:
  - 1) Adjustment of the Inboard Right Wing Cable before this adjustment.
  - 2) A fit check of rig pins A13 and A18 after this adjustment.
- (q) Adjustment of the Left Inboard Aileron PCAs requires:
  - 1) Adjustment of the Left Inboard Aileron Droop before this adjustment.
  - 2) A fit check of rig pins A7 and A17 after this adjustment.
- (r) Adjustment of the Right Inboard Aileron PCAs requires:
  - 1) Adjustment of the Right Inboard Aileron Droop before this adjustment.
  - 2) A fit check of rig pins A13 and A18 after this adjustment.
- (s) Adjustment of the Left Outboard Aileron PCAs requires:
  - 1) Adjustment of the Outboard Left Wing Cables before this adjustment.
  - 2) A fit check of rig pin A9 after this adjustment.
- (t) Adjustment of the Right Outboard Aileron PCAs requires:
  - 1) Adjustment of the Outboard Right Wing Cables before this adjustment.
  - 2) A fit check of rig pin A15 after this adjustment.
- (3) Adjust the aileron PCAs with the airplane on its landing gear and the engines (or equivalent weights) installed on the struts. For other adjustments to the aileron control system, the airplane can be on jacks or its landing gear.
- (4) Before this procedure is done, make sure that the airplane temperature is stable (use a tolerance of  $\pm 5^{\circ}\text{F}$ ) along the cable. Make sure that the temperature has been stable for at least 1 hour.

**B. Equipment**

- (1) Inboard Aileron Rigging Bar - A27024-55 (Recommended), -47 (Optional), -2 (Optional)
- (2) Inboard Aileron Rigging Bar Mount Equipment - A27110-1
- (3) Outboard Aileron Rigging Bar - A27024-31 (Recommended) and A27024-29 (Optional)
- (4) Rig Pins from Set A20004-XX (AMM 20-10-24/201):
  - (a) A1 - P/N A20004-15
  - (b) A2 - P/N A20004-17
  - (c) A3 - P/N A20004-22
  - (d) A4 - P/N A20004-19
  - (e) A5 - P/N A20004-22
  - (f) A6 - P/N A20004-22
  - (g) A7 - P/N A20004-20
  - (h) A8 - P/N A20004-15
  - (i) A9 - P/N A20004-22
  - (j) A10 - P/N A20004-17
  - (k) A11 - P/N A20004-15
  - (l) A12 - P/N A20004-21
  - (m) A13 - P/N A20004-20
  - (n) A14 - P/N A20004-15
  - (o) A15 - P/N A20004-22
  - (p) A16 - P/N A20004-16
  - (q) A17 - P/N A20004-15
  - (r) A18 - P/N A20004-15
  - (s) A19 - P/N A20004-15
- (5) Power Supply, (LCCA Adjustment Procedure 1) - Powertron Model 5900  
Industrial Test Equipment Corp.  
Port Washington, New York
- (6) Digital Voltmeter - John Fluke 8020B or equivalent  
John Fluke Manufacturing Co., Inc.  
Everett, Washington
- (7) Breakout Box, Cables - A27063-91 (Preferred)  
Position Transmitter Tester - PTTS-892B (Alternate)  
Phase Synchronous Voltmeter - 101-AC5/6/7/8 (Alternate)
- (8) Bubble Protractor - Commercially Available
- (9) 10,000 ohm Resistor - Commercially Available
- (10) Control Wheel Straightedge - A27020-1
- (11) Cable Tensiometer - Commercially Available

**C. Consumable Materials**

- (1) D00633 Grease, Corrosion Preventive - BMS 3-33 (Preferred)
- (2) D00015 Grease, Corrosion Preventive - BMS 3-24 (Alternate)

**D. References**

- (1) AMM 06-44-00/201, Wing Access Doors and Panels
- (2) AMM 24-22-00/201, Electrical Power - Control

E. Access

(1) Location Zones

- 211 Control Cabin (Left)
- 212 Control Cabin (Right)
- 556 Inboard Aileron (Left)
- 656 Inboard Aileron (Right)
- 561 Rear Spar to Trailing Edge (Left)
- 661 Rear Spar to Trailing Edge (Right)
- 567 Outboard Aileron (Left)
- 667 Outboard Aileron (Right)

(2) Access Panels

- 561AB Wing TE Structure, Aileron Controls (Left)
- 661AB Wing TE Structure, Aileron Controls (Right)
- 561BB Wing TE Inboard Aileron Actuator (Left)
- 661BB Wing TE Inboard Aileron Actuator (Right)
- 561MB Outboard Aileron Actuator (Left)
- 661MB Outboard Aileron Actuator (Right)
- 561RBX Outboard Aileron Lockout Mechanism (Left)
- 661RBX Outboard Aileron Lockout Mechanism (Right)

F. Prepare for the Adjustment

S 865-050

- (1) Supply electrical power (AMM 24-22-00/201).

S 215-051

- (2) Make sure that the landing gear downlocks are installed (AMM 32-00-20/201).

S 495-052

**WARNING:** USE THE PROCEDURE IN AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (3) Open the main gear doors and install the door locks (AMM 32-00-15/201).

EFFECTIVITY

ALL

27-11-00

09

Page 521  
Apr 22/06

S 865-053

- (4) Move the FLT CONTROL SHUTOFF WING switches L, C, and R on the right side panel, P61, to OFF. Attach DO-NOT-OPERATE tags and make sure that the amber switch-position legend lights come ON.

S 865-054

- (5) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
- (a) 11H15, FLT CONT SHUTOFF WING LEFT
  - (b) 11H16, FLT CONT SHUTOFF WING CTR
  - (c) 11H26, FLT CONT SHUTOFF WING RIGHT

S 865-055

- (6) Retract the trailing edge flaps (AMM 27-51-00/201).

S 865-056

- (7) Do the deactivation procedure for the trailing edge flaps (AMM 27-51-00/201).

S 015-057

- (8) Open these access panels (AMM 06-44-00/201):

**NOTE:** If performing the adjustment out of sequence, only the applicable access panels must be opened.

- (a) 561AB/661AB to get access to the droop mechanism and summing lever.
- (b) 561BB/661BB to get access to the inboard aileron PCAs.
- (c) 561RBX/661RBX to get access to the outboard aileron lockout mechanism.
- (d) 561MB/661MB to get access to the outboard aileron PCAs.

G. Adjust the Control Column Cables (A1A, A1B, A2A, and A2B)

S 495-075

- (1) Attach the control wheel straightedge across the bottom of the control wheels.

**NOTE:** Remove the control wheel clipboard before the straightedge is installed.

EFFECTIVITY

ALL

27-11-00

01

Page 522  
Apr 22/06

S 035-067

- (2) Disconnect the bus rod from the crank for the first officer's drum assembly.

S 215-076

- (3) Adjust the cables between the control wheels and the drum assemblies to the value shown (Fig. 503). Do the checks that follow:
  - (a) Make sure that rig pins A1 (for the captain's drum assembly), A2 (for the first officer's drum assembly), can be easily installed (Fig. 501).
  - (b) Make sure that the control wheels are aligned correctly. It is permitted for one surface rest to be 0.03 inch (0.76 mm) (or less) away from the straightedge.
  - (c) Remove the rig pins A1 and A2.

H. Adjust the Aileron Drum Assembly Bus Rod

S 495-068

- (1) Install rig pins A1 (for the captain's drum assembly) and A2 (for the first officer's drum assembly) (Fig. 501).

S 825-069

- (2) Adjust the bus rod until the rod end bolt can be easily installed. Install the bolt and tighten the locknut.
  - (a) Make sure that rig pins A1 and A2 can be easily installed. (Fig. 501).
  - (b) Remove the rig pins A1 and A2.

I. Adjust the Aileron Primary Control Body Cables (A1A and A1B)

S 035-058

- (1) Disconnect the control rod between the feel, centering, and trim mechanism and the left LCCA torque tube.

S 825-059

- (2) Operate the aileron trim switches on the aft electronic control panel, P8, until rig pin A6 (Fig. 501) (for the feel, centering, and trim mechanism) can be easily installed. Remove the rig pin.

EFFECTIVITY

ALL

27-11-00

03

Page 523  
Aug 22/03

S 825-060

- (3) Adjust the cable tension to the value shown (Fig. 503). Do the check that follows:

**NOTE:** The turnbuckles for cables A1A and A1B are located behind a sidewall panel. This panel is opposite of the third panel aft of the forward cargo doors. Cables A1A and A1B are the second cables in from the compartment. Refer to AMM 25-52-01/401 for the sidewall panel removal procedure.

- (a) Make sure that rig pins A1 (for the captain's drum assembly), A3 (for the feel, centering, and trim mechanism), and A6 can be easily installed (Fig. 501).

J. Adjust the Aileron Back-Up Control Body Cables (A2A and A2B)

S 035-062

- (1) Disconnect the control rod between the right LCCA torque tube and the aileron-control override mechanism.

S 035-063

- (2) Disconnect the control rod between the right LCCA output quadrant and the right aileron-control output quadrant.

S 215-064

- (3) Adjust the cable tension to the value shown (Fig. 503). Do the checks that follow:

**NOTE:** The turnbuckles for back-up body cables A2A and A2B are located behind the third sidewall panel aft of the forward cargo door. Cables A2A and A2B are the second cables in from the compartment. Refer to AMM 25-52-01/401 for the sidewall panel removal procedure.

- (a) Make sure that rig pins A2 (for the first officer's drum assembly), A10 (for the override mechanism), and A12 (for the right aileron control output quadrant) can be easily installed (Fig. 501).

EFFECTIVITY

ALL

27-11-00

05

Page 524  
Aug 22/03

(b) Make sure that the breakout cam is in its center position in the override mechanism.

K. Adjust the Aft Power Bus Cables (AB3A and AB3B)

S 035-077

- (1) Disconnect the output control rods between the left LCCAs (top and bottom) and the left LCCA output quadrant.

S 035-078

- (2) Disconnect the output control rod between the right side (center hydraulic system) LCCA and the right LCCA output quadrant.

NOTE: The control rods will stay disconnected until the LCCAs are adjusted.

S 215-430

- (3) Make sure the cam is in its center position on the right LCCA output quadrant.

S 215-079

- (4) Adjust the cable tension to the value shown (Fig. 503). Do the check that follows:
- (a) Make sure that rig pins A5 (for the left LCCA output quadrant) and A11 (for the right LCCA output quadrant) can be easily installed (Fig. 501).
  - (b) Remove the rig pins.

L. Adjust the Aft Bus Input Cables (AB2A and AB2B)

S 825-070

- (1) Operate the aileron trim switches on the P8 panel until rig pin A6 (for the feel, centering, and trim mechanism) can be easily installed (Fig. 501). Remove the rig pin.

S 035-071

- (2) Disconnect the control rod between the right aileron control quadrant and the right LCCA torque tube.

EFFECTIVITY

ALL

27-11-00

S 215-072

- (3) Adjust the cable tension to the value shown (Fig. 503). Do the check that follows:
  - (a) Make sure that rig pins A3 (for the feel, centering, and trim mechanism) and A4 (for the right aileron control quadrant) can be easily installed (Fig. 501).

M. Adjust the Right Wheel Well Components

S 215-097

- (1) Make sure that the aileron-control override mechanism roller is in its center (detent) position of the cam.

S 215-098

- (2) Adjust the control rod between the right LCCA torque tube and the aileron control override mechanism. Make sure that these rig pins can be easily installed at the same time:
  - (a) A10 (for the aileron control override mechanism)
  - (b) A19 (for the right LCCA torque tube)

S 435-099

- (3) Tighten the thumb nut.

S 095-100

- (4) Remove rig pin A10.

S 215-101

- (5) Adjust the control rod between the right aileron control quadrant and the right LCCA torque tube. Make sure that these rig pins can be easily installed at the same time:
  - (a) A4 (for the right aileron control quadrant)
  - (b) A19 (for the right LCCA torque tube)

S 435-102

- (6) Tighten the thumb nut.

EFFECTIVITY

ALL

27-11-00

05

Page 526  
Aug 22/03

S 095-103

- (7) Remove rig pins A4 and A19.

S 215-104

- (8) Adjust the control rod between the right LCCA output quadrant and the right aileron output quadrant. Make sure that these rig pins can be easily installed at the same time.
- (a) A11 (for the right LCCA output quadrant)
  - (b) A12 (for the right aileron output quadrant)

S 435-105

- (9) Tighten the thumb nut.

S 095-106

- (10) Remove rig pins A11 and A12.

N. Adjust the Left LCCA Torque Tube

S 215-107

- (1) Install rig pin A3 (for the feel, centering, and trim mechanism). Make sure that rig pin A16 (for the left LCCA torque tube) can be easily installed. If the rig pins can not be easily installed at the same time, do these steps:
- (a) Disconnect the control rod between the left LCCA torque tube and the feel, centering, and trim mechanism.
  - (b) Adjust the control rod until rig pin A16 can be easily installed in the left LCCA torque tube.
  - (c) Tighten the thumb nut.

S 095-603

- (2) Remove rig pins A3 and A16.

O. Adjust the Inboard Left Wing Cables (A3A and A3B)

S 035-080

- (1) Disconnect the control rod between the inboard quadrant of the left droop mechanism and the droop summing lever.

EFFECTIVITY

ALL

27-11-00

S 225-431

- (2) Make sure that the disc index mark on the droop angle gearbox is aligned with the housing index mark, use a tolerance of  $\pm 0.015$  inch (0.38mm) (Fig. 504).

S 215-081

- (3) Adjust the cables to the value shown (Fig. 503). Do the checks that follow:

**NOTE:** Add 3 pounds (1.36 kg) to the cable rigging load for each 10,000 pounds (4536 kg) of fuel up to 80,000 pounds (36287 kg) of fuel.

- (a) Make sure that rig pins A5 (for the left LCCA output quadrant) and A7 (for the inboard quadrant - left droop mechanism) can be easily installed (Fig. 501).
- (b) Remove rig pin A5.

P. Adjust the Inboard Right Wing Cables (A4A and A4B)

S 035-086

- (1) Disconnect the control rod between the inboard quadrant of the right droop mechanism and the droop summing lever.

S 215-087

- (2) Adjust the cable tension to the value shown (Fig. 503). Do the check that follows:

**NOTE:** Add 3 pounds (1.36 Kg) to the cable rigging load for each 10,000 pounds (4535 kg) of fuel up to 80,000 pounds (36287 kg) of fuel.

- (a) Make sure that rig pins A12 (for the right aileron control output quadrant) and A13 (for the inboard quadrant - right droop mechanism) can be easily installed (Fig. 501).

EFFECTIVITY

ALL

27-11-00

09

Page 528  
Aug 22/03

(b) Remove rig pin A12.

Q. Adjust the Outboard Left Wing Cables (A3A and A3B)

S 495-432

(1) Install rig pin A7 (for the inboard quadrant - left droop mechanism).

S 215-093

(2) Make sure that the cam is in its center position on the outboard quadrant of the left droop mechanism.

S 215-094

(3) Adjust the cable tension to the value shown (Fig. 503). Do the check that follows:

**NOTE:** The turnbuckles for the left outboard wing cables A3A and A3B are located behind access panel 561LB (AMM 06-44-00/201).

(a) Make sure that rig pin A9 (for the left aileron lockout mechanism) can be easily installed (Fig. 501).

(b) Remove rig pins A7 and A9.

R. Adjust the Outboard Right Wing Cables (A4A and A4B)

S 495-433

(1) Install rig pin A13 (for the inboard quadrant - right droop mechanism).

S 215-095

(2) Make sure that the cam is in its center position on the outboard quadrant of the right droop mechanism.

S 215-096

(3) Adjust the cable tension to the value shown (Fig. 503). Do the check that follows:

**NOTE:** The turnbuckles for the outboard right wing cables A4A and A4B are located behind access panel 661LB (AMM 06-44-00/201).

(a) Make sure that rig pin A15 (for the right aileron lockout mechanism) can be easily installed (Fig. 501).

EFFECTIVITY

ALL

27-11-00

02

Page 529  
Aug 22/01

(b) Remove rig pins A13 and A15.

S. Do a Check of the Aileron Control Cable System

S 495-108

- (1) Make sure that these rig pins can be easily installed at the same time (Fig. 501):
- (a) A1 (for the captain's drum assembly)
  - (b) A2 (for the first officer's drum assembly)
  - (c) A3 (for the feel, centering, and trim mechanism)
  - (d) A4 (for the aileron control quadrant)
  - (e) A5 (for the left LCCA output quadrant)
  - (f) A6 (for the feel, centering, and trim mechanism)
  - (g) A7 (for the inboard quadrant - left droop mechanism)
  - (h) A8 (for the Left Droop summing Lever)
  - (i) A9 (for the left aileron lockout mechanism)
  - (j) A10 (for the aileron control override mechanism)
  - (k) A11 (for the right LCCA output quadrant)
  - (l) A12 (for the right aileron control output quadrant)
  - (m) A13 (for the inboard quadrant - right droop mechanism)
  - (n) A14 (for the Right Droop summing Lever)
  - (o) A15 (for the right aileron lockout mechanism)
  - (p) A16 (for the Left LCCA Torque Tube)
  - (q) A17 (for the input crank of the Left Aileron Outboard PCA)
  - (r) A18 (for the input crank of the Right Aileron Inboard PCA)
  - (s) A19 (for the Right LCCA Torque Tube)

S 095-109

- (2) Remove the rig pins.

T. Adjust the Left Inboard Aileron Droop Mechanism

S 225-110

- (1) Make sure that the disc index mark on the droop angle gearbox is aligned with the housing index mark (use a tolerance of  $\pm 0.015$  inch) (Fig. 504).

S 495-111

- (2) Install rig pins A7 (for the inboard quadrant - left droop mechanism) and A8 (for the left droop summing lever) (Fig. 501).

S 825-112

- (3) Adjust the control rod between the inboard quadrant and the summing lever until the bolts can be easily installed.

EFFECTIVITY

ALL

27-11-00

02

Page 530  
Aug 22/03

S 035-113

- (4) Install the control rod and tighten the locknuts. Apply a thin layer of grease to the threads that show.

S 095-114

- (5) Remove rig pins A7 and A8 (Fig. 501).

U. Adjust the Right Inboard Aileron Droop Mechanism

S 225-115

- (1) Make sure that the disk index mark on the droop angle gearbox is aligned with the housing index mark (use a tolerance of  $\pm 0.015$  inch) (Fig. 504).

S 495-116

- (2) Install rig pins A13 (for the inboard quadrant - right droop mechanism) and A14 (for the right droop summing lever).

S 825-117

- (3) Adjust the control rod between the inboard quadrant and the summing lever until the bolts can be easily installed.

S 035-118

- (4) Install the control rod and tighten the locknuts. Apply a thin layer of grease to the threads that show.

S 095-119

- (5) Remove rig pins A13 and A14.

V. Adjust the Lateral Central Control Actuator (LCCA)

**NOTE:** Four procedures are supplied to adjust the LCCAs.

PROCEDURE 1 - uses a commercially available power supply, a resistor, a digital voltmeter (DVM), and breakout box equipment.

PROCEDURE 2 - uses airplane power and a DVM with the breakout box equipment.

PROCEDURE 3 - uses a phase synchronous voltmeter only.

PROCEDURE 4 - uses the MCDP TEST 66.

S 845-806

- (1) Prepare for the LCCA Adjustment.
  - (a) Disconnect these control rods:
    - 1) Disconnect the control rod to the outboard aileron PCA linkage from the outboard aileron lockout mechanism (both wings). Use a bungee cord to attach the linkage to the airplane structure.

EFFECTIVITY

ALL

27-11-00

03

Page 531  
Apr 22/06

- 2) Disconnect the control rod to the inboard aileron PCA linkage from the droop summing lever (both wings). Use a bungee cord to attach the linkage to the airplane structure.
- (b) Adjust the three LCCA input control rods to a length of 20.20 ±0.05 inches. Install the control rods.
- (c) Install rig pins A1 (for the captain's drum assembly), A2 (for the first officer's drum assembly), and A3 (for the feel, centering, and trim mechanism) (Fig. 501).
- (d) Open these circuit breakers on the P11 panel and attach DO-NOT-CLOSE tags:
  - 1) 11E17, FLT CONT CMPTR PWR L
  - 2) 11E18, FLT CONT CMPTR SERVO L
  - 3) 11E20, FLT CONT CMPTR PWR C
  - 4) 11E21, FLT CONT CMPTR SERVO C
  - 5) 11E35, FLT CONT CMPTR PWR R
  - 6) 11E36, FLT CONT CMPTR SERVO R

S 825-689

- (2) Adjust the Right Side (center hydraulic system) LCCA (PROCEDURE 1)
  - (a) Make sure that the LCCA output rod is disconnected from the right LCCA.
  - (b) Install rig pins A10 (for the aileron control override mechanism), A11 (for the right LCCA output quadrant), and A19 (for the right LCCA torque tube) (Fig. 501).

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (c) Supply pressure to the center hydraulic system only (AMM 29-11-00/201).
- (d) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:

**NOTE:** This circuit breaker is opened in section "Prepare for Adjustment" of procedure "Adjustment - Aileron and Aileron Control System".

- 1) 11H16, FLT CONT SHUTOFF WING CTR

- (e) Remove the DO-NOT-OPERATE tag and move the FLT CONTROL SHUTOFF WING C switch on the P61 panel to ON.

NOTE: This switch is moved to OFF position in section "Prepare for Adjustment" of procedure "Adjustment - Aileron and Aileron Control System".

- (f) Do these steps to connect the breakout box equipment:
- 1) Disconnect the airplane connector from the LCCA. Connect the breakout box and the -41 cable assembly to the LCCA as shown (Fig. 505).
  - 2) Connect the DVM to the breakout box at pins 14 (SIG HI) and 16 (SIG LO).
  - 3) Connect the power supply to the breakout box at pins 12 and 13. Connect the resistor between pins 14 and 16. Adjust the power supply to  $26 \pm 0.020$  volts ac RMS, 400 Hz.
- (g) Adjust the input control rod to the right LCCA until the output voltage is  $0 \pm 0.050$  volt ac RMS at DVM 1.
- (h) Tighten the two nut and bolt assemblies on the output control rods to clamp threads.
- (i) Make sure that the voltage stays at  $0 \pm 0.050$  volt ac RMS.
- (j) Adjust the right LCCA output control rod until the rod end bolts can be easily installed.
- (k) Tighten the two nut and bolt assemblies on the output control rods to clamp threads.
- (l) Do these steps to remove the breakout box equipment:
- 1) Disconnect the power supply, the resistor, and the DVM from the breakout box.
  - 2) Disconnect the breakout box and the -41 cable assembly from the LCCA connector. Connect the airplane connector to the LCCA connector.
- (m) Remove rig pins A1, A2, A3, A10, A11, and A19 (Fig. 501).

NOTE: These rig pins A1, A2, A3 are installed in section "Prepare for LCCA Adjustment" of this procedure.

- (g) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:
  - 1) 11E17, FLT CONT CMPTR PWR L
  - 2) 11E18, FLT CONT CMPTR SERVO L
  - 3) 11E20, FLT CONT CMPTR PWR C
  - 4) 11E21, FLT CONT CMPTR SERVO C
  - 5) 11E35, FLT CONT CMPTR PWR R
  - 6) 11E36, FLT CONT CMPTR SERVO R
- (h) Make sure that the input voltage (at DVM 2) is 24 to 30 volts ac RMS, 400 Hz.
- (i) Adjust the input control rod that is connected between the left LCCA torque tube and the left bottom side (right hydraulic system) LCCA until the output voltage is  $0 \pm 0.050$  volt ac RMS.
- (j) Adjust the vertical control rod of the left LCCA output quadrant until the bolts can be easily installed and install the rod end bolts.
- (k) Tighten the lock nuts and lockwire. Make sure that the rod end bolts are free to move. Make sure that rig pins A5 and A16 can be easily installed and removed (Fig. 501). Make sure that the output voltage stays at  $0 \pm 0.050$  volt ac RMS.
- (l) Make sure that rig pins A4 (for the right aileron control quadrant), A10 (for the aileron control override mechanism), A5 and A11 (for the left and right LCCA output quadrants), A12 (for the right aileron control output quadrant), A16 and A19 (for the left and right LCCA torque tubes) can be easily installed (Fig. 501). Remove the rig pins.
- (m) Open these circuit breakers on the P11 panel and attach DO-NOT-CLOSE tags:
  - 1) 11E17, FLT CONT CMPTR PWR L
  - 2) 11E18, FLT CONT CMPTR SERVO L
  - 3) 11E20, FLT CONT CMPTR PWR C
  - 4) 11E21, FLT CONT CMPTR SERVO C
  - 5) 11E35, FLT CONT CMPTR PWR R
  - 6) 11E36, FLT CONT CMPTR SERVO R
- (n) Do these steps to remove the breakout box equipment:
  - 1) Disconnect the breakout box and the -40 cable assembly from the airplane connector. Disconnect the DVMs from the breakout box.

EFFECTIVITY

ALL

27-11-00

Aug 22/01

- 2) Disconnect the breakout box and the -41 cable assembly from the left bottom side (right hydraulic system) LCCA.  
Connect the airplane connector to the LCCA.
- (o) Remove rig pins A1, A2 and A3 installed in section "Prepare for LCCA Adjustment" of this procedure (Fig. 501).
- (p) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:
  - 1) 11E17, FLT CONT CMPTR PWR L
  - 2) 11E18, FLT CONT CMPTR SERVO L
  - 3) 11E20, FLT CONT CMPTR PWR C
  - 4) 11E21, FLT CONT CMPTR SERVO C
  - 5) 11E35, FLT CONT CMPTR PWR R
  - 6) 11E36, FLT CONT CMPTR SERVO R
- (q) Do the MCDP test 07 SERVO AIL (FIM 22-00-03/101, Fig. 107).

**NOTE:** This procedure does a check of the autopilot/flight director and thrust management system interface.

- (r) Remove the power from the left, right, and center hydraulic systems (AMM 29-11-00/201).
- (s) Continue to "Adjust the PCAs for the left Inboard Aileron" procedure.

S 825-695

- (10) Adjust the Left Top Side (left hydraulic system) LCCA (PROCEDURE 3):
  - (a) Disconnect the output control rod for the left top side (left hydraulic system) LCCA from the left LCCA output quadrant.
  - (b) Disconnect the vertical control rod from the left side of the left LCCA output quadrant.

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (c) Supply pressure to the left and center hydraulic systems (AMM 29-11-00/201).

EFFECTIVITY

Page 548  
Apr 22/06

- (d) Make sure that rig pins A5 (for the left LCCA output quadrant) and A16 (for the left LCCA torque tube) can be easily installed and removed (Fig. 501).
- (e) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:

NOTE: These circuit breakers are opened in section "Prepare for Adjustment" of procedure "Adjustment - Aileron and Aileron Control System".

- 1) 11H15, FLT CONT SHUTOFF WING LEFT
- 2) 11H16, FLT CONT SHUTOFF WING CTR
- (f) Remove the DO-NOT-OPERATE tags and move the FLT CONTROL SHUTOFF WING L and C switches on the P61 panel to ON.

NOTE: These switches are opened in section "Prepare for Adjustment" of procedure "Adjustment - Aileron and Aileron Control System".

- (g) Disconnect the airplane connector from the left top side (left hydraulic system) LCCA.
- (h) Use the tool instructions to prepare the phase synchronous voltmeter for use.
- (i) Attach the necessary cable assembly from the phase synchronous voltmeter to the left top side LCCA's LVDT.
- (j) Adjust the input control rod that is connected between the left LCCA torque tube and the left top side (left hydraulic system) LCCA until the output voltage on the phase synchronous voltmeter is  $0 \pm 0.050$  volt ac RMS.
- (k) Tighten the locknuts. Make sure that the output voltage stays at  $0 \pm 0.050$  volt ac RMS.
- (l) Adjust the top LCCA output control rod until the rod end bolts can be easily installed. Tighten the nuts. Make sure that rig pins A5 and A16 are able to move freely (Fig. 501).
- (m) Disconnect the phase synchronous voltmeter and the cable assembly from the left top side (left hydraulic system) LCCA. Connect the airplane connector to the LCCA.

S 825-701

- (11) Adjust the Left Bottom Side (right hydraulic system) LCCA (PROCEDURE 3):
  - (a) Make sure vertical control rod at the left side output quadrant is disconnected.

EFFECTIVITY

ALL

27-11-00

- (b) Supply pressure to the right hydraulic system (left and center hydraulic systems are already pressurized) (AMM 29-11-00/201).
- (c) Make sure that pins A5 (for the left LCCA output quadrant) and A16 (for the left LCCA torque tube) can be easily installed and removed (Fig. 501).
- (d) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:

NOTE: This circuit breaker is opened in section "Prepare for Adjustment" of procedure "Adjustment - Aileron and Aileron Control System".

- 1) 11H26, FLT CONT SHUTOFF WING RIGHT
- (e) Remove the DO-NOT-OPERATE tag and move the FLT CONTROL SHUTOFF WING R switch on the P61 panel to ON.

NOTE: This switch is opened in section "Prepare for Adjustment" of procedure "Adjustment - Aileron and Aileron Control System".

- (f) Disconnect the airplane connector from the left bottom side (right hydraulic system) LCCA.
- (g) Use the tool instructions to prepare the phase synchronous voltmeter for use.
- (h) Attach the necessary cable assembly from the phase synchronous voltmeter to the bottom left side LCCA's LVDT.
- (i) Adjust the input control rod that is connected between the left LCCA torque tube and the left bottom side (right hydraulic system) LCCA until the output voltage is  $0 \pm 0.050$  volt ac RMS.
- (j) Adjust the vertical control rod of the left LCCA output quadrant until the bolts can be easily installed and install the rod end bolts.
- (k) Tighten the locknuts and lockwire. Make sure that rig pins A5 and A16 can be easily installed (Fig. 501). Make sure that the output voltage stays at  $0 \pm 0.050$  volt ac RMS.
- (l) Make sure that rig pins A4 (for the right aileron control quadrant), A10 (for the aileron control override mechanism), A5 and A11 (for the left and right LCCA output quadrants), A12 (for the right aileron control output quadrant), A16 and A19 (for the left and right LCCA torque tubes) can be easily installed (Fig. 501). Remove the rig pins.

EFFECTIVITY

ALL

  - 5) 11E35, FLT CONT CMPTR PWR R
  - 6) 11E36, FLT CONT CMPTR SERVO R
- (d) Start the MCDP Ground Test 66 - XDCR OUTPUTS (FIM 22-00-04/101).
- 1) Push YES/ADV until 66 AIL SURF DEG shows.
- (e) Adjust the input control rod to the left top LCCA and/or to the left bottom LCCA until the applicable servo display is  $0.0 \pm 0.1$  degree. Tighten the locknuts.
- (f) Adjust the left top LCCA and/or left bottom LCCA output control rod (s) until the rod end bolts can be easily installed. Tighten the nuts.
- (g) Remove rig pins A1, A2, and A3 (Fig. 501).

NOTE: These pins are installed in section "Prepare for LCCA Adjustment" of this procedure.

- (h) Do the MCDP test 07 SERVO AIL (FIM 22-00-03/101, Fig. 107).

NOTE: This procedure does a check of the autopilot/flight director and thrust management system interface.

- (i) Remove the power from the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 845-808

- (13) Complete the LCCA adjustment
- (a) Connect the control rod from the outboard aileron lockout mechanism to the outboard aileron PCA linkage (both wings).
  - (b) If performing the LCCA adjustment out of sequence, connect the control rod from the droop summing lever to the inboard aileron PCA linkage (both wings).

W. Adjust the PCAs for the Left Inboard Aileron

S 495-230

- (1) Install rig pins A7, in the left inboard droop quadrant, and A8, in the left droop summing lever (Fig. 501).

S 825-231

- (2) Do these steps to connect the control rod for the inboard aileron PCAs to the droop summing lever:
- (a) Install rig pin A17, in the input crank of the outboard PCA for the left aileron.

EFFECTIVITY

ALL

27-11-00

- (b) Adjust the control rod until the rod end bolts can be easily installed.
- (c) Tighten the control rod locknuts and rod end bolts.

S 095-233

- (3) Remove rig pins A7, A8, and A17.

S 495-236

- (4) Install the inboard aileron rigging bar with the mount equipment against the wing bottom surface. Put the bar approximately 1.0 inch (25.4mm) inboard from and parallel to the outboard edge of the inboard aileron (Fig. 507).

S 825-234

- (5) If it is necessary, adjust the PCA input rods until their length is 20.31 ±0.05 inches (515.9mm +/-1.27mm).

S 035-235

- (6) Disconnect the input rod from the outboard PCA.

S 865-237

- (7) Supply pressure to the center hydraulic system only (AMM 29-11-00/201).

NOTE: The inboard PCA will be powered.

S 495-444

- (8) Install rig pin A3, in the feel, centering, and trim mechanism (Fig. 501)

S 985-269

- (9) During the input rod adjustment, manually move the input lever for the outboard PCA across its neutral position.

NOTE: This step is necessary to bleed unwanted hydraulic pressure from the outboard PCA.

EFFECTIVITY

ALL

27-11-00

S 825-268

- (10) Increase the length of the input rod for the inboard PCA until the aileron moves below the faired position approximately 1.00 inch (25.4 mm).

NOTE: The aileron faired position is found when the bottom trailing edge of the aileron is aligned with the "1" mark on the rigging bar scale.

S 825-298

- (11) Adjust the input rod until the aileron is  $0.40 \pm 0.10$  inch (10.16  $\pm$  2.54 mm) ( $0.40 \pm 0.10$  degrees) below its faired position (Fig. 508).

NOTE: The aileron is now in the rigged position.

S 435-299

- (12) Tighten the input rod locknuts and rod end bolts.

NOTE: Make sure that the aileron stays in the rigged position.

S 835-301

- (13) Keep a record of the position of the aileron trailing edge.

NOTE: This is the datum position that will be used when the outboard PCA is adjusted.

S 865-303

- (14) Remove the power from the center hydraulic system (AMM 29-11-00/201).

EFFECTIVITY

ALL

27-11-00

S 435-304

- (15) Install the bolt to temporarily connect the input rod to the outboard PCA.

S 865-306

- (16) Supply pressure to the left hydraulic system only (AMM 29-11-00/201) and stop for 3 minutes.

NOTE: The outboard PCA will be powered.

S 825-336

- (17) Increase the length of the input rod for the outboard PCA until the aileron is approximately 1.00 inch (25.4mm) below the faired position.

S 825-338

- (18) Adjust the input rod for the outboard PCA until the aileron is less than 0.1 inch (2.54mm) away from the datum position.

S 435-339

- (19) Tighten the input rod locknuts and rod end bolts.

NOTE: Make sure that the aileron is not more than 0.1 inch (2.54mm) away from the datum position.

S 865-341

- (20) Remove the power from the left hydraulic system (AMM 29-11-00/201).

S 865-343

- (21) Supply pressure to the center hydraulic system only (AMM 29-11-00/201) and stop for three minutes.

EFFECTIVITY

ALL

27-11-00

S 835-344

- (22) Keep a record of the position of the aileron trailing edge.

S 865-345

- (23) Remove the power from the center hydraulic system and supply pressure to the left hydraulic system only (AMM 29-11-00/201). Stop for 3 minutes.

S 225-346

- (24) Make sure that the aileron trailing edge is not more than 0.10 inch away from the position that you recorded. If it is necessary, adjust the input rod of the outboard PCA again. Tighten the jam nuts.

NOTE: After the nuts are tightened, make sure that the aileron is not more than 0.10 inch (2.54mm) away from the position that you recorded.

S 865-347

- (25) Remove the power from the left hydraulic system (AMM 29-11-00/201).

S 435-348

- (26) Install a lockwire on the inboard and outboard PCA input rods and apply a thin layer of grease to the threads that show.

S 095-350

- (27) Remove rig pin A3 and the inboard aileron rigging bar.

NOTE: The left inboard aileron is now in the rigged position.

X. Adjust the PCAs for the Right Inboard Aileron

S 495-351

- (1) Install rig pins A13, in the right inboard droop mechanism, and A14, in the right droop summing lever (Fig. 501).

EFFECTIVITY

ALL

- (14) Remove the power from the center hydraulic system (AMM 29-11-00/201).

S 435-410

- (15) Install the bolt to temporarily connect the input rod to the outboard PCA.

S 865-412

- (16) Supply pressure to the right hydraulic system only (AMM 29-11-00/201) and stop for three minutes.

NOTE: The outboard PCA will be powered.

S 825-500

- (17) Increase the length of the input rod for the outboard PCA until the aileron is approximately 1.00 inch (25.4mm) below the faired position.

S 825-458

- (18) Adjust the input rod until the aileron is less than 0.1 inch (2.54mm) away from the datum position.

S 435-446

- (19) Tighten the input rod locknuts and rod end bolts.

NOTE: Make sure that the aileron is not more than 0.1 inch (2.54mm) away from the datum position.

S 865-448

- (20) Remove the power from the right hydraulic system (AMM 29-11-00/201).

S 865-450

- (21) Supply pressure to the center hydraulic system only (AMM 29-11-00/201) and stop for three minutes.

EFFECTIVITY

ALL

27-11-00

02

Page 559  
Aug 22/01

S 835-451

- (22) Keep a record of the position of the aileron trailing edge.

S 865-452

- (23) Remove the power from the center hydraulic system and supply pressure to the right hydraulic system only (AMM 29-11-00/201). Stop for 3 minutes.

S 225-453

- (24) Make sure that the aileron trailing edge is not more than 0.10 inch (2.54mm) away from the position that you recorded. If it is necessary, adjust the input rod of the outboard PCA again. Tighten the jamnuts.

NOTE: After the nuts are tightened, make sure that the aileron is not more than 0.10 inch (2.54mm) away from the position that you recorded.

S 865-456

- (25) Remove the power from the right hydraulic system (AMM 29-11-00/201).

S 435-455

- (26) Install a lockwire on the inboard and outboard PCA input rods and apply a thin layer of grease to the threads that show.

S 095-457

- (27) Remove rig pin A3 and the inboard aileron rigging bar.

NOTE: The right inboard aileron is now in the rigged position.

Y. Adjust the PCAs for the Left Outboard Aileron

S 865-458

- (1) Do these steps to put the lockout actuator for the outboard aileron (Fig. 502) in its lockout position (actuator extended):

NOTE: The actuator must stay in its lockout position during the PCA adjustment procedure.

- (a) Move the AIR DATA CMPTR test switch on the P61 panel to L and hold it there.

NOTE: The actuator will extend in approximately 15 seconds.

EFFECTIVITY

ALL

27-11-00

02

Page 560  
Aug 22/01

- (b) Open these circuit breakers on the P11 panel and attach DO-NOT-CLOSE tags:
  - 1) 11C17, OUTBOARD AILERON LOCKOUT L
  - 2) 11C18, OUTBOARD AILERON LOCKOUT R
- (c) Release the AIR DATA CMPTR test switch.
- (d) Make sure that rig pin A9 (for the left aileron lockout mechanism) can move freely.

S 435-373

- (2) Make sure that the control rod from the outboard aileron PCAs to the lockout mechanism is connected.

S 495-459

- (3) Install the (A27024-31 replaces -29 which superseded -1) outboard aileron rigging bar against the wing bottom surface. Put the bar approximately 1.0 inch (2.54 cm) outboard from and parallel to the inboard edge of the outboard aileron (Fig. 507).

S 825-525

- (4) Use the outboard aileron rigging bar to find the aileron faired position.

NOTE: The faired position is found when the bottom trailing edge of the aileron is aligned with the "1" mark on the -29 (replaced by -31) rigging bar scale, or the "0" mark on the A27024-31 rigging bar scale.

S 825-678

- (5) Disconnect, and if necessary, adjust the inboard PCA input rod length to 9.62 ±0.05 inch (244.4 mm +/-1.27 mm).

S 865-463

- (6) Supply pressure to the left hydraulic system only (AMM 29-11-00/201).

NOTE: The inboard PCA will be powered.

EFFECTIVITY

ALL

27-11-00

02

Page 561  
Dec 22/01

S 825-501

- (7) Increase the length of the inboard PCA input rod until the aileron has moved approximately 1.0 inch (25.4mm) below the faired position.

**NOTE:** Adjust the rod ends if large adjustments are necessary and the body of the rod for small adjustments. When the PCA input rods are adjusted, be very careful not to move the input rod, the PCA or any other linkages in the area. Make sure that the neutral positions of the PCAs and its linkages do not change during the adjustment.

S 825-446

- (8) Disconnect the PCA input rod from the outboard PCA lever (Fig. 501).

S 985-638

- (9) Move the outboard PCA input lever across its neutral position. Do not move the aileron control surface.

**NOTE:** This step is necessary to bleed unwanted hydraulic pressure from the PCA that is not powered.

S 435-447

- (10) Install the bolt to temporarily connect the input rod to the outboard PCA lever.

S 825-523

- (11) Adjust the input rod for the inboard PCA until the bottom trailing edge of the aileron has moved up to 0.87 ±0.05 inch (22.1mm +/-1.27mm) below the aileron faired position (Fig. 508).

**NOTE:** The outboard aileron is in the rigged position.

Move the input rod in small increments. Disconnect and move the input lever for the outboard PCA across its neutral position, as necessary, to bleed any hydraulic pressure.

EFFECTIVITY

ALL

27-11-00

02

Page 562  
Aug 22/01

S 435-467

- (12) Engage the tab washers and tighten the inboard PCA input rod locknuts and rod end bolts.

NOTE: Make sure that the aileron stays in the rigged position.

S 835-469

- (13) Keep a record of the position of the aileron trailing edge.

NOTE: This is the datum position that will be used when the outboard PCA is adjusted.

S 865-470

- (14) Remove the power from the left hydraulic system (AMM 29-11-00/201).

S 865-473

- (15) Supply pressure to the right hydraulic system only (AMM 29-11-00/201) and stop for 3 minutes.

NOTE: The outboard PCA will be powered.

S 825-502

- (16) Increase the length of the outboard PCA input rod until the aileron has moved 1 inch (2.54 cm) below the faired position.

NOTE: When the PCA input rods are adjusted, be very careful not to move the input rod, the PCA or any other linkages in the area. Make sure that the neutral positions of the PCAs and its linkages do not change during the adjustment.

S 825-524

- (17) Adjust the input rod for the outboard PCA until the bottom trailing edge of the aileron is no more than 0.05 inch (1.27mm) away from the datum position.

EFFECTIVITY

ALL

Dec 22/01

S 435-477

- (18) Engage the tab washers and tighten the input rod locknuts and rod end bolts.

NOTE: Make sure that the aileron is no more than 0.05 inch (1.27mm) away from the datum position after the locknuts are tightened.

S 865-478

- (19) Remove the power from the right hydraulic system (AMM 29-11-00/201).

S 865-480

- (20) Supply pressure to the left hydraulic system only (AMM 29-11-00/201) and stop for three minutes.

S 835-481

- (21) Keep a record of the position of the aileron trailing edge.

S 865-482

- (22) Supply pressure to the right hydraulic system and remove the power from the left hydraulic system (AMM 29-11-00/201). Stop for three minutes.

S 225-483

- (23) Make sure that the aileron is not more than 0.05 inch (1.27mm) away from the position you recorded. If it is necessary, adjust the input rod of the outboard PCA again. Tighten the jam nuts.

NOTE: After the nuts are tightened, make sure that the aileron is not more than 0.05 inch (1.27mm) away from the position you recorded.

S 865-484

- (24) Remove the power from the right hydraulic system (AMM 29-11-00/201).

EFFECTIVITY

ALL

27-11-00

02

Page 564  
Aug 22/01

S 435-485

- (25) Install the lockwire on the inboard and outboard PCA input rods and apply a thin layer of grease to the threads that show.

S 215-448

- (26) Make sure that rig pin A9 (for the left aileron lockout mechanism) installs easily (Fig. 501).

S 865-487

- (27) Do this step to put the lockout actuator in its unlocked position (actuator retracted):

(a) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:

- 1) 11C17, OUTBOARD AILERON LOCKOUT L
- 2) 11C18, OUTBOARD AILERON LOCKOUT R

Z. Adjust the PCAs for the Right Outboard Aileron

S 865-488

- (1) Do these steps to put the lockout actuator for the outboard aileron (Fig. 502) in its lockout position (actuator extended):

**NOTE:** The actuator must stay in its lockout position during the PCA adjustment procedure.

- (a) Move the AIR DATA CMPTR test switch on the P61 panel to R and hold it there.

**NOTE:** The actuator will extend in approximately 15 seconds.

- (b) Open these circuit breakers on the P11 panel and attach DO-NOT-CLOSE tags:

- 1) 11C17, OUTBOARD AILERON LOCKOUT L
- 2) 11C18, OUTBOARD AILERON LOCKOUT R

- (c) Release the AIR DATA CMPTR test switch.

Aug 22/01

(d) Make sure that rig pin A15 (for the right aileron lockout mechanism) can move freely.

S 435-372

- (2) Make sure that the control rod from the outboard aileron PCAs to the lockout mechanism is connected.

S 495-489

- (3) Install the (A27024-31 replaces -29 which superseded -1) outboard aileron rigging bar against the wing bottom surface. Put the bar approximately 1.0 inch (25.4mm) outboard from and parallel to the inboard edge of the outboard aileron (Fig. 507).

S 825-532

- (4) Use the outboard aileron rigging bar to find the aileron faired position.

**NOTE:** The aileron faired position is found when the bottom trailing edge of the aileron is aligned with the "1" mark on the -29 (replaced by -31) rigging bar scale, or the "0" mark on the A27024-31 rigging bar scale.

S 825-531

- (5) Disconnect and if necessary adjust the inboard PCA input rod length to 9.62 ±0.05 inch (244.4mm +/-1.27mm).

S 865-493

- (6) Supply pressure to the right hydraulic system only (AMM 29-11-00/201).

**NOTE:** The inboard PCA will be powered.

S 035-494

- (7) Remove the lockwire, loosen the locknuts, and disengage the tab washers that are on the inboard PCA input rod.

EFFECTIVITY

ALL

27-11-00

02

Page 566  
Aug 22/01

S 825-530

- (8) Increase the length of the inboard PCA input rod until the aileron has moved approximately 1.0 inch (25.4mm) below the faired position.

NOTE: Adjust the rod ends if large adjustments are necessary and the body of the rod for small adjustments. When the PCA input rods are adjusted, be very careful not to move the input rod, the PCA or any other linkages in the area. Make sure that the neutral positions of the PCAs and its linkages do not change during the adjustment.

S 825-450

- (9) Disconnect the PCA input rod from the outboard PCA lever (Fig. 501).

S 985-642

- (10) Move the outboard PCA input lever across its neutral position. Do not move the aileron control surface.

NOTE: This step is necessary to bleed unwanted hydraulic pressure from the outboard PCA.

S 435-451

- (11) Install the bolt to temporarily connect the input rod to the outboard PCA lever.

S 825-503

- (12) Adjust the input rod for the inboard PCA until the bottom trailing edge of the aileron has moved up to  $0.87 \pm 0.05$  inch (22.1mm +/-1.27mm) below the aileron faired position (Fig. 508).

NOTE: The outboard aileron is in the rigged position.

Move the input rod in small increments. Disconnect and move the input lever for the outboard PCA across its neutral position, as necessary, to bleed any hydraulic pressure.

EFFECTIVITY

ALL

Dec 22/01

S 865-679

- (25) Remove the power from the left hydraulic system (AMM 29-11-00/201).

S 435-515

- (26) Install the lockwire on the inboard and outboard PCA input rods and apply a thin layer of grease to the threads that show.

S 095-516

- (27) Make sure that rig pin A15 (for the right aileron lockout mechanism) install easily (Fig. 501).

S 865-517

- (28) Do this step to put the lockout actuator in its unlocked position (actuator retracted):

(a) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:

- 1) 11C17, OUTBOARD AILERON LOCKOUT L
- 2) 11C18, OUTBOARD AILERON LOCKOUT R

AA. Check Inboard Aileron Droop

**NOTE:** All droop measurements are taken from the aileron faired position (Fig. 508).

S 865-645

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (1) Supply pressure to the left, right, and center hydraulic systems (AMM 29-11-00/201).

EFFECTIVITY

ALL

27-11-00

10

Page 570  
Aug 22/01

S 225-650

- (2) Move the flap lever to its 30-unit detent position. Let the flaps extend. Do the check that follows:
  - (a) Make sure the inboard ailerons move to  $5.50 \pm 0.75$  degrees down from the faired position. Make sure the ailerons move at the same time. If these conditions are not satisfactory, do the Adjust Inboard Aileron Droop procedure.

NOTE: Use a bubble protractor to measure the aileron movement in the adjustment procedure.

#### AB. Adjust Inboard Aileron Droop

NOTE: All droop measurements are taken from the aileron faired position (Fig. 508).

S 865-651

- (1) Remove the power from the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 035-652

- (2) Disconnect the flap input and output torque tubes from the aileron gearboxes (AMM 27-51-40/401).

NOTE: Do not let the torque tubes turn. If the tubes turn, then the flap retracted overtravel stop clearance and the flap synchronization will need to be adjusted (AMM 27-51-00/501).

S 865-653

- (3) Supply pressure to the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 825-656

- (4) With the flap control lever in the 30-unit detent position. Do these steps to adjust the ailerons:
  - (a) If the left aileron is too far down, turn the gearbox input shaft counterclockwise to move the aileron up. Move the aileron up to the 4.5-degree down position (approximately) and then move it down to the  $5.50 \pm 0.75$ -degree down position.

NOTE: One-half turn of the input shaft for the left or right gearboxes will move the aileron 0.18 degree (0.17 inch) (4.32 mm). Turn input shaft in increments of one third (1/3) revolution to make the attachment of torque tubes easier.

EFFECTIVITY

ALL

27-11-00

- (b) If the left aileron is too far up, turn the gearbox input shaft clockwise to move the aileron down to the  $5.50 \pm 0.75$ -degree down position.
- (c) If the right aileron is too far down, turn the gearbox input shaft clockwise to move the aileron up. Move the aileron up to its 4.5-degree down position (approximately) and then move the aileron down to the  $5.50 \pm 0.75$ -degree down position.
- (d) If the right aileron is too far up, turn the gearbox input shaft counterclockwise to move the aileron down to the  $5.50 \pm 0.75$ -degree down position.

S 865-659

- (5) Remove the power from the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 435-660

- (6) Connect the torque tubes. Use the nearest alignment coupling screw holes  $\pm 1/3$  of a revolution.

**NOTE:** Do not let the torque tubes turn when you connect them to the gearbox.

S 865-661

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (7) Supply pressure to the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 865-662

- (8) Move the flap lever to its 0-unit detent position. Let the flaps retract.

EFFECTIVITY

ALL

27-11-00

S 225-663

- (9) Move the flap lever to its 5-unit detent position. Let the flaps extend. Do the check that follows:
- (a) Measure the inboard aileron droop.
  - (b) Make sure that the mismatch between left and right inboard ailerons is less than 0.5 degrees (0.45 inches)(11.43 mm).
    - 1) If the mismatch is more than 0.5 degrees, do the adjustment procedure again.

S 865-518

- (10) Move the flap lever to its 0-unit detent position. Let the flaps retract.

S 865-519

- (11) Remove the power from the left, right, and center hydraulic systems (AMM 29-11-00/201).

AC. Put the Airplane Back to its Usual Condition

S 095-520

- (1) Remove the outboard aileron rigging bar.

S 095-664

**WARNING:** USE THE PROCEDURE IN AMM 32-00-15/201 TO REMOVE THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Remove the door locks for the main landing gear and close the doors (AMM 32-00-15/201).

S 865-522

- (3) Remove electrical power if it is not necessary (AMM 24-22-00/201).

S 415-523

- (4) Close the access panels that you removed.

EFFECTIVITY

TASK 27-11-00-735-524

4. System Test - Aileron and Aileron Trim Control

A. General

- (1) The neutral position for the control wheels is found when the bottom sides of the wheels align with a straight edge, use a tolerance of  $\pm 0.03$  inch (0.76 mm). The aileron trim must be adjusted to 0 units of trim when the control wheel neutral position is found.
- (2) The aileron trim indicator can be used to measure the control wheel position. One unit of aileron trim is equal to 5.5 degrees of control wheel movement.
- (3) Inboard and outboard aileron positions are measured from the faired position. You must add or subtract the actual rigged position measurements, as applicable, to get the aileron travel from the rigged position (Fig. 508).

B. Equipment

- (1) Control Wheel Straightedge - A27020-1
- (2) Inboard Aileron Rigging Bar - A27024-55 (Recommended), -47 (Optional), -2 (Optional)
- (3) Outboard Aileron Rigging Bar - A27024-31 (Recommended), A27024-29 (Alternative)
- (4) Bubble Protractor or Equivalent - Commercially Available
- (5) Control Wheel Adapter Equipment - A27021-96 or -98
- (6) Control Wheel Protractor Kit - A27021-29 (two A27021-30 protractors included) 4MIT65B80307-1 (optional)
- (7) Stopwatch - Commercially Available

C. References

  - 667 Outboard Aileron (Right)

E. Prepare to Test

S 865-525

- (1) Supply electrical power (AMM 24-22-00/201).

EFFECTIVITY

ALL

27-11-00

S 865-676

- (2) Make sure that these circuit breakers on the overhead panel, P11, are closed:
  - (a) EICAS (6 locations)
  - (b) 11L9, LEFT ENGINE OIL PRESS OR  
LEFT ENGINE OIL PRESS EICAS REF
  - (c) 11L36, RIGHT ENGINE OIL PRESS OR  
RIGHT ENGINE OIL PRESS EICAS REF

S 865-665

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (3) Supply pressure to the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 825-675

- (4) Push the STATUS button on the display select panel to show the control surface position indicator on the display.
- F. Test Control Wheel Operation (Fig. 504)

S 865-674

- (1) Retract the trailing edge flaps.

S 045-529

- (2) Do the deactivation procedure for the trailing edge flaps (AMM 27-51-00/201).

S 215-530

- (3) Make sure that the speedbrake lever is in its down and locked position.

S 215-531

- (4) Make sure that the control wheels are in their neutral positions.

EFFECTIVITY

ALL

27-11-00

S 025-813

- (5) Remove the medallions and chart holders from the control wheels.  
(a) Remove the two screws from the bottom of the medallion.  
(b) Remove the medallion and chart holder.

S 495-532

- (6) Install the control wheel adapter equipment and the protractor on the control wheels and do this check:  
(a) Make sure the adapter fully touches the bottom part of the control wheel.

NOTE: Make sure the control wheel equipment is balanced correctly. Make sure it does not cause more than 1.0 inch-pound of torque when you measure it at the control wheel pivot.

S 215-533

- (7) Turn the captain's control wheel to its full clockwise position and then its full counterclockwise position. Do the checks that follow:

NOTE: The control wheel can shake when it is moved quickly from full input to its neutral position. This is not an indication of incorrect operation of the aileron system. The control wheel shakes because it is moved to its neutral position faster than usual.

- (a) Make sure that the captain's control wheel travel in each direction is at least 65 degrees (measured from the neutral position). Make sure that the first officer's control wheel moves at least 63.5 degrees in each direction when the captain's control wheel is operated.  
(b) Make sure that the ailerons and the spoilers operate smoothly through their full travel range.

EFFECTIVITY

ALL

27-11-00

S 215-534

- (8) Turn the first officer's control wheel to its full clockwise position and then its full counterclockwise position. Do the checks that follow:

NOTE: The control wheel can shake when it is moved quickly from full input to its neutral position. This is not an indication of incorrect operation of the aileron system. The control wheel shakes because it is moved to its neutral position faster than usual.

- (a) Make sure that the first officer's control wheel travel in each direction is at least 65 degrees (measured from the neutral position). Make sure that the captain's control wheel moves at least 63.5 degrees in each direction when the first officer's control wheel is operated.

S 495-535

- (9) Attach a torque wrench to the first officer's control wheel.

S 225-536

- (10) Use a clamp to hold the captain's wheel in its full clockwise position. Turn the first officer's wheel to its full counterclockwise position and do the checks that follow:

- (a) Make sure that the maximum torque is 333-444 pound-inches (37.6-50.1 newton-meters).

NOTE: The maximum torque will occur when the control wheel positions are 25-35 degrees apart.

- (b) Make sure that the first officer's control wheel can move a total of 128-135 degrees.

S 225-537

- (11) Use a clamp to hold the captain's control wheel in its full counterclockwise position. Turn the first officer's wheel to its full clockwise position and do the above checks again.

G. Test Feel, Centering, and Trim

NOTE: During this test, the control wheel may shake when it is released from an input to its neutral position. This is not an indication of incorrect operation of the aileron system. The control wheel shakes because it is moved to its neutral position faster than usual.

S 865-538

- (1) Operate the aileron trim switches on the aft electronic control panel, P8, until the aileron trim indicator (on the control wheel) shows zero units of trim.

EFFECTIVITY

ALL

27-11-00

S 215-539

- (2) Turn the control wheel clockwise until the trim indicator shows one unit of trim. Hold it there momentarily and then release it. Do the check that follows:
  - (a) Make sure that the control wheel moves back to its neutral position (use a tolerance of  $\pm 2$  degrees).

NOTE: Use the trim indicator to measure the control wheel position. Two degrees of control wheel movement is equal to 0.07 inch (1.78 mm) measured at the trim indicator scale.

S 215-540

- (3) Turn the control wheel counterclockwise until the trim indicator shows one unit of trim. Hold it there momentarily and then release it. Do the check that follows:
  - (a) Make sure that the control wheel moves back to its neutral position (use a tolerance of  $\pm 2$  degrees).

S 215-541

- (4) Turn the control wheel clockwise until the trim indicator shows 5 units of trim. Hold it there momentarily and then release it. Do the check that follows:
  - (a) Make sure that the control wheel moves back to its neutral position (use a tolerance of  $\pm 2$  degrees).

NOTE: Use the trim indicator to measure the control wheel position. Two degrees of control wheel movement is equal to 0.07 inch (1.78 mm) measured at the trim indicator scale.

S 215-542

- (5) Turn the control wheel counterclockwise until the trim indicator shows 5 units of trim. Hold it there momentarily and then release it. Do the check that follows:
  - (a) Make sure that the control wheel moves back to its neutral position (use a tolerance of  $\pm 2$  degrees).

- (12) Turn the control wheel clockwise until the trim indicator shows one unit of trim. Hold it there momentarily and then release it. Do the check that follows:
- (a) Make sure that the control wheel moves back to its neutral position (use a tolerance of  $\pm 2$  degrees).

NOTE: Use the trim indicator to measure the control wheel position. Two degrees of control wheel movement is equal to 0.07 inch (1.78mm) measured at the trim indicator scale.

S 215-550

- (13) Turn the control wheel counterclockwise until the trim indicator shows one unit of trim. Hold it there momentarily and then release it. Do the check that follows:
- (a) Make sure that the control wheel moves back to its neutral position (use a tolerance of  $\pm 2$  degrees).

S 215-551

- (14) Turn the control wheel clockwise until the trim indicator shows five units of trim. Hold it there momentarily and then release it. Do the check that follows:
- (a) Make sure that the control wheel moves back to its neutral position (use a tolerance of  $\pm 2$  degrees).

NOTE: Use the trim indicator to measure the control wheel position. Two degrees of control wheel movement is equal to 0.07 inch (1.78mm) measured at the trim indicator scale.

S 215-552

- (15) Turn the control wheel counterclockwise until the trim indicator shows five units of trim. Hold it there momentarily and then release it. Do the check that follows:
- (a) Make sure that the control wheel moves back to its neutral position (use a tolerance of  $\pm 2$  degrees).

S 865-553

- (16) Supply pressure to the right hydraulic system only (AMM 29-11-00/201).

EFFECTIVITY

ALL

27-11-00

05

Page 580  
Apr 22/08

S 215-554

(17) Turn the control wheel clockwise until the trim indicator shows one unit of trim. Hold it there momentarily and then release it. Do the check that follows:

(a) Make sure that the control wheel moves back to its neutral position (use a tolerance of  $\pm 2$  degrees).

NOTE: Use the trim indicator to measure the control wheel position. Two degrees of control wheel movement is equal to 0.07 inch (1.78mm) measured at the trim indicator scale.

S 215-555

(18) Turn the control wheel counterclockwise until the trim indicator shows one unit of trim. Hold it there momentarily and then release it. Do the check that follows:

(a) Make sure that the control wheel moves back to its neutral position (use a tolerance of  $\pm 2$  degrees).

S 215-556

(19) Turn the control wheel clockwise until the trim indicator shows five units of trim. Hold it there momentarily and then release it. Do the check that follows:

(a) Make sure that the control wheel moves back to its neutral position (use a tolerance of  $\pm 2$  degrees).

NOTE: Use the trim indicator to measure the control wheel position. Two degrees of control wheel movement is equal to 0.07 inch (1.78mm) measured at the trim indicator scale.

S 215-557

(20) Turn the control wheel counterclockwise until the trim indicator shows five units of trim. Hold it there momentarily and then release it. Do the check that follows:

(a) Make sure that the control wheel moves back to its neutral position (use a tolerance of  $\pm 2$  degrees).

S 865-558

(21) Supply pressure to the left and center hydraulic systems (AMM 29-11-00/201).

NOTE: Make sure that the control wheel equipment is balanced correctly. Make sure that it does not cause more than 1.0 pound-inch of torque when it is measured at the wheel pivot.

EFFECTIVITY

ALL

27-11-00

02

Page 580A  
Aug 22/01

S 865-455

- (22) Turn the control wheel clockwise and then counterclockwise to its 65-degree position. Do the checks that follow:

NOTE: Use a torque wrench with a full scale indication of no more than 300 pound-inches (33.9 Nm).

- (a) Make sure that the breakout torque in the clockwise and counterclockwise directions (measured between 1 and 2 degrees) is between 20.0 - 32.5 pound-inches (2.25 Nm-3.67 Nm).
- (b) Make sure that the torque at the  $60 \pm 2$  degree position is between 65.0 - 104.0 pound-inches (7.34 Nm-11.75 Nm).

NOTE: Measure the torques while the control wheel moves slowly through the position to higher wheel angles.

- (c) Release the control wheel from the 65-degree position. Make sure that the control wheel goes back to its neutral position (use a tolerance of  $\pm 2$  degrees).

S 215-559

- (23) Move the aileron trim switches on the P8 panel to RIGHT WING DOWN and hold them there until the control wheel movement stops. Make sure that the system is in its center detent position. Do the checks that follow:

NOTE: Hit the control wheel lightly to make sure that the system is in its center detent position.

- (a) Make sure that the control wheels turn in the clockwise direction.
- (b) Make sure that the captain's control wheel turns  $30 \pm 2$  degrees from the neutral position.

S 215-560

- (24) Move the aileron trim switches on the P8 panel to LEFT WING DOWN and hold them there until the control wheel movement stops. Make sure that the system is in its center detent position. Do the checks that follow:

NOTE: Hit the control wheel lightly to make sure that the system is in its center detent position.

- (a) Make sure that the control wheels turn in the counterclockwise direction.
- (b) Make sure that the captain's control wheel turns  $30 \pm 2$  degrees from the neutral position.

EFFECTIVITY

ALL

27-11-00

08

Page 580B  
Dec 22/01

S 865-561

- (25) Move the trim switches to RIGHT WING DOWN and hold them there until the control wheel movement stops.

S 215-562

- (26) Turn the control wheel clockwise and then counterclockwise to its full travel limits and release it. Do the check that follows:  
(a) Make sure that the control wheel goes back to a position that is  $30 \pm 2$  degrees away from the neutral position.

S 865-563

- (27) Move the trim switches to LEFT WING DOWN and hold them there until the control wheel movement stops.

S 215-564

- (28) Turn the control wheel counterclockwise and then clockwise to its travel limits and release it. Do the check that follows:  
(a) Make sure that the control wheel goes back to a position that is  $30 \pm 2$  degrees from its neutral position.

S 215-565

- (29) Move each trim switch to the RIGHT WING DOWN position while the other switch stays at its neutral position. Do the check that follows:  
(a) Make sure that the control wheels do not move.

S 215-566

- (30) Move each trim switch to the LEFT WING DOWN position while the other switch stays in its neutral position.  
(a) Make sure that the control wheels do not move.

S 865-567

- (31) Operate the trim switches until the aileron trim indicator shows zero units of trim.

H. Test Aileron Response Time

S 215-568

- (1) Make sure that the trim system is in its neutral position. Make sure that the control wheels are in their center position.

EFFECTIVITY

ALL

27-11-00

08

Page 580C  
Aug 22/01

S 225-569

- (2) Turn the control wheel to its full clockwise position in no more than 1 second. Do the check that follows:
- (a) Make sure the ailerons move to their full travel positions in no more than 3 seconds.

S 215-570

- (3) Move the control wheel to its neutral position in no more than 1 second. Do the check that follows:

**NOTE:** The control wheel can shake when it is moved quickly from full input to its neutral position. This is not an indication of incorrect operation of the aileron system. The control wheel shakes because it is moved to its neutral position faster than usual.

- (a) Make sure the ailerons move to their rigged positions in no more than 3 seconds.

S 215-571

- (4) Turn the control wheel to its full counterclockwise position in no more than 1 second. Do the check that follows:
- (a) Make sure the ailerons move to their full travel positions in no more than 3 seconds.

S 215-572

- (5) Move the control wheel to its neutral position in no more than 1 second. Do the check that follows:

**NOTE:** The control wheel can shake when it is moved quickly from full input to its neutral position. This is not an indication of incorrect operation of the aileron system. The control wheel shakes because it is moved to its neutral position faster than usual.

- (a) Make sure the ailerons move to their rigged positions in no more than 3 seconds.

EFFECTIVITY

27-11-00

I. Test Aileron Travel

NOTE: All measurements are taken from the ailerons in their faired position (Fig. 508).

S 215-573

- (1) Make sure that the aileron trim is set to 0. Make sure the control wheels are in their center detent. Use the aileron rigging bars and do the checks that follow:

(a) Make sure the inboard ailerons are in the rigged position,  $0.40 \pm 0.24$  degree down from the aileron faired position.

NOTE: Use a bubble protractor and the inboard aileron rigging bar to make sure the inboard aileron rigging is in tolerance.

(b) Make sure the outboard ailerons are in the rigged position,  $2.0 \pm 0.28$  degrees down from the aileron faired position.

NOTE: Use a bubble protractor and the outboard aileron rigging bar to make sure the outboard aileron rigging is in tolerance.

S 225-575

- (2) Turn the control wheel clockwise to 32 and 54 degree positions ( $\pm 2$  degrees). Make sure that the inboard ailerons move to the positions shown in Table 501.

NOTE: Use a bubble protractor to measure the aileron movement from the faired position.

S 865-576

- (3) Move the control wheel to its center detent.

S 225-577

- (4) Turn the control wheel clockwise and then counterclockwise to the 32 and 54 degree positions ( $\pm 2$  degrees). Make sure that the ailerons move to the positions shown in Table 501.

EFFECTIVITY

ALL

27-11-00

Aileron Positions from the Faired Position Table 501				
WHEEL POSITION Degrees( $\pm 2$ Degrees)	LEFT INBOARD AILERON		RIGHT INBOARD AILERON	
	POSITION Degrees	DIRECTION ( $\pm 1$ Degree)	POSITION Degrees	DIRECTION ( $\pm 1$ Degree)
32 cw	21.5	Down	21.5	Up
32 ccw	21.5	Up	21.5	Down
WHEEL POSITION Degrees( $\pm 2$ Degrees)	LEFT OUTBOARD AILERON		RIGHT OUTBOARD AILERON	
	POSITION Degrees	DIRECTION ( $\pm 1$ Degree)	POSITION Degrees	DIRECTION ( $\pm 1$ Degree)
54 cw	15.5	Down	30.5	Up
54 ccw	30.5	Up	15.5	Down

J. Test Inboard Aileron Droop

S 865-666

- (1) Make sure the aileron trim is set to 0. Make sure that the control wheels are in their center detent position.

S 865-668

**WARNING:** TO PREVENT INJURY OR DAMAGE, KEEP ALL PERSONS AND EQUIPMENT AWAY FROM THE CONTROL SURFACES. THE TRAILING EDGE FLAPS AND THE LEADING EDGE SLATS ARE FULLY POWERED. MAKE SURE THAT THE ENGINE STRUT ACCESS DOORS AND THE THRUST REVERSER COWLING ARE CLOSED. THIS WILL PREVENT DAMAGE WHEN THE SLATS ARE OPERATED.

- (2) Do the activation procedure for the trailing edge flaps (AMM 27-51-00/201).

S 215-752

- (3) Move the flap lever to its 5-unit detent position. Do the check that follows:
  - (a) Make sure that the left inboard aileron moves to  $10.44 \pm 1.00$  degrees down from the faired position.
  - (b) Make sure that the right inboard aileron moves to  $10.81 \pm 1.00$  degrees down from the faired position.

EFFECTIVITY

ALL

27-11-00

S 215-392

- (4) Move the flap lever to its 30-unit detent position and do this check (Inboard aileron droop decreases when the flaps are moved to the 30-unit position):
- (a) Make sure the two inboard ailerons move at the same time to  $5.50 \pm 0.75$  degrees down from the faired position.

**NOTE:** Make sure the difference between the left inboard aileron position and the right inboard aileron position is not more than 0.75 degree.

S 865-457

- (5) Move the flap lever to its 15-unit detent position. Do the check that follows:
- (a) Make sure that the left inboard aileron moves to  $10.44 \pm 1.00$  degrees down from the faired position.
- (b) Make sure that the right inboard aileron moves to  $10.81 \pm 1.00$  degrees down from the faired position.

S 225-578

- (6) Turn the control wheel (from the neutral position) clockwise and then counterclockwise to its 16 and 50-degree positions ( $\pm 1$  degree). Do the check that follows:
- (a) Make sure that the inboard ailerons move to the positions shown in Table 502.

Table 502				
WHEEL POSITION Degrees ( $\pm 1$ Degree)	LEFT INBOARD AILERON		RIGHT INBOARD AILERON	
	DISPLACEMENT Degrees	DIRECTION ( $\pm 1$ Degree)	DISPLACEMENT Degrees	DIRECTION ( $\pm 1$ Degree)
16 cw	21.5	Down	0.25	Down
50 cw	21.5	Down	21.5	Up
16 ccw	0.0		21.5	Down
50 ccw	21.5	Up	21.5	Down

S 865-579

- (7) Do the activation procedure for the trailing edge flaps (AMM 27-51-00/201).

S 865-580

- (8) Move the flap lever to its zero detent position. Let the flaps retract.

EFFECTIVITY

ALL

27-11-00

S 215-581

- (9) Do the deactivation procedure for the trailing edge flaps (AMM 27-51-00/201). Do the check that follows:
- (a) Make sure that the inboard ailerons move to their rigged position.

S 095-428

- (10) Remove the control wheel adapter equipment.

S 425-814

- (11) Install the medallions and chart holders.
- (a) Put the medallion and chart holder in place and install the two screws in the bottom of the medallion.

K. Test Aileron Lockout Operation (Fig. 502)

S 215-582

- (1) Make sure that the aileron trim is set to 0. Make sure that the control wheels are in their center positions.

S 225-583

- (2) Push the FUNCTIONAL TEST switch on the left or right air data computer (ADC) module located on the E1-3 or E2-3 equipment shelf. Hold the switch in and do these steps:

**NOTE:** The lockout actuators will extend when the switch is pushed. The AIL LOCK light on the P5 panel will come ON. Also, an AILERON LOCKOUT message will come into view on the display.

Do not push the ADC switch when pressure is supplied to the pitot-static system. An incorrect fault condition can occur. To remove the fault, push the ADC test switch with the pitot-static system at ambient pressure.

- (a) Turn the control wheel 65 degrees clockwise and then 65 degrees counterclockwise. Do the check that follows:
  - 1) Make sure that the outboard ailerons do not move more than 1 degree up or 1 degree down.
  - 2) Move the control wheel to its neutral position.

S 215-584

- (3) Release the FUNCTIONAL TEST switch and do the check that follows:
- (a) Make sure that the AIL LOCK light on the pilots' overhead panel, P5, is OFF.

S 215-585

- (4) Move the COMPUTER select switch on the P9 panel to L. Do the check that follows:
- (a) Make sure that the amber AILERON LOCKOUT message does not come into view on the display.

EFFECTIVITY

ALL

27-11-00

S 215-586

- (5) Move the COMPUTER select switch on the P9 panel to R. Do the check that follows:
  - (a) Make sure that the amber AILERON LOCKOUT message does not come into view on the display.

S 215-587

- (6) Do a check on the left and right Stabilizer Trim/Aileron Lockout Modules (SAMs) (located on the E1-1 and E2-1 equipment shelves). Make sure that these fault balls are black on each SAM.
  - (a) ADC
  - (b) L AIL/E ASY ACT
  - (c) R AIL ACT
  - (d) SAM
  - (e) AIR/GND

L. Test Aileron Lockout Crossfeed

S 865-541

- (1) Move the COMPUTER select switch, on the P9 panel, to L.

S 865-588

- (2) Open this circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:
  - (a) 11A10, AIR DATA CMPTR L

S 215-589

- (3) Stop for 2 seconds. Make sure that the amber AIL LOCK light on the P5 panel is OFF.

S 865-590

- (4) Open this circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:
  - (a) 11F30, AIR DATA CMPTR R

S 215-591

- (5) Make sure that the amber AIL LOCK light is ON. Make sure that the amber AILERON LOCKOUT message comes into view on the display.

EFFECTIVITY

ALL

27-11-00

01

Page 580I

- S 865-513  
(6) Move the COMPUTER select switch on the P9 panel to R.

- S 865-542  
(7) Make sure that the amber AILERON LOCKOUT message is shown on the display.

- S 865-592  
(8) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:  
(a) 11A10, AIR DATA CMPTR L

- S 215-593  
(9) Stop for 6 seconds. Make sure that the amber AIL LOCK light is OFF. Make sure that the amber AILERON LOCKOUT message does not come into view on the display.

- S 865-594  
(10) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:  
(a) 11F30, AIR DATA CMPTR R

M. Test Left Aileron Lockout Function

S 865-669

**WARNING:** DO THE DEACTIVATION PROCEDURE FOR THE SPOILERS OR MOVE ALL PERSONS AND EQUIPMENT AWAY FROM THE SPOILERS. THE SPOILERS CAN RETRACT QUICKLY AND CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (1) Do the deactivation procedure for the spoilers (AMM 27-61-00/201) or move all persons and equipment away from the spoilers.

- S 865-670  
(2) Open these circuit breakers on the P11 panel and attach DO-NOT-CLOSE tags:  
(a) 11G17, FLT CONT ELEC 1R AC  
(b) 11G26, FLT CONT ELEC 2R AC

- S 215-595  
(3) Move the L AIR DATA test switch on the miscellaneous test panel, P61, to CMPTR for approximately 2 seconds. Do the checks that follow:  
(a) Make sure that the AIL LOCK light on the P5 panel comes ON.  
(b) Stop for 45 seconds. Make sure that the AIL LOCK light on P5 panel goes OFF.

EFFECTIVITY

ALL

27-11-00

20

- (4) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:
  - (a) 11G17, FLT CONT ELEC 1R AC
  - (b) 11G26, FLT CONT ELEC 2R AC

N. Test Right Aileron Lockout Function

S 865-671

**WARNING:** DO THE DEACTIVATION PROCEDURE FOR THE SPOILERS OR MOVE ALL PERSONS AND EQUIPMENT AWAY FROM THE SPOILERS. THE SPOILERS CAN RETRACT QUICKLY AND CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (1) Do the deactivation procedure for the spoilers (AMM 27-61-00/201) or move all persons and equipment away from the spoilers.

S 865-597

- (2) Stop for 10 seconds, then open these circuit breakers on the P11 panel and attach DO-NOT-CLOSE tags:
  - (a) 11C6, FLT CONT ELEC 1L AC
  - (b) 11C8, FLT CONT ELEC 2L AC

S 215-598

- (3) Move the R AIR DATA test switch on the P61 panel to CMPTR for approximately 2 seconds. Do the checks that follow:
  - (a) Make sure that the AIL LOCK light on the P5 panel comes ON.
  - (b) Stop for at least 45 seconds, then make sure that the AIL LOCK light on the P5 panel goes OFF.

S 865-599

- (4) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:
  - (a) 11C6, FLT CONT ELEC 1L AC
  - (b) 11C8, FLT CONT ELEC 2L AC

O. Put the Airplane Back to its Usual Condition

S 865-600

- (1) Remove the power from the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 865-601

- (2) Remove electrical power if it is not necessary (AMM 24-22-00/201).

TASK 27-11-00-715-393

5. Aileron Response - Test

**NOTE:** This is a scheduled maintenance task.

EFFECTIVITY

ALL

27-11-00

21

Page 580K  
Aug 22/01

A. General

- (1) Be careful because the spoilers will operate when you move the control wheel.

**NOTE:** A single thumping noise can be heard from a PCA when the ailerons are moved full up or full down. This noise is heard only when the direction of movement of the PCA is changed. It is heard when the snubbing ring moves in the snubbing gland to change the direction of movement of the piston at the end of the stroke.

B. References

- (1) AMM 24-22-00/201, Electrical Power - Control
- (2) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems

C. Prepare for the Test

S 865-394

- (1) Supply electrical power (AMM 24-22-00/201).

S 865-396

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (2) Supply pressure to the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 865-397

- (3) Push the STATUS switch on the display select panel to show the aileron position indicator on the display.

D. Aileron Response - Test

S 215-398

- (1) Turn one of the control wheels clockwise and hold it there for 2 seconds. Do these checks:
  - (a) Make sure the two left ailerons move down and the two right ailerons move up.

**NOTE:** The spoilers on the right wing will operate when you turn the control wheel.

EFFECTIVITY

ALL

27-11-00

- (b) Make sure all the ailerons operate smoothly through their full travel range.

S 215-399

- (2) Turn one of the control wheels counterclockwise and do these checks:
  - (a) Make sure the two left ailerons move up and the two right ailerons move down.

NOTE: The spoilers on the left wing will operate when you turn the control wheel.

- (b) Make sure the ailerons operate smoothly through their full travel range.

E. Aileron System and Lateral Control Shutoff Valve Operation with a Single Hydraulic Source - Test

S 865-400

- (1) Remove the power from the center and right hydraulic systems (AMM 29-11-00/201).

S 215-401

- (2) Turn the control wheel fully counterclockwise and hold it there for at least 4 seconds. Do this check:
  - (a) Make sure the two left ailerons move up and the right outboard aileron moves down.

NOTE: Ignore the movement of the right inboard aileron.

S 215-402

- (3) Turn the control wheel fully clockwise and hold it there for at least 4 seconds. Do this check:
  - (a) Make sure the two left ailerons move down and the right outboard aileron moves up.

NOTE: Ignore the movement of the right inboard aileron.

EFFECTIVITY

ALL

27-11-00

- S 865-803
- (4) Move the control wheel to its neutral position.
- S 865-405
- (5) Supply pressure to the right hydraulic system (AMM 29-11-00/201).
- S 865-406
- (6) Remove the power from the left hydraulic system (AMM 29-11-00/201).
- S 215-407
- (7) Turn the control wheel to fully clockwise and hold it there for at least 4 seconds. Do this check:
- (a) Make sure the two right ailerons move up and the left outboard aileron moves down.

NOTE: Ignore the movement of the left inboard aileron.

- S 215-408
- (8) Turn the control wheel fully counterclockwise and hold it there for at least 4 seconds. Do this check:
- (a) Make sure the two right ailerons move down and the left outboard aileron moves up.

NOTE: Ignore the movement of the left inboard aileron.

- S 865-533
- (9) Remove the power from the right hydraulic system (AMM 29-11-00/201).

- S 865-410
- (10) Supply pressure to the center hydraulic system (AMM 29-11-00/201).

- S 215-411
- (11) Turn the control wheel fully clockwise and hold it there for at least 4 seconds. Do this check:
- (a) Make sure the right inboard aileron moves up and the left inboard aileron moves down.

NOTE: Ignore the movement of the outboard ailerons.

INBOARD AILERON - REMOVAL/INSTALLATION

1. General

- A. This procedure contains two tasks. The first task supplies the data that is necessary to remove the inboard aileron. The second task supplies the data that is necessary to install it.

NOTE: It is not necessary to perform Flight Test following the replacement of the Inboard Aileron.

TASK 27-11-01-024-051

2. Remove Inboard Aileron

A. Equipment

- (1) Sling, Inboard Aileron - A27015-15 (Part of sling equipment, A27015-1)  
(a) Load positioner - commercially available  
(2) Inboard Aileron Deactivation Hook - A27013-1

B. References

- (1) AMM 06-44-00/201, Wing Access Doors and Panels  
(2) AMM 06-45-00/201, Engine Nacelle Access Doors and Panels

561/661CB	Wing T.E. Structure, Aileron Controls

D. Prepare for Removal

S 864-001

- (1) Supply electrical power (AMM 24-22-00/201).

S 824-002

- (2) Make sure that the control wheels are in their neutral position.

EFFECTIVITY

ALL

27-11-01

03

Page 401  
Apr 22/99

S 864-004

- (3) Move the FLT CONTROL SHUTOFF WING L, C, and R switches on the right side panel, P61, to OFF. Attach DO-NOT-OPERATE tags and make sure that the amber switch-position legend lights come on.

S 864-003

- (4) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
  - (a) 11H15, FLT CONT SHUTOFF WING L
  - (b) 11H16, FLT CONT SHUTOFF WING CTR
  - (c) 11H26, FLT CONT SHUTOFF WING R
  - (d) 11K14, AILERON POS L
  - (e) 11K23, AILERON POS R

S 014-005

- (5) Remove access panel 437DB (left engine) or 447DB (right engine) (AMM 06-43-00/201).

S 014-006

- (6) Open access panels 552JB, 561AB, 561BB and 561CB (left aileron) or 652JB, 661AB, 661BB, and 661CB (right aileron) (AMM 06-44-00/201).

S 494-007

- (7) Install the deactivation hook (37).

S 014-025

- (8) Open access panel 556AB (left aileron) or 656AB (right aileron) (AMM 06-44-00/201).

E. Remove the Inboard Aileron

S 494-026

- (1) Use a hoist to attach the sling to the aileron (1) (Fig. 403).

**NOTE:** If you use the load positioner, movement of the aileron can be made easier.

S 034-050

- (2) Disconnect these components (Fig. 401):
  - (a) The position transmitter control-rod (22) from the aileron (1).
  - (b) The aileron PCA rod ends (29) from the aileron front spar (1).
  - (c) The reaction links (30) from the aileron front spar (1).

EFFECTIVITY

ALL

27-11-01

S 434-027

**CAUTION:** THE PCA CAN BE DAMAGED IF IT FALLS FROM THE WING STRUCTURE. MAKE SURE THAT THE AILERON PCA'S ARE TIGHTLY ATTACHED TO THE STRUCTURE AFTER THEY ARE DISCONNECTED.

- (3) Turn the reaction links and PCAs down. Attach the PCAs to the wing structure.

S 034-028

- (4) Disconnect the hinges and jumpers (7, 15) from the aileron (1) with the steps that follow:
- (a) Loosen the bolts (12, 13) first and next remove these bolts to disconnect the inboard hinge from the structure.

**NOTE:** If you remove the bolt (12) before loosening the bolt (13), you can cause damage to the antirotation plate (14) or to the aileron (1) when you try to remove the bolt (13) with the bolt (12) removed.

- (b) Remove bolts (8) and (9) to disconnect the outboard hinge from the structure.

S 034-029

- (5) Remove the fail-safe hinge bolts (16, 21).

S 024-030

- (6) Remove the aileron (1).

TASK 27-11-01-424-031

3. Install the Inboard Aileron

A. Equipment

- (1) Sling, Inboard Aileron - A27015-15 (Part of sling equipment, A27015-1)  
(a) Loadpositioner - commercially available
- (2) Inboard Aileron Rigging Bar - A27024-55 (recommended)  
- A27024-47 (optional)  
- A27024-2 (optional)
- (3) Inboard Aileron Rigging Bar Mount Equipment - A27110-1
- (4) Bonding Meter - Avtron Model T477H, Avtron Manufacturing Inc., Cleveland, Ohio

B. Consumable Materials

- (1) D00633 Grease - BMS 3-33 (Preferred)

S 434-033

- (2) To connect the fail-safe hinges, do these steps:
- (a) Install the outboard hinge bolt (21), washers (3), bushing (20), and nut (19). Tighten the nut (19).
  - (b) Install the inboard hinge bolt (16), washers (3), bushing (18), and nut (19). Tighten the nut (19).

S 434-034

- (3) To connect the inboard hinge, do these steps:
- (a) Install the bushings (2).
  - (b) Push the bolt (13) through the antirotation plate (14) and the bushings (2).
  - (c) Install the washer (3) and the nut (4).
  - (d) Tighten the bolthead to 3300-3500 pound-inches (373-395 newton-meters) or tighten the nut to 2600-3400 pound-inches (294-384 newton-meters).
  - (e) Lubricate the hinge with grease.

S 434-035

- (4) To connect the inboard jumper, do these steps:
- (a) Push the bolt (12) through the washers (10), bushing (11), and the antirotation plate (14). Install the nut (5).
  - (b) Use a bonding meter to make sure that the resistance between the aileron and the airplane structure is less than 0.002 ohm.

S 434-036

- (5) To connect the outboard hinge, do these steps:
- (a) Install the bushing (2).
  - (b) Install the bolt (9), washers (3), and the nut (4).
  - (c) Tighten the bolthead to 3300-3500 pound-inches (373-395 newton-meters) or tighten the nut to 2600-3400 pound-inches (294-384 newton-meters).
  - (d) Lubricate the hinge with grease.

S 434-037

- (6) To connect the outboard jumper (7), do these steps (View A):
- (a) Install the bolt (8), washers (6), and the nut (5).
  - (b) Use a bonding meter to make sure that the resistance between the aileron and the airplane structure is less than 0.002 ohm.

S 094-038

- (7) Remove the aileron sling.

S 214-039

- (8) Manually move the aileron (1) through four full cycles.
- (a) Make sure that the aileron moves freely and does not need too much force.

Aug 22/05

S 434-040

- (9) Do these steps to install the aileron PCAs (29) to the aileron (1):
- (a) Apply a thin layer of corrosion preventive grease to the bolts (39), bushings (40), washers (38), and nuts (41) before they are installed.
  - (b) Lubricate the PCA rod ends (29) and PCA reaction link bearings with grease before they are installed.
  - (c) Connect the reaction links (30) to the aileron front spar (1).
    - 1) Install the bolt (39), washer (38), bushing (40), and nut (41). Tighten the nut to 1000 - 1200 pound-inches (113-135 newton-meters).
  - (d) Install the bolts (39) and washers (38) that connect the PCA rod ends (29) to the aileron front spar. Make sure that they can be freely installed and do not need too much force.
    - 1) Install the bushing (40) and nut (41). Tighten the nut to 1000 - 1200 pound-inches (113-135 newton-meters).

S 434-041

- (10) Install the screw (23) and washers (24) that connect the adjustable end of the position transmitter control-rod (22) to the aileron.

S 414-042

- (11) Close access panels 556DZ, 556EZ, and 556FZ (left aileron) or 656DZ, 656EZ, and 656FZ (right aileron).

S 094-043

- (12) Remove the deactivation hook (37).

S 824-044

- (13) Adjust the PCAs to inboard aileron (AMM 27-11-00/501).

**NOTE:** This step is not necessary if no changes are made to the adjustable rods, actuators.

S 824-045

- (14) Do the procedure 3 of the aileron position indication adjustment (AMM 27-18-00/501).

**NOTE:** This step is not necessary if no changes are made to the adjustable rods, actuators.

S 714-055

- (15) Do the operational test for the aileron and aileron trim (AMM 27-11-00/501).

OUTBOARD AILERON – REMOVAL/INSTALLATION

1. General

- A. This procedure contains two tasks. The first task is used to remove the outboard aileron and the second is used to install it.
- B. Refer to AMM 27-11-02/601 for the applicable wear limit data.

TASK 27-11-02-024-001

2. Remove The Outboard Aileron

A. Equipment

- (1) Aileron Sling – A27015-16 (Part of Aileron Sling Equipment, A27015-1)
  - (a) Loadpositioner – commercially available

B. References

- (1) AMM 06-44-00/201, Wing Access Doors and Panels
- (2) AMM 24-22-00/201, Electrical Power – Control
- (3) AMM 27-51-00/201, Trailing Edge Flap System

C. Access

(1) Location Zones

- 561 Rear Spar to Trailing Edge (Left)
- 661 Rear Spar to Trailing Edge (Right)

(2) Access Panels

- 561/661CB Wing TE Structure, Aileron Controls
- 561/661RBX Wing TE Structure, Aileron Lockout Mechanism
- 561/661MB Outboard Aileron Actuators
- 561/661NB Wing TE Structure, Outboard Aileron Installation
- 561/661PB Wing TE Structure, Outboard Aileron Installation
- 561/661QB Wing TE Structure, Outboard Aileron Installation

D. Prepare for Removal

S 864-002

- (1) Supply electrical power (AMM 24-22-00/201).

S 864-003

- (2) Extend the trailing edge flaps.

S 044-004

- (3) Do the deactivation procedure for the trailing edge flaps (AMM 27-51-00/201).

S 864-005

- (4) Move the FLT CONTROL SHUTOFF WING L, C, and R switches on the right side panel, P61, to OFF. Attach DO-NOT-OPERATE tags and make sure that the amber switch-position legend lights come ON.

S 864-011

- (5) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
  - (a) 11H15, FLT CONT SHUTOFF WING L

- (e) 11K23, AILERON POS R

S 014-006

- (6) Open access panels 561LB, 561RBX, 561MB, 561NB, 561PB, and 561QB (left aileron) or 661LB, 661RBX, 661MB, 661NB, 661PB, and 661QB (right aileron) (AMM 06-44-00/201).

E. Remove the Outboard Aileron

S 494-007

- (1) Use a hoist to attach the sling to the aileron (1) (Fig. 403).

**NOTE:** If you use a loadpositioner, the movement of the aileron can be made easier.

S 034-008

- (2) Disconnect the PCA rod ends (30) and the reaction links (31) from the aileron front spar (1). Turn the reaction links and PCAs down, away from the aileron.

S 034-009

- (3) Disconnect the position transmitter from the aileron front spar.

S 034-010

- (4) Do these steps to disconnect the aileron jumpers:
  - (a) Disconnect the jumpers (26) from the aileron at the four inboard hinges.
  - (b) Disconnect the jumpers (21) from the brackets that are located at the outboard end of the aileron.

S 034-012

- (5) Remove the bolts (6, 11, and 16) from the five aileron hinges.

S 024-013

- (6) Remove the aileron.

**NOTE:** To make sure that the operational balance moment is correct, keep a record of all the repairs and painting that is done. The ailerons will shake during flight if the operational balance moment is not correct. Refer to the Structural Repair Manual (SRM 51-60-00) for the operational balance moment data.

  - 561/661PB Wing TE Structure, Outboard Aileron Installation
  - 561/661QB Wing TE Structure, Outboard Aileron Installation

F. Install the Outboard Aileron

S 644-015

- (1) Apply a thin layer of grease to the five hinge bolts (6, 11, 16) and the hinges before they are installed.

S 824-016

- (2) Use a hoist to move the aileron (1) into position (Fig. 403).

NOTE: If you use a loadpositioner, the movement of the aileron can be made easier.

S 434-017

- (3) Do these steps to connect the center hinge of the aileron to the wing:
  - (a) Install the bolt (11), washers (8 and 10), bushing (9), and the nut (7).

S 434-018

- (4) Do these steps to connect the two hinges that are located on each side of the center hinge:
  - (a) Install the bolt (11), washers (8 and 10), bushing (9), and the nut (7).
  - (b) Install the bolt (16), washers (13 and 5), bushing (14), and the nut (12).

S 434-019

- (5) Do these steps to connect the aileron to the two outboard hinges:
  - (a) Install the bolt (16), washers (13 and 15), bushings (14), and the nut (12).

EFFECTIVITY

ALL

27-11-02

01

Page 408  
Aug 22/05

- (b) Install the bolt (6), washers (3 and 5), bushing (4), and the nut (2).

S 434-020

- (6) Do these steps to connect the jumpers (21) to the brackets that are located at the outboard end of the aileron:
  - (a) Clean the brackets to get good electrical conductivity.
  - (b) Install the bolts (17), washers (19), and nuts (20) that connect the jumpers to the brackets.
  - (c) Apply primer, and then enamel to the fasteners, jumper terminals, and brackets.
  - (d) Use a bonding meter to make sure that the resistance between the aileron and the airplane structure is less than 0.002 ohm.

S 434-021

- (7) Do these steps to connect the jumpers (26) that are located near the four inboard hinges:
  - (a) Make the aileron surface (1) under the washer rough and clean.
  - (b) Install the bolts (25), washers (24 and 23), and nuts (22) that connect the jumpers.
  - (c) Apply primer, and then enamel to the fasteners, jumper terminals, and the aileron surface.
  - (d) Use a bonding meter to make sure that the resistance between the aileron and the airplane structure is less than 0.002 ohm.

S 094-025

- (8) Remove the aileron sling.

S 214-024

- (9) Manually move the aileron (1) through its full travel and do the check that follows:
  - (a) Make sure that the aileron moves freely and does not need too much force.

S 214-023

- (10) Make sure that the control wheels are in their neutral position.

EFFECTIVITY

ALL

27-11-02

01

Page 409  
Aug 22/05

S 494-022

- (11) Install the control wheel straight edge.

S 214-026

- (12) Make sure that the actuator piston rods are fully retracted.

S 434-027

- (13) Do these steps to install the PCAs (30) to the aileron (1):
- (a) Apply a thin layer of grease to the bolts, washers, screws, bushings, and nuts before they are installed.
  - (b) Apply a layer of grease to the aileron PCA rod ends and PCA reaction link bearings before they are installed.
  - (c) Attach the reaction links (31) to the aileron front spar (1).
  - (d) Install the bolt (38), washer (37), bushing (39), washer (36) and the nut (40).
  - (e) Install the bolt (38) and washer (37) that connect the outboard PCA rod end (30) to the aileron front spar. Make sure that they can be freely installed and do not need too much force.

**NOTE:** Move the aileron control rods and then move the aileron up and down to make the bolt (38) fit.

- (f) Install the bushing (39), washer (36), and the nut (40).
- (g) Move the inboard PCA rod end (30) up to the aileron front spar (1) and do these steps to install it:
  - 1) Manually move the aileron up and then down until the bolt (38) and washer (37) can be easily installed.
  - 2) Install the bushing (39), washer (36), and the nut (40) and tighten to 660-980 pound-inches (74.6nm-110.7nm).

S 434-028

- (14) Connect the position transmitter to the aileron.

S 824-029

- (15) Adjust the PCAs to outboard aileron (AMM 27-11-00/501).

**NOTE:** This step is not necessary if no changes are made to the adjustable rods, actuator.

Aug 22/05

S 864-030

**WARNING:** TO PREVENT INJURY OR DAMAGE, MOVE ALL PERSONS AND EQUIPMENT AWAY FROM THE CONTROL SURFACES BEFORE HYDRAULIC POWER IS SUPPLIED. STAY AWAY FROM THE AREA DURING THEIR OPERATION.

(16) Supply hydraulic power (AMM 29-11-00/201).

S 864-039

(17) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:

- (a) 11H15, FLT CONT SHUTOFF WING L
- (b) 11H16, FLT CONT SHUTOFF WING CENTER
- (c) 11H26, FLT CONT SHUTOFF WING R

S 864-031

(18) Remove the DO-NOT-OPERATE tags and move the FLT CONTROL SHUTOFF WING L, C, and R switches on the P61 panel to ON.

S 094-032

(19) Remove the straight edge from the control wheel.

S 824-033

(20) Do these steps to adjust the aileron position transmitter:

**NOTE:** This step is not necessary if no changes are made to the adjustable rods, actuator.

- (a) Install the aileron rigging bar against the lower wing surface. Position the bar approximately 1.0 inch (25.4mm) outboard from and parallel to the inboard edge of the outboard aileron (Fig. 402).
- (b) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:
  - 1) 11K14, AILERON POS L

EFFECTIVITY

ALL

27-11-02

01

Page 411  
Aug 22/05

- 2) 11K23, AILERON POS R
- (c) Make sure that these circuit breakers on the P11 panel are closed:
  - 1) 11L9, LEFT ENGINE OIL PRESS or LEFT ENGINE OIL PRESS EICAS REF
  - 2) 11L36, RIGHT ENGINE OIL PRESS or RIGHT ENGINE OIL PRESS EICAS REF
- (d) Push the STATUS button on the display select panel, P9, to show the control-surface position.
- (e) Hold the bottom trailing edge of the aileron (1)  $0.87 \pm 0.05$  inch (22.1mm +/-1.27mm) below the wing trailing edge. Use the rigging bar to find the correct distance.
- (f) Adjust the position transmitter control rod until the position pointer is aligned with the mid-scale mark.
- (g) Tighten the control-rod locknut. Install the lockwire.
- (h) Remove the outboard aileron rigging bar.

S 714-041

- (21) Do the operational test for the aileron and aileron trim (AMM 27-11-00/501).

G. Put the Airplane Back to its Usual Condition

S 444-035

- (1) Do the activation procedure for the trailing edge flaps (AMM 27-51-00/201).

S 864-034

- (2) Retract the trailing edge flaps.

S 864-036

- (3) Remove the power from the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 864-037

- (4) Remove electrical power, if it is not necessary (AMM 24-22-00/201).

S 414-038

- (5) Close the access panels you removed (AMM 06-44-00/201).

AILERON DRUM ASSEMBLIES – REMOVAL/INSTALLATION

1. General

- A. This procedure contains two tasks. The first task supplies the data that is necessary to remove the captain's (or the first officer's) drum assembly. The second task contains the data that is necessary to install them.

TASK 27-11-03-024-001

2. Aileron Drum Assemblies – Removal

A. Equipment

- (1) Rig Pins from Kit A20004-XX (AMM 20-10-24/201):  
(a) A10 – P/N A20004-17  
(b) A12 – P/N A20004-21

B. References

- (1) AMM 06-41-00/201, Fuselage Access Doors and Panels  
(2) AMM 24-22-00/201, Electrical Power – Control  
(3) AMM 25-52-01/401, Sidewall Panels  
(4) AMM 27-61-04/401, Spoiler RVDT Unit  
(5) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems  
(6) AMM 31-35-11/401, Aileron Control Force Transducer  
(7) AMM 32-00-15/201, Landing Gear Door Locks  
(8) AMM 32-00-20/201, Landing Gear Downlocks

C. Access

- (1) Location Zones  
211/212 Control Cabin

D. Prepare for Removal

S 864-013

- (1) Supply electrical power (AMM 24-22-00/201).

S 864-010

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (2) Supply pressure to the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 214-014

- (3) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

EFFECTIVITY

ALL

27-11-03

04

Page 401  
Apr 22/04

S 494-011

**WARNING:** USE THE PROCEDURE IN AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (4) Open the doors for the main landing gear and install the door locks (AMM 32-00-15/201).

S 864-015

- (5) Move the control wheels to their neutral positions.

S 494-016

- (6) Install rig pin A3 (for the feel, centering, and trim mechanism).

S 864-017

- (7) Move the FLT CONTROL SHUTOFF WING L, C, and R switches on the right side panel, P61, to OFF. Attach DO-NOT-OPERATE tags and make sure the amber switch position legend lights come ON.

S 864-018

- (8) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
- (a) 11H15, FLT CONT SHUTOFF WING L
  - (b) 11H16, FLT CONT SHUTOFF WING CTR
  - (c) 11H26, FLT CONT SHUTOFF WING R
  - (d) 11K15, AILERON TRIM

S 494-019

- (9) Install these rig pins for the first officer's drum assembly:
- (a) A10 (for the aileron control override mechanism)
  - (b) A12 (for the right aileron control output quadrant)

E. Remove the Drum Assemblies (Fig. 401)

S 824-020

- (1) Release the tension in these body cables at their turnbuckles:

**NOTE:** The turnbuckles for body cables A1A and A1B are located behind a sidewall panel opposite the third panel aft of the forward cargo door. The turnbuckles for body cables A2A and A2B are located behind the third sidewall panel aft of the forward cargo door. Refer to AMM 25-52-01/401 for the sidewall panel removal procedure.

- (a) A1A and A1B for the captain's drum assembly
- (b) A2A and A2B for the first officer's drum assembly.

E. Access

- (1) Location Zones  
211/212 Control Cabin

F. Install the Drum Assemblies (Fig. 401)

S 434-032

- (1) Attach these components to the drum assembly:
  - (a) the bottom drum support (4 screws)
  - (b) the top drum cable guard.

S 434-033

- (2) Put the control wheel cable around the top cable drum.

S 434-034

- (3) Engage the drum assembly in the top drum support and attach the bottom drum support to the structure (12 screws).

S 434-035

- (4) Install these components:
  - (a) the body cables on the bottom cable drum
  - (b) the bottom drum cable guard (4 screws).

S 434-006

- (5) Connect the transmitter control rod to the captains drum assembly and safety the bolt with wire.

S 434-089

- (6) If you have it removed, install the control wheel steering force transducer on the captain's drum assembly (AMM 31-35-11/401).

S 214-038

- (7) Make sure that the control drum can move freely and does not need too much force.

S 434-039

- (8) Install the spoiler RVDT unit on the drum assembly (AMM 27-61-04/401).

S 494-040

- (9) Install these rig pins:
  - (a) A1, A3, and A6 for the captain's drum assembly

EFFECTIVITY

ALL

27-11-03

(b) A2 for the first officer's drum assembly.

NOTE: Rig pins A10 and A12 were installed in the drum removal procedure and must stay installed during the steps that follow.

S 824-041

(10) Adjust the body cable tension to the values shown in Table 1.

TABLE 1 AILERON CABLE RIGGING LOADS		
TEMP °F	CONTROL COLUMN CABLES A1A, A1B, A2A, A2B (+20/-10 LBS)	BODY CABLES A1A, A1B, A2A, A2B (+20/-10 LBS)
110	88	118
90	79	109
70	70	100
50	62	92
30	54	84
10	45	75
-10	37	67
-30	29	59
-40	23	53

S 434-042

(11) Install clip locks on the body cable turnbuckles.

S 824-043

(12) Do these steps to adjust the control wheel cables:

(a) Attach the control wheel straightedge across the bottom of the control wheels.

(b) Tighten the control wheel cable tension to the value shown in Table 1 and do the checks that follow:

1) Make sure the control wheels are aligned correctly.

NOTE: It is permitted for one surface rest to be 0.03 inch (0.76 mm)(or less) away from the straightedge.

2) Make sure rig pins A1 and A2 can move freely in their holes.

(c) Install clip locks on the turnbuckles for the control wheel cables.

S 824-044

(13) Adjust the bus rod until the rod end bolts can be easily installed. Tighten the jamnut.

EFFECTIVITY

- (15) Make sure these rig pins can move freely in their holes, then remove them:
- (a) A1, A3, and A6 for the captain's drum assembly
  - (b) A2, A10, and A12 for the first officer's drum assembly
- S 094-047
- (16) Remove the straightedge from the control wheels.
- S 864-048
- (17) Make sure these circuit breakers on the overhead panel, P11 are closed:
- (a) 11L9, LEFT ENGINE OIL PRESS or LEFT ENGINE OIL PRESS EICAS REF
  - (b) 11L36, RIGHT ENGINE OIL PRESS or RIGHT ENGINE OIL PRESS EICAS REF
- S 864-049
- (18) Push the STATUS switch on the pilot's display select panel, P9, to show the aileron position indicator on the display.
- S 864-050
- (19) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:
- (a) 11H15, FLT CONT SHUTOFF WING L
  - (b) 11H16, FLT CONT SHUTOFF WING CTR
  - (c) 11H26, FLT CONT SHUTOFF WING R
  - (d) 11K15, AILERON TRIM
- S 864-051
- (20) Remove the DO-NOT-OPERATE tags and move the FLT CONTROL SHUTOFF WING L, C, and R switches on the right side panel, P61, to ON.
- S 214-065
- (21) Turn the control wheel to its full counterclockwise position and do these checks:
- (a) Make sure the control wheel operates smoothly and does not need to much force.
  - (b) Make sure the left ailerons move up and the right ailerons move down.
- S 214-066
- (22) Turn the control wheel to its full clockwise position and do these checks:
- (a) Make sure the control wheel operates smoothly and does not need too much force.

03

Page 410  
Dec 22/00

- (b) Make sure the left ailerons move down and the right ailerons move up.

S 214-067

- (23) Move the control wheel to its neutral position and do this check:
  - (a) Make sure the ailerons go back to their neutral positions.

S 864-052

- (24) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:
  - (a) 11C6, FLT CONT ELEC 1L AC
  - (b) 11C7, FLT CONT ELEC 1L DC
  - (c) 11C8, FLT CONT ELEC 2L AC
  - (d) 11C9, FLT CONT ELEC 2L DC
  - (e) 11G17, FLT CONT ELEC 1R AC
  - (f) 11G18, FLT CONT ELEC 1R DC
  - (g) 11G26, FLT CONT ELEC 2R AC
  - (h) 11G27, FLT CONT ELEC 2R DC

S 824-053

- (25) Adjust the spoiler RVDTs (AMM 27-61-00/501).

S 824-009

- (26) Adjust the control wheel position transmitter (AMM 31-31-00/501).
- G. Put the Airplane Back to Its Usual Condition

S 094-012

**WARNING:** USE THE PROCEDURE IN AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (1) Remove the door locks from the main landing gear and close the doors (AMM 32-00-15/201).

S 414-054

- (2) Close all the access panels that were removed (AMM 06-41-00/201).

S 864-055

- (3) Remove the power from the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 864-056

- (4) Remove electrical power if it is not necessary (AMM 24-22-00/201).

AILERON DRUM ASSEMBLIES INSPECTION/CHECK

1. General

- A. This procedure only has an illustration and a wear limit table which show the data for wear limits. There are no procedures for access, removal, or installation of the parts. Refer to The Aileron Drum Assembly - Removal/Installation for procedure to do these tasks.

TASK 27-11-03-206-002

2. Aileron Drum Assembly - Wear Limits

A. Access

- (1) Location Zone  
211/212 Control Cabin

B. Procedure

S 226-001

- (1) Use the supplied data (Fig. 601) to examine the aileron drum assemblies for too much wear.

AILERON CONTROL WHEEL AND BEARINGS - REMOVAL/INSTALLATION

1. General

- A. This procedure contains two tasks. The first task supplies the data that is necessary to remove the aileron central wheel and its bearings. The second task supplies the data that is necessary to install the aileron control wheel and its bearings.
- B. This procedure is applicable to a control wheel that has a stabilizer trim switch, an autopilot disengage switch, and an interphone/microphone switch.

TASK 27-11-06-024-001

2. Aileron Control Wheel and Bearings - Removal

A. Equipment

- (1) Wire Extraction Tool - Deutsch part number M15570-20 optional to M83723-31-20  
Deutsch Company  
700-T Hathaway St.  
Banning, CA

B. References

- (1) 24-22-00/201, Electrical Power - Control

C. Access

- (1) Location Zones  
211/212 Control Cabin

D. Prepare for the Removal

S 864-007

- (1) Supply electrical power (Ref 24-22-00/201).

S 864-008

- (2) Move the FLT CONTROL SHUTOFF WING and TAIL switches L, C, and R on the right side panel, P61, to OFF. Attach DO-NOT-OPERATE tags and make sure the amber switch position legend lights come ON.

S 864-009

- (3) Open these circuit breakers on overhead panel, P11, and attach DO-NOT-CLOSE tags:
  - (a) 11C25, INTERPHONE CAPT SUP-NUM FLT AMPL DUAL PWR
  - (b) 11C26, INTERPHONE F/O OBS DUAL PWR

- (aa) 11H27, FLT CONT SHUTOFF TAIL RIGHT

E. Remove the Aileron Control Wheel (Fig. 401)

S 034-011

- (1) Remove the medallion, the chart holder, and the wire guard from the control wheel.

S 034-012

- (2) Use the extraction tool to disconnect the wires at their connectors. Tag the wires for identification.

S 034-013

- (3) Remove the cap nuts (3 locations).

S 024-014

- (4) Carefully remove the control wheel.

F. Remove Aileron Control Wheel Bearings (Fig. 402)

S 494-015

- (1) Install rig pin A1 (A2) in the captain's (first officer's) drum assembly.

S 034-016

- (2) Remove the forward cover from the control column.

EFFECTIVITY

ALL

27-11-06

07

Page 405  
Dec 22/00

S 034-017

- (3) Remove the screws (1, 2), washers, nuts, and the spacer (3). Remove the stop plate from the control column.

**NOTE:** Do not remove the fasteners (below the stop plate) that attach the control cable clamps to the control column.

S 034-018

- (4) Carefully remove the coiled part of the wire bundle forward and out of the top of the control column.

**NOTE:** Be careful not to remove or pull on the straight part of the wire bundle that goes down the control column.

S 034-006

- (5) Remove these components:
- (a) The bolt retainer from the control cable drum.
  - (b) The three retaining bolts from the control cable drum.
  - (c) The cable drum.
  - (d) The forward control wheel bearing.
  - (e) The bearing retainer from the aft side of the control column.
  - (f) The aft control wheel bearing.

TASK 27-11-06-424-019

3. Aileron Control Wheel and Bearings - Installation

A. Equipment

- (1) Insulation Tester (500 volts) - Commercially Available
- (2) Connector - BACC45FN14-15P
- (3) Connector - BACC45FN16-24P6

B. Consumable Materials

- (1) D00133 Lubricating Oil - MIL-L-6085

C. References

- (1) 24-22-00/201, Electrical Power - Control

D. Access

- (1) Location Zones  
211/212 Control Cabin

E. Install the Aileron Control Wheel Bearings (Fig. 402)

S 644-034

- (1) Lubricate the forward and aft control wheel bearings with oil.

**NOTE:** This step applies to bearings without seals only.

S 214-020

- (2) Make sure that the spacer between the forward and aft bearing is installed.

EFFECTIVITY

ALL

27-11-06

01

Page 406  
Apr 22/99

S 434-002

- (3) Install these components (Fig. 402):

**CAUTION:** BE CAREFUL TO KEEP THE BEARINGS AND THE EMPTY SPACE BETWEEN THE BEARINGS CLEAN.

- (a) The forward and aft control wheel bearings.

**NOTE:** If installing control wheel bearings with seals, make sure bearings are installed with seals facing out (away from bearing spacer).

- (b) The bearing retainer on the aft side of the control column.  
(c) The control cable drum.  
(d) The three retaining bolts in the cable drum.  
(e) The bolt retainer.

**NOTE:** Make sure that the heads of the three retaining bolts fit into the slots in the bolt retainer.

S 434-021

- (4) Carefully install the coiled part of the wire bundle in the control column.

S 434-022

- (5) Install the stop plate on the control column.

S 434-023

- (6) Install the forward cover on the control column.

S 094-024

- (7) Remove rig pin A1 (A2).

F. Install the Aileron Control Wheel (Fig. 401)

S 214-025

- (1) Make sure that the push-to-talk switch moves freely before the control wheel is installed.

S 824-026

- (2) Put the wire bundle through the control wheel.

EFFECTIVITY

ALL

27-11-06

01

Page 407  
Apr 22/04

S 434-036

**CAUTION:** MAKE SURE THE WIRE CLAMP IS INSTALLED IN THE POSITION SHOWN ON FIG. 401. PUT THE CABLE COIL IN THE CENTER OF THE CONTROL WHEEL. FRICTION WILL RESULT IF THE WIRE CLAMPS ARE NOT INSTALLED CORRECTLY AND THE CABLE COIL IS NOT PUT IN THE CENTER. DAMAGE TO EQUIPMENT CAN OCCUR.

- (3) Put the control wheel on the three retaining bolts in the control column and install the three capnuts.

S 434-003

- (4) Use the identification tags to connect the correct wires to the correct electrical connectors.

S 224-028

- (5) Pull lightly on the electrical connections to make sure they are tight.

S 764-039

- (6) Do a continuity test on the electrical circuits for each switch.

**NOTE:** As an optional test to the continuity and high potential electrical insulation tests called out at this part of the procedure, do an operational test like an MCDP Test 11 or Test 40 (FIM 22-00-03/101), a push to talk switch test, move the stab trim full speed when both stab trim switches are pushed up or down and make sure that there is no stab movement when only one stab trim switch is moved.

S 764-004

- (7) On the high-potential electrical insulation tests that follow:
  - (a) Turn the control wheel from its full clockwise position to its full counterclockwise position during each test.
  - (b) Remove electrical connectors D5131P and D5133P on the E1-1 shelf.
  - (c) Install these mating connectors:
    - 1) Mating connector BACC45FN16-24P6 to airplane connector D5131P.
    - 2) Mating connector BACC45FN14-15P to airplane connector D5133P.

EFFECTIVITY

ALL

27-11-06

01

Page 408  
Apr 22/04

- (d) If the first officer's and/or captain's aileron control wheel and bearings were replaced, do a check with a 500 volts insulation tester between these pins:

NOTE: Do a check between the wire and ground, and also between the wires. Make sure that the insulation test does not cause an insulation breakdown. The insulation resistance must be at least 100 megohms:

Do the test at the mating connectors only. Do not probe the airplane connectors.

- 1) Connector D5131P pin 12 to connector D5131P pin 11.
  - 2) Connector D5131P pin 12 to connector D5131P pin 10.
  - 3) Connector D5131P pin 12 to connector D5133P pin 11.
  - 4) Connector D5131P pin 12 to connector D5133P pin 10.
  - 5) Connector D5131P pin 11 to connector D5131P pin 10.
  - 6) Connector D5131P pin 11 to connector D5133P pin 11.
  - 7) Connector D5131P pin 11 to connector D5133P pin 10.
  - 8) Connector D5131P pin 10 to connector D5133P pin 11.
  - 9) Connector D5131P pin 10 to connector D5133P pin 10.
  - 10) Connector D5133P pin 11 to connector D5133P pin 10.
- (e) Remove the mating connectors. Connect the four airplane connectors to the E1-1 and E2-1 shelf.

S 434-038

CAUTION: MAKE SURE THAT WIRE GUARD ASSEMBLY SLIDES SMOOTHLY IN GROOVE OF WHEEL ASSEMBLY DURING INSTALLATION. KEEP ALL WIRES AND CONNECTORS CLEAR OF PLANE OF GROOVE TO PREVENT POSSIBLE WIRE INSULATION DAMAGE DURING ASSEMBLY.

- (8) Install the medallion, the chart holder, and the wire guard on the control wheel.

G. Put the Airplane Back to Its Usual Condition

S 864-032

- (1) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel, P11:
- (a) 11C25, INTERPHONE CAPT SUP-NUM FLT AMPL DUAL PWR
  - (b) 11C26, INTERPHONE F/O OBS DUAL PWR
  - (c) 11C06, FLT CONT ELEC 1L AC

D. Remove the Feel, Centering, and Trim Mechanism (Fig. 401)

S 034-015

- (1) Disconnect the electrical connector from the trim actuator.

S 034-016

- (2) Remove the bonding jumpers from the actuator and the housing assembly if they are installed (Fig. 403).

S 824-017

- (3) In increments, release the tension from aft bus input cables AB2A and AB2B.

**NOTE:** The turnbuckles for cables AB2A and AB2B are in the right wheel well for the main gear.

S 824-018

- (4) In increments, release the tension from primary body cables A1A and A1B.

**NOTE:** The turnbuckles for cables A1A and A1B are found behind a sidewall panel. This panel is opposite the third panel aft of the forward cargo door. Refer to 25-52-01 for the sidewall panel removal procedure.

S 034-019

- (5) Disconnect cables A1A, A1B, AB2A, and AB2B from the feel, centering, and trim mechanism.

S 034-002

- (6) Remove these components:
- (a) The debris guard from its bracket (Fig. 402).
  - (b) The dual bolt assembly that connects the control rod for the left LCCA torque tube to the feel, centering, and trim mechanism (View A-A, Fig. 401).
  - (c) The bolts that attach the feel, centering, and trim mechanism to its bracket (6 locations).

S 024-020

- (7) Remove the feel, centering, and trim mechanism.

TASK 27-11-08-424-021

3. Feel, Centering, and Trim Mechanism - Installation

**NOTE:** Refer to 27-11-08 for the applicable wear limit data.

A. Equipment

LATERAL TRIM ACTUATOR – REMOVAL/INSTALLATION

1. General

- A. This procedure contains two tasks. The first task supplies the data that is necessary to remove the lateral trim actuator. The second task supplies the data that is necessary to install it.

TASK 27-11-09-024-001

2. Lateral Trim Actuator – Removal

A. References

- (1) 24-22-00/201, Electrical Power – Control
- (2) 32-00-15/201, Landing Gear Door Locks
- (3) 32-00-20/201, Landing Gear Downlocks

B. Access

- (1) Location Zone  
730 Left Hand Main Landing Gear and Doors

C. Prepare for Removal

S 864-002

- (1) Supply electrical power (Ref 24-22-00).

S 214-003

- (2) Make sure the downlocks are installed on the nose and main landing gear (Ref 32-00-20).

S 494-004

**WARNING:** USE AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (3) Open the doors for the main landing gear and install the door locks (Ref 32-00-15).

S 864-005

- (4) Move the FLT CONTROL SHUTOFF WING L, C, and R switches on the right side panel, P61, to OFF. Attach DO-NOT-OPERATE tags and make sure the amber switch position legend lights come ON.

S 864-024

- (5) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
  - (a) 11H15, FLT CONT SHUTOFF WING L
  - (b) 11H16, FLT CONT SHUTOFF WING CTR
  - (c) 11H26, FLT CONT SHUTOFF WING R
  - (d) 11K15, AILERON TRIM

S 094-025

LATERAL CENTRAL CONTROL ACTUATOR (LCCA) – REMOVAL/INSTALLATION

1. General

- A. This procedure contains two tasks. The first task is used to remove the lateral central control actuator (LCCA) and the second task is used to install it.

**NOTE:** If you find an LCCA that shows signs of oil leakage, you can stop leakage by replacing O-ring and seal plate in solenoid valve and/or in servo valve of LCCA and prevent unnecessary LCCA replacement.

TASK 27-11-14-024-001

2. LCCA – Removal

A. References

- (1) AMM 24-22-00/201, Electrical Power – Control

- (5) AIPC 27-11-56 Fig. 3

B. Access

- (1) Location Zones  
730/740 Main Landing Gear and Doors

C. Prepare for Removal

S 864-006

- (1) Supply electrical power (AMM 24-22-00/201).

S 214-007

- (2) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

S 494-002

**WARNING:** USE THE PROCEDURE IN AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (3) Open the doors for the main landing gear and install the door locks (AMM 32-00-15/201).

S 864-008

- (4) Remove the pressure from the applicable hydraulic system (AMM 29-11-00/201):
  - (a) Left hydraulic system for the top left side LCCA.
  - (b) Right hydraulic system for the bottom left side LCCA.
  - (c) Center hydraulic system for the right side LCCA.

EFFECTIVITY

ALL

27-11-14

01

Page 401  
Aug 22/05

S 864-009

- (5) Move the FLT CONTROL SHUTOFF WING L, C, and R switches on the right side panel, P61, to OFF. Attach DO-NOT-OPERATE tags and make sure the switch position legend lights come ON.

S 864-010

- (6) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
  - (a) 11E17, FLT CONT CMPTR PWR L
  - (b) 11E18, FLT CONT CMPTR SERVO L
  - (c) 11E20, FLT CONT CMPTR PWR C

(b) A11 (for the right LCCA output quadrant)

S 494-018

- (2) Install these rig pins for the top left (left hydraulic system) LCCA and the bottom left (right hydraulic system) LCCA:  
(a) A16 (for the left LCCA torque tube)  
(b) A5 (for the left LCCA output quadrant)

S 124-019

- (3) Use a rotary bonding brush or rotary abrasive disk to clean the mating surfaces of the LCCA and its support (AMM 20-10-22/701).

S 644-020

- (4) Apply grease to the smooth surfaces of the bolts.

S 434-021

- (5) Do these steps to attach the LCCA to its support:  
(a) Hold the LCCA in its correct position and install the washers (5) and nuts (6) that connect it to the support (4 locations).  
(b) Apply sealing compound to the nuts and the washers. Apply the protective finish if it is necessary.  
(c) Use the bonding meter to make sure the resistance between mating surfaces is less than 0.005 ohms.

S 434-022

- (6) Connect the hydraulic lines.

S 824-023

- (7) Do the LCCA adjustment procedure (AMM 27-11-00/501).

**NOTE:** The input and output rods for the LCCA are connected during the adjustment procedure.

LATERAL CENTRAL CONTROL ACTUATOR (LCCA) – INSPECTION/CHECK

1. General

- A. This procedure only has an illustration and a wear limit table which show the data for wear limits. There are no procedures for access, removal, or installation of the parts. Refer to the Lateral Central Control Actuator (LCCA) – Removal/Installation for procedures to do these tasks.

TASK 27-11-14-206-002

2. Lateral Central Control Actuator (LCCA) – Wear Limits

A. Access

(1) Location Zones

730	Left Hand Main Landing Gear and Doors
740	Right Hand Main Landing Gear and Doors

B. Procedure

S 226-001

- (1) Use the supplied data (Fig. 601) to examine the top left side (left hydraulic system) LCCA, bottom left side (right hydraulic system) LCCA, and right side (center hydraulic system) LCCA for too much wear.

LCCA FILTER REMOVAL/INSTALLATION

1. General

- A. This procedure contains two tasks. The first task is used to remove the LCCA filter and the second task is used to install it.

TASK 27-11-15-024-001

2. LCCA Filter – Removal

A. References

- (1) 24-22-00/201, Electrical Power – Control
- (2) 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems
- (3) 32-00-15/201, Landing Gear Door Locks
- (4) 32-00-20/201, Landing Gear Downlocks

B. Access

- (1) Location Zones
  - 730 Left Hand Main Landing Gear and Doors
  - 740 Right Hand Main Landing Gear and Doors

C. Prepare for Removal

S 864-008

- (1) Supply electrical power (Ref 24-22-00).

S 214-009

- (2) Make sure the downlocks are installed on the nose and main landing gear (Ref 32-00-20).

S 494-004

**WARNING:** USE THE PROCEDURE IN AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (3) Open the doors for the main landing gear and install the door locks (Ref 32-00-15).

S 864-010

- (4) Remove the pressure from the hydraulic system that supplies the LCCA filter to be removed (Ref 29-11-00).
  - (a) The left system for the top left LCCA.
  - (b) The right system for the bottom left LCCA.
  - (c) The center system for the right LCCA.

S 864-011

- (5) Move the FLT CONTROL SHUTOFF WING switches L, C, and R on the right side panel, P61, to OFF. Attach DO-NOT-OPERATE tags and make sure the amber switch position legend lights come ON.

D. Access

(1) Location Zones

- 730 Left Hand Main Landing Gear and Doors
- 740 Right Hand Main Landing Gear and Doors

E. Install the LCCA Filter (Fig. 401)

S 644-021

- (1) Apply a thin layer of lubricant to the O-rings and fittings before they are installed.

S 434-002

- (2) Install the o-ring (3) and the backup rings (4) on the filter (2).

S 434-016

- (3) Install the two O-rings (6, 7) and the back-up rings (8) on the filter cover (1).

S 824-017

- (4) Put the filter (2) into the LCCA (5).

S 434-018

- (5) Apply lubricant to the filter cover threads. Install the filter (2) and tighten the filter cover (1) to 54 - 66 pound-feet (73.2-89.5 newton-meters).

S 434-019

- (6) Lock the filter cover with wire.

S 214-023

- (7) Do these steps to check the filter cover for leaks.

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

LEFT LATERAL CENTRAL CONTROL ACTUATOR (LCCA) TORQUE TUBE -  
REMOVAL/INSTALLATION

1. General

- A. This procedure contains two tasks. The first task supplies the data that is necessary to remove the torque tube for the left lateral central control actuator (LCCA). The second task supplies the data that is necessary to install it.

TASK 27-11-16-024-005

2. Left LCCA Torque Tube - Removal

A. References

- (1) AMM 24-22-00/201, Electrical Power - Control
- (2) AMM 32-00-15/201, Main Gear Door Locks
- (3) AMM 32-00-20/201, Landing Gear Downlocks

B. Access

- (1) Location Zone  
730 Left Hand Main Landing Gear and Doors

C. Prepare for Removal

S 864-006

- (1) Supply electrical power (AMM 24-22-00/201).

S 214-007

- (2) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

S 494-001

**WARNING:** USE AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (3) Open the doors for the main landing gear and install the door locks (AMM 32-00-15/201).

S 864-008

- (4) Move the FLT CONTROL SHUTOFF WING L, C, and R switches on the right side panel, P61, to OFF. Attach DO-NOT-OPERATE tags and make sure the amber switch position legend lights come ON.

S 864-009

- (5) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
  - (a) 11H15, FLT CONT SHUTOFF WING L
  - (b) 11H16, FLT CONT SHUTOFF WING CTR

D. Remove the Left LCCA Torque Tube (Fig. 401)

S 034-010

- (1) Disconnect these components from the left LCCA torque tube:
  - (a) The control rod from the feel, centering, and trim mechanism (view C-C).
  - (b) The 2 input rods for the LCCAs (view B).

S 024-024

- (2) Remove the cable guard from the torque tube, if installed.

S 024-011

- (3) Remove the bolts that connect the torque tube to its brackets and remove the torque tube (views A-A, B-B, and C-C).

**NOTE:** The new 251T1305-17 torque tube assembly located in the left wheel well has a new support bracket, a shorter tube, and a new crank to increase the clearance between the lower end of the torque tube and the new landing gear door valve assembly throughout the range of the torque tube motion.

E. Remove the Lower Bracket

S 034-021

- (1) If it is necessary, do these steps to remove the bracket from the rear spar (view B).
  - (a) Remove the bolts which connect the bracket to the rear spar (3 places).
  - (b) Remove the bracket.

F. Remove the Upper Bracket

S 024-029

- (1) If it is necessary, do these steps to remove the upper bracket from the rear spar.
  - (a) Disconnect cable AB3A from the Left LCCA Output Quadrant.
    - 1) Install these rig pins
      - a) A5 (for the left LCCA output quadrant)

EFFECTIVITY

ALL

27-11-16

02

Page 405  
Apr 22/07

- b) A11 (for the right LCCA output quadrant)
- 2) Release the tension from the aft power bus cable AB3A at the turnbuckle.

NOTE: The turnbuckle for cable AB3A is located outboard of the center bulkhead for the right wheel well.

- 3) Disconnect the cable from the left LCCA output quadrant.
- 4) Remove the cable from the cable guide.
- (b) Remove the bolts, bushings, washers, and nuts from the bracket.
- (c) Remove the bracket.

TASK 27-11-16-424-012

3. Left LCCA Torque Tube - Installation

NOTE: Refer to AMM 27-11-16/601 for the applicable wear limit data.

A. Equipment

- (1) Rig pins from Kit A20004-78 (AMM 20-10-24/201):
  - (a) A3 - P/N A20004-22
  - (b) A16 - P/N A20004-16

B. Consumable Materials

- (1) D00633 Grease, Corrosion Preventive - BMS 3-33 (Preferred)
- (2) D00015 Grease, Corrosion Preventive - BMS 3-24 (Alternate)

C. References

- (1) AMM 24-22-00/201, Electrical Power - Control
- (2) AMM 27-11-00/501, Aileron and Aileron Trim Control System
- (3) AMM 27-11-16/601, Left Lateral Central Control Actuator (LCCA) Torque Tube
- (4) AMM 32-00-15/201, Main Gear Door Locks

D. Access

- (1) Location Zone  
730 Left Hand Main Landing Gear and Doors

E. Install the Lower Bracket

S 434-022

- (1) Do the steps that follow if the bracket was removed from the rear spar (view B).
  - (a) Apply grease to the bushings and bolts before installation.

EFFECTIVITY

ALL

27-11-16

02

Page 406  
Apr 22/08

- (b) Install the bolts, bushings, washers, and nuts which connect the bracket to the rear spar.

NOTE: The middle bolt has a clearance fit of 0.125 inch (3.175 mm). Bolt-Bushing assembly must be free to wobble in the clevis after nut installation. Fill the empty space between the straight bushing OD and the flanged bushing ID with BMS 5-95 to prevent vibration.

F. Install the Upper Bracket

S 424-030

- (1) Do these steps if the bracket was removed from the rear spar.
  - (a) Apply grease to the bushings.
  - (b) Hold the bracket in position and install the bushings.
  - (c) Install the bolts, washers, and nuts.
  - (d) Connect cable AB3A to the Left LCCA Output Quadrant.
    - 1) Put the cable through the cable guide and connect it to the left LCCA output quadrant.
    - 2) Make sure that the cable is correctly positioned on all of the pulleys. Tighten cable AB3A to the correct tension (27-11-00/501) and do these steps:

NOTE: Apply the tensiometer to the cable at least six inches from the turnbuckle terminal or other fittings. To make sure you have the correct cable tension, permit a minimum of one hour at constant ambient temperature (+/- 5 degrees Fahrenheit) for airframe temperature to become stable.

- a) Make sure rig pins A5 and A11 can move freely in their holes.
- b) Install cliplocks on the turnbuckles.
- 3) Remove these rig pins
  - a) A5 (for the left LCCA output quadrant)

EFFECTIVITY

ALL

27-11-16

Page 407  
Apr 22/07

- b) A11 (for the right LCCA output quadrant)  
G. Install the Left LCCA Torque Tube

S 644-013

- (1) Apply grease to the bushings and bolts before installation.

S 434-025

- (2) Install the cable guard on the torque tube, if it had one installed.

S 434-014

- (3) Do these steps to connect the torque tube to the top bracket

(view A-A):

(a) Hold the torque tube in position and install the bushings.

(b) Install the bolts, washers and the nuts.

**NOTE:** There will be a 0.1748 - 0.1767 inch  
(4.44-4.49 mm) gap between the bolt and the bearing  
after the installation.

S 434-015

- (4) Do these steps to connect the torque tube to the bottom bracket

(view C-C):

**NOTE:** The new 251T1305-17 torque tube assembly located in the left  
wheel well has a new support bracket, a shorter tube, and a  
new crank to increase the clearance between the lower end of  
the torque tube and the new landing gear door valve assembly  
throughout the range of the torque tube motion.

(a) Hold the torque tube in position and install the bushings.

(b) Install the bolt, bushings, washer, and the nut.

S 494-016

- (5) Install these rig pins:

(a) A3 (for the feel, centering, and trim mechanism)

EFFECTIVITY

ALL

27-11-16

01

Page 408  
Apr 22/07

(b) A16 (for the left LCCA torque tube).

S 434-003

- (6) Do these steps to install the control rod from the feel, centering, and trim mechanism (view C-C):
- (a) Adjust the control rod until its rod end bolts can be easily installed. Tighten the jamnuts.
  - (b) Connect the control rod to the torque tube.
  - (c) Make sure rig pins A3 and A16 can move freely in their holes.

S 094-019

- (7) Remove rig pins A3 and A16.

S 824-017

- (8) Do the adjustment procedure for the top left side (left hydraulic system) LCCA and for the bottom left side (right hydraulic system) LCCA (AMM 27-11-00/501).

**NOTE:** The LCCA input rods are installed in the adjustment procedure.

#### H. Put the Airplane Back to its Usual Condition

S 094-002

**WARNING:** USE AMM 32-00-15/201 TO REMOVE THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (1) Remove the door locks from the main landing gear and close the doors (AMM 32-00-15/201).

S 864-020

- (2) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel, P11:
- (a) 11H15, FLT CONT SHUTOFF WING L

LEFT LATERAL CENTRAL CONTROL ACTUATOR (LCCA) OUTPUT QUADRANT -  
REMOVAL/INSTALLATION

1. General

- A. This procedure contains two tasks. The first task supplies the data that is necessary to remove the output quadrant for the top left side (left hydraulic system) LCCA and for the bottom left side (right hydraulic system) LCCA. The second task contains the data that is necessary to install it.

TASK 27-11-18-024-021

2. Left LCCA Output Quadrant - Removal

A. References

- (1) AMM 06-44-00/201, Wing Access Doors and Panels
- (2) AMM 24-22-00/201, Electrical Power - Control
- (3) AMM 27-51-00/201, Trailing Edge Flap System
- (4) AMM 32-00-15/201, Landing Gear Door Locks
- (5) AMM 32-00-20/201, Landing Gear Downlocks

B. Access

- (1) Location Zone  
730 Left Hand Main Landing Gear and Doors

C. Prepare for Removal

S 864-001

- (1) Supply electrical power (AMM 24-22-00/201).

S 214-002

- (2) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

S 494-022

**WARNING:** USE AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (3) Open the doors for the main landing gear and install the door locks (AMM 32-00-15/201).

S 044-003

- (4) Do the deactivation procedure for the trailing edge flaps (AMM 27-51-00/201).

S 864-005

- (5) Move the FLT CONTROL SHUTOFF WING L, C, and R switches on the right side panel, P61, to OFF. Attach DO-NOT-OPERATE tags and make sure the amber switch position legend lights come ON.

S 864-004

- (6) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
  - (a) 11E17, FLT CONT CMPTR PWR L
  - (b) 11E18, FLT CONT CMPTR SERVO L
  - (c) 11E20, FLT CONT CMPTR PWR C
  - (d) 11E21, FLT CONT CMPTR SERVO C
  - (e) 11E35, FLT CONT CMPTR PWR R
  - (f) 11E36, FLT CONT CMPTR PWR R

  - (h) 11H16, FLT CONT SHUTOFF WING CTR
  - (i) 11H26, FLT CONT SHUTOFF WING R

S 014-006

- (7) Open access panel 561AB (AMM 06-44-00/201).
- D. Remove the Left LCCA Output Quadrant (Fig. 401)

S 434-023

- (1) Do these steps to disconnect the cables from the quadrant:
  - (a) Release the tension from inboard wing cables A3A and A3B at their turnbuckles.

NOTE: The turnbuckles for cables A3A and A3B are located outboard of the left LCCA output quadrant.
  - (b) Disconnect the cables from the quadrant and tag them for identification.
  - (c) Release the tension from the aft power bus cables AB3A and AB3B at the turnbuckles.

NOTE: The turnbuckles for cables AB3A and AB3B are located outboard of the center bulkhead for the right wheel well.
  - (d) Disconnect the cables from the quadrant and tag them for identification.

S 434-007

- (2) Disconnect these components:
  - (a) The LCCA output rods from the quadrant
  - (b) The two support rods and the link.

S 034-008

- (3) Remove the bolts that connect the quadrant support to the airplane structure.

EFFECTIVITY

S 024-009

- (4) Remove the quadrant and support assembly.

TASK 27-11-18-424-010

### 3. Left LCCA Output Quadrant - Installation

NOTE: Refer to AMM 27-11-18/601 for the applicable wear limit data.

#### A. Equipment

- (1) Rig Pins from Kit A20004-78 (AMM 20-10-24/201):
  - (a) A5 - P/N A20004-22
  - (b) A7 - P/N A20004-20
  - (c) A11 - P/N A20004-15
  - (d) A16 - P/N A20004-16
- (2) Cable Tensiometer, Commercially Available

#### B. Consumable Materials

- (1) D00633 Grease, Corrosion Preventive - BMS 3-33 (Preferred)
- (2) D00015 Grease, Corrosion Preventive - BMS 3-24 (Alternate)

#### C. References

- (1) AMM 06-44-00/201, Wing Access Doors and Panels
- (2) AMM 24-22-00/201, Electrical Power - Control
- (3) AMM 27-11-00/501, Aileron and Aileron Trim Control System
- (4) AMM 27-11-18/601, Left Lateral Central Control Actuator (LCCA) Output Quadrant
- (5) AMM 32-00-15/201, Landing Gear Door Locks
- (6) AMM 32-00-20/201, Landing Gear Downlocks

#### D. Access

- (1) Location Zone  
730 Left Hand Main Landing Gear and Doors

#### E. Install Left LCCA Output Quadrant

S 644-011

- (1) Apply grease to the smooth surface of the bolts and bushings before installation.

S 424-012

- (2) Apply sealant to the bolts (before installation) and install the quadrant and the support assembly.

S 434-013

- (3) Connect these components:
  - (a) Apply sealant to the bolt (before installation) and connect the link to the quadrant assembly.
  - (b) Install the bolt, washer and nut that connect the two support rods to the quadrant.
  - (c) Cables A3A, A3B, AB3A, and AB3B to the quadrant.

EFFECTIVITY

ALL

27-11-18

02

Page 405  
Apr 22/08

- S 494-014
- (4) Install these rig pins:
- (a) A5 (for the left LCCA output quadrant)
  - (b) A7 (for the left inboard droop quadrant)
  - (c) A16 (for the left LCCA torque tube)
  - (d) A11 (for the right LCCA output quadrant).
- S 824-015
- (5) Tighten cables A3A and A3B to the tensions shown in Table 401 and do these steps:
- (a) Make sure rig pins A5 and A7 can move freely in their holes.
  - (b) Install cliplocks on the turnbuckles.
- S 824-016
- (6) Tighten cables AB3A and AB3B to the tensions shown in Table 401 and do these steps:
- (a) Make sure rig pins A5 and A11 can move freely in their holes.
  - (b) Install cliplocks on the turnbuckles.

Aileron Cable Rigging Loads Table 401		
TEMP °F	AFT POWER BUS CABLES (AB3A, AB3B) ±10 LBS	INBOARD WING CABLES A3A, A3B, A4A & A4B ±10 LBS
110	88	148
90	79	139
70	70	130
50	62	122
30	54	114
10	45	105
-10	37	97
-30	29	89
-40	23	83

- S 824-026
- (7) Do the adjustment procedure for the top left side (left hydraulic system) LCCA and for the bottom left side (right hydraulic system) LCCA (AMM 27-11-00/501).

**NOTE:** The output rods for the LCCAS will be connected during the adjustment procedure.

EFFECTIVITY

ALL

27-11-18

F. Put the Airplane Back to Its Usual Condition

S 094-017

- (1) Remove rig pins A5, A7, A11, and A16.

S 094-025

**WARNING:** USE AMM 32-00-15/201 TO REMOVE THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Remove the door locks from the main landing gear and close the doors (AMM 32-00-15/201).

S 864-018

- (3) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel P11:

- (a) 11E17, FLT CONT CMPTR PWR L
- (b) 11E18, FLT CONT CMPTR SERVO L
- (c) 11E20, FLT CONT CMPTR PWR C
- (d) 11E21, FLT CONT CMPTR SERVO C
- (e) 11E35, FLT CONT CMPTR PWR R
- (f) 11E36, FLT CONT CMPTR PWR R
- (g) 11H15, FLT CONT SHUTOFF WING L
- (h) 11H16, FLT CONT SHUTOFF WING CTR
- (i) 11H26, FLT CONT SHUTOFF WING R

S 864-024

- (4) Remove the DO-NOT-OPERATE tags and move the FLT CONTROL SHUTOFF WING L, C and R switches on the right side panel, P61, to ON.

S 864-019

- (5) Remove electrical power if it is not necessary (AMM 24-22-00/201).

S 414-020

- (6) Close access panel 561AB (AMM 06-44-00/201).

RIGHT LATERAL CENTRAL CONTROL ACTUATOR (LCCA) TORQUE TUBE -  
REMOVAL/INSTALLATION

1. General

- A. This procedure contains two tasks. The first task is used to remove the torque tube for the right lateral central control actuator (LCCA). The second task is used to install it.

TASK 27-11-24-024-001

2. Right LCCA Torque Tube - Removal

A. References

- (1) AMM 24-22-00/201, Electrical Power - Control
- (2) AMM 32-00-15/201, Landing Gear Door Locks
- (3) AMM 32-00-20/201, Landing Gear Downlocks

B. Access

- (1) Location Zone  
740 Right Hand Main Landing Gear and Doors

C. Prepare for Removal

S 864-002

- (1) Supply electrical power (AMM 24-22-00/201).

S 214-003

- (2) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

S 494-004

**WARNING:** USE AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (3) Open the doors for the main landing gear and install the door locks (AMM 32-00-15/201).

S 864-005

- (4) Move the FLT CONTROL SHUTOFF WING L, C, and R switches on the right side panel, P61, to OFF. Attach DO-NOT-OPERATE tags and make sure the amber switch position legend lights come ON.

S 864-006

- (5) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
  - (a) 11H15, FLT CONT SHUTOFF WING L
  - (b) 11H16, FLT CONT SHUTOFF WING CTR
  - (c) 11H26, FLT CONT SHUTOFF WING R

D. Remove the Right LCCA Torque Tube (Fig. 401)

S 034-007

- (1) Disconnect these components from the right LCCA torque tube:
- (a) The control rod (from the right aileron control quadrant)
  - (b) The LCCA input rod
  - (c) The control rod (to the override mechanism).

S 034-008

- (2) Do these steps to disconnect the torque tube:
- (a) Remove the bolts, washers, nuts, and bushings that connect the torque tube to the bottom support.
  - (b) Remove the nut, washer, bushing, and the debris guard that connect the torque tube to the top support.

S 024-023

- (3) Remove the cable guard from the torque tube.

S 024-009

- (4) Remove the torque tube.

E. Remove the Upper Bracket

S 024-026

- (1) If it is necessary, do these steps to remove the upper bracket from the rear spar.
- (a) AIRPLANES WITH CABLE GUIDE;
- Disconnect cable A2A-4 from the Right Aileron Control Output Quadrant.
- 1) Install these rig pins
    - a) A2 (for the first officer's drum assembly)
    - b) A12 (for the right aileron control output quadrant)
  - 2) Follow the cable A2A from the override mechanism inboard to the pulley. Follow cable A2A upward to where the cable enters the airplane and block cable A2A using cable clamps or an equivalent device.

EFFECTIVITY

ALL

27-11-24

02

Page 405  
Apr 22/07

- 3) Release the tension from the cables A2A at the turnbuckle just outboard of the aileron control override mechanism.
  - 4) Disconnect cable A2A-4 from the override mechanism.
  - 5) Remove the cable from the cable guide.
- (b) Remove the bolts, washers, and nuts from the upper bracket.  
(c) Remove the bracket.

TASK 27-11-24-424-010

3. Right LCCA Torque Tube - Installation

NOTE: Refer to AMM 27-11-24/601 for the applicable wear limit data.

A. Equipment

- (1) Rig Pins from Kit A20004-78 (AMM 20-10-24/201):
  - (a) A4 - P/N A20004-19
  - (b) A10 - P/N A20004-17
  - (c) A19 - P/N A20004-15

B. Consumable Materials

D. Access

- (1) Location Zone  
740 Right Hand Main Landing Gear and Doors

E. Install the Upper Bracket

S 424-027

- (1) Do these steps if the bracket was removed from the rear spar.
  - (a) Apply sealant to the bolts.
  - (b) Install the bolts, washers, and nuts to connect the bracket to the spar.
  - (c) AIRPLANES WITH CABLE GUIDE;  
Connect cable A2A-4 to the Override Mechanism.
    - 1) Put the cable through the cable guide and connect it to the override mechanism.

EFFECTIVITY

ALL

02

Page 406  
Aug 22/07

- 2) Tighten cable A2A to the correct tension (27-11-00/501) and do these steps:

NOTE: Apply the tensiometer to the cable at least six inches from the turnbuckle terminal or other fittings. To make sure you have the correct cable tension, permit a minimum of one hour at constant ambient temperature (+/- 5 degrees Fahrenheit) for airframe temperature to become stable.

- a) Remove all cable clamps.
  - b) Make sure rig pins A2, A10 and A12 can move freely in their holes.
  - c) Install cliplocks on the turnbuckles.
- 3) Remove these rig pins
    - a) A2 (for the first officer's drum assembly)
    - b) A12 (for the right aileron control output quadrant)

F. Install the Right LCCA Torque Tube (Fig. 401)

NOTE: The torque tube upper fitting may be secured for transport with a spacer and nut. These parts must be removed before the torque tube is installed on the airplane.

S 644-011

- (1) Apply grease to the bolts and bushings before installation.

S 434-024

- (2) Install the cable guard on the torque tube.

S 434-020

- (3) Do these steps to install the torque tube:
  - (a) Install the debris guard, bushing, washer, and the nut that connect the torque tube to its top support.

NOTE: Apply grease to the bearing surfaces before installation.

- (b) Install the bushings, bolts, washers, and nuts that connect the torque tube to its bottom support.

EFFECTIVITY

ALL

27-11-24

Apr 22/08

- S 494-012
- (4) Install these rig pins:
- (a) A4 (for the right control quadrant)
  - (b) A10 (for the override mechanism)
  - (c) A19 (for the right torque tube)
- S 434-013
- (5) Do these steps to connect the control rod (from the right aileron control quadrant):
- (a) Adjust the control rod (from the right aileron control quadrant) until the rod end bolts can be easily installed. Tighten the jamnuts.
  - (b) Connect the control rod to the torque tube.
  - (c) Make sure that rig pins A4 and A19 can move freely in their holes.
- S 434-014
- (6) Do these steps to connect the control rod (to the override mechanism) to the torque tube:
- (a) Adjust the control rod (to the override mechanism) until the rod end bolts can be easily installed. Tighten the jamnuts.
  - (b) Connect the control rod to the torque tube.
  - (c) Make sure that rig pins A10 and A19 can move freely in their holes.
- S 094-015
- (7) Remove rig pins A4, A10 and A19.
- S 824-016
- (8) Do the adjustment procedure for the right side (center hydraulic system) LCCA (AMM 27-11-00/501).

**NOTE:** The LCCA input rod will be connected during this procedure.

G. Put the Airplane Back to Its Usual Condition

S 094-017

**WARNING:** USE AMM 32-00-15/201 TO REMOVE THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (1) Remove the door locks from the main landing gear doors and close the doors (AMM 32-00-15/201).

S 864-018

- (2) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel, P11:
  - (a) 11H15, FLT CONT SHUTOFF WING L
  - (b) 11H16, FLT CONT SHUTOFF WING CTR
  - (c) 11H26, FLT CONT SHUTOFF WING R

S 864-021

- (3) Remove the DO-NOT-OPERATE tags and move the FLT CONTROL SHUTOFF WING L, C, and R switches on the right side panel, P61, to ON.

S 864-019

- (4) Remove electrical power if it is not necessary (AMM 24-22-00/201).

RIGHT AILERON CONTROL QUADRANT - REMOVAL/INSTALLATION

1. General

- A. This procedure contains two tasks. The first task is used to remove the right aileron control quadrant and the second task is used to install it.

TASK 27-11-26-024-008

2. Right Aileron Control Quadrant - Removal

A. References

- (1) AMM 24-22-00/201, Electrical Power - Control
- (2) AMM 32-00-15/201, Landing Gear Door Locks
- (3) AMM 32-00-20/201, Landing Gear Downlocks

B. Access

- (1) Location Zone  
740 Main Landing Gear and Doors (Right)

C. Prepare for Removal

S 864-009

- (1) Supply electrical power (AMM 24-22-00/201).

S 214-010

- (2) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

S 494-007

**WARNING:** USE AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (3) Open the doors for the main landing gear and install the door locks (AMM 32-00-15/201).

S 864-011

- (4) Move the FLT CONTROL SHUTOFF WING L, C, and R switches on the right side panel, P61, to OFF. Attach DO-NOT-OPERATE tags and make sure the amber switch position legend lights come ON.

S 864-012

- (5) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
  - (a) 11H15, FLT CONT SHUTOFF WING L
  - (b) 11H16, FLT CONT SHUTOFF WING CTR
  - (c) 11H26, FLT CONT SHUTOFF WING R

D. Remove the Right Aileron Control Quadrant (Fig. 401)

S 824-013

- (1) Release the tension from aft input bus cables AB2A and AB2B at their turnbuckles.

**NOTE:** The turnbuckles for cables AB2A and AB2B are located inboard of the right aileron control quadrant in the wheel well for the right main gear.

S 034-014

- (2) Disconnect these components from the control quadrant:
  - (a) cables AB2A and AB2B and tag them for identification
  - (b) the control rod (to the torque tube).

S 034-001

- (3) Do these steps to remove the quadrant and its support assembly:
  - (a) Remove the four bolts that connect the assembly to the airplane structure (Views B-B and C-C).
  - (b) Remove the quadrant, the support assembly, and the debris guard as an assembly from the airplane structure.

S 034-002

- (4) Do these steps to remove the control quadrant from its support assembly:
  - (a) Remove the quadrant pivot bolt.
  - (b) Remove the control quadrant.

TASK 27-11-26-424-015

3. Right Aileron Control Quadrant - Installation

**NOTE:** Refer to AMM 27-11-26/601 for the applicable wear limit data.

A. Equipment

- (1) Rig Pins from Kit A20004-78 (AMM 20-10-24/201):
  - (a) A3 - P/N A20004-22
  - (b) A4 - P/N A20004-19
  - (c) A19 - P/N A20004-15

- (2) Cable Tensiometer, Commercially Available

B. Consumable Materials

- (1) D00633 Grease, Corrosion Preventive - BMS 3-33 (Preferred)
- (2) D00015 Grease, Corrosion Preventive - BMS 3-24 (Alternate)

C. References

- (1) AMM 24-22-00/201, Electrical Power - Control
- (2) AMM 27-11-26/601, Right Aileron Control Quadrant
- (3) AMM 29-11-00/201, Main (Left, Right and Center) Hydraulic Systems
- (4) AMM 32-00-15/201, Landing Gear Door Locks

EFFECTIVITY

ALL

27-11-26

02

Page 404  
Apr 22/08

D. Access

- (1) Location Zone  
740 Main Landing Gear and Doors (Right)

E. Install the Right Aileron Control Quadrant (Fig. 401)

S 644-016

- (1) Apply grease to the smooth surface of the bolts before installation.

S 494-017

- (2) Install these rig pins:  
(a) A3 (for the feel, centering, and trim mechanism)  
(b) A19 (for the right LCCA torque tube)

S 434-003

- (3) Do the steps to install the quadrant in its support assembly:  
(a) Align the quadrant with the hole for the pivot bolt in the support assembly.  
(b) Install the spacers, bearings, bushing, bolt, washer and the nut. Tighten the nut to 90-110 pound-inches (10.2-12.4 Nm) above the self-locking torque.

NOTE: Tighten the nut to just before it makes contact with the support assy, which time the self-locking torque should be measured. The self-locking torque should be measured. The self-locking torque should then be added to the 90 to 110 inches-pounds torque value and the nut tightened to within the calculated torque range.

S 424-018

- (4) Install the quadrant support and tighten the bolts that connect it to the airplane structure (4 locations).

S 434-019

- (5) Do these steps to install the control rod (from the torque tube):  
(a) Install rig pin A4 (for the right aileron control quadrant).  
(b) Adjust the control rod until the rod end bolts can be easily installed and tighten the jamnuts.  
(c) Connect the control rod to the control quadrant.  
(d) Make sure rig pins A4 and A19 can move freely in their holes.  
(e) Remove rig pin A19.

S 824-020

- (6) Do these steps if new cables were installed:  
(a) Tighten the cables to two times the value shown in Table 401.  
(b) Remove rig pins A3 and A4.  
(c) Cycle the control wheel 25 times through its full travel range.  
(d) Install rig pins A3 and A4.

EFFECTIVITY

ALL

27-11-26

03.1

Page 405  
Aug 22/09

S 824-021

- (7) Adjust the cable tension to the values shown in Table 401.

**NOTE:** Make sure the airplane temperature is stable (use a tolerance of  $\pm 5^{\circ}$  F) along the cable. Make sure the temperature has been stable for at least one hour.

Table 401 AILERON CABLE RIGGING LOADS	
TEMP °F	AFT INPUT BUS CABLES AB2A, AB2B $\pm 10$ pounds
110	88
90	79
70	70
50	62
30	54
10	45
-10	37
-30	29
-40	23

S 214-022

- (8) Make sure rig pins A3 and A4 can move freely in their holes.

S 094-004

- (9) Remove rig pins A3 and A4.

S 864-005

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS AND DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (10) Supply pressure to the left, right, and center hydraulic systems (AMM 29-11-00/201).

EFFECTIVITY

ALL

27-11-26

03

Page 406  
Dec 22/05

S 864-024

- (11) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:
- (a) 11H15, FLT CONT SHUTOFF WING L
  - (b) 11H16, FLT CONT SHUTOFF WING CTR
  - (c) 11H26, FLT CONT SHUTOFF WING R

S 864-025

- (12) Remove the DO-NOT-OPERATE tags and move the FLT CONTROL SHUTOFF WING L, C, and R switches on the right side panel, P61, to ON.

S 864-026

- (13) Push the STATUS button on the display select panel to show the aileron position indicator on the display.

S 214-027

- (14) Turn the control wheel clockwise and do these checks:
- (a) Make sure the right ailerons move up and the left ailerons move down.
  - (b) Make sure the control wheel moves smoothly and does not need too much force.

S 214-028

- (15) Turn the control wheel counterclockwise and do these checks:
- (a) Make sure the control wheel moves smoothly and does not need too much force.
  - (b) Make sure the left ailerons move up and the right ailerons move down.

S 214-029

- (16) Move the control wheel to its neutral position and do this check:
- (a) Make sure the ailerons go back to their neutral positions.

S 214-030

- (17) Make sure that no more than two threads show at the turnbuckles.

EFFECTIVITY

ALL

27-11-26

03

Page 407  
Dec 22/00

S 434-031

- (18) Install clip locks on the turnbuckles.

S 214-032

- (19) Turn the control wheel through its full travel range and do these checks:
- (a) Make sure the pulleys turn freely and do not touch the guards.
  - (b) Make sure the control wheel goes back to its neutral position when it is released.

F. Put the Airplane Back to Its Usual Condition

S 094-006

**WARNING:** USE AMM 32-00-15/201 TO REMOVE THE DOOR LOCKS. THE DOORS CAN OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (1) Remove the door locks from the main landing gear and close the doors (AMM 32-00-15/201).

S 864-033

- (2) Remove the power from the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 864-034

- (3) Remove electrical power if it is not necessary (AMM 24-22-00/201).

RIGHT LATERAL CENTRAL CONTROL ACTUATOR (LCCA) OUTPUT QUADRANT -  
REMOVAL/INSTALLATION

1. General

- A. This procedure contains four tasks. The first task contains the data that is necessary to remove the right LCCA output quadrant. The second task is used to install it. The third task supplies the data that is necessary to remove the right LCCA output quadrant spring. The fourth task is used to install it.

TASK 27-11-28-024-001

2. Right LCCA Output Quadrant - Removal

A. Equipment

- (1) Rig Pins from Kit A20004-78 (AMM 20-10-24/201):  
(a) A5 - P/N A20004-22  
(b) A12 - P/N A20004-21  
(c) A19 - P/N A20004-15

B. References

- (1) AMM 24-22-00/201, Electrical Power - Control  
(2) AMM 32-00-15/201, Landing Gear Door Locks  
(3) AMM 32-00-20/201, Landing Gear Downlocks

C. Access

- (1) Location Zone  
740 Right Hand Main Landing Gear and Doors

D. Prepare for Removal

S 864-002

- (1) Supply electrical power (AMM 24-22-00/201).

S 214-003

- (2) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

S 494-004

**WARNING:** USE THE PROCEDURE IN AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (3) Open the doors for the main landing gear and install the door locks (AMM 32-00-15/201).

S 864-005

- (4) Move the FLT CONTROL SHUTOFF WING L, C, and R on the right side panel, P61, to OFF. Attach DO-NOT-OPERATE tags and make sure the amber switch position legend lights come ON.

- (5) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
- (a) 11E17, FLT CONT CMPTR PWR L
  - (b) 11E18, FLT CONT CMPTR SERVO L
  - (c) 11E20, FLT CONT CMPTR PWR C
  - (d) 11E21, FLT CONT CMPTR SERVO C
  - (e) 11E35, FLT CONT CMPTR PWR R
  - (f) 11E36, FLT CONT CMPTR SERVO R
  - (g) 11H15, FLT CONT SHUTOFF WING L
  - (h) 11H16, FLT CONT SHUTOFF WING CTR
  - (i) 11H26, FLT CONT SHUTOFF WING R

E. Remove the Right LCCA Output Quadrant (Fig. 401)

S 494-057

- (1) Install these rig pins:
- (a) A5 (for the left LCCA output quadrant)
  - (b) A12 (for the right aileron control output quadrant)
  - (c) A19 (for the right LCCA torque tube)

S 034-007

- (2) Do these steps to remove the cables from the quadrant:
- (a) Release the tension from aft power bus cables AB3A and AB3B at their turnbuckles.
  - (b) Remove the cables from the quadrant and tag them for identification.

NOTE: The turnbuckles for cables AB3A and AB3B are located outboard of the center bulkhead in the wheel well for the right main gear.

S 034-058

- (3) Do these steps to remove the cable A2A from the right aileron control output quadrant:
- (a) Release the tension from cable A2A at the turnbuckle.
  - (b) Remove the cable A2A from the quadrant and tag it for identification.

S 034-008

- (4) Disconnect these components from the quadrant:
- (a) The LCCA output rod.
  - (b) The output quadrant control rod.

S 034-009

- (5) Remove the bolts that connect the quadrant support to the airplane structure (5 locations).

- (6) Remove the quadrant and its support.

TASK 27-11-28-424-011

### 3. Right LCCA Output Quadrant - Installation

NOTE: Refer to 27-11-28 for the applicable wear limit data.

#### A. Equipment

- (1) Rig Pins from Kit A20004-78 (AMM 20-10-24/201):
  - (a) A2 - P/N A20004-17
  - (b) A5 - P/N A20004-22
  - (c) A10 - P/N A20004-17
  - (d) A11 - P/N A20004-15
  - (e) A12 - P/N A20004-21
  - (f) A19 - P/N A20004-15
- (2) Cable Tensiometer, Commercially Available

#### B. Consumable Materials

- (1) A00247 Sealant, Chromate Type - BMS 5-95
- (2) D00633 Grease, Corrosion Preventive - BMS 3-33 (Preferred)
- (3) D00015 Grease, Corrosion Preventive - BMS 3-24 (Alternate)

#### C. References

- (1) AMM 24-22-00/201, Electrical Power - Control
- (2) AMM 27-11-00/501, Aileron and Aileron Trim Control System
- (3) AMM 27-11-28/601, Right Lateral Central Control Actuator (LCCA) Output Quadrant
- (4) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems
- (5) AMM 32-00-15/201, Landing Gear Door Locks

#### D. Access

- (1) Location Zone  
740 Right Hand Main Landing Gear and Doors

#### E. Install the Right LCCA Output Quadrant (Fig. 401)

S 644-012

- (1) Apply grease to the smooth surfaces of the bolts before installation.

S 424-013

- (2) Install the quadrant and its support on the airplane structure. Tighten the bolts (5 locations) and apply sealant.

S 494-014

- (3) Install these rig pins:
  - (a) A5 (for the left LCCA output quadrant)
  - (b) A11 (for the right LCCA output quadrant)
  - (c) A12 (for the right aileron control output quadrant)
  - (d) A19 (for the right LCCA torque tube)

EFFECTIVITY

ALL

27-11-28

02

Page 405  
Apr 22/08

S 434-015

- (4) Do these steps to connect the output quadrant control rod:
- (a) Adjust the control rod until the rod end bolts can be easily installed.
  - (b) Connect the control rod.
  - (c) Make sure rig pins A11 and A12 can move freely in their holes.

S 824-053

- (5) Connect cable A2A to the quadrant.

S 824-054

- (6) Adjust the cable tension to the values shown in the Aileron Cable Rigging Loads Table (AMM 27-11-00/501). Do the checks that follow:

**NOTE:** The turnbuckles for cables A2A and A2B are located behind the third sidewall panel aft of the forward cargo door.

- (a) Make sure that rig pins A2 (for the first officer's drum assembly), A10 (for the override mechanism), and A12 (for the right aileron control output quadrant) can be easily installed.
- (b) Make sure that the breakout cam is in its center position in the override mechanism.

S 094-016

- (7) Remove rig pins A2, A10, A12 and A19.

S 824-017

- (8) Connect cables AB3A and AB3B to the quadrant. Do these steps if new cables were installed:
- (a) Tighten the cables to two times the value shown in Table 401.
  - (b) Remove rig pins A5 and A11.
  - (c) Cycle the control wheel 25 times through its full travel range.
  - (d) Install rig pins A5 and A11.

S 824-018

- (9) Adjust the cable tension to the values shown in Table 401.

**NOTE:** Make sure the airplane temperature is stable (use a tolerance of  $\pm 5$  °F) along the cable. Make sure the temperature has been stable for at least one hour.

F. Right LCCA Output Quadrant Springs Installation Test

S 024-041

- (1) Disconnect the control rod between the Right LCCA Output quadrant and the Right Aileron Control Output quadrant.

S 484-042

- (2) Attach the spring scale to the Right LCCA Output Quadrant lever where the control rod was removed. Position the scale at 90 degrees with the lever.

S 824-046

- (3) Make sure the force requires to breakout the cam detent is 30 to 32 lbs. The LCCA will stop the movement of the quadrant assembly.

**NOTE:** Add or remove washers if it is necessary to obtain the breakout force.

- (a) Torque the nut to 50-80 pound-inches (5.6-9.0 newton-meters).

S 084-043

- (4) Remove the spring scale from the lever.

S 424-044

- (5) Connect the control rod to the Right LCCA Output quadrant.

G. Put the Airplane Back to Its Usual Condition

S 084-027

**WARNING:** USE THE PROCEDURE IN AMM 32-00-15/201 TO REMOVE THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (1) Remove the door locks from the main landing gear and close the doors (AMM 32-00-15/201).

S 864-028

- (2) Remove the power from the left, right, and center hydraulic systems (AMM 29-11-00/201).

RIGHT AILERON CONTROL OUTPUT QUADRANT – REMOVAL/INSTALLATION

1. General

- A. This procedure contains two tasks. The first task is used to remove the right aileron control output quadrant. The second task contains the data that is necessary to install it.

TASK 27-11-34-024-001

2. Right Aileron Control Output Quadrant – Removal

A. References

- (1) AMM 06-44-00/201, Wing Access Doors and Panels
- (2) AMM 24-22-00/201, Electrical Power – Control
- (3) AMM 25-52-01/401, Sidewall Panels
- (4) AMM 27-51-00/201, Trailing Edge Flap System
- (5) AMM 32-00-15/201, Landing Gear Door Locks
- (6) AMM 32-00-20/201, Landing Gear Downlocks

B. Access

- (1) Location Zones
  - 740 Right Hand Main Landing Gear and Doors
  - 661 Rear Spar to Trailing Edge
- (2) Access Panel
  - 661AB Wing TE Structure Aileron Controls

C. Prepare for Removal

S 864-005

- (1) Supply electrical power (AMM 24-22-00/201).

S 214-006

- (2) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

S 494-002

**WARNING:** USE AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (3) Open the doors for the main landing gear and install the door locks (AMM 32-00-15/201).

S 044-007

- (4) Do the deactivation procedure for the trailing edge flaps (AMM 27-51-00/201).

S 864-008

- (5) Move the FLT CONTROL SHUTOFF WING L, C, and R switches on the right side panel, P61, to OFF. Attach DO-NOT-OPERATE tags and make sure the amber switch position legend lights come ON.

S 014-010

- (7) Open access panel 661AB (AMM 06-44-00/201).
- D. Remove the Right Aileron Control Output Quadrant (Fig. 401)

S 824-011

- (1) Release the tension from body cables A2A, A2B, and inboard wing cables A4A, A4B at their turnbuckles.

**NOTE:** The turnbuckle for cable A2A is located between the aileron control override mechanism and the right aileron control output quadrant in the wheel well for the right main gear. The turnbuckle for cable A2B is located behind the third sidewall panel aft of the forward cargo door. Refer to 25-52-01 for the sidewall panel removal procedure.

The turnbuckles for cables A4A and A4B are located outboard of the right aileron control output quadrant along the wing rear spar.

S 034-012

- (2) Disconnect these components:
  - (a) The cables from the quadrant and tag them for identification.
  - (b) The control rod from the quadrant.
  - (c) The quadrant from its support bracket.

S 024-013

- (3) Move the quadrant in the outboard direction and remove it.

TASK 27-11-34-424-014

### 3. Right Aileron Control Output Quadrant - Installation

**NOTE:** Refer to AMM 27-11-34/601 for the applicable wear limit data.

#### A. Equipment

- (1) Rig Pins from Kit A20004-78 (AMM 20-10-24/201):
  - (a) A2 - P/N A20004-17
  - (b) A10 - P/N A20004-17
  - (c) A11 - P/N A20004-15
  - (d) A12 - P/N A20004-21
  - (e) A13 - P/N A20004-20
- (2) Cable Tensiometer, Commercially Available

D. Access

- (1) Location Zones
  - 740 Right Hand Main Landing Gear and Doors
  - 661 Rear Spar to Trailing Edge
- (2) Access Panel
  - 661AB Wing TE Structure Aileron Controls

E. Install the Right Aileron Control Output Quadrant (Fig. 401)

S 494-015

- (1) Install these rig pins:
  - (a) A2 (for the first officer's drum assembly)
  - (b) A11 (for the right LCCA output quadrant)
  - (c) A13 (for the inboard quadrant of the right aileron droop mechanism).

S 644-016

- (2) Apply grease to the bolts, bushings, and bearing before installation.

S 424-017

- (3) Do these steps to install the quadrant:
  - (a) Align the quadrant with the support bracket.
  - (b) Install the bushings, spacer, bearing, and bolt that attach the quadrant to the bracket.
  - (c) Install the nut and tighten it.

S 494-018

- (4) Install rig pin A12 in the quadrant.

S 434-019

- (5) Do these steps to connect the control rod to the quadrant:
  - (a) Adjust the control rod until the rod end bolts can be easily installed. Tighten the jam nuts.
  - (b) Connect the control rod to the quadrant.
  - (c) Make sure rig pins A11 and A12 can move freely in their holes.

S 094-020

- (6) Remove rig pins A11 and A12.

S 434-021

- (7) Connect cables A2A, A2B, A4A, and A4B to the quadrant.

EFFECTIVITY

ALL

27-11-34

02

Page 405  
Apr 22/08

- S 824-022
- (8) Do these steps if new cables have been installed:
- (a) Tighten the cables to two times the value shown in Table 401.
  - (b) Remove rig pins A2 and A13.
  - (c) Cycle the control wheel 25 times through its full travel range.
  - (d) Install rig pins A2 and A13.

- S 824-023
- (9) Adjust the cable tension to the value shown in Table 401.

**NOTE:** Make sure the airplane temperature is stable (use a tolerance of  $\pm 5^{\circ}\text{F}$ ) along the cable. Make sure the temperature has been stable for at least one hour.

Table 401 Aileron Cable Rigging Loads		
TEMP °F	BACK-UP CABLES A2A & A2A $\pm 10$ LBS	INBOARD WING CABLES A4A & A4A $\pm 10$ LBS

-30	59	89
-40	53	83

- S 094-024
- (10) Remove rig pins A2 and A13.
- S 224-025
- (11) Cycle the control wheels 3 times through their full travel range, then do the checks that follow:
- (a) Make sure the cable tension is correct.
  - (b) Make sure that rig pins A2, A12, and A13 can be easily installed and removed at the same time.
  - (c) Make sure that rig pin A10 can be easily installed and removed in the override mechanism.
  - (d) Make sure the pulleys turn freely and do not touch the guards.

- S 434-026
- (12) Install the clip locks on the turnbuckles.

EFFECTIVITY

ALL

27-11-34

F. Test Right Aileron Control Output Quadrant.

S 094-027

- (1) Make sure all the rig pins have been removed.

S 864-029

- (2) Push the STATUS switch on the pilot's display select panel, P9, to show the aileron position indicator on the display.

S 864-003

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (3) Supply pressure to the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 864-030

- (4) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:
- (a) 11H15, FLT CONT SHUTOFF WING L
  - (b) 11H16, FLT CONT SHUTOFF WING CTR
  - (c) 11H26, FLT CONT SHUTOFF WING R

S 864-031

- (5) Remove the DO-NOT-OPERATE tags and move the FLT CONTROL SHUTOFF WING L, C, and R switches on the right side panel, P61, to ON.

S 214-032

- (6) Turn one of the two control wheels clockwise and do this check:
- (a) Make sure the right ailerons move up and the left ailerons move down.

S 214-033

- (7) Turn one of the two control wheels counterclockwise and do this check:
- (a) Make sure the right ailerons move down and the left ailerons move up.

EFFECTIVITY

ALL

27-11-34

02

Page 407  
Aug 22/01

S 214-034

- (8) Use a clamp to hold the captain's control wheel in its full clockwise position and do these steps:
- (a) Turn the first officer's wheel to its full counterclockwise position and do this check:
    - 1) Make sure the right ailerons move down and the left ailerons stay down.

S 214-035

- (9) Use a clamp to hold the captain's control wheel in its full counterclockwise position and do these steps:
- (a) Turn the first officer's control wheel to its full clockwise position and do this check:
    - 1) Make sure the right ailerons move up and the left ailerons stay up.

S 864-036

- (10) Put the two control wheels back in their neutral position.
- G. Put the Airplane Back to Its Usual Condition

S 094-004

**WARNING:** USE AMM 32-00-15/201 TO REMOVE THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (1) Remove the door locks from the main landing gear and close the doors (AMM 32-00-15/201).

S 864-037

- (2) Remove the power from the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 864-038

- (3) Remove electrical power if it is not necessary (AMM 24-22-00/201).

S 414-039

- (4) Close access panel 661AB (AMM 06-44-00/201).

AILERON CONTROL OVERRIDE MECHANISM – REMOVAL/INSTALLATION

1. General

A. This procedure contains these tasks:

- Aileron Control Override Mechanism – Removal
- Aileron Control Override Mechanism – Installation
- Dual Aileron Control Path Override – Test
- Aileron Control Override Quadrant Spring – Removal
- Aileron Control Override Quadrant Spring – Installation

TASK 27-11-36-024-036

2. Aileron Control Override Mechanism – Removal

NOTE: Refer to AMM 27-11-36/601 for the applicable wear limit data.

A. References

- (1) AMM 24-22-00/201, Electrical Power – Control
- (2) AMM 25-52-01/401, Sidewall Panels
- (3) AMM 32-00-15/201, Landing Gear Door Locks
- (4) AMM 32-00-20/201, Landing Gear Downlocks

B. Access

- (1) Location Zone  
740 Main Landing Gear and Doors (Right)

C. Prepare for the Removal

S 864-001

- (1) Supply electrical power (AMM 24-22-00/201).

S 214-002

- (2) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

S 494-003

WARNING: USE AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (3) Open the doors for the main landing gear and install the door locks (AMM 32-00-15/201).

S 864-005

- (4) Move the FLT CONTROL SHUTOFF WING L, R, and C switches on the right side panel, P61, to OFF. Attach DO-NOT-OPERATE tags and make sure the switch position lights come on.

M76146

- S 864-006
- (5) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
- (a) 11H15, FLT CONT SHUTOFF WING LEFT
  - (b) 11H16, FLT CONT SHUTOFF WING CTR
  - (c) 11H26, FLT CONT SHUTOFF WING RIGHT
- S 864-085
- (6) Disconnect the electrical power if not needed (AMM 24-22-00/201).
- S 494-091
- (7) Install these rig pins:
- (a) A1 (for the captain's drum assembly)
  - (b) A2 (for the first officer's drum assembly)
  - (c) A3 (for the feel, centering, and trim mechanism)
  - (d) A10 (override mechanism).
  - (e) A12 (for the right aileron control output quadrant)
  - (f) A19 (for the right LCCA torque tube).
- D. Override Mechanism - Removal (Fig. 401)
- S 214-082
- (1) If necessary, make sure you have available a new upper bearing and spacer to be installed in the override mechanism before you install the mechanism on the airplane (Fig. 401).
- S 824-074
- (2) In the right wheel well, locate the turnbuckle outboard of the override mechanism (along the wing rear spar) on body cable A2A and block the cable outboard of the turnbuckle using cable clamps or an equivalent device (Fig. 402).
- NOTE:** Keep tension on cables not disturbed so that the cable drums will not unwrap and the cable will not move out of the pulley guides.
- S 824-092
- (3) In the right wheel well, follow the cable A2A from the override mechanism inboard to the pulley. Follow cable A2A upward to where the cable enters the airplane and block cable A2A using cable clamps or an equivalent device (Fig. 402).
- NOTE:** Keep tension on the cables that are not disconnected. This will make sure that the cables do not unwrap from the drum or come out of the pulley guides.

Apr 22/08

- S 434-089
- (5) Connect body cables A2A to the override mechanism.
- S 494-088
- (6) Install rig pin A10 in the override mechanism.
- S 434-017
- (7) Do these steps to connect the control rod:
- (a) Make sure the roller is in its center position on the cam.
  - (b) If required, adjust the control rod until you can easily install the rod end bolt.
  - (c) Tighten the control rod jamnuts.
  - (d) Install the bolt, bushing, and nut that connect the control rod to the mechanism.
  - (e) Make sure rig pins A10 and A19 move freely in their holes.
- S 824-019
- (8) Do these steps if you installed new cables:
- (a) Tighten the cables to two times the value shown in Table 401.
  - (b) Remove rig pins A1, A2, A3, A10, A12, and A19.
  - (c) Operate the control wheel 25 times through its full travel range.
  - (d) Install rig pins A1, A2, A3, A10, A12, and A19.
- S 824-034
- (9) Adjust the A2A cable tension at the turnbuckle just outboard of the override mechanism to the value shown in Table 401.

**NOTE:** Apply and record tension of A2A cable using a tensiometer capable of 43-128 lbs torque range and 1/8 inch size of the cable. Apply the tensiometer to the cable at least six inches from the turnbuckle terminal or other fittings. To make sure you have the correct cable tension, permit a minimum of one hour at constant ambient temperature ( $\pm 5^{\circ}\text{F}$  tolerance) for airframe temperature to become stable.

- (b) Make sure the pulleys turn freely and do not touch the pulley guards.

S 864-040

- (15) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel, P11:
  - (a) 11H15, FLT CONT SHUTOFF WING LEFT
  - (b) 11H16, FLT CONT SHUTOFF WING CTR
  - (c) 11H26, FLT CONT SHUTOFF WING RIGHT

S 864-042

- (16) Remove the DO-NOT-OPERATE tags and move the FLT CONT SHUTOFF WING L, R, and C switches on the right side panel, P61, to ON.

S 714-038

- (17) Do the "Dual Aileron Control Path Override - Test" task.
- F. Put the Airplane Back to Its Usual Condition

S 094-039

**WARNING:** USE AMM 32-00-15/201 TO REMOVE THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (1) Remove the door locks from the main landing gear doors and close the doors (AMM 32-00-15/201).

S 864-041

- (2) Remove electrical power if it is not necessary (AMM 24-22-00/201).

TASK 27-11-36-714-043

4. Dual Aileron Control Path Override - Test

A. References

- (1) AMM 24-22-00/201, Electrical Power - Control
- (2) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems

B. Access

- (1) Location Zones
  - 211/212 Control Cabin

C. Prepare for the Test

S 214-022

- (1) Make sure you removed all the rig pins in the aileron system.

S 864-023

- (2) Supply electrical power (AMM 24-22-00/201).

EFFECTIVITY

ALL

27-11-36

01

Page 411  
Dec 22/04

S 214-064

- (3) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

S 494-065

**WARNING:** USE AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (4) Open the doors for the main landing gear and install the door locks (AMM 32-00-15/201).

S 864-066

- (5) Make sure the FLT CONTROL SHUTOFF WING, L, R and C switches on the right side panel P61, are in the ON position.

S 864-024

- (6) Make sure these circuit breakers on the overhead panel, P11, are closed:
- (a) 11H15, FLT CONT SHUTOFF WING LEFT
  - (b) 11H16, FLT CONT SHUTOFF WING CTR
  - (c) 11H26, FLT CONT SHUTOFF WING RIGHT
  - (d) 11L9, LEFT ENGINE OIL PRESS
  - (e) 11L36, RIGHT ENGINE OIL PRESS
  - (f) EICAS (6 LOCATIONS)

S 864-068

- (7) Push the STATUS switch on the display select panel to show the aileron position indicator on the display.

S 864-026

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (8) Supply pressure to the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 824-035

- (9) Operate the aileron trim switches on the aft electronic control panel, P8, until the trim indicator (on the control wheel) shows zero units of trim.

EFFECTIVITY

ALL

27-11-36

01

Page 412  
Dec 22/05

S 214-029

- (10) Use a clamp to hold the captain's control wheel fully clockwise and do these steps:

**CAUTION:** DO NOT GIVE A SUDDEN LARGE INPUT TO THE FIRST OFFICER'S CONTROL WHEEL. DO NOT EXCEED A MAXIMUM FORCE OF 500 IN-LBS TO THE FIRST OFFICER'S CONTROL WHEEL. THIS CAN SHEAR THE SHEAROUT RIVETS OF THE RIGHT LCCA TORQUE TUBE.

- (a) Turn the first officer's control wheel fully counterclockwise with a slow and constant motion, and do this check:
- 1) Make sure the right ailerons move down and the left ailerons stay down.
  - 2) Get to the right wheel well to make sure that the roller of the cam follower lever moves out of its indent and rolls freely on the track.
  - 3) Replace the roller or the complete lever assembly, if the roller is frozen (SB 27-0142).

S 214-030

- (11) Use a clamp to hold the captain's control wheel fully counterclockwise and do these steps:

**CAUTION:** DO NOT GIVE A SUDDEN LARGE INPUT TO THE FIRST OFFICER'S CONTROL WHEEL. DO NOT EXCEED A MAXIMUM FORCE OF 500 IN-LBS TO THE FIRST OFFICER'S CONTROL WHEEL. THIS CAN SHEAR THE SHEAROUT RIVETS OF THE RIGHT LCCA TORQUE TUBE.

- (a) Turn the first officer's control wheel fully clockwise with a slow and constant motion, and do this check:
- 1) Make sure the right ailerons move up and the left ailerons stay up.
  - 2) Get to the right wheel well to make sure that the roller of the cam follower lever moves out of its indent and rolls freely on the track.
  - 3) Replace the roller bearing, or the complete lever assembly, if the roller bearing is frozen.

S 864-031

- (12) Move the control wheels back to their neutral positions.

S 864-072

- (13) Make sure the shearout rivets of the LCCA torque tube are not damaged. Replace rivets if necessary.

EFFECTIVITY

ALL

27-11-36

- (1) AMM 24-22-00/201, Electrical Power - Control
- (2) AMM 32-00-15/201, Main Gear Door Locks
- (3) AMM 32-00-20/201, Landing Gear Downlocks

B. Access

- (1) Location Zones  
740 Right Hand Main Landing Gear and Doors

C. Prepare for Removal

S 864-045

- (1) Supply electrical power (AMM 24-22-00/201).

S 214-046

- (2) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

S 484-047

**WARNING:** USE AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (3) Open the doors for the main landing gear and install the door locks (AMM 32-00-15/201).

S 864-059

- (4) Move the FLT CONTROL SHUTOFF WING L, C, and R switches on the right side panel, P61, to OFF. Attach DO-NOT-OPERATE tags and make sure the amber switch position legend lights come ON.

EFFECTIVITY

ALL

27-11-36

01

Page 414  
Apr 22/05

S 864-058

- (5) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
  - (a) 11H15, FLT CONT SHUTOFF WING L
  - (b) 11H16, FLT CONT SHUTOFF WING CTR
  - (c) 11H26, FLT CONT SHUTOFF WING R

D. Override Quadrant Springs Removal

S 024-050

- (1) Remove the spring from the Override mechanism:
  - (a) Remove the nuts and washers from the bolts that connect the springs to the Override Quadrant Assembly. Keep a record of the number of washers that were removed.
  - (b) Remove the bolts from the quadrant assembly.
  - (c) Remove both springs from the lever assembly.

TASK 27-11-36-404-056

6. Override Quadrant Springs Installation

A. Equipment

- (1) Rig Pins from Kit A20004-1 (AMM 20-10-24/201):
  - (a) A10 - P/N A20004-17
- (2) Spring Scale, Commercially Available

B. Consumable Materials

- (1) D00633 Grease, Corrosion Preventive - BMS 3-33 (Preferred)
- (2) D00015 Grease, Corrosion Preventive - BMS 3-24 (Alternate)

C. References

- (1) AMM 24-22-00/201, Electrical Power - Control
- (2) AMM 27-11-00/501, Aileron and Aileron Trim Control System
- (3) AMM 27-11-36/601, Aileron Control Override Mechanism
- (4) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems
- (5) AMM 32-00-15/201, Main Gear Door Locks

D. Access

- (1) Location Zones  
740 Right Hand Main Landing Gear and Doors

E. Override Quadrant Springs Installation

S 424-051

- (1) Install the Override quadrant innermost spring:
  - (a) Apply grease to the spring hooks.
  - (b) Install one end of the innermost spring to the lever assembly.
  - (c) Install the other end of the spring to the bolt.
  - (d) Install the bolt to the quadrant assembly with the nut and washers. Install the same number of washers that were removed.

S 734-052

- (2) Test the Override quadrant innermost spring:
  - (a) Disconnect the inboard end of the control rod that connect the Override quadrant to the LCCA Torque Tube.
  - (b) Install rig pin A10 in the override mechanism.

EFFECTIVITY

ALL

 **BOEING**  
767  
MAINTENANCE MANUAL

- (c) Attach the spring scale to the free end of the control rod. Position the control rod at 90 degrees with the lever.
- (d) Make sure the force requires to breakout the cam detent is 27.0 to 29.6 lbs (120.1-131.6 newtons). The rig pin will stop the movement of the quadrant assembly.

NOTE: Add or remove washers if it is necessary to obtain the breakout force. Torque the nut to 50-80 in-lbs.

S 424-053

- (3) Install the Override quadrant outermost spring:
  - (a) Apply grease to the spring hooks.
  - (b) Install one end of the outermost spring to the lever assembly.
  - (c) Install the other end of the spring to the bolt.
  - (d) Install the bolt to the quadrant assembly with the nut and washers. Install the same number of washers that were removed.

S 734-054

- (4) Test both of the Override quadrant springs:
  - (a) Attach the spring scale to the free end of the control rod. Position the control rod at 90 degrees with the lever.
  - (b) Make sure the force requires to breakout the cam detent is 50.1 to 52.7 lbs (222.8-234.4 newtons) The rig pin will stop the movement of the quadrant assembly.

NOTE: Add or remove washers from the outermost nut if it is necessary to obtain the breakout force. Torque the nut to 50-80 in-lbs (5.7-9.0 newton-meters).

- (c) Remove the spring scale from the free end of the control rod.
- (d) Remove rig pin A10 from the override mechanism.
- (e) Reconnect the inboard end of the control rod that connect the Override quadrant to the LCCA Torque Tube.

F. Put the Airplane Back to Its Usual Condition

S 864-032

- (1) Remove the power from the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 864-033

- (2) Remove electrical power if it is not necessary (AMM 24-22-00/201).

AILERON DROOP MECHANISM INBOARD QUADRANT – REMOVAL/INSTALLATION

1. General

- A. This procedure contains four tasks. The first task is used to remove the inboard droop quadrant. The second task is used to install the inboard droop quadrant. The third task is used to remove the inboard droop quadrant springs. The fourth task is used to install inboard droop quadrant springs.

TASK 27-11-38-024-036

2. Inboard Droop Quadrant Removal

A. References

- (1) AMM 06-44-00/201, Wing Access Doors and Panels
- (2) AMM 24-22-00/201, Electrical Power – Control
- (3) AMM 27-51-00/201, Trailing Edge Flap System
- (4) AMM 32-00-15/201, Main Gear Door Locks
- (5) AMM 32-00-20/201, Landing Gear Downlocks

B. Access

- (1) Location Zones
  - 561/661 Rear Spar to Trailing Edge
- (2) Access Panels
  - 561/661AB Wing TE Structure, Aileron Controls
  - 561/661BB Wing TE Inboard Aileron Actuators
  - 561/661CB Wing TE Structure, Aileron Controls

C. Prepare for Removal

- S 864-001
  - (1) Supply electrical power (AMM 24-22-00/201).
- S 214-002
  - (2) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).
- S 494-003

**WARNING:** USE AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (3) Open the doors for the main landing gear and install the door locks (AMM 32-00-15/201).

- S 044-004
  - (4) Do the deactivation procedure for the trailing edge flaps (AMM 27-51-00/201).

S 434-019

- (9) Do these steps to install the summing lever control rod:
- (a) Adjust the control rod until the rod end bolts can be easily installed and removed.
  - (b) Tighten the control rod jamnuts.
  - (c) Connect the control rod.
  - (d) Make sure rig pins A7 and A8, or A13 and A14 can move freely in their holes.

S 094-020

- (10) Remove rig pins A5, A7, and A8, or A12, A13, and A14.

S 864-022

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (11) Supply pressure to the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 864-023

- (12) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:
- (a) 11H15, FLT CONT SHUTOFF WING L
  - (b) 11H16, FLT CONT SHUTOFF WING CTR
  - (c) 11H26, FLT CONT SHUTOFF WING R

S 864-024

- (13) Remove the DO-NOT-OPERATE tags and move the FLT CONTROL SHUTOFF WING L, C, and R switches on the right side panel, P61, to ON.

S 864-025

- (14) Push the STATUS switch on the display select panel to show the aileron position indicator on the display.

S 214-026

- (15) Turn the control wheel counterclockwise and do these checks:
- (a) Make sure the left ailerons move up and the right ailerons move down.

EFFECTIVITY

ALL

27-11-38

02

Page 408  
Apr 22/08

- (b) Make sure the control wheel moves freely and does not need too much force.

S 214-027

- (16) Turn the control wheel clockwise and do these checks:
  - (a) Make sure the right ailerons move up and the left ailerons move down.
  - (b) Make sure the control wheel moves freely and does not need too much force.

S 214-028

- (17) Release the control wheel and do this check:
  - (a) Make sure the ailerons move to their neutral positions.

S 214-029

- (18) Make sure that no more than two threads show at the turnbuckles.

S 434-030

- (19) Install clip locks on the turnbuckles.

S 724-031

- (20) Do the inboard aileron droop test procedure (AMM 27-11-00/501).
- F. Put the Airplane Back to Its Usual Condition

S 864-032

**WARNING:** USE AMM 32-00-15/201 TO REMOVE THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (1) Remove the door locks from the main landing gear doors and close the doors (AMM 32-00-15/201).

S 864-033

- (2) Remove the power from the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 864-034

- (3) Remove electrical power if it is not necessary (AMM 24-22-00/201).

S 414-035

- (4) Close these access panels (AMM 06-44-00/201):
  - (a) 561AB, 561BB, 561CB for the left inboard droop mechanism
  - (b) 661AB, 661BB, 661CB for the right inboard droop mechanism

EFFECTIVITY

ALL

TASK 27-11-38-004-039

4. Inboard Droop Quadrant Spring Removal

A. References

- (1) AMM 06-44-00/201, Wing Access Doors and Panels
- (2) AMM 24-22-00/201, Electrical Power - Control
- (3) AMM 27-51-00/201, Trailing Edge Flap System
- (4) AMM 32-00-15/201, Main Gear Door Locks
- (5) AMM 32-00-20/201, Landing Gear Downlocks

B. Access

- (1) Location Zones
  - 561/661 Rear Spar to Trailing Edge
- (2) Access Panels
  - 561/661AB Wing TE Structure, Aileron Controls
  - 561/661BB Wing TE Inboard Aileron Actuators
  - 561/661CB Wing TE Structure, Aileron Controls

C. Prepare for Removal

S 864-040

- (1) Supply electrical power (AMM 24-22-00/201).

S 214-041

- (2) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

S 494-042

**WARNING:** USE THE PROCEDURE IN AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (3) Open the doors for the main landing gear and install the door locks (AMM 32-00-15/201).

S 864-041

- (4) Do the deactivation procedure for the trailing edge flaps (AMM 27-51-00/201).

S 864-050

- (5) Move the FLT CONTROL SHUTOFF WING L, C, and R switches on the right side panel, P61, to OFF. Attach DO-NOT-OPERATE tags and make sure the amber switch position legend lights come ON.

S 864-043

- (6) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
  - (a) 11H15, FLT CONT SHUTOFF WING L
  - (b) 11H16, FLT CONT SHUTOFF WING CTR
  - (c) 11H26, FLT CONT SHUTOFF WING R

EFFECTIVITY

ALL

27-11-38

01

Page 410  
Aug 22/01

S 014-044

- (7) Open these access panels (AMM 06-44-00/201):  
 (a) 561AB, 561BB, and 561CB for the left droop mechanism  
 (b) 661AB, 661BB, and 661CB for the right droop mechanism

D. Inboard Droop Quadrant Spring Removal

S 024-045

- (1) Remove the spring from the droop mechanism:  
 (a) Remove the nut and washers from the pivot of the droop quadrant.  
 (b) Remove the bolt, washers, and nut that attach the spring to the bottom and top plate of the pivot.  
 (c) Remove the collar, bolt, and spacer that attach the other end of the spring to the crank.  
 (d) Remove the droop quadrant spring.

TASK 27-11-38-404-046

5. Inboard Droop Quadrant Spring Installation

A. Equipment

- (1) Rig Pins from Kit A20004-78 (AMM 20-10-24/201):  
 (2) A5 - P/N A20004-22  
 (3) A7 - P/N A20004-20  
 (4) A8 - P/N A20004-15  
 (5) A12 - P/N A20004-21  
 (6) A13 - P/N A20004-20  
 (7) A14 - P/N A20004-15  
 (8) Cable Tensiometer, Commercially Available

B. Consumable Materials

- (1) D00633 Grease, Corrosion Preventive - BMS 3-33 (Preferred)  
 (2) D00015 Grease, Corrosion Preventive - BMS 3-24 (Alternate)

C. References

- (1) AMM 06-44-00/201, Wing Access Doors and Panels

E. Inboard Droop Quadrant Spring Installation

S 424-047

- (1) Install the inboard droop quadrant springs:
  - (a) Apply grease to the spring hooks.
  - (b) Install one end of the spring to the crank with the bolt, bushing, washer, and collar.
  - (c) Install the other end of the spring to the top and bottom plates of the droop quadrant with the bolt, bushing, washer, and nut.
  - (d) Install the pivot to the droop quadrant with the nut and washers.

S 024-048

- (2) Disconnect these components:
  - (a) The control rod between the inboard droop quadrant and the outboard droop quadrant.
  - (b) Cables A3A and A3B from the left inboard droop quadrant, or A4A and A4B from the right inboard droop quadrant. Tag them for identification.

NOTE: The turnbuckles are located outboard of the LCCA output quadrants in the left and right wheel wells for the main gear.

S 864-049

- (3) Hold the control rod to the inboard aileron power control unit's in position.

NOTE: Measure force by pulling quadrant and holding rod tightly.

S 484-049

- (4) Attach the spring scale to the cable quadrant.

NOTE: You can put a cord around the quadrant cable groove to attach the spring scale.

S 824-050

- (5) Adjust (for detent breakout force) the nut that attaches the pivot to the inboard droop quadrant until the spring scale reads 46-53 lbs (204.6-235.7 newtons)(for nuts on the right aileron control-quadrant/droop installations), or 62-72 lbs (275-320 Newtons) (for nuts on the left aileron control-quadrant/droop installations).

NOTE: Add or remove washers if it is necessary.

EFFECTIVITY

ALL

- S 084-051
- (6) Remove the spring scale from the cable quadrant.
- S 024-050
- (7) Disconnect the summing lever control rod from the droop summing lever.
- S 424-051
- (8) Connect these components:
- (a) Cables A3A and A3B to the left droop quadrant, or A4A and A4B to the right droop quadrant.
  - (b) The control rod (to the outboard droop quadrant) to the inboard droop quadrant.
- S 484-052
- (9) Install these rig pins for the left inboard droop quadrant:
- (a) A5 (for the left LCCA output quadrant)
  - (b) A7 (for the left inboard droop quadrant)
  - (c) A8 (for the left droop summing lever)
- S 484-053
- (10) Install these rig pins for the right inboard droop quadrant:
- (a) A12 (for the right aileron control output quadrant)
  - (b) A13 (for the right inboard droop quadrant)
  - (c) A14 (for the right droop summing lever)
- S 824-054
- (11) Tighten the cables to the values shown in Table 401. Make sure the breakout cam for the outboard droop quadrant stays in its center position.
- S 484-055
- (12) Do this check:
- (a) For the left inboard droop quadrant, make sure that rig pins A5 and A7 can move freely in their holes.
  - (b) For the right inboard droop quadrant, make sure that rig pins A12 and A13 can move freely in their holes.

AILERON DROOP MECHANISM INBOARD QUADRANT - INSPECTION/CHECK

1. General

- A. This procedure only has an illustration and a wear limit table which show the data for wear limits. There are no procedures for access, removal, or installation of the parts. Refer to the Aileron Droop Mechanism Inboard Quadrant - Removal/Installation for procedures and do these tasks.

TASK 27-11-38-206-001

2. Aileron Droop Mechanism Inboard Quadrant - Wear Limits

A. Access

- (1) Location Zone  
561/661 Rear Spar to Trailing Edge

B. Procedure

S 226-002

- (1) Use the supplied data (Fig. 601) to examine the inboard droop quadrant for too much wear.

AILERON DROOP MECHANISM OUTBOARD QUADRANT – REMOVAL/INSTALLATION

1. General

- A. This procedure contains four tasks. The first task supplies the data that is necessary to remove the outboard droop quadrant. The second task supplies the data that is necessary to install outboard droop quadrant. The third task supplies the data that is necessary to remove the outboard droop quadrant spring. The fourth task supplies the data that is necessary to install the outboard droop quadrant spring.

TASK 27-11-39-024-001

2. Outboard Droop Quadrant – Removal

A. References

- (1) AMM 06-44-00/201, Wing Access Doors and Panels
- (2) AMM 24-22-00/201, Electrical Power – Control
- (3) AMM 27-51-00/201, Trailing Edge Flap System
- (4) AMM 32-00-15/201, Main Gear Door Locks
- (5) AMM 32-00-20/201, Landing Gear Downlocks

B. Access

- (1) Location Zone  
       561/661       Rear Spar to Trailing Edge
  
- (2) Access Panels
 

561/661AB	Wing T.E. Structure, Aileron Controls
561/661BB	Wing T.E. Inboard Aileron Actuators
561/661CB	Wing T.E. Structure, Aileron Controls
561/661LB	Wing T.E. Structure Outboard Aileron Installation

C. Prepare for Removal

- S 864-002
- (1) Supply electrical power (AMM 24-22-00/201).
  
- S 214-003
- (2) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).
  
- S 494-030

**WARNING:** USE AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (3) Open the doors for the main landing gear and install the door locks (AMM 32-00-15/201).
  
- S 044-004
- (4) Do the deactivation procedure for the trailing edge flaps (AMM 27-51-00/201).

S 864-005

- (5) Move the FLT CONTROL SHUTOFF WING L, C, and R switches on the right side panel, P61, to OFF. Attach DO-NOT-OPERATE tags and make sure the amber switch position lights come ON.

S 864-006

- (6) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
  - (a) 11H15, FLT CONT SHUTOFF WING L
  - (b) 11H16, FLT CONT SHUTOFF WING CTR
  - (c) 11H26, FLT CONT SHUTOFF WING R

S 014-007

- (7) Open these access panels (AMM 06-44-00/201):
  - (a) 561AB, 561BB, 561CB, and 561LB to get access to the left droop mechanism.
  - (b) 661AB, 661BB, 661CB, and 661LB to get access to the right droop mechanism.

D. Remove the Outboard Droop Quadrant

S 034-008

- (1) Disconnect cables A3A and A3B from the left outboard droop quadrant, or A4A and A4B from the right outboard droop quadrant. Tag the cables for identification.

**NOTE:** The turnbuckles are located behind access panel 561LB (left) or 661LB (right).

S 034-009

- (2) Disconnect the control rod (from the inboard droop quadrant) from the outboard droop quadrant.

S 024-010

- (3) Remove the bolts (5 locations) that connect the quadrant support to the wing structure, and remove the outboard droop quadrant.

TASK 27-11-39-424-011

3. Outboard Droop Quadrant - Installation

**NOTE:** Refer to AMM 27-11-38/601 for the applicable wear limit data.

A. General

- (1) Before this procedure is done, make sure that the airplane temperature is stable (use a tolerance of  $\pm 5^{\circ}$  F) along the cable. Make sure that the temperature has been stable for at least one hour.

B. Equipment

- (1) Rig Pins from Kit A20004-78 (AMM 20-10-24/201):
  - (a) A7 - P/N A20004-20

    - 561/661LB Wing T.E. Structure Outboard Aileron Installation
- F. Install Outboard Droop Quadrant
  - S 644-012
    - (1) Apply a layer of grease to the bolts that connect the droop quadrant to the wing.
  - S 434-013
    - (2) Hold the quadrant support in position and install the bolts that connect the outboard droop quadrant to the wing (5 locations).
  - S 434-031
    - (3) Connect these components:
      - (a) Cables A3A and A3B to the left outboard droop quadrant, or A4A and A4B to the right outboard droop quadrant.
      - (b) The control rod (from the inboard quadrant) to the outboard droop quadrant.
  - S 214-014
    - (4) Make sure the breakout cam for the outboard droop quadrant is in its center position.
  - S 494-015
    - (5) Install these rig pins for the left outboard droop quadrant (Fig. 402):
      - (a) A7 (for the left inboard droop quadrant)
      - (b) A9 (for the left aileron lockout mechanism)

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (9) Supply pressure to the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 864-020

- (10) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:
- (a) 11H15, FLT CONT SHUTOFF WING L
  - (b) 11H16, FLT CONT SHUTOFF WING CTR
  - (c) 11H26, FLT CONT SHUTOFF WING R

S 864-021

- (11) Remove the DO-NOT-OPERATE tags and move the FLT CONTROL SHUTOFF WING L, C, and R switches on the right side panel, P61, to ON.

S 864-022

- (12) Push the STATUS button on the display select panel to show the aileron position indicator on the display.

S 214-023

- (13) Turn the control wheel clockwise and do the checks that follow:
- (a) Make sure the control wheel moves freely and does not need too much force.
  - (b) Make sure the left ailerons move down and the right ailerons move up.

S 214-024

- (14) Turn the control wheel counterclockwise and do the checks that follow:
- (a) Make sure the control wheel moves freely and does not need too much force.
  - (b) Make sure the left ailerons move up and the right ailerons move down.

  - 561/661CB Wing TE Structure, Aileron Controls
  - 561/661LB Wing TE Structure Outboard Aileron Installation

E. Outboard Droop Quadrant Spring Installation

S 424-115

- (1) Install the outboard droop quadrant springs:
  - (a) Apply grease to the spring hooks.
  - (b) Install one end of the spring to the crank with the bolt, bushing, washer, and collar.
  - (c) Install the other end of the spring to the top and bottom plates of the droop quadrant with the bolt, bushing, washer, and nut.
  - (d) Install the pivot to the droop quadrant with the nut and washers.

EFFECTIVITY

ALL

27-11-39

02

Page 410  
Apr 22/08

F. Outboard Droop Quadrant Springs Installation Test

S 024-116

- (1) Disconnect the cables A3A and A3B from the left outboard droop quadrant, or A4A and A4B from the right outboard droop quadrant. Tag them for identification.

NOTE: The turnbuckles are located outboard of the LCCA output quadrants in the left and right wheel wells for the main gear.

S 864-117

- (2) Hold the input linkage to the control rod (from the inboard quadrant) in position.

NOTE: Measure force by pulling quadrant and holding rod tightly.

S 484-118

- (3) Attach the spring scale to the cable quadrant.

NOTE: You can put a cord around the quadrant cable groove to attach the spring scale.

S 824-119

- (4) Adjust (for detent breakout force) the nut that attach the pivot to the droop quadrant until the breakout torque of the override mechanism is 62.5-69 pounds (278.0-307.0 newtons).

NOTE: Add or remove washers if it is necessary.

S 084-120

- (5) Remove the spring scale from the cable quadrant.

S 424-121

- (6) Connect the cables A3A and A3B to the left droop quadrant, or A4A and A4B to the right droop quadrant.

S 864-141

- (7) Make sure the breakout cam for the outboard droop quadrant is in its center position.

S 484-122

- (8) Install these rig pins for the left outboard droop quadrant:
  - (a) A7 (for the left inboard droop quadrant)
  - (b) A9 (for the left aileron lockout mechanism)

EFFECTIVITY

ALL

27-11-39

01

Page 411  
Apr 22/06

S 484-123

- (9) Install these rig pins for the right outboard droop quadrant:
- (a) A13 (for the right inboard droop quadrant)
  - (b) A15 (for the right aileron lockout mechanism)

S 214-124

- (10) Tighten the cables to the values shown in Table 401 and do the checks that follow:
- (a) Make sure the breakout cam for the outboard droop quadrant stays in its center position.
  - (b) Make sure that rig pins A7 and A9 (left), or A13 and A15 (right), can move freely.

S 094-125

- (11) Remove rig pins A7 and A9, or A13 and A15, as applicable.

S 864-127

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (12) Supply pressure to the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 864-128

- (13) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:
- (a) 11H15, FLT CONT SHUTOFF WING L
  - (b) 11H16, FLT CONT SHUTOFF WING CTR
  - (c) 11H26, FLT CONT SHUTOFF WING R

S 864-129

AILERON DROOP MECHANISM SUMMING LEVER – REMOVAL/INSTALLATION

1. General

- A. This procedure contains two tasks. The first task supplies the data that is necessary to remove the summing lever for the aileron droop mechanism. The second task supplies the data that is necessary to install it.

TASK 27-11-40-024-026

2. Aileron Droop Mechanism Summing Lever – Removal

A. References

- (1) AMM 06-44-00/201, Wing Access Doors and Panels
- (2) AMM 24-22-00/201, Electrical Power – Control
- (3) AMM 27-51-00/201, Trailing Edge Flap System
- (4) AMM 32-00-15/201, Main Gear Door Locks
- (5) AMM 32-00-20/201, Landing Gear Downlocks

B. Access

(1) Location Zones

- 561 Rear Spar to Trailing Edge (Left )
- 661 Rear Spar to Trailing Edge (Right)

(2) Access Panels

- 561/661AB Wing T.E. Structure, Aileron Controls
- 561/661BB Wing T.E. Inboard, Aileron Actuators
- 561/661CB Wing T.E. Structure, Aileron Controls

C. Prepare for Removal

S 864-009

- (1) Supply electrical power (AMM 24-22-00/201).

S 214-010

- (2) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

S 494-001

**WARNING:** USE AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (3) Open the main gear doors for the landing gear and install the door locks (AMM 32-00-15/201).

S 864-011

- (4) Retract the trailing edge flaps.

EFFECTIVITY

- S 044-002
- (5) Do the deactivation procedure for the trailing edge flaps (AMM 27-51-00/201).
- S 864-012
- (6) Move the FLT CONTROL SHUTOFF WING L, C, and R switches on the right side panel, P61, to OFF. Attach DO-NOT-OPERATE tags and make sure the amber switch position legend lights come ON.
- S 864-013
- (7) Open these circuit breakers on overhead panel, P11, and attach DO-NOT-CLOSE tags:
- (a) 11H15, FLT CONT SHUTOFF WING L
  - (b) 11H16, FLT CONT SHUTOFF WING CTR
  - (c) 11H26, FLT CONT SHUTOFF WING R
- S 014-003
- (8) Open these access panels (AMM 06-44-00/201).
- (a) 561AB, 561BB, and 561CB to get access to the left droop mechanism.
  - (b) 661AB, 661BB, and 661CB to get access to the right droop mechanism.

D. Remove the Summing Lever (Fig. 401)

- S 034-014
- (1) Disconnect the PCA control rod from the summing lever.
- S 034-015
- (2) Disconnect the summing lever control rod from the summing lever.
- S 024-016
- (3) Remove the bolt that connects the summing lever to the droop angle gearbox and remove the summing lever.

TASK 27-11-40-424-017

3. Aileron Droop Mechanism Summing Lever - Installation

NOTE: Refer to AMM 27-11-38/601 for the applicable wear limit data.

A. Equipment

- (1) Rig Pins from Kit A20004-78 (AMM 20-10-24/201):
- (a) A7 - P/N A20004-20
  - (b) A8 - P/N A20004-15
  - (c) A13 - P/N A20004-20
  - (d) A14 - P/N A20004-15
  - (e) A17 - P/N A20004-15
  - (f) A18 - P/N A20004-15

B. Consumable Materials

- (1) D00633 Grease, Corrosion Preventive - BMS 3-33 (Preferred)

EFFECTIVITY

ALL

27-11-40

02

Page 404  
Apr 22/08

- (2) D00015 Grease, Corrosion Preventive - BMS 3-24  
(Alternate)

C. References

- (1) AMM 06-44-00/201, Wing Access Doors and Panels
- (2) AMM 24-22-00/201, Electrical Power - Control
- (3) AMM 27-11-38/601, Aileron Droop Mechanism Inboard Quadrant
- (4) AMM 32-00-15/201, Main Gear Door Locks

D. Access

- (1) Location Zones
  - 561 Rear Spar to Trailing Edge (Left)
  - 661 Rear Spar to Trailing Edge (Right)
- (2) Access Panels
  - 561/661AB Wing T.E. Structure, Aileron Controls
  - 561/661BB Wing T.E. Inboard, Aileron Actuators
  - 561/661CB Wing T.E. Structure, Aileron Controls

E. Install the Summing Lever

S 644-008

- (1) Lubricate the summing lever bolts with grease.

S 434-018

- (2) Connect the summing lever to the droop angle gearbox.

S 494-004

- (3) Install rig pins A7 and A8 (A13 and A14) for the left (right) summing lever.

S 824-019

- (4) Adjust the summing lever control rod until rig pins A7 and A8, or A13 and A14 can move freely.

S 094-020

- (5) Tighten the locknut for the summing lever control rod and remove rig pins A7 (for the left summing lever) or A13 (for the right summing lever).

S 494-006

- (6) Install rig pin A17 (A18) for the left (right) summing lever.

EFFECTIVITY

ALL

27-11-40

02

Page 405  
Apr 22/08

S 824-021

- (7) Adjust the PCA control rod until rig pins A8 and A17, or A14 and A18 can move freely.

S 094-022

- (8) Remove rig pins A8 and A17 (for the left summing lever), or A14 and A18 (for the right summing lever).

F. Put the Airplane Back to Its Usual Condition

S 094-007

**WARNING:** USE AMM 32-00-15/201 TO REMOVE THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (1) Remove the door locks from the landing gear doors and close doors (AMM 32-00-15/201).

S 864-023

- (2) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:
  - (a) 11H15, FLT CONT SHUTOFF WING L
  - (b) 11H16, FLT CONT SHUTOFF WING CTR
  - (c) 11H26, FLT CONT SHUTOFF WING R

S 864-005

- (3) Remove the DO-NOT-OPERATE tags and move the FLT CONTROL SHUTOFF WING L, C, and R switches on the right side panel, P61, to ON.

S 864-024

- (4) Remove electrical power if it is not necessary (AMM 24-22-00/201).

S 414-025

- (5) Close these access panels (AMM 06-44-00/201):
  - (a) 561AB, 561BB, and 561CB for the left droop mechanism.

OUTBOARD AILERON LOCKOUT MECHANISM – MAINTENANCE PRACTICES

1. General

- A. This procedure contains the removal and installation tasks for the outboard aileron lockout mechanism and the aileron lockout actuator.

TASK 27-11-44-022-004

2. Lockout Mechanism or Lockout Actuator – Removal

A. General

- (1) This task contains two procedures, one to remove the outboard aileron lockout mechanism and one to remove the lockout actuator.

To start one of these two procedures, first do the procedure section "Prepare for the Removal". Then, follow one of these two procedure sections as you need: "Remove the Lockout Mechanism", or "Remove the Lockout Actuator".

B. References

- (1) 06-44-00/201, Wing Access Doors and Panels  
(2) 24-22-00/201, Electrical Power – Control  
(3) 27-51-00/201, Trailing Edge Flap System

C. Access

- (1) Location Zone  
561/661 Rear Spar to Trailing Edge
- (2) Access Panels  
561/661AB Wing T.E. Structure, Aileron Controls  
561/661LB Wing T.E. Structure, Outboard Aileron Installation  
561/661RBX Outboard Aileron Lockout Mechanism

D. Prepare for the Removal

- S 862-005  
(1) Supply electrical power (AMM 24-22-00).
- S 042-006  
(2) Do the deactivation procedure for the trailing edge flaps (AMM 27-51-00).

EFFECTIVITY

S 862-007

- (3) Move the FLT CONTROL SHUTOFF WING L, C, and R switches on the right side panel, P61, to OFF. Attach DO-NOT-OPERATE tags and make sure the switch position lights are on.

S 862-008

- (4) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
  - (a) 11C17, OUTBOARD AILERON LOCKOUT L
  - (b) 11C18, OUTBOARD AILERON LOCKOUT R
  - (c) 11H15, FLT CONT SHUTOFF WING LEFT
  - (d) 11H16, FLT CONT SHUTOFF WING CTR
  - (e) 11H26, FLT CONT SHUTOFF WING RIGHT

S 012-009

- (5) Open these access panels (AMM 06-44-00):
    - (a) 561AB, 561LB, and 561RBX (for the left lockout mechanism)
    - (b) 661AB, 661LB, and 661RBX (for the right lockout mechanism).
- E. Remove the Lockout Mechanism (Fig. 201)

S 032-010

- (1) Loosen the two outboard wing cables at their turnbuckles.

NOTE: Get access to these cables through access panels 561LB (for the left wing) or 661LB (for the right wing).

S 032-011

- (2) Disconnect these components:
  - (a) The cables from the quadrant and tag them for identification
  - (b) The control rod for the power control actuators (PCAs) from the mechanism
  - (c) The electrical connector from the actuator
  - (d) The bonding jumper(s) from the lockout actuator, if it is installed.

S 032-012

- (3) Remove the bolts (4 locations) that connect the mechanism support to the airplane structure.

S 022-013

- (4) Remove the lockout mechanism.

EFFECTIVITY

ALL

27-11-44

01

Page 204  
Aug 22/03

F. Remove the Lockout Actuator (Fig. 201)

**NOTE:** Whenever an aileron lockout actuator is removed, operate the aileron lockout mechanism by hand to inspect if a rough bearing is installed in the mechanism. If a rough bearing is found, it can be due to corrosion formed by water introduced into the bearing, or by water inside of the bearing which gets frozen at altitude and causes the aileron lockout actuator to stall when commanded. Replace the damaged bearing as necessary.

S 032-014

- (1) Disconnect these components:
  - (a) The bonding jumper(s) from the actuator, if they are installed
  - (b) The electrical connector from the actuator
  - (c) The actuator rod from the lockout mechanism
  - (d) The actuator from the lockout mechanism support.

S 022-015

- (2) Remove the actuator.

TASK 27-11-44-422-016

3. Lockout Mechanism or Lockout Actuator - Installation

A. General

- (1) This task contains two procedures, one to install the outboard aileron lockout mechanism and one to install the lockout actuator.

Firstly, do one of these two installation procedure sections as you need: "Install the Lockout Mechanism", or "Install the Lockout Actuator". Secondly, do these two procedure sections "Lockout Actuator and Mechanism - Test" and "Put the Airplane Back to Its Usual Condition" after the completion of any of these two installation procedures.

B. Equipment

- (1) Rig Pins from Set A20004 (AMM 20-10-24):
  - (a) A7 - P/N A20004-20
  - (b) A9 - P/N A20004-22
  - (c) A13 - P/N A20004-20
  - (d) A15 - P/N A20004-22
- (2) Bonding Meter - Avtron Model T477W, Avtron Manufacturing Inc., Cleveland, Ohio
- (3) Cable Tensiometer, Commercially Available

C. Consumable Materials

- (1) A00251 Compound, Sealing - BMS 5-26, Type II
- (2) C00272 Finish, Protective - BMS 10-11, Type I

EFFECTIVITY

E. Access

- (1) Location Zone  
561/661 Rear Spar to Trailing Edge
- (2) Access Panels
  - 561/661AB Wing T.E. Structure, Aileron Controls
  - 561/661LB Wing T.E. Structure, Outboard Aileron Installation
  - 561/661RBX Outboard Aileron Lockout Mechanism

F. Install the Lockout Mechanism (Fig. 201)

NOTE: Refer to AMM 27-11-44 for the applicable wear limit data.

S 642-017

- (1) Apply grease to the smooth surfaces of the bolts before you install them.

S 432-018

- (2) Do these steps to connect the lockout mechanism to the airplane structure:
  - (a) Align the mechanism with the airplane structure.
  - (b) Install and tighten the bolts that connect the mechanism to the structure (4 locations).

S 492-019

- (3) Install these rig pins:
  - (a) A7 and A9 for the left lockout mechanism
  - (b) A13 and A15 for the right lockout mechanism.

S 432-020

- (4) Connect the control rod from the power control actuators (PCAs) to the mechanism.

S 432-021

- (5) Do these steps if bonding jumper(s) were installed:
  - (a) Use a rotary bonding brush or a rotary abrasive disk to clean the connection points for the bonding jumpers (AMM 20-10-22).
  - (b) Install the bonding jumper(s) with the bolts, washers, and nuts.

EFFECTIVITY

ALL

27-11-44

02

Page 206  
Apr 22/08

(c) Apply sealant to the bonding jumper(s) and the fasteners, then apply the protective finish.

S 222-022

(6) Use the bonding meter to make sure the resistance between the lockout actuator and the airplane structure is less than 0.002 ohms.

S 432-023

(7) Connect these components:

- (a) The electrical connector to the lockout actuator
- (b) The cables to the quadrant.

S 822-024

(8) Tighten the cables to the values shown in Table 1 and do these steps:

**NOTE:** Before you adjust the cables, make sure the airplane temperature is stable (use a tolerance of  $\pm 5^{\circ}$  F) along the cable. Make sure the temperature has been stable for at least one hour.

- (a) Make sure that rig pins A7 and A9 (for the left mechanism) or A13 and A15 (for the right mechanism) can move freely in their holes.
- (b) Make sure that no more than two threads can be seen at the turnbuckles.
- (c) Install the clip locks on the turnbuckles.

- (b) A13 and A15 for the right lockout mechanism.  
G. Install the Lockout Actuator (Fig. 201)

NOTE: Refer to AMM 27-11-44 for the applicable wear limit data.

S 212-043

- (1) Manually turn the actuator input on the lockout mechanism and do this check:  
(a) Make sure the lockout mechanism moves freely.

S 492-025

- (2) Install rig pin A9 (for the left wing) or A15 (for the right wing) in the lockout mechanism.

S 432-026

- (3) Connect these components:  
(a) The actuator to the lockout mechanism support  
(b) The actuator rod to the lockout mechanism.

NOTE: Make sure you install the countersunk fastener.

S 432-027

- (4) Do these steps if bonding jumper(s) were installed:  
(a) Use a rotary bonding brush or a rotary abrasive disk to clean the connection points for the bonding jumpers (AMM 20-10-22).  
(b) Use the bolts, washers and nuts to install the bonding jumper(s).  
(c) Apply some of the sealant to the bonding jumper(s) and the fasteners, then apply the protective finish.

S 222-028

- (5) Use the bonding meter to make sure the resistance between the lockout actuator and the airplane structure is less than 0.002 ohms.

S 432-029

- (6) Connect the electrical connector to the lockout actuator.

S 092-030

- (7) Remove rig pin A9 (for the left wing) or A15 (for the right wing).

Apr 22/08

H. Lockout Actuator and Mechanism - Test

**NOTE:** If an aileron lockout actuator is removed for cause, but later passes component operational tests, cold soaking of the unit can help to find out if the actuator is operating incorrectly during flight. The actuator can be cold soaked for 4 hours at -60 degrees Fahrenheit and re-tested. If the actuator fails the test following cold soaking, then remove the cover and wipe off all visual signs of moisture, bake the actuator in an oven for 6 to 8 hours at 120 degrees Fahrenheit and re-test it.

S 862-032

- (1) Push the STATUS button on the display select panel to show the aileron position indicator on the display.

S 862-003

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (2) Supply pressure to the left, right, and center hydraulic systems (AMM 29-11-00).

S 862-033

- (3) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:
  - (a) 11C17, OUTBOARD AILERON LOCKOUT L
  - (b) 11C18, OUTBOARD AILERON LOCKOUT R
  - (c) 11H15, FLT CONT SHUTOFF WING LEFT
  - (d) 11H16, FLT CONT SHUTOFF WING CTR
  - (e) 11H26, FLT CONT SHUTOFF WING RIGHT

S 862-034

- (4) Remove the DO-NOT-OPERATE tags and move the FLT CONTROL SHUTOFF WING L, C, and R switches on the right side panel, P61, to ON.

S 212-035

- (5) Make sure the aileron trim is in its neutral position and the control wheels are in their center positions.

EFFECTIVITY

ALL

27-11-44

01

Page 209  
Aug 22/05

S 862-036

- (6) Push the FUNCTIONAL TEST switch on the left or right air data computer (ADC) module located on the E1-3 or E2-3 shelf.

NOTE: The lockout actuators will extend when the switch is pushed. The AIL LOCK light on the P5 panel will come on. Also, an AILERON LOCKOUT message will show on the top EICAS display.

Do not push the ADC switch when pressure is supplied to the pitot-static system. An incorrect fault condition can occur. To remove the fault, push the ADC test switch with the pitot-static system at ambient pressure.

S 212-037

- (7) Hold the FUNCTIONAL TEST switch on and do these steps:
- (a) Stop for 15 seconds to let the actuators extend.
  - (b) Make sure the ailerons stay in their neutral positions.
  - (c) Turn the control wheel clockwise and then counterclockwise full travel. Do this check:
    - 1) Make sure the ailerons do not move more than one degree.
  - (d) Move the control wheels back to their neutral positions.

S 862-038

- (8) Release the FUNCTIONAL TEST switch and stop for 45 seconds.

NOTE: This will let the lockout actuator retract.

S 212-039

- (9) Turn the control wheel to its full clockwise position and do these checks:
- (a) Make sure the control wheel moves smoothly through its full travel range.
  - (b) Make sure the two left ailerons move down and the two right ailerons move up.
  - (c) Make sure the ailerons move smoothly through their full travel range.

S 212-040

- (10) Move the control wheel to its full counterclockwise position and do these checks:
- (a) Make sure the control wheel moves smoothly through its full travel range.
  - (b) Make sure the two left ailerons move up and the two right ailerons move down.
  - (c) Make sure the ailerons move smoothly through their full travel range.

INBOARD AILERON POWER CONTROL ACTUATOR (PCA) – MAINTENANCE PRACTICES

1. General

- A. This procedure contains the removal and installation procedures for the inboard aileron PCA and its components. These components include the PCA filter and the hanger link for the inboard aileron PCA.

TASK 27-11-48-022-003

2. Inboard Aileron PCA and its Components – Removal

A. General

- (1) This task contains these procedures:

- Remove the Inboard Aileron PCA
- Remove the PCA Filter
- Remove the Hanger Link for the Inboard Aileron PCA.

Because this task contains three procedures, do only the applicable group of steps.

To start one of these procedures, do the "Prepare for the Removal" group of steps. Then, do the group of steps that is necessary to remove the component.

B. Equipment

- (1) Inboard Aileron Deactivation Equipment – A27013-1  
(2) Inboard Aileron PCA GAGE – A27001-2

- S 862-006
- (3) Move the FLT CONTROL SHUTOFF WING L, C, and R switches on the right side panel, P61, to OFF. Attach DO-NOT-OPERATE tags and make sure the switch position lights come on.

- S 862-007
- (4) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
- (a) 11H15, FLT CONT SHUTOFF WING LEFT
  - (b) 11H16, FLT CONT SHUTOFF WING CTR
  - (c) 11H26, FLT CONT SHUTOFF WING RIGHT

- S 012-008
- (5) Open access panel 561BB (for the left aileron) or 661BB (for the right aileron) (AMM 06-44-00/201).

- S 492-093
- (6) Install the hook (7) on the PCA input linkage (6).

**NOTE:** The hook prevents input linkage movement which can accidentally lower the aileron.

F. Remove the PCA (Fig. 201)

- S 012-024
- (1) Open access panel 556AB (for the left aileron) or 656AB (for the right aileron) (AMM 06-44-00/201).
- S 862-025
- (2) Remove the pressure from the hydraulic system that supplies the PCA you will repair (AMM 29-11-00/201).

**NOTE:** The Left system supplies the outboard PCA for the left inboard aileron.  
The Center System supplies the inboard PCAs for the left and right inboard ailerons.  
The Right system supplies the outboard PCA for the right inboard aileron.

- S 032-026
- (3) Disconnect these components:
- (a) The hydraulic lines (3, 4) from the PCA and do this step:
    - 1) Seal the hydraulic lines and the PCA ports with a cap.
  - (b) The input rod (2) from the PCA (5)

**NOTE:** Do not adjust the input rod.

- (c) The PCA rod end (5) from the aileron (1).

EFFECTIVITY

ALL

27-11-48

S 982-027

- (4) Turn the PCA (5) down.

S 222-028

- (5) Measure the shims (23) that are installed between the PCA (5) and the link assembly (16) and keep a record of the shim thickness.

**NOTE:** Do not remove the shims. The shims (23) are connected to the link assembly with screws (24). If the shims become damaged, replace them with shims of the same thickness as your record.

- (a) If it is necessary, you can adjust the shim thickness (you can use the inboard PCA gage tool, A27001-2) (Fig. 203).

**NOTE:** The ailerons must be in the rigged position.

- 1) Make sure dimension A is between 14.716 - 14.726 inches (37.37-37.40 centimeters).
- 2) Install the shims.
  - a) Make sure the Dimension A of the inboard and outboard actuator is between +/- 0.005 inches (+/- 0.127 mm) of each other.
  - b) The total dimension B must be between 0.150 - 0.250 inches (3.81-6.35 mm) (measure the dimension B with a feeler gage).

S 032-029

- (6) Remove the bolts (18, 19) and washers (17) that connect the PCA (5) to the link assembly (16).

S 022-030

- (7) Remove the PCA (5).

G. Remove the PCA Filter (Fig. 201)

S 862-031

- (1) Remove the pressure from the hydraulic system that supplies the PCA you will repair (AMM 29-11-00/201).

**NOTE:** The Left system supplies the outboard PCA for the left inboard aileron.  
The Center System supplies the inboard PCAs for the left and right inboard ailerons.  
The Right system supplies the outboard PCA for the right inboard aileron.

S 032-032

- (2) Disconnect the hydraulic pressure line (3) and seal it with a cap.

EFFECTIVITY

ALL

27-11-48

- S 032-033  
(3) Remove the reducer (20) from the PCA.

- S 032-034  
(4) Remove the packing (22).

- S 022-035  
(5) Remove the filter (21).

H. Remove the Hanger Link for the Inboard Aileron PCA (Fig. 202)

- S 942-036  
(1) Hold the inboard aileron PCA.

- S 032-037  
(2) Remove the bolt, washer, bushing, and the nut that connect the PCA hanger link to the link assembly.

- S 032-038  
(3) Remove the bolts, bushings, and the nuts that connect the hanger link to the rear spar (2 locations).

- S 022-039  
(4) Remove the hanger link from the airplane.

TASK 27-11-48-422-040

3. Inboard Aileron PCA and its Components - Installation

A. General

- (1) This task contains these procedures:
- Install the Inboard Aileron PCA
  - Install the PCA Filter
  - Install the Hanger Link for the Inboard Aileron PCA.

Because this task contains three procedures, only the applicable groups of steps must be done.

To start one of these procedures, do the group of steps that is necessary to install the component. Then, do the applicable test. There is one test for the installation of the PCA or the Hanger Link. There is a different test for the installation of the PCA Filter.

Lastly, do the "Put the Airplane Back to Its Usual Condition" group of steps.

B. Equipment

- (1) Inboard Aileron Rigging Bar - A27024-47 (recommended)  
- A27024-2 (optional)

ALL

27-11-48

S 432-041

- (2) Install the bolts (18, 19) and washers (17) that connect the PCA (5) to the link assembly (16). Tighten the nut to 585-715 pound-inches (66-80 newton-meters).

S 982-042

- (3) Lift the PCA until the rod end is aligned with the aileron.

S 432-043

- (4) Install the bolt (13), washer (12), bushing (14), and nut (15) that connect the PCA rod end to the aileron (1). Tighten the nut to 1000-1200 pound-inches (113-135 newton-meters).

**NOTE:** On the outboard PCA, the bolthead must point inboard. On the inboard PCA, the bolthead must point outboard.

S 432-044

- (5) Install the bolt (8), washers (9,10), and nut that connect the input rod (2) to the PCA (5).

**NOTE:** Do not adjust the PCA input rod.

S 432-045

- (6) Remove the caps from the hydraulic lines (3, 4) and connect them to the PCA.

**NOTE:** Make sure there is a minimum clearance of 0.35 inch (8.89 mm) between the PCA hydraulic lines to prevent chaffing against each other.

S 092-046

- (7) Remove the hook (7) from the PCA input linkage (6).

EFFECTIVITY

ALL

27-11-48

01

Page 213  
Aug 22/05

S 822-048

- (8) Do these steps to adjust the PCA:

**NOTE:** Use this procedure only if you replaced one of the two PCAs (on each wing).

If you replaced both PCAs on either wing at the same time, do the procedure to "Adjust the PCA" for the applicable aileron (AMM 27-11-00/501).

- (a) Make sure the flaps are in their retracted positions.

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (b) Supply pressure to the hydraulic system that supplies the PCA you did not replace (AMM 29-11-00/201).

**NOTE:** The Left system supplies the outboard PCA for the left inboard aileron.  
The Center System supplies the inboard PCAs for the left and right inboard ailerons.  
The Right system supplies the outboard PCA for the right inboard aileron.

- (c) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel, P11:
- 1) 11H15, FLT CONT SHUTOFF WING LEFT
  - 2) 11H16, FLT CONT SHUTOFF WING CTR
  - 3) 11H26, FLT CONT SHUTOFF WING RIGHT
- (d) Remove the DO-NOT-OPERATE tags and move the FLT CONTROL SHUTOFF WING L, R, and C switches on the right side panel, P61, to ON.

EFFECTIVITY

ALL

27-11-48

01

Page 214  
Aug 22/05

- (e) Operate the aileron up and down through an angle of 6 to 10 degrees three times.
- (f) Make a mark for the position of the aileron trailing edge (use the flap trailing edge as a reference).

NOTE: Make sure the mark cannot move.

- (g) Remove the pressure from the hydraulic system that supplies the PCA you did not replace (AMM 29-11-00/201).

WARNING: KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (h) Supply pressure to the hydraulic system that supplies the PCA you replaced (AMM 29-11-00/201).
- (i) Operate the aileron up and down through an angle of 6 to 10 degrees three times.

NOTE: When the PCA input rod is adjusted, be very careful not to move the input rod, the PCA, or any other linkages in the area. Make sure the neutral positions of the PCA and its linkages do not change during the adjustment.

- (j) During the input rod adjustment, manually move the input lever for the PCA you did not replace across its neutral position.

NOTE: This will bleed unwanted hydraulic pressure from the PCA you did not replace.

- (k) Increase the length of the input rod for the PCA you replaced until this condition is satisfactory:
  - 1) The aileron trailing edge is approximately 1 inch (25.4 mm) below the mark.

EFFECTIVITY

ALL

27-11-48

01

Page 215  
Aug 22/05

- (l) Adjust the PCA input rod until the aileron trailing edge is aligned with the mark (use a tolerance of  $\pm 0.1$  inch) ( $\pm 2.54$  mm).

**NOTE:** Make sure you move the aileron trailing edge up during the last adjustment of the input rod.

- (m) Tighten the control rod jamnuts and do this check:
  - 1) Make sure the aileron trailing edge is aligned with the mark (use a tolerance of  $\pm 0.1$  inch) ( $\pm 2.54$  mm).
- (n) Make a new mark for the position of the aileron trailing edge.
- (o) Remove the power from the hydraulic system that supplies the PCA you replaced (AMM 29-11-00/201).

**NOTE:** All hydraulic power must be removed.

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (p) Supply pressure to the hydraulic system that supplies the PCA you did not replace (AMM 29-11-00/201).
- (q) Make sure the aileron trailing edge is aligned with the new position mark (use a tolerance of  $\pm 0.10$  inch) ( $\pm 2.54$  mm).
- (r) Remove the power from the hydraulic system that supplies the PCA you did not replace (AMM 29-11-00/201).
- (s) Move the FLT CONTROL SHUTOFF TAIL L, R, and C switches on the P61 panel to OFF. Attach DO-NOT-OPERATE tags and make sure the switch position lights come on.
- (t) Open these circuit breakers on the P11 panel and attach DO-NOT-CLOSE tags:
  - 1) 11H15, FLT CONT SHUTOFF WING LEFT
  - 2) 11H16, FLT CONT SHUTOFF WING CTR
  - 3) 11H26, FLT CONT SHUTOFF WING RIGHT

S 412-067

- (9) Close access panel 556AB (for the left aileron) or 656AB (for the right aileron) (AMM 06-44-00/201).

EFFECTIVITY

ALL

27-11-48

H. Install the PCA Filter (Fig. 201)

S 432-068

- (1) Install the filter (21).

NOTE: Be careful to prevent damage to the filter.

S 432-069

- (2) Install the packing (22).

S 432-070

- (3) Install the reducer (20) and tighten it to 370-300 pound-inches (33.9-41.8 newton-meters).

S 432-071

- (4) Remove the cap from the hydraulic line (3) and connect it to the PCA (5).

NOTE: Make sure there is a minimum clearance of 0.35 inch (8.89 mm) between the PCA hydraulic lines to prevent chaffing against each other.

I. Install the Hanger Link for the Inboard Aileron PCA (Fig. 202)

S 432-072

- (1) Use the bolt, washer, bushing, and nut to connect the hanger link to the link assembly. Tighten the nut to 520-650 pound-inches (58.7-73.4 newton-meters).

S 432-073

- (2) Use the bolt, bushing, and nut to connect the hanger link to the rear spar (2 locations). Tighten the nuts to 340-425 pound-inches (38.4-48.0 newton-meters).

J. Inboard Aileron PCA - Test

NOTE: This test is for the installation of the PCA or the installation of the Hanger Link.

NOTE: Make sure the airplane is on its landing gear with its engines installed before you do this test.

All aileron position measurements are taken from the faired position (Fig. 204).

S 862-075

- (1) Push the STATUS button on the display select panel to show the aileron position indicator on the display.

Page 218  
Dec 22/00

S 222-080

- (7) Turn the control wheel fully counterclockwise and do the applicable checks that follow:

**NOTE:** An aileron without power can move down a small distance. This condition is not unusual.

Measure the aileron movement from the faired position with a bubble protractor or scale.

- (a) If the left hydraulic system has power, make sure the left inboard aileron moves up  $21.5 \pm 1$  degrees ( $18.38 \pm .85$  inches)( $46.7 \pm 2.1$  centimeters).
- (b) If the right hydraulic system has power, make sure the right inboard aileron moves down  $21.5 \pm 1$  degrees ( $18.38 \pm .85$  inches)( $46.7 \pm 2.1$  centimeters).
- (c) If the center hydraulic system has power, make sure the left inboard aileron moves up  $21.5 \pm 1$  degrees ( $18.38 \pm .85$  inches)( $46.7 \pm 2.1$  centimeters) and the right inboard aileron moves down  $21.5 \pm 1$  degrees ( $18.38 \pm .85$  inches)( $46.7 \pm 2.1$  centimeters).

S 222-081

- (8) Turn the control wheel fully clockwise and do the applicable checks that follow:

- (a) If the left hydraulic system has power, make sure the left inboard aileron moves down  $21.5 \pm 1$  degrees ( $18.38 \pm .85$  inches)( $46.7 \pm 2.1$  centimeters).
- (b) If the right hydraulic system has power, make sure the right inboard aileron moves up  $21.5 \pm 1$  degrees ( $18.38 \pm .85$  inches)( $46.7 \pm 2.1$  centimeters).
- (c) If the center hydraulic system has power, make sure the left inboard aileron moves down  $21.5 \pm 1$  degrees ( $18.38 \pm .85$  inches) and the right inboard aileron moves up  $21.5 \pm 1$  degrees ( $18.38 \pm .85$  inches)( $46.7 \pm 2.1$  centimeters).

S 222-082

- (9) Move the control wheel to its neutral position and do these steps:

**NOTE:** If you replaced two PCA's on each wing, you must do these steps.

- (a) Install the inboard aileron rigging bar with the mount equipment against the wing bottom surface. Put the bar approximately 1.0 inch (25.4 mm) inboard from and parallel to the outboard edge of the inboard aileron (Fig. 204).

EFFECTIVITY

ALL

27-11-48

01

Page 219

INBOARD AILERON POWER CONTROL ACTUATOR (PCA) – INSPECTION/CHECK

1. General

- A. This procedure only has an illustration and a wear limit table which show the data for wear limits. There are no procedures for access, removal, or installation of the parts. Refer to the Inboard Aileron PCA – Maintenance Practices for procedures to do these tasks.
- B. Aileron droop, the slow movement of the surface from the neutral position with hydraulic systems depressurized, and without PCA inputs, is a normal condition. Quick droop with hydraulics depressurized, can be caused by an input to the PCA's or possibly high internal leakage (found in past reports due to worn piston rings). If an airplane shows quick drooping surfaces, with hydraulics depressurized and normal surface positions with hydraulics pressurized, the airplane is considered dispatchable. However, if the airplane shows quick surface droop, the PCA's must be inspected/overhauled at the next convenient opportunity where manpower and components are available not to exceed 120 days.
- C. To find out if a PCA is by-passing, compare the temperature of the PCA's with a PCA that is on a surface that is not quickly drooping. If one of the PCA's is hot to the touch compared to the other PCA, the hot PCA is most likely by-passing fluid and must be removed and inspected/overhauled at the next convenient opportunity where manpower and components are available.

TASK 27-11-48-206-001

2. Inboard Aileron PCA – Wear Limits

A. Access

- (1) Location Zone  
556/656 Inboard Aileron

B. Procedure

S 226-002

- (1) Use the supplied data (Fig. 601) to examine the inboard aileron PCAs for too much wear.

OUTBOARD AILERON POWER CONTROL ACTUATOR (PCA) – MAINTENANCE PRACTICES

1. General

- A. This procedure contains these four tasks:
- (1) Outboard Aileron PCA and Reaction Link – Removal
  - (2) Outboard Aileron PCA Filter – Removal
  - (3) Outboard Aileron PCA and Reaction Link – Installation
  - (4) Outboard Aileron PCA Filter – Installation

TASK 27-11-49-022-014

2. Outboard Aileron PCA and Reaction Link – Removal

A. Equipment

- (1) Outboard Aileron Lock – A27005-1
- (2) Outboard Aileron PCA GAGE – A27001-4
- (3) Bushing Puller – A27106-1

B. References

- (1) 06-44-00/201, Wing Access Doors and Panels
- (2) 24-22-00/201, Electrical Power – Control
- (3) 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems

C. Access

- (1) Location Zone
  - 561/661 Rear Spar to Trailing Edge
- (2) Access Panels
  - 561/661MB Outboard Aileron Actuators
  - 561/661RBX Outboard Aileron Lockout Actuators

D. Prepare for the Removal

S 012-015

- (1) Open access panels 561MB and 561RBX (for the left wing) or 661MB and 661RBX (for the right wing) (Ref 06-44-00).

S 862-016

- (2) Supply electrical power (Ref 24-22-00).

S 862-001

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (3) Supply pressure to the left hydraulic system (Ref 29-11-00).

**NOTE:** Only one hydraulic system must be powered to lift the outboard aileron (3).

EFFECTIVITY

ALL

27-11-49

01

Page 201  
Aug 22/01

- S 862-017
- (4) Turn the control wheel until the aileron you will repair is in its up position.
- S 492-018
- (5) Install the outboard aileron lock.
- S 862-019
- (6) Move the FLT CONTROL SHUTOFF WING L, R, and C switches on the right side panel, P61, to OFF. Attach DO-NOT-OPERATE tags and make sure the switch position lights come on.
- S 862-020
- (7) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
- (a) 11C17, OUTBOARD AILERON LOCKOUT L
  - (b) 11C18, OUTBOARD AILERON LOCKOUT R
  - (c) 11H15, FLT CONT SHUTOFF WING LEFT
  - (d) 11H16, FLT CONT SHUTOFF WING CTR
  - (e) 11H26, FLT CONT SHUTOFF WING RIGHT
- S 862-002
- (8) Remove the power from the left hydraulic system (Ref 29-11-00).
- S 862-021
- (9) Remove the pressure from the hydraulic system that supplies power to the PCA (2) you will remove (Ref 29-11-00).

**NOTE:** The left system supplies the inboard PCA on the left aileron and the outboard PCA on the right aileron.

The right system supplies the inboard PCA on the right aileron and the outboard PCA on the left aileron.

E. Remove the PCA (Fig. 201)

- S 032-022
- (1) Disconnect these components:
- (a) The hydraulic lines (5,7) from the PCA manifolds (2) and do this step as shown in Fig. 201 View C:
    - 1) Seal the hydraulic lines and the PCA ports with a cap.
  - (b) The input rod (8) from the PCA input lever (1).
    - 1) Do not adjust the length of input rod (8).
  - (c) The reaction link (4) from the aileron (3) and do this step as shown in Fig. 201 View D:
    - 1) Turn the reaction link down.

- (d) The PCA (2) from the aileron (3) and do this step as shown in Fig. 201 View D:  
1) Turn the PCA (2) down.

S 222-023

- (2) Measure and keep a written record of the shim (17) thickness as shown in Fig. 201 View A-A.

**NOTE:** The shims (17) are connected to the trunnion (6) with screws. Do not remove or change the shims. If you replace the shims, do not change their thickness (use your record).

- (a) If it is necessary, you can adjust the shim thickness (you can use the outboard PCA gage, A27001-4) (Fig. 202).

**NOTE:** The ailerons must be in the neutral position.

- 1) Make sure dimension A is between 11.095 - 11.115 inches (28.18-28.23 cm).
- 2) Install the shims.
  - a) Make sure the dimension A of the inboard and outboard actuator is between +/- 0.005 inches (+/- 0.127 mm) of each other.
  - b) The total shim thickness must be between 0.110 - 0.200 inches (measure the shim thickness with a feeler gage).

S 022-024

- (3) Disconnect the PCA (2) from its trunnion (6) and remove it as shown in Fig. 201 View A-A.

F. Remove the Reaction Link Assembly (Fig. 201)

**NOTE:** The reaction link assembly consists of the reaction link and the the trunnion.

S 032-025

- (1) Use the bushing puller tool to remove the bolt and bushing that connect the reaction link assembly to the airplane structure (View B-B).

S 022-026

- (2) Remove the reaction link assembly.

S 032-027

- (3) Remove the shims (17) from the trunnion (6) if the trunnion (the reaction link assembly) is replaced with the new one.

**NOTE:** These shims must be installed on the new trunnion (the new reaction link assembly).

F. Install the Reaction Link Assembly (Fig. 201)

NOTE: The reaction link assembly consists of the reaction link and the trunnion.

S 432-029

- (1) Install the shims (17) on the trunnion (6) if the shims are not installed.

NOTE: The shims (17) must be installed on the trunnion (the reaction link assembly).

NOTE: Install the shims that were removed or shims of equal thickness. Make sure the shim thickness is the same as the shim thickness before the PCA was removed.

- (a) If it is necessary, you can adjust the shim thickness (the ailerons must be in the rigged position).

NOTE: Do not adjust the shim thickness unless you cannot obtain the correct adjustment with the control rod.

- 1) Make sure dimension A for the inboard actuator is between 11.095 - 11.115 inches (281.81-282.32 mm) (Fig. 202).
- 2) Install the shim for the outboard actuator.
  - a) Make sure there is not more than a 0.003 inch (0.076 mm) difference between the dimension A measurement of the inboard and outboard actuator.
  - b) The total shim thickness for the outboard actuator must be between 0.100 - 0.200 inches (2.54-5.08 mm).

S 422-030

- (2) Install the bushing and the bolt that connect the reaction link assembly to the airplane structure as shown in View B-B.

G. Install the PCA (Fig. 201)

NOTE: Refer to 27-11-49 for the applicable wear limit data.

S 642-031

- (1) Apply grease to the bolts, nuts, washers, and bushings before they are installed.

S 422-032

- (2) Do these steps to connect the PCA (2) to its trunnion (6) View A-A:
  - (a) Hold the PCA in its correct position.
  - (b) Install the washer (18) and bolt (19) that connect the PCA to its trunnion and tighten them to 115-135 pound-inches (13.0-15.25 newton-meters) (4 locations).

EFFECTIVITY

ALL

27-11-49

(c) Lock the bolts with wire.

S 432-033

- (3) Do these steps to connect the PCA (2) to the aileron (3) View D:
- (a) Turn the PCA up until it is aligned with the aileron connection point.
  - (b) Install the bolt (15), bushing (16), washers (13,14), and nut (12) that connect the PCA to the aileron and tighten them to 795 - 845 pound-inches.

S 432-034

- (4) Do these steps to connect the reaction link (4) to the aileron (3) (View D):
- (a) Turn the reaction link until it is aligned with the aileron connection point.
  - (b) Install the bolt (15), bushing (16), washers (13,14), and nut (12) that connect the reaction link to the aileron.

S 432-035

- (5) Connect these components (View C):
- (a) The input rod (8) to the input Lever (1)
  - (b) The hydraulic lines (5,7) to the PCA manifolds (2).

S 092-036

- (6) Remove the outboard aileron lock.

S 862-037

- (7) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel, P11:
- (a) 11C17, OUTBOARD AILERON LOCKOUT L
  - (b) 11C18, OUTBOARD AILERON LOCKOUT R

S 822-039

- (8) Do these steps to adjust the PCA:

**NOTE:** Use this procedure only if one of the two PCAs (on each wing) was replaced.

If you replaced more than 1 PCA, do the procedure to Adjust the PCAs for the applicable aileron (Ref 27-11-00/501).

- (a) Do these steps to put the lockout actuator for the outboard aileron in its lockout position (actuator extended):
- 1) Push and hold the L or R AIR DATA test switch on the P61 panel and do these steps.

**NOTE:** The actuator will extend in approximately 15 seconds.

- 2) Open these circuit breakers on the P11 panel and attach DO-NOT-CLOSE tags:
  - a) 11C17, OUTBOARD AILERON LOCKOUT L
  - b) 11C18, OUTBOARD AILERON LOCKOUT R
- 3) Release the AIR DATA CMPTR test switch.

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (b) Supply pressure to the hydraulic system that supplies power to the PCA you did not replace (Ref 29-11-00).

**NOTE:** The left system supplies the inboard PCA on the left aileron and the outboard PCA on the right aileron.

The right system supplies the inboard PCA on the right aileron and the outboard PCA on the left aileron.

- (c) Remove the DO-NOT-CLOSE tag and close the applicable circuit breaker on the P11 panel:
  - 1) 11H15, FLT CONT SHUTOFF WING LEFT
  - 2) 11H26, FLT CONT SHUTOFF WING RIGHT
- (d) Make sure the other two FLT CONT SHUTOFF WING circuit breakers on the P11 panel are open.
- (e) Remove the DO-NOT-OPERATE tag and move the applicable FLT CONTROL SHUTOFF WING L or R switch on the P61 panel to ON.
- (f) Make sure the other two FLT CONT SHUTOFF WING switches on the P61 panel are OFF.
- (g) Make a mark that shows the position of the aileron trailing edge (use a part of the wing that does not move).

**NOTE:** Make sure the mark cannot move during the adjustment.

- (h) Remove the power from the hydraulic system that supplies power to the PCA you did not replace (Ref 29-11-00).
- (i) Move the applicable FLT CONTROL SHUTOFF WING L or R switch on the P61 panel to OFF. Attach a DO-NOT-OPERATE tag and make sure the switch position light comes on.
- (j) Open the applicable circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:
  - 1) 11H15, FLT CONT SHUTOFF WING LEFT
  - 2) 11H26, FLT CONT SHUTOFF WING RIGHT

EFFECTIVITY

ALL

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (k) Supply pressure to the hydraulic system that supplies power to the PCA you replaced (Ref 29-11-00).

**NOTE:** The left system supplies the inboard PCA on the left aileron and the outboard PCA on the right aileron.

The right system supplies the inboard PCA on the right aileron and the outboard PCA on the left aileron.

- (l) Remove the DO-NOT-CLOSE tag and close the applicable circuit breaker on the P11 panel:  
1) 11H15, FLT CONT SHUTOFF WING LEFT  
2) 11H26, FLT CONT SHUTOFF WING RIGHT
- (m) Make sure the other two FLT CONT SHUTOFF WING circuit breakers on the P11 panel are open.
- (n) Remove the DO-NOT-OPERATE tag and move the applicable FLT CONTROL SHUTOFF WING L or R switch on the P61 panel to ON.
- (o) Make sure the other two FLT CONT SHUTOFF WING switches on the P61 panel are OFF.
- (p) Increase the length of the input rod for the powered PCA until the aileron trailing edge is approximately 1 inch (25.4 mm) below the mark.
- (q) Adjust the input rod until the aileron trailing edge is aligned with the mark (use a tolerance of  $\pm 0.05$  inch ( $\pm 1.27$  mm)) and do these steps:

**NOTE:** Always move the aileron trailing edge up during the last adjustment of the input rod.

- 1) Tighten the jamnuts for the input rod.  
2) Make sure the aileron trailing edge is aligned with the mark (use a tolerance of  $\pm 0.05$  inch ( $\pm 1.27$  mm)).
- (r) Make a new mark for the position of the aileron trailing edge.
- (s) Remove the power from the hydraulic system that supplies power to the PCA you replaced (Ref 29-11-00).
- (t) Move the applicable FLT CONTROL SHUTOFF WING L or R switch on the P61 panel to OFF. Attach a DO-NOT-OPERATE tag and make sure the switch position light comes on.
- (u) Open the applicable circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:  
1) 11H15, FLT CONT SHUTOFF WING LEFT  
2) 11H26, FLT CONT SHUTOFF WING RIGHT

Dec 22/00

S 222-045

- (6) Turn the control wheel to its full counterclockwise position and do this check:
- (a) Make sure the left outboard aileron moves up  $30.5 \pm 1.0$  degrees ( $13.66 \pm 0.44$  inches ( $34.69 \pm 1.12$  cm)) and the right outboard aileron moves down  $15.5 \pm 1.0$  degrees ( $6.76 \pm 0.44$  inches ( $17.17 \pm 1.12$  cm)).

**NOTE:** An aileron without power can move down a small distance. This condition is not unusual.

Measure the aileron movement from the faired position, with a bubble protractor or scale.

S 222-046

- (7) Turn the control wheel to its full clockwise position and do this check:
- (a) Make sure the left outboard aileron moves down  $15.5 \pm 1.0$  degrees ( $6.76 \pm 0.44$  inches ( $17.17 \pm 1.12$  cm)) and the right outboard aileron moves up  $30.5 \pm 1.0$  degrees ( $13.66 \pm 0.44$  inches ( $34.70 \pm 1.12$  cm)).

S 222-047

- (8) If a rigging bar is available, move the control wheel back to its neutral position and do these steps:

**NOTE:** If you replaced the two PCAs on each wing, you must do these steps.

- (a) Install the outboard aileron rigging bar against the wing bottom surface. Put the bar approximately 1.0 inch (25.4 mm) outboard from and parallel to the inboard edge of the outboard aileron (Fig. 202).
- (b) Make sure the outboard aileron is in the rigged position. The bottom surface of the aileron trailing edge is 0.87 +/- 0.15 inch below the faired position (Fig. 203).

OUTBOARD AILERON PCA – INSPECTION/CHECK

1. General

- A. This procedure only has an illustration and a wear limit table which show the data for wear limits. There are no procedures for access, removal, or installation of the parts. Refer to the Outboard Aileron PCA – Maintenance Practices for procedures to do these tasks.
- B. Aileron droop, the slow movement of the surface from the neutral position with hydraulic systems depressurized, and without PCA inputs, is a normal condition. Quick droop with hydraulics depressurized, can be caused by an input to the PCA's or possibly high internal leakage (found in past reports due to worn piston rings). If an airplane shows quick drooping surfaces, with hydraulics depressurized and normal surface positions with hydraulics pressurized, the airplane is considered dispatchable. However, if the airplane shows quick surface droop, the PCA's must be inspected/overhauled at the next convenient opportunity where manpower and components are available not to exceed 120 days.
- C. To find out if a PCA is by-passing, compare the temperature of the PCA's with a PCA that is on a surface that is not quickly drooping. If one of the PCA's is hot to the touch compared to the other PCA, the hot PCA is most likely by-passing fluid and must be removed and inspected/overhauled at the next convenient opportunity where manpower and components are available.

TASK 27-11-49-206-001

2. Outboard Aileron PCA – Wear Limits

A. Access

- (1) Location Zone  
567/667 Outboard Aileron

B. Procedure

S 226-002

- (1) Use the supplied data (Fig. 601) to examine the outboard aileron PCAs for too much wear.

AILERON AND SPOILER HYDRAULIC SHUTOFF VALVES -  
DESCRIPTION AND OPERATION

1. General

A. The aileron and spoiler hydraulic shutoff valves block hydraulic fluid flow to the aileron and spoiler PCAs and aileron LCCAs. There are three valves, one for each hydraulic system.

2. Component Details

A. Aileron and Spoiler Hydraulic Shutoff Valves (Fig. 1)

(1) The left and right hydraulic system shutoff valves are located near the inboard edge of the inboard ailerons. The center system shutoff valve is located in the left main gear wheel well on the aft bulkhead.

(2) An electrical actuator operates each three-way, two-position valve. Two limit switches in the actuator shut off power to the actuator motor when the selected position is reached. An override handle on the actuator manually operates the valve.

3. Operation (Fig. 2)

A. The valves are operated by push-on, push-off switches on right side panel P61. The control switches are normally in the ON (open) position. When the switches are OFF (closed), they are lit by an amber light. A clear plastic cover guards the switches.

NOTE: All flt control switches must be in the ON (valve open) position for flight.

AILERON AND SPOILER HYDRAULIC SHUTOFF VALVES – INSPECTION/CHECK

1. General

- A. This procedure contains one task. The task does a check of the hydraulic shutoff valves and the applicable indicator displays.

TASK 27-13-00-216-001

2. Aileron and Spoiler Shutoff Valve – Check

A. References

- (1) AMM 06-44-00/201, Wing Access Doors and Panels
- (2) AMM 24-22-00/201, Electrical Power – Control
- (3) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems

B. Access

- (1) Location Zones
  - 552/652 MLG Support Beam to Trailing Edge
  - 730 Left Hand Main Landing Gear and Doors
- (2) Access Panels
  - 552/652HB Wing TE Structure

C. Prepare for the Check

S 866-009

- (1) Supply electrical power (AMM 24-22-00/201).

S 216-008

- (2) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

S 496-002

**WARNING:** USE THE PROCEDURE IN AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (3) Open the doors for the main landing gear and install the door locks (AMM 32-00-15/201).

**NOTE:** The shutoff valve for the center hydraulic system is located on the aft bulkhead in the left wheel well.

S 016-010

- (4) Open these access panels (AMM 06-44-00/201):
  - (a) 552HB for the shutoff valve for the left hydraulic system.

## 767 MAINTENANCE MANUAL

Aileron and Spoiler Hydraulic Shutoff Check  
Figure 601

EFFECTIVITY	
	ALL

27-13-00

(b) 652HB for the shutoff valve for the right hydraulic system.

S 866-003

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

(5) Supply pressure to the left, right, and center hydraulic systems (AMM 29-11-00/201).

D. Aileron and Spoiler Shutoff Valve Check

S 216-012

- (1) Make sure these circuit breakers on the P11 panel are closed:
- (a) 11H15, FLT CONT SHUTOFF WING L
  - (b) 11H16, FLT CONT SHUTOFF WING CTR
  - (c) 11H26, FLT CONT SHUTOFF WING R

S 866-014

- (2) Move the FLT CONTROL SHUTOFF WING L, C, and R switches on the right side panel, P61, to ON. Make sure the amber switch position legend lights are OFF.

S 216-013

- (3) Turn the control wheel clockwise and then counterclockwise full travel. Do the check that follows:
- (a) Make sure the ailerons move through their full travel range.

**NOTE:** The spoilers will also move when the control wheel is operated.

S 216-015

- (4) Move the FLT CONTROL SHUTOFF WING L switch on the P61 panel to OFF. Do the checks that follow:
- (a) Make sure the valve motor operates smoothly and that the motor hum stops when it has moved to its full travel position.
  - (b) Make sure the manual override (position indicator) handle on the base of the motor is in the closed position (POS 2).
  - (c) Make sure the amber switch position legend light is ON.
  - (d) Make sure the L WING HYD VAL message comes into view on the EICAS display.

EFFECTIVITY

ALL

27-13-00

01

Page 603  
Aug 22/01

S 216-016

- (5) Do the above step again for the FLT CONTROL SHUTOFF WING C and R switches.

**NOTE:** When more than one valve is closed, an amber FLT CONT VALS message will come into view on the display.

S 216-017

- (6) Turn the control wheel clockwise and then counterclockwise full travel. Do the check that follows:  
(a) Make sure the ailerons and spoilers do not move.

S 866-018

- (7) Remove the power from the center and right hydraulic systems only (AMM 29-11-00/201).

S 216-004

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (8) Move the FLT CONTROL SHUTOFF WING L switch on the P61 panel to ON. Do the checks that follow:  
(a) Make sure the valve motor operates smoothly and that the motor hum stops when the indicator handle moves to the open position (POS 1).  
(b) Make sure the amber switch position legend light is OFF.  
(c) Turn the control wheel clockwise and then counterclockwise full travel. Do the checks that follow:  
1) Make sure the left ailerons and the right outboard aileron operate correctly. Make sure the right inboard aileron does not move.  
2) Make sure that spoilers 1, 6, and 12 operate when the control wheel is moved. Make sure the other spoilers do not move.

**NOTE:** Spoiler panel 6 will only operate during the first cycle of the control wheel. This is because the SCM will be automatically set to OFF.

- (d) Move the control wheel to its neutral position.

S 866-019

- (9) Remove the power from the left hydraulic system (AMM 29-11-00/201).

EFFECTIVITY

ALL

27-13-00

02

Page 604  
Dec 22/00

S 866-020

- (10) Supply pressure to the center hydraulic system only  
(AMM 29-11-00/201).

S 216-005

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (11) Move the FLT CONTROL SHUTOFF WING C switch on the P61 panel to ON. Do the checks that follow:
- (a) Make sure the valve motor operates smoothly and that the motor hum stops when the indicator handle moves to the open position (POS 1).
  - (b) Make sure the amber switch position legend light is OFF.
  - (c) Turn the control wheel clockwise and then counterclockwise full travel. Do the checks that follow:
    - 1) Make sure the inboard ailerons operate correctly when the control wheel is moved. Make sure the outboard ailerons do not move.
    - 2) Make sure that spoilers 3, 4, 5, 8, 9, and 10 operate when the control wheel is moved. Make sure the other spoilers do not move.

S 866-021

- (12) Remove the power from the center hydraulic system  
(AMM 29-11-00/201).

S 866-022

- (13) Supply pressure to the right hydraulic system only  
(AMM 29-11-00/201).

S 216-006

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (14) Move the FLT CONTROL SHUTOFF WING R switch on the P61 panel to ON. Do the checks that follow:
- (a) Make sure the valve motor operates smoothly and that the motor hum stops when the indicator handle moves to the open position (POS 1).
  - (b) Make sure the amber switch position legend light is OFF.

EFFECTIVITY

ALL

27-13-00

**WARNING:** USE THE PROCEDURE IN AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

(b) Open the doors for the main landing gear and install the door locks (Ref 32-00-15).

S 014-003

- (3) Do this step if you will remove the left or right shutoff valve:  
(a) Open access panel 552HB (left) or 652HB (right)  
(AMM 06-44-00/201) .

S 864-010

- (4) Move the FLT CONTROL SHUTOFF WING switches L, C, and R on the right side panel, P61, to OFF. Attach DO-NOT-OPERATE tags and make sure the amber switch position legend lights come ON.

S 864-011

- (5) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:  
(a) 11H15, FLT CONT SHUTOFF WING L  
(b) 11H16, FLT CONT SHUTOFF WING CTR  
(c) 11H26, FLT CONT SHUTOFF WING R

S 864-012

- (6) Remove the pressure from the applicable hydraulic system (Ref 29-11-00):  
(a) The left system for the left shutoff valve.  
(b) The center system for the center shutoff valve.  
(c) The right system for the right shutoff valve.

D. Remove the Shutoff Valve (Fig. 401)

S 034-013

- (1) Disconnect the electrical connector (1).

EFFECTIVITY

ALL

27-13-04

02

AILERON POSITION INDICATING SYSTEM – DESCRIPTION AND OPERATION

1. General
  - A. The aileron position indicating system provides visual indication on the flight deck of aileron angular displacement.
2. Component Details (Fig. 1)
  - A. Flight Control Surface Position Indicator
    - (1) The flight control surface position indicator is displayed on the display unit status page. The indicator shows the position of the ailerons, rudder, and elevators.
  - B. Aileron Position Transmitter
    - (1) The position transmitters are accessible through panels on the wing lower surface. Adjustable control rods attach the transmitters to the ailerons. The transmitter is adjusted to electrical zero when the aileron is in its neutral position.
3. Operation
  - A. Functional Description (Fig. 2)
    - (1) When the aileron deflects, it drives the control rod which produces an electrical signal in the transmitter. The voltage is proportional to the amount of aileron movement. The display unit receives the signal and shows aileron position. Four pointers indicate each aileron position separately.
  - B. Control
    - (1) Aileron position indicating is automatic when power is on. The 28 volts ac left and right bus powers the aileron position indicating system when the AILERON POS circuit breakers L and R on overhead circuit breaker panel P11 are closed.
    - (2) The aileron position indicator can be displayed when the related system circuit breakers on P11 are closed.

AILERON POSITION INDICATING SYSTEM – ADJUSTMENT/TEST

1. General

A. This procedure contains these tasks:

- Aileron Position Indication – Operational Test
- Aileron Position Indication – Adjustment

These tasks are applicable to all of the four aileron position transmitters.

TASK 27-18-00-715-003

2. Aileron Position Indication – Operational Test

A. References

- (1) 24-22-00/201, Electrical Power – Control
- (2) 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems

B. Access

- (1) Location Zones  
211/212 Control Cabin

C. Prepare for the Test

S 865-004

- (1) Supply electrical power (AMM 24-22-00/201).

S 865-002

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (2) Supply pressure to the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 865-039

- (3) Operate the aileron trim switches on the aft electronic control panel, P8, until this condition is satisfactory:
  - (a) The aileron trim indicators show zero units of trim.

EFFECTIVITY

ALL

27-18-00

Page 501  
Dec 22/00

D. Aileron Position Indication - Operational Test

S 215-007

- (1) Push the STATUS button on the display select panel to show the aileron position indicator on the display.
  - (a) Make sure the aileron position pointers align with the mid-scale mark.

NOTE: Use a tolerance of  $\pm$  one-half an arrow width.

S 215-008

- (2) Push and hold the L AIR DATA test switch on the right side panel, P61, and do this step:

NOTE: The lockout actuators will extend when you operate the switch. The AIL LOCK light on the P5 panel will come on. Also, an AILERON LOCKOUT message will come into view on the display.

Do not operate the test switch when the pitot-static system has pressure. An incorrect fault condition can occur. To remove the fault, operate the test switch with the pitot-static system at ambient pressure.

- (a) Make sure the aileron position pointers align with the mid-scale mark.

NOTE: Use a tolerance of  $\pm$  one-half an arrow width.

S 215-009

- (3) After you release the test switch, stop for one minute and do this check:
  - (a) Make sure the aileron position pointers align with the mid-scale mark.

NOTE: Use a tolerance of  $\pm$  one-half an arrow width.

- (4) Turn the control wheel fully clockwise and do these checks:  
(a) Make sure the position pointers for the left ailerons move down to the bottom mark on the scale.

NOTE: It is permitted for the arrows to go below the bottom mark.

- (b) Make sure the position pointers for the right ailerons move up to the top mark on the scale.

NOTE: It is permitted for the arrows to go above the top mark.

S 215-011

- (5) Turn the control wheels fully counterclockwise and do these checks:  
(a) Make sure the position pointers for the left ailerons move up to the top mark on the scale.

NOTE: It is permitted for the arrows to go above the top mark.

- (b) Make sure the position pointers for the right ailerons move down to the bottom mark on the scale.

NOTE: It is permitted for the arrows to go below the bottom mark.

S 865-012

- (6) Release the control wheel.

S 865-013

- (7) Open these circuit breakers on the P11 panel and attach DO-NOT-CLOSE tags:  
(a) 11K14, AILERON POS L  
(b) 11K23, AILERON POS R

S 215-014

- (8) Move the control wheel through its full travel range and do this check:  
(a) Make sure the aileron position pointers do not move.

E. Put the Airplane Back to Its Usual Condition

S 215-015

- (1) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:  
(a) 11K14, AILERON POS L  
(b) 11K23, AILERON POS R

TASK 27-18-00-825-018

3. Aileron Position Indication - Adjustment

A. General

- (1) There are three procedures to adjust the aileron position transmitters. (PROCEDURES 1 and 2 are recommended).

PROCEDURE 1 - Uses a commercially available power supply, a digital voltmeter (DVM), and the breakout box equipment.

PROCEDURE 2 - Uses airplane power and a DVM with the breakout box equipment.

PROCEDURE 3 - Adjusts the control rod and uses the position indicator and communication between the flight deck and the aileron.

B. Consumable Materials

- (1) D00633 Grease, Corrosion Preventive - BMS 3-33 (Preferred)  
(2) D00015 Grease, Corrosion Preventive - BMS 3-24 (Alternate)  
(3) A00247 Sealant, Chromate Type - BMS 5-95

C. Equipment

- (1) Rig Pins from Set A20004-XX (AMM 20-10-24/201):  
(a) A1 - P/N A20004-15  
(b) A2 - P/N A20004-17  
(2) Breakout Box, Cables - A27063-91 (Preferred)  
Position Transmitter Tester - PTTS-892B (Alternate)  
Phase Synchronous Voltmeter - 101-AC5/6/7/8 (Alternate)  
(3) Power Supply - Powertron Model 5900  
Industrial Test Equipment Corp.  
Port Washington, New York  
(4) Digital Voltmeter - John Fluke 8020B or equivalent  
John Fluke Manufacturing Co.  
Everett, Washington

(2) Access Panels

561/661CB Inboard Aileron Position Transmitter  
561/661QB Outboard Aileron Position Transmitter

F. Prepare for the Adjustment

S 865-098

- (1) Supply electrical power (AMM 24-22-00/201).

S 045-019

- (2) Do the deactivation procedure for the trailing edge flaps (AMM 27-51-00/201).

S 015-020

- (3) Open these access panels (AMM 06-44-00/201):  
(a) 561CB (for the left inboard aileron)  
(b) 561QB (for the left outboard aileron)  
(c) 661CB (for the right inboard aileron)  
(d) 661QB (for the right outboard aileron)

S 865-021

- (4) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:  
(a) 11K14, AILERON POS L  
(b) 11K23, AILERON POS R

S 865-023

- (5) Operate the aileron trim switches on the aft electronic control panel, P8, and do these steps:  
(a) Make sure the aileron trim indicator shows zero units of trim.  
(b) Attach DO-NOT-OPERATE tags to the aileron trim switches.

S 865-025

**WARNING:** ATTACH DO-NOT-OPERATE TAGS TO THE TWO CONTROL WHEELS. YOU WILL ADJUST THE POSITION TRANSMITTERS WITH HYDRAULIC POWER ON. ACCIDENTAL MOVEMENT OF THE CONTROL WHEELS WILL CAUSE AILERON MOVEMENT AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (6) Attach a DO-NOT-OPERATE tag to each of the two control wheels.

S 495-026

- (7) Install these rig pins:  
(a) A1 (for the captain's drum assembly)  
(b) A2 (for the first officer's drum assembly)

(8) Supply pressure to the left, right, and center hydraulic systems (AMM 29-11-00/201).

G. Aileron Position Indication - Adjustment (PROCEDURE 1)

S 035-041

(1) Disconnect the electrical connector from the aileron position transmitter.

S 495-042

- (2) Do these steps to connect the breakout box equipment:
- (a) Connect the breakout box and the -19 cable assembly to the transmitter (Fig. 502).
  - (b) Connect a digital voltmeter (DVM) to the breakout box at pins 5 (SIG HI) and 4 (SIG LO).
  - (c) Connect the power supply to the breakout box at pins 1 (LO) and 2 (HI).
  - (d) Adjust the power supply to  $26 \pm 0.02$  volts ac RMS.

S 825-043

(3) Adjust the control rod for the transmitter until the voltage at DVM 1 is  $0 \pm 0.050$  volts ac RMS.

S 225-044

(4) Make sure the control rod dimensions are not more than the maximum values shown (Fig. 502).

S 825-045

- (5) Do these steps if the control rod dimensions are more than the maximum:
- (a) Loosen the screws that hold the transmitter in its bracket.
  - (b) Adjust the control rod to the initial dimensions (Fig. 502).
  - (c) Turn the transmitter in its bracket until the output voltage is very near 0.
  - (d) Tighten the screws that hold the transmitter in its bracket.

AILERON POSITION TRANSMITTER - REMOVAL/INSTALLATION

1. General

A. This procedure contains these tasks:

- Aileron Position Transmitter - Removal
- Aileron Position Transmitter - Installation

These tasks are applicable to the position transmitters for the inboard and outboard ailerons.

TASK 27-18-10-024-002

2. Aileron Position Transmitter - Removal

A. References

- (1) 06-44-00/201, Wing Access Doors and Panels
- (2) 24-22-00/201, Electrical Power - Control
- (3) 27-51-00/201, Trailing Edge Flap System

B. Access

- (1) Location Zone  
561/661 Rear Spar to Trailing Edge
- (2) Access Panels  
561/661CB Inboard Aileron Position Transmitter  
561/661QB Outboard Aileron Position Transmitter

C. Prepare for the Removal

- S 864-003
- (1) Supply electrical power (Ref 24-22-00/201).
- S 044-004
- (2) Do the deactivation procedure for the trailing edge flaps (Ref 27-51-00/201).
- S 864-005
- (3) Move the FLT CONTROL SHUTOFF WING L, R, and C switches on the right side panel, P61, to OFF. Attach DO-NOT-OPERATE tags and make sure the switch position lights come on.
- S 864-006
- (4) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
  - (a) 11H15, FLT CONT SHUTOFF WING LEFT
  - (b) 11H16, FLT CONT SHUTOFF WING CTR
  - (c) 11H26, FLT CONT SHUTOFF WING RIGHT
  - (d) 11K14, AILERON POS L

D. Aileron Position Transmitter - Removal (PROCEDURE 1)

NOTE: This procedure is recommended and removes the transmitter, bracket, and control rod as an assembly from the airplane.

S 034-008

- (1) Disconnect these components from the transmitter:
  - (a) The electrical connector
  - (b) The control rod
  - (c) The bonding jumper, if it is installed.

S 034-009

- (2) Remove the screws that connect the transmitter and its bracket to the airplane (2 locations).

S 024-010

- (3) Remove the transmitter and its bracket from the airplane.

S 034-029

- (4) Disconnect the control rod from the aileron and remove it.

S 034-012

- (5) Do these steps if it is necessary to remove the transmitter from its bracket:
  - (a) Remove the crank from the transmitter shaft.
  - (b) Remove the two clamp screws that hold the transmitter in its bracket.
  - (c) Remove the transmitter from its bracket.

E. Aileron Position Transmitter - Removal (PROCEDURE 2)

NOTE: This procedure removes the transmitter without the removal of the control rod and bracket attached.

S 034-027

- (1) Disconnect these components from the transmitter:
  - (a) The electrical connector
  - (b) The control rod
  - (c) The bonding jumper, if it is installed.

E. Aileron Position Transmitter - Installation (PROCEDURE 1)

**NOTE:** Use this procedure if you used PROCEDURE 1 to remove the position transmitter as an assembly with the bracket and control rod attached.

S 224-014

- (1) Do this check if the transmitter, crank, and bracket are assembled:
  - (a) Make sure the transmitter output voltage is 0 +/- .050 volts ac RMS when the crank and its bracket are in the positions shown (Fig. 402).

S 434-015

- (2) Do these steps if it is necessary to assemble the transmitter and its bracket:
  - (a) Use a rotary bonding brush or an abrasive disk to clean the mating surfaces of the transmitter and the bracket (Ref 20-10-22/701).
  - (b) Put the transmitter in its bracket and do these steps to initially adjust it:
    - 1) Install the clamp screws but do not tighten them.
    - 2) Make sure the top clamp screw engages the transmitter groove.
  - (c) Put the crank on the transmitter shaft and do these steps:
    - 1) Make sure the index mark on the transmitter shaft aligns with the crank slot.
    - 2) Make sure the crank screw engages the groove on the shaft.
    - 3) Tighten the screw that holds the crank on the transmitter shaft.

Page 408  
Apr 22/08

- (d) Do these steps to connect the breakout box equipment:
  - 1) Connect the breakout box and the -19 cable assembly to the transmitter (Fig. 402).
  - 2) Connect the digital voltmeter (DVM) to the breakout box at pins 4 (SIG L0) and 5 (SIG HI).
  - 3) Connect the power supply to the breakout box at pins 1 (L0) and 2 (HI).
  - 4) Adjust the power supply to 26 +/- 0.020 volts ac RMS.
- (e) Put the crank and its bracket in the positions shown (Fig. 402) and do these steps:
  - 1) Turn the transmitter in its bracket until the output voltage is 0 +/- 0.050 volts ac RMS.
  - 2) Tighten the bracket clamp screws.
  - 3) Make sure the output voltage stays at 0 +/- 0.050 volts ac RMS.
- (f) Disconnect the breakout box equipment from the transmitter.

S 424-018

- (3) Do these steps to connect the transmitter assembly to the airplane:
  - (a) Use a rotary bonding brush or an abrasive disk to clean the mating surfaces of the airplane and the transmitter bracket (Ref 20-10-22/701).
  - (b) Put the transmitter assembly in its correct position.
  - (c) Install the screws, washers, and nuts that connect the transmitter assembly to the airplane (2 locations) and do this step:
    - 1) Apply some of the sealant to the screws and the bracket.

S 824-016

- (4) Adjust the control rod to the initial dimensions shown (Fig. 401).

S 434-019

- (5) Connect the control rod between the transmitter and the aileron and do this step:
  - (a) Apply grease to the screws, washers, and nuts.

S 434-020

- (6) If it was installed, connect the bonding jumper to the transmitter and do this step:
  - (a) Apply some of the sealant to the bolts.

S 224-021

- (7) Use a bonding meter to make sure the resistance between the transmitter and the airplane is a maximum of 0.003 ohms.

EFFECTIVITY

ALL

  - (e) 11K23, AILERON POS R

S 864-001

- (10) Remove the DO-NOT-OPERATE tags and move the FLT CONTROL SHUTOFF WING L, R, and C switches on the right side panel, P61, to ON.

S 824-024

- (11) Adjust the aileron position transmitter (Ref 27-18-00/501).

**NOTE:** You will apply some of the sealant at the bracket to transmitter interface after you adjust the transmitter.

#### F. Aileron Position Transmitter - Installation (PROCEDURE 2)

**NOTE:** Use this procedure if you used PROCEDURE 2 to remove the position transmitter as a separate unit from the bracket and the control rod.

S 424-032

- (1) Put the transmitter in its bracket and do these steps:
- (a) Install the transmitter clamp screws but do not tighten them.
  - (b) Make sure the top clamp screw engages the transmitter groove.

S 434-033

- (2) Put the crank on the transmitter shaft and do these steps:
- (a) Make sure the crank aligns with the electrical index mark.
  - (b) Install the screw that holds the crank to the shaft and tighten it.
  - (c) Make sure the screw engages the groove in the transmitter shaft.

Aug 10/91

- S 824-031
- (3) Adjust the control rod to the initial dimensions shown (Fig. 401).
- S 434-034
- (4) Connect the control rod between the transmitter and the aileron and do this step:
- (a) Apply some of the grease to the screw, washer, and nut.
- S 434-035
- (5) If it was installed, connect the bonding jumper to the transmitter and do this step:
- (a) Apply some of the sealant to the bolts.
- S 434-036
- (6) Connect the electrical connector to the position transmitter.
- S 864-041
- (7) Operate the aileron trim switches on the aft electronic control panel, P8, and do these steps:
- (a) Make sure the aileron trim indicator shows zero units of trim.
- (b) Attach DO-NOT-OPERATE tags to the aileron trim switches.
- S 864-042

**WARNING:** ATTACH DO-NOT-OPERATE TAGS TO THE TWO CONTROL WHEELS. YOU WILL ADJUST THE POSITION TRANSMITTERS WITH HYDRAULIC POWER ON. ACCIDENTAL MOVEMENT OF THE CONTROL WHEELS WILL CAUSE AILERON MOVEMENT AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (8) Attach a DO-NOT-OPERATE tag to each of the two control wheels.

- S 494-044
- (9) Install these rig pins:
- (a) A1 (for the captain's drum assembly)
- (b) A2 (for the first officer's drum assembly)

S 864-043

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (10) Supply pressure to the left, right, and center hydraulic systems (Ref 29-11-00/201).

RUDDER AND RUDDER TRIM CONTROL SYSTEM – DESCRIPTION AND OPERATION

1. General

- A. The rudder and rudder trim control system provides directional control and stability around the vertical axis. This section provides a detailed description of rudder trim control system components and their operation. Description and operation of the tail hydraulic shutoff valves is found in AMM 27-23-00/001. The rudder position indication system description and operation is found in AMM 27-28-00/001.
- B. Description and operation of the rudder ratio changer module (RRCM) is covered in the following paragraphs. Removal and installation of the module is covered in AMM 27-09-00/201.
- C. Control (Fig. 1)
- (1) The captain's and first officer's rudder pedals provide rudder control through a cable and linkage system to the power control actuators (PCAs) at the rudder. An electric actuator which repositions the feel and centering springs provides rudder control trim about system centered position. Trim switches on the aft electronic control panel P8 control the trim actuator. Three directional autopilot servos are also connected to the input controls. A rudder ratio changer system in the input linkage reduces rudder control commands as a function of airspeed. Yaw damper servo outputs, summed with other control inputs, provide a command signal to the PCAs.
  - (2) The rudder is powered by the three hydraulic PCAs. Each PCA is independently supplied with pressure by one of three separate hydraulic systems. Any one PCA is capable of providing the required rudder travel.
  - (3) A rudder left hydraulic system fuse is installed to prevent the complete loss of hydraulic fluid, and thus, loss of airplane control, in the event of a hydraulic system rupture downstream of the fuse.
- D. Indication
- (1) Rudder position is indicated on the EICAS status page from the rudder position transmitter. A trim position indicator next to the rudder trim switch on P8 displays the amount of rudder trim. An amber RUDDER RATIO caution light and EICAS message identifies an inoperative ratio changer system. A yaw damper INOP light for each yaw damper indicates yaw damper inoperative or OFF.

## 2. Component Details

### A. Rudder Pedals (Fig. 2)

(1) Two sets of rudder pedals are located below the captain's and first officer's instrument panel. Each pair have rig pin holes (R1 or R2) in the pedal arms located beneath the flight deck floor. Access to this area is through a door forward of the nose gear wheel well. Pedal travel is limited to about four inches from neutral in either direction by stops on the two forward quadrant and jackshaft assemblies.

### B. Rudder Pedal Adjustment Crank

(1) The captain's and first officer's rudder pedal adjustment cranks are on the pedal housing front panel. The cranks adjust their respective pedals independent of one another and are detented to retain position. Each crank drives a flex cable which is connected to a jackshaft.

### C. Forward Quadrant and Jackshaft Assembly

(1) An adjustable yoke is mounted on the aft side of each forward quadrant. The yoke is attached to the pedals by two pushrods and is cable-driven by a jackshaft to provide fore and aft pedal adjustment. The forward quadrants are tied together by a bus rod so that either set of pedals can provide input to both quadrants.

(2) The quadrants are the forward terminal for the rudder cables. The left quadrant has a stop bumper that contacts structural stop to limit pedal movement. The left quadrant also contains rig pin hole R3, which is used to rig the rudder pedals and set cable tension.

### D. Rudder Control Cables (Fig. 3)

(1) The two rudder control cables are attached at the left and right forward quadrants. The cables run under the flight deck, up the rear wall of the flight deck, and above the main deck compartment to the feel, centering, and trim mechanism aft quadrant. Three turnbuckles per cable are used for adjusting tension with rig pins R3 and R4 installed. The two forward turnbuckle pairs are accessed through panels in the main deck compartment ceiling. The third turnbuckle pair is aft of the pressure bulkhead accessible through the stabilizer compartment service door.

### E. Feel, Centering, and Trim Mechanism (Fig. 4)

(1) The feel, centering, and trim mechanism is located at the vertical fin base. Access is through panel 324BL on the left fin side. All mechanism inputs and outputs are connected to its offset torque tube. The aft quadrant transfers cable inputs from the rudder pedals to the torque tube and also backdrives the cable system in response to rudder movement caused by autopilot inputs. Other input sources are the trim actuator and three directional autopilot servos. The torque tube output consists of two control rods which provide ratio changer mechanism input. Two aft quadrant stops limit the feel, centering, and trim mechanisms rotation. Rig pin R4 fixes the aft quadrant to the structural support during the rigging process.

Page 7  
May 01/86

- (2) Feel and centering functions are provided by a cam-roll-spring mechanism. It simulates a feel force to rudder pedal input and a centering force to return pedals to neutral when input is removed. The mechanism consists of two arms, spring-joined at one end and connected to the trim actuator at the other. The lower arm contains a roller which follows a cam surface. The cam is attached to the torque tube and pivots on the torque tube axis of rotation. Force to move the roller out of the cam face detent is 19 pounds (84.5 newtons), increasing with pedal deflection to 71 pounds (316 newtons) at full travel.

F. Rudder Trim Actuator

- (1) The rudder trim actuator housing is attached to the vertical fin rear spar and the actuator rod end is connected to the feel, centering, and trim mechanism. Trim commands from the trim switch cause the actuator to extend or retract which rotates the feel, centering, and trim mechanism. This provides a new zero force pedal position corresponding to the trimmed rudder position. The actuator provides the ground point for the feel, centering, and trim mechanism.
- (2) ON ALL EXCEPT SAS 050-051;  
the actuator uses an acme screw design for irreversibility and is powered by a self-contained dc motor that operates on 28 volts dc. Limit switches on the actuator control its stroke. An RVDT inside the actuator drives the flight deck trim position indicator on aft electronic control panel P8. The trim indicator provides units of trim since rudder trim in degrees is dependent on ratio changer position. The maximum trim authority is about 17 degrees (rudder travel rate of 1 degree per second) with rudder ratio changer in low-speed position. Actuator stroke is 2.74 inches (69.6 mm), full travel in one direction takes about 17 seconds.
- (3) ON SAS 050-051;  
the actuator uses an acme screw design for irreversibility and is powered by a self-contained dc motor that operates on 28 volts dc. Limit switches on the actuator control its stroke. An RVDT inside the actuator drives the flight deck trim position indicator on aft electronic control panel P8. The trim indicator provides units of trim since rudder trim in degrees is dependent on ratio changer position. The maximum trim authority is about 21.5 degrees (rudder travel rate of 1 degree per second) with rudder ratio changer in low-speed position. Actuator stroke is 3.42 inches (86.9 mm), full travel in one direction takes about 21 seconds.

G. Rudder Trim Temperature Compensating Linkage (Fig. 1 and 7)

- (1) The rudder trim temperature compensating linkage consists of two major components, a support shaft and a rod. The support shaft attaches to the yaw damper summing lever and the fin rear spar at the upper end of the linkage. The rod is attached to the support shaft arm which extends through the fin rear spar at the upper end and to a support bracket attached to the fin rear spar at the lower end. The rod is not adjustable.

EFFECTIVITY

ALL

27-21-00

07

Page 8  
Dec 22/01

- (2) During climb, the structure cools faster than the rudder control linkage. This causes the rudder to shift left due to different expansion rates of the structure and rudder control linkage, requiring right rudder trim to compensate. As temperatures equalize during cruise, rudder trim is gradually removed, leaving only the normal cruise trim requirements. Opposite conditions occur during descent, as the structure warms faster than the rudder control linkage. The rudder trim temperature compensating linkage eliminates the need for manual rudder trim in such situations. The compensating linkage rod expands/contracts at the same rate as the rudder control linkage. Therefore, when the structure is expanding/contracting faster than the rudder linkage, the compensating linkage rod repositions the support shaft, providing input to the yaw damper summing lever to counteract rudder deflection due to different expansion/contraction rates between the structure and rudder control linkage.
- H. Directional Autopilot Servos
- (1) The three directional autopilot servos directly below the feel, centering, and trim mechanism are driven by the flight control computer. They provide autopilot input to the rudder control system in the auto-land mode only (AMM 22-13-00/001).
- I. Rudder Ratio Changer Mechanism (Fig. 5)
- (1) The rudder ratio changer mechanism is mounted in the vertical fin directly above the feel, centering, and trim mechanism. The mechanism limits rudder travel as a function of airspeed. As airspeed increases, rudder travel decreases. The ratio changer output is controlled by an electro-hydraulic actuator. This actuator is powered by the left hydraulic system and receives an actuating signal from one of the two rudder ratio changer modules (RRCMs). The actuator is hydraulically and mechanically biased to return to the retract (low speed) position.
  - (2) The ratio changer has an offset torque tube with two inputs and two outputs. The two inputs come from the feel, centering, and trim mechanism through two control rods. These control rods are adjustable for rigging purposes. Two output support bearings have bell cranks mounted to them. The bell cranks are bussed together by an adjustable interconnect rod to provide for rigging adjustments. Control rods for the primary and secondary control path outputs are attached to the bell cranks. These control rods provide input to the yaw damper summing lever. The left bell crank mounts the ratio changer actuator rod end. Both bell cranks have springs which develop 30 pound-inches (3.4 newton-meters) to return the mechanism to the low speed position. Rig pins R6 and R7 fix the cranks to the torque tube in the high speed position.
  - (3) The standby bus provides 28 volts dc power to the RRCMs for the shutdown solenoid, relays and faultball indicators. CSEU power supply modules (PSMs) provide 115 volts ac separately sourced dual power supply to the RRCMs.

27-21-00

- J. Linear Variable Differential Transformer (LVDT)
- (1) A LVDT is attached to the ratio changer between the right bell crank and the left crank support. Dual channels provide position feedback signals to the two RRCMs. The LVDT can be adjusted for rigging purposes. The housing contains a dual element LVDT powered by 26 volts ac from PSM 2R and 2L.
- K. Load Limiter Control Rod
- (1) The load limiter is a control rod with a crushable core located on the primary control path between the ratio changer and the yaw damper summing lever. The crush core is an aluminum alloy honeycomb and provides load limiting protection in the primary control path. A compressive force of 166 to 310 pounds (738-1379 newtons) is required to initiate or sustain crushing. The maximum load limiter crush distance is 4.3 inches (10.9 centimeters) if the system is jammed at one extreme and moved to the other extreme.
  - (2) Index marks visible through the load limiter inspection port verify core integrity. Unless the core is crushed, the narrow band will be aligned within the wide band (Details C and D). If the index marks are not visible, one end of the load limiter can be disconnected and the limiter checked for freeplay. Freeplay indicates a crushed core.
- L. Rudder Ratio Changer Actuator (RRCA) (Fig. 6)
- (1) The RRCA is located on top and to the left of the ratio changer mechanism. The RRCA base is bearing-mounted to the vertical fin rear spar structure and the rod end is attached to the left ratio changer bell crank. The actuator has four line replaceable units: a solenoid valve, an electro-hydraulic servo valve (EHSV), a filter, and a screen. The solenoid valve controls the hydraulic supply to the actuator. The EHSV controls the rate and direction of hydraulic flow within the actuator. The filter and screen together provide double filtering of the hydraulic fluid input.
  - (2) Inputs to the RRCA consist of hydraulic pressure (3000 psi) from the left hydraulic system and electrical signals to the solenoid valve and EHSV. Outputs from the RRCA are hydraulic pressure to the middle power control actuator and mechanical drive to the left ratio changer bell crank.
- M. Yaw Damper Summing Lever (Fig. 7)
- (1) The summing lever is located directly above the ratio changer mechanism. The lever sums control inputs from the ratio changer and the yaw damper then transfers the resultant to the rudder PCAs via output control rods. The summing lever contains rig pin hole R8.

- (2) The secondary control path override mechanism provides load limiting and bias to reduce system hysteresis from linkage backlash. It consists of a cam-roller-spring assembly mounted in the summing lever secondary control path. The spring-loaded roller joins together the input and output control paths. The cam roller is offset from the yaw damper neutral detent by two degrees of rudder in order to eliminate linkage and bearing backlash. Yaw damper servos description and operation is in AMM 22-21-00/001.
- N. Summing Lever Bias Pogo
- (1) The bias pogo is attached between the summing lever torque tube and the vertical fin rear spar. During normal operation, the bias pogo removes backlash in the yaw damper linkage by maintaining a retracting force. Should a failure occur in the yaw damper input, the bias pogo provides a hardpoint for summing lever operation. Pogo retract force is 22.8 ±3.4 pounds (101.4 +/- 15.1 newtons) in the rigged position.
- O. Power Control Actuators (PCAs) (Fig. 8)
- (1) The three interchangeable PCAs are controlled by primary or secondary path inputs through the transfer bell cranks. The upper PCA is powered by the center hydraulic system, the middle PCA is powered by the left system (through the RRCA), and the lower PCA is powered by the right hydraulic system.
- (2) The PCAs are mounted in a parallel vertical row above the yaw damper summing mechanism, between the vertical fin rear spar and rudder front spar. The PCA cylinder base is mounted on a trunnion block connected to the vertical fin rear spar; the rod end is mounted to the rudder front spar. The trailing edge beam must be removed to replace any PCA. The rudder must be positioned full right and two PCA lockout tools installed.
- P. PCA Linkages
- (1) The PCA linkages transfer inputs from the yaw damper summing lever to the actuators via bell cranks. The primary control path provides input to the middle PCA transfer bell crank only. The input is transferred by a secondary crank arm, through the secondary control path, into the upper and lower transfer bell cranks. The secondary control path input is in series to all three bell cranks. The middle PCA transfer bell crank contains rig pin hole R5.
- (2) Each PCA has a cam-spring override mechanism. This mechanism allows continued rudder control in case of a jam in the PCA control valve or linkage. If a jam occurs, the flight crew can breakout the override mechanism by applying 40 pounds (178 newtons) extra pedal force at speeds below 140 knots. The breakout force is reduced with increasing airspeed. For example, the force is 8 pounds (35.6 newtons) at 300 knots.
- (3) The cam is mounted on the rotational axis of the transfer bell crank. Spring biased arms connected to the PCA input rod hold two rollers in the cam detents. A jam in a PCA valve causes the rollers to ride out of the detent when the bell cranks rotate, allowing input to the other PCAs.

- Q. PCA Reaction Link
- (1) The reaction link provides mechanical feedback from rudder surface movement to reposition the actuator body and null out the valve input. One end is connected to the rudder front spar on the right side of the rudder pivot. The other end is connected to the trunnion assembly on the vertical fin rear spar. Actuator connection and reaction link connections are not the same distance from the rudder pivot point. The top and bottom of the trunnion assembly ride in curved slots. The trunnion right side is connected to the hanger link which is bearing mounted to the vertical fin rear spar.
- R. Rudder (Fig. 9)
- (1) The rudder has a surface area of 178 square feet (54.25 square meters) and vertical height of about 31 feet (9.45 meters).
  - (2) ON ALL EXCEPT SAS 050-051;  
the rudder travel limits are 26 degrees at low speed and 4 degrees at 360 knots. The rudder trim limits are 17 degrees at low speed and 2.6 degrees at 360 knots.
  - (3) ON SAS 050-051;  
the rudder travel limits are 26 degrees at low speed and 4 degrees at 360 knots. The rudder trim limits are 21.5 degrees at low speed and 3.3 degrees at 360 knots.
- S. Rudder Left Hydraulic System Fuse
- (1) This hydraulic fuse is installed in the left hydraulic system pressure line upstream of the rudder power control actuators. This one fuse installed for the rudder system is located in the left hydraulic pressure line beneath the vertical fin.
  - (2) The fuse senses the hydraulic fluid flow rate to the rudder control system. In the event of hydraulic line rupture downstream, the fuse will close to prevent loss of hydraulic fluid and will preserve hydraulic pressure in the system upstream of the fuse.
- T. Rudder Structure
- (1) The rudder surface is a graphite composite which weighs 1.5 pounds (6.67 kilograms) per square foot. The entire rudder structure weighs about 430 pounds (195 Kg). Nine hinge fittings are mounted between the vertical fin rear spar and the rudder front spar. Two thrust hinges provide rudder positioning. Seven expansion link hinges account for the difference in thermal expansion between the graphite rudder and aluminum hinges. A seal between the rudder bull-nose and the fin trailing edge panels prevents air flow across the hinge line at all deflection angles. There are two drain holes in the base of the rudder. Hoisting points are located at the rudder front spar, below the third hinge and the eighth hinge from the bottom.
  - (2) A record should be kept of all painting and repairs done to the rudder to ensure that the operational balance moment is not exceeded. A rudder surface which exceeds the operational balance moment may flutter during flight. Refer to the Structural Repair Manual (SRM 51-60-00) for operational balance moment determination.

- U. Rudder Trim Control Switch and Indicator (Fig. 10)
  - (1) The trim position indicator is driven electrically by a RVDT in the rudder trim actuator on the feel, centering, and trim mechanism. The indicator is located on aft electronic control panel P8 next to the rudder trim knob and is powered by 28 volts ac from bus L. The RUDDER TRIM POS circuit breaker is located on overhead circuit breaker panel P11. The indicator shows up to about 17 units of left or right trim.
  - (2) The rudder trim switch is located on P8 and activates arming and control switches, which direct electrical input to the rudder trim actuator motor. The switch is spring-loaded to return to neutral. The RUDDER TRIM circuit breaker is located on P11.
- V. Warning Indications
  - (1) A white RUDDER RATIO message on the lower EICAS display unit maintenance page indicates a failure in one RRCM internal circuitry or RRCM input data error. The maintenance page can only be called up while the airplane is on the ground.
  - (2) The standby bus must be on for rudder ratio system maintenance message display.
  - (3) An amber RUDDER RATIO light indicates rudder ratio changer system shutdown. This is due to failure of both RRCMs or a failure of the ratio changer mechanism or actuator. A corresponding amber message, RUDDER RATIO, will appear on the upper EICAS display unit with the right engine in RUN mode.

### 3. Operation

#### A. Functional Description

- (1) Pedal Adjustment
  - (a) Pedal adjustment cranks drive the adjustable yokes through a flexible cable. Rotation of the crank causes rotation of a jackscrew which moves the yoke forward or aft. Control rods between the rudder pedals and yokes move the pedals in the direction of yoke movement, adjusting closeness to the pilot.
- (2) Pedal Input to Feel, Centering, and Trim Mechanism
  - (a) Each set of pedals drives a forward quadrant through two control rods. Pushing in one pedal causes its forward quadrant to rotate and pull out the other pedal. The forward quadrants are tied together by a non-adjustable bus rod. Pedal input causes the forward quadrants to rotate in opposite directions and backdrive the other set of pedals. Rotation in opposite directions slackens one cable and tightens the other to rotate the feel, centering, and trim mechanism aft quadrant.

EFFECTIVITY

ALL

27-21-00

- (a) Flight crew inputs through the rudder pedals and inputs from the directional autopilot servos provide a rotational force to the offset torque tube of the feel, centering, and trim mechanism. A cam plate mounted on the torque tube also rotates, forcing a roller to ride up the inclined face of the cam. As the roller rides up the cam, the spring arms spread causing the tension spring to stretch. As a result, the spring load increases. When input is removed, this load drives the cam plate back to the detent position and backdrives the rudder pedals to the centered or trimmed position.
  - (b) Feel force is the resistance to rudder pedal movement experienced by the flight crew. This force is produced by spring extension when the roller is forced to climb the inclined surface of the cam plate. Feel force increases with rudder deflection.
  - (c) The trim actuator rod end is connected to the spring arms and cam roller assembly. The upper arm is bearing-mounted on the torque tube's axis of rotation. As the trim actuator extends/retracts, the spring arms are forced to rotate about the bearing mount on the cam. The roller in the lower spring arm is held in the cam detent by the spring force. The cam is forced to follow the roller movement causing the torque tube to turn, thus providing trim input through the drive train to the rudder PCAs.
- (4) Trim Control Switch
- (a) The rudder trim switch in the flight deck provides input to the trim actuator. Rotating the trim knob arms the trim motor circuit and selects either the extend mode for left rudder trim or the retract mode for right rudder trim. The switch is powered by 28 volts dc.
  - (b) Movement of the trim switch through the 5° position removes the system ground. Movement through the 15° position arms the trim motor circuit. Rotation through the 25° position closes the control switch and selects the extend (left trim) or retract (right trim) operation. The switch has a mechanical stop at the 30° position.
- (5) Trim Actuator
- (a) The trim actuator is driven by a self-contained electric motor. The motor drive is controlled by the rudder trim switch or by activation of an internal limit switch. An electromagnetic brake prevents actuator overrun and internal mechanical stops prevent overtravel in case of a limit switch malfunction.

EFFECTIVITY

ALL

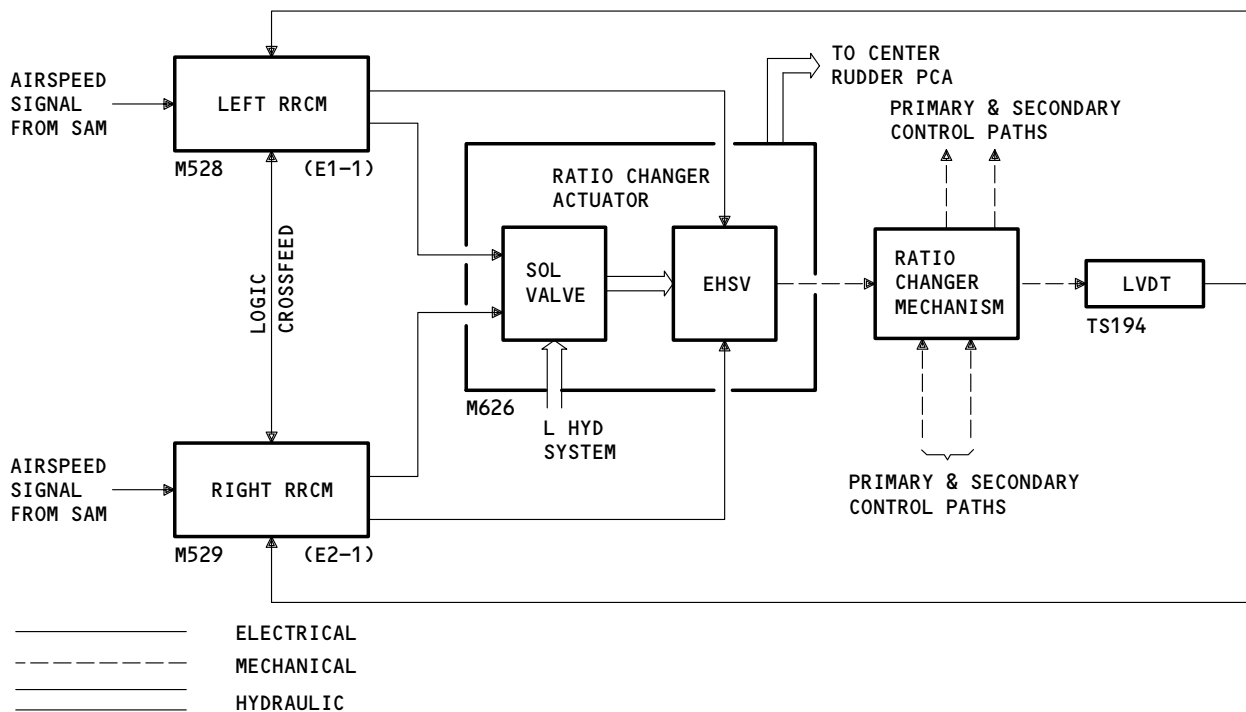

27-21-00

06

Page 22  
Dec 22/01

- (6) Trim Position Indicator
- (a) The trim actuator has a self-contained position transmitter (RVDT) driven by a gear train. The RVDT sends a signal to the indicator which is summed with a feedback signal from the indicator's rebalance potentiometer. When the potentiometer shaft is in the proper position, the feedback signal cancels the RVDT signal. The indicator then displays the present trim position. When changing the trim position, the RVDT signals are not cancelled by the potentiometer signal, resulting in a difference signal. This difference signal causes a dc amplifier to drive the indicator dc motor. The motor drives the rebalance potentiometer in the correct direction to cancel out the RVDT signal. The roller-driven-pointer then displays the new trim position.
- (7) Rudder Ratio Changer System (Fig. 12 and 13)
- (a) The ratio changer system varies the amount of maximum rudder travel as a function of airspeed. The system provides for constant rudder pedal response over the entire airplane operating speed range. The rudder ratio changer actuator (RRCA) is electro-hydraulic and is driven by two separate analog control channels.

Ratio Changer Block Diagram  
Figure 12

EFFECTIVITY

ALL
-----

27-21-00

(b) The RRCA mechanically varies the output of the ratio changer mechanism. In the low speed position, the RRCA is retracted and the left and right ratio changer cranks are swung out farther from the ratio changer torque tube axis of rotation. This increases the up or down control rod movement to the yaw damper as the torque tube rotates from control inputs. As airspeed increases, the actuator is commanded to extend, causing the left and right cranks to swing inward. This decreases the control rod movement and results in smaller control inputs to the yaw damper and PCAs. Rudder response varies from 26.5 degrees at 150 knots to 2.05 degrees at 450 knots.

(8) Ratio Changer Actuator

(a) The left hydraulic system supplies pressure to the ratio changer actuator. When the engage relay is activated, the solenoid valve is driven to the powered position and ports hydraulic pressure to the actuator bypass valve. The actuator bypass valve opens and left hydraulic pressure is supplied to the center rudder PCA and the EHSV. When no signal is supplied to the EHSV, the actuator is biased to return to the retract position. This corresponds to the low airspeed condition.

Rudder Ratio Changer  
Figure 13

EFFECTIVITY ——— ALL

27-21-00

Rudder PCA and Ratio Changer Hydraulic Schematic  
Figure 14

EFFECTIVITY

ALL
-----

27-21-00

- (b) As airspeed increases, a signal is sent to the EHSV from the RRCM. The signal commands the EHSV to port left hydraulic pressure to extend the actuator piston. As airspeed decreases, the EHSV ports pressure from the extend side of the actuator to the return line. Since the actuator always has pressure on the retract side it will move toward the low airspeed position.
- (9) Rudder Ratio Changer LVDT Function
  - (a) The LVDT has two channels. Each channel feeds back the ratio changer bell crank position to a channel of its respective RRCM. The feedback information is used for nulling of the command input signal and for malfunction detection.
- (10) Rudder Ratio Changer Interfaces (Fig. 15)
  - (a) The digital air data computers (DADC) provide dual path calibrated airspeed signals to the stabilizer trim/aileron lockout modules (SAM). Air/ground relays and hydraulic sensing provide logic to the RRCM for ground testing and maintenance data annunciation.
  - (b) Each SAM receives airspeed data from both DADCs. These signals are converted into two independent program airspeed signals Vpa and Vpc (designated ARM and CONTROL) and are sent to the corresponding RRCM. Each SAM monitors DADC data input, its own operation, and Vpa and Vpc agreement. Each SAM also generates a Vp VALID signal and sends it to the RRCM to signify valid SAM output.
- (11) Rudder Ratio Changer Module (RRCM) (Fig. 16)
  - (a) Each RRCM receives two airspeed signals from its SAM. Individual commands to the actuator are produced on both RRCM dual analog computation paths. The RRCM in control is determined randomly at power up; one module will be active and the other on standby. Each airspeed signal is summed with the LVDT and equalizer circuit output. When the airspeed changes, an error exists between the LVDT and airspeed signals. This error signal is amplified and sent to the actuator's electro-hydraulic servo valve (EHSV). These signals command the actuator to drive to a new position. The LVDT is driven by the actuator through the right ratio changer crank. It provides crank position feedback to the RRCM to eliminate the error signal. The amplified error signals on each RRCM computation path are monitored by current detectors. If a difference between error signals exists, an equalization signal is subtracted from the high signal and added to the low. This equalizes the signals to the EHSV.

**27-21-00**

- (b) Failure monitoring of RRCM output is performed on the dual analog computation paths. The output monitoring consists of a command difference, command hardover, and an open load monitor. The difference and hardover monitors use current detectors on each signal path. The difference monitor compares the current output commands of the two computation paths for a difference exceeding  $\pm 2.5$  MA. Latch will occur after a 0.82-second time delay. The hardover monitor sums the output commands of the dual analog paths. The sum of two commands exceeding  $\pm 5.0$  milliamps trips the monitor. Latch will occur after a 2.5 second delay. The open load monitor checks the output voltage in each computation path. Absence of load current is reflected in the output voltage. Signal latch occurs if 7.8 volts is exceeded for 1.6 seconds.
- (12) RRCM Latch and Control Logic (Fig. 15)
  - (a) Module latch and control logic functions are performed by monitoring several inputs. These inputs are internal module monitors, validated airspeed signal from SAM (Vp), hydraulic pressure sensing, and air/ground status from the air/ground relays.
  - (b) Each module processes these inputs and provides suitable control and fault annunciation signals. The module engages/relaxes the engage relay (if in command), provides/receives control and engage interlock signals between modules. The module also provides input to the EICAS computer and amber RUDDER RATIO light.
- (13) Channel Selection and Interlock Logic
  - (a) The first module to receive a validated airspeed signal from the respective SAM takes control to become the primary channel. This module provides a low logic signal locking the other module in the STANDBY MODE. Activation of the engage relay by the module in control provides an engage interlock signal. This signal inhibits the standby module from activating its own engage relay.
- (14) Latching Logic – Power Up Sequence
  - (a) During initial power up, the Difference and Hardover Latches are set to low logic (capable of control) for 12.5 seconds. Invalid to valid transition of SAM Vp VALID signal includes a 10–15 second delay which inhibits the output monitors while system signals are synchronized.

EFFECTIVITY

ALL

27-21-00

05

Page 29  
Nov 10/88

- (b) In the power up sequence, SAM Vp VALID signal remains invalid and the control line is high logic. The latch monitors are forced low for 12.5 seconds. Engage relays are de-energized and the amber RUDDER RATIO light is on. SAM Vp VALID signal changes from invalid to valid, forcing the hardover and difference monitors to a inhibit non-failure state. One module takes control locking the other module to standby and inhibits energizing of the other engage relay. Amber light goes out, servo and solenoid valve signals connect actuator through solenoid valve. Hydraulic power is applied and the actuator drives to the commanded position. Monitor inhibit is released and tripping function enabled.
- (15) Latching Logic - Control and Shutdown
- (a) Module in command hardover, difference or open load monitor trips, causes the control line to go to high logic and de-energizes the engage relay. Control is shifted to the standby module and a white RUDDER RATIO message appears on the maintenance page.
  - (b) Module on standby monitors trips, forces the control line to remain in high logic and inhibits passing of control from module in command. A white RUDDER RATIO message appears on the maintenance page.
  - (c) Left system hydraulic pressure loss causes both modules to de-energize their engage relays. Hydraulic shutdown of the actuator follows causing loss of ratio changer function and cycling of ratio changer to low speed position. The amber RUDDER RATIO light goes on; the RUDDER RATIO alert message (level C) appears on EICAS when the engine inhibit is removed.
  - (d) Loss of SAM Vp VALID signal drives the control line high, de-energizes the engage relay and shift or inhibit shifting of command between modules depending on which module loses the signal.
- (16) Ground Test Logic
- (a) TEST mode selection forces the module selected to energize the engage relay and drives the actuator to high speed position. The amber RUDDER RATIO light goes on and the amber RUDDER RATIO message appears on EICAS with engine run inhibit removed. The hardover monitor is inhibited. Inhibit lasts for 12.5 seconds after test switch is returned to NORMAL. Failure annunciation ceases once the test switch is returned to NORMAL. Air/ground relays prevent activation of TEST mode while aircraft is flying.
- (17) Fault Detection and Annunciation (Fig. 17)
- (a) Two types of failures will cause the engage relays to de-energize; a second failure in the electronic systems that affect both RRCMs, or a failure in the "single thread" portion of the system. The single thread components are the electro-hydraulic servo valve, the ratio changer actuator, the ratio changer mechanism, and the LVDT. Removal of one RRCM will activate an interlock which causes the amber light to come on.

- (b) Ratio changer modules continuously monitor system status, through open load, difference, and hardover monitors, and the presence of Vp valid signal. Detection of failure in any monitor shifts control to the standby module. This is a single (ratio changer) module failure.
  - (c) Detection of a single module failure provides a signal input to the EICAS computers. The EICAS computers store a white RUDDER RATIO message for ground access only. The suitable faultball will set on the ratio changer module.
  - (d) Detection of a dual module failure will de-energize the engage relay. The ratio changer actuator solenoid valve will close, allowing the actuator to retract to the low speed position. Hydraulic pressure to the middle power control actuator is cut off.
  - (e) Dual module failure causes an amber RUDDER RATIO alert message (level C) on the upper EICAS display with EICAS engine inhibit removed. The RUDDER RATIO amber caution light on overhead panel P5 comes on and suitable faultballs will set on the ratio changer module.
- (18) Maintenance Faultballs
- (a) Each RRCM contains four faultballs and a faultball reset button. The faultball display is non-volatile and can be reset only at the module.
  - (b) LVDT faultball
    - 1) Each channel of the dual channel LVDT is sent to one RRCM. Circuitry continuously monitors the LVDT secondary element common mode sum voltage to 2.5 volts ac. The faultball will set if voltage is less.
  - (c) PCA faultball
    - 1) The PCA faultball is set by any of three independent logic signals. Latching of the hardover monitor, (dual channel failure or low hydraulic pressure inhibits this faultball signal), failure of both modules within 2.5 seconds of each other, and latching of the open load monitor.
    - 2) A PCA faultball will also set if the left hydraulic system is pressurized, and pressure to the rudder is removed by closing the left rudder/elevator hydraulic shutoff valve.
  - (d) Module faultball
    - 1) Faultball will set if the difference monitor latches and the PCA faultball dual channel failure signal is not received within 2.5 seconds.
  - (e) Test Fail faultball
    - 1) Failure of BITE test or returning the test switch to NORMAL before test is complete will set the faultball.
  - (f) Reset function provides a reset signal to a set of latches. The latch provides a ground for a 28 volt dc circuit to reset the faultball.

- (a) Primary summing path
    - 1) Input from the ratio changer causes the summing lever to rotate about point "A". When the yaw damper input is fixed, the torque tube is fixed. Since the primary input and output rods are joined as one piece, they both rotate about point "A" and the input is passed directly to the output rod.
    - 2) Yaw damper input causes rotation of the torque tube. When the input from the ratio changer is fixed, the summing lever will rotate about the fixed input attach point. This motion is then passed to the output rod.
  - (b) Secondary summing path
    - 1) During normal operation the secondary summing path operates the same way as the primary summing path. When the yaw damper input is fixed the lever rotates about point "B". The cam, which also pivots at "B", is attached to the secondary output crank arm. When the ratio changer input is fixed, its attach point to the lever becomes a pivot for yaw damper inputs. The roller rides on the override cam slightly out of the detent to prevent backlash in the system.
    - 2) Should a jam occur in the output rods from the summing lever, the load limiter in the primary path will crush. At the same time, the roller will ride along the override cam in the secondary summing path. This enables the secondary control path to remain intact if the jam frees itself. When the jam clears, the roller will be held in the cam detent and normal rudder operation will resume through the secondary control path.
- (20) Power Control Actuator (PCA) (Fig. 11)
- (a) Each actuator is supplied hydraulic pressure by a separate system. Input to the control valve comes from the output of the yaw damper summing lever and through the transfer bell cranks to the input linkage.
  - (b) When the control valve is moved, hydraulic pressure is ported to either the retract or extend side of the piston. The opposite side is connected to the return line. As the piston drives the rudder surface, the reaction link backdrives the actuator body. This action provides feedback to the input linkage to null out valve input.
  - (c) Counterclockwise rotation of the PCA input lever ports pressure to the retract side of the actuator which causes left rudder. Clockwise rotation of the PCA input lever ports pressure to the extend side of the actuator which causes right rudder.

EFFECTIVITY

ALL

27-21-00

06

Page 34  
Aug 22/01

- (d) When the hydraulic system to the PCA is depressurized, the inlet check valve prevents reverse flow and the return line compensator maintains a small pressure within the actuator. Two anticavitation valves are located in the return line to provide a low resistant fluid path from either side of the piston to the other. Two relief valves provide internal relief when pressure exceeds 3600 psi. The valves reset at 3000 psi.
- (21) Rudder Left Hydraulic System Fuse
  - (a) The rudder left hydraulic system fuse operates by spring-action. The fuse closes when the pressure drop across the fuse increases due to an increased hydraulic fluid flow from a failed component or line rupture downstream. The fuse automatically resets by its spring-action once the pressure on both sides of the fuse is equal.
  - (b) This fuse incorporates a time delay to regulate its spring-action closure. This prevents inadvertent setting of the fuse due to pressure surges that occur when the hydraulic system is first pressurized.
- B. BITE (Fig. 19)
  - (1) Each RRCM has self-test capability. On the front of the RRCM is a test switch. When the switch is moved to TEST, the module IN TEST light on both RRCMs will come on and the amber RUDDER RATIO light on P5 will illuminate. The amber RUDDER RATIO message will appear on EICAS with engine run inhibit removed. During the self-test process, the RRCM commands the RRCA to extend. When the switch is returned to NORMAL, the RRCA will retract, and the RUDDER RATIO and IN TEST lights will go out. Should the RRCM fail its self-test, the TEST FAIL fault ball will appear yellow.
- C. Control
  - (1) Provide electrical power (AMM 24-22-00/201).

**WARNING:** KEEP PERSONNEL AND EQUIPMENT CLEAR OF ALL CONTROL SURFACES TO PREVENT INJURY OR DAMAGE. AILERONS, ELEVATORS, RUDDER, TRAILING EDGE FLAPS, LEADING EDGE SLATS, STABILIZER AND SPOILERS ARE FULLY POWERED.

- (2) Provide left, center and right hydraulic systems power (AMM 29-11-00/201).

**NOTE:** Hydraulic power from only one system is required to operate the rudder.

- (3) Rudder Pedals Control
  - (a) Push right pedal for right rudder; push left pedal for left rudder.
  - (b) Remove foot pressure on pedals to return rudder to neutral or trimmed position.
- (4) Rudder Trim Control
  - (a) Turn trim knob right for right rudder; turn trim knob left for left rudder.

RUDDER AND RUDDER TRIM CONTROL SYSTEM – ADJUSTMENT/TEST

1. General

A. This procedure contains these tasks:

- Operational Test – Rudder and Rudder Trim Control System
- Adjustment – Rudder and Rudder Trim Control System
- System Test – Rudder and Rudder Trim Control System
- Rudder Single Hydraulic Source – Test (for Scheduled Maintenance)
- Rudder Ratio Changer Actuator Bypass Valve – Test (for Scheduled Maintenance)

Refer to 27-28-00/501 to get adjustment and test data for the rudder position indicating system.

TASK 27-21-00-715-018

2. Operational Test – Rudder and Rudder Trim Control System

A. General

- (1) This procedure is used to make sure that the rudder and rudder trim control system operate correctly. No special equipment is necessary to do the test.

B. Equipment

- (1) Nose Gear Towing Lever Lockpin – A09003-1

C. References

- (1) AMM 24-22-00/201, Electrical Power – Control  
(2) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic System  
(3) AMM 31-41-00/201, EICAS

D. Access

- (1) Location Zones  
211/212 Control Cabin

E. Prepare for the Test

S 865-019

- (1) Supply electrical power (AMM 24-22-00/201).

S 865-020

- (2) Make sure that these circuit breakers on the overhead panel, P11, are closed:
- (a) EICAS (6 locations)
  - (b) 11A10, AIR DATA CMPTR L
  - (c) 11F30, AIR DATA CMPTR RIGHT
  - (d) 11L9, LEFT ENGINE OIL PRESS EICAS REF
  - (e) 11L36, RIGHT ENGINE OIL PRESS EICAS REF

S 825-021

- (3) Push the STATUS button on the pilot's display-select panel, P9, to show the rudder position indicator on the bottom EICAS display.

EFFECTIVITY

ALL

27-21-00

06

Page 501  
Aug 22/02

S 865-022

- (4) Make sure that these circuit breakers on the P11, panel are closed:
- (a) 11H17, FLT CONT SHUTOFF TAIL LEFT
  - (b) 11H18, FLT CONT SHUTOFF TAIL CTR
  - (c) 11H27, FLT CONT SHUTOFF TAIL RIGHT

S 865-023

- (5) Move the FLT CONTROL SHUTOFF TAIL L, C, and R switches on the right side panel, P61, to ON. Make sure that the amber switch-position legend lights are OFF.

S 865-001

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (6) Supply pressure to the left, center, and right hydraulic systems (AMM 29-11-00/201).

S 215-024

- (7) Turn the captain's pedal adjustment crank full clockwise and then counterclockwise. Make sure that the rudder pedals move in a longitudinal direction.

S 215-025

- (8) Do the above step again for the first officer's controls.

S 215-026

- (9) Push the left and right pedals to their travel limits and release. Make sure the pedals move smoothly and do not need too much force. Make sure that the pedals go back to their neutral position.

F. Test Rudder Ratio Changer Actuator Bypass Valve

S 865-027

- (1) Move the FLT CONTROL SHUTOFF TAIL C and R switches on the P61 panel to OFF. Attach DO-NOT-OPERATE tags and make sure that the amber switch-position legend lights come ON.

S 865-028

- (2) Open these circuit breakers on the P11 panel and attach DO-NOT-CLOSE tags:
- (a) 11G10, RUDDER RATIO
  - (b) 11H18, FLT CONT SHUTOFF TAIL CTR
  - (c) 11H27, FLT CONT SHUTOFF TAIL RIGHT

EFFECTIVITY

ALL

Page 502  
Aug 22/02

S 215-029

**WARNING:** MOVE ALL PERSONS AND EQUIPMENT AWAY FROM THE NOSE GEAR BEFORE THE RUDDER PEDALS ARE OPERATED. THE GEAR CAN TURN QUICKLY AND CAUSE INJURY TO PERSONS AND DAMAGE TO EQUIPMENT.

- (3) Push the rudder pedals full forward, left and right. Make sure that the rudder does not move.

S 865-030

- (4) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:
  - (a) 11G10, RUDDER RATIO
  - (b) 11H18, FLT CONT SHUTOFF TAIL CTR
  - (c) 11H27, FLT CONT SHUTOFF TAIL RIGHT

S 865-250

- (5) Remove the DO-NOT-OPERATE tags and put the FLT CONTROL SHUTOFF TAIL C and R switches on the P61 panel to ON.

G. Test Rudder System with Single Hydraulic Source

S 015-407

- (1) Move the towing lever on the metering valve module to the tow position and install the towing lever lockpin in the nose gear (Fig. 501).

S 865-031

- (2) Make sure that the FLT CONTROL SHUTOFF TAIL L, C, and R switches on the P61 panel are ON. Make sure that the amber switch-position legend lights are OFF.

S 865-032

- (3) Remove the power from the center and right hydraulic systems (AMM 29-11-00/201). Make sure that only the left hydraulic system is powered.

S 215-033

- (4) Make sure that the amber RUDDER RATIO light on the P5 panel is OFF. If the light is ON, do the steps that follow:
  - (a) Push the RRCM RESET button on the RRCM.
  - (b) Open this circuit breaker on the P11, panel:
    - 1) 11G10, RUDDER RATIO
  - (c) Close this circuit breaker on the P11, panel:
    - 1) 11G10, RUDDER RATIO

EFFECTIVITY

ALL

27-21-00

02

Page 503  
Aug 22/02

- S 215-034
- (5) Operate the rudder pedals to their full travel limits and do the check that follows:
- (a) Make sure that the rudder moves through its full travel range.

- S 825-035
- (6) Move the rudder pedals to their neutral position.

- S 865-036
- (7) Remove the power from the left hydraulic system (AMM 29-11-00/201).

**NOTE:** When the left hydraulic system power is removed from the rudder, an amber RUDDER RATIO light on the P5 panel will come ON. Also, an amber RUDDER RATIO message will come into view on EICAS.

If the left rudder/elevator hydraulic-shutoff valve is used to remove pressure from the rudder, a PCA faultball will set on the rudder ratio-changer module.

- S 865-037
- (8) Supply pressure to the center hydraulic system (AMM 29-11-00/201).

- S 215-038
- (9) Operate the rudder pedals to their full travel limits and do the check that follows:
- (a) Make sure that the rudder moves through its full travel range.

- S 825-039
- (10) Return the rudder pedals to their neutral position.

- S 865-040
- (11) Remove the power from the center hydraulic system (AMM 29-11-00/201).

- S 865-041
- (12) Supply pressure to the right hydraulic system (AMM 29-11-00/201).

- S 215-042
- (13) Operate the rudder pedals to their full travel limits and do the check that follows:
- (a) Make sure that the rudder moves through its full travel range.

- S 825-043
- (14) Move the rudder pedals back to their neutral position.

EFFECTIVITY

ALL

27-21-00

05

Page 504  
Aug 22/02

S 095-408

**WARNING:** STAY AWAY FROM THE NOSE GEAR WHEELS WHEN THE LOCKPIN IS REMOVED. THE NOSE WHEELS CAN TURN TO THE CENTERED POSITION QUICKLY AND CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (15) Make sure that the nose gear wheels are in their center position and remove the nose gear towing lever lockpin.

S 865-044

- (16) Supply pressure to the left and center hydraulic systems (AMM 29-11-00/201).

S 825-045

- (17) If a PCA faultball is set on the rudder ratio changer module, push the module RESET switch.

H. Test Rudder Trim Authority and Rate

S 215-046

- (1) Turn the rudder trim switch on the aft electronic control panel, P8, clockwise and hold it there until the rudder movement stops.

(a) SAS 050-051;

Make sure the rudder movement stops in approximately 18 to 30 seconds.

(b) ALL SAS AIRPLANES EXCEPT SAS 050-051;

ALL MTH AIRPLANES;

Make sure the rudder movement stops in approximately 13 to 21 seconds.

(c) ALL SAS AIRPLANES EXCEPT SAS 050-051;

ALL MTH AIRPLANES;

Make sure that the trim indicator shows at least 14 units of right trim. Make sure that the EICAS rudder position indicator moves to the right approximately two-thirds of full scale (approximately 17 degrees).

(d) SAS 050-051;

Make sure that the trim indicator shows at least 14 units of right trim. Make sure that the EICAS rudder position indicator moves to the right approximately two-thirds of full scale. (approximately 21.5 degrees).

S 215-048

- (2) Turn the rudder trim switch on the aft electronic control panel, P8, counterclockwise and hold it there until the rudder movement stops.

(a) SAS 050-051;

Make sure the rudder movement stops in approximately 36 to 60 seconds.

(b) ALL SAS AIRPLANES EXCEPT SAS 050-051;

ALL MTH AIRPLANES;

Make sure the rudder movement stops in approximately 26 to 42 seconds.

EFFECTIVITY

ALL

27-21-00

- (c) ALL SAS AIRPLANES EXCEPT SAS 050-051;  
ALL MTH AIRPLANES;  
Make sure that the trim indicator shows at least 14 units of left trim. Make sure that the EICAS rudder position indicator moves to the left approximately two-thirds of full scale (approximately 17 degrees).
- (d) SAS 050-051;  
Make sure that the trim indicator shows at least 14 units of left trim. Make sure that the EICAS rudder position indicator moves to the left approximately two-thirds of full scale (approximately 21.5 degrees).

S 825-050

- (3) Operate the rudder trim switch until the trim indicator shows zero units of trim.
  - (a) Make sure the rudder goes to its neutral position.

I. Test Rudder Ratio-Changer System

S 825-051

- (1) Turn the rudder trim switch on the P8 panel until the rudder trim indicator shows 9 units of trim.

S 215-052

- (2) Move the left ratio-changer module test switch, located on the E1 equipment shelf, to the TEST position.

**NOTE:** The amber RUDDER RATIO light on the P5 panel will come on when the RRCM test switch is moved to its TEST position. An amber RUDDER RATIO message will come into view on EICAS with the engine shutdown inhibit removed (AMM 31-41-00/201).

- (a) Make sure that the IN TEST light does not stay on for more than 20 seconds.
- (b) Make sure that the left and right module TEST FAIL fault balls are not set.
- (c) Make sure that the EICAS rudder position indicator moves in the direction of its neutral position.

S 215-053

- (3) Move the left ratio-changer module test switch to the NORMAL position.
  - (a) Make sure that the IN TEST light does not stay on for more than 20 seconds.
  - (b) Make sure that the left and right module TEST FAIL fault balls are not set.
  - (c) Make sure that the EICAS rudder position indicator moves away from the neutral position.

EFFECTIVITY

ALL

27-21-00

S 215-054

- (4) Move the right ratio-changer module test switch, located on the E2 equipment shelf, to the TEST position.
  - (a) Make sure that the IN TEST light does not stay on for more than 20 seconds.
  - (b) Make sure that the left and right module TEST FAIL fault balls are not set.
  - (c) Make sure that the EICAS rudder position indicator moves in the direction of its neutral position.

S 215-055

- (5) Move the right ratio changer module test switch to the NORMAL position.
  - (a) Make sure that the IN TEST light does not stay on for more than 20 seconds.
  - (b) Make sure that the left and right module TEST FAIL fault balls are not set.
  - (c) Make sure that the EICAS rudder position indicator moves away from its neutral position.

S 825-056

- (6) Operate the rudder trim switch until the trim indicator shows zero units of trim.
    - (a) Make sure the rudder goes to its neutral position.
- J. Put the Airplane Back to Its Usual Condition

S 215-057

**CAUTION:** IF THE RRCM TEST SWITCH IS NOT MOVED TO "NORMAL", THE AMBER "RUDDER RATIO" LIGHT WILL COME ON. IF THIS LIGHT IS ON, THE AIRPLANE CAN NOT BE DISPATCHED.

- (1) Make sure that the RRCM test switch is in its NORMAL position.

S 865-058

- (2) Remove the power from the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 865-059

- (3) Remove electrical power if it is not necessary (AMM 24-22-00/201).

TASK 27-21-00-825-060

3. Adjustment – Rudder and Rudder Trim Control System

A. General

- (1) SYSTEM ADJUSTMENT SEQUENCE: This task adjusts the rudder control system and its components in the sequence that follows. This sequence is recommended for a complete system adjustment:
- (a) Adjust the Rudder Pedals and Jackshaft.
  - (b) RRCA Oscillation check.
  - (c) Adjust the Control Cables RA and RB.
  - (d) Adjust the Middle Rudder PCA.
  - (e) Adjust the Top Rudder PCA.
  - (f) Adjust the Bottom Rudder PCA.
  - (g) Adjust the three Rudder PCAs System.
  - (h) Adjust the Rudder Ratio Changer Mechanism.
  - (i) Adjust the Yaw Damper Summing Lever.
  - (j) Adjust the Rudder Trim Indicator Null.
- (2) OUT OF SEQUENCE ADJUSTMENTS: It is possible to adjust some components in a different sequence. You must do some other adjustments before the component adjustment and some adjustments after it is done. The necessary adjustments are as follows:
- (a) Adjust the Rudder Pedals and Jackshaft.
    - 1) There is no task to perform before or after this adjustment.
  - (b) Adjust the Control Cables RA and RB.
    - 1) There is no task to perform before or after this adjustment.
  - (c) Adjust the Power Control Actuator (PCA).
    - 1) There is no task to perform before this adjustment.
    - 2) After the adjustment of the PCA, do the following adjustments in sequence:
      - a) Adjust the Rudder Ratio Changer Mechanism.
      - b) Adjust the Yaw Damper Summing Lever.
      - c) Adjust the Rudder Trim Indicator Null.

27-21-00

- (d) Adjust the Rudder Ratio Changer (RRC) Mechanism.
    - 1) Before the adjustment of the RRC Mechanism, do the adjustments of the Rudder PCAs.
    - 2) After the adjustment of the RRC Mechanism, do the following adjustments in sequence:
      - a) Adjust the Yaw Damper Summing Lever.
      - b) Adjust the Rudder Trim Indicator Null.
  - (e) Adjust the Yaw Damper Summing Lever.
    - 1) Before the adjustment of the Yaw Damper Summing Lever, do the following adjustments in sequence:
      - a) Adjust the Rudder PCAs.
      - b) Adjust the RRC Mechanism.
    - 2) After the adjustment of the Yaw Damper Summing Lever, do the adjustment of the Rudder Trim Indicator Null.
  - (f) Adjust the Rudder Trim Indicator Null.
    - 1) Before the adjustment of the Rudder Trim Indicator Null, do the following adjustments in sequence:
      - a) Adjust the Rudder PCAs.
      - b) Adjust the RRC Mechanism.
      - c) Adjust the Yaw Damper Summing Lever.
    - 2) There is no task to perform after this adjustment.
- (3) Before this procedure is done, make sure that the airplane temperature is stable (use a tolerance of  $\pm 5^{\circ}$  F) along the cable. Make sure that the temperature has been stable for at least one hour.
- (4) You may not be able to install rig pin R4 in the feel, centering, and trim mechanism if the rudder is in the neutral position. This is due to the fact that the initial adjustment is done with 3 to 5 units of trim input.

**NOTE:** Due to the large tolerance of rig pin hole R4, trim is input into the system during initial adjustment to ensure a good repeatable position of the rudder trailing at the neutral position.

- (5) Do a check of the rudder system adjustment:
- (a) Turn the rudder trim switch on the control stand panel, P8, counterclockwise until the trim position indicator shows 3 to 5 units of left trim.

**NOTE:** Make sure to use the same amount of trim used when the rudder system was initially adjusted.

EFFECTIVITY

ALL

27-21-00

02

Page 513  
Aug 22/03

- (b) Manually turn the feel, centering and trim aft quadrant clockwise against the spring force until rig pin R4 can be installed.

NOTE: This will ensure the rudder trailing edge is at a good repeatable position to do a check of the rudder system adjustment.

- (c) Install rig pin R4 into aft quadrant to hold in position.
- (d) Make sure the rudder trailing edge is at the neutral position ( $\pm 0.05$  inch ( $\pm 1.27$  mm)).

NOTE: Make sure the left, center and right hydraulic systems are pressurized when you do the check for the rudder trailing edge.

- (e) If the rudder trailing edge position is not as shown above, do the Rudder and Rudder Control System Adjustment procedure.
- (f) Remove rig pin R4.

#### B. Equipment

- (1) Rig pins from Set A20004-XX (AMM 20-10-24/201):
  - (a) R1 - P/N A20004-25
  - (b) R2 - P/N A20004-25
  - (c) R3 - P/N A20004-14
  - (d) R4 - P/N A20004-20
  - (e) R5 - P/N A20004-13
  - (f) R6 - P/N A20004-14
  - (g) R7 - P/N A20004-14
  - (h) R8 - P/N A20004-12
  - (i) E1 - P/N A20004-22
  - (j) E2 - P/N A20004-22

27-21-00

E. Access

(1) Location Zones

- 211/212 Control Cabin
- 324 Vertical Stabilizer – Rear Spar to Trailing Edge

(2) Access Panels

- 113AL Flight/Landing Gear/Engine Control Components
- 324BL Hinge Fittings and Feel, Centering, and Trim Mechanism
- 324EL Hinge Fittings and Mechanical Control Path
- 324GL Hinge Fittings and Mechanical Control Path
- 324JL Hinge Fittings and T.E. of Vertical Stabilizer
- 324LL Hinge Fittings and Mechanical Control Path

F. Prepare for Adjustment

S 865-061

- (1) Supply electrical power (AMM 24-22-00/201).

S 865-062

- (2) Move the FLT CONTROL SHUTOFF TAIL L, C, and R switches on the right side panel, P61, to OFF. Attach DO-NOT-OPERATE tags and make sure that the amber switch-position legend lights come ON.

S 865-063

- (3) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
- (a) 11G10, RUDDER RATIO
  - (b) 11H17, FLT CONT SHUTOFF TAIL LEFT
  - (c) 11H18, FLT CONT SHUTOFF TAIL CTR
  - (d) 11H27, FLT CONT SHUTOFF TAIL RIGHT

S 865-389

**WARNING:** MAKE SURE TO OPEN THE CIRCUIT BREAKERS FOR THE CAPTAIN'S AND THE FIRST OFFICER'S SEATS BEFORE YOU WORK AROUND THEM. A FAILURE TO OPEN THE CIRCUIT BREAKERS CAN CAUSE THE SEATS TO MOVE ACCIDENTALLY. THIS CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (4) Open these circuit breakers on the main power distribution panel, P6, and attach DO-NOT-CLOSE tags:
- (a) 6H15, CAPT SEAT

S 825-064

- (5) Move the Yaw Damper Engage switches on the pilot's overhead panel, P5, to INOP.

S 015-065

- (6) Open access panel 324BL to get access to the feel, centering, and trim mechanism (AMM 06-42-00/201).

EFFECTIVITY

ALL

27-21-00

06

Page 516  
Apr 22/08

S 015-066

- (7) Open access panel 324EL to get access to the ratio-changer mechanism and yaw damper summing mechanism (AMM 06-42-00/201).

S 015-067

- (8) Open access panels 324GL, 324JL, and 324LL to get access to the bottom, middle, and top power control actuators (AMM 06-42-00/201).

S 015-068

- (9) Open access panel 113AL forward of the nose gear wheel well to access rig pin holes R1, R2, E1, and E2 (AMM 06-41-00/201).

S 015-069

- (10) Move the towing lever on the metering valve module to the tow position and install the towing lever lockpin in the nose gear (Fig. 501).

S 495-070

- (11) Install rig pins E1 and E2 into the control column torque tube to prevent accidental elevator movement.

G. Adjust the Rudder Pedals and Jackshaft (Fig. 503)

S 825-071

- (1) Turn the captain's pedal adjustment crank clockwise until the jackshaft is in its full forward pedal position. Turn the crank counterclockwise 3.25 turns and put it in the nearest detent.

S 825-008

- (2) Do the above step again for the first officer's pedal adjustment crank.

S 035-072

- (3) Disconnect the control rods from the left and right rudder pedal arms.

S 495-073

- (4) Install rig pin R3 into the left forward quadrant.

S 825-074

- (5) Do these steps to adjust the captain's pedals and jackshaft:  
(a) Install rig pin R1 in the captain's pedals.  
(b) Adjust the control rods until the bolts can be easily installed through the rod end bearings at the pedal arms.  
(c) Connect the control rods and tighten the jamnuts.

S 825-075

- (6) Do these steps to adjust the first officer's pedals and jackshaft:  
(a) Install rig pin R2 in the first officer's pedals.  
(b) Adjust the control rods until the bolts can be easily installed through the rod end bearings at the pedal arms.

EFFECTIVITY

ALL

27-21-00

08

Page 517  
Apr 22/08

(c) Connect the control rods and tighten the jamnuts.

S 095-076

(7) Remove rig pins R1, R2, and R3.

S 215-077

(8) Cycle the rudder pedals. Make sure there is full quadrant travel between its stops.

S 225-078

(9) Do an inspection on all the control rods. Make sure that control rod threads can be seen in at least one-half of the control rod inspection hole.

H. Rudder Ratio Changer Actuator (RRCA) - Oscillation Check

S 495-258

(1) Install rig pin R4 (for the feel, centering, and trim mechanism).

S 865-259

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

(2) Supply pressure to the left hydraulic system (AMM 29-11-00/201).

S 865-260

(3) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11, panel:

(a) 11H17, FLT CONT SHUTOFF TAIL LEFT

S 865-261

(4) Remove the DO-NOT-OPERATE tag and move the FLT CONTROL SHUTOFF switch L on the P61, panel to ON.

S 865-268

(5) Move the left RRCM test switch on the E1 equipment shelf to TEST and do these checks:

**NOTE:** The amber RUDDER RATIO light on the P5 panel will come ON and stay ON. An amber RUDDER RATIO message will come into view on EICAS when the RRCM test switch is in its TEST position.

(a) Make sure the IN TEST light stays on for a maximum of 18 seconds.

(b) After 30 seconds, make sure all the RRCM faultballs are black.

EFFECTIVITY	
	ALL

27-21-00

- S 825-262
- (6) Observe the RRCA and Rudder Ratio Changer Output Arms for oscillations. If oscillations are noted, troubleshoot and correct the oscillation before you complete this procedure.
- S 095-263
- (7) Remove rig pin R4.
- S 865-264
- (8) Move the left RRCM test switch to NORMAL.
- S 865-320
- (9) Remove the power from the left hydraulic system (AMM 29-11-00/201).
- S 865-266
- (10) Move the L FLT CONTROL SHUTOFF switch on the P61 panel to OFF.
- S 865-382
- (11) Install a DO-NOT-OPERATE tag and make sure the switch position light comes ON.
- S 865-383
- (12) Open this circuit breaker on the P11, panel and attach a DO-NOT-CLOSE tag:
- (a) 11H17, FLT CONT SHUTOFF TAIL LEFT
- I. Adjust Rudder Control Cables RA and RB
- S 825-079
- (1) Turn the rudder trim switch on the P8 panel until rig pin R4 can be easily installed in the feel, centering and trim mechanism (Fig. 505).
- (a) To stretch the cables, adjust the turnbuckles for cables RA and RB at the same time to  $270 \pm 18$  pounds ( $1.20 \pm 0.08$  KN). Make sure that rig pin R3 can be easily installed in the left forward quadrant.
- S 225-080
- (2) Make sure that none of the cable seals bend the cables. Adjust the cables if it is necessary.
- S 095-081
- (3) Remove rig pins R3 and R4.
- S 225-082
- (4) Cycle the rudder pedals through their full travel 25 times. Do the check that follows:
- (a) Make sure that the cables are not bent by the fairleads, rub strips, or grommets that are in the system.
- (b) Make sure that the cable guards are installed correctly and that the pulleys turn freely.

EFFECTIVITY

ALL

27-21-00

01

Page 523  
Apr 22/08

- (c) Make sure that the cables are installed through the necessary grommets and air pressure seals.
- (d) Make sure that the cables are lubricated for full travel over their pulleys, grommets, fair leads, and quadrants.
- (e) Make sure that the cables are aligned with their pulleys and quadrants (use a tolerance of  $\pm 2$  degrees).

S 495-083

- (5) Install rig pin R4.

S 825-084

- (6) Adjust the cable tension to the load shown in Fig. 502. Make sure that rig pin R3 can be easily installed.

S 095-085

- (7) Remove rig pins R3 and R4.

S 225-086

- (8) Move the pedals through one full travel cycle and do a check of the cable tension.

S 425-087

- (9) Install clip locks on all the turnbuckles.

J. Adjust the Middle Rudder Power Control Actuator (PCA) (Fig. 504)

**NOTE:** This procedure supplies the data that is necessary to do a PCA system adjustment. To adjust a single PCA, refer to AMM 27-21-02/201

This procedure will make sure that the rudder trailing edge does not move (use a tolerance of 0.10 inch (2.54 mm) left or right of the rudder neutral position) when only one PCA is powered at a time.

S 825-088

- (1) Turn the rudder trim switch on the P8 panel counterclockwise until the trim position indicator shows 3 to 5 units of left trim.

**NOTE:** Due to the large tolerance of rig pin hole R4, trim is input into the system during initial adjustment to ensure a good repeatable position of the rudder trailing at the neutral position.

EFFECTIVITY

ALL

27-21-00

08

Page 524  
Apr 22/08

S 985-089

**CAUTION:** MAKE SURE THAT THE RIG PIN HOLES IN THE FEEL, CENTERING, AND TRIM AFT QUADRANT ALIGN BEFORE RIG PIN R4 IS INSTALLED. IT IS POSSIBLE FOR RIG PIN R4 TO BE INSTALLED INCORRECTLY IF THE QUADRANT IS NOT IN ITS CORRECT POSITION.

- (2) Manually turn the feel, centering and trim aft quadrant clockwise against the spring force until rig pin R4 can be installed.

**NOTE:** This will make a stable position for the PCA adjustment procedure. The mechanism springs hold the rig pin hole to positively ground the ratio-changer mechanism.

S 485-394

- (3) Install rig pin R4 in the aft quadrant.

S 035-090

- (4) Disconnect the bottom end of the YELLOW (right) control rod from the yaw damper summing lever.

S 495-091

- (5) Install rig pin R5 in the middle PCA input crank.

**NOTE:** Because of the load that is caused by the load limiter/cam in the secondary loop, the PCA linkage must be manually moved to install rig pin R5.

S 495-092

- (6) Use a bungee cord to put a load on the top PCA torque tube assembly in a clockwise direction.

**NOTE:** This removes backlash in the top PCA linkage.

EFFECTIVITY

ALL

27-21-00

MAINTENANCE MANUAL

Not Used  
Figure 507

27-21-00

01

Page 526  
Feb 10/90

S 825-094

- (7) Adjust the BLACK (left) control rod between the yaw damper summing lever and the bottom PCA. Make sure that rig pin R8 fits loosely in the load limiter/cam at the yaw damper linkage.

**NOTE:** This removes the backlash from the middle and bottom PCA linkages.

- (a) Remove rig pin R8.  
(b) Do not tighten the lock nuts.

**NOTE:** The lock nuts will be tightened after the control rod is adjusted in the Yaw Damper Summing Lever adjustment procedure.

S 865-002

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (8) Supply pressure to the left hydraulic system only (AMM 29-11-00/201).

**NOTE:** The middle PCA will be powered. This step is for the middle PCA adjustment only.

S 865-095

- (9) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11, panel:
- (a) 11G10, RUDDER RATIO
  - (b) 11H17, FLT CONT SHUTOFF TAIL LEFT
  - (c) 11H18, FLT CONT SHUTOFF TAIL CTR
  - (d) 11H27, FLT CONT SHUTOFF TAIL RIGHT

EFFECTIVITY

ALL

27-21-00

03

Page 527  
Aug 22/01

S 865-096

- (10) Make sure that these circuit breakers on the P11, panel are closed:
- (a) 11H11, STAB TRIM L
  - (b) 11H20, STAB TRIM R
  - (c) 11A10, AIR DATA CMPTR L
  - (d) 11F30, AIR DATA CMPTR R
  - (e) 11A11, AIR DATA AOA SENSOR L
  - (f) 11F31, AIR DATA AOA SENSOR R
  - (g) 11A12, AIR DATA BARO CORRECT L
  - (h) 11F32, AIR DATA BARO CORRECT R

S 865-097

- (11) Remove the DO-NOT-OPERATE tags and move the FLT CONTROL SHUTOFF TAIL L, C, and R switches on the P61 panel to ON.

NOTE: All the switches are opened to let unwanted hydraulic pressure bleed during the PCA adjustment.

S 825-098

- (12) Loosen the lock nut to let you adjust the middle PCA rod if necessary.

NOTE: This will let you move the rudder left or right of neutral a small distance, if necessary.

S 825-101

- (13) If a large adjustment is necessary to move the rudder to a position that is left of neutral a small amount, do the steps that follow:

NOTE: For large adjustments, an input rod end must be turned one-half turn at a time to move the rudder trailing edge very near neutral. The hydraulic system must be powered after each turn to do a check of the rudder position.

When you make the input rod longer the rudder moves to the left and when it is made shorter it moves the rudder to the right.

EFFECTIVITY

ALL

27-21-00

02

Page 528  
Aug 22/01

**WARNING:** DO NOT DISCONNECT ALL 3 OF THE RUDDER PCA INPUT RODS WITH THE HYDRAULIC POWER ON. THE RUDDER WILL MOVE QUICKLY TO ITS FULL LEFT POSITION AND CAN CAUSE INJURY TO PERSONS AND DAMAGE TO EQUIPMENT.

- (a) Move the FLT CONTROL SHUTOFF TAIL switches L, C, and R on the P61 panel to OFF. Attach DO-NOT-OPERATE tags and make sure that the amber switch-position legend lights come ON.
- (b) Disconnect the PCA input rod end and turn it one-half turn at a time until the rudder is very near neutral. To do a check of the rudder position, connect the input rod and move the FLT CONTROL SHUTOFF TAIL switches L, C, and R to ON.
- (c) When the rudder is very near neutral, connect and tighten the PCA input rod end bolt.
- (d) Remove the DO-NOT-OPERATE tags and move the FLT CONTROL SHUTOFF TAIL switches L, C, and R on the P61 panel to ON.

S 825-102

- (14) If a small adjustment is needed to move the rudder to a position that is slightly left of neutral, do the steps that follow:

**NOTE:** All adjustments to the rudder PCAs must make the rudder move from left to right.

- (a) Loosen the lock nuts of the PCA input rod.
- (b) Increase the length of the PCA input rod to move the rudder left of neutral a small distance.

**NOTE:** Turn the input rod in the clockwise direction to move the rudder to the right and counterclockwise to move it to the left.

When you tighten the lock nuts the rudder will move a small amount.

S 915-103

- (15) Stop for three minutes, or move the top and bottom PCA input rods across the neutral position, to bleed the unwanted pressure from the center and right hydraulic systems.

THEN THE CORRECT FORCE MEASUREMENT IS  
20LB. X 0.91 = 18.20lb.

Rudder Pedal Force Checking Installation  
Figure 509

27-21-00

01

Page 531  
Aug 22/08

E75421

S 825-104

- (16) In increments, decrease the length of the middle (top or bottom) PCA input rod until the rudder is less than 0.05 inch (1.27 mm) away from the neutral position (the datum position) (View A-A, Fig. 502).

NOTE: Between increments, stop and let the other PCA control valves bleed hydraulic pressure. This will make the rudder position become stable.

S 225-233

- (17) Make sure that the rudder position is very near neutral. Make sure that the rudder trailing edge is not out of the groove in the rudder index plate (Fig. 502).

S 435-105

- (18) Tighten the lock nuts and the input rod bolts. Make sure that the rudder does not move from its neutral position when the lock nuts are tightened.

NOTE: Make sure that the rudder does not move from the datum position when the top and bottom PCAs are adjusted.

#### K. Adjust the Top Rudder PCA

S 865-106

- (1) Remove the power from the left hydraulic system (AMM 29-11-00/201).

S 865-107

- (2) Supply pressure to the center hydraulic system only (AMM 29-11-00/201).

NOTE: The top PCA will be powered.

S 825-108

- (3) Use the middle PCA adjustment procedure to adjust the top PCA. Do not disconnect and move the other PCA input rods once the PCA has been adjusted, stop for three minutes to bleed the unwanted hydraulic pressure.

#### L. Adjust the Bottom Rudder PCA

S 865-109

- (1) Remove the power from the center hydraulic system (AMM 29-11-00/201).

EFFECTIVITY

ALL

27-21-00

02

Page 532  
Aug 22/03

S 865-110

- (2) Supply pressure to the right hydraulic system only (AMM 29-11-00/201).

NOTE: The bottom PCA will be powered.

S 825-111

- (3) Use the middle PCA adjustment procedure to adjust the bottom PCA. Do not disconnect and move the other PCA input rods once the PCA has been adjusted, stop for three minutes to bleed the unwanted hydraulic pressure from the PCAs.

M. Adjust the Three Rudder PCAs System

S 865-112

- (1) Remove the power from the right hydraulic system (AMM 29-11-00/201).

S 865-113

- (2) Supply pressure to the left hydraulic system only (AMM 29-11-00/201).

S 225-114

- (3) Use a tolerance of  $\pm 0.05$  inch ( $\pm 1.27$  mm) and make sure that the rudder is in its neutral position (Fig. 502, View A-A). Keep a record of its position.

NOTE: This position is the datum position.

S 865-115

- (4) Supply pressure to the center hydraulic system and remove the power from the left hydraulic system (AMM 29-11-00/201). Stop for three minutes.

S 225-116

- (5) Make sure that the rudder is less than 0.05 inch (1.27 mm) away from the datum position. If the rudder is more than 0.05 inch (1.27 mm) away from the datum position, do these steps:
  - (a) In increments, adjust the top PCA input rod until the rudder is less than 0.05 inch (1.27 mm) away from the datum position. Between increments, stop and let the other PCA control valves bleed hydraulic pressure. This will make the rudder position become stable.
  - (b) Tighten the lock nuts. Do not lockwire the input rod. Make sure that the rudder does not move more than 0.05 inch (1.27 mm) away from the datum position when the lock nuts are tightened.
  - (c) Remove the power from the center hydraulic system (Ref 29-11-00/201).
  - (d) Do the "Adjust the Three PCA System" group of steps again.

Dec 22/01

S 435-133

- (13) Lockwire the lock nuts on the middle, top and bottom PCA input rods.

S 435-134

- (14) Connect the bottom end of the YELLOW control rod to the yaw damper summing lever. If it is necessary, adjust the rod until the bolt can be easily installed. Tighten the lock nut.

S 095-135

- (15) Remove rig pins R4, R5 and the bungee cord.

S 225-136

- (16) Do an inspection on all the control rods. Make sure that control rod threads can be seen in at least one-half of the control rod inspection hole.

S 825-137

- (17) Do the adjustment procedure for the Rudder Ratio Changer Mechanism.

S 825-138

- (18) Do the adjustment procedure for the Yaw Damper Summing Lever.

N. Adjust Rudder Ratio Changer Mechanism (Fig. 505)

**NOTE:** Make sure that the rudder power control actuators are adjusted correctly before you do this procedure.

S 865-163

- (1) Operate the rudder trim switch on the aft electronic control panel, P8, until the rudder trim indicator shows 3 to 5 units of left trim.

S 495-165

- (2) Manually turn the feel, centering, and trim mechanism clockwise until you can install rig pin R4.

**NOTE:** The feel springs push against the rig pin and keep the quadrant in a stable position during the adjustment.

S 215-166

- (3) Make sure the rudder ratio changer module (RRCM) test switches, on the E1 and E2 equipment shelves, are in the NORMAL position.

S 035-405

**CAUTION:** MAKE SURE THAT YOU ONLY DISCONNECT THE LEFT "BLUE" CONTROL ROD. IF YOU DISCONNECT BOTH LEFT AND RIGHT RODS, DAMAGE MAY OCCUR.

- (4) Disconnect the bottom end of the BLUE (left) control rod nearest the trim actuator from the feel, centering, and trim mechanism.

EFFECTIVITY

ALL

Dec 22/01

S 865-003

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (5) Supply pressure to the left, center, and right hydraulic systems (AMM 29-11-00/201).

S 865-141

- (6) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:
- (a) 11G10, RUDDER RATIO
  - (b) 11H17, FLT CONT SHUTOFF TAIL LEFT
  - (c) 11H18, FLT CONT SHUTOFF TAIL CTR
  - (d) 11H27, FLT CONT SHUTOFF TAIL RIGHT

S 865-142

- (7) Remove the DO-NOT-OPERATE tags and move the FLT CONTROL SHUTOFF TAIL L, C, and R switches on the P61 panel to ON.

S 865-168

- (8) Move one of the RRCM test switches, on the E1 or E2 equipment shelf, to TEST and do these checks:

**NOTE:** The amber RUDDER RATIO light on the overhead panel, P5, will come on and stay on. The EICAS message, RUDDER RATIO, will show on the top EICAS display when the switch is in its TEST position.

- (a) Make sure the IN TEST light stays on for a maximum of 18 seconds.
- (b) After 30 seconds, make sure all the RRCM faultballs are black.

S 215-234

- (9) Make sure that rig pin R6 is able to move freely. If rig pin R6 can not be installed and move freely do the steps that follow:
- (a) Remove the LVDT lockwire.
  - (b) LVDTs WITH AN ADJUSTMENT NUT;  
turn the adjustment nut until rig pin R6 can be easily installed in the left ratio-changer crank and install a lockwire on the LVDT.
  - (c) LVDTs WITH CASE ADJUSTMENT;  
loosen the lock nut and turn the outer case until rig pin R6 can be easily installed in the left ratio-changer crank.  
Tighten the lock nut and install a lockwire.

Dec 22/01

S 215-169

- (10) Make sure you can easily install and remove rig pin R7.

**NOTE:** If you cannot install the rig pin, start the adjustment procedure again.

S 825-167

**WARNING:** MAKE SURE THE LEFT HYDRAULIC SYSTEM DOES NOT HAVE POWER WHEN YOU ADJUST THE WHITE INTERCONNECT ROD. THE RATIO CHANGER ACTUATOR CAN MOVE QUICKLY AND CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (11) If necessary, do these steps to examine and adjust the WHITE interconnect rod:
- (a) Adjust the WHITE interconnect rod until you can easily install and remove rig pin R7.
  - (b) Tighten the lock nuts for the WHITE interconnect rod.

S 095-159

- (12) Remove rig pins R6 and R7.

S 225-174

- (13) Keep a written record of the position of the rudder trailing edge.

S 215-170

- (14) Move the RRCM test switch to NORMAL and do these steps:
- (a) Make sure the IN TEST light is on for a maximum of 18 seconds.
  - (b) After 30 seconds, make sure all the RRCM faultballs are black.
  - (c) Measure and keep a written record for the distance and direction the rudder trailing edge moves.

**NOTE:** If the rudder trailing edge moves to the right, you must decrease the length of the BLUE (right) control rod. If the rudder trailing edge moves left, you must increase the length of the BLUE (right) control rod.

EFFECTIVITY

ALL

27-21-00

Dec 22/01

S 825-171

**WARNING:** IF IT IS NECESSARY TO REMOVE THE BOLT WHEN THE CONTROL ROD IS ADJUSTED, REMOVE THE POWER FROM THE LEFT, RIGHT, AND CENTER HYDRAULIC SYSTEMS (AMM 29-11-00/201). INJURY TO PERSONS AND DAMAGE TO EQUIPMENT CAN OCCUR.

(15) Do these steps to adjust the BLUE control rods:

- (a) If the rudder trailing edge moved more than 0.03 inch (0.75 mm) when the switch was moved, do these steps:

**NOTE:** Adjustment of the rods should be to the position of the rudder trailing edge recorded above.

- 1) If a small adjustment of the BLUE (right) control rod is necessary, turn the knurled adjustment knob.

**NOTE:** One full turn of the adjustment knob will move the rudder trailing edge 0.20 inch (5.08 mm). If you turn the knob clockwise, the length of the rod will decrease.

- 2) If a large adjustment of the BLUE (right) control rod is necessary, disconnect the rod at the top end. Turn the rod full turns to keep the locknut pointed to the access door and the coarse adjuster nut pointed aft.

**NOTE:** One full turn of the rod only (with the bottom rod end and the knurled adjustment knob held) will move the rudder trailing edge 0.80 inch (20.3 mm).

One full turn of the rod and the knurled adjustment knob (at the same time, with only the bottom rod end held) will move the rudder trailing edge 0.60 inch (15.24 mm).

S 225-162

- (16) Make sure the rudder moves no more than 0.03 inch (0.76 mm) when the RRCM test switch is moved to TEST then NORMAL.

S 825-172

- (17) If the movement is not satisfactory, adjust the BLUE (right) control rod again.

EFFECTIVITY

ALL

27-21-00

04

Page 538  
Dec 22/01

S 825-235

- (18) Adjust the BLUE (left) control rod until you can easily install the bolt that connects it.

NOTE: It is possible for the rudder to be away from its neutral position.

S 825-236

- (19) Tighten the locknut for the BLUE (left) control rod to 80 - 110 pound-inches (9.0-12.4 newton-meters).

S 215-164

- (20) Move the RRCM test switch to TEST and do these checks:
- (a) Make sure the IN TEST light stays on for a maximum of 18 seconds.
  - (b) Make sure all the RRCM faultballs are black.
  - (c) Make sure you can easily install and remove rig pins R6 and R7.

S 865-166

- (21) Move the RRCM test switch to NORMAL.

S 865-167

- (22) Remove the power from the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 225-009

- (23) Do the inspections that follow:
- (a) Make sure you can see control rod threads in at least one-half of all the control rod inspection holes.
  - (b) Make sure the narrow index mark aligns with the wide index mark on the ratio-changer load limiter. Replace the load limiter if the marks do not align (Fig. 505).
  - (c) Do a check of the yaw damper summing lever adjustment.
0. Adjust the Yaw Damper Summing Lever (Fig. 506)

S 035-168

- (1) Disconnect the bottom end of the YELLOW (right) control rod that is connected between the yaw damper summing lever and the middle PCA.

S 495-169

- (2) Install rig pin R5 in the middle PCA input crank.

NOTE: Because the yaw damper summing lever has a load, the middle PCA input crank must be manually moved to install rig pin R5.

Dec 22/01

S 825-170

- (3) Adjust the YELLOW (right) control rod until the bolt can be easily installed. Do not tighten the lock nut.

S 825-238

- (4) Adjust the BLACK (left) control rod between the yaw damper summing lever and the bottom PCA until rig pin R8 can be easily installed in the yaw damper summing lever. Do not tighten the lock nuts.

S 095-172

- (5) Remove rig pin R5.

S 865-004

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (6) Supply pressure to the left, center, and right hydraulic systems (AMM 29-11-00/201). Make sure that the ratio-changer actuator is powered.

S 825-173

- (7) Make sure that the rudder is in its neutral position (Fig. 502). If it is not in its neutral position, do the steps that follow:
- (a) Adjust the YELLOW (right) control rod in small increments until the rudder is in its neutral position.
  - (b) If it is necessary, adjust the BLACK (left) control rod until rig pin R8 can be easily installed.

S 435-174

- (8) Tighten the lock nut on the YELLOW control rod to 80 - 110 pound-inches. Tighten the lock nuts on the BLACK control rod. Make sure that the rudder does not move from its neutral position when the nuts are tightened.

**NOTE:** Rig pin R5 may not be installed easily after this adjustment has been made.

S 865-175

- (9) Remove the power from the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 865-176

- (10) Move the FLT CONTROL SHUTOFF TAIL L, C, and R switches on the P61 panel to OFF. Attach DO-NOT-OPERATE tags and make sure that the amber switch-position legend lights come ON.

TASK 27-21-00-735-199

4. System Test – Rudder and Rudder Trim Control

A. General

NOTE: The airplane must not be on jacks when the distances are measured.

- (1) Rudder pedal neutral is the no-load pedal position when the cam roller is in its detent on the feel, centering, and trim mechanism with zero units of trim.
- (2) Rudder neutral is found when the two sides of the rudder trailing edge are aligned with the rudder index plate groove.
- (3) Measure the rudder pedal positions from the pedal cover aft face (Fig. 508).
- (4) Measure the pedal forces at the pedal pivot center, parallel to the flight deck floor.
- (5) Rudder movement is measured from the bottom outboard corner of the rudder trailing edge to the aft near corner of the index plate groove.
- (6) To make sure that the rudder is in neutral, hit the rudder pedals lightly and let the cam roller move to its detent in the feel, centering, and trim mechanism.

B. Equipment

- (1) Rig Pins from Set A20004-XX (AMM 20-10-24/201):
  - (a) E1 – P/N A20004-22
  - (b) E2 – P/N A20004-22
- (2) Force Checking Tool, Rudder Pedal – F80212-30
- (3) Nose Gear Towing Lever Lockpin – A09003-1
- (4) Scales, to measure rudder travel – Commercially Available
- (5) Square, to measure rudder pedal travel – Commercially Available

F. Test Rudder Pedal Adjustment Mechanism Travel

S 225-208

- (1) Turn the captain's and the first officer's pedal adjustment crank counterclockwise to move the pedals to their full aft position.

NOTE: Measure the rudder pedal positions from the pedal cover aft face (Fig. 508).

- (a) Make sure that all four pedals are positioned at  $4.49 \pm 0.50$  inches.
- (b) Push the captain's left pedal and then right pedal full forward.
- (c) Make sure that the stops on the forward quadrant are touched for each pedal.
- (d) Do the steps above again for the first officer's pedals.

S 225-209

- (2) Turn the captain's and the first officer's pedal adjustment crank clockwise to move the pedals to their full forward position.
  - (a) Make sure that all four pedals are positioned at  $11.93 \pm 0.50$  inches ( $303.0 \pm 12.7$  mm).
  - (b) Push the captain's left pedal and then the right pedal full forward. Make sure that the aft stop, then the forward stop are touched for each pedal. Do this step again for the first officer's pedals.
  - (c) Cycle the pedals in a longitudinal direction four times. Make sure that the pedals move smoothly and do not need too much force.

G. Test Captain's Rudder Pedal Travel

S 225-210

- (1) Turn the pedal adjustment crank clockwise to the full forward pedal position. Then turn it counterclockwise 3.25 turns and put it in the nearest detent.
  - (a) Make sure that the pedals are positioned at  $9.11 +0.63/-0.85$  inches ( $231.4 +16.0/-21.6$  mm). Make sure that the difference between the left and right pedals is not more than 0.30 inches (7.62 mm).

H. Test First Officer's Pedal Travel

S 225-211

- (1) Do the Captain's Rudder Pedal Travel Test on the first officer's rudder pedals.

EFFECTIVITY

ALL

Page 546  
Dec 22/07

I. Test Captain's Rudder Pedal Forces (Fig. 509)

**NOTE:** You must measure the forces with the pedal moving away from the neutral position. If the pedal moves more than the specified distance, you must repeat the test and start with the pedal at neutral position. Do not stop to take the measurements, if you stop the measurements can vary due to the loss of friction.

S 865-006

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (1) Supply pressure to the left, center, and right hydraulic systems (AMM 29-11-00/201).

S 865-212

- (2) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11, panel:
  - (a) 11G10, RUDDER RATIO
  - (b) 11H17, FLT CONT SHUTOFF TAIL LEFT
  - (c) 11H18, FLT CONT SHUTOFF TAIL CTR
  - (d) 11H27, FLT CONT SHUTOFF TAIL RIGHT

S 865-292

- (3) Remove the DO-NOT-OPERATE tags and move the FLT CONTROL SHUTOFF TAIL L, C, and R switches on the P61 panel to ON.

S 825-214

- (4) Operate the rudder trim switch and hit the rudder pedals lightly to move the rudder to its neutral position.

S 225-227

- (5) Slowly push the left pedal forward with the rudder pedal force checking tool, F80212-30, until the rudder trailing edge has moved  $0.41 \pm 0.03$  inch ( $10.41 \pm 0.76$  mm). Make sure that the necessary force is from 15.2 to 33.1 pounds (68 to 147 newtons).

**NOTE:** Make sure the lockpin on the tool is in the operating position and not in the stowed position.

S 225-228

- (6) Continue to push the left pedal forward until the rudder trailing edge has moved  $5.08 \pm 0.03$  inches ( $129.0 \pm 0.76$  newtons). Make sure that the necessary force is 30.1 to 51.5 pounds (68 to 229 newtons).

EFFECTIVITY

ALL

27-21-00

Apr 22/08

S 825-229

- (7) Release the rudder pedal.

S 225-230

- (8) Push the left pedal forward until the aft quadrant is less than 0.1 inch (2.54 mm) away from the stop. Make sure that the quadrant does not touch the stop (Fig 505).  
(a) Make sure that the necessary force is from 64.6 to 93.5 pounds (287 to 416 newtons).

S 215-231

- (9) Release the pedal. Make sure that the rudder goes back to its neutral position.

S 225-244

- (10) Slowly push the right pedal forward with the rudder pedal force checking tool until the rudder trailing edge has moved  $0.41 \pm 0.03$  inch ( $10.41 \pm 0.76$  mm). Make sure that the necessary force is from 15.2 to 33.1 pounds (68 to 147 newtons).

S 225-245

- (11) Continue to push the right pedal forward until the rudder trailing edge has moved  $5.08 \pm 0.03$  inches ( $129.03 \pm 0.762$  mm). Make sure that the necessary force is 30.1 to 51.5 pounds (134-229 newtons).

S 825-246

- (12) Release the rudder pedal.

S 225-247

- (13) Push the right pedal forward until the aft quadrant is less than 0.1 inch (2.54 mm) away from the stop. Make sure that the quadrant does not touch the stop (Fig 505).  
(a) Make sure that the necessary force is from 64.6 to 93.5 pounds (287-416 newtons).

S 215-248

- (14) Release the pedal. Make sure that the rudder goes back to its neutral position.

J. Test First Officer's Rudder Pedal Forces

S 225-249

- (1) Do the captain's rudder pedal force test on the first officer's rudder pedals.

EFFECTIVITY

ALL

27-21-00

04

Page 548  
Dec 22/05

K. Test Rudder Return to Center

S 215-250

- (1) Make sure that the rudder is in its neutral position and that the rudder trim is at zero units.

**NOTE:** Do not operate the rudder trim during this test.

S 825-251

- (2) Push the captains left pedal until the rudder has moved approximately 10.0 inches (25.4 cm) and hold it there.

S 225-252

- (3) Slowly release the pedal. Make sure that the rudder returns to its neutral position (use a tolerance of  $\pm 0.41$  inch ( $\pm 10.4$  mm)).

S 825-253

- (4) Push the captains right pedal until the rudder has moved approximately 10.0 inches (254 mm) and hold it there.

S 225-254

- (5) Slowly release the pedal. Make sure that the rudder returns to its neutral position (use a tolerance of  $\pm 0.41$  inch ( $\pm 10.4$  mm)).

S 225-255

- (6) Do the above procedure again for the first officer's rudder pedals.

S 865-256

- (7) Remove the power from the left, right, and center hydraulic systems (AMM 29-11-00/201).

L. Test Single Hydraulic System and PCA

S 865-007

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (1) Supply pressure to the left hydraulic system only (AMM 29-11-00/201).

S 865-369

- (2) Make sure that these circuit breakers on the P11 panel are closed:
  - (a) 11A10, AIR DATA CMPTR L
  - (b) 11A11, AIR DATA AOA SENSOR L
  - (c) 11A12, AIR DATA BARO CORRECT L
  - (d) 11C5, RUDDER TRIM

S 225-256

- (18) Push the captain's right pedal forward until the aft quadrant touches its stop.
  - (a) Make sure that the rudder trailing edge moves at least 41.10 inches (1.04 meters) (26.0 degrees) to the right.
  - (b) Make sure that the EICAS rudder position indicator moves to the full right end-mark on its scale.

S 215-246

- (19) Slowly release the pedal. Make sure that the rudder returns to its neutral position (use a tolerance of  $\pm 0.41$  inch ( $\pm 10.4$  mm)).

S 865-368

- (20) Remove the power from the center and right hydraulic systems (AMM 29-11-00/201).

NOTE: The left hydraulic system will stay powered.

#### M. Test Rudder Ratio-Changer System

NOTE: Ignore the flight deck annunciations unless they are specified by this procedure.

S 865-269

- (1) Use the reset switches on the front panel of the rudder ratio changer modules (RRCMs) to reset the left and right RRCMs.
  - (a) Make sure that the white RUDDER RATIO message does not show on the bottom EICAS display.

S 025-268

- (2) Remove the right RRCM (M529) on the E2 forward equipment shelf (AMM 27-09-00/201).
  - (a) Make sure that the white RUDDER RATIO message shows on the bottom EICAS display.

NOTE: Stop for 25 seconds to let the white EICAS message show.

S 825-269

- (3) Turn the rudder trim switch on the P8 panel until the rudder trim indicator shows approximately 8 units of trim.

S 215-010

- (4) Do the left RRCM check that follows:
  - (a) Move the left RRCM (M528) test switch to the TEST position.
    - 1) Make sure that the EICAS rudder position indicator moves in the direction of its neutral position.
    - 2) Stop for 20 seconds.

EFFECTIVITY

ALL

27-21-00

- (b) Move the left RRCM (M528) test switch to the NORMAL position.
  - 1) Make sure that the EICAS rudder position indicator moves away from the neutral position.
  - 2) Stop for 20 seconds.

S 825-270

- (5) Use the reset switch to set the left RRCM (M528).

S 215-273

- (6) Do the above left RRCM check 3 more times. Use the reset switch to set the left RRCM (M528) after each check.

S 215-357

- (7) Do the above left RRCM check again. Make sure that all the faultballs on the RRCM are black.

S 215-011

- (8) Do the checks that follow:
  - (a) Make sure that the amber RUDDER RATIO light is OFF.
  - (b) Stop for 20 seconds. Make sure that a RUDDER RATIO maintenance message comes into view on the bottom EICAS display.

S 425-275

- (9) Install the right RRCM, M529 (AMM 27-09-00/201).
  - (a) Make sure that the white RUDDER RATIO message does not show on the bottom EICAS display.

S 025-276

- (10) Remove the Left RRCM, M528 (AMM 27-09-00/201).
  - (a) Make sure that the white RUDDER RATIO message shows on the bottom EICAS display.

NOTE: Stop for 25 seconds to let the white EICAS message show.

S 215-358

- (11) Do the right RRCM check that follows:
  - (a) Move the right RRCM (M529) test switch to the TEST position and do the checks that follow:
    - 1) Make sure that the EICAS rudder position indicator moves in the direction of its neutral position.
    - 2) Stop for 20 seconds.
  - (b) Move the right RRCM (M529) test switch to the NORMAL position and do the checks that follow:
    - 1) Make sure that the EICAS rudder position indicator moves away from the neutral position.
    - 2) Stop for 20 seconds.

S 825-359

- (12) Use the reset switch to set the right RRCM (M529).

EFFECTIVITY

ALL

27-21-00

S 215-376

- (13) Do the above right RRCM check 3 more times. Use the reset switch to set the right RRCM (M529) after each check.

S 215-280

- (14) Do the above right RRCM check again. Make sure that all the faultballs on the RRCM are black.

S 215-012

- (15) Do the checks that follow:
- (a) Make sure that the amber RUDDER RATIO light is OFF.
  - (b) Stop for 20 seconds. Make sure that a RUDDER RATIO message comes into view on the bottom EICAS display.

S 825-281

- (16) Turn the rudder trim switch on the P8 panel until the rudder trim goes back to zero.

S 435-282

- (17) Install the Left RRCM (M528) (Ref 27-09-00).
- (a) Make sure that the white RUDDER RATIO message does not show on the bottom EICAS display.

S 865-277

- (18) Open these circuit breakers on the P11, panel and attach DO-NOT-CLOSE tags:
- (a) 11C08, FLT CONT ELEC 2L AC
  - (b) 11C09, FLT CONT ELEC 2L DC
  - (c) 11G17, FLT CONT ELEC 1R AC
  - (d) 11G18, FLT CONT ELEC 1R DC
  - (e) 11G26, FLT CONT ELEC 2R AC
  - (f) 11G27, FLT CONT ELEC 2R DC

S 215-384

- (19) Do a check of these indications:
- (a) Make sure the amber RUDDER RATIO light on the P5 panel is off.
  - (b) Make sure that the amber RUDDER RATIO message does not show on the top EICAS display.

S 865-279

- (20) Close this circuit breaker on the P11 panel and remove the DO-NOT-CLOSE tag:
- (a) 11C08, FLT CONT ELEC 2L AC
  - (b) 11C09, FLT CONT ELEC 2L DC

S 865-280

(c) Make sure that the amber RUDDER RATIO light on the P5, panel is OFF.

S 215-334

- (16) Push the ECS/MSG button on the P61, panel.  
(a) Make sure that a white RUDDER RATIO message does not come into view on the bottom EICAS display.  
(b) Make sure that the rudder is in its neutral position.

S 865-335

- (17) Put the EICAS computer back to its usual condition (AMM 31-41-00/201).

S 865-387

- (18) Put the safety-sensitive systems back to their initial conditions (AMM 32-09-02/201).

Q. Test Rudder Authorities

S 865-336

- (1) Supply pressure to the right and center hydraulic systems. Make sure that the left hydraulic system is powered (AMM 29-11-00/201).

S 865-337

- (2) Make sure that this circuit breaker on the P11 panel is closed:  
(a) 11G10, RUDDER RATIO

S 825-338

- (3) Push the STATUS button on the pilots display select panel, P9, to show the rudder position indicator on the bottom EICAS display.

EFFECTIVITY

ALL

27-21-00

S 215-339

- (4) Hit the rudder pedals lightly to position the cam roller in its detent in the feel, centering, and trim mechanism.
- (a) Make sure that the rudder trim indicator on the P8, panel shows zero units of trim. Make sure that the pointer is on the zero mark.
  - (b) Make sure that the EICAS position indicator pointer is on the mid-scale mark of the display ( $\pm$  the pointer width).

S 225-340

- (5) Pressurize the pitot-static system to 142 knots at zero altitude (impact pressure = 0.98 inches of mercury (38.2 millibars)) (AMM 34-11-00/201).

**NOTE:** Pressurize both captain's and first officer's pitot static systems.

- (a) Do the captain's authority test that follows:
  - 1) Push the captain's left pedal forward until the aft quadrant touches its stop and hold it there.
  - 2) Make sure that the rudder trailing edge moves to the left at least 41.10 inches (1.04 meters) (26.0 degrees).
  - 3) Make sure that the EICAS rudder position pointer is on the left end-scale mark.

**NOTE:** The pointer can be left of the left end-mark. This condition is permitted.

- 4) Keep a record of the rudder position. Pressurize the pitot-static system to 158  $\pm$ 2 knots at zero altitude (impact pressure = 1.21 inches of mercury (41.0 millibar)).
- 5) Make sure that the rudder moves in the direction of its neutral position.
- 6) Release the rudder pedal.
- 7) Decrease the pitot-static system to 142  $\pm$ 2 knots at zero altitude (impact pressure = 0.98 inches of mercury (33.2 millibar)).
- 8) Push the captain's right pedal forward until the aft quadrant touches its stop and hold it there.
- 9) Make sure that the rudder trailing edge moves to the right at least 41.10 inches (26.0 degrees).
- 10) Make sure that the EICAS rudder position pointer is on the right end-scale mark.

**NOTE:** The pointer can be right of the right end-scale mark. This condition is permitted.

- 11) Keep a record of the rudder position. Pressurize the pitot-static system to 158  $\pm$ 2 knots at zero altitude (impact pressure = 1.21 inches of mercury (41.0 millibar)).

EFFECTIVITY

ALL

27-21-00

- 12) Make sure that the rudder moves in the direction of its neutral position.
- 13) Release the rudder pedal.
- (b) Do the first officer's authority test that follows:
  - 1) Pressurize the pitot-static system to 142 knots at zero altitude (impact pressure = 0.98 inches of mercury (33.2 millibar)).
  - 2) Use the first officer's rudder pedals to do the captain's authority test again.

S 225-341

- (6) Increase the pitot-static pressure to 275 knots at zero altitude (impact pressure = 3.78 inches of mercury (128 millibar)).
  - (a) Do the captain's authority test that follows:
    - 1) Push the captain's left pedal forward until the aft quadrant touches its stop and hold it there.
    - 2) Make sure that the rudder trailing edge moves left 10.33-13.32 inches (6.4-8.3 degrees).
    - 3) Release the rudder pedal.
    - 4) Push the captain's right pedal forward until the aft quadrant touches its stop and hold it there.
    - 5) Make sure that the rudder trailing edge moves to the right 10.33-13.32 inches (6.4-8.3 degrees).
    - 6) Release the rudder pedal.
  - (b) Do the first officer's authority test that follows:
    - 1) Use the first officer's rudder pedals and do the captain's authority test again.

S 225-342

- (7) Increase the pitot-static pressure to 360 knots at zero altitude (impact pressure = 6.68 inches of mercury (226 millibar)).
  - (a) Do the captain's authority test that follows:
    - 1) Push the captain's left pedal forward until the aft quadrant touches its stop and hold it there.
    - 2) Make sure that the rudder trailing edge moves to the left 5.38-7.99 inches (3.2-4.9 degrees).
    - 3) Release the rudder pedal.
    - 4) Push the captain's right pedal forward until the aft quadrant touches its stop and hold it there.
    - 5) Make sure that the rudder trailing edge moves to the right 5.38-7.99 inches (3.2-4.9 degrees).
    - 6) Release the rudder pedal. Let the rudder go back to its neutral position.
    - 7) Open this circuit breaker on the P11, panel and attach a DO-NOT-CLOSE tag:
      - a) 11G10, RUDDER RATIO
    - 8) Stop for 20 seconds. Push the captain's right pedal forward until the aft quadrant touches its stop and hold it there.
    - 9) Make sure that the rudder trailing edge moves to the right 41.10 inches (26.0 degrees).

EFFECTIVITY

ALL

27-21-00

- 10) Release the rudder pedal.
- 11) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11, panel:
  - a) 11G10, RUDDER RATIO
- (b) Do the first officer's authority test that follows:
  - 1) Use the first officer's rudder pedals and do the captain's authority test again.
- (c) Decrease the pitot-static pressure to zero knots.

S 865-343

- (8) Return the pitot-static system to ambient pressures (AMM 34-11-00/301).

R. Rudder Trim Authority and Rate Test

**NOTE:** Make sure to shake the control wheel before you take any travel measurements to make sure the cam on the centering mechanism is in the center position.

S 215-344

- (1) Turn the rudder trim switch to its full clockwise position, hold it there and then release it.
  - (a) Make sure that the rudder trim switch goes quickly to its neutral position. Make sure that the rudder movement stops.

S 215-345

- (2) Turn the rudder trim switch to its full counterclockwise position, hold it there and then release it.
  - (a) Make sure that the rudder trim switch goes quickly to its neutral position. Make sure that the rudder movement stops.

S 215-346

- (3) Do the above two steps at least one more time.

S 215-347

- (4) Turn the rudder trim switch until the rudder is in its neutral position. Hit the rudder pedals lightly to position the cam roller in the feel, centering and trim mechanism detent.
  - (a) Make sure that the rudder trim indicator shows zero units of trim and that the pointer is on the zero mark.

S 225-349

- (5) Turn the rudder trim switch on the aft electronic control panel, P8, clockwise and hold there until the rudder movement stops. Alternately tap the left and right rudder pedals lightly to seat the feel cam roller in its detent.
  - (a) ALL SAS AIRPLANES EXCEPT SAS 050-051;  
ALL MTH AIRPLANES;  
Make sure that the rudder moves to the right and stops in 13 to 21 seconds.

EFFECTIVITY

ALL

27-21-00

- (b) SAS 050-051;  
Make sure that the rudder moves to the right and stops in 18 to 30 seconds.
- (c) ALL SAS AIRPLANES EXCEPT SAS 050-051;  
ALL MTH AIRPLANES;  
Make sure that the rudder trailing edge moves to the right at least 27.0 inches (17.0 degrees).
- (d) SAS 050-051;  
Make sure that the rudder trailing edge moves to the right at least 34.1 inches (21.5 degrees).
- (e) Make sure that the rudder trim indicator shows at least 14.0 units of right trim.

S 865-248

- (6) Turn the rudder trim switch on the aft electronic control panel, P8, counterclockwise and hold it there until the rudder movement stops. Alternately tap the left and right rudder pedals lightly to seat the feel cam roller in it's detent.
  - (a) ALL SAS AIRPLANES EXCEPT SAS 050-051;  
ALL MTH AIRPLANES;  
Make sure that the rudder moves to the left and stops in 26 to 42 seconds.
  - (b) SAS 050-051;  
Make sure that the rudder moves to the left and stops in 36 to 60 seconds.
  - (c) ALL SAS AIRPLANES EXCEPT SAS 050-051;  
ALL MTH AIRPLANES;  
Make sure that the rudder trailing edge moves to the left at least 27.0 inches (17.0 degrees).
  - (d) SAS 050-051;  
Make sure that the rudder trailing edge moves to the left at least 34.1 inches (21.5 degrees).
  - (e) Make sure that the rudder trim indicator shows at least 14.0 units of left trim.

S 825-350

- (7) Operate the rudder trim switch to move the rudder to its neutral position.
- S. Put the Airplane Back to Its Usual Condition

S 095-247

**WARNING:** STAY AWAY FROM THE NOSE GEAR WHEELS WHEN THE LOCKPIN IS REMOVED. THE WHEELS CAN TURN TO THEIR CENTER POSITION QUICKLY AND CAN CAUSE INJURY TO PERSONS AND DAMAGE TO EQUIPMENT.

- (1) Make sure that the nose gear wheels are in their centered position. Remove the nose gear towing lever lockpin.

S 095-352

- (2) Remove rig pins E1 and E2.

EFFECTIVITY

ALL

27-21-00

- S 215-353
- (3) Make sure that the RRCM test switch is in its NORMAL position.
- S 865-354
- (4) Remove the power from the left, right, and center hydraulic systems (AMM 29-11-00/201).
- S 865-355
- (5) Remove electrical power if it is not necessary (AMM 24-22-00/201).
- S 415-356
- (6) Close the access panels you removed.

TASK 27-21-00-715-179

5. Single Hydraulic Source - Test

NOTE: This is a scheduled maintenance task.

A. References

- (1) AMM 24-22-00/201, Electrical Power - Control
- (2) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems

B. Prepare for the Test

- S 865-180
- (1) Supply electrical power (AMM 24-22-00/201).
- S 215-181
- (2) Make sure these circuit breakers on the overhead panel, P11, are closed:
  - (a) 11J2, EICAS CMPTR L
  - (b) 11J3, EICAS UPPER DSPL
  - (c) 11J29, EICAS CMPTR R
  - (d) 11J30, EICAS LOWER DSPL
  - (e) 11J31, EICAS DSPL SW
  - (f) 11J32, EICAS DSPL SELECT
  - (g) 11A10, AIR DATA CMPTR L
  - (h) 11F30, AIR DATA CMPTR RIGHT
  - (i) 11L9, LEFT ENGINE OIL PRESS EICAS REF
  - (j) 11L36, RIGHT ENGINE OIL PRESS EICAS REF
- S 865-381
- (3) Push the STATUS switch on the pilot's display select panel, P9, to show the rudder position indicator on the bottom EICAS display.

EFFECTIVITY

ALL

27-21-00

S 015-410

- (4) Move the towing lever on the metering valve module to the tow position and install the towing lever lockpin in the nose gear (Fig. 501).

S 215-183

- (5) Make sure these circuit breakers on the P11, panel are closed:
  - (a) 11H17, FLT CONT SHUTOFF TAIL LEFT
  - (b) 11H18, FLT CONT SHUTOFF TAIL CTR
  - (c) 11H27, FLT CONT SHUTOFF TAIL RIGHT

S 865-184

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (6) Supply pressure to the left, right, and center hydraulic systems (AMM 29-11-00/201).

C. Rudder Single Hydraulic Source - Test

S 215-185

- (1) Make sure the FLT CONTROL SHUTOFF TAIL L, R, and C switches on the right side panel, P61, are ON.

S 865-186

- (2) Remove the power from the center and right hydraulic systems (AMM 29-11-00/201).

**NOTE:** Make sure only the left hydraulic system has power.

S 865-318

- (3) Do these steps if the amber RUDDER RATIO light on the overhead panel, P5, is on:
  - (a) Push the RESET switch on the RRCM.
  - (b) Open this circuit breaker on the P11, panel:
    - 1) 11G10, RUDDER RATIO
  - (c) Close this circuit breaker on the P11, panel:
    - 1) 11G10, RUDDER RATIO

S 215-188

- (4) Move the rudder pedals through their full travel range and do this check:
  - (a) Make sure the rudder moves through its full travel range.

S 865-317

- (5) Release the rudder pedals.

EFFECTIVITY

ALL

27-21-00

S 865-190

- (6) Remove the power from the left hydraulic system (Ref 29-11-00/201).

**NOTE:** When you remove power from the left hydraulic system, an amber RUDDER RATIO light on the P5 panel will come on. Also, an amber RUDDER RATIO message will show on EICAS.

If you use the left rudder/elevator hydraulic shutoff valve to remove hydraulic pressure, a PCA faultball will set on the RRCM.

S 865-216

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (7) Supply pressure to the center hydraulic system (AMM 29-11-00/201).

S 215-191

- (8) Move the rudder pedals through their full travel range and do this check:  
(a) Make sure the rudder moves through its full travel range.

S 865-192

- (9) Release the rudder pedals.

S 865-193

- (10) Remove the power from the center hydraulic system (AMM 29-11-00/201).

S 865-217

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (11) Supply pressure to the right hydraulic system (AMM 29-11-00/201).

EFFECTIVITY

ALL

27-21-00

S 215-316

- (12) Move the rudder pedals through their full travel range and do this check:  
(a) Make sure the rudder moves through its full travel range.

S 865-315

- (13) Release the rudder pedals.

S 865-218

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (14) Supply pressure to the left and center hydraulic systems (AMM 29-11-00/201).

S 865-198

- (15) If a PCA faultball shows on the RRCM, push the RESET switch.  
D. Put the Airplane Back to Its Usual Condition

S 865-199

- (1) Remove the power from the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 865-200

- (2) Remove electrical power if it is not necessary (AMM 24-22-00/201).

S 095-411

**WARNING:** STAY AWAY FROM THE NOSE GEAR WHEELS WHEN THE LOCKPIN IS REMOVED. THE NOSE WHEELS CAN TURN TO THE CENTERED POSITION QUICKLY AND CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (3) Make sure that the nose gear wheels are in their center position and remove the nose gear towing lever lockpin.

TASK 27-21-00-715-201

6. Rudder Ratio Changer Actuator Bypass Valve - Test

**NOTE:** This is a scheduled maintenance task.

A. References

- (1) AMM 24-22-00/201, Electrical Power - Control  
(2) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems

EFFECTIVITY

ALL

27-21-00

B. Prepare for the Test

S 865-202

- (1) Supply electrical power (AMM 24-22-00/201).

S 215-203

- (2) Make sure these circuit breakers on the overhead panel, P11, are closed:
- (a) 11J2, EICAS CMPTR L
  - (b) 11J3, EICAS UPPER DSPL
  - (c) 11J29, EICAS CMPTR R
  - (d) 11J30, EICAS LOWER DSPL
  - (e) 11J31, EICAS DSPL SW
  - (f) 11J32, EICAS DSPL SELECT
  - (g) 11A10, AIR DATA CMPTR L
  - (h) 11F30, AIR DATA CMPTR RIGHT
  - (i) 11L9, LEFT ENGINE OIL PRESS EICAS REF
  - (j) 11L36, RIGHT ENGINE OIL PRESS EICAS REF

S 865-314

- (3) Push the STATUS switch on the pilot's display select panel, P9, to show the rudder position indicator on the bottom EICAS display.

S 215-205

- (4) Make sure these circuit breakers on the P11 panel are closed:
- (a) 11H17, FLT CONT SHUTOFF TAIL LEFT
  - (b) 11H18, FLT CONT SHUTOFF TAIL CTR
  - (c) 11H27, FLT CONT SHUTOFF TAIL RIGHT

S 865-313

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (5) Supply pressure to the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 215-207

- (6) Turn the captain's pedal adjustment crank fully clockwise and then fully counterclockwise.
- (a) Make sure the rudder pedals move in a longitudinal direction.

S 215-208

- (7) Do the above step again for the first officer's pedals.

EFFECTIVITY

ALL

27-21-00

S 215-209

- (8) Move the left and right rudder pedals through their full travel range and release them. Do these checks:
  - (a) Make sure the pedals move smoothly and do not need too much force.
  - (b) Make sure the pedals go back to the neutral position.

C. Rudder Ratio Changer Actuator Bypass Valve - Test

S 865-210

- (1) Move the FLT CONTROL SHUTOFF TAIL C and R switches on the right side panel, P61, to OFF. Attach DO-NOT-OPERATE tags and make sure the switch position lights come on.

S 865-211

- (2) Open these circuit breakers on the P11, panel and attach DO-NOT-CLOSE tags:
  - (a) 11G10, RUDDER RATIO
  - (b) 11H18, FLT CONT SHUTOFF TAIL CTR
  - (c) 11H27, FLT CONT SHUTOFF TAIL RIGHT

S 215-212

**WARNING:** MOVE ALL PERSONS AND EQUIPMENT AWAY FROM THE NOSE GEAR BEFORE YOU OPERATE THE RUDDER PEDALS. THE NOSE GEAR CAN TURN QUICKLY AND CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (3) Move the rudder pedals through their full travel range and do this check:
  - (a) Make sure the rudder does not move.

S 865-312

- (4) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11, panel:
  - (a) 11G10, RUDDER RATIO
  - (b) 11H18, FLT CONT SHUTOFF TAIL CTR
  - (c) 11H27, FLT CONT SHUTOFF TAIL RIGHT

S 865-214

- (5) Remove the power from the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 865-215

- (6) Remove electrical power if it is not necessary (AMM 24-22-00/201).

S 865-402

- (7) Remove the DO-NOT-OPERATE tags and move the FLT CONTROL SHUTOFF TAIL C and R switches on the right side panel, P61, to ON.

EFFECTIVITY

ALL

27-21-00

RUDDER - REMOVAL/INSTALLATION

1. General

A. This procedure contains the removal and installation tasks for the rudder.

TASK 27-21-01-024-001

2. Rudder - Removal

A. Equipment

- (1) Rudder Sling - A27022-81 (Recommended)
- (2) Rudder Sling - A27022-75 (Optional)
- (3) Rig Pin R5 - P/N A20004-13, part of Set A20004-72 (AMM 20-10-24)
- (4) Load Positioner - Customer furnished for use with A27022-81. LL-5-3.

B. References

- (1) AMM 06-42-00/201, Empennage Access Doors and Panels
- (2) AMM 20-10-24/201, Rig Pins

S 864-003

- (2) Move the FLT CONTROL SHUTOFF TAIL L, R, and C switches on the P61 panel to OFF. Attach DO-NOT-OPERATE tags and make sure the switch position lights come on.

S 864-004

- (3) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
  - (a) 11G10, RUDDER RATIO
  - (b) 11H17, FLT CONT SHUTOFF TAIL LEFT
  - (c) 11H18, FLT CONT SHUTOFF TAIL CTR
  - (d) 11H27, FLT CONT SHUTOFF TAIL RIGHT

S 014-039

- (4) Open access panels 324BL, 324EL, 324GL, 324JL, 324LL, 324PL, 324SL, 324WL, 324HL, 324KL, 324ML, 324KR, 324NR, 325DZ, 325EZ, 325FZ, 326DL, and 326CL (AMM 06-42-00/201).

S 494-006

- (5) Install rig pin R5 in the middle PCA linkage.
- E. Remove the Rudder (Fig. 401)

S 494-007

- (1) Attach the sling to the rudder (two locations on each side) (Fig. 403).

**NOTE:** Put the sling in its locked position before you connect it to the rudder, and make sure that the locking device is fully engaged.

S 864-008

- (2) Lift the rudder until the the load is removed from its hinges.

S 034-009

- (3) Disconnect these components from the rudder:
  - (a) The jumper straps that you find near the top hinge.
  - (b) The three power control actuators (PCAs).
  - (c) The control rod for the rudder position transmitter.

S 034-010

- (4) Remove these components:
  - (a) The top three hinge bolts (View D).
  - (b) The bottom four hinge bolts (View C and D).
  - (c) The hinge bolts that are located above and below the top rudder PCA (View A and B).

Aug 22/03

S 024-011

- (5) Move the rudder aft of the vertical fin and lower it to the ground.

NOTE: If it is necessary, pull the lock rope and use the guide ropes to turn the rudder to its "counterbalance rotation" position.

S 974-012

- (6) Keep a record of all the painting and repairs you do to the rudder.  
(a) Make sure the operational balance moment is correct.

NOTE: Flight control surfaces that have an incorrect operational balance moment can shake during flight. Refer to the Structural Repair Manual (SRM 51-60-00) for the applicable operational balance moment data.

TASK 27-21-01-424-013

3. Rudder - Installation

NOTE: Refer to AMM 27-21-01/601 for the applicable wear limit data.

A. Equipment

- (1) Rudder Sling - A27022-81 (Recommended)
- (2) Rudder Sling - A27022-75 (Optional)
- (3) Rudder PCA Gage (Shimming Tool) - A27001-1  
(2 are Necessary)
- (4) Bonding Meter - Avtron Model T477W, Avtron Manufacturing Inc., Cleveland, Ohio
- (5) Load Positioner - Customer furnished for use with A27022-81.  
LL-5-3.

B. Consumable Materials

- (1) A00247 Sealant, Chromate Type - BMS 5-95

F. Install the Rudder (Fig. 401)

S 644-036

- (1) Apply a thin layer of grease to the smooth surfaces of the bolts, bushings, and bearings before you install them.

S 494-014

- (2) Attach the sling to the rudder (two locations on each side) (Fig. 403).

**NOTE:** Put the sling in its unlocked position before you connect it to the rudder.

S 984-015

- (3) Lift the rudder to the correct upright position and lock the sling. (Fig. 403).

**NOTE:** Make sure that the locking device is fully engaged.

S 434-016

- (4) Do these steps to connect the hinge that is found below the top power control actuator (PCA) (View B):
  - (a) Install the sleeve (9), spacer (10), washers (8, 11), and the bolt (7).
  - (b) Tighten the nut (12) to 900-1250 pound-inches (101.7-141.2 newton-meters).

S 434-017

- (5) Do these steps to connect the hinge that is located above the top PCA (View A):
  - (a) Install the sleeve (3), top washer (2), and the bolt (1).
  - (b) Tighten the bushing (4) until it is finger-tight and do this check:
    - 1) Make sure there is no clearance between the bushing and the bearing.

EFFECTIVITY

ALL

27-21-01

01

Page 409  
Aug 22/05

(c) Install the bottom washer (5) and nut (6) and tighten the nut to 900-1250 pound-inches (101.7-141.2 newton-meters).

S 434-018

(6) Lock the bottom bushing, nut, and hinge with a wire and do this step:

(a) Apply some of the sealant to the bolt.

S 434-019

(7) Do these steps to connect the bottom four hinges:

(a) Do these steps to connect the bottom two hinges (View D):

1) Install the bolts (18), washers (19, 21), and sleeves (20).

2) Install the nuts (22) and tighten them to 450-650 pound-inches.

(b) Do these steps to connect the top two hinges (View C):

1) Install the bolts (13), washers (14, 16), and sleeves (15).

2) Install the nuts (17) and tighten them to 900-1250 pound-inches.

S 434-020

(8) Do these steps to connect the top three hinges (View D):

(a) Install the bolts (18), washers (19, 21), and sleeves (20) on the hinges.

(b) Install the nuts (22) and tighten them to 450-650 pound-inches (50.9-73.4 newton-meters).

S 984-021

(9) Lower the rudder until the load is on its hinges.

S 094-022

(10) Remove the rudder sling and install the bolts in the sling connection points.

S 984-023

(11) Manually move the rudder to its neutral position.

S 434-024

(12) Do these steps to connect the reaction links to the rudder:

(a) Install the bolt (23), washer (24), bushing (25), and nut (26) (3 locations).

(b) Tighten the nut (26) to 800-1000 pound-inches (90.4-113.0 newton-meters).

EFFECTIVITY

ALL

27-21-01

01

Page 410  
Aug 22/05

S 434-037

- (13) Do these steps if you will install a different rudder or if the rudder hinges were reworked:

**NOTE:** Install the middle PCA before the top and bottom PCAs. Use one PCA gage to hold the rudder in its neutral position. Use the other PCA gage to find the necessary shim thickness for the middle PCA.

- (a) Connect the PCA gage between the trunnion block for the middle PCA and the rudder and measure the necessary shim thickness (Fig. 404).
- (b) Remove the shimming tool and use the screws (30) to install the shims (28, 29) in the trunnion block (27) (View F).
- (c) Use the shimming tool to measure and install shims on the trunnion for the top and bottom PCAs. Do these checks:
  - 1) Make sure the tool dimension is the same (use a tolerance of  $\pm 0.003$  inch) ( $\pm 0.0762$  mm) for the three PCAs when the rudder is held in its neutral position.
  - 2) Make sure the shim thickness is between 0.062 and 0.145 inch.

S 434-025

- (14) Do these steps to install the middle rudder PCA:
- (a) Align the actuator with the holes in the trunnion block.
  - (b) Install the bolts (32) and washers (33) and tighten them to 400-500 pound-inches (45.2-56.5 newton-meters).
  - (c) Turn the actuator until the rod end is aligned with the rudder connection point.
  - (d) Install the bolts (23), washer (24), bushing (25), and nut (26) that connect the PCA rod end to the rudder.
  - (e) Tighten the nut (26) to 800-1000 pound-inches (90.4-113.0 newton-meters).
  - (f) Connect the input rod to the PCA.
  - (g) Connect the hydraulic hoses to the PCA.

Aug 22/09

S 434-026

- (15) Do the above step again for the top and bottom rudder PCAs.

S 434-027

- (16) Do this step to connect the control rod (1) for the position transmitter to the rudder (Fig. 402):  
(a) Install the screw (2), washer (3), and nut (4).

S 434-028

- (17) Do these steps to connect the jumper straps to the rudder:  
(a) Install the bolt (6) through the strap (4) and the structure and install the nut (7).  
(b) Use the bonding meter to make sure the maximum bonding resistance is 0.0025 ohm.

S 094-029

- (18) Remove rig pin R5 from the middle PCA linkage.

S 824-030

- (19) Do the adjustment procedure for the rudder PCAs (AMM 27-21-00/501).

S 714-031

- (20) Do the operational test for the rudder control system (AMM 27-21-00/501).

G. Put the Airplane Back to Its Usual Condition

S 414-032

- (1) Close access panels 324BL, 324EL, 324GL, 324JL, 324LL, 324PL, 324SL, 324WL, 324HL, 324KL, 324ML, 324KR, 324NR, 325DZ, 325EZ, 325FZ, 326DL, and 326CL (AMM 06-42-00/201).

S 864-033

- (2) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel, P11:  
(a) 11G10, RUDDER RATIO  
(b) 11H17, FLT CONT SHUTOFF TAIL LEFT  
(c) 11H18, FLT CONT SHUTOFF TAIL CTR  
(d) 11H27, FLT CONT SHUTOFF TAIL RIGHT

S 864-034

- (3) Remove the DO-NOT-OPERATE tags and move the FLT CONTROL SHUTOFF TAIL L, R, and C switches on the P61 panel to ON.

S 864-035

- (4) Remove electrical power if it is not necessary (AMM 24-22-00/201).

RUDDER POWER CONTROL ACTUATOR (PCA) AND  
REACTION LINK - MAINTENANCE PRACTICES

1. General

- A. This procedure contains these four tasks:
- (1) Rudder PCA Filter - Removal
  - (2) Rudder PCA Filter - Installation
  - (3) Rudder PCA and Reaction Link - Removal
  - (4) Rudder PCA and Reaction Link- Installation

TASK 27-21-02-022-001

2. Rudder PCA Filter - Removal (Fig. 201)

A. Equipment

- (1) Rudder PCA Locks (3 are necessary):
  - (a) PCA Locks - A27003-28 (Part of Lock Set, A27003-23)
- (2) Nose Gear Towing Lever Lockpin - A09003-1

B. References

- (1) 06-42-00/201, Empennage Access Doors and Panels
- (2) 24-22-00/201, Electrical Power - Control
- (3) 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems

C. Access

- (1) Location Zone
  - 324 Vertical Stabilizer, Rear Spar to Trailing Edge
- (2) Access Panels
  - 324GL Bottom Rudder PCA
  - 324JL Middle Rudder PCA
  - 324LL Top Rudder PCA

D. Prepare for the Removal

S 862-002

- (1) Supply electrical power (AMM 24-22-00).

S 012-003

- (2) Open these access panels (AMM 06-42-00):
  - (a) 324GL for the bottom PCA filter
  - (b) 324JL for the middle PCA filter
  - (c) 324LL for the top PCA filter.

EFFECTIVITY

ALL

27-21-02

01

Page 201  
Apr 22/03

S 492-004

- (3) Move the towing lever on the metering valve module to the tow position and install the towing lever lockpin in the nose gear.

S 862-005

- (4) Remove the pressure from the left, right, and center hydraulic systems and their reservoirs (AMM 29-11-00).

S 862-006

- (5) Move the FLT CONTROL SHUTOFF TAIL L, R, and C switches on the P61 panel to OFF. Attach DO-NOT-OPERATE tags and make sure the switch position lights come on.

S 862-007

- (6) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
- (a) 11H17, FLT CONT SHUTOFF TAIL LEFT
  - (b) 11H18, FLT CONT SHUTOFF TAIL CTR
  - (c) 11H27, FLT CONT SHUTOFF TAIL RIGHT

S 492-081

**WARNING:** MAKE SURE THAT HYRAULIC POWER IS REMOVED BEFORE YOU INSTALL THE PCA LOCKSET TOOL. THE RUDDER CAN MOVE QUICKLY AND CAN CAUSE INJURY TO PERSONS AND DAMAGE TO EQUIPMENT.

- (7) Do these steps to install the PCA locks on the three rudder PCAs (Fig. 202):
- (a) Move the right rudder pedal to its full forward position and hold it there until the PCA locks are installed.
  - (b) Manually move the rudder to its full right position and hold it there until the PCA locks are installed.

**CAUTION:** MAKE SURE YOU INSTALL ALL THREE PCA LOCKS. THE RUDDER CAN BECOME DAMAGED IF HYDRAULIC POWER IS ACCIDENTALLY SUPPLIED TO A PCA THAT IS NOT LOCKED.

- (c) Install the PCA locks on the three PCAs.

  - 324JL Middle Rudder PCA
  - 324LL Top Rudder PCA

D. Install the PCA Filter

S 432-013

- (1) Install the filter (18).

**NOTE:** Install the filter carefully to prevent damage to the filter.

EFFECTIVITY

ALL

27-21-02

01

Page 206  
Aug 22/05

S 432-014

- (2) Install the packing (19).

S 432-015

- (3) Install the reducer (17) and tighten it to 270-300 pound-inches (30.5-33.9 newton-meters).

S 032-016

- (4) Remove the cap from the hydraulic line (14).

S 432-017

- (5) Connect the hydraulic line to the PCA (6).

S 092-082

**WARNING:** MAKE SURE THAT HYDRAULIC POWER IS REMOVED BEFORE YOU REMOVE THE PCA LOCK TOOL. THE RUDDER CAN MOVE QUICKLY AND CAN CAUSE INJURY TO PERSONS AND DAMAGE TO EQUIPMENT.

- (6) Do these steps to remove the PCA locks:
- (a) Move the right rudder pedal to its full forward position and hold it there until the PCA locks are removed.
  - (b) Manually move the rudder to its full right position and hold it there until the PCA locks are removed.
  - (c) Remove the PCA locks from the PCAs.
  - (d) Release the rudder pedals.
  - (e) Manually move the rudder back to its neutral position.

S 862-018

- (7) Supply pressure to the hydraulic system that supplies power to the PCA that was repaired (AMM 29-11-00).

**NOTE:** The center system supplies the top PCA.  
The left system supplies the middle PCA.  
The right system supplies the bottom PCA.

S 862-019

- (8) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel, P11:
- (a) 11H17, FLT CONT SHUTOFF TAIL LEFT
  - (b) 11H18, FLT CONT SHUTOFF TAIL CTR
  - (c) 11H27, FLT CONT SHUTOFF TAIL RIGHT

S 862-020

- (9) Remove the DO-NOT-OPERATE tags and move the FLT CONTROL SHUTOFF TAIL L, R, and C switches on the P61 panel to ON.

EFFECTIVITY

ALL

27-21-02

01

Page 207  
Dec 22/01

S 212-021

- (10) Operate the rudder through 10 full travel cycles and do this step:
  - (a) Do a check for hydraulic leaks at the PCA (6).

E. Put the Airplane Back to Its Usual Condition

S 092-083

**WARNING:** STAY AWAY FROM THE NOSE WHEELS WHEN THE LOCKPIN IS REMOVED. THE WHEELS CAN TURN TO THE CENTER POSITION QUICKLY, AND CAN CAUSE INJURY TO PERSONS AND DAMAGE TO EQUIPMENT.

- (1) Make sure the nose wheels are in their center position and remove the towing lever lockpin from the nose gear.

S 862-022

- (2) Remove the power from the left, right, and center hydraulic systems (AMM 29-11-00).

S 412-023

- (3) Close these access panels (AMM 06-42-00):
  - (a) 324GL for the bottom PCA
  - (b) 324JL for the middle PCA
  - (c) 324LL for the top PCA

S 862-024

- (4) Remove electrical power if it is not necessary (AMM 24-22-00).

TASK 27-21-02-022-025

4. Rudder PCA and Reaction Link - Removal (Fig. 201)

**NOTE:** It is necessary to remove the PCA before you can remove the reaction link.

A. Equipment

- (1) Rudder PCA Locks (2 are necessary):
  - (a) PCA Locks - A27003-28 (Part of Lock Set, A27003-23)
- (2) Rudder PCA Gage - A27001-1
- (3) Nose Gear Towing Lever Lockpin - A09003-1

B. References

- (1) 06-42-00/201, Empennage Access Doors and Panels
- (2) 24-22-00/201, Electrical Power - Control
- (3) 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems

C. Access

- (1) Location Zone  
324 Vertical Stabilizer, Rear Spar to Trailing Edge

EFFECTIVITY

- (2) Access Panels
  - 324BL T.E. of the Vertical Stabilizer
  - 324EL Rudder Mechanical Control Path
  - 324GL Bottom Rudder PCA
  - 324JL Middle Rudder PCA
  - 324LL Top Rudder PCA

D. Prepare for the Removal

S 862-026

- (1) Supply electrical power (AMM 24-22-00).

S 012-027

- (2) Open these access panels (AMM 06-42-00):
  - (a) 324BL for the installation of rig pin R4
  - (b) 324EL for the installation of rig pin R8
  - (c) 324GL for the bottom PCA
  - (d) 324JL for the middle PCA and the installation of rig pin R5
  - (e) 324LL for the top PCA.

S 492-028

- (3) Move the towing lever on the metering valve module to the tow position and install the towing lever lockpin in the nose gear.

S 862-029

- (4) Remove the pressure from the left, right, and center hydraulic systems and their reservoirs (AMM 29-11-00).

S 862-030

- (5) Move the FLT CONTROL SHUTOFF TAIL L, R, and C switches on the P61 panel to OFF. Attach DO-NOT-OPERATE tags and make sure the switch position lights come on.

S 862-031

- (6) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
  - (a) 11H17, FLT CONT SHUTOFF TAIL LEFT
  - (b) 11H18, FLT CONT SHUTOFF TAIL CTR
  - (c) 11H27, FLT CONT SHUTOFF TAIL RIGHT

S 492-084

**WARNING:** MAKE SURE THAT HYDRAULIC POWER IS REMOVED BEFORE YOU INSTALL THE PCA LOCK TOOL. THE RUDDER CAN MOVE QUICKLY AND CAN CAUSE INJURY TO PERSONS AND DAMAGE TO EQUIPMENT.

- (7) Do these steps to install the PCA locks on the two rudder PCAs that you will not replace (Fig. 202):
  - (a) Move the right rudder pedal to its full forward position and hold it there until the PCA locks are installed.

EFFECTIVITY

ALL

27-21-02

01

Page 209  
Apr 22/01

- (b) Manually move the rudder to its full right position and hold it there until the PCA locks are installed.

**CAUTION:** MAKE SURE YOU INSTALL PCA LOCKS ON THE TWO PCAS YOU WILL NOT REPLACE. THE RUDDER CAN BECOME DAMAGED IF HYDRAULIC POWER IS ACCIDENTALLY SUPPLIED TO A PCA THAT IS NOT LOCKED.

- (c) Install the PCA locks on the two PCAs.
- (d) Release the rudder pedals.

E. Remove the PCA

S 032-032

- (1) Remove the bolts (15, 16) from the trailing edge beam and do this step:
  - (a) Remove the trailing edge beam.

S 032-033

- (2) Disconnect these components:
  - (a) The input rod (12) from the PCA (6)

**NOTE:** Do not adjust the input rod length.

- (b) The hydraulic lines (14) from the PCA (6) and do this step:
  - 1) Seal the hydraulic lines with a cap.

S 032-034

- (3) Remove the bolt (1) that connects the PCA to the rudder front spar.

S 982-035

- (4) Move the PCA to get access to the bolts (10) on the trunnion block.

S 032-036

- (5) Remove the four bolts and washers (10 and 11) that connect the PCA to the trunnion.

S 022-037

- (6) Remove the PCA (6).

**NOTE:** Do not remove or replace the shims that are connected to the trunnion block.

- (a) If it is necessary, you can adjust the shim thickness (you can use the rudder PCA gage tool, A27001-1) (Fig. 202).

**NOTE:** The rudder must be in the neutral position.

- 1) Make sure dimension A is 17.575 - 17.585 inches (446.40-446.66 mm).

EFFECTIVITY

ALL

27-21-02

01

Page 210  
Dec 22/01

- 2) Install the shims.
  - a) Make sure the Dimension A of the actuators is +/- 0.003 inches of each other.
  - b) The total shim thickness must be 0.062 - 0.145 inches (1.57-3.68 mm) (measure the shim thickness with a feeler gage).

F. Remove the Rudder Reaction Link

S 032-099

- (1) Remove the bolt (1) which connects the reaction link (21) to the rudder front spar.

S 032-100

- (2) Remove the bolts (26) on the upper trunnion to remove the trunnion stop (29).
  - (a) Remove the trunnion stop (29).

S 032-101

- (3) Remove the 3 bolts (22) from the bushing assembly (24).
  - (a) Remove the bushing assembly (24).

S 032-102

- (4) To remove the reaction link for the top PCA, you must remove the grease fitting (30).

**NOTE:** It can be necessary to remove the grease fitting when you remove the reaction links for the middle and bottom PCAs.

S 032-106

- (5) Do the steps that follow to remove the reaction link (21) and the hanger link (25) as an assembly.
  - (a) Move the reaction link (21) along the trunnion track to remove it from the trunnion track.
  - (b) Move the reaction link (21) and the hanger link assembly (25) up to be clear of the support bracket.
  - (c) Turn the reaction link and the hanger link assembly down to remove it.

TASK 27-21-02-422-038

5. Rudder PCA and Reaction Link - Installation (Fig. 201)

A. Equipment

- (1) Rig Pins from Set A20004-XX (AMM 20-10-24):

Dec 22/08

F. Install the Rudder Reaction Link

NOTE: Do these steps only if you removed the rudder reaction link.

S 422-103

- (1) Do the steps that follow to install the hanger link (24) and the reaction link (21) as an assembly.
  - (a) Install the grease fitting (30) if it was removed.
  - (b) Install the bolt (1) to connect the reaction link (21) to the front spar.
    - 1) Tighten the bolt to 800 – 1000 inch pounds (90.4–113.0 newton-meters).
  - (c) Do these steps to install the bushing assembly (24).
    - 1) Temporarily put a 0.015 inch (0.38 mm) shim between the hanger link (25) and the flanged bushing (24).

NOTE: This shim is between the hanger link and the support bracket.

- 2) Install a laminated shim between the flanged bushing (24) and the support bracket.
- 3) Install the three bolts (22) which attach the flanged bushing (24) to the support bracket.
- 4) Tighten the 3 bolts to 30 – 40 inch pounds (3.4–4.5 newton-meters).
- 5) Remove the temporary 0.015 inch (0.38 mm) shim.

S 422-104

- (2) Use the bolt to install the upper trunnion stop.

G. Install the PCA

NOTE: Make sure the rudder is in the full right position and that the PCA locks are installed on the two PCAs which were not removed.

S 642-039

- (1) Apply grease to the bolts and bushings (1, 3, 7, and 10) before they are installed.

EFFECTIVITY

ALL

27-21-02

01

Page 213  
Aug 22/05

S 982-040

- (2) Put the PCA (6) on the trunnion block (13) and align the bolt holes.

**NOTE:** Do not remove or replace the shims that are connected to the trunnion block.

S 432-041

- (3) Install the washers (11) and bolts (10) that connect the PCA to the trunnion block. Tighten the bolts to 400-500 pound-inches (45.2-56.5 newton-meters).

S 982-042

- (4) To install the rod end to the front spar, do the steps that follow:  
(a) Remove the caps for the hydraulic connections from the PCA.

**NOTE:** The caps must be removed to allow you to extend the PCA.

- (b) Connect the return hydraulic line (14) to the PCA (6).  
(c) Turn the manual input crank in the clockwise direction.  
(d) Manually extend the rod end until it is aligned with the rudder front spar.  
(e) Install the bolt (1), washer (2), bushing (3), washer (4) and nut (5).  
1) Tighten the nut to 800-1000 pound-inches (90.4-113.0 Nm).

S 432-044

- (5) Install the bolts (15, 16) that connect the trailing edge beam and tighten them.

S 432-045

- (6) Connect these components:  
(a) The hydraulic lines (14) to the PCA (6)  
(b) The input rod (12) to the PCA (6).

EFFECTIVITY

ALL

27-21-02

01

Page 214  
Aug 22/05

S 092-085

**WARNING:** MAKE SURE THAT HYDRAULIC POWER IS REMOVED BEFORE YOU REMOVE THE THE PCA LOCK TOOL. THE RUDDER CAN MOVE QUICKLY AND CAN CAUSE INJURY TO PERSONS AND DAMAGE TO EQUIPMENT.

- (7) Do these steps to remove the PCA locks:
- (a) Move the right rudder pedal to its full forward position and hold it there until the PCA locks are removed.
  - (b) Manually move the rudder to its full right position and hold it there until the PCA locks are removed.
  - (c) Remove the locks from the PCAs.
  - (d) Release the rudder pedals.
  - (e) Manually move the rudder to its neutral position.
- H. Bleed the Rudder PCA

**NOTE:** Bleed only the PCA(S) that you replaced.

S 822-086

**CAUTION:** DO NOT BLEED MORE THAN ONE PCA AT A TIME. BECAUSE THE PCAS ARE NOT ADJUSTED, THE RUDDER CAN BECOME DAMAGED IF MORE THAN ONE PCA IS OPERATED AT THE SAME TIME.

- (1) Do these steps if you replaced the top PCA:

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (a) Supply pressure to the center hydraulic system only (AMM 29-11-00).
- (b) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the overhead panel, P11:
  - 1) 11H18, FLT CONT SHUTOFF TAIL CTR
- (c) Remove the DO-NOT-OPERATE tag and move the FLT CONTROL SHUTOFF TAIL C switch on the P61 panel to ON.
- (d) Operate the rudder pedals to move the rudder through 10 full travel cycles.
- (e) Move the FLT CONTROL SHUTOFF TAIL C switch on the P61 panel to OFF. Attach a DO-NOT-OPERATE tag and make sure the switch position light comes on.
- (f) Open this circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:
  - 1) 11H18, FLT CONT SHUTOFF TAIL CTR
- (g) Remove the power from the center hydraulic system (AMM 29-11-00).

EFFECTIVITY

ALL

27-21-02

Page 215  
Apr 22/01

S 822-087

- (2) Do these steps if you replaced the middle PCA:

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (a) Supply pressure to the left hydraulic system only (AMM 29-11-00).
- (b) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
  - 1) 11H17, FLT CONT SHUTOFF TAIL LEFT
- (c) Remove the DO-NOT-OPERATE tag and move the FLT CONTROL SHUTOFF TAIL L switch on the P61 panel to ON.
- (d) Operate the rudder pedals to move the rudder through 10 full travel cycles.
- (e) Move the FLT CONTROL SHUTOFF TAIL L switch on the P61 panel to OFF. Attach a DO-NOT-OPERATE tag and make sure the switch position light comes on.
- (f) Open this circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:
  - 1) 11H17, FLT CONT SHUTOFF TAIL LEFT
- (g) Remove the power from the left hydraulic system (AMM 29-11-00).

S 822-088

- (3) Do these steps if you replaced the bottom PCA:

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (a) Supply pressure to the right hydraulic system only (AMM 29-11-00).
- (b) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
  - 1) 11H27, FLT CONT SHUTOFF TAIL RIGHT
- (c) Remove the DO-NOT-OPERATE tag and move the FLT CONTROL SHUTOFF TAIL R switch on the P61 panel to ON.
- (d) Operate the rudder pedals to move the rudder through 10 full travel cycles.
- (e) Move the FLT CONTROL SHUTOFF TAIL R switch on the P61 panel to OFF. Attach a DO-NOT-OPERATE tag and make sure the switch position light comes on.
- (f) Open this circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:
  - 1) 11H27, FLT CONT SHUTOFF TAIL RIGHT

EFFECTIVITY

ALL

27-21-02

01

Page 216  
Apr 22/05

- (g) Remove the power from the right hydraulic system (AMM 29-11-00).

I. Adjust the Rudder PCA

**NOTE:** This adjustment is applicable if you replaced one PCA only.

If you replaced more than one PCA, do the system adjustment for all three PCAs (AMM 27-21-00).

S 492-046

- (1) Use tape to attach a piece of cardboard (that extends down to the index plate) to the rudder trailing edge.

S 492-047

- (2) Do these steps to install rig pin R4:
  - (a) Turn the rudder trim switch on the aft electronic control panel, P8, until the trim indicator shows 3 to 5 units of left trim.
  - (b) Manually turn the aft quadrant clockwise (against the spring force) until rig pin R4 can be installed.

**NOTE:** This will make a stable position for the PCA adjustment procedure. The mechanism springs hold the rig pin hole to positively ground the ratio changer mechanism.

**CAUTION:** MAKE SURE THE RIG PIN HOLES IN THE FEEL, CENTERING, AND TRIM AFT QUADRANT ARE ALIGNED BEFORE RIG PIN R4 IS INSTALLED. IT IS POSSIBLE FOR RIG PIN R4 TO BE INSTALLED INCORRECTLY IF THE QUADRANT IS NOT IN ITS CORRECT POSITION.

- (c) Install rig pin R4.

S 862-055

- (3) Do these steps if you replaced the top PCA:

**NOTE:** Make sure that power is not supplied to the center hydraulic system.

EFFECTIVITY

ALL

27-21-02

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (a) Supply pressure to the left and right hydraulic systems (AMM 29-11-00).
- (b) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:
  - 1) 11H17, FLT CONT SHUTOFF TAIL LEFT
  - 2) 11H27, FLT CONT SHUTOFF TAIL RIGHT
- (c) Remove the DO-NOT-OPERATE tags and move the FLT CONTROL SHUTOFF TAIL L and R switches on the P61 panel to ON.

S 862-056

- (4) Do these steps if you replaced the middle PCA:

**NOTE:** Make sure that power is not supplied to the left hydraulic system.

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (a) Supply pressure to the right and center hydraulic systems (AMM 29-11-00).
- (b) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:
  - 1) 11H18, FLT CONT SHUTOFF TAIL CTR
  - 2) 11H27, FLT CONT SHUTOFF TAIL RIGHT

EFFECTIVITY

ALL

27-21-02

01

Page 218  
Apr 22/05

- (c) Remove the DO-NOT-OPERATE tags and move the FLT CONTROL SHUTOFF TAIL R and C switches on the P61 panel to ON.

S 862-057

- (5) Do these steps if you replaced the bottom PCA:

NOTE: Make sure that power is not supplied to the right hydraulic system.

WARNING: KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (a) Supply pressure to the left and center hydraulic systems (AMM 29-11-00).
- (b) Remove the DO-NOT-OPERATE tags and close these circuit breakers on the P11 panel:
  - 1) 11H17, FLT CONTROL SHUTOFF TAIL LEFT
  - 2) 11H18, FLT CONT SHUTOFF TAIL CTR
- (c) Remove the DO-NOT-OPERATE tags and move the FLT CONTROL SHUTOFF TAIL L and C switches on the P61 panel to ON.

S 212-058

- (6) Make sure the rudder trailing edge is in its groove on the rudder index plate.

S 822-059

- (7) If the rudder is not in the index plate groove, do the procedure to Adjust the Three PCA System (AMM 27-21-00).

S 822-098

- (8) Do these steps if the rudder is in the index plate groove:
  - (a) Put tape on the index plate and make a mark of the rudder trailing edge position.

NOTE: This is the datum position.

EFFECTIVITY

ALL

27-21-02

01

Page 219  
Apr 22/05

- (b) Remove the pressure from the left, center and right hydraulic system (AMM 29-11-00).

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (c) If you replaced the top PCA, supply pressure to the center hydraulic system only (AMM 29-11-00).
- (d) If you replaced the middle PCA, supply pressure to the left hydraulic system only (AMM 29-11-00).
- (e) If you replaced the bottom PCA, supply pressure to the right hydraulic system only (AMM 29-11-00).
- (f) After 1 minute, make sure the rudder trailing edge is less than 0.05 inch (1.27 mm) away from the datum position.
- (g) If the trailing edge is more than 0.05 inches (1.27 mm) from the datum position, do these steps to adjust the input rod of the PCA you removed:
- 1) Make sure the pressure is removed from the left, center and right hydraulic systems (AMM 29-11-00).
  - 2) Disconnect the input rod.
  - 3) Adjust the threads one-half turn.

**NOTE:** Turn the threads a maximum of one-half a turn at a time. This will let the PCA bleed unwanted hydraulic pressure.

- 4) Connect the input rod.

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- 5) If you replaced the top PCA, supply pressure to the center hydraulic system (AMM 29-11-00).
- 6) If you replaced the the middle PCA, supply pressure to the left hydraulic system (AMM 29-11-00).
- 7) If you replaced the bottom PCA, supply pressure to the right hydraulic system (AMM 29-11-00).

EFFECTIVITY

ALL

27-21-02

02

Page 220  
Apr 22/06

- 8) After 1 minute, make sure the rudder trailing edge is less than 0.05 inches (1.27 mm) away from the datum position.
- 9) If the rudder trailing edge is more than 0.05 inches (1.27 mm) away from the datum position, do these steps again.

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (h) Supply pressure to the left, center and right hydraulic system (AMM 29-11-00).
- (i) Put the rudder trim to the neutral position.
  - 1) Remove the rig pin R4 from the feel and centering mechanism.
- (j) Do the steps that follow:
  - 1) Put the rudder to the full left position.
    - a) Make sure the rudder is minimum of 41.10 inches (1.04 meters) from the neutral position.
  - 2) Put the rudder to the full right position.
    - a) Make sure the rudder is a minimum of 41.10 inches (1.04 meters) from the neutral position.
  - 3) Put the rudder to the neutral position.
  - 4) Remove the pressure from the center and right hydraulic systems (AMM 29-11-00).
    - a) Make sure the rudder does not move more than 0.10 inches from the neutral position.

**WARNING:** KEEP PERSONS AND EQUIPMENT FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- 5) Supply pressure to the center hydraulic system (Ref 29-11-00).

- 6) Remove the pressure from the left hydraulic system (AMM 29-11-00).
  - a) Make sure the rudder does not move more than 0.10 inches from the neutral position.

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- 7) Supply pressure to the right hydraulic system (AMM 29-11-00).
- 8) Remove the pressure from the center hydraulic system.
  - a) Make sure the rudder does not move more than 0.10 inches from the neutral position.
- 9) If the rudder is not in the limits shown, adjust the PCAs to the neutral position for the single system check.

**NOTE:** The rudder trailing edge is less than 0.05 inches from the datum position.

(k) Remove the cardboard from the rudder.

J. Rudder PCA - Test

S 862-073

- (1) Push the STATUS button on the display select panel to show the rudder position indicator on the display.

S 862-092

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (2) Supply pressure to the hydraulic system that supplies power to the PCA you will test (AMM 29-11-00).

**NOTE:** The center system supplies the top PCA.  
The left system supplies the middle PCA.  
The right system supplies the bottom PCA.

S 862-105

- (3) Remove the DO-NOT-OPERATE tags and move the FLT CONTROL SHUTOFF TAIL L, R, and C switches on the P61 panel to ON.

S 862-093

- (4) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:
- (a) 11H17, FLT CONT SHUTOFF TAIL LEFT
  - (b) 11H18, FLT CONT SHUTOFF TAIL CTR
  - (c) 11H27, FLT CONT SHUTOFF TAIL RIGHT

S 862-074

- (5) Turn the rudder trim switch on the aft electronic control panel, P8, until the trim indicator shows zero units of trim.

S 212-075

- (6) Move the captain's left pedal to its full forward position and do this check:
- (a) Make sure the rudder position indicator moves to the left full travel mark.

S 212-076

- (7) Move the captain's right pedal to its full forward position and do this check:
- (a) Make sure the rudder position indicator moves to its right full travel mark.

EFFECTIVITY

Apr 22/06

S 212-077

- (8) Release the rudder pedals and do this check:  
(a) Make sure the rudder position indicator goes to its neutral position.

S 212-078

- (9) Do a check on the rudder PCAs for hydraulic leaks.  
K. Put the Airplane Back to Its Usual Condition

S 092-094

**WARNING:** STAY AWAY FROM THE NOSE WHEELS WHEN THE LOCK PIN IS REMOVED. THE WHEELS CAN TURN TO THE CENTER POSITION QUICKLY, AND CAN CAUSE INJURY TO PERSONS AND DAMAGE TO EQUIPMENT.

- (1) Make sure the nose wheels are in their center position and remove the towing lever lockpin from the nose gear.

S 862-079

- (2) Remove the power from the left, right, and center hydraulic systems (AMM 29-11-00).

S 412-095

- (3) Close access panels 324BL, 324EL, 324GL, 324JL, and 324LL (AMM 06-42-00).

S 862-080

- (4) Remove electrical power if it is not necessary (AMM 24-22-00).

RUDDER PEDALS - REMOVAL/INSTALLATION

1. General

- A. This procedure contains the removal and installation tasks for the rudder pedal assemblies. These tasks are applicable to the captain's or the first officer's pedals.

TASK 27-21-05-024-003

2. Rudder Pedal Assembly - Removal

A. Equipment

- (1) Rig Pins from Set A20004-XX (Ref 20-10-24):  
    (a) R3 - P/N A20004-14  
(2) Nose Gear Towing Lever Lockpin - A09003-1

B. References

- (1) 06-41-00/201, Fuselage Access Doors and Panels  
(2) 20-10-24/201, Rig Pins  
(3) 24-22-00/201, Electrical Power - Control

C. Access

- (1) Location Zones  
    211/212      Control Cabin  
  
(2) Access Panel  
    113AL      Flight Control Components

D. Prepare for the Removal

S 864-004

- (1) Supply electrical power (Ref 24-22-00).

S 864-005

- (2) Move the FLT CONTROL SHUTOFF TAIL L, R, and C switches on the right side panel, P61, to OFF. Attach DO-NOT-OPERATE tags and make sure the switch position lights come on.

S 864-006

- (3) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:  
    (a) 11G10, RUDDER RATIO  
    (b) 11H17, FLT CONT SHUTOFF TAIL LEFT  
    (c) 11H18, FLT CONT SHUTOFF TAIL CTR  
    (d) 11H27, FLT CONT SHUTOFF TAIL RIGHT

**WARNING:** MAKE SURE TO OPEN THE CIRCUIT BREAKERS FOR THE CAPTAIN'S AND THE FIRST OFFICER'S SEATS BEFORE YOU DO WORK AROUND THEM. A FAILURE TO OPEN THE CIRCUIT BREAKERS CAN CAUSE THE SEATS TO MOVE ACCIDENTALLY. THIS CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (4) Open these circuit breakers on the main power distribution panel, P6, and attach DO-NOT-CLOSE tags:
  - (a) 6H15, CAPT SEAT

S 014-007

- (5) Open access door 113AL to get access to the rudder pedal assemblies (Ref 06-41-00).

S 494-008

- (6) Install rig pin R3 in the forward quadrant and jackshaft (Fig. 402).

S 494-009

- (7) Move the towing lever on the metering valve module to the tow position and install the towing lever lockpin in the nose gear (Fig. 403).

E. Rudder Pedal Assemblies - Removal (Fig. 401)

S 034-010

- (1) Disconnect these components:
  - (a) The brake pushrods from the bellcrank
  - (b) The quadrant pushrods from the rudder pedal arms.

S 034-011

- (2) On the Captain's rudder pedals, do these steps:
  - (a) Disconnect the spring from the parking brake pawl and remove it.
  - (b) Disconnect the parking brake rod from the pawl.
  - (c) Remove the pawl rod.

S 034-012

- (3) On the First Officer's pedals, disconnect and remove the spring.

S 014-014

- (4) Remove the top side panels from the rudder pedal cover.

S 034-015

- (5) Hold the rudder pedal assemblies and remove the rudder pedal shaft (View F).

E. Rudder Pedal Assembly - Installation (Fig. 401)

S 624-019

- (1) Apply the corrosion preventive compound to the rudder pedal shaft.

S 424-020

- (2) Put the rudder pedals in the support structure and do these steps:
  - (a) Install the support shaft from the inboard side of the pedal assemblies through the bushings.
  - (b) Put the washer and nut on the rudder pedal support shaft.
  - (c) Tighten the nut.

S 824-021

- (3) Do these steps to adjust the rudder pedal position:
  - (a) Turn the pedal adjustment crank clockwise until the jackshaft is in its full forward position.
  - (b) Turn the pedal adjustment crank 3.25 turns counterclockwise.
  - (c) Put the crank in its nearest detent position.
  - (d) Install these rig pins in the rudder pedal arms:
    - 1) R1 (for the captain's rudder pedals)

EFFECTIVITY

ALL

2) R2 (for the first officer's rudder pedals)

S 824-022

- (4) Do these steps to adjust and install the quadrant pushrods:
- (a) Loosen the locknuts on the pushrods.
  - (b) Turn the pushrods until you can attach them to the pedal arms.
  - (c) Make sure you see control rod threads in at least one-half of the inspection hole for the pushrod.
  - (d) Tighten the locknuts 160-240 pound-inches (18.0-27.1 newton-meters) at the pushrod ends.
  - (e) Apply the corrosion preventive compound at the connection points for the pushrods.
  - (f) Connect the pushrods to the rudder pedal arms.
    - 1) Install the bolts, washers, and nuts.
    - 2) Torque the nuts to 110-150 inch-pounds (12.4-16.9 Nm).
      - a) Install the cotter pins on the nuts.

S 094-023

- (5) Remove these rig pins:
- (a) R1 (for the captain's rudder pedals)
  - (b) R2 (for the first officer's rudder pedals)
  - (c) R3 (for the forward quadrant and jackshaft).

S 414-024

- (6) Install the side panels on the rudder pedal cover.

S 434-025

- (7) On the Captain's rudder pedals, do these steps:
- (a) Apply the corrosion preventive compound to the bolts before the installation.
  - (b) Install the pawl rod.
  - (c) Connect the parking brake rod to the pawl.
  - (d) Connect the spring between the pawl and the bracket.

S 434-026

- (8) On the First Officer's rudder pedals, connect the spring.

S 434-028

- (9) Do these steps to connect the brake pushrods to the bellcrank:
- (a) Apply the corrosion preventive compound to the bolts before the installation.
  - (b) Connect the brake pushrods to the bellcrank.
  - (c) Make sure you can easily install and remove rig pin R1 in the captain's rudder pedals.
  - (d) If it is necessary, adjust the brake pushrods (Ref 32-41-00).

F. Rudder Pedal Operation - Test

RUDDER PEDAL ADJUSTMENT CRANK - REMOVAL/INSTALLATION

1. General

- A. This procedure contains the removal and installation tasks for the rudder pedal adjustment cranks. These tasks are applicable to the two cranks.

TASK 27-21-06-024-001

2. Rudder Pedal Adjustment Crank - Removal

A. Equipment

- (1) Rig Pins from Set A20004-XX (AMM 20-10-24/201):  
(a) R1 - P/N A20004-25  
(b) R2 - P/N A20004-25  
(c) R3 - P/N A20004-14

B. References

- (1) AMM 06-41-00/201, Fuselage Access Doors and Panels  
(2) AMM 20-10-24/201, Rig Pins  
(3) AMM 24-22-00/201, Electrical Power - Control

C. Access

- (1) Location Zones  
211/212 Control Cabin  
113 Area Forward of the NLG Wheel Well
- (2) Access Panel  
113AL Flight Control Components

D. Prepare for the Removal

S 864-002

- (1) Supply electrical power (AMM 24-22-00/201).

S 864-003

- (2) Move the FLT CONTROL SHUTOFF TAIL L, R, and C switches on the right side panel, P61, to OFF. Attach DO-NOT-OPERATE tags and make sure the switch position lights come on.

S 864-004

- (3) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:  
(a) 11H17, FLT CONT SHUTOFF TAIL LEFT  
(b) 11H18, FLT CONT SHUTOFF TAIL CTR  
(c) 11H27, FLT CONT SHUTOFF TAIL RIGHT

S 864-024

**WARNING:** MAKE SURE TO OPEN THE CIRCUIT BREAKERS FOR THE CAPTAIN'S AND THE FIRST OFFICER'S SEATS BEFORE YOU DO WORK AROUND THEM. A FAILURE TO OPEN THE CIRCUIT BREAKERS CAN CAUSE THE SEATS TO MOVE ACCIDENTALLY. THIS CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (4) Open these circuit breakers on the main power distribution panel, P6, and attach DO-NOT-CLOSE tags:
  - (a) 6H15 or 6J15, CAPT SEAT
  - (b) 6J21, F/O SEAT

S 014-005

- (5) Open access door, 113AL, to get access to the captain's forward quadrant (AMM 06-41-00/201).

E. Remove the Rudder Pedal Adjustment Crank (Fig. 401)

S 494-006

- (1) Install these rig pins:
  - (a) R3 (for the captain's forward quadrant)
  - (b) R1 or R2 (for the rudder pedals of the crank you will remove).

S 034-007

- (2) Do these steps to disconnect the bottom of the cable:
  - (a) Loosen the cable retaining nut at the forward quadrant.
  - (b) Remove the cable clamps (6 locations)
  - (c) Hold the cable retaining nut and washer, then pull the cable from the jackshaft and through the grommet hole.

S 034-008

- (3) Do these steps to disconnect the top of the cable:

**NOTE:** Get access to the cable housing and the crank lever assembly through the side panel for the rudder pedal housing.

- (a) Remove the nut and washer from the crank lever assembly.
- (b) Remove the crank lever assembly and the washer.
- (c) Remove the cable retaining sleeve at the crank housing and move it to the middle of the cable.
- (d) Pull the cable from the housing and remove it.

S 034-009

- (4) Remove the bolts, washers, and nuts that connect the stop plate to the housing (4 locations).

S 034-010

- (5) Remove the stop plate and the crank housing.

TASK 27-21-06-424-011

3. Rudder Pedal Adjustment Crank - Installation

A. Consumable Materials

- (1) D00633 Grease, Corrosion Preventive - BMS 3-33 (Preferred)
- (2) D00015 Grease, Corrosion Preventive - BMS 3-24 (Alternate)

B. References

- (1) AMM 06-41-00/201, Fuselage Access Doors and Panels
- (2) AMM 24-22-00/201, Electrical Power - Control

C. Access

(1) Location Zones

- 211/212 Control Cabin
- 113 Area Forward of the NLG Wheel Well

(2) Access Panel

- 113AL Flight Control Components

D. Install the Rudder Pedal Adjustment Crank (Fig. 401)

S 434-012

- (1) Do these steps to connect the cable to the rudder pedal jackshaft:
  - (a) Put the grommet on the cable.
  - (b) Push the cable through the jackshaft support, and do this step:
    - 1) Put the cable retaining nut and washer on the cable.
  - (c) Put the end of the cable in the jackshaft and do this step:
    - 1) Turn the cable until the cable engages the pin in the jackshaft.
  - (d) Apply some of the corrosion preventive compound to the cable threads.
  - (e) Tighten the cable retaining nut.

S 434-013

- (2) Install the cable clamps and do this check:
  - (a) Make sure the cable radius is more than 5.0 inch (127 mm) for all the curves in the cable.

NOTE: If the radius is less than 5.0 inch (127 mm), the cable will not operate correctly.

S 434-014

- (3) Install the bolts, washers, and nuts that connect the stop plate and crank housing to the rudder pedal housing (4 locations).

S 434-015

- (4) Do these steps to connect the cable to the crank lever assembly:
  - (a) Push the cable through the housing.
  - (b) Tighten the cable retaining sleeve.
  - (c) Put the washer on the cable end that shows.

EFFECTIVITY

ALL

27-21-06

03

Page 404  
Apr 22/08

- (d) Install the crank lever assembly, washer, and nut on the cable end.
- (e) Install the lockwire.

S 094-016

- (5) Remove these rig pins:
  - (a) R3 (for the captain's forward quadrant)
  - (b) R1 or R2 (for the rudder pedals)

S 214-017

- (6) Turn the adjustment crank between its full travel positions and do this check:
  - (a) Make sure the cable turns smoothly and easily.

E. Put the Airplane Back to Its Usual Condition

S 414-018

- (1) Install the side panels on the rudder pedal housing.

S 864-019

- (2) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel, P11:
  - (a) 11H17, FLT CONTROL SHUTOFF TAIL LEFT
  - (b) 11H18, FLT CONTROL SHUTOFF TAIL CTR
  - (c) 11H27, FLT CONTROL SHUTOFF TAIL RIGHT

S 864-025

- (3) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the main power distribution panel, P6:
  - (a) 6H15 or 6J15, CAPT SEAT
  - (b) 6J21, F/O SEAT

S 864-020

- (4) Remove the DO-NOT-OPERATE tags and move the FLT CONTROL SHUTOFF TAIL L, R, and C switches on the right side panel, P61, to ON.

S 414-021

- (5) Close access door, 113AL (AMM 06-41-00/201).

S 864-022

- (6) Remove electrical power if it is not necessary (AMM 24-22-00/201).

RUDDER FORWARD QUADRANT AND JACKSHAFT ASSEMBLY – REMOVAL/INSTALLATION

1. General

A. This procedure contains the removal and installation tasks for the rudder forward quadrant and jackshaft assembly. These tasks are applicable to the captain's or the first officer's assembly.

TASK 27-21-07-024-003

2. Rudder Forward Quadrant and Jackshaft – Removal (Fig. 401)

A. Equipment

(1) Rig Pins from Set A20004-XX (Ref 20-10-24):

- (a) R1 – P/N A20004-25
- (b) R2 – P/N A20004-25
- (c) R4 – P/N A20004-20

(2) Lockpin, Nose Gear Towing Lever – A09003-1

B. References

- (1) AMM 06-41-00/201, Fuselage Access Doors and Panels
- (2) AMM 06-42-00/201, Empennage Access Doors and Panels
- (3) AMM 20-10-24/201, Rig Pins
- (4) AMM 24-22-00/201, Electrical Power – Control
- (5) AMM 31-31-10/401, Rudder Pedal Position Transducer

C. Access

(1) Location Zones

211/212	Control Cabin
113	Area Forward of the NLG Wheel Well
324	Vertical Stabilizer – Rear Spar to Trailing Edge

(2) Access Panels

113AL	Flight Control Components
312AR	Stabilizer Jackscrew Compartment
324BL	Feel, Centering, and Trim Mechanism

D. Prepare for the Removal

S 864-004

(1) Supply electrical power (Ref 24-22-00).

S 864-005

(2) Move the FLT CONTROL SHUTOFF TAIL L, R, and C switches on the P61 panel to OFF. Attach DO-NOT-OPERATE tags and make sure the switch position lights come on.

S 864-006

(3) Open these circuit breakers on the P11 panel and attach DO-NOT-CLOSE tags:

- (a) 11G10, RUDDER RATIO
- (b) 11H17, FLT CONT SHUTOFF TAIL LEFT
- (c) 11H18, FLT CONT SHUTOFF TAIL CTR
- (d) 11H27, FLT CONT SHUTOFF TAIL RIGHT

Aug 22/01

S 014-007

- (4) Open access door 113AL to get access to the forward quadrant and jackshaft (Ref 06-41-00).

S 014-008

- (5) Open access panel 324BL to get access to the feel, centering, and trim mechanism (Ref 06-42-00).

S 014-009

- (6) Open access door 312AR to get access to cables RA and RB (Ref 06-42-00).

S 494-010

- (7) Install these rig pins:  
(a) R1 (for the captain's rudder pedals)  
(b) R2 (for the first officer's rudder pedals)  
(c) R4 (for the feel, centering, and trim mechanism)

S 494-011

- (8) Move the towing lever to the tow position and install the towing lever lockpin in the nose gear.

E. Rudder Forward Quadrant and Jackshaft - Removal

S 034-012

**CAUTION:** KEEP SOME TENSION IN THE CONTROL CABLES AT ALL TIMES. IF THE TENSION IS REMOVED, THE CABLES CAN BECOME INCORRECTLY ALIGNED AND WILL OPERATE INCORRECTLY. YOU MUST DO A FULL INSPECTION OF THE CONTROL CABLE SYSTEM IF THE TENSION IS REMOVED.

- (1) Do these steps to disconnect cables RA and RB from the forward quadrant:  
(a) Release the tension equally from cables RA and RB at their turnbuckles.  
(b) Use a cable clamp to hold the cables in position.  
(c) Use a tag to identify the cables.  
(d) Disconnect cables RA and RB from the forward quadrant.

S 034-013

- (2) Disconnect the bus rod from the jackshaft you will remove.

S 034-016

- (3) Remove the crank and the pushrod for the rudder pedal position transmitter from the captain's jackshaft (Ref 31-31-10).

S 034-018

- (4) Remove the backplate from the jackshaft support.

S 034-019

- (5) Disconnect the quadrant pushrods from the jackshaft you will remove.

- E. Forward Quadrant and Jackshaft - Installation
- S 624-026
- (1) Apply the corrosion preventive compound to all the nuts before the installation.
- S 224-027
- (2) Examine the quadrant assembly for too much wear.
- S 434-028
- (3) Put the top and bottom bearing housings and their bearings on the jackshaft.
- S 424-029
- (4) Put the quadrant assembly in its correct position in the airplane and do these steps:
- (a) Install the bolts, washers, and nuts (4 locations) that connect the bottom bearing housing to the airplane.
- (b) Install the bolts, washers, and nuts (4 locations) that connect the top bearing housing to the airplane.
- S 494-030
- (5) Install rig pin R3 in the captain's forward quadrant.
- S 434-031
- (6) Connect the bus rod to the jackshafts.
- S 434-032
- (7) Do these steps to install the rudder pedal adjustment cable:
- (a) Put the cable through the airplane structure and install the washer and the retaining nut on the cable.
- (b) Put the cable in the jackshaft.
- (c) Tighten and lock the retaining nut with a wire.

- S 434-033
- (8) On the First Officer's Jackshaft, install the nose gear steering crank.
- S 434-034
- (9) Install the crank and the pushrod for the rudder pedal position transmitter on the captain's jackshaft (AMM 31-31-10/401).
- S 434-041
- (10) Connect the nose gear steering pushrod to the first officer's jackshaft.
- S 824-038
- (11) If it is necessary, do these steps to adjust the quadrant pushrods:
- (a) Make sure you installed rig pins R1, R2, and R3.
  - (b) Loosen the locknut at the rod end.
  - (c) Adjust the pushrod length until you can connect the rod end to the quadrant.
  - (d) Make sure you can see control rod threads in at least one-half of the pushrod inspection holes.
  - (e) Tighten the locknuts.
- S 434-039
- (12) Connect the pushrods to the jackshaft.
- S 434-040
- (13) Install the backplate on the jackshaft support.
- S 434-042
- (14) Do these steps to connect the rudder cables to the forward quadrants:

**NOTE:** Refer to the adjustment in 27-21-00 if you installed new cables.

- (a) Connect the cables to the forward quadrants.
- (b) Adjust the turnbuckles equally until the cable tension is correct (Fig. 402).
- (c) Make sure you can easily install and remove rig pins R1, R2, R3, and R4.
- (d) Remove rig pins R1, R2, R3, and R4.
- (e) Operate the rudder pedals through one full travel cycle and do these steps:
  - 1) Make sure the cable tension is correct.
  - 2) Install cliplocks on the turnbuckles and apply a thin layer of corrosion preventive compound to the threads that show.

EFFECTIVITY

ALL

02

Page 408  
Apr 22/06

F. Rudder Operation - Test

S 214-043

- (1) Operate the rudder pedals through their full travel range and do these checks:
  - (a) Make sure the pedals move freely and easily.
  - (b) Make sure the aft quadrant touches its stops at the two full travel positions.

S 864-001

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (2) Supply pressure to the left, right, and center hydraulic systems (Ref 29-11-00).

S 864-044

- (3) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel, P11:
  - (a) 11G10, RUDDER RATIO
  - (b) 11H17, FLT CONT SHUTOFF TAIL LEFT
  - (c) 11H18, FLT CONT SHUTOFF TAIL CTR
  - (d) 11H27, FLT CONT SHUTOFF TAIL RIGHT

S 864-045

- (4) Remove the DO-NOT-OPERATE tags and move the FLT CONTROL SHUTOFF TAIL L, R, and C switches on the P61 panel to ON.

S 864-047

- (5) Push the STATUS button on the display select panel, P9, to show the rudder position indicator on the bottom EICAS display.

S 214-048

- (6) Operate the rudder pedals through their full travel range and do these checks:
  - (a) Make sure the rudder operates correctly.
  - (b) Make sure the rudder position indicator operates correctly and moves through its full travel range.

EFFECTIVITY

ALL

Apr 22/06

S 214-049

- (7) Release the rudder pedals and do this check:  
(a) Make sure the rudder goes back to its neutral position.
- G. Put the Airplane Back to Its Usual Condition

S 094-002

**WARNING:** STAY AWAY FROM THE NOSE WHEELS WHEN THE LOCKPIN IS REMOVED.  
THE WHEELS CAN TURN TO THE CENTER POSITION QUICKLY, AND CAN  
CAUSE INJURY TO PERSONS AND DAMAGE TO EQUIPMENT.

- (1) Make sure the nose wheels are in their center positions and remove the towing lever lockpin from the nose gear.

S 864-050

- (2) Remove the power from the left, right, and center hydraulic systems (Ref 29-11-00).

S 864-051

- (3) Remove electrical power if it is not necessary (Ref 24-22-00).

S 414-052

- (4) Close access door 113AL (Ref 06-41-00).

S 414-053

- (5) Close access panels 312AR and 324BL (Ref 06-42-00).

RUDDER FEEL, CENTERING, AND TRIM MECHANISM – MAINTENANCE PRACTICES

1. General

- A. This procedure contains four tasks. The first task removes the rudder feel, centering and trim mechanism and its components. The second task installs the rudder feel, centering and trim mechanism and its components. The third task adjusts the feel and centering springs. The fourth task does the test for the feel, centering and trim mechanism.

TASK 27-21-10-022-001

2. Rudder Feel, Centering, and Trim Mechanism and its Components – Removal

A. General

- (1) This task contains these two procedures:

- Rudder Feel, Centering, and Trim Mechanism – Removal
- Spring Arm and Cam Roller Arm Assembly – Removal.

Because this task contains two procedures, do only the applicable groups of steps.

To start one of these procedures, do the "Prepare for the Removal" group of steps. Then, do the group of steps that is necessary to remove the component.

B. Equipment

- (1) Rig Pins from Set A20004-XX (AMM 20-10-24):  
(a) R3 – P/N A20004-14  
(b) R4 – P/N A20004-20  
(c) R5 – P/N A20004-13  
(2) Lockpin, Nose Gear Towing Lever – A09003-1

C. References

- (1) AMM 06-41-00/201, Fuselage Access Doors and Panels  
(2) AMM 06-42-00/201, Empennage Access Doors and Panels  
(3) AMM 20-10-24/201, Rig Pins

Feb 10/91

S 492-008

- (7) Install these rig pins:
- (a) R3 in the captain's forward quadrant (Fig. 202)
  - (b) R4 in the feel, centering, and trim mechanism (Fig. 201)
  - (c) R5 in the linkage for the middle power control actuator (Fig. 204).

S 012-009

- (8) Open access door 312AR to get access to cables RA and RB (AMM 06-42-00).

S 032-010

**CAUTION:** KEEP SOME TENSION IN THE CONTROL CABLES AT ALL TIMES. IF THE TENSION IS REMOVED, THE CABLES CAN BECOME INCORRECTLY ALIGNED AND WILL OPERATE INCORRECTLY. YOU MUST DO A FULL INSPECTION OF THE CONTROL CABLE SYSTEM IF YOU REMOVE THE TENSION.

- (9) Do these steps to disconnect cables RA and RB from the aft quadrant:
- (a) Use a cable clamp to hold the cables in position.
  - (b) Use a tag to identify the cables.
  - (c) Release the tension equally from cables RA and RB at their turnbuckles.
  - (d) Disconnect cables RA and RB from the aft quadrant.

F. Rudder Feel, Centering, and Trim Mechanism - Removal (Fig. 201)

S 032-011

- (1) Do these steps to disconnect the control rods for the autopilot rollout guidance (ARG) servos:
- (a) Remove the bolt that connects the middle control rod, for the ARG servos, to the torque tube for the aft quadrant.
  - (b) Remove the bolts that connect the left and right control rods to the ARG servos.
  - (c) Remove the control rod bodies, for the left and right control rods, from their rod ends at the torque tube.

S 032-013

- (2) Remove the rudder trim actuator (AMM 27-21-11).

S 032-014

- (3) Do these steps to disconnect the feel, centering, and trim mechanism from its left support bracket (Detail F):
- (a) Remove the outer nut, washer, and the inner nut from the bolt assembly.

EFFECTIVITY

ALL

27-21-10

(b) Remove the bolt assembly and its bushings.

S 032-015

(4) Remove the bolts, bushings, washers, and nuts from the right support brackets (Detail G).

S 032-012

(5) Disconnect the control rods to the rudder ratio changer mechanism (2 locations).

S 022-016

(6) Remove the feel, centering, and trim mechanism from the airplane.

S 032-017

(7) Remove the bolt assembly that connects the spring arm assembly to the cam plate on the torque tube.

S 032-018

(8) Remove the rod ends for the left and right control rods, for the ARG servos, from the torque tube.

G. Spring Arm and Cam Roller Arm Assembly - Removal (Fig. 201)

S 032-019

(1) Loosen the eyebolts until there is no tension in the springs.

S 032-020

(2) Remove these components:

(a) The two feel and centering springs

(b) The bolt assembly that connects the spring arm assembly to the trim actuator

(c) The bolt assembly that connects the spring arm assembly to the cam plate on the torque tube.

S 022-021

(3) Remove the spring arm and the cam roller arm assembly from the airplane.

S 032-022

(4) If it is necessary, remove the bolt assembly that connects the spring arm assembly to the cam roller arm.

TASK 27-21-10-422-023

3. Rudder Feel, Centering, and Trim Mechanism and its Components - Installation

A. General

(1) This task contains these procedures:

- Feel, Centering, and Trim Mechanism - Installation
- Spring Arm and Cam Roller Arm Assembly - Installation

Because this task contains two procedures, do only the applicable groups of steps.

To start one of these procedures, do the group of steps necessary to install the component. Then, do the task for the "Feel and Centering Springs - Adjustment" and then the task for the "Feel, Centering, and Trim Mechanism - Test" groups of steps. And last, do the "Put the Airplane Back to Its Usual Condition" group of steps.

B. Equipment

(1) Cable Tensiometer - Commercially Available

C. Consumable Materials

- (1) D00633 Grease, Corrosion Preventive - BMS 3-33 (Preferred)
- (2) D00015 Grease, Corrosion Preventive - BMS 3-24 (Alternate)

D. References

F. Rudder Feel, Centering, and Trim Mechanism - Installation

S 622-024

- (1) Apply the corrosion preventive compound to the bolts, bushings, nuts and washers before you install them.

S 432-025

- (2) Connect the rod ends for the left and right control rods, for the autopilot rollout guidance (ARG) servos, to the torque tube.

S 862-026

- (3) Put the feel, centering, and trim mechanism in its correct position in the airplane.

S 432-031

- (4) Connect the control rods from the ratio changer mechanism (View E).

S 432-027

- (5) Do these steps to install the bolt assembly that connects the mechanism to its left support bracket (View F):
  - (a) Install the bushings and the bolt assembly.
  - (b) Install the inner nut and tighten it to 60-80 pound-inches (6.8-9.0 newton-meters).
  - (c) Install the outer nut and tighten it to 30-40 pound-inches (3.4-4.5 newton-meters).

NOTE: Do not turn the inner nut during this step.

S 432-028

- (6) Do these steps to connect the mechanism to its right support brackets (View G):
  - (a) Install the bushings and the bolts.
  - (b) Install the nuts and tighten them.

S 822-099

- (7) Do the Feel and Centering Springs - Adjustment.

S 432-029

- (8) Install the rudder trim actuator (Ref 27-21-11).

S 862-030

- (9) Operate the rudder trim switch on the aft electronic control panel, P8, until you can easily install rig pin R4.

S 432-032

- (10) Do these steps to connect the control rods for the ARG servos:
  - (a) Connect the middle control rod to the quadrant torque tube.
  - (b) Connect the left and right control rod bodies to the rod ends on the quadrant torque tube.

EFFECTIVITY

ALL

27-21-10

01

Page 211  
Dec 22/01

- (c) Adjust the length of the left and right control rods until you can easily install the bolts at the ARG servos.
- (d) Install the bolts that connect the control rods to the ARG servos.
- (e) Make sure you see control rod threads in at least one-half of the inspection holes for the control rods.

S 432-033

- (11) Connect cables RA and RB to the aft quadrant.

**NOTE:** If you installed new cables, go to 27-21-00/501 for the cable adjustment procedure.

S 822-034

- (12) Adjust the tension in cables RA and RB to the value shown (Fig. 202) and do these steps:
  - (a) Make sure you can easily install and remove rig pins R3 and R4.
  - (b) Remove rig pins R3, R4, and R5.

S 212-035

- (13) Operate the rudder pedals through one full travel cycle and do these steps:
  - (a) Make sure the tension in the cables is correct.
  - (b) Install cliplocks on the turnbuckles.

S 722-100

- (14) Do the Rudder Feel, Centering, and Trim Mechanism - Test.
- G. Spring Arm and Cam Roller Arm Assembly - Installation (Fig. 201)

S 432-036

- (1) Do these steps to connect the cam roller arm to the spring arm assembly (View I):
  - (a) Install the spacer and the bearings in the cam roller arm.
  - (b) Align the bolt holes in the arms.
  - (c) Install the bushing, bolt assembly, and the washer.
  - (d) Install the inner nut and tighten it to 60-80 pound-inches (6.8-9.0 newton-meters).
  - (e) Install the washer and the outer nut.
  - (f) Tighten the outer nut to 30-40 pound-inches (3.4-4.5 newton-meters).

**NOTE:** Do not turn the inner nut during this step.

S 432-037

- (2) Do these steps to connect the spring arm assembly to the cam plate on the torque tube (View H):
  - (a) Align the bolt holes in the spring arm assembly with the cam plate.
  - (b) Install the retainer, bolt assembly, and the retainer.

EFFECTIVITY

ALL

01

Page 212  
Dec 22/01

- (c) Install the inner nut and tighten it to 60–80 pound-inches (6.8–9.0 newton-meters).
- (d) Install the washer and the outer nut.
- (e) Tighten the outer nut to 30–40 pound-inches (3.4–4.5 Nm).

NOTE: Do not turn the inner nut during this step.

S 432-038

- (3) Do these steps to connect the trim actuator to the spring arm assembly:
  - (a) Install the bushing and the bolt assembly.
  - (b) Install the inner nut and tighten it to 60–80 pound-inches (6.8–9.0 newton-meters).
  - (c) Install the washer and the outer nut.
  - (d) Tighten the outer nut to 30–40 pound-inches (3.4–4.5 newton-meters).

NOTE: Do not turn the inner nut during this step.

S 432-039

- (4) Install the short spring between the cam roller arm and the spring arm assembly.

NOTE: You will adjust the springs in the "Feel and Centering Springs – Adjustment" group of steps below.

S 432-040

- (5) Install the long spring between the cam roller arm and the spring arm assembly.

S 862-041

- (6) Operate the rudder trim switch on the aft electronic control panel, P8, until you can easily install rig pin R4.

S 432-042

- (7) Connect the control rods from the ratio changer mechanism (View E).

S 722-102

- (8) Do the Feel and Centering Springs – Adjustment.

S 432-043

- (9) Do these steps to connect the control rods for the ARG servos:
  - (a) Connect the middle control rod to the quadrant torque tube.
  - (b) Connect the left and right control rod bodies to the rod ends on the quadrant torque tube.
  - (c) Adjust the length of the left and right control rods until you can easily install the bolts at the ARG servos.

**NOTE:** If you installed new cables, go to 27-21-00/501 for the cable adjustment procedure.

S 822-045

- (11) Adjust the tension in cables RA and RB to the value shown (Fig. 202) and do these steps:
  - (a) Make sure you can easily install and remove rig pins R3 and R4.
  - (b) Remove rig pins R3, R4, and R5.

S 212-046

- (12) Operate the rudder pedals through one full travel cycle and do these steps:
  - (a) Make sure the tension in the cables is correct.
  - (b) Install cliplocks on the turnbuckles.

S 722-103

- (13) Do the Rudder Feel, Centering, and Trim Mechanism - Test.
- H. Put the Airplane Back to Its Usual Condition

S 092-091

**WARNING:** STAY AWAY FROM THE NOSE WHEELS WHEN YOU REMOVE THE LOCKPIN. THE WHEELS CAN TURN TO THE CENTER POSITION QUICKLY, AND CAN CAUSE INJURY TO PERSONS AND DAMAGE TO EQUIPMENT.

- (1) Make sure the nose wheels are in their center positions and remove the towing lever lockpin from the nose gear.

S 862-093

- (2) Remove the power from the left, right, and center hydraulic systems (AMM 29-11-00).

S 862-094

- (3) Remove electrical power if it is not necessary (AMM 24-22-00).

S 412-095

- (4) Close access panels 312AR, 324BL, and 324JL (AMM 06-42-00).

S 412-096

- (5) Close access door 113AL (AMM 06-41-00).

TASK 27-21-10-822-097

4. Feel and Centering Springs - Adjustment

A. Equipment

- (1) Feel and Centering, Force Measurement Equipment:  
 A27057-13 (Reccommended)  
 A27057-9 (alternative)  
 A27057-1 (alternative)

NOTE: The attach bracket is in the tool kit. The force dial is in the A27057-1 and A27057-9 tool kits.

- (2) Protractor - 1 each A27021-30 (from the A27021-29 Kit) or 4MIT65B80307-1  
 (3) Force dial - Commercially Available (needed for use with A27057-13).

B. Access

- (1) Location Zones  
     211/212      Control Cabin  
     324          Vertical Stabilizer - Rear Spar to Trailing Edge
- (2) Access Panels  
     113AL      Flight Control Components  
     312AR      Control Cables RA and RB  
     324BL      Feel, Centering, and Trim Mechanism  
     324JL      Trailing Edge of Vertical Stabilizer  
     324CR      Feel, Centering, and Trim Mechanism

C. Do the adjustment for the feel and centering springs.

S 492-047

- (1) Connect the force measurement equipment to the quadrant as shown (Fig. 205).

S 212-048

- (2) Make sure the long feel and centering spring is loose and does not apply a force during the short spring adjustment.

S 822-063

- (3) Do these steps to adjust the short feel spring:  
 (a) Pull on the force measurement equipment until the quadrant starts to move clockwise and do these steps:  
     1) Make sure the breakout force is 4.4 to 4.6 pounds (19.6 to 20.5 newtons).  
     2) Loosen the eyebolt jamnut if it is necessary.  
     3) Adjust the fine adjustment nut for the short spring until the breakout force is correct.

NOTE: One turn of the adjustment nut is approximately equal to one pound of force.

EFFECTIVITY

ALL

27-21-10

02

Page 215  
 Apr 22/03

S 822-078

- (4) Do these steps to adjust the long feel spring:
- (a) Pull on the force measurement equipment until the quadrant starts to move clockwise and do these steps:
    - 1) Make sure the breakout force is 9.1 to 9.5 pounds (40.5 to 42.26 newtons).

NOTE: The two springs will operate.

- 2) Loosen the eyebolt jamnut if it is necessary.
- 3) Adjust the fine adjustment nut for the long spring until the breakout force is correct.

NOTE: One turn of the adjustment nut is approximately equal to 0.6 pounds of force (2.67 newtons).

- (b) Pull on the force measurement equipment until the quadrant moves  $30 \pm 0.5$  degrees clockwise and do this step:
  - 1) Make sure the necessary force is 51.5 to 53.5 pounds (229.0-238.0 newtons).
- (c) Pull on the force measurement equipment until the quadrant starts to move counterclockwise and do this step:
  - 1) Make sure the breakout force is 9.0 to 9.5 pounds (40.0-42.25 newtons).
- (d) Pull on the force measurement equipment until the quadrant moves  $30 \pm 0.5$  degrees counterclockwise and do this step:
  - 1) Make sure the necessary force is 51.5 to 53.5 pounds (229.0-238.0).
- (e) Tighten the jamnuts for the two eyebolts.

S 092-079

- (5) Remove the force measurement equipment from the quadrant.

TASK 27-21-10-712-098

5. Rudder Feel, Centering, and Trim Mechanism - Test

- (5) Remove the DO-NOT-OPERATE tags and move the FLT CONT SHUTOFF TAIL L, R, and C switches on the right side panel, P61, to ON.

S 212-084

- (6) Make sure these circuit breakers, on the P11 panel, are closed:
  - (a) EICAS (6 locations)
  - (b) 11L9, LEFT ENGINE OIL PRESS EICAS REF
  - (c) 11L36, RIGHT ENGINE OIL PRESS EICAS REF

S 862-085

- (7) Push the STATUS switch on the display select panel, P9, to show the rudder position indicator on the bottom EICAS display.

S 212-086

- (8) Move the rudder pedals through their full travel range and do these checks:
  - (a) Make sure the rudder moves smoothly through its full travel range.
  - (b) Make sure the rudder moves in the correct direction.
  - (c) Make sure the rudder trailing edge moves at least 41.10 inches (1.04 meters) (26 degrees) from the neutral position in each direction.
  - (d) Make sure the rudder position indicator operates correctly and moves to its full travel mark in each direction.

S 212-087

- (9) Release the rudder pedals and do this check:
  - (a) Make sure the rudder goes back to its neutral position.

S 212-088

- (10) Turn the rudder trim switch on the aft electronic control panel, P8, fully clockwise and hold it there until the rudder movement stops. Do these checks:
  - (a) Make sure the trim indicator shows a minimum of 14 units of right trim.

EFFECTIVITY

ALL

27-21-10

05

RUDDER TRIM ACTUATOR – MAINTENANCE PRACTICES

1. General

- A. This procedure contains the removal and installation tasks for the rudder trim actuator.

TASK 27-21-11-022-002

2. Rudder Trim Actuator – Removal (Fig. 201)

A. Equipment

- (1) Rig Pins from Set A20004-XX (AMM 20-10-24/201):  
(a) R4 – P/N A20004-20

B. References

- (1) AMM 06-42-00/201, Empennage Access Doors and Panels  
(2) AMM 20-10-24/201, Rig Pins  
(3) AMM 24-22-00/201, Electrical Power – Control

C. Access

- (1) Location Zones  
211/212 Control Cabin  
324 Vertical Stabilizer – Rear Spar to Trailing Edge
- (2) Access Panels  
324BL Feel, Centering, and Trim Mechanism  
324EL Rudder Mechanical Control Path

D. Prepare for the Removal

S 862-003

- (1) Supply electrical power (AMM 24-22-00/201).

S 862-004

- (2) Move the FLT CONTROL SHUTOFF TAIL L, R, and C switches on the right side panel, P61, to OFF. Attach DO-NOT-OPERATE tags and make sure the switch position lights come on.

S 862-005

- (3) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:  
(a) 11G10, RUDDER RATIO  
(b) 11H17, FLT CONT TAIL SHUTOFF LEFT  
(c) 11H18, FLT CONT TAIL SHUTOFF CTR  
(d) 11H27, FLT CONT TAIL SHUTOFF RIGHT

S 012-006

- (4) Open access panels 324BL and 324EL (AMM 06-42-00/201).

S 492-007

- (5) Install rig pin R4 in the feel, centering, and trim mechanism.

**NOTE:** Operate the rudder trim switch on the aft electronic control panel, P8, if it is necessary.

E. Rudder Trim Actuator - Installation

S 622-013

- (1) Apply the corrosion preventive compound to the bolts, washers, and nuts before the installation.

S 422-014

- (2) Do these steps to install the trim actuator:
  - (a) Align the actuator with the support bracket and the spring arm.
  - (b) Install the two bolt assemblies.
  - (c) Install the inner nut and tighten it to 60-80 pound-inches (6.78-9.03 newton-meters).
  - (d) Install the outer nut and tighten it to 30-40 pound-inches (3.39-4.51 newton-meters).

NOTE: Do not turn the inner nut during this step.

S 432-015

- (3) If it is necessary, do these steps to install the bonding straps:
  - (a) Clean the bonding surfaces with solvent.
  - (b) Apply the Alodine to the surfaces you cleaned.
  - (c) Connect the bonding straps to the actuator.
  - (d) Use the bonding meter to make sure the maximum resistance between the bonding surfaces is 3.8 milliohms.
  - (e) Apply the sealant to the area around the fastener.

S 432-016

- (4) Connect the electrical connector to the actuator.

S 092-017

- (5) Remove rig pin R4.

S 862-019

- (6) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the overhead panel, P11:
  - (a) 11C5, RUDDER TRIM

F. Rudder Trim Actuator - Test

S 212-020

- (1) Make sure the rudder pedals are in their neutral positions.

S 212-021

- (2) Make sure the rudder is in its neutral position.

RUDDER RATIO CHANGER MECHANISM – MAINTENANCE PRACTICES

1. General

A. This procedure contains the removal and installation procedures for the rudder ratio changer mechanism and its components.

TASK 27-21-13-022-001

2. Rudder Ratio Changer Mechanism and Its Components – Removal

A. General

(1) This task contains these three procedures:

- Rudder Ratio Changer Mechanism – Removal
- Rudder Ratio Changer LVDT – Removal
- Load Limiter – Removal.

Because this procedure contains more than one procedure, do only the applicable groups of steps.

To start one of these procedures, do the "Prepare for the Removal" group of steps. Then, do the group of steps that is necessary to remove the component.

B. Equipment

- (1) Rig Pins from Set A20004-XX (AMM 20-10-24/201):
- (a) R4 – P/N A20004-20
  - (b) R5 – P/N A20004-13

C. References

- (1) AMM 06-42-00/201, Empennage Access Doors and Panels
- (2) AMM 20-10-24/201, Rig Pins
- (3) AMM 24-22-00/201, Electrical Power – Control
- (4) AMM 27-21-15/201, Rudder Ratio Changer Actuator
- (5) AMM 27-61-00/201, Spoiler/Speedbrake Control System

D. Access

- (1) Location Zones
- 211/212 Control Cabin
  - 324 Vertical Stabilizer – Rear Spar to Trailing Edge
- (2) Access Panels
- 324BL Rudder Feel, Centering, and Trim Mechanism
  - 324DR Mechanical Control Path
  - 324EL Mechanical Control Path

E. Prepare for the Removal

S 862-002

- (1) Supply electrical power (AMM 24-22-00/201).

S 862-003

- (2) Move the FLT CONTROL SHUTOFF TAIL L, R, and C switches on the right side panel, P61, to OFF. Attach DO-NOT-OPERATE tags and make sure the switch position lights come on.

S 862-004

- (3) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
- (a) 11G10, RUDDER RATIO
  - (b) 11H17, FLT CONT SHUTOFF TAIL LEFT
  - (c) 11H18, FLT CONT SHUTOFF TAIL CTR
  - (d) 11H27, FLT CONT SHUTOFF TAIL RIGHT

S 042-005

**WARNING:** DO THE DEACTIVATION PROCEDURE FOR THE SPOILERS OR MOVE ALL PERSONS AND EQUIPMENT AWAY FROM THE SPOILERS. THE SPOILERS CAN RETRACT QUICKLY AND CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (4) Do the deactivation procedure for the spoilers (AMM 27-61-00/201) or move all persons and equipment away from the spoilers.

S 862-006

- (5) Open these circuit breakers on the P11, panel and attach DO-NOT-CLOSE tags:
- (a) 11C6, FLT CONT ELEC 1L AC
  - (b) 11C7, FLT CONT ELEC 1L DC
  - (c) 11C8, FLT CONT ELEC 2L AC
  - (d) 11C9, FLT CONT ELEC 2L DC
  - (e) 11G17, FLT CONT ELEC 1R AC
  - (f) 11G18, FLT CONT ELEC 1R DC
  - (g) 11G26, FLT CONT ELEC 2R AC
  - (h) 11G27, FLT CONT ELEC 2R DC

S 012-007

- (6) Open access panels 324BL, 324DR, and 324EL (AMM 06-42-00/201).

S 492-008

- (7) Install rig pin R4 in the feel, centering, and trim mechanism (Fig. 202).

F. Rudder Ratio Changer Mechanism - Removal (Fig. 201)

S 492-009

- (1) Install rig pin R5 in the middle PCA linkage.

EFFECTIVITY

ALL

27-21-13

01

Page 202  
Aug 22/01

- S 032-010  
(2) Remove the rudder ratio changer actuator (AMM 27-21-15/201).

- S 032-011  
(3) Disconnect these components:  
(a) The LVDT electrical connectors and use a tag for identification  
(b) The control rods (25) to the feel, centering, and trim mechanism  
(c) The control rods (26) to the yaw damper summing lever.

- S 032-012  
(4) Do these steps to disconnect the rudder ratio changer mechanism (3) from its supports:  
(a) Remove the outer and inner nuts (14, 13) from the left and right supports.  
(b) Remove the bolt assembly (10), bushing (15), and bearing (16) from the right support.  
(c) Remove the bolt assembly (10) and bushings (11, 12) from the left support.

- S 022-013  
(5) Remove the rudder ratio changer mechanism (3).  
G. Rudder Ratio Changer LVDT - Removal (Fig. 201)

- S 032-014  
(1) Disconnect the LVDT electrical connectors (22), and use a tag for identification.

S 022-015

**CAUTION:** HOLD THE LVDT DURING THE REMOVAL. DAMAGE TO THE LVDT CAN OCCUR IF IT HANGS FROM ONLY ONE OF THE TWO SUPPORTS.

- (2) Do these steps to remove the LVDT:  
(a) Disconnect the LVDT (21) from the left support.  
(b) Disconnect the LVDT from the right variable crank.  
(c) Remove the LVDT.

H. Load Limiter - Removal

- S 032-016  
(1) Disconnect the load limiter (34) from the ratio changer.

- S 032-017  
(2) Disconnect load limiter (34) from the yaw damper summing lever.

- S 022-018  
(3) Remove the load limiter (34).

TASK 27-21-13-422-019

3. Rudder Ratio Changer Mechanism and Its Components - Installation

A. General

(1) This task contains these procedures:

- Rudder Ratio Changer Mechanism - Installation
- Rudder Ratio Changer LVDT - Installation
- Load Limiter - Installation
- Rudder Ratio Changer - Test.

Because this procedure contains more than one procedure, do only the applicable groups of steps.

To start one of these procedures, do the group of steps that is necessary to install the component. Then, do the "Rudder Ratio Changer - Test" group of steps. And last, do the "Put the Airplane Back to Its Usual Condition" group of steps.

B. Equipment

- (1) Rig Pins from Set A20004-XX (AMM 20-10-24/201):
- (a) R6 - P/N A20004-14
  - (b) R7 - P/N A20004-14
- (2) Nose Gear Towing Lever Lockpin - A09003-1

Rig Pin Locations

27-21-13

 **BOEING**  
767  
MAINTENANCE MANUAL

- (d) Install the inner nut (13) at the left support and tighten it to 60-80 pound-inches (6.8-9.0 newton-meters).
- (e) Install the inner nut (13) at the right support and tighten it to 60-80 pound-inches (6.8-9.0 newton-meters).
- (f) Install the outer nuts (14) at the left and right supports and tighten them to 30-40 pound-inches (3.4-4.5 newton-meters).

NOTE: Do not turn the inner nut during this step.

S 432-022

- (3) Do these steps to connect the control rods (25) from the feel, centering, and trim mechanism to the ratio changer (View C):
  - (a) Install the bolt (6), bushing (7), and washer (8).
  - (b) Install the nut (9) and tighten it.

S 432-023

- (4) Do this step to connect the control rods (26) from the yaw damper summing lever to the ratio changer (View B):
  - (a) Install bolt (4), bushing (5) and tighten.

S 432-024

- (5) Connect the electrical connectors (22) to the LVDT.

S 432-025

- (6) Install the rudder ratio changer actuator (AMM 27-21-15/201).

S 092-026

- (7) Remove rig pin R5.

S 862-051

- (8) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel, P11:
  - (a) 11C6, FLT CONT ELEC 1L AC
  - (b) 11C7, FLT CONT ELEC 1L DC

EFFECTIVITY

- (g) 11G26, FLT CONT ELEC 2R AC
- (h) 11G27, FLT CONT ELEC 2R DC

S 822-027

- (9) Do the adjustment procedure for the rudder ratio changer mechanism (AMM 27-21-02/201).

S 092-028

- (10) Remove rig pin R4.

H. Rudder Ratio Changer Mechanism LVDT - Installation (Fig. 201)

S 642-029

- (1) Apply grease to the screws, washers, nuts, and bushing before you install them.

S 432-030

- (2) Install the screw (17), washers (18), and nut (19) that connect the LVDT (21) to the right output crank.

S 432-031

- (3) Install the screw (24), bushing (23), washer (18), and nut (19) that connect the LVDT to its left support.

S 432-032

- (4) Connect the electrical connectors (22) to the LVDT.

S 862-052

- (5) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11, panel:
  - (a) 11C6, FLT CONT ELEC 1L AC
  - (b) 11C7, FLT CONT ELEC 1L DC
  - (c) 11C8, FLT CONT ELEC 2L AC
  - (d) 11C9, FLT CONT ELEC 2L DC
  - (e) 11G17, FLT CONT ELEC 1R AC
  - (f) 11G18, FLT CONT ELEC 1R DC
  - (g) 11G26, FLT CONT ELEC 2R AC

(6) Do the Rudder Ratio Changer Actuator (RRCA) - Oscillation Check (AMM 27-21-00/501).

- S 822-033  
(7) Do the adjustment procedure for the rudder ratio changer mechanism (AMM 27-21-00/501).

- S 092-034  
(8) Remove rig pin R4.

I. Load Limiter - Installation

- S 642-035  
(1) Apply grease to the bushings, bolts, washers, and nuts before you install them.

- S 432-036  
(2) Do this step to connect the load limiter (34) to the yaw damper summing lever:  
(a) Install the bolt (31), washer (32), and nut (33) that connect the load limiter to the yaw damper summing lever and tighten.

- S 432-037  
(3) Do this step to connect the load limiter (34) to the rudder ratio changer mechanism:  
(a) Install the bolt (27), bushing (28), washer (29), and nut (30) that connect the load limiter to the ratio changer mechanism and tighten.

- S 862-000  
(4) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:  
(a) 11C6, FLT CONT ELEC 1L AC  
(b) 11C7, FLT CONT ELEC 1L DC  
(c) 11C8, FLT CONT ELEC 2L AC  
(d) 11C9, FLT CONT ELEC 2L DC  
(e) 11G17, FLT CONT ELEC 1R AC  
(f) 11G18, FLT CONT ELEC 1R DC  
(g) 11G26, FLT CONT ELEC 2R AC  
(h) 11G27, FLT CONT ELEC 2R DC

- S 822-038  
(5) Do the adjustment procedure for the rudder ratio changer mechanism (AMM 27-21-00/501).

- S 092-039  
(6) Remove rig pin R4.

J. Rudder Ratio Changer Mechanism - Test

S 492-041

- (1) Move the towing lever to the tow position and install the towing lever lockpin in the nose gear (Fig. 203).

S 862-053

- (2) Operate the rudder trim switch on the aft electronic control panel, P8, until the trim indicator shows 3 to 5 units of left trim.

S 492-052

- (3) Manually turn the feel, centering, and trim mechanism clockwise until you can install rig pin R4.

**NOTE:** The feel springs push against the rig pin and keep the quadrant in a stable position during the adjustment.

S 862-054

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (4) Supply pressure to the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 862-059

- (5) Remove DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel, P11:
  - (a) 11G10, RUDDER RATIO
  - (b) 11H17, FLT CONT SHUTOFF TAIL LEFT
  - (c) 11H18, FLT CONT SHUTOFF TAIL CTR
  - (d) 11H27, FLT CONT SHUTOFF TAIL RIGHT

S 862-055

- (6) Remove DO-NOT-OPERATE tags and move the FLT CONTROL SHUTOFF TAIL L, R, and C switches on the right side panel, P61, to ON.

EFFECTIVITY

ALL

27-21-13

02

Page 213  
Aug 22/01

S 212-056

- (7) Move the left rudder ratio changer module (RRCM) test switch, on the E1 equipment shelf, to TEST and do these checks:
- (a) Make sure the IN TEST light for each RRCM stays on for a maximum of 18 seconds.
  - (b) Make sure the RRCA fully extends.
  - (c) Make sure you can easily install and remove rig pins R6 and R7.
  - (d) If you cannot easily install and remove rig pins R6 and R7, do the adjustment procedure for the rudder ratio changer mechanism (AMM 27-21-00/501).
  - (e) After 30 seconds, make sure all the RRCM faultballs are black.
  - (f) Make sure the rudder does not move more than 0.03 inches (0.762 mm) when you move the RRCM test switch between NORMAL and TEST.
  - (g) Do this step if the rudder moves more than 0.03 inches (0.762 mm) :
    - 1) Do the adjustment procedure for the rudder ratio changer mechanism (AMM 27-21-00/501).
  - (h) Move the rudder ratio changer test switch back to NORMAL and do these checks:
    - 1) Make sure the IN TEST light for each RRCM stays on for a maximum of 18 seconds.
    - 2) Make sure the RRCA retracts fully.
    - 3) After 30 seconds, make sure all the RRCM faultballs are black.

S 092-060

- (8) Remove rig pin R4.

S 862-043

- (9) Push the STATUS switch on the display select panel, P9, to show the rudder position indicator on the bottom EICAS display.

S 212-044

- (10) Move the rudder pedals through their full travel range and do these checks:
- (a) Make sure the rudder moves smoothly in the correct direction.
  - (b) Make sure the rudder position indicator moves full scale in each direction on the display.

S 212-045

- (11) Release the rudder pedals and do this check:
- (a) Make sure the rudder moves back to its neutral position.

EFFECTIVITY

ALL

27-21-13

02

Page 214  
Dec 22/01

S 862-060

- (12) Hit the left and right rudder pedals lightly to put the feel cam roller in its neutral detent position.

S 212-061

- (13) Turn the rudder trim switch, on the P8 panel, clockwise and hold it there until the rudder movement stops and do these checks:
- (a) Make sure the rudder trim indicator shows at least 14.0 units of right trim.
  - (b) Make sure the rudder position indicator moves to the right approximately two-thirds of its full travel.

S 212-057

- (14) Turn the rudder trim switch, on the P8 panel, counterclockwise and hold it there until the rudder movement stops and do these checks:
- (a) Make sure the rudder trim indicator shows at least 14.0 units of left trim.
  - (b) Make sure the rudder position indicator moves to the left approximately two-thirds of its full travel.

S 212-058

- (15) Operate the rudder trim switch until the trim indicator shows zero units of trim and do these checks:
- (a) Make sure the rudder position indicator aligns with the neutral position mark (use a tolerance of one-half an arrow width).
  - (b) Make sure the rudder is in its neutral position.
- K. Put the Airplane Back to Its Usual Condition

S 092-046

**WARNING:** STAY AWAY FROM THE NOSE WHEELS WHEN YOU REMOVE THE LOCKPIN. THE WHEELS CAN TURN TO THE CENTER POSITION QUICKLY, AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (1) Make sure the nose wheels are in their center positions and remove the towing lever lockpin from the nose gear.

EFFECTIVITY

ALL

27-21-13

02

Page 215  
Dec 22/00

S 212-047

**CAUTION:** MAKE SURE THE RRCM TEST SWITCH IS IN ITS "NORMAL" POSITION. IF THE SWITCH IS IN ITS "TEST" POSITION, THE "RUDDER RATIO" LIGHT WILL COME ON AND WILL PREVENT AIRPLANE DISPATCH.

(2) Make sure the RRCM test switch is in its NORMAL position.

S 862-048

(3) Remove the power from the left, right, and center hydraulic systems (Ref 29-11-00/201).

S 862-049

(4) Remove electrical power if it is not necessary (AMM 24-22-00/201).

S 412-050

RUDDER RATIO CHANGER ACTUATOR – MAINTENANCE PRACTICES

1. General

- A. This procedure contains the removal and installation data for the rudder ratio changer actuator and its components.

TASK 27-21-15-022-001

2. Rudder Ratio Changer Actuator and its Components – Removal

A. General

- (1) This task contains these procedures:

- Rudder Ratio Changer Actuator (RRCA) – Removal
- RRCA Filter – Removal
- RRCA Screen – Removal
- RRCA Electro-Hydraulic Servo Valve (EHSV) – Removal
- RRCA Solenoid Valve – Removal
- RRCA Support Clevis – Removal

Because this procedure contains more than one task, do only the applicable groups of steps.

To start one of these procedures, do the "Prepare for the Removal" group of steps. Then, do the group of steps that is necessary to remove the component.

B. Equipment

- (1) Rig Pins from Set A20004-XX (Ref 20-10-24):

- (a) R4 – P/N A20004-20
- (b) R6 – P/N A20004-14

- (2) Rudder Ratio Changer Rigging Bar – A27109-1

C. References

- (1) 06-42-00/201, Empennage Access Doors and Panels
- (2) 20-10-24/201, Rig Pins
- (3) 24-22-00/201, Electrical Power – Control
- (4) 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems

D. Access

- (1) Location Zones

- 211/212 Control Cabin
- 324 Vertical Stabilizer – Rear Spar to Trailing Edge

- (2) Access Panels

- 324BL Feel, Centering, and Trim Mechanism
- 324EL Mechanical Control Path

EFFECTIVITY

ALL

Page 201  
May 10/96

E. Prepare for the Removal

S 862-002

- (1) Supply electrical power (Ref 24-22-00).

S 862-003

- (2) Move the FLT CONTROL SHUTOFF TAIL L, R, and C switches on the right side panel, P61, to OFF. Attach DO-NOT-OPERATE tags and make sure the switch position lights come on.

S 862-004

- (3) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
- (a) 11G10, RUDDER RATIO
  - (b) 11H17, FLT CONT SHUTOFF TAIL LEFT
  - (c) 11H18, FLT CONT SHUTOFF TAIL CTR
  - (d) 11H27, FLT CONT SHUTOFF TAIL RIGHT

S 012-005

- (4) Open access panels 324BL and 324EL (Ref 06-42-00).

S 862-006

- (5) Remove the pressure from the left hydraulic system (Ref 29-11-00).

S 492-007

- (6) Operate the rudder trim switch on the aft electronic control panel, P8, until you can easily install this rig pin:
- (a) R4 in the feel, centering, and trim mechanism (Fig. 202).

F. Rudder Ratio Changer Actuator (RRCA) - Removal (Fig. 201)

S 032-008

- (1) Disconnect these components:
- (a) The hydraulic hoses (16, 19, 20) to the RRCA (37).
    - 1) Install a cap on the hoses and the actuator ports.
  - (b) The RRCA electrical connectors (29, 36) and use a tag for identification.

S 032-009

- (2) If it is necessary, remove the bonding straps (45) from the RRCA (37).

S 032-010

- (3) Do these steps to remove the RRCA:
- (a) Disconnect the RRCA from the actuator mount.
  - (b) Disconnect the RRCA from the left output crank for the ratio changer mechanism.
  - (c) Remove the RRCA (37).

EFFECTIVITY

ALL

27-21-15

01

Page 202  
Feb 10/91

S 032-011

- (4) Remove the tube unions (15, 21) and the packing (14, 22) from the return line (16) and the line to the middle PCA (20).

NOTE: Do not remove the union from the pressure line.

G. RRCA Filter - Removal

S 032-012

- (1) Remove these components:
  - (a) The filter cap (34)
  - (b) The backup rings (33) and packing (35) from the filter cap (34).

S 022-013

- (2) Remove the filter (32).

S 032-014

- (3) Remove the backup rings (30), and packing (31) from the filter (32).

H. RRCA Screen - Removal

S 032-015

- (1) Disconnect the pressure tube (19) from the RRCA.

S 032-016

- (2) Remove these components:
  - (a) The lockwire from the union (18)
  - (b) The union (18)
  - (c) The packing (17) from the union (18).

S 022-017

- (3) Remove the screen (23).

I. RRCA Electro-Hydraulic Servo Valve (EHSV) - Removal

S 032-018

- (1) Remove the lockwire.

S 032-019

- (2) Remove the four screws (26) and washers (27).

S 022-020

- (3) Remove the EHSV (25) and the gasket plate (28).
  - (a) Remove the retainer and packing.

NOTE: AIPC 27-21-13-50, items 112 and 113

J. RRCA Solenoid Valve - Removal

S 032-021

- (1) Remove the lockwire.

- (3) Remove the support fitting, nut, washer, and shims.

**NOTE:** Do not lose or cause damage to the shims. The shim thickness sets the rig length of the RRCA.

- (a) If it is necessary, you can adjust the shim thickness (you can use the rudder ratio changer rigging bar, A27109-1) (Fig. 203).
- 1) Install the rigging bar, A27109-1, between the actuator mount and left output shaft.
  - 2) Add or remove shims until you can easily install and remove the rig pin R6. Keep a record of the shim thickness.
  - 3) Remove the rigging bar, A27109-1.

TASK 27-21-15-422-024

3. Rudder Ratio Changer Actuator and its Components - Installation

A. General

- (1) This task contains these procedures:

- Rudder Ratio Changer Actuator (RRCA) - Installation
- RRCA Filter - Installation
- RRCA Screen - Installation
- RRCA Electro-Hydraulic Servo Valve (EHSV) - Installation
- RRCA Solenoid Valve - Installation
- RRCA Support Clevis - Installation
- RRCA Hydraulic Hose Strap - Inspection
- RRCA - Test

Because this task contains more than one procedure, do only the applicable groups of steps.

To start one of the procedures, do the group of steps necessary to install the component. Then, do the "Hydraulic Hose Strap - Inspection" group of steps. Then, do the "RRCA - Test" group of steps. And last, do the "Put the Airplane Back to Its Usual Condition" group of steps.

G. Rudder Ratio Changer Actuator (RRCA) - Installation

- S 642-025
  - (1) Apply grease to the bolts before you install them.
- S 432-026
  - (2) Install the packing (14, 22) tube and the unions (15, 21) to the RRCA return line (16) and the line to the middle PCA (20).

EFFECTIVITY

ALL

27-21-15

S 422-027

- (3) Do these steps to install the RRCA:
- (a) Install the bolt (10), bushing (11), washer (12), and nut (13) that connect the RRCA (37) to the left output crank for the ratio changer mechanism.
  - (b) SAS 050, 051, 150-157, 162-167, 275-278, 280 WITHOUT SB27-127; Install the bolt (6), washer (7), and nut (8) that connect the RRCA (37) to the actuator mount.
  - (c) SAS 050, 051, 150-157, 162-167, 275-278, 280 WITH SB27-127 AND SAS 052-149, 158-161, 168-274, 279, 281-999; Install the bolt (6), washer (7), bushing (50), and nut (8) that connect the RRCA (37) to the actuator mount.

S 432-028

- (4) If it is necessary, do these steps to connect the bonding straps (45) to the RRCA:
- (a) Put the bolt (4) through the washer (5), strap (8), and the actuator connection point.
  - (b) Install the washer (6) and the nut (7).
  - (c) Make sure the resistance between the RRCA solenoid valve and the vertical fin rear spar is less than 6 milliohms.

S 432-029

- (5) Connect the RRCA electrical connectors (29, 36).

S 432-030

- (6) Connect the hydraulic hoses (16, 19, 20) to the RRCA (37).

S 822-071

- (7) Do the Rudder Ratio Changer Actuator (RRCA) - Oscillation Check (AMM 27-21-00/501).

S 822-031

- (8) Do the RRCA - Test for the rudder ratio changer mechanism.

H. RRCA Filter - Installation

S 642-032

- (1) Lubricate the cap (34) seal, packing (31, 35), and backup rings (30, 33) with hydraulic fluid before you install them.

S 432-033

- (2) Install the packing (31) and the backup rings (30) on the filter (32).

S 432-034

- (3) Put the filter (32) in its correct location in the RRCA.

EFFECTIVITY

ALL

27-21-15

- S 432-035
- (4) Do these steps to install the filter cap (34):
    - (a) Install the packing (35) and the backup rings (33) on the cap (34).
    - (b) Apply the sealant to the cap (34) threads.
    - (c) Install the cap (34) and tighten it.
    - (d) Install the lockwire.
- I. RRCA Screen - Installation
- S 642-036
- (1) Lubricate the packing (17) with some hydraulic fluid.
- S 432-037
- (2) Put the screen (23) in its correct location in the RRCA (37).
- S 432-038
- (3) Install the packing (17) on the union (18).
- S 432-039
- (4) Install the union (18) and tighten it to 480-500 pound-inches (54.3-56.5 newton-meters).
- S 432-040
- (5) Install the lockwire.
- S 432-041
- (6) Connect the pressure port tubing (19) to the RRCA (37).
- J. RRCA Electro-Hydraulic Servo Valve (EHSV) - Installation
- S 432-042
- (1) Align the gasket plate (28) and the EHSV (25) with the four screw holes in the RRCA.
    - (a) Install the retainer and packing.
- NOTE: AIPC 27-21-13-50, items 112 and 113
- S 642-043
- (2) Apply some of the lubricant to the screws (26).
- S 432-044
- (3) Install the washers (27) and screws (26) and tighten them to 27-32 pound-inches.
- S 432-045
- (4) Install the lockwire.
- S 822-072
- (5) Do the Rudder Ratio Changer Actuator (RRCA) - Oscillation Check (AMM 27-21-00/501).

EFFECTIVITY

ALL

27-21-15

06

Page 213  
Apr 22/07

S 822-073

- (6) Do the RRCA – Test for the rudder ratio changer mechanism (AMM 27-21-15-2/501).

K. RRCA Solenoid Valve – Installation

S 432-046

- (1) Align the gasket plate (38) and the solenoid valve (24) with the four screw holes in the RRCA.
  - (a) Install the retainer and packing.

NOTE: AIPC 27-21-13-50, items 112 and 113

S 642-047

- (2) Apply some of the lubricant to the screws (39).

S 432-048

- (3) Install the washers (40) and screws (39) and tighten them to 27-32 pound-inches.

S 432-049

- (4) Install the lockwire.

L. RRCA Support Clevis – Installation

S 422-068

- (1) Install the support fitting, shims, nut, and washer.

S 422-069

- (2) Connect the RRCA:
  - (a) Connect the RRCA to the support Clevis.
  - (b) Connect the RRCA to the left output crank.
    - 1) Make sure that the rig pin R6 can easily be installed and removed.

M. RRCA Hydraulic Hose Strap – Inspection (Fig. 204)

S 012-086

- (1) Open the access panel 311AZ (AMM 06-42-00/201).

S 212-082

- (2) Examine the RRCA hydraulic hose straps for damage.

S 962-084

- (3) Replace the straps if necessary.

EFFECTIVITY

ALL

27-21-15

03

Page 214  
Apr 22/07

- S 222-083
- (4) Examine the RRCA hydraulic hose straps for the correct location.
- S 822-085
- (5) Adjust the straps if necessary.
- S 412-087
- (6) Close the access panel 311AZ (AMM 06-42-00/201).
- N. RRCA - Test
- S 092-050
- (1) Remove rig pin R4.
- S 862-051
- (2) Operate the rudder trim switch on the aft electronic control panel, P8, until the trim indicator shows 3 to 5 units of left trim.
- S 492-052
- (3) Manually turn the feel, centering, and trim mechanism clockwise until you can install rig pin R4.
- NOTE:** The feel springs push against the rig pin and keep the quadrant in a stable position during the adjustment.
- S 862-053
- WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.
- (4) Supply pressure to the left, right, and center hydraulic systems (Ref 29-11-00).
- S 862-054
- (5) Remove DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel, P11:
- (a) 11G10, RUDDER RATIO
  - (b) 11H17, FLT CONT SHUTOFF TAIL LEFT
  - (c) 11H18, FLT CONT SHUTOFF TAIL CTR
  - (d) 11H27, FLT CONT SHUTOFF TAIL RIGHT
- S 862-075
- (6) Remove DO-NOT-OPERATE tags and move the FLT CONTROL SHUTOFF TAIL L, R, and C switches on the right side panel, P61, to ON.

EFFECTIVITY

ALL

27-21-15

03

Page 215  
Apr 22/06

S 212-056

- (7) Move the left rudder ratio changer module (RRCM) test switch on the E1 equipment shelf, to TEST and do these checks:

**NOTE:** You can use the left or right RRCM to do this test.

- (a) Make sure the IN TEST light for each RRCM stays on for a maximum of 18 seconds.
- (b) Make sure the RRCA fully extends.
- (c) Make sure you can easily install and remove rig pins R6 and R7.
- (d) If you cannot easily install and remove rig pins R6 and R7, do the adjustment procedure for the rudder ratio changer mechanism (Ref 27-21-00).
- (e) After 30 seconds, make sure all the RRCM faultballs are black.
- (f) Observe the RRCA and rudder ratio changer output arms for oscillations. If oscillation are noted, troubleshoot and correct the oscillation before you complete this procedure.
- (g) Make sure the rudder does not move more than 0.03 inches (0.762 mm) when you move the RRCM test switch between NORMAL and TEST
- (h) Do this step if the rudder moves more than 0.03 inches (0.762 mm) :
  - 1) Do the adjustment procedure for the rudder ratio changer mechanism (AMM 27-21-00/501).
- (i) Move the rudder ratio changer test switch back to NORMAL and do these checks:
  - 1) Make sure the IN TEST light for each RRCM stays on for a maximum of 18 seconds.
  - 2) Make sure the RRCA retracts fully.
  - 3) After 30 seconds, make sure all the RRCM faultballs are black.

S 092-060

- (8) Remove rig pin R4.

S 862-061

- (9) Operate the rudder trim switch, on the P8 panel, until the rudder trim indicator shows zero units of trim and do these checks:
- (a) Make sure the rudder position indicator aligns with the neutral mark (use a tolerance of one-half an arrow width).
  - (b) Make sure the rudder is in its neutral position.

0. Put the Airplane Back to Its Usual Condition

S 212-062

**CAUTION:** MAKE SURE THE RRCM TEST SWITCH IS IN ITS "NORMAL" POSITION. IF THE SWITCH IS IN ITS "TEST" POSITION, THE "RUDDER RATIO" LIGHT WILL COME ON AND WILL PREVENT AIRPLANE DISPATCH.

- (1) Make sure the RRCM test switch is in its NORMAL position.

YAW DAMPER SUMMING LEVER ASSEMBLY – REMOVAL/INSTALLATION

1. General

- A. This procedure contains the removal and installation tasks for the yaw damper summing lever.

TASK 27-21-18-024-003

2. Yaw Damper Summing Lever – Removal

A. Equipment

- (1) Rig Pins from Set A20004-XX (Ref 20-10-24):  
    (a) R4 – P/N A20004-20  
    (b) R5 – P/N A20004-13  
(2) Nose Gear Towing Lever Lockpin – A09003-1

B. References

- (1) 06-42-00/201, Empennage Access Doors and Panels  
(2) 20-10-24/201, Rig Pins  
(3) 24-22-00/201, Electrical Power – Control

C. Access

- (1) Location Zone  
    324 Vertical Stabilizer, Rear Spar to Trailing Edge  
  
(2) Access Panels  
    324BL TE of Vertical Stabilizer  
    324EL Rudder Mechanical Linkages  
    324JL TE of Vertical Stabilizer

D. Prepare for the Removal

S 864-004

- (1) Supply electrical power (Ref 24-22-00).

S 864-005

- (2) Move the FLT CONTROL SHUTOFF TAIL L, C, and R switches on the right side panel, P61, to OFF. Attach DO-NOT-OPERATE tags and make sure the switch position lights are ON.

S 864-006

- (3) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:  
    (a) 11A18, YAW DAMPER L  
    (b) 11F34, YAW DAMPER R  
    (c) 11G10, RUDDER RATIO  
    (d) 11H17, FLT CONT SHUTOFF TAIL LEFT  
    (e) 11H18, FLT CONT SHUTOFF TAIL CTR  
    (f) 11H27, FLT CONT SHUTOFF TAIL RIGHT

S 494-007

- (4) Move the towing lever on the metering valve module to the tow position and install the towing lever lockpin in the nose gear.

RUDDER TEMPERATURE COMPENSATING LINKAGE – REMOVAL/INSTALLATION

1. General

- A. This procedure contains the removal and installation tasks for the support shaft assembly and the grounding rods. These items are part of the rudder temperature compensating linkage.

TASK 27-21-19-024-004

2. Rudder Temperature Compensating Linkage – Removal

A. General

- (1) This task contains two procedures, one to remove the support shaft assembly, and one to remove the grounding rods. Because this procedure contains two procedures, do only the applicable groups of steps.

To start one of these procedures, do the "Prepare for the Removal" group of steps. Then, do the group of steps that is necessary to remove the component.

B. Equipment

- (1) Rig Pins from Set A20004-XX (Ref 20-10-24):  
(a) R4 – P/N A20004-20  
(b) R5 – P/N A20004-13  
(2) Nose Gear Towing Lever Lockpin – A09003-1

C. References

- (6) 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems

E. Access

(1) Location Zones

- 311/312 Area Aft of Pressure Bulkhead to BS 1725
- 324 Vertical Stabilizer, Rear Spar to Trailing Edge

(2) Access Panels

- 311AZ Dorsal Fin
- 312AR Stabilizer Jackscrew
- 324BL T.E. of the Vertical Stabilizer
- 324EL Rudder Mechanical Linkages
- 324JL T.E. of the Vertical Stabilizer

F. Install the Support Shaft Assembly (Fig. 401)

S 644-019

- (1) Apply grease to the bushings before you install them.

S 434-020

- (2) Install the bushings and bolts that connect the support shaft to its brackets (3 locations).

S 434-021

- (3) Put the seal and the retainer on the support shaft lever arm.

NOTE: Do not connect them to the fin structure.

S 434-022

- (4) Connect the grounding rod to the support shaft lever arm.

S 434-023

- (5) Install the "hi-lock" fastener that connects the support shaft assembly to its bracket.

NOTE: This connection will be loose.

EFFECTIVITY

ALL

Page 406  
Nov 10/94

- S 424-026
- (6) Install the Yaw Damper Summing Lever Assembly (Ref 27-21-18).
- S 214-025
- (7) Make sure a .2900 diameter rod (L size drill) can go through the rig pin hole in the bracket.
- S 824-027
- (8) Do these steps if the rod does not go through its hole:
- (a) Disconnect the grounding rod from the support shaft lever arm.
  - (b) Install rig pin R8 in the rig pin hole on the bracket.
- NOTE: Rig pin R8 is used but you could use a rod with an equivalent diameter to rig pin R8. This is not the rig pin R8 location.
- (c) Remove the "hi-lock" fasteners from the bottom end of the middle part of the grounding rod.
  - (d) Loosen the bolts that connect the guides to the fin structure.
  - (e) Connect the top part of the grounding rod to the support shaft lever arm.
  - (f) Tighten the bolts that connect the guides to the fin structure.
  - (g) Drill the "hi-lock" fastener holes until the next larger fastener will fit in the grounding rod.
  - (h) Install the larger "hi-lock" fasteners in the holes you drilled.
  - (i) Remove rig pin R8.
- S 434-028
- (9) Tighten the screws that connect the retainer and the seal to the fin rear spar.
- S 094-029
- (10) Remove the rod from the rig pin hole.
- S 094-030
- (11) Remove these rig pins:
- (a) R4 (for the rudder feel, centering, and trim mechanism)
  - (b) R5 (for the rudder middle power control actuator)

EFFECTIVITY

ALL

27-21-19

S 414-031

- (12) Close access panels 324BL, 324EL, 324JL, and access doors 311AZ and 312AR (Ref 06-42-00).

G. Install the Grounding Rod

S 494-032

- (1) Install rig pin R8 in the rig pin hole on the support shaft assembly.

NOTE: This is the rig pin R8 location.

S 434-033

- (2) Do these steps to connect the grounding rod:  
(a) Put the grounding rod parts in their correct positions.

NOTE: The top and bottom parts must go through their guides before they go into the middle part of the grounding rod.

- (b) Connect the top part of the grounding rod to the support shaft lever arm.  
(c) Connect the bottom part of the grounding rod to the support bracket.

S 824-034

- (3) Do these steps to adjust the length of the grounding rod:  
(a) Move the middle part of the grounding rod until this condition is satisfactory:  
1) Make sure the distance between the ends of the middle part and the drain holes of the top and bottom parts are equal (approximately).  
(b) Tighten the bolts that connect the guides to the structure.  
(c) Use the hole locations shown on the middle part of the grounding rod to drill the 0.247 - 0.250 diameter holes.  
(d) Install "hi-lock" fasteners in the grounding rod holes.  
(e) Loosen the screws that hold the retainer and the seal to the fin.  
(f) Make sure the seal is in a satisfactory position (against the groove of the support shaft lever arm) and tighten the screws.

AILERON AND RUDDER TRIM CONTROL MODULE -  
MAINTENANCE PRACTICES

1. General

- A. This procedure contains the removal and installation tasks for the trim control module for the ailerons and the rudder. This procedure also contains a procedure to clean the rudder trim knob and its lightplate.

TASK 27-21-23-022-001

2. Aileron and Rudder Trim Control Module - Removal

A. References

- (1) AMM 24-22-00/201, Electrical Power - Control

B. Access

- (1) Location Zones  
211/212 Control Cabin

C. Prepare for the Removal

S 862-002

- (1) Supply electrical power (AMM 24-22-00/201).

S 862-003

- (2) Move the FLT CONTROL SHUTOFF TAIL L, R, and C switches on the right side panel, P61, to OFF. Attach DO-NOT-OPERATE tags and make sure the switch position lights come on.

S 862-004

- (3) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
- (a) 11C5, RUDDER TRIM
  - (b) 11H17, FLT CONT SHUTOFF TAIL LEFT
  - (c) 11H18, FLT CONT SHUTOFF TAIL CTR
  - (d) 11H27, FLT CONT SHUTOFF TAIL RIGHT
  - (e) 11K15, AILERON TRIM
  - (f) 11K17, RUDDER TRIM POS

D. Aileron and Rudder Trim Module - Removal (Fig. 201)

S 032-005

- (1) Turn the four fasteners that connect the trim module to the aft electronic control panel, P8.

S 022-006

- (2) Lift the trim module from the P8 panel and do these steps:
- (a) Disconnect the two electrical connectors from the trim module.
  - (b) Remove the module from the P8 panel.

RUDDER AND ELEVATOR SHUTOFF VALVES – DESCRIPTION AND OPERATION

1. General

A. Three hydraulic shutoff valves isolate the rudder and elevators from hydraulic pressure. This allows for line maintenance on the rudder and elevators while the hydraulic systems are pressurized. Description and operation of the rudder and rudder trim control system is found in section 27-21-00. Description and operation of the elevator control system is found in section 27-31-00.

2. Component Details (Fig. 1)

A. Shutoff Valve

- (1) The three-port, two-position rotary selector valve is operated by a 28-volt dc motor. There are three ports in the valve body; a pressure port (pressure in), a cylinder port (pressure out), and a return port. The motor shaft rotates about 90 degrees to change the valve position.
- (2) The valves are located on the left and right fuselage sides in the stabilizer access area; enter through access door 312AR. V101 controls the left hydraulic system, V102 the right system and V103 the center system. Markings on the motor case, POS1 (open) and POS2 (closed) indicate what position the valve and manual override handle are in.

B. Shutoff Valve Control

- (1) The valves are controlled by the TAIL FLT CONTROL SHUTOFF switches L, C, and R on the right side panel P61. The switch face is flush with the panel when the valve is open and protrudes beyond the panel when the valve is closed. Spring-loaded plastic covers guard each switch; the cover will not close with the switch protruding.
- (2) TAIL FLIGHT CONTROL SHUTOFF circuit breakers L, C, and R on overhead circuit breaker panel P11 controls electrical power (28 volts dc) to the switches. Power for the L and C systems is supplied from L bus, the R system is supplied from R bus.
- (3) Voltmeter jacks located below the shutoff valves switches are used in hydraulic leak detection tests.

C. Shutoff Indication

- (1) An amber light in the FLT CONTROL SHUTOFF switches indicates the valve is closed.
- (2) An amber L, C, or R TAIL HYD VAL EICAS message (level C) indicates which valve is closed.

NOTE: If more than one valve is closed, the EICAS message changes to FLT CONT VALS.

3. Operation (Fig. 2)

- A. With electrical power provided, FLT CONTROL SHUTOFF switch ON, the amber switch light is not on, and the valve opens. When the switch is placed to OFF, the amber switch light comes on and the valve closes. An L, C, or R TAIL HYD VAL EICAS message appears. As the valve reaches the open or closed position, internal limit switches open the motor circuit and de-energize the valve motor. When the valve is in the closed position, the pressure port is blocked off and the cylinder port is connected to the return port. This allows the de-pressurization of the isolated systems.

RUDDER AND ELEVATOR HYDRAULIC SHUTOFF VALVES – MAINTENANCE PRACTICES

1. General

- A. This procedure contains the removal and installation tasks for the tail hydraulic shutoff valves for the rudder and the elevator.

TASK 27-23-01-022-001

2. Rudder and Elevator Shutoff Valves – Removal

A. References

- (1) 06-42-00/201, Empennage Access Doors and Panels
- (2) 24-22-00/201, Electrical Power – Control
- (3) 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems

B. Access

- (1) Location Zone  
312 Area Aft of Pressure Bulkhead to BS 1725
- (2) Access Panel  
312AR Hydraulic Shutoff Valve

C. Prepare for the Removal

S 862-002

- (1) Supply electrical power (Ref 24-22-00).

S 862-003

- (2) Open this circuit breaker on the overhead panel, P11, and attach a DO-NOT-CLOSE tag:
  - (a) 11G10, RUDDER RATIO

S 862-004

- (3) Move the FLT CONTROL SHUTOFF TAIL switches L, C, and R on the right side panel, P61, to OFF. Attach DO-NOT-OPERATE tags and make sure the switch position lights come on.

S 862-005

- (4) Open these circuit breakers on the P11 panel and attach DO-NOT-CLOSE tags:
  - (a) 11H17, FLT CONT SHUTOFF TAIL LEFT
  - (b) 11H18, FLT CONT SHUTOFF TAIL CTR
  - (c) 11H27, FLT CONT SHUTOFF TAIL RIGHT

S 862-006

**WARNING:** MAKE SURE THE HYDRAULIC PRESSURE IS REMOVED FROM THE SYSTEM THAT SUPPLIES THE VALVE YOU WILL REMOVE. INJURY TO PERSONS AND DAMAGE TO EQUIPMENT CAN OCCUR IF THE PRESSURE IS NOT REMOVED.

- (5) Remove the pressure from the left, right, or center hydraulic system (Ref 29-11-00).

D. Access

- (1) Location Zone  
312 Area Aft of Pressure Bulkhead to BS 1725
- (2) Access Panel  
312AR Hydraulic Shutoff Valve

E. Install the Hydraulic Shutoff Valve

S 102-012

- (1) Clean the bracket and the valve mating surfaces.

S 622-013

- (2) Apply Alodine to the valve and the bracket mating surfaces.

NOTE: The maximum bond resistance is 0.0025 ohms.

S 432-014

- (3) Do these steps to connect the shutoff valve to the airplane structure:
  - (a) Align the shutoff valve with the bolt connection points.
  - (b) Install the bolts (1) and the washers (2).

S 622-015

- (4) Apply primer to the surfaces you cleaned that are near the shutoff valve.

S 432-016

- (5) Connect these components:
  - (a) The hydraulic lines (4)
  - (b) The electrical connector (3).

S 732-017

- (6) Do the test procedure for the rudder and elevator shutoff valves (Ref 27-23-00).

S 212-018

- (7) Make sure that no hydraulic fluid leaks occurred during the test.

F. Put the Airplane Back to Its Usual Condition

S 862-019

- (1) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel, P11:
  - (a) 11H17, FLT CONT SHUTOFF TAIL LEFT
  - (b) 11H18, FLT CONT SHUTOFF TAIL CTR
  - (c) 11H27, FLT CONT SHUTOFF TAIL RIGHT

S 862-020

- (2) Remove the DO-NOT-OPERATE tags and move the FLT CONTROL SHUTOFF TAIL switches L, R, and C on the right side panel, P61, to ON.

RUDDER HYDRAULIC FUSE – MAINTENANCE PRACTICES

1. General

- A. This procedure contains two tasks. The first task is used to remove the rudder hydraulic fuse and the second task is used to install it.

TASK 27-23-51-022-004

2. Rudder Hydraulic Fuse – Removal

A. References

- (1) 06-42-00/201, Empennage Access Doors and Panels  
(2) 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems

B. Access

- (1) Location Zone  
312 Area Aft of Pressure Bulkhead to BS 1725
- (2) Access Panel  
312AR Stabilizer Jackscrew

C. Prepare for Removal

S 862-005

- (1) Remove the pressure from the left hydraulic system and its reservoir (Ref 29-11-00).

S 012-002

**WARNING:** STAY OFF THE SERVICE ACCESS DOOR, 312AR, AND THE ACCESS DOOR FOR THE CONTROLS BAY, 313AL. YOUR WEIGHT CAN CAUSE THE SPRING-LOADED LATCHES TO RELEASE. IF YOU FALL THROUGH THE DOOR, INJURY CAN OCCUR.

- (2) Open access door 312AR (Ref 06-42-00).

D. Remove the Fuse (Fig. 201)

S 032-006

- (1) Remove the clamps from the hydraulic lines to let them move during the fuse removal.

S 022-007

- (2) Remove the fuse from the hydraulic lines and do this step:  
(a) Seal the hydraulic lines with a cap.

RUDDER POSITION INDICATING SYSTEM – DESCRIPTION AND OPERATION

1. General
  - A. The rudder position indicating system provides the flight crew with the amount of deflection of the rudder surface. This system does not include the rudder trim indication system. For information on the rudder and rudder trim control system, see 27-21-00.
2. Component Details
  - A. Position Transmitter (Fig. 1)
    - (1) The rudder position transmitter is mounted below the lower power control actuator. The transmitter's crank is attached to the rudder front spar by adjustable control rod. The position transmitter is clamped to a bracket mounted to a vertical fin rib (Fig. 1). Access through panel 324EL.
    - (2) Electrical power to the transmitter is controlled by the RUDDER POS circuit breaker on overhead circuit breaker panel P11.
  - B. Position Indicator
    - (1) The rudder position indicator appears on the lower center display. The indicator scale in each direction is equal to 26 degrees.
3. Operation
  - A. The left power bus supplies 28 volts ac to the rotor in the transmitter, which is inductively coupled to the stator. The rotor is mechanically connected to the airplane control surface and rotates with the surface at the same time. Movement of the rudder changes the rotor position which in turn changes the stator output. This output signal is interpreted by computers and displayed on the flight deck. The control surface position is displayed on the lower center display.
  - B. Press the EICAS STATUS button on panel P9 to show the flight control position on the display screen.

**WARNING:** STAY AWAY FROM THE NOSE WHEELS WHEN YOU OPERATE THE RUDDER PEDALS. THE NOSE WHEELS CAN TURN QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Push the left rudder pedal fully forward and do this check:
  - (a) Make sure the rudder position pointer moves to the left full travel mark (approximately 26 degrees) (Fig. 501).

S 215-010

- (3) Push the right rudder pedal fully forward and do this check:
  - (a) Make sure the rudder position pointer moves to the right full travel mark (approximately 26 degrees) (Fig. 501).

S 215-011

- (4) Release the rudder pedals and do this check:
  - (a) Make sure the rudder position pointer aligns with the mid-scale mark.

NOTE: Use a tolerance of +/- one-half an arrow width.

E. Put the Airplane Back to Its Usual Condition

S 865-012

- (1) Remove the power from the left, right, and center hydraulic systems (Ref 29-11-00/201).

S 865-013

- (2) Remove electrical power if it is not necessary (Ref 24-22-00/201).

TASK 27-28-00-825-014

3. Rudder Position Indication - Adjustment

A. General

- (1) Three procedures are supplied to adjust the rudder position transmitter.

PROCEDURE 1 uses a commercially available power supply, a digital voltmeter (DVM), and the breakout box equipment.

PROCEDURE 2 uses airplane power, a DVM, and the breakout box equipment.

PROCEDURE 3 uses communication between person at the flight deck reading the displays and person at the rudder.

B. Equipment

- (1) Nose Gear Towing Lever Lockpin - A09003-1

S 495-065

**WARNING:** MAKE SURE YOU DO NOT OPERATE THE RUDDER TRIM SWITCH OR MOVE THE RUDDER PEDALS DURING THE ADJUSTMENT. THE HYDRAULIC SYSTEM HAS POWER AND ACCIDENTAL RUDDER MOVEMENT CAN CAUSE INJURY TO PERSONS AND DAMAGE TO EQUIPMENT.

- (6) Attach a DO-NOT-OPERATE tag to the rudder trim switch.

S 865-069

- (7) Open this circuit breaker on the overhead panel, P11, and attach a DO-NOT-CLOSE tag:  
(a) 11K16, RUDDER POS

S 495-019

- (8) Move the towing lever on the metering valve module to the tow position and install the towing lever lockpin in the nose gear (Fig. 503).

G. Rudder Position Transmitter - Adjustment (PROCEDURE 1)

S 035-020

- (1) Disconnect the electrical connector from the rudder position transmitter (Fig. 502).

S 495-021

- (2) Do these steps to connect the breakout box equipment:  
(a) Connect the breakout box and the -19 cable assembly to the transmitter.  
(b) Connect the digital voltmeter (DVM) to the breakout box at pins 5 (SIG HI) and 4 (SIG LO).  
(c) Connect the power supply to the breakout box at pins 1 (LO) and 2 (HI).  
(d) Adjust the power supply to  $26 \pm 0.02$  volts ac RMS.

S 825-023

- (3) Adjust the control rod for the transmitter until the output voltage is  $0 \pm 0.050$  volts ac RMS at the DVM.

EFFECTIVITY

ALL

27-28-00

04

Page 509  
Aug 22/06

- S 215-052
- (4) Make sure the control rod dimensions are not more than the maximum values shown (Fig. 502).
- S 825-053
- (5) Do these steps if the control rod dimensions are more than the maximum:
- (a) Loosen the screws that hold the transmitter in its bracket.
  - (b) Adjust the control rod to the initial dimensions (Fig. 502).
  - (c) Turn the transmitter in its bracket until the output voltage is very near zero.
  - (d) Tighten the screws that hold the transmitter in its bracket.
  - (e) Adjust the control rod for the transmitter until the output voltage is  $0 \pm 0.050$  volts ac RMS at the DVM.
  - (f) Make sure the control rod dimensions are not more than the maximum values shown (Fig. 502).
- S 215-024
- (6) Lock the control rod with a wire and do these steps:
- (a) Make sure the output voltage stays at  $0 \pm 0.050$  volts ac RMS.
  - (b) Apply a thin layer of grease to the threads that show.
- S 095-025
- (7) Disconnect the breakout box equipment.
- S 395-054
- (8) If it is necessary, apply some of the sealant at these locations:
- (a) The transmitter to bracket interface.
  - (b) The airplane to bracket interface.
  - (c) The bracket screws.
  - (d) The bonding jumper, if it is installed.
- S 435-026
- (9) Connect the electrical connector to the transmitter.
- S 095-027
- (10) Remove rig pin R4.
- S 865-055
- (11) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
- (a) 11K16      RUDDER POS
- S 095-066
- (12) Remove the DO-NOT-OPERATE tag from the rudder trim switch.
- S 715-028
- (13) Do the "Rudder Position Indication - Operational Test" task.

H. Rudder Position Indication - Adjustment (PROCEDURE 2)

S 035-029

- (1) Disconnect the electrical connector from the transmitter (Fig. 502).

S 495-030

- (2) Do these steps to connect the breakout box equipment:
- (a) Connect the breakout box and the -19 cable assembly to the transmitter.
  - (b) Connect the digital voltmeter (DVM) to the breakout box at pins 5 (SIG HI) and 4 (SIG LO).
  - (c) Connect the breakout box and the -18 cable assembly to the airplane electrical connector.
  - (d) Connect DVM 2 to the breakout box at pins 1 (LO) and 2 (HI) to monitor the airplane power.

S 865-031

- (3) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the overhead panel, P11:
- (a) 11K16, RUDDER POS

S 225-032

- (4) Make sure the airplane voltage is between 24 and 30 volts ac RMS at DVM 2.

S 825-033

- (5) Adjust the control rod until the output voltage is  $0 \pm 0.050$  volts ac RMS at DVM 1.

S 215-056

- (6) Make sure the control rod dimensions are not more than the maximum values shown (Fig. 502).

S 865-070

- (7) Do these steps if the control rod dimensions are more than the maximum:
- (a) Loosen the screws that hold the transmitter in its bracket.
  - (b) Adjust the control rod to the initial dimensions (Fig. 502).
  - (c) Turn the transmitter in its bracket until the output voltage is very near zero.
  - (d) Tighten the screws that hold the transmitter in its bracket.
  - (e) Adjust the control rod for the transmitter until the output voltage is  $0 \pm 0.050$  volts ac RMS at DVM 1.
  - (f) Make sure the control rod dimensions are not more than the maximum values shown (Fig. 502).

S 215-034

- (8) Lock the control rod with a wire and do these steps:
- (a) Make sure the output voltage stays at  $0 \pm 0.050$  volts ac RMS at DVM 1.
  - (b) Apply a thin layer of grease to the threads that show.

RUDDER POSITION TRANSMITTER - REMOVAL/INSTALLATION

1. General

- A. This procedure contains the removal task and the installation task for the rudder position transmitter.

TASK 27-28-01-024-002

2. Rudder Position Transmitter - Removal (Fig. 401)

A. Equipment

- (1) Nose Gear Towing Lever Lockpin - A09003-1

B. References

- (1) 06-42-00/201, Empennage Access Doors and Panels  
(2) 20-10-22/701, Metal Surface Cleaning/Painting  
(3) 24-22-00/201, Electrical Power - Control  
(4) 27-28-00/501, Rudder Position Indicating System

C. Access

- (1) Location Zone  
324 Vertical Stabilizer, Rear Spar to Trailing Edge
- (2) Access Panels  
324EL Rudder Mechanical Control Path  
324JL TE of Vertical Stabilizer

D. Prepare for the Removal

S 864-003

- (1) Supply electrical power (Ref 24-22-00/201).

S 864-004

- (2) Move the FLT CONTROL SHUTOFF TAIL switches L, C, and R on the right side panel, P61, to OFF. Attach DO-NOT-OPERATE tags and make sure the switch position lights come on.

S 864-005

- (3) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
- (a) 11G10, RUDDER RATIO
  - (b) 11H17, FLT CONT SHUTOFF TAIL LEFT
  - (c) 11H18, FLT CONT SHUTOFF TAIL CTR
  - (d) 11H27, FLT CONT SHUTOFF TAIL RIGHT
  - (e) 11K16, RUDDER POS

S 864-006

- (4) Move the towing lever to the tow position and install the towing lever lockpin in the nose gear.

S 014-007

- (5) Open access panels 324EL and 324JL (Ref 06-42-00/201).

E. Rudder Position Transmitter - Removal (PROCEDURE 1)

NOTE: This procedure removes the transmitter and its bracket from the airplane as an assembly and is the recommended procedure.

S 034-009

- (1) Disconnect these components from the transmitter:
  - (a) The electrical connector
  - (b) The control rod
  - (c) The bonding jumper, if it is installed.

S 034-025

- (2) Remove the screws that connect the transmitter and its bracket to the airplane (2 locations).

S 024-010

- (3) Remove the transmitter and its bracket from the airplane.

S 034-026

- (4) Disconnect the control rod from the rudder and remove it.

S 034-012

- (5) Do these steps if it is necessary to remove the transmitter from its bracket:
  - (a) Remove the crank from the transmitter shaft.
  - (b) Remove the two clamp screws that hold the transmitter in its bracket.
  - (c) Remove the transmitter from its bracket.

F. Rudder Position Transmitter - Removal (PROCEDURE 2)

NOTE: This procedure removes the transmitter as a separate unit from its bracket.

S 034-027

- (1) Disconnect these components from the transmitter:
  - (a) The electrical connector
  - (b) The control rod
  - (c) The bonding jumper, if it is installed.

E. Rudder Position Transmitter - Installation (PROCEDURE 1)

NOTE: Use this procedure if you used PROCEDURE 1 to remove the position transmitter.

S 864-045

- (1) Operate the rudder trim switch on the aft electronic control panel, P8, until you can easily install rig pin R5.

S 224-016

- (2) Do this check if the transmitter, crank, and bracket are assembled:  
(a) Make sure the transmitter output voltage is  $0 \pm 0.050$  volts ac RMS when the crank and the bracket are in the positions shown (View D, Fig. 401).

S 434-017

- (3) Do these steps if it is necessary to assemble the transmitter and its bracket:
- (a) Use a rotary bonding brush or an abrasive disk to clean the mating surfaces of the transmitter and the bracket (Ref 20-10-22/701).
- (b) Put the transmitter in its bracket and do these steps:  
1) Install the clamp screws but do not tighten them.  
2) Make sure the top clamp screw engages the transmitter groove.
- (c) Put the crank on the transmitter shaft and do these steps:  
1) Make sure the index mark on the transmitter shaft aligns with the crank slot.  
2) Make sure the crank screw engages the groove on the shaft.  
3) Tighten the screw that holds the crank on the transmitter shaft.
- (d) Do these steps to connect the breakout box equipment:  
1) Connect the breakout box and the -19 cable assembly to the transmitter (Fig. 402).  
2) Connect the digital voltmeter (DVM) to the breakout box at pins 4 (SIG LO) and 5 (SIG HI).  
3) Connect the power supply to the breakout box at pins 1 (LO) and 2 (HI).  
4) Adjust the power supply to  $26 \pm 0.020$  volts ac RMS.
- (e) Put the crank and its bracket in the positions shown (Fig. 401) and do these steps:  
1) Turn the transmitter in its bracket until the output voltage is  $0 \pm 0.050$  volts ac RMS.  
2) Tighten the bracket clamp screws.  
3) Make sure the output voltage stays at  $0 \pm 0.050$  volts ac RMS.
- (f) Disconnect the breakout box equipment from the transmitter.

- S 424-019
- (4) Do these steps to install the position transmitter:
- (a) Use a rotary bonding brush or an abrasive disk to clean the mating surfaces of the airplane and the transmitter bracket (Ref 20-10-22/701).
  - (b) Put the transmitter assembly in its correct position.
  - (c) Install the screws, washers, and nuts that connect the transmitter assembly to the airplane (2 locations) and do this step:
    - 1) Apply some of the sealant to the screws and the bracket.
- S 824-030
- (5) Adjust the control rod to the initial dimensions shown (Fig. 401).
- S 434-031
- (6) Connect the control rod between the transmitter and the rudder and do this step:
- (a) Apply some of the sealant to the screws, washers, and nuts.
- S 434-032
- (7) If it was installed, connect the bonding jumper to the transmitter and do these steps:
- (a) Apply some of the sealant to the bolts.
  - (b) Use a bonding meter to make sure the resistance between the transmitter and the airplane is a maximum of 0.010 ohms.
- S 434-033
- (8) Connect the electrical connector to the transmitter.
- S 864-034
- (9) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel, P11:
- (a) 11G10, RUDDER RATIO
  - (b) 11H17, FLT CONT SHUTOFF TAIL LEFT
  - (c) 11H18, FLT CONT SHUTOFF TAIL CTR
  - (d) 11H27, FLT CONT SHUTOFF TAIL RIGHT
  - (e) 11K16, RUDDER POS
- S 864-044
- (10) Remove the DO-NOT-OPERATE tags and move the FLT CONTROL SHUTOFF TAIL L, R, and C switches on the right side panel, P61, to ON.
- S 824-020
- (11) Adjust the rudder position transmitter (Ref 27-28-00/501).

**NOTE:** You will apply some of the sealant at the bracket to transmitter interface after you adjust the transmitter.

F. Rudder Position Transmitter - Installation (PROCEDURE 2)

NOTE: Use this procedure if you used PROCEDURE 2 to remove the position transmitter.

S 864-046

- (1) Operate the rudder trim switch on the aft electronic control panel, P8, until you can easily install rig pin R5.

S 424-036

- (2) Put the transmitter in its bracket and do these steps:
  - (a) Install the transmitter clamp screws but do not tighten them.
  - (b) Make sure the top clamp screw engages the transmitter groove.

S 434-037

- (3) Put the crank on the transmitter shaft and do these steps:
  - (a) Make sure the index mark on the transmitter shaft aligns with the crank slot.
  - (b) Install the screw that holds the crank to the shaft and tighten it.
  - (c) Make sure the screw engages the groove in the transmitter shaft.

S 824-035

- (4) Adjust the control rod to the initial dimensions shown (Fig. 401).

S 434-039

- (5) Connect the control rod between the transmitter and the rudder and do this step:
  - (a) Apply some of the sealant to the screws, washers, and nuts.

S 434-038

- (6) If it was installed, install the bonding jumper to the transmitter and do this step:
  - (a) Apply some of the sealant to the bolts.

S 434-040

- (7) Connect the electrical connector to the transmitter.

EFFECTIVITY

ALL

27-28-01

ELEVATOR CONTROL SYSTEM – DESCRIPTION/OPERATION

1. General (Fig. 1)

- A. The elevator control system provides primary control of the airplane about its pitch axis. The elevators vary airplane pitch attitude for climb, descend, and altitude hold. The elevator control system automatically responds to mach and speed trim demands and initiates automatic stabilizer trim functions.
- B. Two inboard and two outboard elevators are connected to the stabilizer rear spar by hinges. Each inboard and outboard elevator is connected by two interconnect links. The outboard elevator is rigged faired with the inboard elevator. Deflection of the elevators is caused by six power control actuators (PCA's). Three PCA's are attached to each left and right outboard elevator. Each set of three PCA's is powered by the left, right, and center hydraulic systems. Only one PCA is needed to control each of the elevators.

27-31-00

- C. The elevator control system consists of two equal systems in parallel. The captain's control column inputs to the left outboard elevator PCA's. The first officer's control column inputs to the right outboard elevator PCA's. The left and right elevator control systems are interconnected through override mechanisms at the control columns and aft quadrants. The left and right outboard elevators are connected by a slave cable interconnect. The captain's and first officer's elevator controls have equal authority. The two systems normally act together as one system because of the override mechanisms. If one system becomes immobilized, the other system will control independent of the first. Only one system is needed to control the airplane.
- D. In the manual mode, control column inputs are transmitted through tension regulator quadrants. The tension regulator quadrants drive the cable systems and provide cable tension. The two cable systems translate column motion to the aft quadrant assemblies. The aft quadrant assemblies are aligned parallel and are bussed together by an override mechanism. The aft quadrant assemblies serve as the interface between the cable systems and the elevator PCA input control rods. The aft quadrant assemblies translate aft quadrant rotary motion into linear motion for the PCA input rods. The input rods control the PCA control valves. The left and right elevator PCA input control rods and linkages are interconnected by the two lost motion devices and a slave cable system which guards against control linkage jams.
- E. The elevator feel unit is connected to the elevator aft quadrant assemblies by pushrods. The feel unit supplies neutral position and feel force for the elevator controls. The neutral shift linkage provides neutral position to the feel unit. The neutral position is determined by stabilizer position input to the neutral shift linkage. The feel force is the sum of mechanical and hydraulic feel spring forces in the feel unit. Hydraulic feel force is supplied by the feel computer. Hydraulic feel pressure increases with an increase in airspeed and nose down trim. The feel computer consists of two analog computers operating in parallel. The pilot feels effect of higher pressure only at the feel unit. The feel force is unaffected if one computer is inoperative.
- F. The autopilot system provides automatic elevator control. The autopilot servos power the aft quadrant assemblies through their actuating rods and cranks. The left and center autopilot servos input to the left aft quadrant. The right autopilot servo inputs to the right aft quadrant. (See AMM 22-10-00/001, Autopilot (Flight Control) - Description and Operation.) ON SOME AIRPLANES (See Fig. 1 for effectivity), the control wheel steering (CWS) feature of the autopilot system allows pilot input to the elevator without disengaging the autopilot. The CWS inputs through the autopilot servos. (See AMM 22-12-00/001, Autopilot/Flight Director Pitch Channel - Description and Operation.)

- G. Elevator surface position and system fault indication is provided by the engine indicating and crew alerting system (EICAS). The control surfaces position indicator appears in the lower left hand corner of the lower EICAS screen when the STATUS button is pushed. Elevator control system fault indications appear on both EICAS screens.
- H. A stall warning condition is indicated by the shaking of two stick shakers located on the control column torque tube. The stick shakers are activated by a ground signal from the left and right stall warning modules. The stall warning modules monitor leading edge slat and flap position, and airplane angle of attack to determine stall proximity. (See AMM 27-32-00/001, Stall Warning System - Description and Operation.)

## 2. Component Details

### A. Control Column Assembly (Fig. 2)

- (1) The control column torque tube assemblies are located under the cabin floor. Access is through the forward equipment bay hatch. The control columns are mounted on torque tubes. The torque tubes are supported by offset pivot bearings at each end. The outboard ends of the control column torque tube are connected to force transducer bellcranks. The force transducer bellcrank is mounted on a pivot to the torque tube bellcrank and is restrained by the force transducer and lost motion limiter. The force transducer bellcranks are connected by non-adjustable pushrods to the forward cable tension regulator quadrants. The inboard ends of the control column torque tubes are linked together by a column override spring assembly. Override alignment is maintained by three springs. The springs hold a roller on the left torque tube in a cam detent position on the right torque tube.
- (2) There are two rig pin locations on the control column torque tubes. Vertical rig pin hole E-1 goes through the outboard end of the left torque tube. Horizontal rig pin hole E-2 goes through the bellcrank below the outboard end of the right torque tube.

### B. Tension Regulator Quadrant (Fig. 2)

- (1) The tension regulator quadrants are located below the cabin floor forward of the control column torque tube. Access is through the forward equipment bay hatch. One quadrant is attached to each of the captain's and first officer's torque tube bellcranks by non-adjustable pushrods. Elevator control cables run from the tension regulator quadrants to the elevator aft quadrants. The tension regulator quadrants control cable tension by compensating for dimensional changes in cables and structure from changes in temperature and applied forces.

C. Elevator Aft Quadrant (Fig. 3)

- (1) The elevator aft quadrants are located just aft of the horizontal stabilizer. Access is through the lower service door aft of the horizontal stabilizer compartment. The aft quadrants are supported by offset pivot bearings at the top and bottom of the quadrants. The aft quadrants are attached to bulkhead structure. The elevator aft quadrants receive inputs from the pilot's control cables, autopilot servo actuators, and the feel unit. Control outputs from the aft quadrants are sent through non-adjustable pushrods to the PCA input linkage.
- (2) The aft quadrants are interconnected by an adjustable pushrod and override assembly. There are two rig pin locations on the elevator aft quadrants. Rig pin E3 goes through the forward flange of the bulkhead of the left aft quadrant. Rig pin E4 goes through the forward flange of the bulkhead of the right aft quadrant.

D. Power Control Actuator (PCA) (Fig. 3)

- (1) There are three PCAs attached to each outboard elevator and stabilizer rear spar. Each PCA on each side is powered by a single and different hydraulic system, either the left, right, or center. Rig pin holes E-5 (left side) and E-6 (right side) are located in the bellcrank to the input arm on the middle PCA. Access to the PCAs is through removable access panels on the under side of horizontal stabilizer.
- (2) The PCA's are supported by a trunnion block and hangar link at the stabilizer rear spar. The PCA's are attached to the elevator by a reaction link and the PCA rod end. The PCA input linkage is connected to the PCA summing arm through the PCA input rod. The PCA summing arm is connected to the actuator bellcrank. The PCA's drive the elevators to the desired trim position.

E. Inboard and Outboard Elevators (Fig. 5)

- (1) The elevator surfaces consist of an inboard and outboard elevator on each side. The inboard and outboard elevators on each side are rigidly connected by two interconnect links. The inboard elevator is connected by three hinges to the stabilizer rear spar. The outboard elevator is connected by six hinges to the stabilizer rear spar. Each outboard elevator is driven by three PCAs.

- F. Elevator Slave Cable Interconnect (Fig. 3)
- (1) The outboard elevators are slaved together through a slave cable interconnect bus. The slave cable interconnect runs through the stabilizer torque box. Slave cable quadrants are located near the outboard end of the outboard elevator. The slave cable quadrants are connected to the outboard elevator through an override and adjustable pushrod. The PCA input linkage is connected to the slave cable quadrant through a lost motion device and a PCA input override. Rig pin holes E7 and E9 (left side) and E8 and E10 (right side) are located in the linkage between the elevator and slave cable quadrant. Access to the slave cable interconnect is through removable panels on the underside of the horizontal stabilizer.
- G. Feel Computer (Fig. 4)
- (1) The feel computer is mounted to a bulkhead in the horizontal stabilizer compartment on the left side of the airplane. The feel computer consists of two analog computers in parallel. One analog is powered by the left hydraulic system and the other is powered by the center hydraulic system. An adjustable pushrod and crank from the feel computer is attached to the horizontal stabilizer. The feel computer receives position inputs from the horizontal stabilizer through the pushrod and crank. The feel computer receives pressure inputs from the pitot-static system. The feel computer sends two hydraulic pressures in parallel to the feel actuator to supply artificial feel to the elevator control system. The feel computer varies hydraulic pressure to simulate feel effects with changes in airspeed and stabilizer position. The feel computer output feel pressure is also connected to the stabilizer trim control modules. Access to the feel computer is through the lower service door forward of the horizontal stabilizer.
  - (2) On some airplanes the feel computer hydraulic return lines have line-mounted relief valves to provide required back pressure.
- H. Feel Actuator (Fig. 3)
- (1) The feel actuator is part of the feel unit assembly. The feel actuator is located outboard of and level with the top of the left elevator aft quadrant. The feel actuator consists of two hydraulic cylinders connected end to end. The feel actuator piston rods are connected to levers on the feel unit. The feel actuator cylinders are supported by the piston rods. Hydraulic pressure at the rod end of each cylinder is connected to the hydraulic pressure output of the feel computer. Access to the feel actuator is through the lower service door aft of the horizontal stabilizer.

I. Feel Unit

(1) The feel unit is mounted on the aft side of the bulkhead aft of the stabilizer. The feel unit transmits hydraulic and mechanical feel forces through cranks and adjustable pushrods to the elevator aft quadrants. The feel unit is supported by a single pivot on the bulkhead, and is restrained from rotation by the pushrod attached to the neutral shift and override mechanism (767-200 airplanes) or override mechanism (767-300 airplanes). Access to the feel unit is through the lower service door aft of the horizontal stabilizer.

J. 767-200;

Neutral Shift and Override Mechanism (Fig. 3)

(1) This mechanism is located in horizontal stabilizer compartment on forward side of bulkhead directly forward of feel unit. A crank assembly is connected to horizontal stabilizer by an adjustable pushrod. A cam lever assembly is connected to feel unit by a non-adjustable pushrod. Access to neutral shift and override mechanism is through lower surface door forward of horizontal stabilizer.

K. 767-300;

Override Mechanism (Fig. 3)

(1) This mechanism is located in horizontal stabilizer compartment mounted on forward side of bulkhead directly forward of feel unit. A cam lever assembly is connected to feel unit by a non-adjustable pushrod. The override mechanism is not connected to horizontal stabilizer and does not provide neutral shift to the elevator system. Access to the override mechanism is through lower surface door forward of horizontal stabilizer.

3. Operation

A. Functional Description (Fig. 5)

(1) The elevators vary airplane pitch attitude for climb, descend, and altitude hold. There are two elevators on each side of the airplane and are connected together by two interconnect links. The elevators are attached by hinges to the stabilizer rear spar. Fore and aft motion of the control columns causes deflection of the elevator control surfaces. The captain's and first officer's elevator control systems have equal authority. The movement of either control column controls both the left and right elevator systems through forward and aft overrides. The forward override is located at the control column torque tubes. The aft override is located at the aft quadrants. Control column movement is transmitted through a torque tube assembly to two pushrods. The two pushrods drive two forward tension regulator quadrants. The tension regulator quadrants drive the two cable systems and provide cable tension. The cable systems are connected to the right and left elevator aft quadrants. The aft quadrants are driven by the control cables in the manual mode and by the autopilot servo actuators in the automatic mode. Aft quadrant rotation is restrained by the feel unit. The aft quadrants serve as the interface between the cable systems and the elevator PCA input control rods and linkages. The aft quadrants translate rotary motion into linear motion for the PCA input rods. The input rods control the PCA control valves.

Elevator Control System Operation  
Figure 5

EFFECTIVITY

ALL

27-31-00

- (2) Override springs bias the override interconnect to one side at each aft quadrant. With one aft quadrant jammed, the override springs on the interconnect will yield when a force of 25 pounds (111.2 newtons) is applied. In override travel, limit stops limit the override to 20 degrees of maximum asymmetry of the elevator surfaces in either direction.
- (3) The PCAs receive control inputs through control rods and linkages from the aft quadrants. A control input to the PCA summing control arm displaces the arm from neutral and moves the control linkage to the overtravel linkage. The overtravel linkage shifts the servo valve spool. The servo valve meters hydraulic pressure to one side of the piston in the actuator power cylinder and connects the other side of the piston to the return side of the hydraulic system. The actuator piston and the output rod moves in response to the differential pressure across the piston, moving the elevator. As the actuator output rod moves, feedback through the summing control arm moves the servo valve spool back to the neutral position. With the servo valve spool in neutral position, pressure across the actuator piston in the power cylinder is equalized, stopping any further motion.
- (4) The slave cable interconnect provides a control input to the PCA's from the opposite elevator if linkage between the PCA's and the elevator aft quadrant is broken. If the linkage between the left aft quadrant and left elevator PCA's is broken, the right aft quadrant drives the input linkage to the right PCA's. The right PCA's drive the right elevators and the right elevators drive the slave interconnect cable. The slave interconnect cable drives the left PCA input linkage through the left PCA override and lost motion device. The left PCA's drive the left elevators. If the linkage between the right aft quadrant and right elevator PCA's is broken, the left aft quadrant will provide the input to the right side elevators by the reverse process.
- (5) The lost motion device permits the PCA input lever to be moved without the pilot feeling resistance from the elevator through the slave cable interconnect linkage. The lost motion device in the PCA input connection to the slave cable interconnect causes one elevator to trail the opposite elevator by 2 degrees when driven through the slave cable interconnect.
- (6) The elevator feel computer provides feel pressure to the elevator feel unit for regulation of the feel force at the elevator control column. The feel computer gives almost constant feel force in all flight conditions. The system limits autopilot authority. The computer is a dual system to provide redundant feel pressures to the feel unit. Hydraulic pressure, supplied to both computer systems from independent hydraulic systems, is regulated above return pressure to provide two hydraulic feel pressure outputs from the feel computer.

EFFECTIVITY

ALL

27-31-00

01

Page 14  
Dec 22/01

- (7) Pitot air pressure on the computer bellows opposes static air pressure on the opposite side of the bellows. This opposition results in a differential bellows force dependent on airspeed and altitude of the airplane. The differential force moves the bellows by deflecting the input spring arm, transmitting a force to the feel force valve. The force positions the feel force valve to meter the feel pressure to the feel pressure port.
- (8) The stabilizer input arm is coupled to the stabilizer to position the stabilizer camshaft assembly. Rotation of the camshaft positions a stop arm in the main housing. As the pitot pressure increases, the bellows piston force rapidly increases the feel pressure until the bellows piston contacts the stop arm. Until this point, the bellows piston force is opposed by the spring arm assembly only. Upon contact with the stop arm, the increasing piston force is divided between the spring arm and stop arm. The rate in the increase of feel pressure with the piston force is reduced.
- (9) A pressure differential switch provides a monitor of the feel pressures. Normally, both feel pressures are equal and the monitor circuit is open. If the feel pressures differ by 25 percent or more, the pressure differential switch actuates and closes the monitor circuit. When the circuit is closed, a message (ELEV FEEL) will appear on the EICAS screen when the STATUS button is pushed.
- (10) The elevator feel unit provides the feel force for the elevator control system. The feel force is a force which moves the controls to the neutral position and resists displacement from the neutral position. The feel force is the sum of the mechanical feel spring force and the hydraulic feel spring force. The mechanical feel spring acts on the cam and roller attached to the first officer's input crank arm of the feel unit. The mechanical feel spring, cam and roller provide neutral position and constant centering and feel force at all speeds.

EFFECTIVITY

ALL

27-31-00

01

Page 15  
Feb 01/86

(11) Hydraulic pressure from the feel computer is supplied to the feel actuator. The feel actuator cylinders provide a retracting force on the piston rods to pull the feel unit levers together. The feel levers supply tension loads in the links and ties attached to the output shaft assemblies on the captain's and first officer's input cranks. The tension forces on the output shaft assemblies supply a hydraulic feel and centering force to the input cranks. Deflection of the output shaft assemblies, by inputs from the aft quadrants, is resisted by the tension of the links and ties on the output shaft assemblies. Deflection of the output shaft assemblies causes the deflection of the hydraulic levers. Deflection of the levers forces hydraulic fluid from the feel actuator cylinders back through the lines to the feel computer. The hydraulic fluid rubs the return side of the hydraulic valve in the feel computer. The force required to allow hydraulic fluid to flow back through the feel computer determines the hydraulic feel force. The feel force at either control column is the total resistive forces felt at the captain's and first officer's output cranks of the feel unit plus friction. The captain and first officer feel the same force because of the override connections between the left and right elevator systems.

(12) 767-200;

The position of the neutral shift linkage fixes the position of the feel unit and determines the location of the neutral position of the elevator system. The crank assembly in the neutral shift linkage floats at stabilizer trim equal to +2 degrees to -6.4 degrees. The grounding spring holds the spring carrier assembly in the neutral shift linkage against the grounding stop at stabilizer trim equal to +2 degrees to -6.4 degrees. At -6.4 degrees of stabilizer trim, the crank assembly contacts the stop tube in the neutral shift linkage. At -6.4 degrees to -12.5 degrees of stabilizer trim, the crank assembly forced against the tube stop rotates the spring carrier assembly away from the grounding stop. Rotation of the spring carrier assembly and cam lever assembly rotates the feel unit through a pushrod. Rotation of the feel unit by the pushrod from the neutral shift linkage shifts the neutral position of the elevator system. The neutral position of the outboard elevator moves from faired position to 2.0 degrees up as the stabilizer moves from -6.4 degrees to -12.5 degrees of trim. Movement of the neutral position of the outboard elevator from faired position to 2.0 degrees up increases the effective nose-up trim as the stabilizer goes from -6.4 degrees to -12.5 degrees. If the feel unit internal mechanisms jam, the neutral shift linkage yields and provides the feel and centering force to the elevator system.

The override mechanism is not connected to horizontal stabilizer and does not provide neutral shift to feel unit.  
If the feel unit internal mechanisms jam, the override mechanism yields and provides feel and centering force to elevator system.
- B. Fault Indication (Fig. 6)
- (1) Elevator control system fault monitoring is provided by the EICAS system. The EICAS system elevator fault monitoring can be obtained by pushing the STATUS button or one of the maintenance buttons on the EICAS MAINT panel. Elevator control system warnings and cautions will appear on the EICAS screen automatically.
- C. Control (Fig. 1, Fig. 5, Fig. 7)
- (1) Manual Operation
- (a) Provide electrical power (AMM 24-22-00).
- (b) Check that the following overhead circuit breaker panel P11 circuit breakers are closed.
- 1) 11H17, FLT CONT SHUTOFF TAIL L
  - 2) 11H18, FLT CONT SHUTOFF TAIL CENTER
  - 3) 11H27, FLT CONT SHUTOFF TAIL R
  - 4) 11L9, LEFT ENGINE OIL PRESS EICAS REF
  - 5) 11L36, RIGHT ENGINE OIL PRESS EICAS REF
- (c) Check that LEFT, RIGHT, and CENTER FLT CONT SHUTOFF TAIL valve switches on sidewall panel P61 are in ON position.

**WARNING:** THE AILERONS, ELEVATORS, RUDDER, SPOILERS, STABILIER, SLATS, AND TRAILING EDGE FLAPS ARE FULLY POWERED SURFACES. ENSURE PERSONNEL AND EQUIPMENT ARE CLEAR OF ALL CONTROL SURFACES BEFORE PROVIDING HYDRAULIC POWER. INJURY TO PERSONNEL OR DAMAGE TO EQUIPMENT COULD RESULT.

- (d) Provide left, right, and center systems hydraulic power (AMM 29-11-00).
- (e) Pull control columns aft, both elevators will move up smoothly and stop at the same angle as shown on the position indicator.
- (f) Release control columns, both elevators, control columns, and position indications will return to neutral position unassisted.

ELEVATOR CONTROL SYSTEM – ADJUSTMENT/TEST

1. General

- A. This procedure contains these tasks for the Operational Test, Adjustment, and System Tests for the Elevator Control System:

Operational Test – Elevator Control System  
Elevator Control System – Adjustment  
System Test – Elevator Controls  
Shutoff Valve Operation With a Single Hydraulic Source  
Dual Control Path Override System Test  
Elevator Neutral Shift and Override Mechanism Test (767-200 AIRPLANES)

The last 3 tasks (the Shutoff Valve Operation With a Single Hydraulic Source, the Dual Control Path Override System Test, and the Elevator Neutral Shift and Override Mechanism Test) are necessary for scheduled maintenance. The task for the Operational Test contains the instructions to do these last three tasks. Thus, if you do all of the steps in the Operational Test task, it is not necessary to do the last three tasks in this list.

TASK 27-31-00-715-001

2. Operational Test – Elevator Control System

A. General

- (1) No ground support equipment is necessary to do the operational test for the elevator control system. This test lets maintenance people monitor all functions of the elevator control system to make sure that it operates freely.

NOTE: A single thumping noise can be heard from a PCA when an elevator is moved full up or full down. This noise is heard only when the direction of movement of the PCA is changed at the end of the stroke. It is caused when the snubbing ring moves in the snubbing gland to change the direction of movement of the piston at the end of the stroke.

S 865-013

- (10) Move the control columns.  
(a) Make sure that the elevators do not move.

NOTE: The elevators may hang down because of their weight when the control column is moved and no hydraulic power is supplied.

S 865-014

- (11) Put the LEFT, RIGHT, and CENTER FLT CONT SHUTOFF TAIL valve switches on the P61 panel to ON.  
(a) Make sure that there is no ELEV FEEL message on the EICAS screen when the STATUS button is pushed.

S 865-324

- (12) Put the CENTER FLT CONT SHUTOFF TAIL valve switch on the P61 panel to OFF.

S 865-016

- (13) Move the control columns to remove remaining hydraulic pressure.  
(a) Make sure that the ELEV FEEL message on the EICAS screen comes on.

NOTE: Wait at least 30 seconds for the message to come on.

S 865-017

- (14) Put the CENTER FLT CONT SHUTOFF TAIL valve switch on the P61 panel to ON.  
(a) Make sure that the ELEV FEEL message is not shown on the EICAS display.

S 865-325

- (15) Put the LEFT FLT CONT SHUTOFF TAIL valve switch on the P61 panel to OFF.

S 865-336

- (16) Move the control columns to remove remaining hydraulic pressure.  
(a) Make sure that the ELEV FEEL message comes on.

NOTE: Wait at least 30 seconds for the message to come on.

S 865-020

- (17) Put the LEFT FLT CONT SHUTOFF TAIL valve switch on the P61 panel to ON.  
(a) Make sure that the ELEV FEEL message is not shown on the EICAS display.

TASK 27-31-00-825-060

3. Elevator Control System - Adjustment

A. General

- (1) **SYSTEM ADJUSTMENT SEQUENCE:** The procedure contains steps to adjust the elevator control system components and mechanisms. The sequence that follows is recommended for complete system adjustment:

**NOTE:** The elevator control system must be adjusted after a control rod or cable is replaced.

- (a) **Override Cam:** Refer to the "Adjust the Override Cam" paragraph
  - (b) **Override Springs:** Refer to the "Adjust the Override Springs" paragraph
  - (c) **Stabilizer Cutoff Switches:** Refer to the "Adjust the Stabilizer Cutoff Switches" paragraph
  - (d) **Body Cables:** Refer to the "Adjust the Body Cables" paragraph
  - (e) **Feel Unit Rods:** Refer to the "Adjust the Feel Unit Rods" paragraph
  - (f) **Autopilot Servo Rods:** Refer to the "Adjust the Elevator Autopilot Servo Rods" paragraph
  - (g) 767-200;  
**Neutral Shift Rod:** Refer to the "Adjust the Neutral Shift Control Rod" paragraph
  - (h) **Feel Computer Rod:** Refer to the "Adjust the Feel Computer Control Rod" paragraph
  - (i) **PCA Rods:** Refer to the "Adjust the Power Control Actuator (PCA) Control Rods" paragraph
  - (j) **Slave Cables:** Refer to the "Adjust the Slave Cables" paragraph
  - (k) **Lost Motion-to-PCA Rods:** Refer to the "Lost Motion to PCA Control Rod Adjustment" paragraph
  - (l) **PCA Input Rods:** Refer to the "Adjust the Power Control Actuator (PCA) Input Rods" paragraph
  - (m) **Lost Motion-to-Elevator Rods:** Refer to the "Adjust the Lost Motion-to-Elevator Control Rod" paragraph
  - (n) **Elevator Position Transmitter Rods:** Refer to the "Elevator Position Transmitter Rod Adjustment" paragraph
- (2) **OUT OF SEQUENCE ADJUSTMENTS:** A component and mechanism can be adjusted out of the recommended sequence if the conditions below are correct. Necessary components must be adjusted subsequently.

**NOTE:** Prepare for Adjustment steps must be done before the out of sequence adjustments that follow.

- (a) **Override Cam**
  - 1) Do the "Prepare for Adjustment" paragraph
  - 2) Do the "Adjust the Override Cam" paragraph

EFFECTIVITY

27-31-00

08

Page 528  
Apr 22/06

- (3) **ADJUSTMENT REQUIREMENTS:** The elevator control system is adjusted correctly if it operates smoothly through its full travel range and if the conditions that follow are correct:

**NOTE:** The stabilizer trim control system must be correctly adjusted (AMM 27-41-00/501) before the elevator control system is adjusted.

- (a) Elevator Body Cables E1A, E1B, E2A, E2B

**NOTE:** Adjustment is not necessary for the appropriate cables if the conditions that follow are correct.

- 1) The cable adjustment is correct if the conditions that follow can occur at the same time:
  - Rig pin E2 is in the base of the right control column (Fig. 504)
  - All cables have the correct tension
  - Rig pins E3 and E4 can be freely put in the left and right aft quadrant arms (Fig. 506).
- 2) Tensions in cables E1A, E1B, E2A, and E2B are correct if the indication on the tension regulator indicator is in tolerance for ambient temperatures.

- (b) Elevator Feel Unit and Aft Interconnect Rod

- 1) The feel unit is adjusted correctly if the conditions that follow can occur at the same time:
  - The captain's auxiliary pitot system is pressurized to 4.0 psig (395 knots)
  - Rig pins E3 and E4 can be freely put in the left and right aft quadrant arms (Fig. 506).

- (c) Feel Computer

- 1) The feel computer is adjusted correctly if the conditions that follow can occur at the same time:
  - a) 767-200 AIRPLANES;  
Dimension A on the ballscrew actuator is at  $3.00 \pm 0.03$  inches (76.2 +/- 0.8 mm)
  - b) 767-300 AIRPLANES;  
Dimension A on the ballscrew actuator is at  $2.50 \pm 0.03$  inches (63.5 +/- 0.8 mm)
  - c) Rig pin E11 can be freely put in the feel computer arm.

- (d) Power Control Actuator (PCA) Control Rod

- 1) The left side PCA control rod is adjusted correctly if the conditions that follow can occur at the same time:
  - Rig pin E5 can be freely put in the center PCA input crank
  - Rig pin E3 can be freely put in the left aft quadrant stop arm (Fig. 506).

EFFECTIVITY

ALL

27-31-00

- 2) The right side PCA control rod is correctly adjusted if the conditions that follow can occur at the same time:
  - Rig pin E6 can be freely put in the center PCA input crank
  - Rig pin E4 can be freely put in the right aft quadrant stop arm (Fig. 506).
- (e) Slave Cables EA0, EB0
  - 1) Cable tensions are correct if the conditions that follow can occur at the same time:
    - Rig pin E9 can be freely put in the lost motion device on the left side
    - Rig pin E10 can be freely put in the lost motion device on the right side (Fig. 506).
- (f) Lost Motion Input Rod
  - 1) The left side lost motion input rod is correctly adjusted if the conditions that follow can occur at the same time:
    - Rig pin E5 can be freely put in the center PCA input crank
    - Rig pin E7 can be freely put in the lost motion device (Fig. 506).
  - 2) The right side lost motion input rod is correctly adjusted if the conditions that follow can occur at the same time:
    - Rig pins E6 can be freely put in the center PCA input crank
    - Rig pin E8 can be put in the lost motion device (Fig. 506).
- (g) Power Control Actuator (PCA)
  - 1) The power control actuators are correctly adjusted if:
    - Both elevators move up and down and stop at the same angle (as shown on the position indicators) in the necessary tolerances.

NOTE: The indicators can be used to verify gross elevator surface position at various column positions. The power control actuator adjustment check is good if the top surface of the trailing edge of both elevators aligns with the center of the index plate groove within 0.05 inch (1.3 millimeter).

- 2) Each PCA is adjusted by the adjustment of its PCA input rod.
- (h) Slave System Elevator Input Rod
  - 1) The left slave system elevator input rod is adjusted correctly if the conditions that follow can occur at the same time:
    - Rig pin E5 can be freely put in the left side PCA bellcrank
    - Rig pin E9 can be freely put in the lost motion device (Fig. 506).

EFFECTIVITY

ALL

27-31-00

01

Page 530  
Apr 22/06

2) The right slave system elevator input rod is adjusted correctly if the conditions that follow can occur at the same time:

- Rig pin E6 can be freely put in the right side PCA bellcrank
- Rig pin E10 can be freely put in the lost motion device (Fig. 506).

(i) Elevator Position Transmitter

1) The elevator position transmitter is adjusted correctly if the conditions that follow can occur at the same time:

- The horizontal stabilizer is at neutral (2 units of trim)
- Elevator position indicators follow the movement of elevators correctly.

#### B. Equipment

- (1) Control Wheel Adapter Equipment - A27021-96 or -98
- (2) Milliohmmeter -0- to 0.1- ohm range

(3) Rig Pins from Set A20004-XX (AMM 20-10-24/201):

- (a) E1 - P/N A20004-22
- (b) E2 - P/N A20004-22
- (c) E3 - P/N A20004-17
- (d) E4 - P/N A20004-17
- (e) E5 - P/N A20004-15
- (f) E6 - P/N A20004-15
- (g) E7 - P/N A20004-21
- (h) E8 - P/N A20004-21
- (i) E9 - P/N A20004-21
- (j) E10 - P/N A20004-21
- (k) E11 - P/N A20004-17

(4) Service Platform, Control Bay Access Door - A51001-19

(5) Control Column Protractor - 1 each A27021-30 (from the A27021-29 kit) or 4MIT65B80307-1

#### C. Consumable Materials

- (1) C00308 Compound - Corrosion Preventive  
MIL-C-11796 Class III

#### D. References

345DB	Elevator Bellcrank (Right)

F. Prepare for Adjustment

S 865-061

- (1) Supply electrical power (AMM 24-22-00/201).

S 865-261

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** START ONE HYDRAULIC SYSTEM AT A TIME UNLESS SPECIFIED DIFFERENTLY. HIGH LOADS MAY OCCUR IN THE ELEVATOR, RUDDER, AND STABILIZER STRUCTURES FROM FORCES THAT CAN RESULT FROM INCORRECTLY ADJUSTED POWER CONTROL ACTUATORS. DAMAGE TO EQUIPMENT CAN OCCUR.

- (2) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 225-063

- (3) Move the horizontal stabilizer such that Dimension A on the stabilizer trim ballscrew actuator is  $3.84 \pm 0.03$  inches (97.5 +/- 0.7 mm) (neutral position) (Fig. 503).

S 865-064

- (4) Remove the power from the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 865-065

- (5) Put the RIGHT, LEFT, and CENTER FLT CONT SHUTOFF TAIL valve switches on the right side panel, P61, to OFF.

EFFECTIVITY

ALL

27-31-00

- S 865-066
- (6) Put the LEFT and CENTER STAB TRIM SHUTOFF valve switches on the control stand, P10, to CUTOUT.
- S 865-067
- (7) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
- (a) AIRPLANES WITH ALTERNATE STAB TRIM SWITCHES;  
11A36, ALT STAB TRIM
  - (b) 11C12, STAB TRIM SHUTOFF L
  - (c) 11C13, STAB TRIM SHUTOFF CENTER
  - (d) 11H17, FLT CONT SHUTOFF TAIL LEFT
  - (e) 11H18, FLT CONT SHUTOFF TAIL CTR
  - (f) 11H27, FLT CONT SHUTOFF TAIL RIGHT

- S 015-068
- (8) Open the access door, 113AL, for the forward equipment bay (AMM 06-41-00/201).

- S 015-069
- (9) Open the access door, 312AR, for the stabilizer trim ballscrew actuator (AMM 06-42-00/201).

- S 015-070
- (10) Open the access door, 313AL, for the elevator mechanical linkages (AMM 06-42-00/201).

S 495-314

**WARNING:** STAY OFF THE SERVICE ACCESS DOOR, 312AR, AND THE ACCESS DOOR FOR THE CONTROLS BAY, 313AL. YOUR WEIGHT CAN CAUSE THE SPRING-LOADED LATCHES TO RELEASE. IF YOU FALL THROUGH THE DOOR, INJURY CAN OCCUR.

- (11) Install the service platform on the controls bay access door, 313AL.

- S 015-072
- (12) Remove the access panels that follow (AMM 06-42-00/201):
- (a) 335EB, 335GB, 335HB, 335JB, and 335AFB for left elevator adjustments.

EFFECTIVITY

ALL

27-31-00

(b) 345EB, 345GB, 345HB, 345JB, and 345AFB for right elevator adjustments.

G. Adjust the Override Cam (Fig. 504)

S 495-073

- (1) Install rig pin E1 in the left column torque tube.

S 035-074

- (2) Disconnect the control rods from the left and right column torque tubes.

S 825-075

- (3) Do the steps that follow to adjust the override cam:
- (a) Loosen the cam mounting bolts.
  - (b) Adjust the cam adjusting bolt such that rig pin E2 can be put in freely.
  - (c) Tighten the cam mounting bolts and the adjusting bolt check nut.

NOTE: Do not tighten adjacent bolts or nuts one after the other.

S 095-315

- (4) Remove rig pins E1 and E2.

H. Adjust the Override Springs (Fig. 504)

S 495-076

- (1) Install the control wheel adapter equipment on the captain's and first officer's control wheels.

NOTE: The adapter equipment is used to measure control column force and angular travel.

S 495-077

- (2) Install rig pin E2.

S 825-078

- (3) Adjust the column override springs so that the override breakout torque value measured about the column and torque tube pivot is  $904 \pm 72$  lb-in ( $102 \pm 8$  newton-meters).

NOTE: This is equivalent to  $25 \pm 2$  lbs ( $111 \pm 9$  newtons) applied at the finger reference point (the center of the control wheel grip).

EFFECTIVITY

ALL

27-31-00

S 825-079

- (4) Do the steps that follow to adjust the spring tension:  
(a) Adjust the tension screws.

NOTE: One turn of all three screws will change the breakout torque by approximately 45 lb-in (5.1 newton-meters).

- (b) Make sure that Dimension A is the same at each of the screws with a tolerance of 0.03 inch (0.8 mm).

S 095-263

- (5) Remove rig pin E2.

S 095-080

- (6) Remove the control wheel adapter equipment.  
I. Adjust the Stabilizer Cut-Off Switches (Fig. 505)

S 825-263

- (1) If the stabilizer cut-off switches are not rigged directly after you completed the adjustment of the override cam, do these steps:  
(a) Install the rig pins E1 and E2.  
(b) If the rig pin E2 cannot be put in freely, make sure the adjustment for the override cam is correct.  
(c) Remove the rig pins E1 and E2.

S 035-264

- (2) Make sure the switch actuating bolts for the left and right stabilizer cutoff switches are completely loosened from the stops and switches.

S 825-265

- (3) Adjust the switch actuating bolts for the stabilizer trim cutoff switches as follows (Fig. 505):  
(a) SAS 050, 051, 150-166, 275-277, 279 PRE-SB 27-102;  
Do the steps that follow:  
1) Adjust each bolt to let the switch transfer within the angle shown in Table 2.  
2) Tighten the jamnuts for the switch actuating bolts.

NOTE: Be careful not to change the adjustment.

- (b) SAS 050, 051, 150-166, 275-277, 279 POST-SB 27-102;  
SAS 052-149, 167-274, 278, 280-999;  
Adjust each bolt to let the switch transfer within the angle shown in Table 2.

NOTE: Open the opposite switch shown in Table 501, with a shim between the stop bolt and its stop.

EFFECTIVITY

ALL

27-31-00

**BOEING**  
767  
MAINTENANCE MANUAL

- 1) 767-200 AIRPLANES;  
Use the table that follows:

3) Tighten the jamnuts for the switch actuating bolts.

NOTE: Be careful not to change the adjustment.

S 865-266

- (4) Put the control column to the neutral position.  
 (a) Install the rig pin E1.

S 825-267

- (5) Do the steps that follow to adjust the stop bolt for each stabilizer trim cutoff switch:  
 (a) Turn the stop bolt until it touches the stop.  
 (b) Turn the stop bolt 1/2 to 3/4 of a turn (180 to 270 degrees) more into the stop.  
 (c) Tighten the jamnut for the stop bolt.

NOTE: Be careful not to change the adjustment.

If there is a space between the cam and the cam rollers, ignore the space.

S 825-268

- (6) Use the volt-ohmmeter to make sure the switches have continuity as shown in Table 1 Fig 505 (Sheet 2).

EFFECTIVITY

ALL

27-31-00

06

Page 537  
Apr 22/06

S 085-269

- (7) Remove the rig pin E1.

S 825-270

- (8) Use the volt-ohmmeter to make sure there is no continuity through the switches as shown in Table 2 Fig 505 (Sheet 2).  
(a) If it is necessary, adjust the stop bolt for the stabilizer trim switch.  
(b) Do the check again to make sure there is no continuity.

S 435-271

- (9) Connect the control rods to the left and right column torque tubes.

**NOTE:** If a large force is necessary to connect the second rod, adjust the body cables, the feel unit rod, and the autopilot servo rods.

J. Adjust the Body Cables (Fig. 507)

S 825-081

- (1) Do these steps to adjust the body cables:  
(a) Remove the aft quadrant interconnect rod (Fig. 506).  
(b) Install rig pins E5 and E6 in the left and right middle PCA input linkage.  
(c) Disconnect the aft quadrant output arm control rods from the left and right aft quadrants.  
(d) Disconnect two feel unit control rods and three autopilot servo actuator control rods from the left and right aft quadrants.  
(e) Disconnect the tension regulator control rod from the captain's tension regulator.  
(f) Insert rig pin E2 in the base of the first officer's control column (Fig. 504).

**WARNING:** BE CAREFUL WHEN YOU ENGAGE OR DISENGAGE THE CABLE TURNBUCKLES. A SUDDEN MOVEMENT BY THE TENSION REGULATOR OR CABLES CAN CAUSE INJURY TO A PERSON.

- (g) Adjust the turnbuckles on cables E2A and E2B to the correct SCALE POSITION vs AMBIENT TEMPERATURE.

**NOTE:** Adjust both turnbuckles at the same time such that both cables are loaded evenly.

- 1) Make sure that rig pin E4 can be freely put in the right aft quadrant (Fig. 506).  
(h) Install rig pin E4.  
(i) Align the pressure seals for cables E2A and E2B to remove any bends in the cable.  
(j) Install rig pin E3 in the left aft quadrant (Fig. 506).

- (k) Adjust the aft quadrant interconnect rod until the rod end bolt can be freely installed through the clevis and rod ends.

**WARNING:** BE CARDFUL WHEN YOU ENGAGE OR DISENGAGE THE CABLE TURNBUCKLES. A SUDDEN MOVEMENT BY THE TENSION REGULATOR OR CABLES CAN CAUSE INJURY TO A PERSON.

- (l) Adjust the turnbuckles on cables E1A and E1B to the correct SCALE POSITION vs AMBIENT TEMPERATURE.

**NOTE:** Adjust both turnbuckles at the same time such that both cables are loaded evenly.

- 1) Make sure the tension regulator control rod bolt can be freely installed through the captain's tension regulator and rod end.
- (m) Connect the tension regulator control rod to the captain's tension regulator.
- (n) Align the pressure seals for E1A and E1B to remove any bends in the cable.
- (o) Make sure that rig pins E1, E2, E3, and E4 (Fig. 504 and 506) can be removed with finger pressure only.
- (p) Remove rig pins E1, E2, E3, and E4.
- (q) Make sure the conditions that follow are correct:
  - 1) The cables do not touch pulleys or quadrant flanges for the total cable travel.
  - 2) The cables are in 2 degrees of the plane of the pulley or quadrant.
  - 3) Cables are installed through grommets and seals in the structure.
  - 4) Fairleads, rub strips, and grommets do not move the cables from the rigged or normal operational position.
  - 5) The pulleys rotate without blockage from the guards.
- (r) Operate the cable system through full travel 25 times.
- (s) Make sure that rig pins E1, E2, E3 and E4 can be put in with finger pressure only.
- (t) Install locking clips on all of the turnbuckles.
- (u) Make sure that rig pins E1, E2, E3 and E4 can be put in with finger pressure only.
- (v) Connect three autopilot servo actuator control rods to the left and right aft quadrant.
- (w) Connect the feel unit upper arm control rod to the left aft quadrant.

S 865-082

- (2) For the feel unit adjustment, keep rig pins E5 and E6 installed and the control rods that follow disconnected:
  - (a) Left and right aft quadrant output arm control rods.
  - (b) Feel unit lower arm control rod.

EFFECTIVITY

ALL

Apr 22/00

S 825-083

- (3) Adjust the feel unit rods (refer to the "Adjust the Feel Unit Rods" paragraph).

K. Adjust the Feel Unit Rods (Fig. 506)

**NOTE:** The body cables must be adjusted before the feel unit rod can be adjusted.

S 865-267

**CAUTION:** DO NOT LET THE PRESSURE GO ABOVE 4.75 PSI (426 KNOTS). THIS WILL PREVENT DAMAGE TO THE FEEL COMPUTER. MAKE PRESSURE CHANGES SUCH THAT THE INDICATED RATE OF CLIMB (OR DESCENT) IS LESS THAN 5000 FEET PER MINUTE FOR THE STATIC SYSTEM AND 300 KNOTS PER MINUTE FOR THE PITOT SYSTEM. APPLICABLE GAUGE SAVER RESTRICTORS OR EQUIVALENT DEVICES MUST BE USED.

- (1) Pressurize auxiliary pitot system No. 2 to 4.0 psi (395 knots) (AMM 34-11-00/201).

S 865-085

- (2) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:
  - (a) 11C13, STAB TRIM SHUTOFF CENTER
  - (b) 11H18, FLT CONT SHUTOFF TAIL CTR

S 865-086

- (3) Put the CENTER FLT CONT SHUTOFF TAIL valve switch on the P61 panel to ON.

S 865-087

- (4) Put the CENTER STAB TRIM SHUTOFF VALVE switch on the P10 panel to NORM.

S 865-088

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (5) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 865-089

- (6) Make sure that the horizontal stabilizer is such that Dimension A on the stabilizer jackscrew is  $3.84 \pm 0.03$  inches (97.5 +/- 0.8 mm) (neutral position).

EFFECTIVITY

ALL

27-31-00

S 825-090

- (7) Do the steps that follow to adjust the feel unit control rods:
- (a) Shake the left quadrant to make sure that the feel unit has set the elevator to its neutral position.
  - (b) Adjust the feel unit upper control rod until rig pin E3 can be freely put in the left aft quadrant stop arm.
  - (c) Remove rig pin E3.
  - (d) Adjust the length of the lower control rod for the feel unit such that the bolt can be freely installed through the clevis and bearing of the feel unit crank.
  - (e) Install the control rod between the feel unit and the right aft quadrant.
  - (f) Shake the right aft quadrant to make sure that the feel unit has set the elevator to its neutral position.
  - (g) Make sure that rig pins E3 and E4 can be put in with finger pressure only.
  - (h) Make sure that the upper and lower control rod ends correctly engage the thread.

NOTE: The length of the threads that show on the rod end cannot be more than as shown (Fig. 511).

S 865-091

- (8) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).

S 095-092

- (9) Remove rig pins E3, E4, E5, and E6.

S 435-093

- (10) Connect the control rods to the output arms of the left and right aft quadrants.

S 865-094

- (11) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel to CUTOUT.

S 865-095

- (12) Put the CENTER FLT CONT SHUTOFF TAIL valve switch on the P61 panel to OFF.

S 865-096

- (13) Open these circuit breakers on the P11 panel and attach DO-NOT-CLOSE tags:
- (a) 11C13, STAB TRIM SHUTOFF CENTER
  - (b) 11H18, FLT CONT SHUTOFF TAIL CTR

- (2) Make sure that rig pin E3 can be put in the left aft quadrant and E5 can be put in the left middle PCA input crank.

S 825-144

- (3) If rig pins E3 and E5 cannot be put in, do the steps that follow to adjust the left control rod:
- (a) Disconnect the inboard end of the Left PCA control rod at the bellcrank above access panel 335DB (One bay inboard from inboard PCA).
  - (b) Install rig pin E5 in the left middle PCA input crank.
  - (c) Install rig pin E3 in the left aft quadrant stop arm.
  - (d) Adjust the control rod length until the rod end bolt can be installed freely through the clevis and rod end with finger pressure only.
  - (e) Install the rod end bolt and make sure that rig pin E5 can be put in with finger pressure only.
  - (f) Make sure that the rod end threads are correctly engaged.
  - (g) Make sure that the rod end threads can be seen through the inspection hole.

S 095-269

- (4) Remove rig pins E3 and E5.

S 215-144

- (5) Make sure that rig pin E4 can be put in the right aft quadrant and E6 can be put in the right middle PCA input crank.

S 825-145

- (6) If rig pins E4 and E6 cannot be put in, do the steps that follow to adjust the right control rod:
- (a) Disconnect the inboard end of the Right PCA control rod at the bellcrank above access panel 345DB (One bay inboard from inboard PCA).
  - (b) Install rig pin E6 in the right middle PCA input crank.
  - (c) Install rig pin E4 in the right aft quadrant stop arm.
  - (d) Adjust the control rod length until the rod end bolt can be installed freely through the clevis and rod end with finger pressure only.
  - (e) Install the rod end bolt and make sure that rig pin E6 can be put in with finger pressure only.
  - (f) Make sure that the rod end threads are correctly engaged.
  - (g) Make sure the rod end threads can be seen through the inspection hole.

P. Adjust the Slave Cables (Fig. 510)

S 215-146

- (1) Make sure that the power from the left, right, and center hydraulic systems is removed.

S 035-147

- (2) Disconnect the rods that follow for the left and right elevators:
  - (a) Disconnect the forward end of the control rod that is between the lost motion device and the elevator.
  - (b) Disconnect the outboard end of the control rod that is between the lost motion device and the outboard PCA.

S 825-148

- (3) Do the adjustment that follows only if new cables have been installed:
  - (a) Install rig pin E9 in the left lost motion device.
  - (b) Adjust the turnbuckles in the center section of the horizontal stabilizer to apply a tension of 280 to 320 pounds (1246 - 1423 newtons) to cables EAO and EB0.
  - (c) Adjust the turnbuckles so rig pin E10 can be freely put in the right lost motion device.
  - (d) Remove rig pins E9 and E10.
  - (e) Manually cycle the elevator system and make sure that the conditions that follow are correct:
    - 1) The cables do not contact a pulley or quadrant flanges for its total cable travel.
    - 2) The cables are in 2 degrees of the plane of the pulley or quadrant.
    - 3) The cables are installed through grommets.
    - 4) The cables are not moved by rub strips.
    - 5) Pulleys turn freely without blockage from the guards.
  - (f) Manually cycle the slave cables through full travel 25 times.

S 495-149

- (4) Put rig pin E9 in the left motion device.

S 825-150

- (5) Adjust the tension of the slave cable to the value shown (Fig. 510).

S 215-151

- (6) Make sure that rig pin E10 can be freely put in the right lost motion device with finger pressure only.

S 435-152

- (7) Install locking clips on the turnbuckles.

S 095-153

- (8) Remove rig pins E9 and E10.

EFFECTIVITY

ALL

27-31-00

S 435-154

- (9) Connect the rods that follow for the left and right elevators:
- (a) Connect the control rod that is between the lost motion device and the elevator.
  - (b) Connect the control rod that is between the lost motion device and the outboard PCA.

Q. Lost Motion to PCA Control Rod Adjustment

S 215-155

- (1) Make sure that power from the left, right, and center hydraulic systems is removed.

S 825-156

- (2) Do the steps that follow to adjust the control rod from the lost motion device to the PCA on the left elevator:
- (a) Disconnect the control rod that is between the lost motion device and the elevator.
  - (b) Disconnect the control rod that is between the lost motion device and the outboard PCA.
  - (c) Put rig pin E5 in the left middle PCA (Fig. 506), and rig pins E7 and E9 in the left lost motion device (Fig. 510).
  - (d) Adjust the length of the control rod that is between the lost motion device and the outboard PCA.

NOTE: The bolt must be able to be freely installed through the clevis and the rod end with finger pressure only.

- (e) Adjust the control rod until rig pin E7 is free.
- (f) Install the control rod bolt and make sure that rig pin E7 can be put in with finger pressure only.
- (g) Make sure that the threads on the rod end engage correctly.
- (h) Make sure the rod end threads can be seen through the inspection hole.
- (i) Connect the control rod that is between the lost motion device and the elevator.

S 825-157

- (3) Do the steps that follow to adjust the control rod from the lost motion device to the PCA on the right elevator:
- (a) Disconnect the control rod that is between the lost motion device and the elevator.
  - (b) Disconnect the control rod that is between the lost motion device and the outboard PCA.
  - (c) Put rig pin E6 in the right middle PCA (Fig. 506), and rig pins E8 and E10 in the right lost motion device (Fig. 510).

EFFECTIVITY

ALL

27-31-00

- (d) Adjust the length of the control rod that is between the lost motion device and the outboard PCA.

NOTE: The bolt must be able to be freely installed through the clevis and the rod end with finger pressure only.

- (e) Adjust the control rod until rig pin E8 is free.
- (f) Install the control rod bolt and make sure that rig pin E8 can be put in with finger pressure only.
- (g) Make sure that the threads on the rod end engage correctly.
- (h) Make sure that the rod end threads can be seen through the inspection hole.
- (i) Connect the control rod that is between the lost motion device and the elevator.

S 095-158

- (4) Remove rig pins E5, E6, E7, E8, E9, and E10 (Figs. 506 and 510).
- R. Adjust the Power Control Actuator (PCA) Input Rods (Fig. 506)

S 845-317

(1) General

- (a) When the PCA input rods are adjusted, only pressurize the hydraulic system that powers that PCA. The PCAs on both elevators are powered by the hydraulic systems that follow:

NOTE: Allow time for PCAs that are not powered to depressurize before you do an adjustment on a powered PCA.

- 1) The outboard PCA is powered by the left hydraulic system.
  - 2) The middle PCA is powered by the right hydraulic system.
  - 3) The inboard PCA is powered by the center hydraulic system.
- (b) The middle PCA is adjusted first. This will be the neutral position to which the inboard and outboard PCAs are adjusted. This makes sure the null positions of all three PCAs are the same.
  - (c) If work platforms cannot be put under both elevators at the same time, adjust all three PCAs on one elevator. After all the PCAs on one elevator are adjusted, adjust the PCAs on the other elevator.
  - (d) If work platforms can be put under both elevators at the same time, adjust the PCAs on both elevators that have power from the same hydraulic system. Pressurize the hydraulic systems, one at a time, and adjust the appropriate PCAs before you pressurize the next hydraulic system.

S 845-161

- (2) Prepare for the adjustment as follows:

EFFECTIVITY

ALL

27-31-00

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM THE AREA BELOW THE ELEVATOR. INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR IF AN OBJECT FALLS.

- (a) Make sure the PCA control rod is adjusted as shown in Adjust the Power Control Acuator (PCA) Control Rods.
- (b) Make sure the lost motion input rod is adjusted as shown in the Lost Motion to PCA Control Rod Adjustment.
- (c) Make sure that Dimension A on the stabilizer trim ballscrew actuator is  $3.84 \pm 0.03$  inch (97.5 +/- 0.8 mm) (Fig. 503).

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS AND STABILIZER ARE FULLY POWERED SURFACES. INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (d) Pressurize the left, center, and right hydraulic systems (AMM 29-11-00/201).
- (e) Move the elevator from the neutral position to the nose up position and the nose down 25 times.
  - 1) Complete the movement with the elevator in the neutral position after it was moved from the nose down position.

**NOTE:** Do not move the column again until the adjustments are made to all six PCAs.

**CAUTION:** DO NOT PRESSURIZE THE PITOT SYSTEM MORE THAN 4.75 PSIG (426 KNOTS). DAMAGE CAN OCCUR TO THE AIRPLANE IF YOU PRESSURIZE THE PITOT SYSTEM MORE THAN 4.75 PSIG (426 KNOTS).

- (f) Pressurize the auxiliary pitot systems to 4.0 psig (395 knots) (AMM 34-11-00/201).
- (g) Install rig pins E5 and E6.

S 825-009

- (3) Do these steps to adjust the input rod for the middle PCA (Fig. 506):
  - (a) Remove the power from the left and center hydraulic systems (AMM 29-11-00/201).

**NOTE:** The middle PCA will be supplied with power.

- (b) Stop for 2 minutes before you measure the elevator trailing edge.

EFFECTIVITY

ALL

27-31-00

14

Page 549  
Apr 22/06

- (c) Loosen the jam nuts and increase the length of the input rod for the middle PCA.
  - 1) Make sure you move the elevator at least 0.5 inches (13 mm) below the bottom of the groove in the index plate (Fig. 502).

- (d) Adjust the input rod until the elevator is approximately 0.25 inches below the center groove in the index plate (Fig. 502).

**NOTE:** You must first move the elevator below the bottom of the groove before you make this last adjustment.

- (e) Make sure, at the rod end of the middle PCA input rod, you can see rod end threads in a minimum of half of the inspection hole.

**NOTE:** This will make sure the threads are engaged correctly.

- (f) Tighten the jam nut, but do not install a lockwire at this time.

**NOTE:** Make sure that when you tighten the jam nut, the elevator does not move from the neutral position.

- (g) Make a record of the position of the elevator trailing edge in relation to the bottom of the groove in the index plate.

**NOTE:** This position is used as a datum for when you adjust the inboard and outboard PCAs.

S 825-010

- (4) Do these steps to adjust the input rod for the inboard PCA (Fig. 506):

- (a) Remove the power from the right hydraulic system (AMM 29-11-00/201).

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS AND STABILIZER ARE FULLY POWERED SURFACES. INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (b) Pressurize the center hydraulic system (AMM 29-11-00/201).

**NOTE:** The inboard PCA will be supplied with power.

- (c) Stop for 2 minutes before you measure the elevator trailing edge.

EFFECTIVITY

ALL

27-31-00

- (d) Loosen the jam nuts and increase the length of the input rod for the inboard PCA.
  - 1) Make sure you move the elevator at least 0.5 inch (13 mm) below the bottom of the groove in the index plate (Fig. 502).
- (e) Adjust the input rod until the elevator is no more than 0.05 inches away from the position you made a record of when you adjusted the middle PCA.

**NOTE:** You must first move the elevator below the bottom of the groove before you make this final adjustment.

- (f) Make sure at the rod end of the inboard PCA input rod, you can see rod end threads in a minimum of half of the inspection hole.

**NOTE:** This will make sure the threads are engaged correctly.

- (g) Tighten the jam nut, but do not install a lockwire at this time.

**NOTE:** Make sure that when you tighten the jam nut, the elevator does not move from the neutral position.

S 825-011

- (5) Do these steps to adjust the input rod for the outboard PCA (Fig. 506):

- (a) Remove the power from the center hydraulic system (AMM 29-11-00/201).

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS AND STABILIZER ARE FULLY POWERED SURFACES. INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (b) Pressurize the left hydraulic system (AMM 29-11-00/201).

**NOTE:** The outboard PCA will be supplied with power.

- (c) Stop for 2 minutes before you measure the elevator trailing edge.
- (d) Loosen the jam nuts and lengthen the input rod for the outboard PCA.
  - 1) Make sure you move the elevator at least 0.5 inch (13 mm) below the bottom of the groove in the index plate (Fig. 502).

EFFECTIVITY

ALL

27-31-00

- (e) Adjust the input rod until the elevator is no more than 0.05 inch (1.3 mm) away from the position you made a record of when you adjusted the middle PCA.

**NOTE:** You must first move the elevator below the bottom of the groove before you make this last adjustment.

- (f) Make sure at the rod end of the outboard PCA input rod, you can see rod end threads in a minimum of half of the inspection hole.

**NOTE:** This will make sure the threads are engaged correctly.

- (g) Tighten the jam nut, but do not install a lockwire at this time.

**NOTE:** Make sure that when you tighten the jam nut, the elevator does not move from the neutral position.

S 865-337

- (6) Remove the power from the left hydraulic system (AMM 29-11-00/201).

S 865-162

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS AND STABILIZER ARE FULLY POWERED SURFACES, INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (7) Pressurize the right hydraulic system (AMM 29-11-00/201).

S 225-014

- (8) Make a record of the position of the trailing edges of the left and right elevator.

S 865-338

- (9) Remove the power from the right hydraulic system (AMM 29-11-00/201).

S 865-165

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS AND STABILIZER ARE FULLY POWERED SURFACES. INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (10) Pressurize the center hydraulic system (AMM 29-11-00/201).

EFFECTIVITY

ALL

27-31-00

S 225-017

- (11) Make sure the elevators on the left and right side of the airplane are no more than 0.05 inch (1.3 mm) away from the position you made a record of with only the right hydraulic system powered.
- (a) Adjust the input rods of the inboard PCAs, if it is necessary.

**NOTE:** If you adjust the input rods, make sure at the rod end of the inboard PCA input rod, you can see rod end threads in a minimum of half of the inspection hole.

- (b) If you adjust the input rods of the inboard PCAs, tighten the jam nuts.

S 865-339

- (12) Remove the power from the center hydraulic system (AMM 29-11-00/201).

S 865-340

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS AND STABILIZER ARE FULLY POWERED SURFACES. INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (13) Pressurize the left hydraulic system (AMM 29-11-00/201).

S 225-020

- (14) Make sure the elevators on the left and right side of the airplane are no more than 0.05 inch (1.3 mm) away from the position you made a record of with only the right hydraulic system pressurized.
- (a) Adjust the input rods of the outboard PCAs, if it is necessary.

**NOTE:** If you adjust the input rods, make sure at the rod end of the outboard PCA input rod, you can see rod end threads in a minimum of half of the inspection hole.

- 1) If you adjusted the input rods of the outboard PCAs, tighten the jam nuts.

15

Page 553  
Apr 22/08

S 095-447

- (15) Remove rig pins E5 and E6.

S 865-341

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS AND STABILIZER ARE FULLY POWERED SURFACES. INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (16) Pressurize the right and center hydraulic system (AMM 29-11-00/201).

S 215-022

- (17) Make sure the elevator on the left side of the airplane is in the groove of the index plate.  
(a) Adjust the length of the PCA control rod until the elevator is in the groove.

S 215-023

- (18) Make sure the elevator on the right side of the airplane is in the groove of the index plate.  
(a) Adjust the length of the PCA control rod until the elevator is in the groove.

S 865-342

- (19) Remove the power from the left, center, and right hydraulic system (AMM 29-11-00/201).

S 435-025

- (20) Safety the jam nuts on the six input rods with lockwires.

S 865-343

- (21) Remove the pressure from the auxiliary pitot systems (AMM 34-11-00/201).

S. Adjust the Lost Motion-to-Elevator Control Rod (Fig. 506)

**NOTE:** PCA input rods and the lost motion-to-PCA control rod must be adjusted before the lost motion-to-elevator control rod can be adjusted.

If shims need to be installed/removed on the PCAs, it must be done before the lost motion-to-elevator control rod is adjusted.

EFFECTIVITY

ALL

27-31-00

S 215-166

**WARNING:** MAKE SURE RIG PINS E5 AND E6 ARE PUT IN BEFORE YOU SUPPLY HYDRAULIC POWER. THE ELEVATORS ARE POWERED WHEN THESE CONTROL RODS ARE ADJUSTED. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR IF THE RIG PINS ARE NOT INSTALLED.

- (1) Make sure that the power from the left, right and center hydraulic systems is removed (AMM 29-11-00/201).

S 035-167

- (2) Disconnect the rods that follow for the left and right elevators:
  - (a) Disconnect the control rod from the lost motion device to the elevator.
  - (b) Disconnect the control rod from the lost motion device to the slave cable quadrant.

S 495-168

- (3) Put rig pin E5 in the left middle PCA bellcrank and rig pin E7 in the left lost motion device.

S 495-169

- (4) Put rig pin E6 in the right middle PCA bellcrank and rig pin E8 in the right lost motion device.

S 865-170

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** START ONE HYDRAULIC SYSTEM AT A TIME UNLESS SPECIFIED DIFFERENTLY. HIGH LOADS CAN OCCUR IN THE ELEVATOR, RUDDER, AND STABILIZER STRUCTURES FROM THE FORCE FIGHT DUE TO INCORRECTLY ADJUSTED POWER CONTROL ACTUATORS.

- (5) Pressurize the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 865-172

- (6) Pressurize auxiliary pitot system No. 2 to 4.0 psig (395 knots) (AMM 34-11-00/201).

S 865-173

- (7) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:
  - (a) 11H17, FLT CONT SHUTOFF TAIL LEFT
  - (b) 11H18, FLT CONT SHUTOFF TAIL CTR

EFFECTIVITY

ALL

27-31-00

(c) 11H27, FLT CONT SHUTOFF TAIL RIGHT

S 865-174

- (8) Put the LEFT, RIGHT, and CENTER FLT CONT SHUTOFF TAIL valve switches on the P61 panel to ON.

S 825-175

- (9) Adjust the control rod between the lost motion device and the elevator. The bolt must be able to be freely installed through the lost motion device elevator input arm clevis and the rod end.

S 435-176

- (10) Install the rod bolt.

S 215-177

- (11) Make sure the rod end threads engage correctly.

S 215-178

- (12) Make sure the rod end threads can be seen through the inspection hole.

S 425-179

- (13) Install the rod between the lost motion device and the slave cable quadrant. Do this for the left and right elevators.

S 215-180

- (14) Make sure that rig pins E5, E6, E7, E8, E9, E10 are free when the elevator is at the neutral position.

S 865-181

- (15) Remove the power from the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 865-182

- (16) Remove the pressure from auxiliary pitot system No. 2 (AMM 34-11-00/201).

S 865-183

- (17) Put the LEFT, RIGHT, and CENTER FLT CONT SHUTOFF TAIL valve switches on the P61 panel to OFF.

S 865-184

- (18) Open these circuit breakers on the P11 panel and attach DO-NOT-CLOSE tags:

- (a) 11H17, FLT CONT SHUTOFF TAIL LEFT
- (b) 11H18, FLT CONT SHUTOFF TAIL CTR
- (c) 11H27, FLT CONT SHUTOFF TAIL RIGHT

S 095-185

- (19) Remove rig pins E5, E6, E7, and E8.

T. Elevator Position Transmitter Rod Adjustment

S 825-186

- (1) Do the elevator position transmitter rod adjustment (AMM 27-38-00/501).

NOTE: The PCA control rods must be adjusted before the elevator position transmitter rod is adjusted.

U. Put the Airplane Back to Its Usual Condition

S 865-187

- (1) Make sure that power from the left, right, and center hydraulic systems is removed (AMM 29-11-00/201).

S 865-188

- (2) Make sure that electrical power is removed (AMM 24-22-00/201).

S 865-189

- (3) Make sure that these circuit breakers on the P11 panel are closed:
  - (a) AIRPLANES WITH ALTERNATE STAB TRIM SWITCHES ON THE CONTROL STAND;  
11A36, ALT STAB TRIM
  - (b) 11C12, STAB TRIM SHUTOFF L
  - (c) 11C13, STAB TRIM SHUTOFF CENTER
  - (d) 11H17, FLT CONT SHUTOFF TAIL LEFT
  - (e) 11H18, FLT CONT SHUTOFF TAIL CTR
  - (f) 11H27, FLT CONT SHUTOFF TAIL RIGHT

S 865-190

- (4) Make sure that the LEFT, RIGHT, and CENTER FLT CONT SHUTOFF TAIL switches on the P61 panel are at ON.

S 865-191

- (5) Make sure that the RIGHT and CENTER STAB TRIM SHUTOFF valve switches on the P10 panel are at NORM.

S 215-192

- (6) Make sure that all rig pins are removed from the system.

S 415-193

- (7) Close the access door, 113AL (AMM 06-41-00/201).

S 415-194

- (8) Close the access door, 312AR (AMM 06-42-00/201).

S 095-195

- (9) Remove the service access platform.

S 415-196

- (10) Close the controls bay access door, 313AL (AMM 06-42-00/201).

EFFECTIVITY

ALL

27-31-00

S 415-197

- (11) Install the access panels that follow (AMM 06-42-00/201):
- (a) 335EB, 335GB, 335HB, 335JB, and 335AFB for left elevator adjustments.
  - (b) 345EB, 345GB, 345HB, 345JB, and 345AFB for right elevator adjustments.

- V. SAS 050, 051, 150-156, 162-165;  
Do the Check for the Transducer

**NOTE:** This test uses the semi-automatic maintenance function of the autopilot flight director system (AFDS). The maintenance control and display panel (MCDP) is in the electronics equipment bay. The MCDP has switches for test control and interactive test direction. The front panel of the MCDP has instructions to do the tests (AMM 22-00-02/201) and (AMM 22-10-00/501).

S 865-307

- (1) Do the steps that follow to prepare for the test:
- (a) Supply electrical power (AMM 24-22-00/201).
  - (b) Do the initial power up test.
    - 1) Push the MCDP ON/OFF switch.
      - a) Make sure the fail light in the ON/OFF switch goes off in approximately 5 seconds.
    - 2) Operate the FLT FAULTS switch.
      - a) Make sure the FLT FAULTS mode is engaged.
    - 3) Operate the GRD TEST switch.
      - a) Make sure the GRD TEST mode is engaged.
    - 4) Use the GRD TEST SEL UP and DOWN switches or the no/SKIP switch to get the specified test.

**NOTE:** The display will show TEST NO. TEST NAME? .

- a) Use the YES/ADV switch to engage the correct test.

EFFECTIVITY

ALL

27-31-00

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (c) Supply pressure to the left, right, and center hydraulic system (AMM 29-11-00/201).
- (d) Move the elevators through their full travel range 25 times.

S 725-308

- (2) To do the check for the left transducer, do the steps that follow:
  - (a) Put the MCDP to the 66 XDCR OUT TEST (FIM 22-00-02/101).
  - (b) Get the message, 66 L COL - LBS/LCR, on the top line.

**NOTE:** Below this message there are 3 values for the output of the left force transducer.

- (c) Make sure the control column is released.
  - 1) The 3 values for the output of the left force transducer must be between -2 lbs to +2 lbs (-9 to +9 newtons).
  - 2) If the values for the output is not between -2 lbs to +2 lbs (-9 to +9 newtons), do these steps to adjust the cable tension:

**NOTE:** To adjust the cable tension, use the turnbuckles in the 48 section of the airplane.

- a) To find which cable is not adjusted correctly, put a small tension on each cable, one cable at a time (monitor the output values each time you put tension on one of the cables).
- b) Remove the locking clip from the applicable turnbuckle.
- c) Turn the turnbuckle approximately 1/4 turn at a time until the 3 output values are between -2 lbs to +2 lbs (-9 to +9 newtons).

EFFECTIVITY

ALL

27-31-00

S 725-309

- (3) To do a check for the right force transducer, do the steps that follow:

- (a) Put the MCDP to the 66 XDCR OUT TEST (AMM 22-00-02/201).
- (b) Get the message 66 R COL-LBS/LCR on the top line.

NOTE: Below this message there are 3 values for the output of the left force transducer.

- (c) Make sure the control column is released.
  - 1) The 3 values for the output of the left force transducer must be between -2 lbs to +2 lbs (-9 to +9 newtons).
  - 2) If the values for the output is not between -2 lbs to +2 lbs (-9 to +9 newtons) do these steps to adjust the cable tension:

NOTE: To adjust the cable tension, use the turnbuckles in the 48 section of the airplane.

- a) To find which cable is not adjusted correctly, put a small tension on each cable on cable at a time (monitor the output values each time you put tension on one of the cables).
- b) Remove the locking clip from the applicable turnbuckle.
- c) Turn the turnbuckle approximately 1/4 turn at a time until the 3 output values are between -2 lbs to + 2 lbs (-9 to +9 newtons).

S 725-310

- (4) After you adjust the the right force transducer, you must do the check for the left force transducer (Continue to adjust the left and then the right force transducer until the left and right force transducers are between -2lbs to +2 lbs (-9 to + 9 newtons) without an adjustment).

EFFECTIVITY

ALL

27-31-00

S 845-386

- (5) Do the steps that follow to Put the Airplane back to Its Usual Condition
  - (a) Install the locking clips in the applicable turnbuckles.
  - (b) Put the MCDP to the OFF position.
  - (c) Remove the hydraulic power if it is not necessary (AMM 29-11-00/201).

TASK 27-31-00-735-198

4. System Test - Elevator Controls

A. General

- (1) The tests in this procedure makes sure the complete elevator system operates correctly.
- (2) The stabilizer trim control system must be adjusted before this procedure is done (AMM 27-41-00/501).

B. Equipment

- (1) Rig Pin E4 - P/N A20004-17, part of Set A20004-XX (20-10-24).
- (2) Control Wheel Adapter Equipment - A27021-96 or -98
- (3) Scale for determining linear dimension - Commercially Available
- (4) Force Gage - DPPH-200 (Preferred)  
Chatillon Inc.  
83-30 Kew Garden Rd.  
Kew Gardens, New York 11415
- (5) Force Gage - DPPH-100 (Optional)  
Chatillon Inc.  
83-30 Kew Garden Rd.  
Kew Gardens, New York 11415
- (6) Force Gage - FDV-100 (Optional)  
Wagner Instruments  
88 River Rd.  
Greenwich, CT 06836
- (7) Control Column Protractor - A27021-29 (contains 2 each A27021-30 protractors) or 4MIT65B80307-1 protractor (2 required)

EFFECTIVITY

ALL

D. Access

- (1) Location Zones
  - 211/212 Control Cabin
  - 313 Stabilizer Torsion Box Compartment
- (2) Access Panel
  - 313AL Elevator Mechanical Linkages

E. Prepare for Tests (Fig. 501)

S 865-199

- (1) Supply electrical power (AMM 24-22-00/201).

S 015-203

- (2) Open the controls bay access door, 313AL (AMM 06-42-00/201).

S 495-204

**WARNING:** STAY OFF THE SERVICE ACCESS DOOR, 312AR, AND THE ACCESS DOOR FOR THE CONTROLS BAY 313AL. YOUR WEIGHT CAN CAUSE THE SPRING-LOADED LATCHES TO RELEASE. IF YOU FALL THROUGH THE DOOR, INJURY CAN OCCUR.

- (3) Install the service platform above the controls bay access door, 313AL.

EFFECTIVITY

ALL

27-31-00

S 865-205

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (4) Pressurize the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 865-206

- (5) Use the control column switches to move the horizontal stabilizer to the airplane nose down electrical travel limit ( $0 \pm 0.25$  units of trim on position indicator).

F. Control Columns Test

S 735-207

- (1) Do the steps that follow to do the control column travel limits test:
- (a) Make sure that the left, right, and center hydraulic systems are pressurized (AMM 29-11-00/201).
  - (b) AIRPLANES WITH STAB TRIM LEVERS ON THE CONTROL STAND; use the stab trim lever to move the stabilizer to  $0 \pm 0.25$  units of trim on the position indicator.

**NOTE:** As the stabilizer gets near the mechanical travel limits, operate the stab trim levers in short cycles. This is so the stabilizer trim ballscrew actuator will not hit the mechanical stops hard.

- (c) AIRPLANES WITH ALTERNATE STAB TRIM SWITCHES ON THE CONTROL STAND; use the alternate stabilizer trim switches to move the stabilizer to  $0 \pm 0.25$  units of trim on position indicator.

EFFECTIVITY

ALL

27-31-00

**NOTE:** As the stabilizer gets near the mechanical travel limits, operate the alternate stab trim switches in short cycles. This is so the stabilizer trim ballscrew actuator will not hit the mechanical stops hard.

- (d) Attach the surface protractor to the control column.
- (e) Move the control columns to the forward stop and then to the aft stop.
  - 1) Make sure that the control columns move smoothly and freely through the forward and aft movement.
- (f) AIRPLANES WITH STAB TRIM LEVERS ON THE CONTROL STAND; use the stab trim levers to carefully move the stabilizer to the airplane nose up mechanical travel limit ( $14.2 \pm 0.3$  units of trim on the position indicator).

**NOTE:** As the stabilizer gets near the mechanical travel limits, operate the stab trim levers in short cycles. This is so the stabilizer trim ballscrew actuator will not hit the mechanical stops hard.

- (g) AIRPLANES WITH ALTERNATE STAB TRIM SWITCHES ON THE CONTROL STAND; use the alternate stab trim switches to carefully move the stabilizer to the airplane nose up mechanical travel limit ( $14.2 \pm 0.3$  units of trim on the position indicator).

**NOTE:** As the stabilizer gets near the mechanical travel limits, operate the alternate stab trim switches in short cycles. This is so the stabilizer trim ballscrew actuator will not hit the mechanical stops hard.

- (h) Move the control columns to the forward stop and then to the aft stop.
  - 1) Make sure the control columns move smoothly and freely through the forward and aft movement.
- (i) AIRPLANES WITH STAB TRIM LEVERS ON THE CONTROL STAND; use the stab trim levers to move the stabilizer to the neutral position (2 units of trim on the position indicator).
- (j) AIRPLANES WITH ALTERNATE STAB TRIM SWITCHES ON THE CONTROL STAND; use the alternate stab trim switches to move the stabilizer to the neutral position (2 units of trim on the position indicator).
- (k) Push the first officer's column to the forward stop.
- (l) Make sure that the travel from the center position to the forward stop is 8.25 to 8.50 degrees.
- (m) Pull the first officer's column to the aft stop.
- (n) Make sure that the travel from the center position to the aft stop is 10.67 to 10.90 degrees.
- (o) Let the control column go to the neutral position.

EFFECTIVITY

ALL

27-31-00

- (p) Push the captain's control column to the forward stop.
- (q) Make sure that the travel from the center position to the forward stop is 8.75 to 9.00 degrees.
- (r) Pull the captain's control column to the aft stop.
- (s) Make sure that the travel from the center position to the aft stop is 11.0 to 11.25 degrees.
- (t) Let the control column go to the neutral position.
- (u) Remove the surface protractor.

S 735-208

- (2) Do the steps that follow to do the column breakout force test:
  - (a) Make sure that the left, right, and center hydraulic systems are pressurized (AMM 29-11-00/201).
  - (b) Make sure that the horizontal stabilizer is in the neutral position (2 units of trim on the position indicator).
  - (c) Install the control wheel adapter and force gage.
  - (d) Make sure that auxiliary pitot systems No. 1 and 2 are not pressurized (AMM 34-11-00/201).
  - (e) Make sure that zero knots is applied to the elevator feel computer.
  - (f) Move the first officer's control column slowly forward.
  - (g) Measure and write down the control column force when the right elevator has moved 0.10 to 0.20 inches (2.5 to 5.1 mm) from the neutral position.

NOTE: Linear measurement of elevator travel is the straight line distance between these two points:

- the top corner of the inboard trailing edge of the inboard elevator
- the center of the forward edge of the index plate groove.

- (h) Make sure that the control column force is between 3.5 and 6.0 pounds.
- (i) Let the control column go to the neutral position.
  - 1) Make sure the elevators go to neutral.
- (j) Move the first officer's control column slowly aft.
- (k) Measure and write down the control column force when the right elevator has moved 0.10 to 0.20 inch (2.5 to 5.1 mm) from the neutral position.
- (l) Make sure that the control column force is between 3.5 and 6.0 pounds.
- (m) Let the control column go to the neutral position.
  - 1) Make sure the elevators go to neutral.
- (n) Move the captain's control column slowly forward.

EFFECTIVITY

ALL

27-31-00

- (o) Measure and write down the control column force when the left elevator has moved 0.10 to 0.20 inches (2.5 to 5.1 mm) from the neutral position.

NOTE: Linear measurement of elevator travel is the straight line distance between these two points:

- the top corner of the inboard trailing edge of the inboard elevator
- the center of the forward edge of the index plate groove.

- (p) Make sure that the control column force is between 3.5 and 6.0 pounds.
- (q) Let the control column go to the neutral position.
  - 1) Make sure the elevators go to neutral.
- (r) Move the captain's control column slowly aft.
- (s) Measure and write down the control column force when the left elevator has moved 0.10 to 0.20 inch (2.5 to 5.1 mm) from the neutral position.
- (t) Make sure that the control column force is between 3.5 and 6.0 pounds.
- (u) Let the control column go to the neutral position.
  - 1) Make sure the elevators go to neutral.

S 735-209

- (3) Do the steps that follow to do the column, quadrant, and slave override functions test:
  - (a) Make sure that the horizontal stabilizer is in the neutral position (2 units of trim on the position indicator).
  - (b) Put rig pin E4 in the right aft quadrant stop.
  - (c) Make sure that the left, right, and center hydraulic systems are pressurized.
  - (d) Slowly pull on the captain's control column until the force on the column is 30 pounds (133 newtons).
  - (e) Make sure that the elevator moves 1.0 inch (25 mm), or less.
  - (f) Increase the force on the column to 55 pounds (245 newtons).
  - (g) Make sure that the elevator moves 1.1 inch (28 mm) or more.
  - (h) Continue to pull on the captain's column.
  - (i) Measure the necessary control column force to move the left elevator 8.9 to 10.0 inches (226 to 254 mm).
  - (j) Make sure that the control column force is 75 to 95 pounds (333 to 422 newtons).
  - (k) Let the control column go to the neutral position.
  - (l) Slowly push on the captain's column until the force on the column is 30 pounds (133 newtons).
  - (m) Make sure that the left elevator moves 1.0 inch (25 mm) or less.
  - (n) Increase the force to 55 pounds (244 newtons).
  - (o) Make sure that the elevator moves 1.1 inch (28 mm) or more.
  - (p) Continue to push the captain's control column.

EFFECTIVITY

ALL

27-31-00

- (q) Measure the necessary control column force to move the left elevator 8.9 to 10.0 inches (226 to 254 mm).
- (r) Make sure that the force is 75 to 95 pounds (333 to 422 newtons).
- (s) Let the control column go to the neutral position.
- (t) Remove rig pin E4.

G. Elevator Neutral and Travel Limits Test

S 735-210

- (1) Do the elevators at neutral position test.
  - (a) Make sure that the left, right, and center hydraulic systems are pressurized (AMM 29-11-00/201).
  - (b) Make sure that the horizontal stabilizer is at the neutral position with Dimension A set to (3.84 +/- 0.03 inches (97.5 +/- 0.8 mm)).

**CAUTION:** DO NOT LET THE PRESSURE GO ABOVE 4.75 PSI (426 KNOTS). THIS WILL PREVENT DAMAGE TO THE FEEL COMPUTER. MAKE PRESSURE CHANGES SUCH THAT THE INDICATED RATE OF CLIMB (OR DESCENT) IS LESS THAN 5000 FEET PER MINUTE FOR THE STATIC SYSTEM AND 300 KNOTS PER MINUTE FOR THE PITOT SYSTEM. APPLICABLE GAUGE SAVER RESTRICTORS OR EQUIVALENT DEVICES MUST BE USED.

- (c) Pressurize auxiliary pitot system No. 1 to 2.5 - 3.5 psig (317 - 371 knots) (AMM 34-11-00/201).
- (d) Move the control column about the neutral position to make sure that the elevators are in the neutral position.
- (e) Make sure that the top surface of the trailing edge on both of the elevators align with the center of the index plate groove by 0.05 inch (1.3 mm).
- (f) Remove the pressure from auxiliary pitot system No. 1 (AMM 34-11-00/201).

S 735-211

- (2) Do the elevator travel limits test.

**NOTE:** Linear measurement of elevator travel is the straight line distance between these two points:

- the top corner of the inboard trailing edge of the inboard elevator
- the center of the forward edge of the index plate groove.

- (a) Push the captain's control column to the forward stop.
- (b) Make sure that the elevators travel 23.5 to 24.5 inches (597 to 622 mm) down.
- (c) Pull the captain's control column to the aft stop.
- (d) Make sure that both elevators travel 33.0 to 34.2 inches (838 to 868 mm) up.
- (e) Let the control column go to the neutral position.
- (f) Push the first officer's control column to the forward stop.

EFFECTIVITY

ALL

27-31-00

- (g) Make sure that both elevators travel 23.5 to 24.5 inches (597 to 622 mm) down.
- (h) Pull the first officer's control column to the aft stop.
- (i) Make sure that both elevators travel 33.0 to 34.2 inches (838 to 868 mm) up.
- (j) Let the control column go to the neutral position.

H. Elevator Position Indication Test

S 735-212

- (1) Do the elevator position indication test (AMM 27-38-00/501).

I. Elevator Power Control Actuators Test

S 215-213

- (1) Make sure that the left, right and center hydraulic systems are pressurized (AMM 29-11-00/201).

S 865-214

- (2) Put the RIGHT and CENTER FLT CONT SHUTOFF TAIL valve switch on the sidewall panel, P61, to OFF.

S 215-215

- (3) Make sure that the LEFT FLT CONT SHUTOFF TAIL valve switch on the P61 panel is at ON.

S 215-216

- (4) Make sure that the EICAS computer system operates (AMM 31-41-00/501).

S 865-217

- (5) Put the EICAS COMPUTER select switch to R and press the STATUS button to display the control surface positions.

S 865-218

- (6) Push the control column forward.
  - (a) Make sure that the left and right elevator position indicators move down and stop at the same position.
  - (b) Make sure that both elevators move down.

S 865-219

- (7) Pull the control column aft.
  - (a) Make sure that both of the indicators move up and stop at the same position.
  - (b) Make sure that both elevators move up.

S 865-220

- (8) Let the control column go to the neutral position.

S 865-221

- (9) Put the LEFT FLT CONT SHUTOFF TAIL valve switch on the P61 panel to OFF.

EFFECTIVITY

ALL

27-31-00

S 865-222

- (10) Put the CENTER FLT CONT SHUTOFF TAIL valve switch on the P61 panel to ON.

S 865-223

- (11) Push the control column forward.  
(a) Make sure that the left and right elevator position indicators move down and stop at the same position.  
(b) Make sure that both elevators move down.

S 865-224

- (12) Pull the control column aft.  
(a) Make sure that both of the indicators move up and stop at the same position.  
(b) Make sure that both elevators move up.

S 865-225

- (13) Let the control column go to the neutral position.

S 865-226

- (14) Put the CENTER FLT CONT SHUTOFF TAIL valve switch on the P61 panel to OFF.

S 865-227

- (15) Put the RIGHT FLT CONT SHUTOFF TAIL valve switch on the P61 panel to ON.

S 865-228

- (16) Push the control column forward.  
(a) Make sure that the left and right elevator position indicators move down and stop at the same position.  
(b) Make sure that both elevators move down.

S 865-229

- (17) Pull the control column aft.  
(a) Make sure that both of the indicators move up and stop at the same position.  
(b) Make sure that both elevators move up.

S 865-230

- (18) Let the control column go to the neutral position.

J. Elevator Feel System Test

S 735-231

- (1) Do the feel computer test.  
(a) Make sure that the left, right and center hydraulic systems are pressurized (AMM 29-11-00/201).  
(b) Make sure that the LEFT, RIGHT, and CENTER FLT CONT SHUTOFF TAIL valve switches on the P61 panel are OFF.

EFFECTIVITY

ALL

27-31-00

22

Page 569  
Apr 22/06

- (c) Make sure these circuit breakers on the P11 panel are open:
- 1) 11H17, FLT CONT SHUTOFF TAIL LEFT
  - 2) 11H18, FLT CONT SHUTOFF TAIL CTR
  - 3) 11H27, FLT CONT SHUTOFF TAIL RIGHT

**WARNING:** DO THE DEACTIVATION PROCEDURE FOR THE SPOILERS OR MOVE ALL PERSONS AND EQUIPMENT AWAY FROM THE SPOILERS. THE SPOILERS CAN RETRACT QUICKLY AND CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (d) Do the deactivation procedure for the spoilers (AMM 27-61-00/201) or move all persons and equipment away from the spoilers.

**WARNING:** MAKE SURE YOU DO THE FLIGHT MODE SIMULATION CORRECTLY. IF THE PROCEDURE IS NOT DONE CORRECTLY, INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR.

- (e) Do the Flight Mode Simulation procedure for the No. 1 and No. 2 air/ground system (AMM 32-09-02/201).
- (f) Make sure that the EICAS computer system operates (AMM 31-41-00/501).
- (g) Put the EICAS COMPUTER select switch to L and press the STATUS button on the pilot's display select panel.
- (h) Make sure that the ELEV FEEL message is not shown on the EICAS display.

**NOTE:** the ELEV FEEL message is a maintenance message.

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZERS ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (i) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
- 1) 11H17, FLT CONT SHUTOFF TAIL LEFT
- (j) Put the LEFT FLT CONT SHUTOFF TAIL valve switch on the P61 panel to ON.
- (k) Make sure that the ELEV FEEL message is shown on the EICAS display.

**NOTE:** It will take at least 30 seconds for the message to show.

- (l) Remove the DO-NOT-CLOSE tag, and close this circuit breaker on the P11 panel:
- 1) 11H18, FLT CONT SHUTOFF TAIL CTR

EFFECTIVITY

ALL

27-31-00

- (m) Put the CENTER FLT CONT SHUTOFF TAIL valve switch on the P61 panel to ON.
- (n) Put the system No.1 and 2 air/ground relays in the ground mode (AMM 32-09-02/201).
- (o) Push the ECS/MSG button and then push AUTO READ KEY button on the EICAS maintenance panel.
- (p) Push and hold the EVENT ERASE KEY for at least 2 seconds. At the same time, cycle the control column to bleed hydraulic pressure.
- (q) Press the STATUS button on the pilots's display select panel.
  - 1) Make sure that the ELEV FEEL message is not shown on the EICAS display.

**CAUTION:** DO NOT LET THE PRESSURE GO ABOVE 4.75 PSI (426 KNOTS). THIS WILL PREVENT DAMAGE TO THE FEEL COMPUTER. MAKE PRESSURE CHANGES SUCH THAT THE INDICATED RATE OF CLIMB (OR DESCENT) IS LESS THAN 5000 FEET PER MINUTE FOR THE STATIC SYSTEM AND 300 KNOTS PER MINUTE FOR THE PITOT SYSTEM. APPLICABLE GAUGE SAVER RESTRICTORS OR EQUIVALENT DEVICES MUST BE USED.

- (r) Put the EICAS COMPUTER select switch to R.
- (s) Pressurize auxiliary pitot system No. 2 to 2.50 - 3.50 psig (317 - 371 knots) (AMM 34-11-00/201).
- (t) Make sure that the ELEV FEEL message is shown on the EICAS display.

**NOTE:** It will be at least 30 seconds before the message is shown.

**CAUTION:** DO NOT LET THE PRESSURE GO ABOVE 4.75 PSI (426 KNOTS). THIS WILL PREVENT DAMAGE TO THE FEEL COMPUTER. MAKE PRESSURE CHANGES SUCH THAT THE INDICATED RATE OF CLIMB (OR DESCENT) IS LESS THAN 5000 FEET PER MINUTE FOR THE STATIC SYSTEM AND 300 KNOTS PER MINUTE FOR THE PITOT SYSTEM. APPLICABLE GAUGE SAVER RESTRICTORS OR EQUIVALENT DEVICES MUST BE USED.

- (u) Pressurize auxiliary pitot system No. 1 to 2.50 - 3.50 psig (317 - 371 knots) (AMM 34-11-00/201).
  - 1) Make sure that the ELEV FEEL message is not shown.
- (v) Remove the pressure from auxiliary pitot system No. 2 (AMM 34-11-00/201).
- (w) Make sure that the ELEV FEEL message is shown on the EICAS display.

**NOTE:** It will take at least 30 seconds for the message to show.

EFFECTIVITY

ALL

27-31-00

- (x) Remove the pressure from auxiliary pitot system No. 1 (AMM 34-11-00/201).
  - 1) Make sure that the ELEV FEEL message is not shown.
- (y) Put the CENTER FLT CONT SHUTOFF TAIL valve switch on the P61 panel to OFF.
  - 1) Open this circuit breakers on the P11 panel, 11H18, FLT CONT SHUTOFF TAIL CTR
  - 2) Make sure that the ELEV FEEL message is shown.
- (z) Put the CENTER FLT CONT SHUTOFF TAIL valve switch on the P61 panel to ON.
  - 1) Close this circuit breaker on the P11 panel. 11H18, FLT CONT SHUTOFF TAIL CTR
- (aa) Put the LEFT FLT CONT SHUTOFF TAIL valve switch on the P61 panel to OFF.
  - 1) Open this circuit breakers on the P11 panel, 11H17, FLT CONT SHUTOFF TAIL LEFT
  - 2) Make sure that the ELEV FEEL message is shown.
- (ab) Put the LEFT FLT CONT SHUTOFF TAIL valve switch on the P61 panel to ON.
  - 1) Close this circuit breakers on the P11 panel, 11H17, FLT CONT SHUTOFF TAIL LEFT

S 735-249

- (2) Do the feel unit test.
  - (a) Make sure that the left, right, and center hydraulic systems are pressurized (AMM 29-11-00/201).
  - (b) Make sure that the ELEV FEEL message is not shown on the EICAS display.
  - (c) Move the horizontal stabilizer such that Dimension A on the stabilizer trim ballscrew actuator is as follows (Fig. 503):
 

$3.84 \pm 0.03$ inches	(97.5 +/- 0.8 mm)	(767-200 AIRPLANES)
$7.88 \pm 0.03$ inches	(200.2 +/- 0.8 mm)	(767-300 AIRPLANES)

**CAUTION:** DO NOT LET THE PRESSURE GO ABOVE 4.75 PSI (426 KNOTS). THIS WILL PREVENT DAMAGE TO THE FEEL COMPUTER. MAKE PRESSURE CHANGES SUCH THAT THE INDICATED RATE OF CLIMB (OR DESCENT) IS LESS THAN 5000 FEET PER MINUTE FOR THE STATIC SYSTEM AND 300 KNOTS PER MINUTE FOR THE PITOT SYSTEM. APPLICABLE GAUGE SAVER RESTRICTORS OR EQUIVALENT DEVICES MUST BE USED.

- (d) 767-200 AIRPLANES;  
 Pressurize auxiliary pitot systems No. 2 to 0.46-0.49 psig (138-142 knots) (AMM 34-11-00/201).

EFFECTIVITY

ALL

27-31-00

- (e) 767-300 AIRPLANES;  
Pressurize auxiliary pitot systems No. 2 to 1.022-1.062 psig (208-212 knots) (AMM 34-11-00/201).
- (f) Push captain's control column forward. Do not let the elevator aft quadrant stops get nearer than 0.10 to 0.20 inch (2.6 to 5.1 mm) of each other.
- (g) 767-200 AIRPLANES;  
Make sure that the force on the control column is 33 to 44 pounds.
- (h) 767-300 AIRPLANES;  
Make sure that the force on the control column is 56 to 67 pounds.
- (i) Pull the captain's control column aft. Do not let the elevator aft quadrant stops get nearer than 0.10 to 0.20 inch (2.6 to 5.1 mm) of each other.
- (j) 767-200 AIRPLANES;  
Make sure that the force on the control column is 28 to 41 pounds.
- (k) 767-300 AIRPLANES;  
Make sure that the force on the control column is 61 to 72 pounds.
- (l) Hold the captain's control column aft with the elevator aft quadrant stops 0.10 to 0.20 inch (2.6 to 5.1 mm) of each other.
- (m) Move the horizontal stabilizer to 8.5 units of trim.
- (n) 767-200 AIRPLANES;  
Make sure that the force on the control column decreases by 0 to 5 pounds (0 to 22 newtons).
- (o) 767-300 AIRPLANES;  
Make sure that the force on the control column decreases by 16 to 37 pounds (71 to 164 newtons).
- (p) 767-200 AIRPLANES;  
Use the control wheel switches to move the stabilizer to 3 units of trim.
- (q) 767-300 AIRPLANES;  
Use the control wheel switches to move the stabilizer to 2.2 units of trim.
- (r) 767-200 AIRPLANES;  
Make sure that Dimension A on the stabilizer trim ballscrew actuator is 5.50 to 5.56 inches (139.7 to 141.2 mm).
- (s) 767-300 AIRPLANES;  
Make sure that Dimension A on the stabilizer trim ballscrew actuator is 4.15 to 4.21 inches (105.4 to 106.9 mm).
- (t) Pressurize auxiliary pitots systems No. 1 and 2 to 2.60 - 2.7 psig (323-329 knots) (AMM 34-11-00/201).
- (u) Pull the captain's control column aft until the elevator moves 2.57 to 2.68 inches (65.2 to 68.0 mm) from the neutral position.

EFFECTIVITY

ALL

27-31-00

- (v) Make sure that the force on the control column is 25 to 38 pounds.

NOTE: For accurate control column force values, use the procedure that follows: With the elevator at the neutral position, measure travel from a point on the side of the tail cone ( not the index mark). To determine this point, visually extend the elevator trailing edge.

- (w) Push the captain's control column forward until the elevator moves 2.57 to 2.68 inches (65.3 to 68.0 mm) from the neutral position.
- (x) Make sure that the force of the control column is 25 to 38 pounds.
- (y) Remove the power from the right and center hydraulic systems (AMM 29-11-00/201).
- (z) Put the RIGHT and CENTER FLT CONT SHUTOFF TAIL valve switches on the P61 panel to OFF.
- (aa) Pull the captain's control column aft until the elevator moves 2.57 to 2.68 inches (65.3 to 68.0) from the neutral position.
- (ab) Make sure that the force on the control column is 25 to 38 pounds.
- (ac) Push the captain's control column forward until the elevator moves 2.57 to 2.68 inches (65.3 to 68.0 mm) from the neutral position.
- (ad) Make sure that the force on the control column is 25 to 38 pounds.
- (ae) Put the CENTER FLT CONT SHUTOFF TAIL valve switch on the P61 panel to ON.
- (af) Pressurize the center hydraulic system (AMM 29-11-00/201).
- (ag) Remove the power from the left hydraulic system (AMM 29-11-00/201).
- (ah) Put the LEFT FLT CONT SHUTOFF TAIL valve switch on the P61 panel to OFF.
- (ai) Pull the captain's control column aft until the elevator moves 2.57 to 2.68 inches (65.3 to 68.0 mm) from the neutral position.
- (aj) Make sure that the force on the control column is 25 to 38 pounds.
- (ak) Push the captain's control column forward until the elevator moves 2.57 to 2.68 inches (65.3 to 68.0 mm) from the neutral position.
- (al) Make sure that the force on the control column is 25 to 38 pounds.
- (am) Let the control column go to the neutral position.
- (an) Remove the pressure from auxiliary pitot systems No. 1 and 2 (AMM 34-11-00/201).
- (ao) Put the LEFT and RIGHT FLT CONT SHUTOFF TAIL valve switches on the P61 panel to ON.

EFFECTIVITY

ALL

27-31-00

S 735-251

- (3) Do the neutral shift test (767-200 AIRPLANES)
- (a) Pressurize the left and right hydraulic systems and make sure that the center hydraulic system is pressurized (AMM 29-11-00/201).
  - (b) Pressurize auxiliary pitot system No. 2 to 3.47 - 3.80 psig (370-385 knots) (AMM 34-11-00/501).
  - (c) Move the horizontal stabilizer in the airplane nose up direction until the feel unit first moves from the neutral position. This will occur near 8.5 units of trim.
  - (d) Make sure that Dimension A on the stabilizer trim ballscrew actuator is 14.55 to 14.85 inches (369.5 to 377.2 mm) (Fig. 503).
  - (e) Move the horizontal stabilizer such that Dimension A on the stabilizer trim ballscrew actuator is  $3.84 \pm 0.03$  inches (95.7 +/- 0.8 mm) (neutral position).
  - (f) Pull the first officer's control column to the aft column stop.
  - (g) Make sure that the necessary force to pull the control column does not exceed 132 pounds (587 newtons).

NOTE: This may be done with the method that follows:  
Pull the captain's and first officer's control columns at the same time and add the applied forces.

- (h) Hold the first officer's column against the column aft stop.
- (i) Make sure that the elevators move up at least 18.9 inches (480 mm).
- (j) Remove the pressure from auxiliary pitot system No. 2 (Ref 34-11-00).

K. 767-200,300;  
Stick Nudger Test

S 735-252

- (1) Do the stick nudger test (FIM 27-32-00/101).

L. Elevator Autopilot Servo Rods Test

S 735-253

- (1) Do the elevator autopilot servo rods test (AMM 22-12-01/401).

M. Put the Airplane Back to Its Usual Condition

S 085-254

- (1) Remove the force gage and the control wheel adapter.

S 865-329

- (2) Remove power from the left, right, and center hydraulic systems (Ref 29-11-00).

S 865-330

- (3) Remove electrical power if it is not necessary (Ref 24-22-00).

EFFECTIVITY

ALL

27-31-00

S 095-257  
(4) Remove the service platform.

S 415-258  
(5) Close the controls bay access door, 313AL (Ref 06-42-00).

TASK 27-31-00-715-272

5. Single Hydraulic Source - Test

NOTE: This is a scheduled maintenance task.

A. References

27-31-00

S 865-299

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO A PERSON OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (2) Pressurize the left and center hydraulic systems (Ref 29-11-00/201).

D. Do the Test

**NOTE:** A single thumping noise can be heard from a PCA when an elevator is moved full up or full down. This noise is heard only when the direction of movement of the PCA is changed at the end of the stroke. It is caused when the snubbing ring moves in the snubbing gland to change the direction of movement of the piston at the end of the stroke.

S 865-300

- (1) Put the CENTER STAB TRIM SHUTOFF switch on the P10 panel to CUTOFF.

S 865-303

- (2) Move the horizontal stabilizer in the airplane nose-up direction (stabilizer leading edge down) until the elevators start to move from the neutral position.
  - (a) Make sure the elevators start to move at approximately 8.4 units of trim.

S 865-304

- (3) Move the stabilizer to the greenband range.
  - (a) Make sure the elevators go to the neutral position.

E. Put the Airplane Back to Its Usual Condition

S 865-305

- (1) Remove the power from the left and center hydraulic systems if it is not necessary (Ref 29-11-00/201).

S 865-306

- (2) Remove the electrical power if it is not necessary (Ref 24-22-00/201).

EFFECTIVITY

ALL

TASK 27-31-00-735-442

8. Functional Test - Elevator PCA Mis-Rig

A. General

- (1) This task contains a procedure that will detect the gross mis-rig of the elevator PCAs.
  - (a) The outboard PCA is powered by the left hydraulic system.
  - (b) The middle PCA is powered by the right hydraulic system.
  - (c) The inboard PCA is powered by the center hydraulic system.

B. Equipment

- (1) Ruler or Tape Measure - Accurate to 0.1 inch (3 mm)
- (2) Masking Tape

C. References

- (1) AMM 24-22-00/201, Electrical Power - Control
- (2) AMM 27-31-05/601, Elevator PCA Bellcrank Shear Rivet Inspection
- (3) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems
- (4) AMM 27-31-00-501, Adjust the PCA Input Rods

D. Access

- (1) Location Zones

336/346	Inboard Elevator
337/347	Outboard Elevator

E. Prepare for the Gross Mis-rig Inspection

S 865-402

- (1) Supply electrical power (AMM 24-22-00/201).

S 865-439

- (2) Put the LEFT and CENTER STAB TRIM SHUTOFF valve switches on the control stand panel, P10, to the NORM position.

S 865-403

**WARNING:** THE AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. MAKE SURE THAT ALL PERSONS AND EQUIPMENT ARE AWAY FROM THE CONTROL SURFACES BEFORE YOU SUPPLY HYDRAULIC POWER. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR.

- (3) Supply pressure to the left hydraulic system only (AMM 29-11-00/201).

**NOTE:** The stabilizer will move at half the normal speed with only the left hydraulic system pressurized.

EFFECTIVITY

ALL

27-31-00

04

Page 580A  
Dec 22/07

S 865-438

- (4) Put the LEFT, RIGHT, and CENTER FLT CONT SHUTOFF TAIL valve switches on the right side panel, P61, to the ON position.

S 865-404

- (5) Use the control wheel switches to move the horizontal stabilizer to the neutral position (2 units of trim on the position indicator).
  - (a) Ensure that the inboard trailing edge of the elevator is positioned on the elevator index plate.

S 865-405

- (6) Move the LEFT STAB TRIM SHUTOFF and the CENTER STAB TRIM SHUTOFF switches on the control stand panel, P10, to their CUTOUT positions.

S 865-443

- (7) Remove the pressure from the left hydraulic system (AMM 29-11-00/201).

F. Verify the Elevator PCA Rig

S 715-446

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (1) Supply pressure to the right hydraulic system only (AMM 29-11-00/201).

**NOTE:** The right hydraulic system supplies power to the middle PCA.

S 715-437

- (2) Move the elevator from the neutral position to the nose up position and then to the nose down position.
  - (a) Make sure that the elevators move correctly with the control column movement.
  - (b) Move the elevator to the nose down position and then let it go back to center at the neutral position.

**NOTE:** Lightly shake the control column forward and aft to make sure it is centered.

- (c) Put tape on the index plate and make a mark for the position of the top surface of the elevator trailing edge.
  - 1) Make a mark on the tape 1.0 inch (25 mm) above and 1.0 inch (25 mm) below the elevator neutral mark that was just made.

EFFECTIVITY

ALL

27-31-00

04

Page 580B  
Apr 22/06

S 865-436

- (3) Remove the pressure from the right hydraulic system (AMM 29-11-00/201).

S 865-410

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (4) Pressurize the center hydraulic system (AMM 29-11-00/201).

**NOTE:** The center hydraulic system supplies power to the inboard PCA.

S 715-435

- (5) Move the elevator from the neutral position to the nose up position and then back to the nose down position.
- (a) Make sure that the elevators move correctly to the control column movement.
- (b) Move the elevator to the nose down position and then let it go back to center at the neutral position.

**NOTE:** Lightly shake the control column forward and aft to make sure it is centered.

- 1) Verify that the elevator is within the 1.0 inch (25 mm) marks above or below the elevator neutral mark that was made on the tape.

S 865-433

- (6) Remove the pressure from the center hydraulic system. (AMM 29-11-00/201).

EFFECTIVITY

ALL

27-31-00

05

Page 580C

S 865-441

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

(7) Pressurize the left hydraulic system (AMM 29-11-00/201).

**NOTE:** The left hydraulic system supplies power to the outboard PCA.

(a) Allow enough time for the center hydraulic system to drop below 100 psi (690 kPa).

S 715-431

(8) Move the elevator from the neutral position to the nose up position, back to the nose down position, and then back to the neutral position.

(a) Make sure that the elevators move correctly to the control column movement.

1) Verify that the elevator is within the 1.0 inch (25 mm) marks above or below the elevator neutral mark that was made on the tape.

S 865-422

(9) Remove the pressure from the left hydraulic system (AMM 29-11-00/201).

S 215-424

(10) If, in the previous checks, either elevator surface was higher or lower than the 1.0 inch (25 mm) marks above and below the neutral index mark marked on the tape, then do the following:

(a) Elevator PCA Shear Rivet Inspection (AMM 27-31-05/601).

(b) Adjust the Power Control Actuator (PCA) Input Rods (AMM 27-31-00/501).

G. Put the Airplane Back to Its Usual Condition.

S 865-428

(1) Remove the DO-NOT-OPERATE tags and move the FLT CONTROL SHUTOFF TAIL L, R, and C switches on the P61 panel to ON.

S 865-430

(2) Remove electrical power, if it is not necessary (AMM 24-22-00/201).

INBOARD ELEVATOR – REMOVAL/INSTALLATION

1. General

A. This procedure contains steps to remove and install the elevator.

TASK 27-31-01-024-002

2. Remove the Elevator

A. Equipment

- (1) Sling and Equipment, Inboard Elevator (from Inboard/Outboard Sling Equipment – A27012-30):
  - (a) Loadpositioner – commercially available
  - (b) Inboard Sling Assembly – A27012-2
  - (c) Clamp Assembly – A27012-26
  - (d) Hoist Ring Assembly – A27012-5  
(2 are necessary)

B. References

- S 864-003
- (2) Move the horizontal stabilizer to 2.0 units of trim (neutral) as shown on the stabilizer position indicator, located on the control stand panel, P10.
- S 864-004
- (3) Remove the power from the left, right, and center hydraulic systems (Ref 29-11-00).
- S 864-005
- (4) Put the LEFT, RIGHT, and CENTER FLT CONT SHUTOFF TAIL valve switches on the right side panel, P61, to the OFF position.
- S 864-006
- (5) Put the LEFT and CENTER STAB TRIM SHUTOFF valve switches, on the P10 panel, to the CUTOUT position.
- S 864-007
- (6) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
- (a) AIRPLANES WITH ALTERNATE STAB TRIM SWITCHES ON THE CONTROL STAND;  
11A36, ALT STAB TRIM
  - (b) 11C12, STAB TRIM SHUTOFF L
  - (c) 11C13, STAB TRIM SHUTOFF CENTER
  - (d) 11H17, FLT CONT SHUTOFF TAIL LEFT
  - (e) 11H18, FLT CONT SHUTOFF TAIL CTR
  - (f) 11H27, FLT CONT SHUTOFF TAIL RIGHT
- S 494-008
- (7) Connect the sling to the elevator.
- (a) Remove and keep the plug bolts from the upper surface of the elevator to install the inboard and outboard cable rings.
- NOTE: Install the aft clamp assembly 36 inches (91.4 cm) the elevator outboard end.
- S 034-009
- (8) Disconnect the position transmitter rod for the inboard elevator (1, 2, 3) (Fig. 403).
- NOTE: Do not change the length of the rod during or after the removal.

S 034-010

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM THE AREA BELOW THE ELEVATOR. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR IF AN OBJECT FALLS.

- (9) Disconnect the bolts (8) from the links that attach the outboard elevator to the inboard elevator (2) (Fig. 402).

S 014-011

- (10) Remove the access panels and the panel seals that follow (Ref 06-42-00):
- (a) 336BB, 335BB, 335CB, 335DB, 335ADB, 335AEB and 336CB for the left inboard elevator.
  - (b) 346BB, 345BB, 345CB, 345DB, 345ADB, 345AEB and 346CB for the right inboard elevator.

E. Remove the Elevator

S 034-012

- (1) Disconnect the bonding jumpers from the upper skin panel on the elevator (Fig. 401) (Ref 20-10-21).

S 034-013

- (2) Remove the bolts (7, 10) from the elevator hinges.

S 024-014

- (3) Move the elevator (2) straight back and remove it from the airplane.

**NOTE:** Keep a record of all work done to the airplane (for example, paint and repairs) to make sure the operational balance moment is not too high. If the operational balance moment is too high, the elevator can shake during flight. Refer to the Structural Repair Manual (SRM 51-60-02) to find the operational balance moment.

If you use a load positioner, movement of the elevator can be made easier.

TASK 27-31-01-424-042

3. Install the Elevator

F. Prepare for the Installation

S 224-015

- (1) Make sure that the structural attach points do not have too much wear (Ref 27-31-00).

S 224-016

- (2) If a used bolt or bearing is installed, make sure it does not have too much wear (Ref 27-31-00).

S 214-017

- (3) Make sure the seals at the stabilizer trailing edge and between the outboard and inboard elevators are in satisfactory condition.

S 964-018

- (4) Replace all damaged seals.

S 214-019

- (5) Make sure all of the bushings and bolts have the correct fit before you install them.

**NOTE:** If there are burrs or sharp edges in the bushings, remove them and smooth them out.

G. Install the Elevator

S 494-020

- (1) Connect the sling to the elevator.

**NOTE:** If you use a loadpositioner, movement of the elevator can be made easier.

- (a) Remove and keep the plug bolts from the upper surface of the elevator to install the inboard and outboard cable rings.

**NOTE:** Install the aft clamp assembly 36 inches (91.4 cm) from the elevator outboard end.

EFFECTIVITY

ALL

27-31-01

01

Page 410  
Aug 22/05

S 424-021

- (2) Put the elevator (2) at the stabilizer trailing edge.

S 424-022

- (3) Install the bolts (7), washers (5, 6), bushings (3), and nuts (4) in the elevator hinges. Tighten the nuts (4) to 440-650 pound-inches (49.7-73.4 newton-meters) of torque.

S 424-023

- (4) Install the bolt (10), washers (8, 11), and nut (9) in the elevator hinge. Tighten the nut (9) to 440-650 pound-inches (49.7-73.4 Nm) of torque.

S 434-024

- (5) Install the bonding jumpers (Ref 20-10-21/401).

**NOTE:** The bolts (12) are electrical bonding fasteners to the upper skin panels on the elevators.

- (a) Clean mating surfaces for the bonding jumper connection.

S 764-025

- (6) Use a bonding meter to make sure that the resistance of the bonding connection is less than 0.1 ohm (Ref 20-10-21/601).

S 824-044

- (7) Rotate the eccentric pin for best alignment of elevator segments at the trailing edge.

S 424-026

- (8) Install the bolts (8), washers (7, 9), bushing (4), and nuts (5) in the forward and aft interconnect links that attach the outboard elevator to the inboard elevator (Figure 402).

S 424-052

- (9) Install the bolt (11), washers (12,13), and nut (14) in the forward interconnect link (Figure 402).

EFFECTIVITY

ALL

- S 424-051
- (10) Tighten the nut (5), (Figure 402), view A-A to 660-980 pound-inches (75-111 Nm).
- S 424-050
- (11) Tighten the nut (5), (Figure 402), view B-B to 400-510 pound-inches (45-58 Nm).
- S 424-049
- (12) Tighten the nut (14), (Figure 402), to 27-33 pound-inches (3-4 Nm).
- S 434-027
- (13) Install the screw (1), washer (2), and nut (3) that connect the control rod for the position transmitter to the elevator front spar (Fig. 403).

**NOTE:** Do not change the length of the control rod. If the length of the rod was changed, do the adjustment for the elevator position transmitter (Ref 27-38-00).

- S 644-028
- (14) Lubricate the elevator hinge fittings (Ref 12-21-04).
- S 414-029
- (15) Install the access panels that follow (Ref 06-42-00):
- (a) 336BB, 335BB, 335CB, 335DB, 335ADB, 335AEB and 336CB for the left inboard elevator.
  - (b) 346BB, 345BB, 345CB, 345DB, 345ADB, 345AEB and 346CB for the right inboard elevator.

- S 094-030
- (16) Remove the sling from the elevator.

- S 434-031
- (17) Install the bolts you removed from the surface of the elevator where the cable rings for the sling were installed.

#### H. Inboard Elevator Test

- S 864-032
- (1) Supply electrical power (Ref 24-22-00).

- S 214-033
- (2) Make sure that these circuit breakers on the overhead panel, P11, are closed:
- (a) 11J32, EICAS DSPL SELECT

OUTBOARD ELEVATOR – REMOVAL/INSTALLATION

1. General

A. This procedure contains steps to remove and install the outboard elevators.

TASK 27-31-02-004-001

2. Remove the Outboard Elevator (Fig. 401)

A. Equipment

- (1) Sling and Equipment, Outboard Elevator (from Inboard/Outboard Sling Equipment – A27012-30):
  - (a) Load positioner – commercially available.
  - (b) Outboard Sling Assembly – A27012-3
  - (c) Clamp Assembly – A27012-26
  - (d) Hoist Ring Assembly – A27012-5  
(Two are Necessary)

B. References

- (1) AMM 06-42-00/201, Empennage – Access Doors and Panels
- (2) AMM 20-10-21/401, Electrical Bonding
- (3) AMM 27-31-01/401, Inboard Elevator
- (4) SRM 51-60-02

C. Access

- (1) Location Zones
  - 335/345 Horizontal Stabilizer Trailing Edge (Left/Right)
  - 336/346 Inboard Elevator (Left/Right)
  
- (2) Access Panels
 

335DB/345DB	Elevator Control Mechanism
335EB/345EB	Elevator Control Mechanism
335GB/345GB	Elevator Control Mechanism
335HB/345HB	Elevator Control Mechanism
335JB/345JB	Elevator Spar Hinge Fitting
335KB/345KB	Elevator Spar Hinge Fitting
335LB/345LB	Elevator Spar Hinge Fitting
335MB/345MB	Elevator Spar Hinge Fitting
335AFB/345AFB	Elevator Hinges
335AJB/345AJB	Elevator Hinges
335AKB/345AKB	Elevator Hinges
336BB/346BB	Elevator Interconnect Fitting
336CB/346CB	Elevator Interconnect Fitting

D. Prepare for outboard elevator removal.

S 864-002

- (1) Put the LEFT, RIGHT and CENTER FLT CONT SHUTOFF TAIL valve switches on the right side panel, P61, to OFF.

S 864-003

- (2) Put the LEFT and CENTER STAB TRIM SHUTOFF valve switches on the control stand panel, P10, to CUTOUT.

S 864-004

- (3) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
- (a) AIRPLANES WITH ALTERNATE STAB TRIM SWITCHES ON THE CONTROL STAND;  
11A36, ALT STAB TRIM
  - (b) 11C12, STAB TRIM SHUTOFF L
  - (c) 11C13, STAB TRIM SHUTOFF CENTER
  - (d) 11H17, FLT CONT SHUTOFF TAIL LEFT
  - (e) 11H18, FLT CONT SHUTOFF TAIL CTR
  - (f) 11H27, FLT CONT SHUTOFF TAIL RIGHT

S 494-005

- (4) Do these steps to attach the sling to the elevator (Fig. 402):
- (a) Remove the plug bolts from the top surface of the elevator to install the inboard and outboard cable rings. Keep the plug bolts.
  - (b) Install the aft clamp assembly at the location shown.

S 014-006

- (5) Open these access panels (AMM 06-42-00/201):
- (a) For the left outboard elevator: 336BB, 335DB, 335EB, 335GB, 335HB, 335JB, 335KB, 335LB, 335MB, 335AFB, 335AJB, 335AKB, and 336CB.
  - (b) For the right outboard elevator: 346BB, 345DB, 345EB, 345GB, 345HB, 345JB, 345KB, 345LB, 345MB, 345AFB, 345AJB, 345AKB, and 346CB.

E. Remove the Outboard Elevator

S 024-054

**WARNING:** STAY AWAY FROM THE AREA BELOW THE ELEVATORS. OBJECTS CAN FALL AND CAUSE INJURY TO PERSONS AND DAMAGE TO EQUIPMENT.

- (1) Remove the inboard elevator (AMM 27-31-01/401).

**NOTE:** If you use the load positioner, movement of the elevator can be made easier.

S 034-008

- (2) Disconnect the input control rod from the actuator.

**NOTE:** Make sure that the length of the control rod does not change during or after the input control rod is disconnected.

S 034-009

- (3) Remove the nuts, washers, and bolts (5, 4, and 2) from the upper skin panel of the elevator.

EFFECTIVITY

ALL

27-31-02

Page 405  
Apr 22/06

- S 024-056
- (8) Disconnect the Lost Motion Device control rod from the elevator attach point by removing the bolt, washer, and nut.

- S 034-014
- (9) Remove the outboard elevator (1).

**NOTE:** Keep a record of all of the painting and the repairs done to the elevators. This will make sure that the operational balance moment is not exceeded. Flight control surfaces that exceed the operational balance moment can shake during flight. Refer to the Structural Repair Manual (SRM 51-60-02) to determine the operational balance moment.

TASK 27-31-02-404-015

3. Install the Outboard Elevator (Fig. 401)

A. Equipment

- (1) Sling and Equipment, Outboard Elevator  
(From the Inboard/Outboard Sling Equipment - A27012-30):
- (a) Loadpositioner - commercially available
  - (b) Outboard Sling Assembly - A27012-3
  - (c) Clamp Assembly - A27012-26
  - (d) Hoist Ring Assembly - A27012-5  
(Two are Necessary)
- (2) Bonding Meter - Avtron Model T477W, Avtron Manufacturing Inc., Cleveland, Ohio

B. Consumable Materials

- (1) D00633 Grease - BMS 3-33 (Preferred)
- (2) D00015 Grease - BMS 3-24 (Alternate)

336BB/346BB	Elevator Interconnect Fitting
336CB/346CB	Elevator Interconnect Fitting

F. Prepare for Installation

- S 224-016
- (1) Make sure that the points where the elevator attaches to the airplane structure are not worn (AMM 27-31-02/601).
- S 224-017
- (2) If a used bolt or bearing will be installed, make sure it does not have more than the permitted wear (AMM 27-31-02/601).

EFFECTIVITY

ALL

**27-31-02**

03

Page 407  
Apr 22/06

S 644-052

- (3) Apply a thin layer of grease to the elevator hinge bushings and the actuator bolts.

S 214-019

- (4) Make sure that the seals at the locations that follow are not damaged:
- (a) The stabilizer trailing edge
  - (b) The inboard end of the outboard elevator.

S 964-053

- (5) Replace any damaged seals.  
G. Install the Elevator (Fig. 401)

S 434-020

- (1) Before installation, put in all of the bushings and bolts by hand.

**NOTE:** In some cases, burrs that are inside the bushings must be removed and sharp edges must be made smooth.

S 494-021

- (2) Do these steps to attach the sling to the elevator (Fig. 402):
- (a) Remove the plug bolts from the top surface of the elevator to install the inboard and outboard cable rings. Keep the plug bolts.
  - (b) Install the aft clamp assembly at the location shown.

S 944-022

- (3) Move the outboard elevator to the stabilizer trailing edge.

**NOTE:** If you use the loadpositioner, movement of the elevator can be made easier.

EFFECTIVITY

ALL

27-31-02

02

Page 408  
Dec 22/05

- S 434-023
- (4) Install bolts (13), washer (14,15), bushing (17), and nut (16) in the reaction hinges, with head of bolt outboard for left side and right side of the airplane.
- S 434-024
- (5) Install bolt (12), washers (8,11), bushing (10), and nut (9) in the elevator hinge. Tighten nut (9) to 440-650 pound-inches (49.7-73.4 newton-meters).
- S 434-025
- (6) Install bolt (21), washers (18,22), bushing (20), and nut (19) in the elevator hinge. Tighten nut (19) to 440-650 pound-inches (49.7-73.4 newton-meters).
- S 434-026
- (7) Install bolt (28), washers (24,29), bushing (26,27), and nut (25) in the elevator hinge. Tighten nut (25) to 440-650 pound-inches (49.7-73.4 newton-meters).

NOTE: Only finger tighten bushing (26).

- S 434-027
- (8) Install bolts (13), washers (14,15), bushing (17), and nut (16) in the actuator rams with the bolt head outboard for the left side and the right side of the airplane.
- (a) Tighten the nut (16) to 1300-1500 pound-inches (146-169 newton-meters).
- S 424-057
- (9) Reconnect the Lost Motion Device control rod to the elevator attach point by installing the bolt, washer, and nut.

NOTE: Apply grease to the bolt shank before installation.

EFFECTIVITY

ALL

27-31-02

01

Page 409  
Aug 22/05

S 434-028

- (10) Install the bonding jumpers (AMM 20-10-21/401).

NOTE: Bolts (2) are the electrical bonding fasteners to the elevators top skin panels.

- (a) Clean mating surfaces for the bonding jumper connection.

S 224-031

- (11) Use a bonding meter to make sure that the resistance of the bonding jumper connection is not more than 0.1 ohm (AMM 20-10-21/601).

S 434-030

- (12) Move the elevator to the neutral position and install the input control rod bolt with the bolt head on the outboard side.

NOTE: The input control rod stops actuator ram movement.

S 644-032

- (13) Lubricate the elevator hinge fittings (AMM 12-21-04/301).

S 424-033

- (14) Install the inboard elevator (AMM 27-31-01/401).

S 414-034

- (15) Install these access panels (AMM 06-42-00/201):

(a) For the left outboard elevator: 336BB, 335DB, 335EB, 335GB, 335HB, 335JB, 335KB, 335LB, 335MB, 335AFB, 335AJB, 335AKB, and 336CB.

(b) For the right outboard elevator: 346BB, 345DB, 345EB, 345GB, 345HB, 345JB, 345KB, 345LB, 345MB, 345AFB, 345AJB, 345AKB, and 346CB.

S 094-035

- (16) Remove the sling from the elevator.

S 434-036

- (17) Install the plug bolts on the top surface of the elevator.

H. Outboard Elevator Test

S 864-037

- (1) Supply electrical power (AMM 24-22-00/201).

EFFECTIVITY

ALL

27-31-02

03

Page 410  
Apr 22/06

S 214-038

- (2) Make sure that these circuit breakers on the overhead panel, P11, are closed:
- (a) 11L9, LEFT ENGINE OIL PRESS OR LEFT ENGINE OIL PRESS EICAS REF
  - (b) 11L36, RIGHT ENGINE OIL PRESS OR RIGHT ENGINE OIL PRESS \*\* \*\* EICAS REF.

S 864-039

- (3) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:
- (a) AIRPLANES WITH ALTERNATE STAB TRIM SWITCHES ON THE CONTROL STAND;  
11A36, ALT STAB TRIM
  - (b) 11C12, STAB TRIM SHUTOFF L
  - (c) 11C13, STAB TRIM SHUTOFF CENTER
  - (d) 11H17, FLT CONT SHUTOFF TAIL LEFT
  - (e) 11H18, FLT CONT SHUTOFF TAIL CTR
  - (f) 11H27, FLT CONT SHUTOFF TAIL RIGHT

S 864-040

- (4) Put the LEFT and CENTER STAB TRIM SHUTOFF VALVE switches on the control stand panel, P10, to NORM.

S 864-041

- (5) Put the LEFT, RIGHT, and CENTER FLT CONT SHUTOFF valve switches on the right side panel, P61, to ON.

S 864-042

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (6) Supply hydraulic power to the left, right, and center systems (AMM 29-11-00/201).

S 864-043

- (7) Move the stabilizer to two units of trim as shown on the stabilizer position indicator.

S 214-044

- (8) Make sure the control columns are at neutral.

S 864-045

- (9) Slowly move the outboard elevator to the full up position, then to the full down position.

EFFECTIVITY

ALL

27-31-02

02

Page 411  
Apr 22/06

S 214-046

- (10) Let the control column go to the neutral position.

S 214-047

- (11) Make sure the elevator has a smooth and continuous movement.

S 824-048

- (12) If you made any structural or surface repair to the elevator, or replaced the old elevator with a new elevator, or made any changes to any one of the following four systems, then do the adjustments to the following four systems (AMM 27-31-00/501):

- (a) Elevator PCA control rods
- (b) Lost motion device input rod
- (c) Elevator PCA's
- (d) Elevator position transmitter rod.

S 734-049

- (13) Do the Elevator Neutral and Travel Limits Test (AMM 27-31-00/501).

I. Put the Airplane Back to Its Usual Condition

S 864-050

- (1) Remove the power from the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 864-051

- (2) Remove electrical power, if it is not necessary (AMM 24-22-00/201).

EFFECTIVITY

ALL

27-31-02

ELEVATOR INDEX PLATE – REMOVAL/INSTALLATION

1. General

- A. This procedure contains steps to remove and install the elevator index plate.
- B. The steps to remove and install the right index plate are the same as the steps for the left index plate.
- C. It is important to mark the exact location of the initial index plate before removal. If you can not find the location of the initial index plate, it will be necessary to use a special tool to make sure the index plate is installed in the correct location.

TASK 27-31-03-024-001

2. Remove the Elevator Index Plate

A. References

- (1) 06-42-00/201, Empennage Access Doors and Panels
- (2) 24-22-00/201, Electrical Power – Control
- (3) 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems

B. Access

(1) Location Zones

- 211/212 Control Cabin
- 311/312 Area Aft of Pressure Bulkhead to BS 1725
- 315/316 APU Compartment

(2) Access Panels

- 312AR Forward Stabilizer Compartment
- 315AL/316AR Elevator Index Plate Rivets

C. Prepare for the Removal

S 864-002

- (1) Supply electrical power (Ref 24-22-00).

S 864-031

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (2) Pressurize the left and center hydraulic systems (Ref 29-11-00).

S 014-032

**WARNING:** STAY OFF THE SERVICE ACCESS DOOR, 312AR AND THE CONTROLS BAY ACCESS DOOR, 313AL. YOUR WEIGHT CAN RELEASE THE SPRING-LOADED LATCHES ON THE DOOR. IF YOU FALL THROUGH THE DOOR, INJURIES CAN OCCUR.

- (3) Open the access door for the forward stabilizer compartment, 312AR (Ref 06-42-00).

S 864-005

- (4) Move the stabilizer until Dimension A on the stabilizer ballscrew actuator is  $3.84 \pm 0.03$  inches (97.5 +/- 0.762 mm) (neutral position) (Fig. 402).

S 864-006

- (5) Put the LEFT and CENTER STAB TRIM SHUTOFF valve switches on the control stand panel, P10, to the CUTOUT position.

S 864-007

- (6) Put the LEFT, RIGHT and CENTER FLT CONT SHUTOFF TAIL valve switches on the right side panel, P61, to the OFF position.

S 864-008

- (7) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
- (a) AIRPLANES WITH ALTERNATE STAB TRIM SWITCHES ON THE CONTROL STAND;  
11A36, ALT STAB TRIM
  - (b) 11C12, STAB TRIM SHUTOFF L
  - (c) 11C13, STAB TRIM SHUTOFF CENTER
  - (d) 11H17, FLT CONT SHUTOFF TAIL LEFT
  - (e) 11H18, FLT CONT SHUTOFF TAIL CTR
  - (f) 11H27, FLT CONT SHUTOFF TAIL RIGHT

S 014-009

- (8) Open the access doors, 315AL and 316AR, for access to the index plate rivets (Ref 06-42-00).

D. Remove the Elevator Index Plate

S 864-010

- (1) Move the control columns to the full forward position.

S 984-011

- (2) Manually turn the trailing edge of the elevator down, away from the index plate.

EFFECTIVITY

ALL

27-31-03

02

Page 404  
Dec 22/01

S 934-034

- (3) Mark the position of the index plate onto the airplane fuselage.

**NOTE:** The new index plate will need to be installed in the same position as the old index plate.

S 034-012

- (4) Remove the rivets that connect the index plate to the airplane fuselage.

S 024-013

- (5) Remove the index plate.

TASK 27-31-03-424-014

3. Install the Elevator Index Plate

A. Equipment

- (1) Scale to Measure the Linear Dimension (Accurate to  $\pm 0.01$  inch (  $\pm 0.25$  mm)) - Commercially Available

B. Consumable Materials

- (1) A00247 Sealant, Chromate Type - BMS 5-95  
(2) Rivets, Blind, 100 Degree Flush Head - NAS1398D5-3 (Two are necessary)

C. References

- (1) 06-42-00/201, Empennage Access Doors and Panels  
(2) 24-22-00/201, Electrical Power - Control  
(3) 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems

D. Access

- (1) Location Zones  
211/212 Control Cabin  
311/312 Area Aft of Pressure Bulkhead to BS 1725  
315/316 APU Compartment
- (2) Access Panels  
312AR Forward Stabilizer Compartment  
315AL/316AR Elevator Index Plate Rivets

E. Install the Elevator Index Plate (Fig. 401)

S 434-015

- (1) Align the new index plate with the marks made on the fuselage.  
(a) Make sure the rivet holes in the fuselage align with the holes in the index plate.

**NOTE:** If the rivet holes in the fuselage do not align with the holes in the index plate, new holes must be drilled in the index plate using the old index plate as a guide.

EFFECTIVITY

ALL

27-31-03

02

Page 405  
Apr 22/05

S 394-021

- (2) Apply a layer of sealant between the index plate and the airplane fuselage.

S 424-023

- (3) Install the index plate on the airplane fuselage with rivets, NAS1398D5-3.

S 864-016

- (4) Do the steps that follow to move the elevator to the neutral position, with the middle PCA only:

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (a) Pressurize the left, right and center hydraulic systems (Ref 29-11-00).

**NOTE:** The elevator surface will droop if all three hydraulic systems are not pressurized.

- (b) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the overhead panel, P11:  
1) 11H27, FLT CONT SHUTOFF TAIL RIGHT
- (c) Put the RIGHT FLT CONT SHUTOFF TAIL valve switch on the right side panel, P61, to the ON position.
- (d) Move the control column forward and aft quickly 4 to 5 times.

**NOTE:** Move the control column less than one inch about its neutral position.

- (e) Let the control column go to the neutral position.

S 824-017

- (5) Put a straight edge on the top surface of the elevator trailing edge and extend it to the fuselage.

S 824-019

- (6) Make sure that the groove in the index plate aligns with the straight edge (Detail B).

F. Put the Airplane Back to Its Usual Condition

S 864-024

- (1) Remove the power from the left and center hydraulic systems (Ref 29-11-00).

ELEVATOR POWER CONTROL ACTUATOR LOCK TOOL – MAINTENANCE PRACTICES

1. General

- A. This procedure contains steps to remove and install the elevator power control actuator (PCA) locks. These locks are installed when it is necessary to hold the elevator surface in the full up position in order to perform maintenance.

TASK 27-31-05-022-001

2. Install the Elevator Power Control Actuator Lock Tool

A. General

- (1) This task contains two procedures, one to install the elevator power control actuator (PCA) locks and one to remove the elevator power control actuator (PCA) locks.

B. Equipment

- (1) Lock – Elevator Actuator – A27111-11  
(2) Elevator PCA Gage – A27001-3

C. References

- (1) AMM 06-42-00/201, Empennage Access Doors and Panels  
(2) AMM 24-22-00/201, Electrical Power – Control  
(3) AMM 27-61-00/201, Spoiler/Speedbrake Control System  
(4) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems

D. Access

- (1) Location Zones  
211/212 Control Cabin  
335/345 Horizontal Stabilizer, Rear Spar to Trailing Edge
- (2) Access Panels  
335EB/335GB/335HB/335AFB Left Elevator PCAs  
345EB/345GB/345HB/345AFB Right Elevator PCAs

E. Do the procedure.

S 862-002

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM THE AREA BELOW THE ELEVATOR. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR IF AN OBJECT FALLS.

- (1) Supply electrical power (AMM 24-22-00/201).

S 862-003

- (2) Put the LEFT and CENTER STAB TRIM SHUTOFF TAIL valve switches on the control stand panel, P10, to the CUTOUT position.

S 862-004

- (3) Do the steps that follow to remove the hydraulic power:
- (a) Remove the pressure from the left, right, and center hydraulic systems and reservoirs (AMM 29-11-00/201).
  - (b) Put the LEFT, RIGHT, and CENTER FLT CONT SHUTOFF TAIL valve switches on the right side panel, P61, to the OFF position.
  - (c) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
    - 1) 11A36, ALT STAB TRIM
    - 2) 11C12, STAB TRIM SHUTOFF L
    - 3) 11C13, STAB TRIM SHUTOFF CENTER
    - 4) 11H17, FLT CONT SHUTOFF TAIL LEFT
    - 5) 11H18, FLT CONT SHUTOFF TAIL CTR
    - 6) 11H27, FLT CONT SHUTOFF TAIL RIGHT

S 862-005

**WARNING:** DO THE DEACTIVATION PROCEDURE FOR THE SPOILERS OR MOVE ALL PERSONS AND EQUIPMENT AWAY FROM THE SPOILERS. THE SPOILERS CAN RETRACT QUICKLY AND CAUSE INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT.

- (4) Do the deactivation procedure for the spoilers (AMM 27-61-00/201) or move all persons and equipment away from the spoilers.

S 862-063

- (5) Remove electrical power, if it is not necessary (AMM 24-22-00/201).

S 012-006

- (6) Remove these access panels (AMM 06-42-00/201):
- (a) For the left elevator PCAs:  
335EB, 335GB, 335HB, and 335AFB
  - (b) For the right elevator PCAs:  
345EB, 345GB, 345HB, and 345AFB

EFFECTIVITY

ALL

27-31-05

02

Page 203  
Dec 22/05

S 982-067

- (7) In the control cabin, pull either control column aft (Nose Up) to its limit of travel and hold it in this position while performing the following operation.
- (a) Install the elevator bushing assembly lock tool on the middle elevator bellcrank (Fig. 201).

S 982-068

- (8) Slowly release the control column until it stops moving and attach a DO-NOT-OPERATE tag on each control column.

S 032-072

**CAUTION:** DO NOT SUPPLY HYDRAULIC SYSTEM PRESSURE TO ANY ELEVATOR PCA WHEN THE ELEVATOR ACTUATOR LOCKS (A27111-11) ARE INSTALLED. DAMAGE TO ELEVATOR PCAs MAY OCCUR IF ONE OR MORE ELEVATOR PCAs OF A SURFACE OPERATE WITH THE ELEVATOR ACTUATOR LOCKS INSTALLED AT THE SURFACE.

IF THIS PROCEDURE IS BEING REFERENCED BY ANOTHER MAINTENANCE TASK AND THE REMOVAL OF THE ELEVATOR PCA IS NOT REQUIRED, INSTALL THE ELEVATOR LOCK TOOL ON ALL THREE ACTUATORS FOR THE SURFACE THAT IS BEING WORKED ON.

- (9) At the elevator surface that is to be raised and locked, lift the elevator trailing edge up (by hand) the amount necessary to enable installation of the Elevator Actuator Locks. Install the Elevator Actuator Locks on the two PCAs which are not being removed (Fig. 201).

F. Remove the Elevator PCA Locks

S 982-009

- (1) At the elevator surface where Elevator Actuator Locks are to be removed, lift the elevator trailing edge up (by hand) the amount necessary to remove loading from the Elevator Actuator Locks. Remove the Elevator Actuator Locks at each of the elevator PCAs of the control surface (Fig. 201).

S 982-071

- (2) Remove the DO-NOT-OPERATE tags from the control columns.

EFFECTIVITY

ALL

27-31-05

ELEVATOR POWER CONTROL ACTUATOR/REACTION LINK - REMOVAL/INSTALLATION

1. General

- A. This procedure contains steps to remove and install the elevator power control actuators (PCAs) and the reaction link.

TASK 27-31-05-024-001

2. Remove the Elevator PCA and Reaction Link

A. General

- (1) This task contains two procedures, one to remove the elevator power control actuator (PCA), and one to remove the reaction link. Because this task contains two procedures, only the applicable group of steps must be done.

To start one of these procedures, do the "Prepare for the Removal" group of steps. Then, do the group of steps that is necessary to remove the component.

NOTE: The LEFT hydraulic system supplies power to the outboard PCA.  
The CENTER hydraulic system supplies power to the inboard PCA.  
The RIGHT hydraulic system supplies power to the middle PCA.

B. Equipment

- (1) Elevator PCA Gage - A27001-3

C. References

  - 335EB/335GB/335HB/335AFB Left Elevator PCAs
  - 335ANZ/335APZ/335AQZ
  - 345EB/345GB/345HB/345AFB Right Elevator PCAs
  - 345ANZ/345APZ/345AQZ

E. Prepare for the Removal (Fig. 401)

**NOTE:** Missing PCA, rod end and trunnion bearing dust seals are not reasons for removing the PCA. Seals should be replaced at convenience or overhaul. The bearings will generate a small amount of dark colored powder which may be observed at the edge of the bearing lines. This powder is the normal product of the self lubricating bearing liner.

S 434-074

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM THE AREA BELOW THE ELEVATOR. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR IF AN OBJECT FALLS.

- (1) Remove these access panels (AMM 06-42-00/201):
  - (a) For the left elevator PCAs:
    - 1) 335EB, 335GB, 335HB, and 335AFB
    - 2) 335ANZ, 335APZ, and 335AQZ
  - (b) For the right elevator PCAs:
    - 1) 345EB, 345GB, 345HB, and 345AFB
    - 2) 345ANZ, 345APZ, and 345AQZ

S 424-077

- (2) Install the Elevator PCA Actuator Locks (AMM 27-31-05/201)
- F. Remove the Elevator PCA (Fig.401)

S 034-076

**WARNING:** DO NOT REMOVE MORE THAN ONE INPUT CONTROL ROD AT A TIME. AND MAKE SURE THAT THE MOTION LIMITER TOOL IS INSTALLED. IF YOU REMOVE MORE THAN ONE INPUT CONTROL ROD, THE ELEVATOR CAN FALL. THIS CAN CAUSE INJURIES TO PERSONNEL OR DAMAGE TO EQUIPMENT.

**CAUTION:** MAKE SURE THE ENDS OF THE INPUT CONTROL ROD ARE DISCONNECTED. IF ONE END OF THE INPUT CONTROL ROD IS CONNECTED, DAMAGE TO THE BEARING CAN OCCUR TO THAT ROD END.

- (1) Remove the bolts (1, 3), washers (4, 16), nuts (5, 12), and bushing (9) to disconnect the ends of the input control rod (2).

S 034-009

- (2) Remove the input control rod.

NOTE: Do not change the adjustment of the input control rod during the removal/installation procedure.

S 034-014

- (3) Disconnect the hydraulic pressure and return lines from the PCA (15).  
(a) Put plugs in the hydraulic lines and caps on the ports.

S 964-015

- (4) Do the steps that follow to replace the screen (filter) in the PCA hydraulic port, if it is necessary:  
(a) Remove the reducer (17) from the hydraulic port.  
(b) Remove the screen (19) from the reducer (17).  
(c) Install a new screen (19) with new packing (18) in the reducer (17).  
(d) Install the reducer (17) in the PCA hydraulic port and tighten the reducer as follows:  
1) Tighten the reducer to 270-300 pound-inches (30.5-33.9 newton-meters).

S 824-016

- (5) Hold the PCA (15).

NOTE: Each PCA weighs approximately 25 pounds (11.3 Kg).

S 034-017

- (6) Remove the nut (6), washers (7, 10), bolt (11), and bushing (8) from the PCA ram hinge.

NOTE: The PCA can turn down a small distance.

S 034-018

- (7) Remove the four bolts (14) and washers (13) that connect the PCA to the trunnion.

NOTE: Do not remove the shims (21) that are held on the trunnion by screws (20). The thickness of the shims (21) change the adjustment and operation of the elevator control system.

S 024-019

- (8) Remove the PCA (15).

EFFECTIVITY

ALL

Aug 22/07

S 964-020

- (9) If the shims (21) are damaged, install shims with the same thickness as the used shims.

**NOTE:** If you must install new shims, you can use tool No. A27001-3 which is the elevator PCA gage to measure the shim thickness (Fig. 404).

G. Remove the Reaction Link (Fig. 403)

S 034-021

- (1) Remove the elevator PCA (Refer to the Remove the Elevator PCA procedure).

S 824-022

- (2) Hold the reaction link (3) and the trunnion (4) in their correct positions.

S 034-023

- (3) Remove the bolt (9) to disconnect the trunnion (4) from the hanger link.

S 034-024

- (4) Remove the nut (1) to disconnect the reaction link (3) from the bearing.

S 034-025

- (5) Remove the reaction link (3) and the trunnion (4) as an assembly.

S 024-026

- (6) Do the steps that follow to disconnect the reaction link (3) from the trunnion (4):  
(a) Remove the bolts (5) to disconnect the cap (7) from the reaction link (3).

TASK 27-31-05-424-027

3. Install the Elevator PCA and Reaction Link

A. General

- (1) This task contains two procedures, one to install the elevator power control actuator (PCA), and one to install the reaction link. Because this task contains two procedures, only the applicable group of steps must be done.

At the end of the installation do the "Put the Airplane Back to Its Usual Condition" procedure.

**NOTE:** The LEFT hydraulic system supplies power to the outboard PCA.  
The CENTER hydraulic system supplies power to the inboard PCA.  
The RIGHT hydraulic system supplies power to the middle PCA.

B. Consumable Materials

- (1) D00633 Grease - BMS 3-33 (Preferred)
- (2) D00015 Grease - BMS 3-24 (Alternate)

F. Install the Reaction Link (Fig. 403)

S 224-047

- (1) Make sure the wear on the trunnion and reaction link attach points is less than the permitted limits (AMM 27-31-05/601).

S 434-048

- (2) Do the steps that follow to attach the trunnion (4) to the reaction link (3):
  - (a) Put the trunnion (4) into the hole on one side of the reaction link.
  - (b) Install the cap (7) on the trunnion (4).
  - (c) Install the bolts (5) and washers (6) and tighten the bolts as follows:
    - 1) Tighten the bolts (5) to 175-225 pound-inches (19.8-25.4 newton-meters).
  - (d) Install a lockwire to connect the cap and trunnion to the reaction link.

S 434-049

- (3) Install the reaction link on the bearing.

S 434-050

- (4) Install the nut (1) and washer (2) to connect the reaction link to the bearing and tighten the nut as follows:
  - (a) Tighten the nut (1) to 950-1100 pound-inches (107.3-124.2 newton-meters).

S 434-051

- (5) Install the bolt (9), washers (10, 11), nut (12) and bushing (8) to connect the trunnion and reaction link to the hanger link.

S 434-052

- (6) Install the elevator PCA.

G. Install the Elevator PCA (Fig. 401)

S 224-028

- (1) Make sure the PCA attach points are in the permitted wear limits (AMM 27-31-05 601).

S 644-029

- (2) Apply a layer of grease on all of the bolt (14) surfaces.

EFFECTIVITY

ALL

27-31-05

02

Page 411

S 434-030

- (3) Hold the PCA in position and install the bolts (14) and washers (13) and tighten the bolts as follows:
- (a) Tighten the bolts (14) to 175-225 pound-inches (19.78-25.4 newton-meters).

S 824-031

- (4) Carefully align the PCA ram with the lugs on the fitting where the PCA attaches to the elevator.

S 644-032

- (5) Apply a thin layer of grease to the bushing (8).

S 434-033

- (6) Install the bushing (8) in the lug.

**NOTE:** Install bushing (8) in the inboard lug of the elevator attachment.

S 284-055

- (7) Make sure the run-on torque on the nut (6) is 90-400 pound-inches (10.1-45.1 newton-meters).

S 644-034

- (8) Apply a layer of grease to all of the bolt (11) surfaces.

S 434-035

- (9) Install the bolt (11), washer (7), and nut (6) and tighten the nut as follows:
- (a) Make sure you install the bolt (11) with the bolt head outboard for left and right wing actuators.
  - (b) Tighten the nut (6) to 1300-1500 pound-inches (147-169 newton-meters).

S 434-036

- (10) Remove the plugs and caps in the hydraulic lines and ports.

S 644-037

- (11) Apply an assembly lubricant to the hydraulic fittings.

EFFECTIVITY

Aug 22/07

S 434-038

(12) Connect the hydraulic lines to the PCA.

S 644-039

(13) Apply grease to the bushing (9) and bolts (1, 3).

S 434-040

(14) Hold the input control rod (2) in its correct position and install bushing (9), bolts (1, 3), washers (4, 16), and nuts (5, 12).

S 434-067

(15) Remove the Elevator PCA Locks (AMM 27-31-05/201).

S 824-046

(16) Do the steps that follow to adjust the PCA input rod:

**NOTE:** This procedure is applicable if you replaced 1 PCA. If you replaced more than 1 PCA, do the Adjust the Power Control Actuator (PCA) Input Rods (AMM 27-31-00/501).

(a) Do these steps to find the datum position:

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERON, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS AND STABILIZER ARE FULLY POWERED SURFACES. INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- 1) Pressurize the center hydraulic system (AMM 29-11-00/201).
- 2) Make sure the Dimension A (Fig. 405) on the stabilizer trim ballscrew actuator is 3.84 +/-0.03 inches (97.5 +/- 0.762 mm).

**CAUTION:** DO NOT PRESSURIZE THE PITOT SYSTEM MORE THAN 4.75 PSIG (426 KNOTS). DAMAGE CAN OCCUR TO THE AIRPLANE IF YOU PRESSURIZE THE PITOT SYSTEM MORE THAN 4.75 PSIG (426 KNOTS).

- 3) Pressurize the auxiliary pitot systems to 4.0 psig (395 knots) (AMM 34-11-00/201).

**NOTE:** The purpose of pressurizing the auxiliary pitot line is to provide a hard centering force on the cam in the elevator feel and centering unit to make sure that the elevator system is in the neutral position.

- 4) Use the Captain's or the First Officer's control column to move the elevator 10 times.
- 5) Install the applicable rig pin E5 or E6.
- 6) Remove the pressure from the left, center and right hydraulic system (AMM 29-11-00/201).
  - a) Let the trailing edge of the elevator droop at least 0.5 inches (12.7 mm) below the index plate groove.

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERON, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS AND STABILIZER ARE FULLY POWERED SURFACES. INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- 7) Pressurize one of the two hydraulic systems which does not supply power to the PCA you replaced (AMM 29-11-00/201).

**NOTE:** The LEFT hydraulic system supplies power to the outboard PCA.  
The CENTER hydraulic system supplies power to the inboard PCA.  
The RIGHT hydraulic system supplies power to the middle PCA.

- 8) Put tape on the index plate and make a mark for the position of the top surface of the elevator trailing edge.

**NOTE:** This is the datum position.

- 9) Remove the pressure from the applicable hydraulic system (AMM 29-11-00/201).
- (b) Do the steps that follow to adjust the input rod of the PCA you replaced:

EFFECTIVITY

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERON, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS AND STABILIZER ARE FULLY POWERED SURFACES. INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- 1) Pressurize the hydraulic system which supplies power to the PCA you replaced (AMM 29-11-00/201).

**NOTE:** The LEFT hydraulic system supplies power to the outboard PCA.  
The CENTER hydraulic system supplies power to the inboard PCA  
The RIGHT hydraulic system supplies power to the middle PCA.

- 2) Loosen the jamnuts and increase the length of the input rod for the applicable PCA.
  - a) Make sure you move the elevator at least 0.50 inches (12.7 mm) below the bottom of the datum position.
- 3) Adjust the input rod until the elevator is at the bottom of the datum position.

**NOTE:** You must first move the elevator below the bottom of the datum position before you make this last adjustment.

- 4) Use the inspection hole at the rod end of the PCA, to make sure you can see a minimum of half of the rod end threads.

**NOTE:** This will make sure the threads are engaged correctly.

EFFECTIVITY

ALL

27-31-05

01

Page 416  
Aug 22/05

5) Tighten the jamnut.

**NOTE:** Make sure that the elevator does not move from the neutral position when you tighten the jamnut.

- 6) Remove the power from the applicable hydraulic system (AMM 29-11-00/201).
- 7) Remove the pressure from the Captain's auxiliary pitot system (AMM 34-11-00/201).
- 8) Install the lockwires on the applicable input rod.
- 9) Remove the applicable rig pins E5 or E6.

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS AND STABILIZER ARE FULLY POWERED SURFACES. INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (c) Make sure the left, center and right hydraulic systems are pressurized (AMM 29-11-00/201).
- (d) Make sure the horizontal stabilizer is at the neutral position (2 units of trim on the position indicator).
- (e) Make sure that the top surface of the trailing edge on the left and right elevators align with the center of the index plate groove  $\pm 0.05$  inch ( $\pm 1.27$  mm).
- (f) Push the Captain's or the First Officer's control column to the forward stop.
- (g) Make sure the elevators travel 23.5 to 24.5 inches (59.7 to 62.2 cm) down.

**NOTE:** Linear measurement of elevator travel is the straight line distance between these two points:  
- Top corner of the inboard trailing edge of the inboard elevator  
- Center of the forward edge of the index plate groove

- (h) Pull the Captain's or the First Officer's control column to the aft stop.

EFFECTIVITY

ELEVATOR POWER CONTROL ACTUATOR/REACTION LINK INSPECTION/CHECK

1. General

- A. This procedure has illustrations and a wear limit table which show the data for wear limits. There are no procedures for access, removal, or installation of the parts with exception for the Elevator PCA Bellcrank Shear Rivet Inspection. Refer to the Elevator Power Control Actuator/Reaction Link Removal/Installation (AMM 27-31-05/401) for access, removal, or installation of the parts.

**NOTE:** Missing PCA, rod end and trunnion bearing dust seals are not reasons for removing the PCA. Seals should be replaced at convenience on overhaul. The bearings will generate a small amount of dark colored powder which may be observed at the edge of the bearing lines. This powder is the normal product of the self lubricating bearing liner.

D. Access

- (1) Location Zones
  - 335/345 Horizontal Stabilizer, Rear Spar to Trailing Edge
- (2) Access Panels
  - 335EB/335GB/335HB Left Elevator PCA Bellcranks
  - 345EB/345GB/345HB Right Elevator PCA Bellcranks

E. Prepare for Inspection.

S 866-005

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM THE AREA BELOW THE ELEVATOR. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR IF AN OBJECT FALLS.

- (1) Supply electrical power (AMM 24-22-00/201).

S 866-006

- (2) Put the LEFT and CENTER STAB TRIM SHUTOFF valve switches on the control stand panel, P10, to the CUTOUT position.

S 866-007

- (3) Do the steps that follow to remove the hydraulic power:
  - (a) Remove the pressure from the left, right, and center hydraulic systems and reservoirs (AMM 29-11-00/201).
  - (b) Put the LEFT, RIGHT, and CENTER FLT CONTROL SHUTOFF TAIL valve switches on the P61 right side panel to the OFF position.
  - (c) Open these circuit breakers on the P11 Overhead Panel and attach the DO-NOT-CLOSE tags:
    - 1) 11A36, ALT STAB TRIM
    - 2) 11C12, STAB TRIM SHUTOFF LEFT
    - 3) 11C13, STAB TRIM SHUTOFF CENTER
    - 4) 11H17, FLT CNTRL SHUTOFF TAIL LEFT
    - 5) 11H18, FLT CNTRL SHUTOFF TAIL CENTER
    - 6) 11H27, FLT CNTRL SHUTOFF TAIL RIGHT

S 866-008

- (4) Remove electrical power if it is not necessary (AMM 24-22-00/201).

S 016-014

- (5) Remove these access panels (AMM 06-42-00/201).
  - (a) For the left elevator PCAs:
    - 335EB, 335GB, 335HB

27-31-05

- (b) For the right elevator PCAs:  
345EB, 345GB, 345HB

F. Inspect the Elevator PCA Bellcrank

S 216-015

- (1) Inspect the shear rivets of all three PCA bellcrank assemblies by inserting a 0.070 inch (1.78 mm) diameter pin (of #50 drill bit) through the hole of one of the two rivets for each bellcrank.

NOTE: If a 0.070 inch (1.77 mm) diameter pin is unable to penetrate the rivet hole at all, a 0.0595 inch (1.51 mm) diameter pin (or #53 drill bit) may be used for the above inspection. Only use the 0.0595 inch (1.51 mm) diameter pin when the rivet hole diameter is less than 0.070 inches (1.78 mm).

- (a) If penetration depth is 0.50 inches (12.7 mm) or more (measure from the top of the rivet head), the rivets in the bellcrank are in good condition and no more action is required.
- (b) If penetration depth is less than 0.50 inches (12.7 mm), the bellcrank is discrepant and must be replaced (AMM 27-31-06/401)

G. Put the Airplane back to its Usual Condition.

S 416-016

- (1) Install these access panels (AMM 06-42-00/201):
  - (a) For the left elevator PCAs:  
335EB, 335GB, 335HB
  - (b) For the right elevator PCAs:  
345EB, 345GB, 345HB

S 866-009

- (2) Close these circuit breakers on the P11 Overhead Panel and remove the DO-NOT-CLOSE tags:
  - (a) 11A36, ALT STAB TRIM
  - (b) 11C12, STAB TRIM SHUTOFF LEFT
  - (c) 11C13, STAB TRIM SHUTOFF CENTER
  - (d) 11H17, FLT CNTRL SHUTOFF TAIL LEFT
  - (e) 11H18, FLT CNTRL SHUTOFF TAIL CENTER
  - (f) 11H27, FLT CNTRL SHUTOFF TAIL RIGHT

S 866-010

- (3) Put the LEFT, RIGHT, and CENTER FLT CONTROL SHUTOFF TAIL valve switches on the P61 right side panel to the ON position.

S 866-011

- (4) Put the LEFT and CENTER STAB TRIM SHUTOFF valve switches on the Control Stand Panel, P10, to the NORM position.

S 866-012

- (5) Remove electrical power if it is not necessary (AMM 24-22-00/201).

ELEVATOR POWER CONTROL ACTUATOR (PCA) INPUT LINKAGE –  
REMOVAL/INSTALLATION

1. General

- A. This procedure contains steps to remove and install the input linkage on the elevator power control actuators (PCAs).

TASK 27-31-06-024-001

2. Remove the PCA Input Linkage

A. Equipment

- (1) Rig Pins from Rig Pin Set A20004-XX (AMM 20-10-24/201):  
(a) E3 – P/N A20004-17  
(b) E4 – P/N A20004-17  
(c) E7 – P/N A20004-21  
(d) E8 – P/N A20004-21

B. References

- (1) 06-42-00/201, Empennage Access Doors and Panels  
(2) 20-10-24/201, Rig Pins  
(3) 24-22-00/201, Electrical Power – Control  
(4) 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems

C. Access

- (1) Location Zones  
335/345 Horizontal Stabilizer – Rear Spar to Trailing Edge
- (2) Access Panels  
335EB, 335GB, 335HB, 335AFB PCA Linkage on the Left Elevator  
345EB, 345GB, 345HB, 345AFB PCA Linkage on the Right Elevator

D. Prepare for the Removal

S 864-002

- (1) Supply electrical power (AMM 24-22-00/201).

S 864-003

- (2) Put the LEFT and CENTER STAB TRIM SHUTOFF TAIL valve switches on the control stand panel, P10, to the CUTOUT position.

S 864-004

- (3) Remove the power from the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 864-005

- (4) Put the RIGHT, LEFT, and CENTER FLT CONT SHUTOFF TAIL valve switches on the right side panel, P61, to the OFF position.

Apr 22/08

S 864-006

- (5) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
- (a) AIRPLANES WITH ALTERNATE STAB TRIM SWITCHES ON THE CONTROL STAND;  
11A36, ALT STAB TRIM
  - (b) 11C12, STAB TRIM SHUTOFF L
  - (c) 11C13, STAB TRIM SHUTOFF CENTER
  - (d) 11H17, FLT CONT SHUTOFF TAIL LEFT
  - (e) 11H18, FLT CONT SHUTOFF TAIL CTR
  - (f) 11H27, FLT CONT SHUTOFF TAIL RIGHT

S 014-007

- (6) Remove these access panels (AMM 06-42-00/201):
- (a) 335EB, 335GB, 335HB, and 335AFB for the PCA linkage on the left elevator.
  - (b) 345EB, 345GB, 345HB, and 345AFB for the PCA linkage on the right elevator.

S 864-043

- (7) Move elevator surface to the full up position for better access to the bellcranks and input control rods.

**NOTE:** Hold elevator surface in the full up position during maintenance to avoid the surface from drooping over time. (Method to hold surface in up position is up to the operator). If elevator PCA locks are used to hold the surface in the full up position, the elevator bushing assembly lock tool can not be used if removing the center PCA bellcrank. Care should be taken as to not pressure the tall hydraulic systems with PCA bellcrank locks installed, especially without the elevator bushing assembly lock tool not installed.

E. Remove the PCA Input Linkage

S 494-035

**WARNING:** DO NOT SUPPLY HYDRAULIC POWER DURING THE REMOVAL/INSTALLATION OF THE PCA INPUT LINKAGE. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR.

- (1) Install rig pin E3 (left elevator) and E4 (right elevator) into the left and right aft quadrants (AMM 27-31-15/401).

**NOTE:** Manually pulling or pushing the aft quadrants may be required to install the rig pins.

- (2) Install rig pins E7 and E8 in the right and left lost motion devices (AMM 27-31-31/201).##

NOTE: Manually pushing or pulling the lost motion devices may be required to install the rig pins.

S 034-042

- (3) Make sure rig pins E3/E4 and E8/E9 are installed at all times when removing and installing the bellcranks and input rods.

S 034-040

- (4) Make sure no adjustments are made in the control rod assemblies connecting to the inboard, center, and outboard power control actuators.

S 034-009

- (5) Remove the retainer (1).

S 034-034

CAUTION: MAKE SURE THE ENDS OF THE CONTROL ROD ARE DISCONNECTED. IF ONE END OF THE ROD IS CONNECTED, DAMAGE TO THE BEARING CAN OCCUR TO THAT ROD END.

- (6) Remove the bolt (8), bushing (9), washer (10), and nut (11) that connect the bellcrank to the input control rod.

S 034-011

- (7) Disconnect the input control rod (12) at the other end and remove the control rod.

NOTE: Do not change the adjustment of the input control rod during the removal/installation. Also, do not remove the retainer, bellcrank and input control rod from the center linkage if only working on the inboard and outboard linkages.

S 034-012

- (8) Remove the bolt (13), washer (14), and nut (15) that connect the bellcrank to the interconnect rod.

CONTROL COLUMN - REMOVAL/INSTALLATION

1. General

A. This procedure contains steps to remove and install the control columns.

TASK 27-31-10-024-001

2. Remove the Control Column

A. Equipment

- (1) Rig Pins from Set A20004-XX (AMM 20-10-24/201):
  - (a) A1 - P/N A20004-15
- (2) Extraction/Insertion Tool - M15570-20 (Deutsch Company, Electronic Components Division, 700 S. Hathaway, Municipal Airport, Banning, CA 92220)

B. References

- (1) AMM 06-41-00/201, Fuselage Access Doors and Panels
- (2) AMM 20-10-24/201, Rig Pins

C. Access

- (1) Location Zones
  - 113/114 Area Forward of NLG Wheel Well
  - 211/212 Control Cabin
- (2) Access Panel
  - 113AL Forward Equipment Bay

D. Prepare for the Removal (Fig. 401)

S 864-002

- (1) Put the LEFT, RIGHT, and CENTER FLT CONT SHUTOFF TAIL valve switches on the right side panel, P61, to the OFF position.

S 864-003

- (2) To remove the captain's control column, open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
  - (a) 11C25, INTERPHONE CAPT/OBS
  - (b) 11G29, INTERPHONE CAPT/OBS

S 864-004

- (3) To remove the first officer's control column, open these circuit breakers on the P11 panel and attach DO-NOT-CLOSE tags:
  - (a) 11C26, INTERPHONE F/O
  - (b) 11G30, INTERPHONE F/O

S 864-005

- (4) Open these circuit breakers on the P11 panel and attach DO-NOT-CLOSE tags:
  - (a) 11C11, STICK SHAKER L
  - (b) 11H11, LEFT STAB TRIM CONT
  - (c) 11H17, FLT CONT SHUTOFF TAIL LEFT
  - (d) 11H18, FLT CONT SHUTOFF TAIL CTR
  - (e) 11H20, STAB TRIM CONT R

S 864-006

**WARNING:** REMOVE ELECTRICAL POWER FROM THE FLIGHT COMPARTMENT SEAT. THE ACCIDENTAL ELECTRICAL OPERATION OF THE FLIGHT COMPARTMENT SEAT CAN CAUSE INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT.

- (5) Open these circuit breakers on the main power distribution panel, P6, and attach DO-NOT-CLOSE tags:
  - (a) 6H15, CAPT SEAT
  - (b) 6J21, F/O SEAT

S 014-007

- (6) Open the access door for the forward equipment bay, 113AL (AMM 06-41-00/201)

S 494-008

- (7) Install rig pin A1 (Fig. 402)

E. Remove the Control Column (Fig. 401)

S 034-009

- (1) Remove the bracket that is aft of the control column.

S 034-010

- (2) Remove the brush from the base of the control column.

S 034-011

- (3) To remove the captain's control column, disconnect the aileron cables, A1A and A1B, at the turnbuckles.

**NOTE:** Put a tag on the cables to identify them for subsequent cable installation.

S 034-012

- (4) To remove the first officer's control column, disconnect the aileron cables, A2A and A2B, at the turnbuckles.

**NOTE:** Put a tag on the cables to identify them for subsequent cable installation.

S 034-013

- (5) Disconnect the wire leads from terminal block 207.

S 034-014

- (6) Hold the control column and remove the bolts that hold the control column to the torque tube.

211/212	Control Cabin

(2) Access Panel

113AL	Forward Equipment Bay
-------	-----------------------

E. Install the Control Column (Fig. 401)

S 624-017

- (1) Apply a layer of sealant to the bolt threads and the thread end of the shank.

S 434-018

- (2) Hold the control column on the torque tube bracket and install the bolts.

S 164-019

- (3) Remove the sealant that is not necessary from the bolts.

S 434-020

- (4) Install the brush to the base of the control column.

S 434-021

- (5) Install the bracket that is aft of the control column.

S 434-022

- (6) Identify and connect the wire leads to terminal block 207.

Dec 22/00

- S 434-023
- (7) Install wire clamps where they are necessary.
- S 434-024
- (8) To install the captain's control column, connect the aileron cables, A1A and A1B, at the turnbuckles.
- S 434-025
- (9) To install the first officer's control column, connect the aileron cables, A2A and A2B, at the turnbuckles.
- S 824-026
- (10) Adjust the aileron cables (Ref 27-11-00).
- S 714-027
- (11) Move the control column forward and aft and turn the control wheel through full travel.
- (a) Make sure the control column and control wheel move freely.
- S 864-028
- (12) Supply electrical power (AMM 24-22-00/201).
- S 864-029
- (13) Put the LEFT, RIGHT, and CENTER FLT CONT SHUTOFF TAIL valve switches on the P61 panel to the ON position.
- S 714-030
- (14) Make sure the control wheel switches operate the stabilizer correctly (AMM 27-41-01/401).
- S 714-031
- (15) Make sure the autopilot button operates correctly (AMM 22-11-03/401).
- S 714-032
- (16) Make sure the control wheel Push-to-Talk (PTT) switch operates correctly (AMM 23-51-03/401).
- F. Put the Airplane Back to Its Usual Condition
- S 864-033
- (1) Remove electrical power (AMM 24-22-00/201).
- S 864-034
- (2) If you removed the captain's control column, close these circuit breakers on the overhead panel.
- (a) 11C25, INTERPHONE CAPT/OBS
- (b) 11G29, INTERPHONE CAPT/OBS

CONTROL COLUMN TORQUE TUBE - REMOVAL/INSTALLATION

1. General

- A. This procedure has these tasks:
  - (1) A removal of a control column torque tube.
  - (2) An installation of a control column torque tube.
- B. The control column torque tube is referred to as "torque tube" in this procedure.
- C. This procedure is applicable for the captain's and first officer's torque tube.

TASK 27-31-11-004-012

2. Control Column Torque Tube - Removal

A. Equipment

- (1) Rig Pins from Set A20004-XX (AMM 20-10-24/201):
  - (a) E1 - P/N A20004-22

B. References

- (1) AMM 06-41-00/201, Fuselage Access Doors and Panels
- (2) AMM 20-10-24/201, Rig Pins
- (3) AMM 27-31-10/401, Control Column
- (4) AMM 27-41-04/401, Stabilizer Trim Cutoff Switch
- (5) AMM 22-12-03/401, Elevator Control Force Transducer
- (6) AMM 31-35-10/401, Elevator Control Force Transducer.
- (7) AMM 31-31-08/401, Control Column Position Transducer.

C. Access

- (1) Location Zones
  - 113/114 Area Forward of NLG Wheel Well
  - 211/212 Control Cabin
- (2) Access Panel
  - 113AL Forward Equipment Bay

D. Prepare for the Removal

S 864-001

- (1) Put the LEFT, RIGHT, and CENTER FLT CONT SHUTOFF TAIL Valve switches on the right side panel, P61, to the OFF position.

S 014-002

- (2) Open the access door for the forward equipment bay, 113AL (AMM 06-41-00/201).

S 484-003

- (3) If you remove the captain's torque tube, then install the rig pin E2 in the first officer's torque tube (Fig. 401).

ELEVATOR CONTROL TENSION REGULATOR QUADRANT – REMOVAL/INSTALLATION

1. General

- A. This procedure contains steps to remove and install the tension regulator quadrants in the elevator control system.

TASK 27-31-12-024-001

2. Remove the Tension Regulator Quadrant

A. Equipment

- (1) Rig Pins from Set A20004-XX (Ref 20-10-24):
  - (a) E1 – P/N A20004-22
  - (b) E2 – P/N A20004-22
- (2) Service Platform, Control Bay Access Door – A51001-19
- (3) Cable Tension Regulator Holding Tool – PN 965042, SARMA – B.P. 29, 26240 ST./Vallier-Sur-Rhone, France

B. References

- (1) 06-41-00/201, Fuselage Access Doors and Panels
- (2) 06-42-00/201, Empennage Access Doors and Panels
- (3) 20-10-24/201, Rig Pins
- (4) 24-22-00/201, Electrical Power – Control
- (5) 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems

C. Access

- (1) Location Zones
  - 113/114 Area Forward of NLG Wheel Well
  - 211/212 Control Cabin
  - 313/314 Stabilizer Torsion Box Compartment
- (2) Access Panels
  - 113AL Forward Equipment Bay
  - 313AL Controls Bay

D. Prepare for the Removal

- S 864-002
- (1) Supply electrical power (Ref 24-22-00).
- S 214-003
- (2) Make sure the stabilizer is at 2 units of trim on the stabilizer position indicator (neutral position).
- S 214-004
- (3) Make sure the control columns are in the neutral position.
- S 864-005
- (4) Remove the power from the left, right, and center hydraulic systems (Ref 29-11-00).
- S 864-006
- (5) Put the LEFT, RIGHT, and CENTER FLT CONT SHUTOFF TAIL valve switches on the right side panel, P61, to the OFF position.

  - (f) 11H27, FLT CONT SHUTOFF TAIL R

S 014-009

- (8) Open the access door for the forward equipment bay, 113AL (Ref 06-41-00).

S 014-050

**WARNING:** STAY OFF THE SERVICE ACCESS DOOR, 312AR AND THE CONTROLS BAY ACCESS DOOR, 313AL. YOUR WEIGHT CAN RELEASE THE SPRING-LOADED LATCHES ON THE DOOR. IF YOU FALL THROUGH THE DOOR, INJURIES CAN OCCUR.

- (9) Open the access door for the controls bay, 313AL (Ref 06-42-00).

S 094-011

- (10) Install a service platform on the access door for the controls bay, 313AL.

S 094-012

- (11) Install rig pins E1 and E2 in the torque tube for the control column (Fig. 401).

E. Remove the Tension Regulator Quadrant (Fig. 401)

S 494-013

- (1) Install the tension regulator tool between the locking shaft end and the locking cross bar of the tension regulator.

S 034-014

- (2) Loosen these body cables at the aft turnbuckles and release the tension equally in the cable:
- (a) Cables E1A (18) and E1B (12) for the left tension regulator quadrant (16).
  - (b) Cables E2A (17) and E2B (11) for the right tension regulator quadrant (15).

E. Install the Tension Regulator Quadrant (Fig. 401)

S 644-024

- (1) Apply grease to the holes on the structure of the tension regulator quadrant.

S 644-025

- (2) Apply grease to the bearings (6).

S 434-026

- (3) Hold the tension regulator quadrant in its correct position and install the bearing housing (5, 20) on the left and right side.

S 434-027

- (4) Install the bearings (6) and the bearing retainer plate (19) on the left and right side.

S 434-028

- (5) Install the screws (3).

S 434-029

- (6) Safety the screws with a wire (Detail B).

S 434-031

- (7) Connect the control rod (13) to the crank arm (14). Use finger pressure only to install bolt (7).

EFFECTIVITY

ALL

- S 094-037  
(14) Remove rig pins E1, E2, E3 and E4.
- S 494-038  
(15) Make sure that you can easily install rig pins E2 and E3 with light finger pressure only.
- S 094-039  
(16) Remove rig pins E2 and E3.
- S 864-051

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** START ONE HYDRAULIC SYSTEM AT A TIME UNLESS SPECIFIED DIFFERENTLY. HIGH LOADS CAN OCCUR IN THE ELEVATOR, RUDDER, AND STABILIZER STRUCTURES FROM FORCES CAUSED BY INCORRECTLY ADJUSTED POWER CONTROL ACTUATORS. DAMAGE TO EQUIPMENT CAN OCCUR.

- (17) Pressurize the left, right, and center hydraulic systems (Ref 29-11-00).
- S 864-041  
(18) Supply electrical power (Ref 24-22-00).
- S 864-042  
(19) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel, P11:
- (a) AIRPLANES WITH ALTERNATE STAB TRIM SWITCHES ON THE CONTROL STAND;  
11A36, ALT STAB TRIM
  - (b) 11C12, STAB TRIM SHUTOFF L
  - (c) 11C13, STAB TRIM SHUTOFF CENTER

ELEVATOR AFT QUADRANT – REMOVAL/INSTALLATION

1. General

- A. This procedure contains steps to remove and install the elevator aft quadrants.

TASK 27-31-15-024-001

2. Remove the Elevator Aft Quadrant

A. Equipment

- (1) Rig Pins from Set A20004-XX (AMM 20-10-24/201):  
(a) E1 – P/N A20004-22  
(b) E2 – P/N A20004-22  
(c) E5 – P/N A20004-15  
(d) E6 – P/N A20004-15  
(2) Service Platform, Control Bay Access Door – A51001-19  
(3) Cable Tension Regulator Holding Tool – P/N 965042, SARMA – 26240 St. Vallier, France

B. References

- (1) AMM 06-41-00/201, Fuselage Access Doors and Panels  
(2) AMM 06-42-00/201, Empennage Access Doors and Panels  
(3) AMM 20-10-24/201, Rig Pins  
(4) AMM 24-22-00/201, Electrical Power – Control  
(5) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems

C. Access

- (1) Location Zones  
113/114 Area Forward of NLG Wheel Well  
211/212 Control Cabin  
313/314 Stabilizer Torsion Box Compartment  
335/345 Horizontal Stabilizer – Rear Spar to Trailing Edge  
(2) Access Panels  
113AL Forward Equipment Bay  
313AL Controls Bay  
335GB Elevator Mechanism (Left)  
345GB Elevator Mechanism (Right)

D. Prepare for the Removal

- S 864-002  
(1) Supply electrical power (AMM 24-22-00/201).  
S 864-003  
(2) Remove the power from the left, right, and center hydraulic systems (AMM 29-11-00/201).  
S 864-004  
(3) Put the RIGHT, LEFT, and CENTER FLT CONT SHUTOFF TAIL valve switches on the right side panel, P61, to the OFF position.

Page 406  
Apr 22/04

S 034-015

- (3) For the right aft quadrant (9), loosen cables E2A (11) and E2B (6).

NOTE: Decrease the tension equally in the body cables.

S 034-016

- (4) Do the steps that follow to disconnect the cables from the right or left aft quadrants:
- (a) Attach tags to the cables for identification during subsequent installation.
  - (b) Attach cable clamps to hold the cables then disconnect the cables from the aft quadrant.

S 824-017

- (5) Hold the aft quadrants.

S 024-018

- (6) Do the steps that follow to remove the left aft quadrant (8):
- (a) Disconnect these adjustable control rods from the left aft quadrant:

NOTE: Do not change the lengths of the adjustable control rods after you disconnect them.

- 1) The control rod for the left feel unit (1)
  - 2) The control rods for the left and center autopilot actuators (2, 14)
  - 3) The interconnect control rod (4).
- (b) Disconnect the control rod for the summing assembly (7) from the left aft quadrant.
  - (c) Remove the bolt that connects the bearing arm to the lower support structure (Detail E).
  - (d) Remove the bolt that connects the bearing arm to the top support structure (Detail B).
  - (e) Remove the left aft quadrant.

EFFECTIVITY

ALL

- (7) Do the steps that follow to remove the right aft quadrant (9):
- (a) Disconnect these adjustable control rods from the right aft quadrant:

**NOTE:** Do not change the lengths of the adjustable control rods after you disconnect them.

- 1) The control rod for the right feel unit (13)
  - 2) The control rod for the right autopilot actuator (12)
  - 3) The interconnect control rod (4).
- (b) Disconnect the control rod for the summing assembly (10) from the right aft quadrant.
  - (c) Remove the bolt that connects the bearing arm to the lower support structure (Detail E).
  - (d) Remove the bolt that connects the bearing arm to the top support structure (Detail B).
  - (e) Remove the right aft quadrant.

TASK 27-31-15-424-020

3. Install the Elevator Aft Quadrant

A. Equipment

- (1) Rig Pins from Set A20004-XX (AMM 20-10-24/201):
  - (a) E1 - P/N A20004-22
  - (b) E2 - P/N A20004-22
  - (c) E3 - P/N A20004-17
  - (d) E4 - P/N A20004-17
  - (e) E5 - P/N A20004-15
  - (f) E6 - P/N A20004-15
- (2) Service Platform, Control Bay Access Door - A51001-19
- (3) Cable Tensiometer - Commercially Available
- (4) Cable Tension Regulator Holding Tool - P/N 965042, SARMA - 26240 St. Vallier, France

B. Consumable Materials

- (1) D00633 Grease, Corrosion Preventive - BMS 3-33 (Preferred)
- (2) D00015 Grease, Corrosion Preventive - BMS 3-24 (Alternate)

C. References

- (1) AMM 06-41-00/201, Fuselage Access Doors and Panels

E. Install the Elevator Aft Quadrant (Fig. 401)

S 424-021

- (1) Do the steps that follow to install the left aft quadrant (8):
- (a) Move the lower end of the aft quadrant to the lower support.
  - (b) Install the bolt, washers and nuts (Detail E).

NOTE: Do not tighten the nuts.

- (c) Align the top end of the aft quadrant with the top support structure.
- (d) Install the bolt, washers, and nuts and tighten the nuts (Detail B) as follows:
  - 1) Tighten the nut (15) to 60–80 pound-inches (6.78–9.03 newton-meters).
  - 2) Tighten the nut (16) to 30–40 pound-inches (3.39–4.52 newton-meters).
- (e) Tighten the nuts on the lower support structure (Detail E) as follows:
  - 1) Tighten the nut (18) to 30–40 pound-inches (3.4–4.5 newton-meters).
  - 2) Tighten the nut (19) to 60–80 pound-inches (6.78–9.03 newton-meters).
- (f) Make sure that rig pins E1 and E2 are installed (Fig. 402).
- (g) Make sure the tension regulator tool is between the crosshead and the hub of the left tension regulator (Fig. 402).
- (h) Connect cables E1A (3) and E1B (5) to the left aft quadrant.
- (i) Remove the tension regulator tool.
- (j) Adjust the turnbuckles in cables E1A (3) and E1B (5) until the tension regulator indicator shows the correct position (Fig. 404).

- (k) Apply corrosion preventive compound to the turnbuckle threads that you can see.
- (l) Make sure that rig pin E3 can be easily installed with light finger pressure only (Fig. 403).
- (m) Install lock clips on the turnbuckles.
- (n) Connect the control rods for the left and center autopilot actuator (2, 14) to the left aft quadrant.
- (o) Connect the control rod for the left feel unit (1) to the left aft quadrant.
  - 1) Tighten the nuts as follows (Detail G):
    - a) Tighten the nut (20) to 60-80 pound-inches (6.8-9.0 newton-meters).
    - b) Tighten the nut (21) to 30-40 pound-inches (3.39-4.52 newton-meters).
- (p) Connect the interconnect control rod (4).
  - 1) Tighten the nut as follows (Detail C):
    - a) Tighten the nut (17) to 30-40 pound-inches (3.39-4.52 newton-meters).
- (q) Connect the control rod for the summing assembly (7) to the left aft quadrant (8).
- (r) Make sure the threads on the adjustable rod ends engage correctly.
- (s) Make sure you can see the end of the rod ends through the inspection hole.
- (t) Remove rig pins E1 and E2 (Fig. 402).
- (u) Remove rig pin E3 (Fig. 403).
- (v) Make sure that rig pins E2 and E3 can be installed with finger pressure only.
- (w) Remove rig pins E2 E3, E5 and E6.

S 424-022

- (2) Do the steps that follow to install the right aft quadrant (9):
  - (a) Move the lower end of the aft quadrant to the lower support.
  - (b) Install the bolt, washers, and nuts (Detail E).

NOTE: Do not tighten the nuts.

- (c) Align the top end of the aft quadrant with the top support structure.
- (d) Install the bolt washers, and nuts and tighten the nuts as follows:
  - 1) Tighten the nut (15) to 60-80 pound-inches (6.8-9.0 newton-meters).
  - 2) Tighten the nut (16) to 30-40 pound-inches (3.39-4.52 newton-meters).

MAINTENANCE MANUAL

- (e) Tighten the nuts on the lower support structure (Detail E) as follows:
  - 1) Tighten the nut (18) to 30-40 pound-inches (3.4-4.5 newton-meters).
  - 2) Tighten the nut (19) to 60-80 pound-inches (6.8-9.0 newton-meters).
- (f) Make sure that rig pins E1 and E2 are installed (Fig. 402).
- (g) Make sure the tension regulator tool is between the crosshead and the hub of the right tension regulator.
- (h) Connect cables E2A (11) and E2B (6) to the right aft quadrant.
- (i) Remove the tension regulator tool.
- (j) Adjust the turnbuckles in cables E2A and E2B until the tension regulator indicator shows the correct position (Fig. 402).
- (k) Apply corrosion preventive compound to the threads that you can see.
- (l) Make sure that rig pin E4 can be installed with light finger pressure only (Fig. 403).
- (m) Install lock clips on the turnbuckles.
- (n) Connect the control rod for the right autopilot actuator (12) to the right aft quadrant.
- (o) Connect the control rod for the right feel unit (13) to the right aft quadrant.
  - 1) Tighten the nuts as follows (Detail G):
    - a) Tighten the nut (20) to 60-80 pound-inches (6.8-9.0 newton-meters).
    - b) Tighten the nut (21) to 30-40 pound-inches (3.4-4.5 newton-meters).
- (p) Connect the interconnect control rod (4).
  - 1) Tighten the nut as follows (Detail C):
    - a) Tighten the nut (17) to 30-40 pound-inches (3.4-4.5 newton-meters).
- (q) Connect the control rod for the summing assembly (10) to the right aft quadrant (9).
- (r) Make sure the threads on the adjustable rod ends engage correctly.
- (s) Make sure you can see the rod ends through the inspection hole.
- (t) Remove rig pins E1 and E2 (Fig. 402).
- (u) Remove rig pin E4 (Fig. 403).
- (v) Make sure that you can install rig pins E2 and E4 with finger pressure only.
- (w) Remove rig pins E2, E4, E5 and E6.

Page 412  
Apr 22/04

S 864-023

**CAUTION:** DO NOT LET THE PRESSURE GO ABOVE 4.75 PSI (426 KNOTS). THIS WILL PREVENT DAMAGE TO THE FEEL COMPUTER. MAKE PRESSURE CHANGES SUCH THAT THE INDICATED RATE OF CLIMB (OR DESCENT) IS LESS THAN 5000 FEET PER MINUTE FOR THE STATIC SYSTEM AND 300 KNOTS PER MINUTE FOR THE PITOT SYSTEM. APPLICABLE GAUGE SAVER RESTRICTORS OR EQUIVALENT DEVICES MUST BE USED. DAMAGE TO EQUIPMENT CAN OCCUR IF THE PITOT SYSTEM IS NOT PRESSURIZED CORRECTLY.

- (3) Pressurize the captain's auxiliary pitot system to 4.0 psi (393 knots) (AMM 34-11-00/201).

S 864-024

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** START ONE HYDRAULIC SYSTEM AT A TIME UNLESS SPECIFIED DIFFERENTLY. HIGH LOADS CAN OCCUR IN THE ELEVATOR, RUDDER, AND STABILIZER STRUCTURES FROM A FORCE FIGHT CAUSED BY INCORRECTLY ADJUSTED POWER CONTROL ACTUATORS.

- (4) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 864-025

- (5) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel, P11:
- (a) 11A36, ALT STAB TRIM
  - (b) 11C13, FLIGHT CONTROLS STAB TRIM CENTER
  - (c) 11H18, FLT CONT SHUTOFF TAIL CENTER

S 864-051

- (6) Put the CENTER FLT CONT SHUTOFF TAIL valve switch on the right side panel, P61, to the ON position.

S 864-026

- (7) Put the CENTER STAB TRIM SHUTOFF valve switch on the control stand panel, P10, to the NORM position.

Page 413  
Dec 22/01

S 864-027

- (8) Move the stabilizer to 2 units of trim on the stabilizer position indicators (neutral position).

NOTE: Use the alternate STAB TRIM switches on the control stand to do this.

S 864-031

- (9) Shake the left aft quadrant (8) to make sure the feel unit has centered the system.

S 494-032

- (10) Make sure that you can easily install rig pin E3 in the stop arm of the left aft quadrant.

S 094-033

- (11) Remove rig pin E3.

S 864-034

- (12) Shake the right aft quadrant (9) to make sure the feel unit has centered the system.

S 494-035

- (13) Make sure that you can easily install rig pin E4 in the stop arm of the right aft quadrant.

NOTE: If rig pins E3 and E4 cannot be easily installed, adjust the elevator system (AMM 27-31-00/501).

S 094-048

- (14) Remove rig pin E4.

S 864-037

- (15) Remove the pressure from the pitot-static system and remove the pitot tube tool (AMM 34-11-00/201).

S 714-042

- (16) Move the control columns through full travel and do the check that follows:  
(a) Make sure the elevators move correctly with the control column as shown on the elevator position indicators.

F. Put the Airplane Back to Its Usual Condition

S 864-043

- (1) Remove hydraulic power if it is not necessary (AMM 29-11-00/201).

ELEVATOR FEEL UNIT AND FEEL ACTUATOR – REMOVAL/INSTALLATION

TASK 27-31-17-024-001

1. Remove the Elevator Feel Unit and Feel Actuator (Fig. 401)

A. General

- (1) This task contains two procedures, one to remove the elevator feel unit, and one to remove the elevator feel actuator. Because this task contains two procedures, only the applicable group of steps must be done.

To start one of these procedures, do the "Prepare for the Removal Procedure" group of steps. Then, do the group of steps that is necessary to remove the component.

B. Equipment

- (1) Rig pins from Set A20004-XX (AMM 20-10-24/201):
  - (a) E3 – P/N A20004-17
  - (b) E4 – P/N A20004-17
- (2) Service Platform, Control Bay Access Door – A51001-19

C. References

- (1) AMM 06-42-00/201, Empennage Access Doors and Panels
- (2) AMM 20-10-24/201, Rig Pins
- (3) AMM 24-22-00/201, Electrical Power – Control
- (4) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems

D. Access

- (1) Location Zones
  - 211/212 Control Cabin
  - 331/341 Horizontal Stabilizer – Center Section
- (2) Access Panel
  - 313AL Controls Bay

E. Prepare for the Removal

- S 864-002
  - (1) Supply electrical power (AMM 24-22-00/201).
- S 864-003
  - (2) Supply power to the center hydraulic system (AMM 29-11-00/201).

EFFECTIVITY

Apr 22/99

S 864-004

- (3) Move the stabilizer until Dimension A on the stabilizer ballscrew actuator is  $3.84 \pm 0.03$  inches (the stabilizer is at the neutral position) (Fig. 403).

**NOTE:** Use the alternate STAB TRIM levers or switches (as installed) on the control stand to do this.

S 864-008

- (4) Remove the pressure from the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 864-009

- (5) Put the LEFT and CENTER STAB TRIM SHUTOFF valve switches on the control stand panel, P10, to the CUTOUT position.

S 864-010

- (6) Put the RIGHT, LEFT, and CENTER FLT CONT SHUTOFF TAIL valve switches on the right side panel, P61, to the OFF position.

S 864-011

- (7) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
  - (a) 11A36, ALT STAB TRIM
  - (b) 11C12, STAB TRIM SHUTOFF L
  - (c) 11C13, STAB TRIM SHUTOFF CENTER
  - (d) 11H17, FLT CONT SHUTOFF TAIL LEFT
  - (e) 11H18, FLT CONT SHUTOFF TAIL CTR
  - (f) 11H27, FLT CONT SHUTOFF TAIL RIGHT

S 014-022

**WARNING:** STAY OFF THE SERVICE ACCESS DOOR, 312AR, AND THE ACCESS DOOR FOR THE CONTROLS BAY, 313AL. YOUR WEIGHT CAN CAUSE THE SPRING-LOADED LATCHES TO RELEASE. IF YOU FALL THROUGH THE DOOR, INJURY CAN OCCUR.

- (8) Open the access door for the controls bay, 313AL (AMM 06-42-00/201).

S 494-013

- (9) Install a service platform on the access door for the controls bay.
- F. Remove the Elevator Feel Unit

S 024-014

- (1) Do the steps that follow to remove the elevator feel unit:
  - (a) Install rig pins E3 and E4.
  - (b) Disconnect the hydraulic lines (12, 13, 14, 15) from the feel actuator (22) and put caps on the lines and ports.
  - (c) Hold the feel unit (6).

EFFECTIVITY

27-31-17

03

Page 406  
Apr 22/01

(d) Disconnect the control rods (10, 11) from the feel unit (6).

NOTE: Do not move the adjustment sleeve and jamnuts.

(e) Remove the bolts that hold the feel unit (6) to the support structure.

(f) Remove the bolts (7) that connect the neutral shift rod to the feel unit housing.

(g) Remove the feel unit (6).

G. Remove the Elevator Feel Actuator

S 024-015

(1) Do the steps that follow to remove the elevator feel actuator:

(a) Disconnect the hydraulic lines (12, 13, 14, 15) from the elevator feel actuator (22) and put caps on the lines and ports.

(b) Hold the feel actuator (22) and remove the bolts that connect the actuator (22) to the feel unit (6).

(c) Remove the feel actuator (22) from the feel unit (6).

TASK 27-31-17-424-021

2. Install the Elevator Feel Unit and Feel Actuator (Fig. 401)

A. General

(1) This task contains two procedures, one to install the elevator feel unit, and one to install the elevator feel actuator. Because this task contains two procedures, only the applicable group of steps must be done.

To start one of these procedures, do the group of steps that is necessary to install the component. Then, do the "Put the Airplane Back to Its Usual Condition" group of steps.

B. Consumable Materials

(1) Lubricants - Use one of the lubricants that follow:

(a) D00054 Lubricant - Hydraulic System MCS 352B

(b) D00153 Fluid - Hydraulic BMS 3-11

F. Install the Elevator Feel Unit

S 424-020

- (1) Do the steps that follow to install the elevator feel unit:
  - (a) Set the feel unit (6) on the support structure and install the bolts (3), washers (4), and nuts (5).
  - (b) Install the bolts (7), washers (8), and nuts (9) that connect the feel unit housing to the neutral shift control rod.
  - (c) Remove the caps from the hydraulic lines and ports.
  - (d) Apply some assembly lubricant to the hydraulic fittings.
  - (e) Connect the hydraulic lines (12, 13, 14, 15) to the feel unit (6).
  - (f) Connect the control rods (10, 11) to the feel unit (6) with the bolt assembly (17), washer (18), nut (19), washer (20), and nut (21).
    - 1) Tighten the nut (19) to 60-80 pound-inch.
    - 2) Tighten the nut (21) to 30-40 pound-inch.
  - (g) Remove rig pins E3 and E4.

G. Install the Elevator Feel Actuator

S 424-016

- (1) Do the steps that follow to install the elevator feel actuator:
  - (a) Set the elevator feel actuator (22) on the feel unit (6) and install the bolts.
    - 1) Tighten the nut (26) to 30-35 pound-inch.
    - 2) Tighten the nut (27) to 85-100 pound-inch.
    - 3) Tighten the nut (37) to 100-150 pound-inch.
    - 4) Tighten the nut (42) to 85-100 pound-inch.
    - 5) Tighten the nut (43) to 30-35 pound-inch.
  - (b) Remove the caps on the hydraulic lines and ports.
  - (c) Apply some assembly lubricant to the hydraulic fittings.
  - (d) Connect the hydraulic lines (12, 13, 14, 15) to the feel actuator (22).

H. Do a Test of the Elevator Feel Unit or Actuator

S 864-018

- (1) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel, P11:
  - (a) 11A36, ALT STAB TRIM

ELEVATOR FEEL LINE - BLEED PROCEDURE

1. General

- A. This procedure bleeds the hydraulic lines between the Elevator Feel Computer and Elevator Feel Unit.

TASK 27-31-19-872-114

2. Bleed the Elevator Feel Line

A. References

- (1) AMM 34-11-00/201, Pitot-Static System
- (2) AMM 24-22-00/201, Electrical Power - Control
- (3) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems

B. Access

- (1) Location Zones
  - 311/312 Area Aft of Pressure Bulkhead to BS 1725
  - 313/314 Stabilizer Torsion Box Compartment
- (2) Access Panels
  - 312AR Forward Stabilizer Compartment
  - 313AL Controls Bay

C. Prepare for the Procedure

S 862-002

- (1) Supply electrical power (AMM 24-22-00/201).

S 862-122

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO A PERSON OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (2) Pressurize the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 862-006

- (3) Make sure these circuit breakers on the overhead panel, P11, are closed:
  - (a) AIRPLANES WITH ALTERNATE STAB TRIM SWITCHES ON THE CONTROL STAND;
    - 11A36, ALT STAB TRIM
  - (b) 11C12, STAB TRIM SHUTOFF L
  - (c) 11C13, STAB TRIM SHUTOFF CENTER

NEUTRAL SHIFT/OVERRIDE MECHANISM – REMOVAL/INSTALLATION

1. General

- A. The neutral shift / override mechanism will be called the override mechanism in this procedure.
  - (1) Airplanes with a neutral shift mechanism will have a control rod which connects the stabilizer to the neutral shift mechanism at the lower forward end of the unit.
- B. This procedure contains steps to remove and install the neutral shift and override mechanism (767-200 Airplanes), or override mechanism (767-300 Airplanes).

TASK 27-31-21-024-001

2. Remove the Neutral Shift/Override Mechanism

A. Equipment

- (1) Service Platform, Control Bay Access Door – A51001-19

B. References

- (1) 06-42-00/201, Empennage Access Doors and Panels

C. Access

- (1) Location Zones
  - 313/314 Stabilizer Torsion Box Compartment
- (2) Access Panel
  - 313AL Controls Bay

D. Prepare for the Removal

S 864-004

- (1) Put the LEFT and CENTER STAB TRIM SHUTOFF valve switches on the control stand panel, P10, to the CUTOUT position.

S 864-005

- (2) Put the LEFT, RIGHT, and CENTER FLT CONT SHUTOFF TAIL valve switches on the right side panel, P61, to the OFF position.

S 864-006

- (3) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:

D. Access

- (1) Location Zones
  - 335/345 Horizontal Stabilizer - Rear Spar to Trailing Edge
- (2) Access Panels
  - 335HB, 345HB Elevator Control Mechanism
  - 335JB, 345JB Elevator Spar Hinge Fitting and T.E.  
Horizontal Stabilizer

E. Lost Motion Device Installation

S 422-019

- (1) Do these steps to install the lost motion device:
  - (a) Apply grease to the bolts (1, 5, 9, and 13).
  - (b) Install the bolt (5), washer (6), and nut (7) that attach the lost motion device (4) to the brackets.
  - (c) For the left lost motion device, install rig pin E7 and E9 (Fig. 201).
  - (d) For the right lost motion device, install rig pin E8 and E10 (Fig. 201).
  - (e) Install the bolt (1), washer (2), and nut (3) to connect the control rod (16) to the lost motion device.
  - (f) Install the bolt (13), washer (14), and nut (15) to connect the control rod (16) to the lost motion device.
  - (g) Install the bolt (9), washer (10), nut (11) to connect the control rod (8) to the lost motion device.
  - (h) Remove rig pin E7, E8, E9, and E10.

Page 204  
Apr 22/08

S 862-047

- (2) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel, P11:
  - (a) AIRPLANES WITH ALTERNATE STAB TRIM SWITCHES ON THE CONTROL STAND;  
11A36, ALT STAB TRIM
  - (b) 11C12, STAB TRIM SHUTOFF L
  - (c) 11C13, STAB TRIM SHUTOFF CENTER
  - (d) 11H17, FLT CONT SHUTOFF TAIL LEFT
  - (e) 11H18, FLT CONT SHUTOFF TAIL CTR
  - (f) 11H27, FLT CONT SHUTOFF TAIL RIGHT

S 862-029

- (3) Put the LEFT, RIGHT and CENTER FLT CONT SHUTOFF TAIL valve switches on the right side panel, P61, to the ON position.

S 862-030

- (4) Put the LEFT and CENTER STAB TRIM SHUTOFF valve switches on the control stand panel, P10, to the NORM position.

S 822-031

- (5) Do the Lost Motion to PCA Control Rod Adjustment (AMM 27-31-00/501).

S 822-046

- (6) Do the Lost Motion-To-Elevator Control Rod Adjustment (AMM 27-31-00/501).

S 732-036

- (7) Do the Column, Quadrant, and Slave Override Functions Test (AMM 27-31-00/501).

F. Put the Airplane Back to Its Usual Condition

S 412-032

- (1) Install these access panels (Ref 06-42-00):
  - (a) 335HB and 335JB for the left lost motion device on the left elevator.
  - (b) 345HB and 345JB for the right lost motion device on the right elevator.

S 862-033

- (2) Remove electrical power if it is not necessary (Ref 24-22-00).

4. Slave Cable Quadrant Removal

A. Equipment

- (1) Rig Pins from Rig Pin Set A20004-XX  
(Ref 20-10-24):
  - (a) E7 - P/N A20004-21
  - (b) E8 - P/N A20004-21
  - (c) E9 - P/N A20004-21
  - (d) E10 - P/N A20004-22

B. References

- (1) 06-42-00/201, Empennage Access Doors and Panels
- (2) 20-10-24/201, Rig Pins
- (3) 24-22-00/201, Electrical Power - Control
- (4) 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems

C. Access

- (1) Location Zones
  - 335/345 Horizontal Stabilizer - Rear Spar to Trailing Edge
- (2) Access Panels
  - 335HB, 345HB Elevator Control Mechanism
  - 335JB, 345JB Elevator Spar Hinge Fitting and  
T.E. Horizontal Stabilizer

D. Prepare for the Removal

- S 862-023
  - (1) Supply electrical power (AMM 24-22-00/201).
- S 862-024
  - (2) Make sure the pressure is removed from the left, right, and center hydraulic system (AMM 29-11-00/201).
- S 862-025
  - (3) Put the LEFT and CENTER STAB TRIM SHUTOFF switches on the control stand panel, P10, to the CUTOFF position.
- S 862-026
  - (4) Put the RIGHT, LEFT, and CENTER FLT CONT SHUTOFF TAIL valve switches on the right side panel, P61, to the OFF position.
- S 862-027
  - (5) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
    - (a) AIRPLANES WITH ALTERNATE STAB TRIM SWITCHES ON THE CONTROL STAND;  
11A36, ALT STAB TRIM
    - (b) 11C12, STAB TRIM SHUTOFF L

- (f) 11H27, FLT CONT SHUTOFF TAIL RIGHT

S 862-050

- (6) Operate the control column through 4 to 5 cycles to remove the remaining hydraulic pressure.

S 012-029

- (7) Remove these access panels (AMM 06-42-00/201):
  - (a) 335HB and 335JB for lost motion device on the left elevator.
  - (b) 345HB and 345JB for the lost motion device on the right elevator.

E. Slave Cable Quadrant Removal

S 822-042

- (1) For the left lost motion device, install rig pin E7 and E9 (Fig. 201).

S 822-043

- (2) For the right lost motion device, install rig pin E8 and E10 (Fig. 201).

S 022-044

- (3) Do these steps to disconnect the cables from the slave cable quadrant:
  - (a) Attach tags to the cables for identification during subsequent installation.
  - (b) Attach cable clamps to hold the cables then disconnect the cables from the slave quadrant.

S 022-045

- (4) Do these steps to remove the slave quadrant:
  - (a) Remove the nut (9), washer (8), bolt (7) that connect the control rod (6) to the slave cable quadrant.
  - (b) Remove the nut (4), washer (3), and bolt (2) that attach the slave cable quadrant to the bracket.
  - (c) Remove the slave cable quadrant (10).

TASK 27-31-31-422-031

5. Slave Cable Quadrant Installation

A. Equipment

- (1) Rig Pins from Rig Pin Set A20004-XX (AMM 20-10-24/201):
  - (a) E7 - P/N A20004-21
  - (b) E8 - P/N A20004-21

E. Slave Cable Quadrant Installation

S 422-032

- (1) Do these steps to install the slave cable quadrant:
  - (a) Apply grease to the bolts (2 and 7).
  - (b) For the left slave cable quadrant, make sure that rig pin E7 and E9 are installed.
  - (c) For the right slave cable quadrant, make sure that rig pin E8 and E10 are installed.
  - (d) Install the bolt (2), washer (3), and nut (4) that attach the slave cable quadrant (10) to the bracket.
  - (e) Install the bolt (7), washer (8), and nut (9) to connect the control rod (6) to the slave cable quadrant.
  - (f) Connect cables EA0 and EB0 to the slave cable quadrant.
  - (g) Make sure that rig pins E7 and E9 for the left slave cable quadrant and rig pins E8 and E10 for the right slave cable quadrant can be installed with light finger pressure only (Fig. 201).
  - (h) Remove rig pin E7, E8, E9, and E10.

S 822-041

- (2) Do the Slave Cables Adjustment (AMM 27-31-00/501).

S 862-051

- (3) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel, P11:
  - (a) AIRPLANES WITH ALTERNATE STAB TRIM SWITCHES ON THE CONTROL STAND;

ELEVATOR HYDRAULIC FUSE – MAINTENANCE PRACTICES

1. General

- A. This procedure contains steps to remove and install the elevator hydraulic fuses.

TASK 27-31-68-022-001

2. Remove the Elevator Hydraulic Fuses

A. References

- (1) 06-42-00/201, Empennage Access Doors and Panels  
(2) 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems

B. Access

(1) Location Zones

- |         |  |
|---------|--|
| 211/212 | Control Cabin                                  |
| 312/313 | Area Aft of Pressure Bulkhead to BS 1725       |
| 314     | Horizontal Stabilizer – Center Section (Left)  |
| 341     | Horizontal Stabilizer – Center Section (Right) |

(2) Access Panels

- |       |                                   |
|-------|-----------------------------------|
| 312AR | Forward Stabilizer Compartment    |
| 341AZ | Horizontal Stabilizer Compartment |

C. Prepare for the Removal

S 862-002

- (1) Remove the pressure from the left and right hydraulic systems and reservoir (Ref 29-11-00).

S 012-003

**WARNING:** STAY OFF THE SERVICE ACCESS DOOR, 312AR AND THE CONTROLS BAY ACCESS DOOR, 313AL. YOUR WEIGHT CAN RELEASE THE SPRING-LOADED LATCHES ON THE DOOR. IF YOU FALL THROUGH THE DOOR, INJURIES CAN OCCUR.

- (2) Open the access door for the forward stabilizer compartment, 312AR (Ref 06-42-00).

S 012-004

- (3) Open the access door to get access to the horizontal stabilizer compartment, 341AZ (Ref 06-42-00).

D. Remove the Fuses (Fig. 201)

S 022-005

- (1) Do the steps that follow to remove the fuse:
- Remove the hydraulic line clamps for movement of the lines while you remove the fuse.
  - Remove the fuses from the hydraulic lines (2 locations).
  - Put caps on the hydraulic lines.

TASK 27-31-68-422-006

3. Install the Elevator Hydraulic Fuses

A. Consumable Materials

- (1) D00153 Hydraulic Fluid - BMS 3-11

B. References

- (1) 06-42-00/201, Empennage Access Doors and Panels  
(2) 24-22-00/201, Electrical Power - Control  
(3) 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems  
(4) 31-41-00/201, EICAS

C. Access

(1) Location Zones

- |         |  |
|---------|--|
| 211/212 | Control Cabin                                  |
| 312/313 | Area Aft of Pressure Bulkhead to BS 1725       |
| 314     | Horizontal Stabilizer - Center Section (Left)  |
| 341     | Horizontal Stabilizer - Center Section (Right) |

(2) Access Panels

- |       |                                   |
|-------|-----------------------------------|
| 312AR | Forward Stabilizer Compartment    |
| 341AZ | Horizontal Stabilizer Compartment |

D. Install the Fuses (Fig. 201)

S 422-007

- (1) Do the steps that follow to install the fuse:
- Remove the caps from the hydraulic lines.
  - Apply a thin layer of BMS 3-11 to the fittings before you install the fuse.
  - Check the placard for flow direction.
  - Install the new fuses to the hydraulic lines (2 locations).
  - Install the hydraulic line clamps, if you removed them.

E. Test for the Elevator Hydraulic Fuse

S 862-008

- (1) Supply electrical power (Ref 24-22-00).

S 212-009

- (2) Make sure these circuit breakers on the overhead panel, P11, are closed:
- 11H17, FLT CONT SHUTOFF TAIL LEFT

Page 203  
Dec 22/00

- (b) 11L09, LEFT ENGINE OIL PRESS
- (c) 11L36, RIGHT ENGINE OIL PRESS 2

S 862-010

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (3) Supply power to the left hydraulic system (Ref 29-11-00).

S 712-011

- (4) Do these steps to do a test for the hydraulic fuses in the elevator system:
  - (a) Make sure the L FLT CONTROL SHUTOFF TAIL valve switch on the right side panel, P61, is at the ON position.
  - (b) Move the control columns through full travel two times, then let the control columns go to the neutral position.
  - (c) Make sure the elevators move correctly with the control column movement.

S 792-017

- (5) Make sure that there are no leaks at the hydraulic line connections to the fuses.

F. Put the Airplane Back to Its Usual Condition

S 862-012

- (1) Remove the power from the left hydraulic system (Ref 29-11-00).

S 862-013

- (2) Remove electrical power if it is not necessary (Ref 24-22-00).

S 412-014

- (3) Close the access door for the forward stabilizer compartment, 312AR (Ref 06-42-00).

S 412-015

- (4) Close the access door for the horizontal stabilizer compartment, 341AZ (Ref 06-42-00).

STALL WARNING SYSTEM – DESCRIPTION AND OPERATION

1. General (Fig. 1)

- A. The stall warning system provides warning and protection from impending stalls, indication and guidance in windshear conditions, and detection and display of system faults.
- B. In impending stall conditions, the system performs the following functions:
  - (1) Shakes the control columns to alert the flight crew.
  - (2) Nudges the elevator feel unit to force the control columns forward motion (down pitch).
- C. In windshear conditions, the system performs the following functions:
  - (1) Signals data to the Ground Proximity Warning Computer (GPWC) to provide the flight crew with visual and aural warnings (Ref 34-46-00).
  - (2) Controls the maximum pitch limit value which is signaled to the Electronic Flight Instrument System (EFIS). The maximum pitch limit value is displayed on the Electronic Attitude Director Indicator (EADI) to guide the flight crew (Ref 34-22-00).
- D. The system detects faults as follows:
  - (1) The system initiates a self-test following each power up. A WARN ELEX message is displayed on EICAS whenever a fault is detected.
  - (2) A BITE detects and displays internal faults and interface anomalies as alphanumeric codes on the Warning Electronic Unit (WEU) BITE Module.
- E. The stall warning system monitors data inputs from the following systems to perform its functions (Fig. 1):
  - (1) Airplane Mach, true air speed, computed airspeed, and indicated angle of attack from the Air Data System (Ref 34-12-00).
  - (2) LE slat position and motion from Flap/Slat Electronic Units (FSEU) (Ref 27-51-00) and Proximity Switch Electronic Unit (PSEU) (Ref 32-09-00).
  - (3) TE flap position and motion from Flap/Stab Position Modules (FSPM) (Ref 27-51-00).
  - (4) Airplane pitch angle and pitch rate from Inertial Reference System (IRS) (Ref 34-22-00).
  - (5) Speedbrake position from Spoiler Control Modules (SCM) (Ref 27-61-00).
  - (6) Power from power supply modules (Ref 31-51-00).
  - (7) Air/Ground Mode from Air/ground relay system (Ref 32-09-00).
- F. The stall warning system includes the following components:
  - (1) Left and right stick shakers
  - (2) A stick nudger
  - (3) Left and right Stall Warning Computers (SWC's)
  - (4) Left and right STALL test switches
  - (5) WEU BITE module

Apr 22/06

- (1) The left and right stick shakers are 28v dc motor-driven vibrating devices attached to the control column torque tubes under the flight compartment floor.
  - (2) The stick shakers are activated by the SWC's to shake the control columns to warn the flight crew in an impending stall condition. The left stick shaker is activated by the left SWC and the right stick shaker by the right SWC.
  - (3) The stick shakers may be activated on the ground for test purposes by using the STALL L/R test switches.
  - (4) Access to stick shakers is through the forward equipment bay access door.
- B. Stick Nudger (Fig. 3)
- (1) The stick nudger is a 28v dc electric motor-driven linear actuator, mounted on the elevator feel unit.
  - (2) When both SWC's detect an impending stall and the flaps and slats are fully retracted, the stick nudger linear actuator will extend. The extended nudger repositions input levers on the elevator feel unit to apply a nose down force on the control columns through cables attached to the elevator aft quadrants. The force is applied through a spring to permit the pilots to override the input.
  - (3) The nudger will retract when the angle of attack drops below the trip point or when the flaps or slats are operated.
  - (4) Access to the stick nudger is through elevator mechanical linkages access door.
- C. Stall Warning Computers (SWC's) (Fig. 4)
- (1) The two identical SWC's are microprocessor circuit cards located in the Warning Electronics Unit (WEU) P51.
  - (2) The SWC's are powered from the power supply modules. They monitor inputs from the ADC, FSEU, PSEU, FSPM, IRS, SCM, and air/ground relays.
  - (3) In impending stall conditions, the SWC's activate the stick shakers and stick nudger. In windshear conditions, the SWC's provide inputs to the GPWC and EFIS to provide the flight crew with visual and aural warnings and guidance.
  - (4) The SWC's continuously monitor internal faults and interface anomalies. Faults and anomalies are identified by EICAS messages and alphanumeric codes displayed on the WEU BITE module.
  - (5) Access to the SWC's is through main equipment center access door.
- D. STALL Test Switches (Fig. 2)
- (1) The STALL L and R test switches are located on sidewall panel P61 in flight compartment. They are used on the ground to activate the SWC's for system testing.
  - (2) The STALL L test switch activates the left stick shaker. The STALL R switch activates the right shaker. Both switches must be operated to activate the stick nudger.

E. WEU BITE Module (Fig. 4)

- (1) The BITE module is located in the WEU P51 panel, below the SWC's. It is a printed circuit board equipped with faultballs for power supplies A and B, a power reset switch, and two pairs of hex indicators to display fault codes.
- (2) The module displays alphanumeric codes for SWC's internal faults, interface anomalies, airplane configuration, airplane options, and software version.

3. Operation

A. Functional Description (Fig. 5)

- (1) The stall warning system is active in the air, and can be activated on ground by using the STALL test switches.
- (2) In the air, the SWC's monitor and compute data inputs from the interfacing systems and provide functional output signals to the stick shakers, stick nudger, and windshear detection and guidance systems.
- (3) The SWC's will activate the stick shakers and the stick nudger in the air when the airplane computed angle of attack exceeds the computed trip angle of attack of impending stall.
- (4) The two stick shakers operate independently of each other. The left stick shaker is controlled by the left SWC. The right stick shaker is controlled by the right SWC.
- (5) The Stick Nudger R relay gets 28v dc from the L BUS through the Stick Nudger circuit breaker, C1024 (11K10). The stick nudger discrete from the R Stall Warning module supplies a ground to the R relay. The relay closes and supplies 28v dc from the L BUS to the Stick Nudger L relay. The stick nudger discrete from the L Stall Warning module supplies a ground to the L relay and the Stick Nudger operates.
- (6) The SWC's compute a pitch limit value based on the difference between the computed trip angle of attack of impending stall and the airplane computed angle of attack. This value is transmitted to the EFIS, which displays the proper Pitch Limit Indicator (PLI) on the EADI to guide the pilots (Ref 34-22-00).
- (7) The SWC's also transmit the flap position to the GPWC to set the windshear sensitivity level (Ref 34-46-00).
- (8) On the ground, the SWC's can be set to a test mode. They monitor and detect internal faults and interface anomalies and display them on BITE and EICAS.

B. BITE

- (1) Following each power up, the SWC's initiate a self-test of internal faults and interface anomalies. If a fault or anomaly is detected, a WARN ELEX status message will be displayed on EICAS, and the appropriate alphanumeric fault code will be displayed on the WEU BITE module. The WARN ELEX message also indicates power supply modules failure (Ref 31-51-00). If no faults or anomalies are detected after power-up, no EICAS message will appear, and the WEU BITE module will display the system configuration and option code.

MAINTENANCE MANUAL

- (2) The BITE test is operable when the airplane is on the ground and the sign status matrix (SSM) associated with the IA0A ARINC 429 word from the ADC is indicating no computed data (NCD). The test is initiated by operating the STALL L or R test switches. The BITE checks the operation of the stick shakers, stick nudger, cross channel faults, and interface anomalies.

NOTE: If ADC test switch has been engaged the IA0A SSM will not return to NCD until the altimeter and airspeed indications (driven by the ADC test) have returned to zero. This will take at least 15 seconds. If Stall Test is run before the SSM returns to NCD, the hex indicators on the WEU BITE Module will display the interface anomaly code D8 (see below) after the STALL L (R) switch is released.

- (a) The WARN ELEX message will display continuously on EICAS during a BITE test. After the BITE test, the message will not display unless the stall warning system is not normal.
- (b) If the system is not normal, the BITE will display the code for the highest priority fault. Lower priority fault codes will be displayed in order of priority as higher priority faults are corrected. This process will continue until all faults are cleared, when the BITE will display only the airplane configuration and option installed.
- (c) If the system is normal, the stick shakers and stick nudger will operate during the BITE test.
- (d) During a BITE test, the two pairs of hex indicators will illuminate until the test switch is released. After release of test switch, the numeric value of the software version will display for approximately 1 second, followed by either the fault code or the configuration/option code.
- (e) The software version code uses only the numeric digit values between 01-09 and 80-99. This code represents only the software version configuration, and is independent from either the airplane configuration or the option selected.

STALL WARNING SYSTEM – ADJUSTMENT/TEST

1. General

- A. This procedure gives an operational test and a system test of the stall warning system. There are no adjustments for the stall warning system.

TASK 27-32-00-715-004

2. Operational Test – Stall Warning System (Fig. 501, 502)

A. General

- (1) The operational test for the left and right stall warning computers (SWC) is the same. This test is written for the left SWC. When you test the right SWC, replace the left references with the right references in parentheses.

B. References

- (1) AMM 24-22-00/201, Electrical Power – Control  
(2) AMM 27-51-00/201, Trailing Edge Flap System

S 285-009

- (3) Make sure that the trailing edge flaps and the leading edge slats are fully retracted (AMM 27-51-00/201 and AMM 27-81-00/201).

S 285-010

- (4) Make sure that the control columns are centered and are free to move.

S 285-013

- (5) Make sure that the IRS and EFI switches on the instrument source select panel, P1, (P3) are in normal (ALTN legend is not shown).

S 985-014

- (6) Make sure L, R, and C IRS mode select switches, on the inertial reference mode panel, P5, in the NAV position.

(a) Make sure that the Inertial Reference System is aligned (AMM 34-21-00/201).

S 285-199

- (7) Make sure the ECS/MSG display select switch, on the EICAS maintenance panel, P61, is selected.

E. Test the Stall Warning System Operation

S 015-131

- (1) Open the EE bay access panel 119AL to see the WEU BITE.

S 715-125

- (2) Push and hold the L (R) STALL test switch on side panel, P61.

S 285-016

- (3) Make sure that these actions occur:
- (a) The L (R) stick shaker operates.
  - (b) The Windshear Pitch Limit indicator (PLI) is shown on the L (R) EADI
  - (c) All segments on the LEFT (RIGHT) STALL hex display are lighted on the WEU BITE Module (P51), and fault code D9 is shown on the RIGHT (LEFT) STALL hex display.
  - (d) The EICAS status message WARN ELEX is shown.

S 985-017

- (4) Release the L (R) STALL test switch.

  - (b) The PLI is not shown on the L (R) EADI.
  - (c) The EICAS message WARN ELEX is not shown.
  - (d) SAS 050-149;  
The LEFT (RIGHT) STALL hex display on the WEU BITE Module (P51) shows 37.
  - (e) SAS 150-999 AND MTH 275-999;  
The LEFT (RIGHT) STALL hex display on the WEU BITE Module (P51) shows 27.

F. Do the steps that follow for the flap position listed below.

S 865-149

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. OPERATION OF STALL WARNING TEST SWITCHES CAN CAUSE THE SLATS TO MOVE TO THEIR FULLY EXTENDED POSITION. INJURY TO PERSONS AND DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (1) Put the flap lever in the 1-unit detent.

S 865-111

- (2) Hold down the L STALL (R STALL) TEST switch.

S 215-112

- (3) Make sure that the L (R) stick shaker operates.

S 865-113

- (4) Release the L STALL (R STALL) test switch.

S 215-114

- (5) Make sure that the L (R) stick shaker stops.

ELEVATOR POSITION INDICATING SYSTEM – DESCRIPTION AND OPERATION

1. General (Fig. 1)
  - A. Elevator position indication is displayed on the engine indicating and crew alerting system (EICAS) screen. Indication arrows appear when the STATUS button is pushed. The left and right elevator positions are displayed by the left and right arrows respectively. The left and right elevator position indication systems are independent of each other. Each elevator has its own synchro position transmitter. Each position transmitter is attached to the stabilizer rear spar near the fuselage. The position transmitters are connected by a crank and pushrod to the elevator. The position transmitters transmit elevator position to the position indicator.
2. Component Details
  - A. Elevator Position Transmitter (Fig. 1)
    - (1) The elevator position transmitter is a synchro transmitter. The transmitter consists of a stator, rotor, housing assembly, and a shaft assembly. The elevator position transmitter rotor is connected by a crank arm and pushrod to the inboard elevator. Each transmitter is connected to the stabilizer rear spar near the fuselage.
  - B. Elevator Position Indicator (Fig. 1)
    - (1) The elevator position indicator is part of a control surfaces position indicator on the EICAS. The position indicator displays the movement of the elevators, ailerons, and rudder. The indicator accepts signals from the individual position transmitters.
3. Operation (Fig. 1)
  - A. Functional Description
    - (1) Elevator position indication is provided on the EICAS. Elevator position is shown by a control surfaces indicator on the lower EICAS screen. The indicator will appear when the STATUS button is pushed. Two position transmitters, one for each elevator, send elevator position data to the EICAS by electrical signals. The EICAS processes the signals and displays the correct position of the elevator on the screen. The elevator position indicating system is powered by two 28 V AC BUS's. The system is on as long as power is supplied to the airplane.

TASK 27-38-00-825-042

3. Adjustment - Elevator Position Indicating System

A. General

- (1) Three procedures are given to do the fine adjustment of the left and right elevator position transmitters (PROCEDURES 1 and 2 are recommended).
  - (a) PROCEDURE 1 uses airplane power, digital voltmeters and breakout box equipment.
  - (b) PROCEDURE 2 uses an external power supply, digital voltmeter and breakout box equipment.
  - (c) PROCEDURE 3 uses the EICAS computer and communication between the flight deck and the elevators.

B. Equipment

- (1) Breakout Box and Cables, Rigging, Flight Controls Position Sensors (from Breakout Box Equipment A27063-71):

NOTE: This equipment is necessary for adjustment PROCEDURES 1 or 2.

- (a) Breakout Box - A27063-2
- (b) Cable Assemblies - A27063-18 and -19
- (2) Digital Voltmeter (Comercially Available)

NOTE: Two DVMs are recommended for adjustment PROCEDURE 1.

- (3) Power Supply - Powertron Model 5900 (adjustment PROCEDURE 1)
- (4) Rig Pins from Set A20004-XX (Ref 20-10-24):
  - (a) E5 - P/N A20004-15
  - (b) E6 - P/N A20004-15

C. Consumable Materials

- (1) A00247 Sealant - BMS 5-95

- (4) 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems

E. Access

- (1) Location Zones
  - 211/212 Control Cabin
  - 335/345 Horizontal Stabilizer, Rear Spar to Trailing Edge
- (2) Access Panels
  - 335GB/335CB/335DB Power Control Actuators (Left)
  - 345GB/345CB/345DB Power Control Actuators (Right)

F. Prepare for the Adjustment

S 715-020

- (1) Do the operational test for the elevator position indicating system.

S 215-021

- (2) Make sure that the power is removed from the left, right, and center hydraulic systems (Ref 29-11-00).

S 015-022

- (3) Remove these access panels to the power control actuators (Ref 06-42-00):
  - (a) 335GB, 335CB, and 335DB on the left side
  - (b) 345GB, 345CB, and 345DB on the right side

S 495-023

**WARNING:** MAKE SURE THAT RIG PINS E5 AND E6 ARE INSTALLED BEFORE YOU SUPPLY HYDRAULIC POWER. THIS WILL PREVENT INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

THE ELEVATOR POSITION TRANSMITTERS MUST BE ADJUSTED WITH THE ELEVATOR PCAs SUPPLIED WITH POWER.

- (4) Install rig pins E5 and E6 in the middle power control actuator (PCA) bellcranks on the left and right elevators (Fig. 503).

S 865-024

- (5) Supply electrical power (Ref 24-22-00).

EFFECTIVITY

ALL

27-38-00

04

Page 508  
May 10/97

S 865-025

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (6) Pressurize the left, right, and center hydraulic systems (Ref 29-11-00).

S 865-026

- (7) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:  
(a) 11K13, ELEV POS L  
(b) 11K22, ELEV POS R

G. Elevator Position Transmitters Adjustment (PROCEDURE 1)

**NOTE:** See the General paragraph for a description of PROCEDURES 1, 2, and 3.

S 825-027

- (1) Adjust the left elevator position transmitter:  
(a) Disconnect the airplane electrical connector from the transmitter (Fig. 502).  
(b) Connect the -19 cable assembly between the transmitter and the breakout box as shown in Fig. 504.  
(c) Connect the -18 cable assembly between the airplane connector and the breakout box.  
(d) Connect digital voltmeter (DVM) No. 2 to the breakout box at pins 1 (LO) and 2 (HI).  
(e) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:  
1) 11K13, ELEV POS L  
2) 11K22, ELEV POS R  
(f) Make sure that the airplane input voltage is between 24 and 30 volts ac RMS at DVM No. 2.  
(g) Connect DVM No. 1 to the breakout box at pins 4 (SIG HI) and 5 (SIG LO).

**NOTE:** If only one DVM is available do the steps that follow:  
- Remove the DVM from the DVM No. 2 position after the airplane input voltage is found  
- Connect it at the DVM No. 1 position.

- (h) Adjust the transmitter control rod at the adjusting nut (Fig. 502) until the output voltage is  $0.0 \pm 0.05$  volt ac RMS at DVM No. 1.

EFFECTIVITY

ALL

27-38-00

03

Page 509  
Dec 22/01

- (i) Make sure that the threads are engaged correctly on the control rod (Fig. 502).

NOTE: Turn the transmitter body in the bracket if necessary to correctly engage the thread and have the correct voltage. If the transmitter is turned, tighten the fasteners and apply sealant.

- (j) Put lockwire on the adjusting nut.
- (k) Make sure that the output voltage is  $0.0 \pm 0.05$  volt ac RMS at DVM No. 1.
- (l) Open these circuit breakers on the P11 panel and attach DO-NOT-CLOSE tags:
  - 1) 11K13, ELEV POS L
  - 2) 11K22, ELEV POS R
- (m) Disconnect the DVMs, cables, and breakout box.
- (n) Connect the airplane electrical connector to the transmitter connector.

S 825-028

- (2) Adjust the right elevator position transmitter.

NOTE: The right elevator position transmitter adjustment procedure is the same as the left elevator position transmitter adjustment procedure.

S 715-029

- (3) Do the operational test for the elevator position indication system.
- H. Adjust the elevator position transmitters (PROCEDURE 2)

NOTE: Refer to the General paragraph for a description of PROCEDURES 1, 2 and 3.

S 825-030

- (1) Adjust the left elevator position transmitter as follows:
  - (a) Disconnect the airplane electrical connector from the transmitter (Fig. 502).
  - (b) Connect the -19 cable assembly between the transmitter and the breakout box as shown in Fig. 504.
  - (c) Adjust the power supply to  $26 \pm 0.02$  volts ac RMS.
  - (d) Connect the power supply to the breakout box at pins 1 (LO) and 2 (HI).
  - (e) Connect the digital voltmeter (DVM) to the breakout box at pins 4 (SIG HI) and 5 (SIG LO).
  - (f) Adjust the transmitter control rod at the adjusting nut (Fig. 502) until the output voltage is  $0.0 \pm 0.05$  volt ac RMS at the DVM.

EFFECTIVITY

ALL

27-38-00

03

Page 510  
May 10/97

- (g) Make sure that the threads are engaged correctly on the control rod (Fig. 502).

NOTE: Turn the transmitter body in the bracket if necessary to correctly engage the thread and have the correct voltage. If the transmitter is turned, tighten the fasteners and apply sealant.

- (h) Put lockwire on the adjusting nut.  
(i) Make sure that the output voltage is  $0.0 \pm 0.05$  volt ac RMS at the DVM.  
(j) Disconnect the power supply, DVM, cable, and breakout box.  
(k) Connect the airplane electrical connector to the transmitter connector.

S 825-031

- (2) Adjust the right elevator position transmitter.

NOTE: The right elevator position transmitter adjustment procedure is the same as for the left elevator position transmitter adjustment procedure.

S 215-039

- (3) Do the operational test for the elevator position indicating system.  
I. Adjust the elevator position transmitters (PROCEDURE 3)

NOTE: Refer to the General paragraph for a description of PROCEDURES 1, 2 and 3.

S 825-032

- (1) Adjust the left elevator position transmitter:  
(a) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:  
1) 11K13, ELEV POS L  
2) 11K22, ELEV POS R  
(b) Make sure the initial adjustment of the control rod is as shown (Fig. 502).  
1) Adjust the control rod if it is necessary.  
(c) If a further adjustment is necessary, do these steps:  
1) Push the STATUS DISPLAY switch on the P9 panel (Fig. 501).  
2) Loosen the screws that hold the transmitter body in the bracket.

EFFECTIVITY

ALL

27-38-00

03

Page 511  
Aug 22/02

- 3) Turn the transmitter body until the elevator position indicators align with the middle tick mark plus or minus 1/2 arrow width.

NOTE: You can make a slight fine adjustment with the pushrod, but make sure the threads are correctly engaged on the control rod (Fig. 502).

- 4) Tighten the screws that hold the position transmitter in the bracket.
- 5) Apply sealant to the transmitter body.
- 6) Make sure that the elevator position is shown correctly on the EICAS display.
- 7) Safety the adjusting nut with a wire.

S 825-033

- (2) Adjust the right elevator position transmitter.

NOTE: The right elevator position transmitter adjustment procedure is the same as the left elevator position transmitter adjustment procedure.

#### J. Put the Airplane Back to Its Usual Condition

S 865-034

- (1) Remove the power from the left, right and center hydraulic systems (Ref 29-11-00).

S 095-035

- (2) Remove rig pins E5 and E6 (Fig. 503).

S 415-036

- (3) Close these access panels to the power control actuators (Ref 06-42-00):
  - (a) 335GB, 335CB, and 335DB on the left side
  - (b) 345GB, 345CB, and 345DB on the right side

S 865-037

- (4) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:
  - (a) 11K13, ELEV POS L
  - (b) 11K22, ELEV POS R

S 865-040

- (5) Remove electrical power if it is not necessary (Ref 24-22-00).

B. Access

- (1) Location Zones
  - 211/212 Control Cabin
  - 335/345 Horizontal Stabilizer - Rear Spar to Trailing Edge
- (2) Access Panels
  - 335CB/335ADB Elevator Position Transmitter (Left)
  - 345CB/345ADB Elevator Position Transmitter (Right)

C. Prepare for the Removal

- S 864-002
  - (1) Supply electrical power (Ref 24-22-00).
- S 864-003
  - (2) Remove the pressure from the left, right, and center hydraulic systems (Ref 29-11-00).
- S 864-004
  - (3) Put the RIGHT, LEFT, and CENTER FLT CONT SHUTOFF TAIL valve switches on the right side panel, P61, to the OFF position.
- S 864-005
  - (4) Put the LEFT and CENTER STAB TRIM SHUTOFF valve switches on the control stand panel, P10, to the CUTOUT position.
- S 864-006
  - (5) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
    - (a) AIRPLANES WITH ALTERNATE STAB TRIM SWITCHES ON THE CONTROL STAND;
      - 11A36, ALT STAB TRIM
    - (b) 11C12, STAB TRIM SHUTOFF L
    - (c) 11C13, STAB TRIM SHUTOFF CENTER
    - (d) 11H17, FLT CONT SHUTOFF TAIL LEFT
    - (e) 11H18, FLT CONT SHUTOFF TAIL CTR
    - (f) 11H27, FLT CONT SHUTOFF TAIL RIGHT

**WARNING:** DO THE DEACTIVATION PROCEDURE FOR THE SPOILERS OR MOVE ALL PERSONS AND EQUIPMENT AWAY FROM THE SPOILERS. THE SPOILERS CAN RETRACT QUICKLY AND CAUSE INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT.

- (6) Do the deactivation procedure for the spoilers (Ref 27-61-00) or move all persons and equipment away from the spoilers.

S 864-008

- (7) Remove electrical power if it is not necessary (Ref 24-22-00).

S 014-009

- (8) Remove these access panels for the elevator position transmitters (Ref 06-42-00):  
(a) 335CB and 335ADB for the left elevator position transmitter  
(b) 345CB and 345ADB for the right elevator position transmitter

D. Remove the Elevator Position Transmitter (Fig. 401)

S 034-010

- (1) Disconnect the electrical connector.

S 034-049

- (2) AIRPLANES WITH BONDING JUMPERS;  
Disconnect the bonding jumper from the transmitter.

S 164-012

- (3) Remove the sealant between the transmitter bracket and the airplane structure.

S 164-013

- (4) Remove the sealant from the screws that attach the transmitter bracket to the stabilizer.

S 034-014

- (5) Remove the nut, washer, and screw that hold the control rod to the crank.

S 034-015

- (6) Remove the nuts, washers, and screws that hold the bracket arm to the stabilizer.

S 024-016

- (7) Remove the transmitter from the bracket.

  - 345CB/345ADB Elevator Position Transmitter (Right)

**D. Install the Elevator Position Transmitter (Fig. 401)**

S 144-018

- (1) Prepare the mating surfaces between the bracket and the stabilizer to make sure there is a good electrical bond (Ref 20-10-22).

S 144-019

- (2) Prepare the mating surfaces between the transmitter and the bracket for a good electrical bond (Ref 20-10-22).

S 424-020

- (3) Install the transmitter in the bracket with the zero electrical index mark on the housing aligned in the bracket (View B-B).

S 434-021

- (4) Install the screws that hold the transmitter to the bracket and tighten the screws as follows:
  - (a) Tighten the screws to 30-35 pound-inches (3.4 - 4.0 Nm).

S 434-022

- (5) Install the crank on the transmitter shaft with the zero electrical index mark on the shaft aligned with the hole in the crank (View B-B) and tighten the screw.

S 434-023

- (6) Install the bracket to the stabilizer.

S 394-024

- (7) Apply a fillet of sealant around the sides of the bracket.

S 394-025

- (8) Apply a layer of sealant on the screw heads and nuts that attach the transmitter bracket to the stabilizer.

HORIZONTAL STABILIZER TRIM CONTROL SYSTEM – DESCRIPTION AND OPERATION

1. General (Fig. 1)

- A. The horizontal stabilizer is a moveable airfoil which trims the airplane longitudinally. Its overall function is to alter its angle of attack during flight, as necessary, to keep the airplane in a condition of maneuvering and speed stability. The system performs the functions of: 1) transmitting the control commands; 2) moving the stabilizer as commanded; and 3) sensing the resulting stabilizer angle.
- B. AIRPLANES WITH STAB TRIM LEVERS ON THE CONTROL STAND; the horizontal stabilizer control system is controlled by either electrical or manual inputs. These inputs are received by two stabilizer trim control modules (STCM's). The left and center hydraulic systems supply hydraulic power to the STCM's. From the inputs the STCM's receive, they regulate fluid flow to two hydraulic motors which power a ballscrew actuator. The ballscrew actuator moves the stabilizer about its center section pivot points.
- C. AIRPLANES WITH ALTERNATE STAB TRIM SWITCHES ON THE CONTROL STAND; the stabilizer control system is controlled by electrical inputs. These inputs are received by two stabilizer trim control modules (STCM's). The left and center hydraulic systems supply hydraulic power to the STCM's. From the inputs the STCM's receive, they regulate fluid flow to two hydraulic motors which power a ballscrew actuator. The ballscrew actuator moves the stabilizer about its center section pivot points.
- D. AIRPLANES WITH STAB TRIM LEVERS ON THE CONTROL STAND; the stabilizer trim control system has three modes of control, two electrical and one manual. The manual mode of control is provided by the stabilizer trim levers located on the left side of the control stand. The electrical modes of control are: 1) the autopilot control through the flight control computers; and 2) the manual electric trim switches on the control wheels.
- E. AIRPLANES WITH ALTERNATE STAB TRIM SWITCHES ON THE CONTROL STAND; the stabilizer trim control system has three modes of control, all electrical. The modes of control are: 1) the autopilot control through the flight control computers; 2) the manual electric trim switches on the control wheels; and 3) the alternate stabilizer trim switches on the left side of the control stand.
- F. Stabilizer trim position is displayed on two indicators located on the control stand. The indicators receive their inputs from three limit switch and position transmitter modules (LSTM's) located beneath the forward end of the stabilizer. The stabilizer trim indicating system is covered in AMM 27-48-00/001.

- G. The term stabilizer neutral position is used during many stabilizer and elevator control system maintenance procedures. Neutral is the position at which the stabilizer is level with the earth. It is not a centered or detented position. The stabilizer is at the neutral position when dimension A on the ballscrew actuator is 3.84 ±0.03 inches (97.5 +/- 0.8 millimeters) (Fig. 6), which is approximately 2 units of trim on the stabilizer position indicators. Neutral is the stabilizer position at which most stabilizer and elevator control system component adjustments are made.
- H. Fault indication of the stabilizer control system is provided by the caution and warning system. Indication of electric trim system failures is accomplished by discrete outputs sent by the stabilizer trim/aileron lockout module (SAM) to the flight deck caution and warning system and EICAS computer.
- I. Description and operation of the SAM is covered in this section. Removal and installation of the SAM is covered in AMM 27-09-00/201.
- J. Functional Mode Priority (Fig. 2)
- (1) AIRPLANES WITH STAB TRIM LEVERS ON THE CONTROL STAND;  
the stabilizer trim control system has three modes of control. They are the manual control mode, the manual electric control mode, and the autopilot control mode. The manual control mode (STAB TRIM control levers) override all electric control. The manual electric control mode (stabilizer trim control wheel switches) override all electric control except when all three autopilots are operating for the autoland function. The autopilot control mode (flight control computers (FCC)) is the primary electric control.
  - (2) AIRPLANES WITH ALTERNATE STAB TRIM SWITCHES ON THE CONTROL STAND;  
the stabilizer trim control system has three modes of control. They are the alternate electric control mode, the manual electric control mode, and the autopilot control mode. The alternate electric control mode (ALTERNATE STABILIZER TRIM SWITCH) has equal priority with the other two modes. The manual electric control mode (stabilizer trim control wheel switches) override all electric control except when all three autopilots are operating for the autoland function. The autopilot control mode (flight control computers (FCC)) is the primary electric control.

- (1) Two sets of dual switches, located in the captain's and first officer's control wheels, control the stabilizer trim system in the manual-electric control mode. Each set provides manual electric arm and control trim signals to the SAM. Both signals are necessary for operation. The switches are spring-loaded to the off position. The two switches in each set are mounted side-by-side on the control wheel so both can be actuated simultaneously with one thumb.
- B. Stabilizer Trim Cutoff Switches (Fig. 4)
- (1) 767-200 AIRPLANES;  
Three single-pole single-throw switches are installed below each control column. These switches interrupt the electric trim commands in the event of a runaway stabilizer. The switches employ a pilot's natural reaction to correct a runaway condition. A column forward movement (greater than 2.2° to 2.7°) in response to an unscheduled nose-up maneuver will open a switch in the airplane nose-up stabilizer command circuit. A column aft action (greater than 2.0° to 2.5° or 3.0° to 3.5° depending on neutral shift status) will open a switch in the airplane nose-down command circuit.
  - (2) 767-300 AIRPLANES;  
Two single-pole single-throw switches are installed below each control column. These switches interrupt the electric trim commands in the event of a runaway stabilizer. The switches employ a pilot's natural reaction to correct a runaway condition. A column forward movement (greater than 2.2° to 2.7°) in response to an unscheduled nose-up maneuver will open a switch in the airplane nose-up stabilizer command circuit. A column aft action (greater than 2.0° to 2.5°) will open a switch in the airplane nose-down command circuit.
- C. Stabilizer Trim Shutoff Switches (Fig. 3)
- (1) The shutoff switches control motor-operated hydraulic shutoff valves in the STCM's. The two guarded switches are mounted on the control stand, one for each of the STCM's. The left shutoff switch controls the left STCM and the right shutoff switch controls the right STCM.

- (1) The control stand is equipped with two STAB TRIM control levers. The levers are connected to the STCM's by mechanical cables.
  - (2) The right lever operates the "arm" hydraulic valve and the left lever operates the "control" hydraulic valve. When both levers are moved forward, an airplane nose DOWN command is given. When both levers are moved aft, an airplane nose UP command is given. The levers will return to neutral when released. Uneven levers indicate bad cable rigging.
  - (3) The right lever rotates a cam which actuates stabilizer trim standby switch (S538) to provide an electrical ground to the SAM when the STAB TRIM control levers are engaged. This prevents erroneous annunciation of unscheduled stabilizer movement.
- E. AIRPLANES WITH ALTN STAB TRIM SWITCHES ON THE CONTROL STAND;  
Alternate Stabilizer Trim Switch (Fig. 3)
- (1) The control stand has two ALTN STAB TRIM switches. These switches are connected to the stabilizer trim control modules by electrical wires.
  - (2) The right ALTN STAB TRIM switch operates the "arm" hydraulic valve. The left ALTN STAB TRIM switch operates the "control" hydraulic valve. Move both switches forward to give an airplane-nose down command. Move both switches aft to give an airplane-nose up command. The switches will return to neutral when released.
  - (3) The right ALTN STAB TRIM switch is mechanically linked to a switch internal to the housing. This internal switch is grounded whenever the stabilizer is operated by the ALTN STAB TRIM switch to prevent incorrect indications of unscheduled stabilizer trim movement.
- F. AIRPLANES WITH STAB TRIM LEVERS ON THE CONTROL STAND;  
Stabilizer Trim Cable System (Fig. 5)
- (1) Two pairs of cables extend from the STAB TRIM control levers to the STCM's. The cables transfer manual trim commands to the STCM's. One pair of cables extends from the arm lever pulley to the arm input lever on the STCM's. The other pair extends from the control lever pulley to the control input lever on the STCM's. A rear quadrant and control rod at the aft end of each pair of cables convert the cable motion to linear motion at the input levers to the STCM's.

G. Stabilizer Trim Control Module (Fig. 6)

- (1) The STCM's are attached to a bulkhead above the ballscrew actuator in the stabilizer compartment. The left and right modules are interchangeable. The function of the STCM is to provide direction control and rate control to the ballscrew actuator.
- (2) AIRPLANES WITH STAB TRIM LEVERS ON THE CONTROL STAND; the STCM's respond to electrical trim commands from the SAM and manual trim commands from the STAB TRIM control levers. A control rate valve within each STCM receives a hydraulic pressure signal from the elevator feel computer. This signal is a function of airspeed. Each STCM contains a motor-operated shutoff valve which controls the supply of fluid to the ballscrew actuator. Each shutoff valve is connected to a stabilizer trim shutoff switch on the control stand. Hydraulic pressure to the left module is supplied by the left system and to the right module by the center system.
- (3) AIRPLANES WITH ALTN STAB TRIM SWITCHES ON THE CONTROL STAND; the STCM's respond to electrical trim commands from the SAM and the alternate-stabilizer trim switch. A control rate valve within each STCM receives a hydraulic pressure signal from the elevator feel computer. This signal is a function of airspeed. Each STCM contains a motor-operated shutoff valve which controls the supply of fluid to the ballscrew actuator. Each shutoff valve is connected to a stabilizer trim shutoff switch on the control stand. Hydraulic pressure to the left module is supplied by the left system and to the right module by the center system.
- (4) The hydraulic line between the left STCM and the elevator feel computer contains a relief valve. The relief valve permits fluid flow in each direction until the hydraulic pressure in the line decreases to 100 psi (689 kPa). At or below this pressure, the relief valve closes, and the check valve permits fluid to flow only into the STCM. The relief valve prevents fluid loss out of the left STCM through the rate control valve, to make sure a sufficient quantity of fluid is available during power transfer unit (PTU) operation. For information on Hydraulic Power Transfer Unit (PTU) operation, refer to AMM 29-22-00/001.

EFFECTIVITY	
	ALL

27-41-00

- (5) Each STCM controls the flow of hydraulic fluid to one side of the drive hydraulic motors and secondary brakes of the ballscrew actuator. A brake pressure switch on each STCM sends an agreement signal on the operating condition of the secondary brakes to the SAM. The SAM analyzes the signal as a check to make sure the brakes are operating correctly. The simultaneous operation of both STCM's will produce twice the stabilizer trim rate of just one STCM.
  - (6) Two hydraulic fuses are installed in the left hydraulic system pressure lines downstream of the left STCM. The fuses are upstream of the left and right elevator PCAs. If a hydraulic line rupture occurs downstream, the fuses close to prevent hydraulic fluid loss and permit stabilizer operation.
- H. Stabilizer Trim Ballscrew Actuator (Fig. 6)
- (1) The stabilizer trim ballscrew actuator is located forward and above the stabilizer center section. The ballscrew actuator is attached to bulkhead structure at the top and to stabilizer structure at the bottom.
  - (2) The ballscrew actuator includes two drive hydraulic motors and two hydraulically released secondary brakes. The secondary brakes are mechanically spring-loaded on and hydraulically powered off. They have a release pressure of 1000 ±50 psi (6895 +/- 345 kPa). The ballscrew actuator consists of a differential gearbox and primary brakes. The differential gearbox has a dual load path for motor operation of the ballscrew. The primary brakes are an irreversible friction brake where air loads develop the resisting torque. The ballscrew actuator is attached to the airplane by upper and lower gimbals. The upper gimbal attaches the actuator to the top of the airframe structure and the lower gimbal attaches the ballnut trunnion to the stabilizer fitting. The ballnut trunnion has dual recirculating ball circuits for smooth stabilizer movement. A safety rod provides a redundant tension load path between the upper gimbal and lower stop.
  - (3) The two drive hydraulic motors are identical units. They require no flight line adjustments. The gearbox differential has a dual load path which permits one motor to trim while the opposite brake is still applied. A single operating motor will provide only one-half rate of trim. The two secondary brakes are identical.
  - (4) AIRPLANES WITH STAB TRIM LEVERS ON THE CONTROL STAND;  
in the manual trim mode, there are mechanical stops on the upper and lower gimbals to limit ballscrew movement. The leading edge up limit is +2° stabilizer angle or 0 units of trim on position indicator or Dimension A on ballscrew actuator of 0.50 inch (12.7 mm). The leading edge down limit is -12.5° stabilizer angle or 14.20 units of trim on position indicator or Dimension A of 24.96 inches (634.0 mm).

EFFECTIVITY

ALL

27-41-00

- (5) AIRPLANES WITH ALTN STAB TRIM SWITCHES ON THE CONTROL STAND;  
in the alternate-electric-stabilizer trim mode, there are mechanical stops on the upper and lower gimbals to limit ballscrew movement. The leading edge up limit is +2° stabilizer angle or 0 units of trim on position indicator or Dimension A on ballscrew actuator of 0.50 inch (12.7 mm). The leading edge down limit is -12.5° stabilizer angle or 14.20 units of trim on position indicator or Dimension A of 24.96 inches (634.0 mm).
- (6) For all stabilizer trim operating modes, except alternate trim mode, the leading edge DOWN travel limit varies as follows:
  - (a) 767-300 AIRPLANES;  
the leading edge DOWN limit is -11.0 degree stabilizer angle, or 12.8 units of trim, or Dimension A of 22.43 inches (569.7 millimeters).
  - (b) 767-200 AIRPLANES;  
the leading edge DOWN limit is -9.94 degree stabilizer angle, or 11.8 units of trim, or Dimension A of 20.64 inches (575.0 mm).
- (7) For all stabilizer trim modes, except alternate trim mode, the flaps retracted/not retracted position determines the leading edge UP limit. When the flaps are UP (retracted), the UP limit is 0.50 degree stabilizer angle, or 1.5 units of trim, or Dimension A is 3.00 inches (76.2 mm).  
When the flaps are DOWN (not retracted), the UP limit is 1.75 degree stabilizer angle, or 0.25 unit of trim, or Dimension A is 0.92 inch (23.4 mm).

I. Horizontal Stabilizer Electronic Components (Fig. 3)

- (1) The stabilizer trim and aileron lockout modules (SAM), flight control computers (FCC), and air data computers (ADC) are in the main equipment center. The SAM (L) is in the E1-1 rack and SAM (R) is in the E2-1 rack. The FCC (L) is in the E1-3 rack, FCC (C) is in the E1-4 rack and FCC (R) is in the E1-5 rack. The ADC (L) is in the E1-3 rack and ADC (R) is in the E2-3 rack. The flap/stabilizer position module (FSPM) is located in the P50 card file of the flap/stabilizer position module.

3. Operation (Fig. 7)

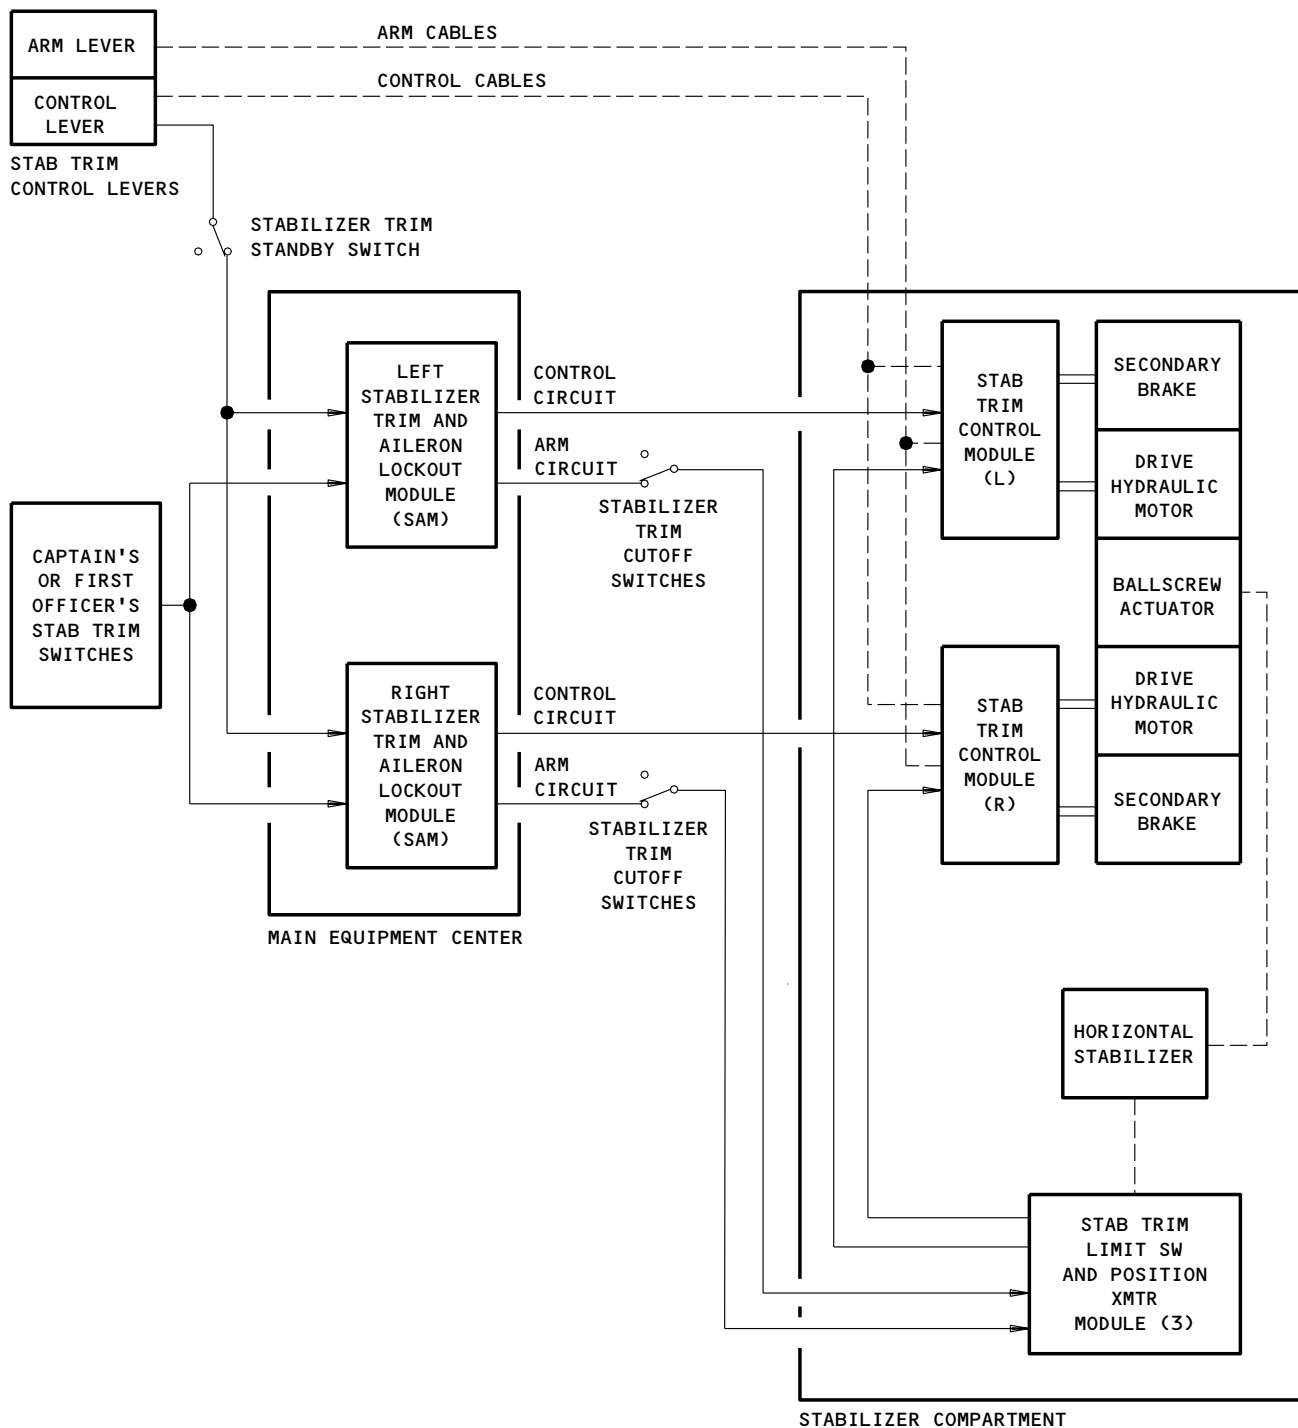

A. Functional Description

- (1) AIRPLANES WITH STAB TRIM LEVERS ON THE CONTROL STAND;  
dual STAB TRIM levers control the stabilizer in the manual control mode. The levers are connected to STCM's by cables. One lever activates the arm hydraulic valve in the STCM's and the other lever activates the control hydraulic valve. These valves are moved by links and control rods from the rear quadrants and override all electric trim solenoid signals. The STCM's port hydraulic fluid to the ballscrew actuator. The ballscrew actuator provides stabilizer trim movement.

Stabilizer Trim System Manual Operation  
Figure 7 (Sheet 2)

EFFECTIVITY  
AIRPLANES WITH THE SAM AND ALTERNATE  
STAB TRIM SWITCHES ON THE CONTROL STAND

**27-41-00**

- (2) AIRPLANES WITH ALTN STAB TRIM SWITCHES ON THE CONTROL STAND; the two ALTN STAB TRIM switches control the stabilizer in the alternate-electric-stabilizer trim mode. One switch activates the arm hydraulic valve in the STCMs and the other switch activates the control hydraulic valve. These valves are activated by the switches through solenoids in the STCMs. The solenoids port hydraulic pressure to move the arm and control hydraulic valve, which then port pressure to the hydraulic motor and secondary brake. The hydraulic motor supplies power to the ballscrew actuator and moves the stabilizer.
- (3) During electrical trim control, the SAM selects the priority mode, either the autopilot (FCC) or the manual electric (control switches). The FCC sends the trim signals to the SAM for the autopilot mode. The captain's or first officer's stabilizer trim control wheel switches send the signals to the SAM for the manual electric mode. The SAM sends separate arm and control signals directly to the STCM NOSE UP or NOSE DOWN solenoid valves. The solenoid valves permit the flow of hydraulic fluid to the motors and brakes of the ballscrew actuator. The ballscrew actuator provides stabilizer trim movement.
- (4) The left and right STCM's receive hydraulic pressure of 3000 psi (20684 kPa) from the left and center systems. Hydraulic power is removed from the STCM's by two motor-operated shutoff valves. The valves are operated by the stabilizer trim shutoff switches on the control stand. The STCM's are located upstream of the tail isolation valves.
- (5) When the left and center hydraulic systems fail, the left STCM receives hydraulic power from a power transfer unit (PTU) driven by the right hydraulic system. An isolation valve will close when the left system pressure or quantity is low. This isolates a dedicated amount of left system fluid for the PTU to operate the left STCM. The PTU is activated when the center hydraulic system pressure is also low, and the Captain's and First Officer's control wheel switches are operated. For more information on the PTU system operation, refer to AMM 29-22-00/001, Description and Operation.
- (6) The left hydraulic system fuses installed downstream of the left STCM operate by spring-action. The fuses close when the pressure drop across the fuse increases because of a failed component or line rupture downstream. The fuses automatically reset when the pressures on the two sides are the same. A time delay in each fuse prevents setting during pressure surges that occur when the hydraulic system is pressurized.
- (7) The flow rate of hydraulic fluid to the ballscrew actuator is regulated by a rate valve within each STCM. The valve is positioned by a hydraulic pressure signal from the elevator feel computer. The signal is a function of airspeed. This action causes the trim rate of the stabilizer to be varied according to airspeed.

EFFECTIVITY

ALL

27-41-00

- (8) AIRPLANES WITH STAB TRIM LEVERS ON THE CONTROL STAND;  
in the standby manual control mode, mechanical input from STAB TRIM control levers through stabilizer trim cables, is input to STCM's at the manual standby arming and control valves. The spring centering of these valves moves the STAB TRIM control levers to their neutral position when they are released. Movement of the manual standby valves to the nose up/down position will cause relief of hydraulic pressure on the ends of the main arm and control valves, moving them both to the nose up/down position. The manual standby valves are upstream of the solenoid valves, thus establishing manual priority over all electrical inputs. Metered flow from system pressure through the rate control valve, now has a path through the arm and control valves in series to release the hydraulic brake and to power the nose up/down side of the hydraulic motor.
- (9) AIRPLANES WITH ALTN STAB TRIM SWITCHES ON THE CONTROL STAND;  
in the alternate-electric-stabilizer trim control mode, electrical input from ALTN STAB TRIM switch is received by the STCM. The electrical input causes nose up/down solenoids (arm and control) on the STCM to rotate, which decreases pressure on the airplane nose up/down side of the arm and control valves. The valves then move and direct hydraulic flow. This hydraulic flow comes from system pressure and is metered by a rate control valve. From the arm and control valves, the hydraulic flow goes to release the hydraulic brake and to power the nose up/down side of the hydraulic motor.
- (10) In the manual electric control or autopilot control modes, electrical input from the SAMs causes the nose up/down solenoids (arm and control) on the STCMs to rotate. This removes the pressure from the airplane nose down/up side of the main arm and control valves. The main valves now move to the airplane nose up/down position. Metered flow from system pressure through the rate control valve, now has a path through the arm and control valves in series to release the hydraulic brake and to power the nose up/down side of the hydraulic motor.
- (11) Both hydraulic released secondary brakes and drive hydraulic motors act through the differential gearbox to trim the stabilizer for airplane nose up/down trim. The ratcheted drum brake is always engaged to prevent air loads from back driving the stabilizer.
- (12) Each STCM contains a brake pressure switch. The switch sends a signal to the SAM. The SAM does a check to see if the switch is operating correctly. A manual brake bypass button on the STCM relieves pressure to the brakes. The button is used to test the secondary brake reaction torque.
- (13) Limit Switches and Position Transmitter Modules (LSTMs) set the limit for stabilizer electrical travels. LSTMs interrupt electrical trim action if a system malfunction drives the stabilizer to either the up or down mechanical motion stop.
- B. Stabilizer Trim Fault Indication System (Fig. 8)
- (1) Stabilizer position and stabilizer trim control system faults are indicated in the flight compartment for the following reasons:
- (a) Unscheduled stabilizer trim.
  - (b) Faulty stabilizer trim drive rate.

- (c) Loss of power to control stand stabilizer trim position indicators.
- (d) Loss of input signal to control stand stabilizer trim position indicators.
- (e) Incorrect stabilizer position for takeoff.
- (2) The unscheduled stabilizer trim fault warning alerts the crew of an unscheduled stabilizer trim. Each SAM provides an unscheduled stabilizer trim fault signal. The unscheduled trim fault warning operates when power is supplied to the airplane. The unscheduled stabilizer trim fault warnings consist of:
  - (a) An amber UNSCHED STAB TRIM light on pilot's overhead panel P5.
  - (b) An EICAS message (UNSCHD STAB TRIM).
  - (c) An aural caution
- (3) The stabilizer trim fault warning alerts the crew when there is a loss of full rate trim during manual electric trim due to actuation or aircraft wiring faults of the SAM. Each SAM provides a stabilizer trim fault signal. The fault warning is operative whenever power is supplied to the airplane. The fault warnings consist of:
  - (a) An amber STAB TRIM light on panel P5.
  - (b) An EICAS message (STAB TRIM).
  - (c) An aural caution
- (4) The stabilizer trim position indicator, located on the P10 control stand, has two indicator faults. An OFF flag will appear if there is a loss of power and the indicating tape will disappear if there is a loss of the input signal.
- (5) The takeoff configuration warning alerts the crew of an incorrect configuration prior to or during the takeoff roll. The takeoff warning is on when the airplane is on the ground and takeoff power is applied to either engine. When turned on, the takeoff warning will be activated when the stabilizer position is outside of the takeoff range. The takeoff configuration warnings consists of:
  - (a) A red CONFIG warning light on the pilot's P2 panel.
  - (b) An aural warning siren.
  - (c) An EICAS red warning message (STABILIZER).
  - (d) Illumination of the captain's and first officer's master warning lamps (P7 glareshield panel).

NOTE: Warnings a, b, and c, when activated due to a wrong configuration, can only be cancelled by correcting the configuration. Warning d may be cancelled at any time by the pilot or will automatically go out when the configuration is corrected.

EFFECTIVITY

ALL

27-41-00

- (6) Continuous built-in test (BIT) monitoring is provided in the SAM. Each SAM isolates faults to the LRU level within the stabilizer trim and aileron lockout systems. The BIT is capable of detecting and locating to the LRU level at least 95 percent of all intermittent and steady failures.
- (a) LRU fault indication is provided on each SAM front panel by non-volatile fault balls. The fault balls are latched to annunciate transient faults. The fault balls are cleared by the power-up reset or the maintenance RESET button.
  - (b) The SAM fault ball is set by the SAM fault latch or by fault identification logic in the CONTROL microprocessor. If the SAM fault ball is set, other fault ball annunciation is disabled.
  - (c) The FCC fault ball is set by a FCC fault or an ARINC 429 bus fault. The fault is cleared if valid data is continuously received for five seconds.
  - (d) The ADC fault ball is set by an ADC fault or an ARINC 429 bus fault. The fault is cleared if valid data is continuously received for at least 30 seconds.
  - (e) The TRIM SW fault ball is set by the manual trim input coincidence monitor. The manual trim input coincidence monitor detects faults in the thumb switch inputs.
  - (f) The MAN LEVER SW faultball is set if the stabilizer trim control lever or switch is out of neutral position for more than 30 seconds.
  - (g) The FSPM fault ball is set by stabilizer or flap position faults. The fault ball is not latched.
  - (h) The STCM fault ball is set by the hydraulic brake pressure switch monitor. The brake monitor will set the fault ball if the brake is released for two seconds without a valid command or if the brake is not released within one second of a valid command. The mach/speed monitor will set the fault ball if the stabilizer moves 0.3° without a valid command or if the stabilizer does not move within two seconds of a valid command. The STCM fault ball will not be set when low hydraulic pressure is sensed by the STCM. The SAM will receive the low hydraulic pressure signal from the STCM and will set the HYD PRESS fault ball instead of the STCM fault ball.
  - (i) The AIR/GND fault ball is set from the air/ground discretes monitor. A first or second air/ground discrete fault sets the fault ball.
  - (j) The HYD PRESS fault ball is set from the hydraulic pressure monitor. Low system hydraulic pressure sets the fault ball.

C. Control (Fig. 9)

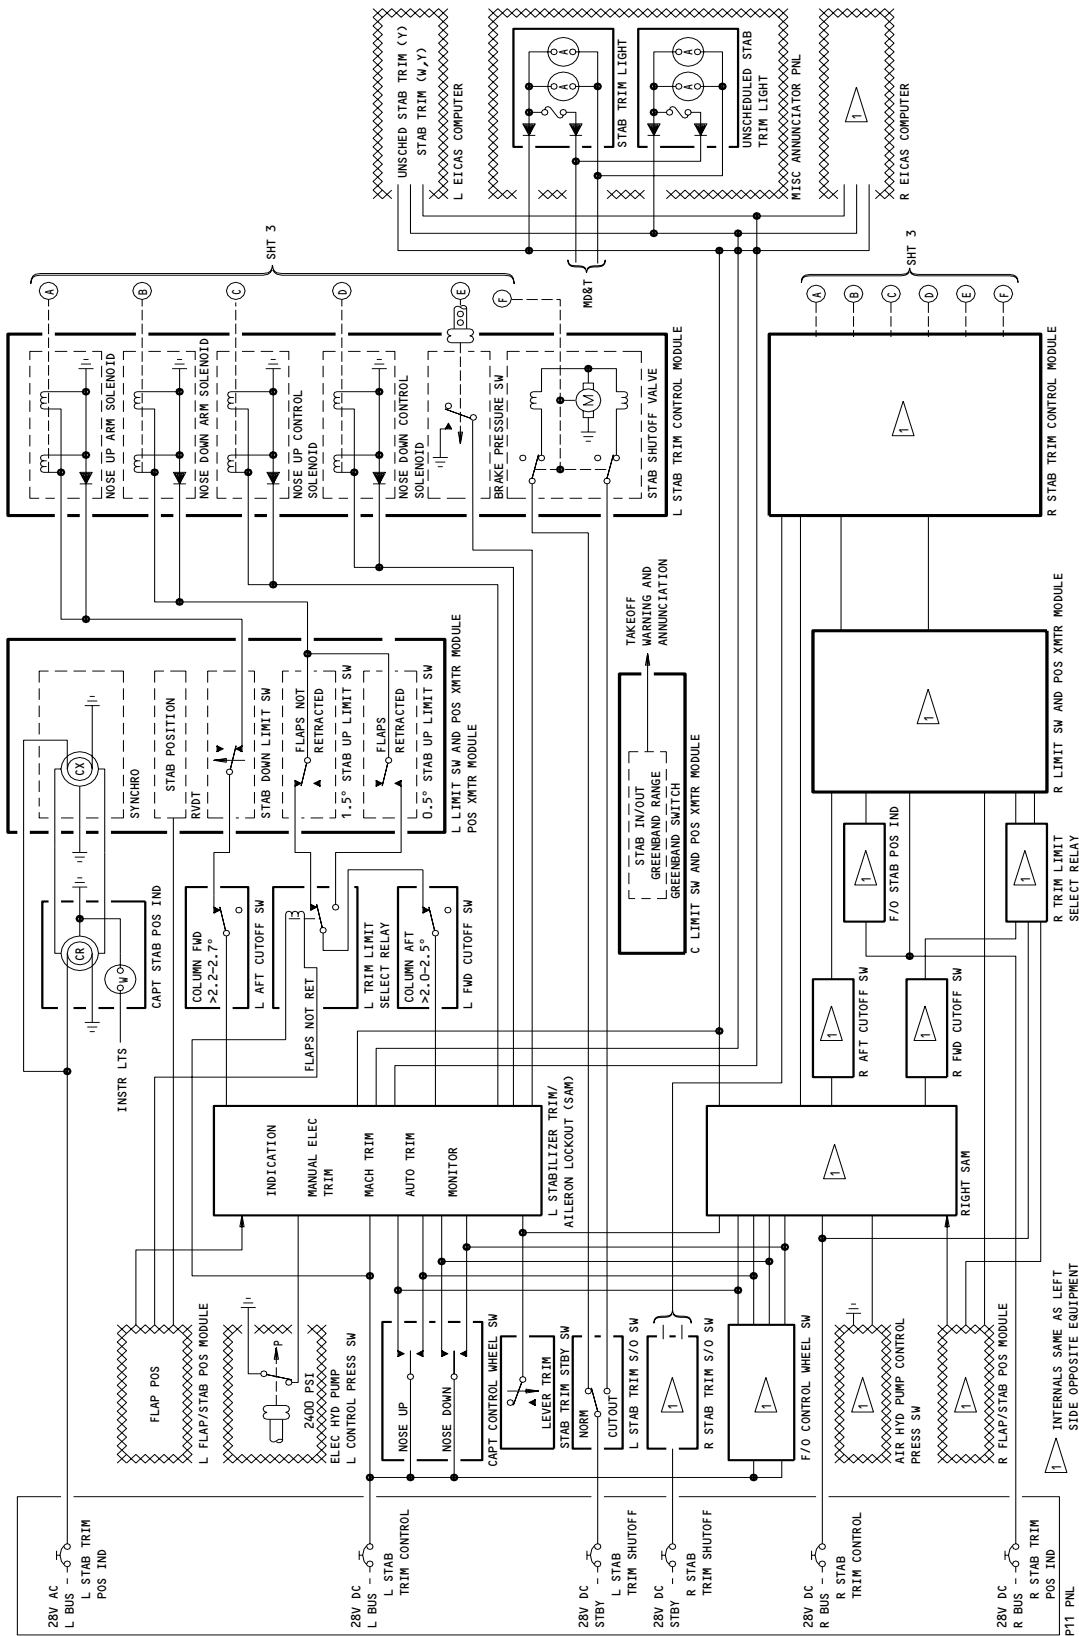

(1) Manual - Electric Operation

- (a) Provide electrical power (AMM 24-22-00/201).
- (b) Make sure that the LEFT, RIGHT AND CENTER TAIL FLT CONT SHUTOFF switches on the right side panel P61 are OFF.
- (c) Make sure these circuit breakers on overhead panel P11 are closed:
  - 1) 11C12, STAB TRIM SHUTOFF L

HORIZONTAL STABILIZER TRIM CONTROL SYSTEM – ADJUSTMENT/TEST

1. General

A. This procedure contains tasks for the operational test, adjustment, and system test for the stabilizer trim control system. The tests are as follows:

- (1) Operational Test – Horizontal Stabilizer Trim Control System
- (2) Adjustment – Horizontal Stabilizer Trim Control System
- (3) System Test – Horizontal Stabilizer Trim Control System
- (4) Manual–Mechanical Stabilizer Trim Control Operational Test
- (5) Alternate Electrical Stabilizer Trim Control Test
- (6) Horizontal Stabilizer Trim Position Transmitter Limit Test
- (7) Stabilizer Trim Control Column Cut-off Switch Test
- (8) Stabilizer Trim Shutoff Switch Test
- (9) Stabilizer Trim Relief Valve Test
- (10) Horizontal Stabilizer Secondary Brake Test
- (11) Stabilizer Trim Override Capability with Split Control Column Commands Test
- (12) Stabilizer Trim Single Switch Test
- (13) Stabilizer Trim Actuator Bearing Friction Test

TASK 27-41-00-715-014

2. Operational Test

A. General

- (1) No ground support equipment is necessary to do the operational test for the horizontal stabilizer trim control system. This test lets maintenance people monitor all functions of the horizontal stabilizer trim control system to make sure that it operates correctly.

B. References

- (1) AMM 24-22-00/201, Electrical Power – Control
- (2) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems

C. Access

- (1) Location Zones  
211/212 Control Cabin

D. Operational Test – Horizontal Stabilizer Trim Control System (Fig. 501)

S 865-015

- (1) Supply electrical power (AMM 24-22-00/201).

- (2) Make sure that these circuit breakers on the overhead panel, P11, are closed:
- (a) 11C12, STAB TRIM SHUTOFF L
  - (b) 11C13, STAB TRIM SHUTOFF CENTER

S 215-017

- (3) Make sure that the LEFT and CENTER STAB TRIM SHUTOFF valve switches on the control stand panel, P10, are in the NORM position.

S 865-018

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (4) Supply power to the left and center hydraulic systems (AMM 29-11-00/201).

S 715-001

- (5) Do the steps that follow to make sure that the stabilizer trim control system operates correctly:
- (a) AIRPLANES WITH STAB TRIM LEVERS;  
Use the STAB TRIM levers on the P10 panel to move the horizontal stabilizer to 2 units of trim.
  - (b) AIRPLANES WITH ALTERNATE STAB TRIM SWITCHES;  
Use the alternate stabilizer trim switches on the P10 panel to move the horizontal stabilizer to 2 units of trim.
  - (c) Put the L and C STAB TRIM shutoff valve switches on the P10 panel in the CUTOUT position.
  - (d) Move the captain's and first officer's stabilizer trim control wheel switches to the APL NOSE UP and APL NOSE DOWN positions.
    - 1) Make sure that the stabilizer does not move.

- (e) AIRPLANES WITH ALTERNATE STAB TRIM SWITCHES;  
Move the alternate stabilizer trim switches on the P10 panel to the APL NOSE UP and APL NOSE DOWN positions.
  - 1) Make sure that the stabilizer does not move.
- (f) Put the L STAB TRIM shutoff valve switch on the P10 panel in the NORM position.
- (g) Move the captain's stabilizer trim control wheel switches to the APL NOSE DN position.
  - 1) Make sure that the stabilizer leading edge moves up.
  - 2) Make sure the EICAS message, STAB TRIM, shows on the EICAS display.
  - 3) Make sure that the amber STAB TRIM light on the P5 overhead panel comes on.
  - 4) Make sure that the stabilizer stops when the control wheel switches are released.
- (h) Move the captain's stabilizer trim control wheel switches to the APL NOSE UP position.
  - 1) Make sure that the stabilizer leading edge moves down.
  - 2) Make sure the EICAS message, STAB TRIM, shows on the EICAS display.
  - 3) Make sure that the amber STAB TRIM light on the P5 overhead panel comes on.
  - 4) Make sure that the stabilizer stops when the control wheel switches are released.
- (i) Move the first officer's stabilizer trim control wheel switches to the APL NOSE DN position.
  - 1) Make sure that the stabilizer leading edge moves up.
  - 2) Make sure the EICAS message, STAB TRIM, shows on the EICAS display.
  - 3) Make sure that the amber STAB TRIM light on the P5 overhead panel comes on.
  - 4) Make sure that the stabilizer stops when the control wheel switches are released.
- (j) Move the first officer's stabilizer trim control wheel switches to the APL NOSE UP position.
  - 1) Make sure that the stabilizer leading edge moves down.

- 2) Make sure the EICAS message, STAB TRIM, shows on the EICAS display.
  - 3) Make sure that the amber STAB TRIM light on the P5 overhead panel comes on.
  - 4) Make sure that the stabilizer stops when the control wheel switches are released.
- (k) Put the C STAB TRIM shutoff valve switch on the P10 panel in the NORM position (Both L and C switches are now in NORM).
- (l) Move the captain's stabilizer trim control wheel switches to the APL NOSE UP.
- (m) Move the captain's stabilizer trim control wheel switches to the APL NOSE DOWN.
- (n) Verify that the amber STAB TRIM light goes out and the EICAS message disappears from the display.
- (o) Put the C STAB TRIM shutoff valve switch on the P10 panel in the CUTOFF position.
- (p) AIRPLANES WITH ALTERNATE STAB TRIM SWITCHES;  
Move the alternate stabilizer trim switches to the APL NOSE DN position.
- 1) Make sure that the stabilizer leading edge moves up.
  - 2) Make sure that the amber STAB TRIM light on the P5 overhead panel does not come on.
  - 3) Make sure that the stabilizer stops when the alternate stab trim switches are released.
- (q) AIRPLANES WITH ALTERNATE STAB TRIM SWITCHES;  
Move the alternate stab trim switches to the APL NOSE UP position.
- 1) Make sure that the stabilizer leading edge moves down.
  - 2) Make sure that the amber STAB TRIM light on the P5 overhead panel does not come on.
  - 3) Make sure that the stabilizer stops when the alternate stab trim switches are released.
- (r) Put the C STAB TRIM shutoff valve switch on the P10 panel in the NORM position.
- (s) Put the L STAB TRIM shutoff valve switch on the P10 panel in the CUTOFF position.
- (t) Move the captain's stabilizer trim control wheel switches to the APL NOSE DN position.
- 1) Make sure that the stabilizer leading edge moves up.
  - 2) Make sure the EICAS message, STAB TRIM, shows on the EICAS display.
  - 3) Make sure that the amber STAB TRIM light on the P5 overhead panel comes on.

(ch) Press and hold the BRAKE BYPASS valve button on the left stabilizer trim control module (Fig. 502).

**WARNING:** MAKE SURE THE AREA AROUND THE STABILIZER, INSIDE THE STABILIZER COMPARTMENT, IS CLEAR BEFORE YOU MOVE THE STABILIZER. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR.

- (ci) Move the captain's or first officer's stabilizer trim control wheel switches full travel in the same direction and hold for ten seconds.  
1) Make sure that the stabilizer does not move.
- (cj) Release the stabilizer trim control wheel switches and then release the BRAKE BYPASS valve button.
- (ck) Move the captain's or first officer's stabilizer trim control wheel switches through full travel.  
1) Make sure that the stabilizer operates correctly.
- (cl) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel in the CUTOFF position.
- (cm) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.
- (cn) Press and hold the BRAKE BYPASS valve button on the right stabilizer trim control module (Fig. 502).
- (co) Move the captain's or first officer's stabilizer trim control wheel switches full travel in the same direction and hold for ten seconds.  
1) Make sure that the stabilizer does not move.
- (cp) Release the stabilizer trim control wheel switches and then release the BRAKE BYPASS valve button.
- (cq) Move the captain's or first officer's stabilizer trim control wheel switches through full travel.  
1) Make sure that the stabilizer operates correctly.
- (cr) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.

E. AIRPLANES WITH STAB TRIM LEVERS;  
Manual-Mechanical Stabilizer Trim Control Operation Test

S 865-019

- (1) Supply electrical power (AMM 24-22-00/201).

S 865-478

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (2) Supply power to the left and center hydraulic systems (AMM 29-11-00/201).

- (3) Do the steps that follow to make sure that the manual mechanical stabilizer trim control operates correctly:
- (a) Move the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel in the CUTOUT position.
  - (b) Move the stab trim levers to the APL NOSE DN position.
    - 1) Make sure that the stabilizer leading edge moves up.
  - (c) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel in the CUTOUT position while the stabilizer moves.
    - 1) Make sure the stabilizer stops.
  - (d) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.
    - 1) Make sure the stabilizer starts to move.
  - (e) Release the stab trim levers.
    - 1) Make sure that the stabilizer stops when the stab trim levers are released.
  - (f) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.
  - (g) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel in the CUTOUT position.
  - (h) Move the stab trim levers to the APL NOSE UP position.
    - 1) Make sure that the stabilizer leading edge moves down.
  - (i) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel in the CUTOUT position while the stabilizer moves.
    - 1) Make sure the stabilizer stops.
  - (j) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.
    - 1) Make sure the stabilizer starts to move.
  - (k) Release the stab trim levers.
    - 1) Make sure that the stabilizer stops when the stab trim levers are released.

**CAUTION:** DO NOT LET THE BALLSCREW ACTUATOR HIT THE MECHANICAL STOPS. DAMAGE TO THE BALLSCREW ACTUATOR AND THE STABILIZER CAN OCCUR.

- (l) Move the stab trim levers full forward and full aft.
  - 1) Make sure that the stabilizer moves smoothly and freely through full travel.
  - 2) Make sure that the stabilizer position indicator correctly shows the position of the stabilizer, (0.25-14.00 pilot units).
- (m) Move only the left STAB TRIM lever forward.
  - 1) Make sure that the stabilizer does not move.
- (n) Move only the right STAB TRIM lever forward.
  - 1) Make sure that the stabilizer does not move.
- (o) Move only the left STAB TRIM lever aft.
  - 1) Make sure that the stabilizer does not move.

TASK 27-41-00-825-054

3. Adjustment - Horizontal Stabilizer Trim Control System

A. General

- (1) The system components that follow can be adjusted independently:

**NOTE:** Adjustment of other system components is not necessary before these system components are adjusted.

(a) STCM lever control rod

(b) Stabilizer body cables.

- (2) AIRPLANES WITH STAB TRIM LEVERS;

Adjustment of the complete stabilizer trim control system is to be done in a specific order, each of which must be completed before a subsequent adjustment is started.

(a) When correctly adjusted, the stabilizer trim control system operates smoothly through its travel range and meets the conditions that follow:

- 1) STCM lever control rod does not bind through full travel.
- 2) The arming and control servo levers on the STCMs are correctly adjusted if the arming and control levers are between the index (scribe) marks on the lever stop plate when the STAB TRIM control levers are in their neutral position.

EFFECTIVITY

ALL

27-41-00

(b) Stabilizer Body Cables ST1A, ST1B, ST2A, ST2B

NOTE: If any of the conditions that follow are not correct, the applicable cables must be adjusted.

- 1) The tension in cables ST1A, ST1B, ST2A, and ST2B are correct if they are in the rig load tolerance band for the ambient temperature (Fig. 504).
- 2) With correctly tensioned cables, the cable adjustment is correct if rig pins ST4 and ST5 can be freely installed with the STAB TRIM control levers in the neutral position.

(c) Limit Switch and Position Transmitter Modules (LSTM's)

- 1) The LSTM's are correctly adjusted if the tension in the LSTM cables is  $50 \pm 5$  pounds (222 +/- 22 newtons).

(3) AIRPLANES WITH ALTERNATE STAB TRIM SWITCHES;

Adjustment of the complete stabilizer trim control system is to be done in a specific order, each of which must be completed before a subsequent adjustment is started.

(4) AIRPLANES WITH ALTERNATE STAB TRIM SWITCHES;

When correctly adjusted, the stabilizer trim control system operates smoothly through its travel range and meets the condition that follows:

(a) Limit Switch and Position Transmitter Modules (LSTM's)

- 1) The LSTM's cables are correctly adjusted if the tension in the cables is  $50 \pm 5$  pounds (222 +/- 22 newtons).

B. Equipment

(1) Rig Pins from Set A20004-XX (AMM 20-10-24/201):

G. AIRPLANES WITH STAB TRIM LEVERS;  
STCM Lever Control Rods Adjustment (Fig. 502)

S 495-060

- (1) Install rig pins ST4 and ST5 in the rear quadrants.

S 215-061

- (2) Make sure that the servo levers on the STCMs are between the index (scribe) marks on the lever stop plate.

**NOTE:** The maximum permitted distance from the scribe mark to the edge of the lever is 0.03 inch (0.8 millimeter).

S 825-062

- (3) If any of the levers are not aligned by more than 0.03 inch (0.8 millimeter), do the steps that follow:
- (a) If a servo lever nearest a quadrant is not aligned, do the steps that follow:
    - 1) Disconnect the control rod from the quadrant.
    - 2) Adjust the rod end until the lever aligns in the index marks.
    - 3) Tighten the check nuts.
  - (b) If a servo lever farthest from a quadrant is not aligned, do the steps that follow:
    - 1) Disconnect the control rod from the lever on the STCM.
    - 2) Adjust the rod end until the lever aligns in the index marks.
    - 3) Tighten the check nuts.

S 095-120

**CAUTION:** DO NOT DISTURB THE LINKAGE WHEN THE RIGGING PIN IS NOT INSTALLED. MOVEMENT OF THE LINKAGE WHEN THE RIGGING PIN IS REMOVED OCCURS WHEN THE LEVERS GO TO THEIR CENTER POSITION.

- (4) Remove rig pins ST4 and ST5 and then put them back.
- (a) If the rigging pins cannot be freely installed, do the steps that follow:
  - (b) Make sure that the servo lever is between the scribe marks on the stop plate in the permitted 0.03 inch (0.8 millimeter).
  - (c) If the servo lever position is correct, the adjustment is satisfactory even if the rig pins cannot be installed freely.

H. AIRPLANES WITH STAB TRIM LEVERS;  
Body Cables Adjustment (Fig. 504)

**NOTE:** The airplane must not be on jacks during the body cable adjustment.

S 825-064

- (1) If new cables have been installed, do the steps that follow to stretch the cables before they are adjusted:
  - (a) Install rig pins ST4 and ST5 in the rear quadrants (Fig. 502).
  - (b) Adjust the turnbuckles in ST1A, ST1B, ST2A, and ST2B, at the same time, to  $140 \pm 10$  pounds ( $623 \pm 44$  newtons) cable tension to stretch the cables.
  - (c) Adjust the turnbuckles such that the STAB TRIM levers are  $\pm 0.5$  inch ( $\pm 13$  millimeters) of the index marks on the limit position decal on the control stand (Fig. 501).
  - (d) Adjust all of the seals so that there are no bends in the cables.
  - (e) Remove rig pins ST4 and ST5.
  - (f) Cycle the control levers through full travel 25 times.
  - (g) Make sure that the conditions that follow are correct:
    - 1) The cables do not touch the pulley or quadrant flanges for the full cable travel.
    - 2) The cables are installed through grommets and air pressure seals in the structure as necessary.
    - 3) The cables are not moved by fairleads, rub strips, or grommets from the adjusted or normal operated positions.
    - 4) The pulleys turn freely with no blockage from the guards.

S 495-065

- (2) Install rig pins ST4 and ST5 in the rear quadrants (Fig. 502).

S 825-066

- (3) Adjust the turnbuckles in cables ST1A, ST1B, ST2A, and ST2B such that the conditions that follow are correct:
  - (a) The cable tension is as specified (Fig. 504).
  - (b) The control levers align with each other by 0.02 inch (0.5 millimeter) and the base of the levers are positioned within the index marks of the limit position decal.

**NOTE:** Thermal expansion of the control cables during flight can cause the difference between the levers to be more than 0.02 inch (0.5 millimeter) while in flight. If the difference between the levers is more than 0.25 inch (6.4 millimeters) while in flight, the levers can be adjusted on the ground. You can adjust the TRIM lever, forward or aft of the STAB lever, one half of the in-flight displacement to a maximum of 0.25 inch (6.4 millimeters).

- S 095-067
- (4) Remove rig pins ST4 and ST5.
- S 865-068
- (5) Cycle the STAB TRIM levers once.
- S 225-069
- (6) Make sure that the cable tension and STAB TRIM lever position are still correct.
- S 435-070
- (7) Install locking clips on the turnbuckles.
- S 625-071
- (8) Apply corrosion preventive compound to the visible turnbuckle threads.
- I. Limit Switch and Position Transmitter Modules (LSTM) Adjustment (Fig. 503)

NOTE: For airplanes with the Stab Trim Levers, the STCM lever control rod and the body cables must be adjusted before the LSTMs are adjusted.

- S 225-072
- (1) Make sure that Dimension A on the stabilizer trim ballscrew actuator is  $12.28 \pm 0.03$  inches (311.9 +/- 0.8 millimeters) (Fig. 502).
- S 825-073
- (2) If Dimension A is not  $12.28 \pm 0.03$  inches (311.9 +/- 0.8 millimeters), do the steps that follow to correctly set the stabilizer:
- (a) AIRPLANES WITH STAB TRIM LEVERS;  
Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:  
1) 11C13, STAB TRIM SHUTOFF CENTER
- (b) AIRPLANES WITH ALTERNATE STAB TRIM SWITCHES;  
Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:  
1) 11A36, STAB TRIM ALT  
2) 11C13, STAB TRIM SHUTOFF CENTER
- (c) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATOR, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (d) Supply power to the center hydraulic system (AMM 29-11-00/201).
- (e) AIRPLANES WITH STAB TRIM LEVERS;  
Use the STAB TRIM levers to move the stabilizer until Dimension A on the stabilizer trim ballscrew actuator is  $12.28 \pm 0.03$  inches (311.9 +/- 0.8 millimeters).
- (f) AIRPLANES WITH ALTERNATE STAB TRIM SWITCHES;  
Use the alternate stab trim switches to move the stabilizer until Dimension A on the stabilizer trim ballscrew actuator is  $12.28 \pm 0.03$  inches (311.9 +/- 0.8 millimeters).
- (g) Remove the power from the center hydraulic system (AMM 29-11-00/201).
- (h) Put the LEFT and CENTER STAB TRIM SHUTOFF valve switch on the P10 panel in the CUTOUT position.
- (i) AIRPLANES WITH STAB TRIM LEVERS;  
Open this circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:
  - 1) 11C13, STAB TRIM SHUTOFF CENTER
- (j) AIRPLANES WITH ALTERNATE STAB TRIM SWITCHES;  
Open these circuit breakers on the P11 panel and attach DO-NOT-CLOSE tags:
  - 1) 11A36, ALT STAB TRIM
  - 2) 11C13, STAB TRIM SHUTOFF CENTER

S 225-074

- (3) Make sure that the tension in each set of LSTM cables (Fig. 503) is  $50 \pm 5$  pounds (222 +/- 22 newtons) (no matter what the ambient temperature is).

S 495-075

- (4) Make sure that rig pins ST1, ST2, and ST3 can be freely installed.

S 825-076

- (5) If necessary, adjust the LSTM cable turnbuckles to get a cable tension of  $50 \pm 5$  pounds (222 +/- 22 newtons) and so rig pins ST1, ST2, and ST3 can be freely installed.
  - (a) Make sure that no more than 0.75 inches (19.1 millimeters) of thread show on the terminal assembly.

S 435-077

- (6) Install the turnbuckle locking clips.

S 095-078

- (7) Remove rig pins ST1, ST2, and ST3.

EFFECTIVITY

ALL

S 215-079

- (8) Do the steps that follow to make sure that the LSTM cables are adjusted correctly:
- (a) AIRPLANES WITH STAB TRIM LEVERS;  
Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
    - 1) 11C13, STAB TRIM SHUTOFF CENTER
  - (b) AIRPLANES WITH ALTERNATE STAB TRIM SWITCHES;  
Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:
    - 1) 11A36, ALT STAB TRIM
    - 2) 11C13, STAB TRIM SHUTOFF CENTER
  - (c) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (d) Supply power to the center hydraulic system (AMM 29-11-00/201).

**CAUTION:** DO NOT LET THE BALLSCREW ACTUATOR HIT THE MECHANICAL STOPS. DAMAGE TO THE BALLSCREW ACTUATOR AND THE STABILIZER CAN OCCUR.

- (e) AIRPLANES WITH STAB TRIM LEVERS;  
Use the STAB TRIM levers to cycle the stabilizer between 1.0 and 13.5 units of trim.

**NOTE:** Do not let the stabilizer ballscrew actuator get closer than 2 inches (51 millimeters) from the up and down mechanical stops.

- (f) Make sure that the conditions that follow are correct:
  - 1) The cables do not touch the pulley or quadrant flanges for the full cable travel.
  - 2) The cables are in 2.0 degrees of the plane of the pulley or quadrant.
  - 3) The pulleys turn freely with no obstruction from the guards.
- (g) AIRPLANES WITH ALTERNATE STAB TRIM SWITCHES;  
Use the alternate stab trim switches to cycle the stabilizer between 1.0 and 13.5 units of trim.

**NOTE:** Do not let the stabilizer ballscrew actuator get closer than 2 inches (51 millimeters) from the up and down mechanical stops.

F. Horizontal Stabilizer Trim Electrical Operation Test (Fig. 501)

S 735-005

- (1) Do the steps that follow to make sure that the electrical stabilizer trim control operates correctly:
  - (a) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel in the CUTOUT position.
  - (b) Open this circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:
    - 1) 11C13, STAB TRIM SHUTOFF CENTER
  - (c) Move the captain's stabilizer trim control wheel switches to the APL NOSE DN position.
    - 1) Make sure that the stabilizer leading edge moves up.
  - (d) Put the LEFT STAB TRIM SHUTOFF valve switch on the panel P10 in the CUTOUT position while the stabilizer moves.
    - 1) Make sure that the stabilizer stops in one second.
  - (e) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.
    - 1) Make sure that the stabilizer starts to move in one second.
  - (f) Release the stabilizer trim control wheel switches.
    - 1) Make sure that the stabilizer stops.
  - (g) Move the first officer's stabilizer trim control wheel switches to the APL NOSE UP position.
    - 1) Make sure that the stabilizer leading edge moves down.
  - (h) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel in the CUTOUT position while the stabilizer moves.
    - 1) Make sure that the stabilizer stops in one second.
  - (i) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.
    - 1) Make sure the stabilizer starts to move in one second.
  - (j) Release the stabilizer trim control wheel switches.
    - 1) Make sure that the stabilizer stops in one second.
  - (k) AIRPLANES WITH ALTERNATE STAB TRIM SWITCHES;  
Do the steps that follow:
    - 1) Move the alternate stab trim switches on the P10 panel to the APL NOSE DN position.
      - a) Make sure that the stabilizer leading edge moves up.
    - 2) While the stabilizer moves, put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel in the CUTOUT position.
      - a) Make sure the stabilizer stops.
    - 3) Move the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.
      - a) Make sure that the stabilizer starts to move.
    - 4) Release the alternate stab trim switches.
      - a) Make sure that the stabilizer stops.
  - (l) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel in the CUTOUT position.
  - (m) Open this circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:
    - 1) 11C12, STAB TRIM SHUTOFF L

Dec 10/98

- (n) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
  - 1) 11C13, STAB TRIM SHUTOFF CENTER
- (o) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.
- (p) Move the captain's stabilizer trim control wheel switches to the APL NOSE UP position.
  - 1) Make sure that the stabilizer leading edge moves down.
- (q) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel in the CUTOUT position while the stabilizer moves.
  - 1) Make sure that the stabilizer stops in one second.
- (r) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.
  - 1) Make sure the stabilizer starts to move in one second.
- (s) Release the control wheel switches.
  - 1) Make sure that the stabilizer stops.
- (t) Move the first officer's stabilizer trim control wheel switches to the APL NOSE DN position.
  - 1) Make sure that the stabilizer leading edge moves up.
- (u) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel in the CUTOUT position while the stabilizer moves.
  - 1) Make sure that the stabilizer stops in one second.
- (v) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.
  - 1) Make sure that the the stabilizer starts to move in one second.
- (w) Release the stabilizer trim control wheel switches.
  - 1) Make sure that the stabilizer stops.
- (x) AIRPLANES WITH ALTERNATE STAB TRIM SWITCHES;  
Do the steps that follow:
  - 1) Move the alternate stab trim switches on the P10 panel to the APL NOSE UP position.
    - a) Make sure that the stabilizer leading edge moves down.
  - 2) While the stabilizer moves, put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel in the CUTOUT position.
    - a) Make sure that the stabilizer stops.
  - 3) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.
    - a) Make sure that the stabilizer moves.
  - 4) Release the alternate stab trim switches.
    - a) Make sure that the stabilizer stops.
- (y) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
  - 1) 11C12, STAB TRIM SHUTOFF L
- (z) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.
- (aa) Move each part of the captain's stabilizer trim control wheel switch to the APL NOSE DN position while the other part stays at neutral.
  - 1) Make sure that the stabilizer does not move.

- (ab) Move each part of the captain's stabilizer trim control wheel switch to the APL NOSE UP position while the other part stays at neutral.
  - 1) Make sure that the stabilizer does not move.
- (ac) Move each part of the first officer's stabilizer trim control wheel switch to the APL NOSE DN position while the other part stays at neutral.
  - 1) Make sure that the stabilizer does not move.
- (ad) Move each part of the first officer's stabilizer trim control wheel switch to the APL NOSE UP position while the other part stays at neutral.
  - 1) Make sure that the stabilizer does not move.
- (ae) AIRPLANES WITH ALTERNATE STAB TRIM SWITCHES;  
Do the steps that follow:
  - 1) Move each alternate stab trim control switch on the P10 panel to the APL NOSE DN position while the other one stays at neutral.
    - a) Make sure that the stabilizer does not move.
  - 2) Move each alternate stab trim control switch on the P10 panel to the APL NOSE UP position while the other one stays at neutral.
    - a) Make sure that the stabilizer does not move.

G. Stabilizer Trim Electrical Travel Limits and Column Cutoff Switches Test (Fig. 502)

S 735-101

- (1) Do the steps that follow for the electrical travel limits and column cutoff switches with only the right STCM test:
  - (a) Do the steps that follow for the nose down electrical limit test:
    - 1) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel in the CUTOUT position.
    - 2) Open this circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:
      - a) 11C12, STAB TRIM SHUTOFF L
    - 3) Make sure this circuit breaker on the P11 panel is closed:
      - a) 11C13, STAB TRIM SHUTOFF CENTER
    - 4) Make sure that the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel is in the NORM position.
    - 5) Make sure that the flaps and slats are retracted and the flap control lever is in the FLAP UP detent.
    - 6) Move the captain's or first officer's stabilizer trim control wheel switches to the APL NOSE DN position and hold until the stabilizer stops.
    - 7) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel in the CUTOUT position.
    - 8) Open this circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:
      - a) 11C13, STAB TRIM SHUTOFF CENTER

EFFECTIVITY

ALL

27-41-00

- 9) Make sure that Dimension A on the stabilizer trim ballscrew actuator is 3.00 +0.15/-0.42 inches (76.2 +3.8/-10.7 millimeters) (Fig. 502).
- 10) Do the steps that follow for the nose down electrical limit test with the flaps in the 5 unit detent:
  - a) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.
  - b) Remove the DO-NOT-CLOSE tag and close the circuit breaker 11C13, STAB TRIM SHUTOFF CENTER on the P11 panel.

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- c) Put the flap control lever to the 5-unit detent to move the TE flaps to the 5 degree position.
  - d) Move the captain's or first officer's stabilizer trim control wheel switches to the APL NOSE DN position and hold until the stabilizer stops.
  - e) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel in the CUTOUT position.
  - f) Open the circuit breaker 11C13, STAB TRIM SHUTOFF CENTER on the P11 panel and attach a DO-NOT-CLOSE tag.
- 11) Make sure that Dimension A on the stabilizer trim ballscrew actuator is 0.92 +0.15/-0.42 inches (23.4 +3.8/-10.7 millimeters) (Fig. 502).
  - 12) Put the flap lever in the FLAP UP detent to retract the flaps.
- (b) Do the steps that follow for the column forward cutoff test:
- 1) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
    - a) 11C13, STAB TRIM SHUTOFF CENTER
  - 2) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.
  - 3) Move the captain's or first officer's stabilizer trim control wheel switches to the APL NOSE UP position.
  - 4) With the stabilizer trim switches held in the APL NOSE UP position, slowly push the control column forward until the stabilizer stops.

EFFECTIVITY

ALL

27-41-00

29.1

Page 549  
Aug 22/09

- 5) Measure the angle of the control column from the column neutral position with the control column angle scale.
  - a) Make sure that the angle is between 2.2 and 2.7 degrees.
- 6) Let the control column go to the neutral position and let the stabilizer move until it stops.
- 7) Release the stabilizer trim control wheel switches.
- (c) Do the steps that follow for the nose up electrical limit test:
  - 1) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel in the CUTOUT position.
  - 2) Open this circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:
    - a) 11C13, STAB TRIM SHUTOFF CENTER
  - 3) Make sure that Dimension A on the stabilizer trim ballscrew actuator is 22.43 +0.42/-0.15 inches (569.7 +10.7/-3.8 millimeters) (Fig. 502).
- (d) 767-200;  
Do the steps that follow for the column/neutral shift cutoff test:

NOTE: Do this test for 767-200 airplanes only.

767-300 airplanes do not have neutral shift and cutoff components.

- 1) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
  - a) 11C13, STAB TRIM SHUTOFF CENTER
- 2) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.
- 3) Move the captain's or first officer's stabilizer trim control wheel switches to the APL NOSE DN position.
- 4) While the switches are held in the APL NOSE DN position, slowly pull the control column aft until the stabilizer stops.

NOTE: The control column must be pulled aft while the stabilizer is at 11.00 or more units of trim.

- 5) Measure the angular displacement of the control column from the neutral position.
  - a) Make sure that the angular displacement is between 3.0 and 3.5 degrees.
- 6) Move the control column forward just enough (control column is more than 2.0 degrees aft of neutral) to let the stabilizer move.
- 7) When the stabilizer stops (at the electrical limit), release the control wheel switches and then the control column.
- 8) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel in the CUTOUT position.

EFFECTIVITY

ALL

27-41-00

- 9) Open this circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:
    - a) 11C13, STAB TRIM SHUTOFF CENTER
  - 10) Make sure that Dimension A on the stabilizer trim ballscrew actuator is  $14.61 +0.21/-0.41$  inches ( $371.1 +5.3/-10.4$  millimeters) (Fig. 502).
- (e) Do the steps that follow for the column aft cutoff test:
- 1) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
    - a) 11C13, STAB TRIM SHUTOFF CENTER
  - 2) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.
  - 3) Move the captain's or first officer's stabilizer trim control wheel switches to the APL NOSE DN position.
  - 4) While the stabilizer trim control wheel switches are held in the APL NOSE DN position, slowly pull the control column aft until the stabilizer stops.
  - 5) Measure the angular displacement of the control column from the neutral position with the control column angle scale.
    - a) Make sure that the angular displacement is between 2.0 and 2.5 degrees.
  - 6) Release the stabilizer trim control wheel switches and then the control column.

S 735-121

- (2) Do the steps that follow for the electrical travel limits and column cutoff switches with only the left STCM test:
- (a) Do the steps that follow for the column forward cutoff test:
- 1) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel in the CUTOUT position.
  - 2) Open this circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:
    - a) 11C13, STAB TRIM SHUTOFF CENTER
  - 3) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
    - a) 11C12, STAB TRIM SHUTOFF L
  - 4) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.
  - 5) Move the captain's or first officer's stabilizer trim control wheel switches to the APL NOSE UP position.
  - 6) While the stabilizer trim control switches are held in the APL NOSE UP position, slowly push the control column forward until the stabilizer stops.
  - 7) Measure the angular displacement of the control column from neutral position with the control column angle scale.
    - a) Make sure that the angular displacement is between 2.2 and 2.7 degrees.
  - 8) Let the control column go to the neutral position and let the stabilizer move until it stops.
  - 9) Release the stabilizer trim control wheel switches when the stabilizer stops.

Aug 22/08

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- c) Put the flap lever in the 5-unit detent to move the TE flaps to the 5 unit detent.
- d) Move the captain's or first officer's stabilizer trim control wheel switches to the APL NOSE DN position and hold until the stabilizer stops.
- e) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel in the CUTOUT position.
- f) Open the circuit breaker 11C12, STAB TRIM SHUTOFF L on the P11 panel and attach a DO-NOT-CLOSE tag.
- 7) Make sure that Dimension A on the stabilizer trim ballscrew actuator is 0.92 +0.15/-0.42 inches (23.4 +3.8/-10.7 millimeters) (Fig. 502).
- 8) Put the flap lever in the FLAP UP detent to retract the flaps.

H. Trim Rate Test (Fig. 501)

S 735-006

- (1) Do the steps that follow to make sure that the stabilizer trim rate is correct when the auxiliary pitot lines are not pressurized:
  - (a) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
    - 1) 11C12, STAB TRIM SHUTOFF L
  - (b) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.
  - (c) Make sure that the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel is in the CUTOUT position.

**NOTE:** When operating an electro-hydraulic valve, you must wait at least 15 seconds before closing the associated circuit breaker. This will allow the valve enough time to operate before losing power.

- (d) Make sure this circuit breaker on the P11 panel is open:
  - 1) 11C13, STAB TRIM SHUTOFF CENTER

EFFECTIVITY

ALL

27-41-00

- (e) Move the captain's or first officer's stabilizer trim control wheel switches to the APL NOSE DN position and hold until the stabilizer stops.
- (f) Move the captain's or first officer's stabilizer trim control wheel switches to the APL NOSE UP position.
- (g) Measure the time necessary for the stabilizer to move to the nose up electrical trim stop.
  - 1) Make sure the necessary time is between 36 and 52 seconds.
- (h) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel in the CUTOFF position.
- (i) Open this circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:
  - 1) 11C12, STAB TRIM SHUTOFF L
- (j) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
  - 1) 11C13, STAB TRIM SHUTOFF CENTER
- (k) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.
- (l) Move the captain's or first officer's stabilizer trim control wheel switches to the APL NOSE DN position.
- (m) Measure the time necessary for the stabilizer to move to the airplane nose down electrical trim stop.
  - 1) Make sure that the necessary time is between 36 and 52 seconds.

S 865-122

- (2) Pressurize the auxiliary pitot lines (lower left and lower right) to  $4.58 \pm 0.10$  psi (31.58 +/- 0.69 kPa) (420 knots) (AMM 34-11-00/201).

S 865-124

- (3) Make sure the LEFT, RIGHT, and CENTER FLT CONT SHUTOFF TAIL valve switches on the right side panel, P61, are ON.

S 865-125

- (4) Make sure these circuit breakers on the P11 panel are closed:
  - (a) 11H17, FLT CONT SHUTOFF TAIL LEFT
  - (b) 11H18, FLT CONT SHUTOFF TAIL CTR
  - (c) 11H27, FLT CONT SHUTOFF TAIL RIGHT

S 735-123

- (5) Do the steps that follow to make sure the trim rate is correct when the auxiliary pitot system is pressurized.
  - (a) Move the captain's or first officer's stabilizer trim control wheel switches to the APL NOSE UP position.
  - (b) Measure the time necessary for the stabilizer to move to the nose up electrical trim stop.
    - 1) Make sure the necessary time is between 59 and 99 seconds.
  - (c) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel in the CUTOFF position.

EFFECTIVITY

ALL

27-41-00

- (d) Open this circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:
  - 1) 11C13, STAB TRIM SHUTOFF CENTER
- (e) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
  - 1) 11C12, STAB TRIM SHUTOFF L
- (f) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.
  - 1) Move the captain's or first officer's stabilizer trim control wheel switches to the APL NOSE DN position.
- (g) Measure the time necessary for the stabilizer to move to the airplane nose down electrical trim stop.
  - 1) Make sure that the necessary time is between 53 and 99 seconds.

S 865-117

- (6) Remove the pressure from the auxiliary pitot system (AMM 34-11-00/201).

I. AIRPLANES WITH STAB TRIM LEVERS;

Manual Operation and Mechanical Travel Limits Test

S 735-007

- (1) Do the steps that follow to make sure that stabilizer trim manual operation is correct (Fig. 501):
  - (a) Make sure that this circuit breaker on the P11 panel is closed:
    - 1) 11C12, STAB TRIM SHUTOFF L
  - (b) Make sure that the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel is in the NORM position.
  - (c) Make sure that the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel is in the CUTOUT position.
  - (d) Make sure that this circuit breaker on the P11 panel is open:
    - 1) 11C13, STAB TRIM SHUTOFF CENTER
  - (e) Move the two STAB TRIM levers to the APL NOSE DOWN position.
    - 1) Make sure that the stabilizer leading edge moves up.
  - (f) Release the two STAB TRIM levers.
    - 1) Make sure that the stabilizer stops.
  - (g) Move the two STAB TRIM levers to the APL NOSE UP position.
    - 1) Make sure that the stabilizer leading edge moves down.
  - (h) Release the two STAB TRIM levers.
    - 1) Make sure that the stabilizer stops.
  - (i) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel in the CUTOUT position.
  - (j) Open this circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:
    - 1) 11C12, STAB TRIM SHUTOFF L
  - (k) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
    - 1) 11C13, STAB TRIM SHUTOFF CENTER
  - (l) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.

EFFECTIVITY

ALL

27-41-00

- (m) Move the two STAB TRIM levers to the APL NOSE DOWN position.
  - 1) Make sure that the stabilizer leading edge moves up.
- (n) Release the two STAB TRIM levers.
  - 1) Make sure that the stabilizer stops.
- (o) Move the two STAB TRIM levers to the APL NOSE UP position.
  - 1) Make sure that the stabilizer leading edge moves down.
- (p) Release the two STAB TRIM levers.
  - 1) Make sure that the stabilizer stops.

S 735-008

- (2) Do the steps that follow to make sure that the stabilizer trim mechanical travel limits are correct:
  - (a) Move the two the STAB TRIM levers to the APL NOSE DOWN position until the stabilizer is at the airplane nose down mechanical stop.

NOTE: The ballscrew mechanical stops are only used if there is a limit switch failure. Avoid operation of the stabilizer into the mechanical stops that is not necessary.

- (b) Make sure that both of the stabilizer trim position indicators show  $0.00 \pm 0.25$  unit of trim.
- (c) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel in the CUTOUT position.
- (d) Open this circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:
  - 1) 11C13, STAB TRIM SHUTOFF CENTER
- (e) Make sure that one set of the upper stop surfaces on the ballscrew touch.
- (f) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
  - 1) 11C13, STAB TRIM SHUTOFF CENTER
- (g) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.
- (h) Move the two STAB TRIM levers to the APL NOSE UP position to move the stabilizer away from the airplane nose down stop.
- (i) Move the two STAB TRIM levers to the APL NOSE UP position to move the stabilizer to the airplane nose up stop.

NOTE: The ballscrew mechanical stops are only used if there is a limit switch failure. Avoid operation of the stabilizer into the mechanical stops.

- (j) Make sure that both of the stabilizer trim position indicators show  $14.2 \pm 0.3$  units of trim.
- (k) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel in the CUTOUT position.
- (l) Open this circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:
  - 1) 11C13, STAB TRIM SHUTOFF CENTER

EFFECTIVITY

ALL

Aug 22/09

(m) Make sure that one set of the lower stop surfaces on the ballscrew touch.

S 865-102

(3) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:

(a) 11C12, STAB TRIM SHUTOFF L

S 865-103

(4) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.

S 865-104

(5) Make sure that this circuit breaker on the P11 panel is open:

(a) 11C13, STAB TRIM SHUTOFF CENTER

S 865-105

(6) Make sure that the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel is in the CUTOUT position.

S 865-106

(7) Use the captain's or first officer's stabilizer trim control wheel switches to move the stabilizer away from the airplane nose up stop.

(a) Make sure that the ballscrew ice scraper stays fully engaged in the ballnut.

J. AIRPLANES WITH ALTERNATE STAB TRIM SWITCHES;

Alternate Electric Trim Operation and Mechanical Travel Limits Test

S 735-009

(1) Do the steps that follow to make sure that alternate electric stabilizer trim operation and mechanical travel limits are correct:

(a) Move the alternate stab trim switches to the APL NOSE DN position to move the stabilizer to the airplane nose down stop.

NOTE: The ballscrew mechanical stops are only used if there is a limit switch failure. Avoid operation of the stabilizer into the mechanical stops that is not necessary.

(b) Make sure that both of the stabilizer trim position indicators show  $0.00 \pm 0.25$  unit of trim.

(c) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel in the CUTOUT position.

(d) Make sure that one set of the upper stop surfaces on the ballscrew touch.

(e) Move the control column to the forward stop, then to the aft stop and then back to neutral.

(f) Make sure that the elevator system operates smoothly with no binding or chatter.

(g) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.

EFFECTIVITY

ALL

27-41-00

- (h) Move the alternate stab trim control switches to the APL NOSE UP position to move the stabilizer to the airplane nose up stop.

NOTE: The ballscrew mechanical stops are only used if there is a limit switch failure. Avoid operation of the stabilizer into the mechanical stops that is not necessary.

- (i) Make sure that both of the stabilizer trim position indicators show  $14.2 \pm 0.3$  units of trim.
- (j) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel in the CUTOUT position.
- (k) Make sure that one set of the lower stop surfaces on the ballscrew touch.
- (l) Move the control column to the forward stop, then to the aft stop, and then back to neutral.
- (m) Make sure that the elevator system operates smoothly with no binding or chatter.

K. Secondary Brake Reaction Torque Test (Fig. 501)

S 735-010

- (1) Do the steps that follow to make sure that the stabilizer trim secondary brake reaction torque is correct:
  - (a) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
    - 1) 11C12, STAB TRIM SHUTOFF L
  - (b) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.
  - (c) Make sure that the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel is in the CUTOUT position.
  - (d) Make sure that this circuit breaker on the P11 panel is open:
    - 1) 11C13, STAB TRIM SHUTOFF CENTER
  - (e) Use the captain's or first officer's stabilizer trim control wheel switches to move the stabilizer at least three units of trim away from ends of the travel range.
  - (f) Press and hold the BRAKE BYPASS valve button on the left STCM (Fig. 502).

NOTE: The BRAKE BYPASS valve button is on the bottom of the STCM.

- (g) Move the captain's or first officer's stabilizer trim control switches full travel in the same direction and hold for 10 seconds.
  - 1) Make sure that the stabilizer does not move.
- (h) Release the control wheel switches and then release the BRAKE BYPASS valve button.
- (i) Move the control wheel switches full travel in one direction and then in the other direction.
  - 1) Make sure that the stabilizer moves correctly.

EFFECTIVITY

ALL

27-41-00

- (j) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel in the CUTOUT position.
  - (k) Open this circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:
    - 1) 11C12, STAB TRIM SHUTOFF L
  - (l) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
    - 1) 11C13, STAB TRIM SHUTOFF CENTER
  - (m) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.
  - (n) Press and hold the BRAKE BYPASS valve button on the right STCM.
  - (o) Move the captain's or first officer's stabilizer trim control wheel switches full travel in the same direction and hold for 10 seconds.
    - 1) Make sure that the stabilizer does not move.
  - (p) Release the control wheel switches and then release the BRAKE BYPASS valve button.
  - (q) Move the control wheel switches full travel in one direction and then in the other direction.
    - 1) Make sure the stabilizer moves correctly.
- L. AIRPLANES WITH STAB TRIM LEVERS;  
Lever Travel Test (Fig. 501)

S 735-011

- (1) Do the steps that follow to make sure that the stabilizer trim secondary brake reaction torque is correct:
  - (a) Put a piece of masking tape that is 6.70 inches (170 millimeters) long over part of the width of the right STAB TRIM lever decal.
  - (b) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
    - 1) 11C12, STAB TRIM SHUTOFF L
  - (c) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.
  - (d) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel in the CUTOUT position.
  - (e) Open this circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:
    - 1) 11C13, STAB TRIM SHUTOFF CENTER
  - (f) Slowly pull the STAB TRIM control levers to the APL NOSE UP position until the stabilizer starts to move.
  - (g) Make a mark on the masking tape at the aft edge of the right STAB TRIM lever.
  - (h) Slowly push the STAB TRIM levers to the APL NOSE DOWN position forward until the stabilizer starts to move.
  - (i) Make a mark on the masking tape at the forward edge of the right STAB TRIM lever.
  - (j) Release the STAB TRIM levers.
  - (k) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
    - 1) 11C13, STAB TRIM SHUTOFF CENTER

EFFECTIVITY

ALL

27-41-00

- (l) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.
- (m) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel in the CUTOFF position.
- (n) Open this circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:
  - 1) 11C12, STAB TRIM SHUTOFF L
- (o) Slowly pull the STAB TRIM levers to the APL NOSE UP position until the stabilizer starts to move.
- (p) Make a mark on the masking tape at the aft edge of the right lever.
- (q) Slowly push the STAB TRIM levers to the APL NOSE DOWN position until the stabilizer starts to move.
- (r) Make a mark on the masking tape at the forward edge of the right lever.
- (s) Release the STAB TRIM levers.
- (t) Measure the distance (along the decal surface) from the forward edge of the white area on the decal to the farthest forward mark on the tape.
  - 1) Make sure that the distance is 1.15 to 1.40 inches (29.2 to 35.6 millimeters).
- (u) Measure the distance (along the decal surface) from the aft boundary of the white area to the farthest aft mark on the tape.
  - 1) Make sure that the distance is 1.15 to 1.40 inches (29.2 to 35.6 millimeters).
- (v) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
  - 1) 11C12, STAB TRIM SHUTOFF L
- (w) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.
- (x) Move only the left STAB TRIM lever to the APL NOSE DOWN position.
  - 1) Make sure that the stabilizer does not move.
- (y) Move only the right STAB TRIM lever to the APL NOSE DOWN position.
  - 1) Make sure that the stabilizer does not move.
- (z) Move only the left STAB TRIM lever to the APL NOSE UP position.
  - 1) Make sure that the stabilizer does not move.
- (aa) Move only the right STAB TRIM lever to the APL NOSE UP position.
  - 1) Make sure that the stabilizer does not move.
- (ab) Move the two STAB TRIM levers, full travel in opposite directions, at the same rate.
  - 1) Make sure that the stabilizer does not move.
- (ac) Change the positions of the levers.

NOTE: Both levers must go through neutral at the same time.

- 1) Make sure that the stabilizer does not move.

EFFECTIVITY

ALL

27-41-00

(ad) Let both of the STAB TRIM levers go to neutral at the same rate.

1) Make sure that the stabilizer does not move.

M. AIRPLANES WITH STAB TRIM LEVERS;  
Lever Force Test (Fig. 501)

S 735-012

(1) Do the steps that follow to make sure that the STAB TRIM lever force is correct:

(a) Put the LEFT and CENTER STAB TRIM SHUTOFF valve switches on the P10 panel in the CUTOUT position.

(b) Open these circuit breakers on the P11 panel and attach DO-NOT-CLOSE tags:

1) 11C12, STAB TRIM SHUTOFF L

2) 11C13, STAB TRIM SHUTOFF CENTER

(c) Apply a force at the base of the lever knob to move each STAB TRIM lever forward (one at a time) to the positions that follow (Ref Lever Travel Test):

1) The mark on the masking tape for the forward edge of the right lever when the STAB TRIM levers were slowly moved forward and the LEFT STAB TRIM SHUTOFF valve switch was at the NORM position.

2) The mark on the masking tape for the forward edge of the right lever when the STAB TRIM levers were slowly moved forward and the CENTER STAB TRIM SHUTOFF valve switch at the NORM position.

(d) Measure the maximum force on each lever.

1) Make sure that the force is not greater than 9.9 pounds (44.0 newtons).

(e) Apply a force at the upper edge of the lever knob to move each STAB TRIM lever aft (one at a time) to the positions that follow (Ref Lever Travel Test):

1) The mark on the masking tape for the aft edge of the right lever when the LEFT STAB TRIM SHUTOFF valve switch was at the NORM position.

2) The mark on the masking tape for the aft edge of the right lever when the STAB TRIM levers were slowly moved aft and the CENTER STAB TRIM SHUTOFF valve switch was at the NORM position.

(f) Measure the maximum force on each lever.

1) Make sure that the force is not greater than 7.8 pounds (34.7 newtons).

N. AIRPLANES WITH STAB TRIM LEVERS;  
Manual Override Test (Fig. 501)

S 735-013

(1) Do the steps that follow to make sure that the stabilizer trim manual override operates correctly:

(a) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:

1) 11C12, STAB TRIM SHUTOFF L

EFFECTIVITY

ALL

27-41-00

- (b) Make sure that this circuit breaker on the P11 panel is open:
  - 1) 11C13, STAB TRIM SHUTOFF CENTER
- (c) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.
- (d) Make sure that the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel is in the CUTOFF position.
- (e) Use the captain's or first officer's stabilizer trim control wheel switches to move the stabilizer to 6 units of trim.
- (f) Move the captain's or first officer's stabilizer trim control wheel switches to the APL NOSE DN position.
- (g) Pull the STAB TRIM levers to the APL NOSE UP position while the stabilizer moves.
  - 1) Make sure that the stabilizer moves in the opposite direction in one second.
- (h) Let the stabilizer trim control wheel switches and STAB TRIM levers go to neutral.
- (i) Move the captain's or first officer's stabilizer trim control wheel switches to the APL NOSE UP position.
- (j) Push the STAB TRIM levers to the APL NOSE DOWN position while stabilizer moves.
  - 1) Make sure that the stabilizer moves in the opposite direction in one second.
- (k) Return the stabilizer trim control wheel switches and the STAB TRIM levers to neutral.
- (l) Remove the DO-NOT-CLOSE tags and close this circuit breaker on the P11 panel:
  - 1) 11C13, STAB TRIM CENTER
- (m) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.
- (n) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel in the CUTOFF position.
- (o) Open this circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:
  - 1) 11C12, STAB TRIM SHUTOFF L
- (p) Move either the captain's or first officer's stab trim control switches to the APL NOSE DN position.
- (q) Pull the two STAB TRIM control levers to the APL NOSE UP position while the stabilizer is moving.
  - 1) Make sure that the stabilizer moves in the opposite direction in one second.
- (r) Let the stabilizer trim control wheel switches and the STAB TRIM levers go to neutral.
- (s) Move the captain's or first officer's stabilizer trim control wheel switches to the APL NOSE UP position.
- (t) Push the two STAB TRIM levers to the APL NOSE DOWN position while the stabilizer moves.
  - 1) Make sure that the stabilizer moves in the opposite direction in one second.
- (u) Let the stabilizer trim control wheel switches and the STAB TRIM levers go to neutral.

EFFECTIVITY

ALL

0. Stabilizer Trim Relief Valve Operation Test

S 735-107

- (1) Do the steps that follow to make sure the relief valve is open in the free flow direction.
  - (a) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.
  - (b) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel in the CUTOUT position.
  - (c) Open this circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:
    - 1) 11C13, STAB TRIM SHUTOFF CENTER
  - (d) Make sure that this circuit breaker on the P11 panel is closed:
    - 1) 11C12, STAB TRIM SHUTOFF L
  - (e) Do the steps that follow while the stabilizer is operated through one full up/down cycle (approximately 1 unit of trim to 12 units of trim and back):
    - 1) Slowly pressurize auxiliary pitot system No. 1 to change the simulated air speed from zero to 300 knots (AMM 34-11-00/201).
    - 2) Make sure that the stabilizer trim rate decreases as the pitot-static pressure increases.
    - 3) Slowly remove the pressure from auxiliary pitot system No. 1 until the pressure is zero (AMM 34-11-00/201).
    - 4) Make sure that the stabilizer trim rate increases as the pitot-static pressure decreases.

S 735-108

- (2) Do the steps that follow to make sure there is no leakage through the relief valve below the re-seat pressure:
  - (a) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel in the CUTOUT position.
  - (b) Open this circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:
    - 1) 11C12, STAB TRIM SHUTOFF L
  - (c) Remove the power from the left and center hydraulic systems (AMM 29-11-00/201).

**WARNING:** CAREFULLY LOOSEN THE HYDRAULIC RETURN LINE ON THE LEFT STCM. THE PTU SYSTEM CAN CAUSE A PRESSURE AS HIGH AS 100 PSI AND A FLUID VOLUME AS MUCH AS 5 CUBIC INCHES TO STAY IN THE LINE. A SPRAY OF FLUID FROM THE CONNECTION CAN CAUSE INJURY TO PERSONS.

- (d) At the relief valve end, slowly loosen the retaining nut of the hydraulic line which connects the left STCM to the relief valve and let the pressure decrease.
- (e) Disconnect the hydraulic line at the STCM.
- (f) Connect the hand pump with a shutoff valve to the hydraulic line leading to the relief valve inlet as shown (Fig. 506).

EFFECTIVITY

ALL

27-41-00

- (g) Disconnect the other hydraulic line connected to the relief valve and move it out of the way.
  - (h) AIRPLANES WITH RELIEF VALVES S/N 516 AND BEFORE;  
Do the steps that follow:
    - 1) Use the hand pump to pressurize the relief valve until it opens (105 - 110 psi (724 - 758 kPa)).
    - 2) Allow the pressure to reduce to 90 +/- 5 psi (621 +/- 34 kPa), and use the hand pump to maintain this pressure.
  - (i) AIRPLANES WITH RELIEF VALVES S/N 517 OR GREATER;  
Do the steps that follow:
    - 1) Use the hand pump to pressurize the relief valve until it opens (130 psi (896 kPa)).
    - 2) Allow the pressure to reduce to 105 psi (724 kPa), and use the hand pump to maintain this pressure.
  - (j) For 10 minutes, use a beaker to capture the fluid that drips from the relief valve.
  - (k) Make sure the amount of hydraulic fluid captured in the beaker is less than 1.5 cc's.
  - (l) If the amount of hydraulic fluid captured in the beaker is more than 1.5 cc's, replace the pressure relief valve (AMM 27-41-19/401).
- P. Put the Airplane Back to Its Usual Condition

S 865-109

- (1) Remove the power from the left and center hydraulic systems (AMM 29-11-00/201).

S 085-110

- (2) Remove the hand pump from the hydraulic line which leads to the relief valve inlet.

S 435-111

- (3) Connect the hydraulic line to the STCM.

S 865-112

- (4) Make sure that these circuit breakers on the P11 panel are closed:
  - (a) 11C12, STAB TRIM SHUTOFF L
  - (b) 11C13, STAB TRIM SHUTOFF CENTER

S 865-113

- (5) Make sure that the LEFT and CENTER STAB TRIM SHUTOFF valve switches on the P10 panel are in the NORM position.

S 085-114

- (6) Remove the control wheel adapter equipment.

S 865-115

- (7) Remove electrical power (AMM 24-22-00/201).

EFFECTIVITY

ALL

27-41-00

S 415-116

- (8) Close the access door, 312AR (AMM 06-42-00/201).

TASK 27-41-00-715-251

5. AIRPLANES WITH STAB TRIM LEVERS:

Manual-Mechanical Stabilizer Trim Control Operational Test

NOTE: This is a scheduled maintenance task.

A. References

- (1) AMM 24-22-00/201, Electrical Power - Control

B. Access

- (1) Location Zones  
211/212 Control Cabin

C. Procedure

S 865-238

- (1) Supply electrical power (AMM 24-22-00/201).

S 215-514

- (2) Make sure that LEFT, RIGHT, and CENTER FLT CONT SHUTOFF TAIL valve switches on the P61 panel are OFF.

S 865-239

WARNING: KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (3) Supply power to the left hydraulic system (AMM 29-11-00/201).

S 715-240

CAUTION: DO NOT LET THE BALLSCREW ACTUATOR HIT THE MECHANICAL STOPS. DAMAGE TO THE BALLSCREW ACTUATOR AND THE STABILIZER CAN OCCUR.

- (4) Move the STAB TRIM levers full forward and full aft (Fig 501).  
(a) Make sure that the stabilizer moves smoothly and freely through its full travel.

S 715-241

- (5) Move only the left STAB TRIM lever forward.  
(a) Make sure that the stabilizer does not move.

EFFECTIVITY

ALL

27-41-00

- S 715-242  
(6) Move only the right STAB TRIM lever forward.  
(a) Make sure that the stabilizer does not move.

- S 715-243  
(7) Move only the left STAB TRIM lever aft.  
(a) Make sure that the stabilizer does not move.

- S 715-244  
(8) Move only the right STAB TRIM lever aft.  
(a) Make sure that the stabilizer does not move.

- S 715-245  
(9) Move the STAB TRIM levers full travel in opposite directions at the same rate.  
(a) Make sure that the stabilizer does not move.

- S 715-246  
(10) Change the positions of the STAB TRIM levers.

NOTE: The STAB TRIM levers must go through neutral at the same time.

- (a) Make sure that the stabilizer does not move.

- S 715-247  
(11) Move the two levers to neutral at the same rate.  
(a) Make sure that the stabilizer does not move.  
D. Put the Airplane Back to Its Usual Condition

- S 865-248  
(1) Remove the power from the left hydraulic system (AMM 29-11-00/201).

- S 865-249  
(2) Remove electrical power (AMM 24-22-00/201).

TASK 27-41-00-715-278

6. AIRPLANES WITH ALTERNATE STAB TRIM SWITCHES;  
Alternate Electrical Stabilizer Trim Control Test

NOTE: This is a scheduled maintenance task.

A. References

EFFECTIVITY

ALL

27-41-00

C. Procedure

S 865-254

- (1) Supply electrical power (AMM 24-22-00/201).

S 215-256

- (2) Make sure that the LEFT and CENTER STAB TRIM SHUTOFF valve switches on the control stand panel, P10, are in the NORM position.

S 215-515

- (3) Make sure that LEFT, RIGHT, and CENTER FLT CONT SHUTOFF TAIL valve switches on the P61 panel are OFF.

S 865-257

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (4) Pressurize the left and center hydraulic systems (AMM 29-11-00/201).

S 865-271

- (5) Use the alternate stabilizer trim switches on the P10 panel to move the horizontal stabilizer to 2 units of trim.

S 865-279

- (6) Put the LEFT and CENTER STAB TRIM SHUTOFF valve switches on the P10 panel to the CUTOUT position.

S 715-272

- (7) Move the alternate stabilizer trim switches on the P10 panel to the APL NOSE UP and APL NOSE DOWN positions.  
(a) Make sure that the stabilizer does not move.

S 865-273

- (8) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.

S 715-280

- (9) Move the alternate stabilizer trim switches to the APL NOSE DN position.  
(a) Make sure that the stabilizer leading edge moves up.  
(b) Make sure that the stabilizer stops when the alternate stab trim switches are released.

S 715-274

- (10) Move the alternate stabilizer trim switches to the APL NOSE UP position.  
(a) Make sure that the stabilizer leading edge moves down.

EFFECTIVITY

ALL

27-41-00

(b) Make sure that the stabilizer stops when the alternate stab trim switches are released.

S 865-281

(11) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.

S 865-282

(12) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel in the CUTOUT position.

S 715-275

(13) Move the alternate stab trim switches to the APL NOSE DN position.

(a) Make sure that the stabilizer leading edge moves up.

(b) Make sure that the stabilizer stops when the alternate stab trim switches are released.

S 715-276

(14) Move the alternate stabilizer trim switches to the APL NOSE UP position.

(a) Make sure that the stabilizer leading edge moves down.

(b) Make sure that the stabilizer stops when the alternate stab trim switches are released.

S 865-277

(15) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.

S 865-160

(16) Remove the power from the left and center hydraulic systems (AMM 29-11-00/201).

S 865-163

(17) Remove electrical power (AMM 24-22-00/201).

TASK 27-41-00-725-258

7. Horizontal Stabilizer Trim Position Transmitter Limit Test

NOTE: This is a scheduled maintenance task.

A. Equipment

(1) Control Wheel Adapter Equipment - A27021-96 or -98

C. Access

(1) Location Zones

- 211/212 Control Cabin
- 312 Area Aft of Pressure Bulkhead to BS 1725 (Right)

(2) Access Panel

- 312AR Stabilizer Trim Ballscrew Actuator

D. Prepare for the Test

S 865-259

- (1) Supply electrical power (AMM 24-22-00/201).

S 015-260

**WARNING:** STAY OFF THE SERVICE ACCESS DOOR, 312AR, AND THE ACCESS DOOR FOR THE CONTROLS BAY, 313AL. YOUR WEIGHT CAN CAUSE THE SPRING-LOADED LATCHES TO RELEASE. IF YOU FALL THROUGH THE DOOR, INJURY CAN OCCUR.

- (2) Open the access panel, 312AR, for the stabilizer trim ballscrew actuator (AMM 06-42-00/201).

S 865-168

- (3) Put the LEFT and CENTER STAB TRIM SHUTOFF valve switches on the P10, control stand panel, to the NORM position.

EFFECTIVITY

ALL

27-41-00

23.1

Page 570  
Aug 22/09

S 485-169

- (4) Install the adapter equipment for the control wheels on the captain's or the first officer's control wheels (Fig. 505).

**NOTE:** The adapter equipment is used to measure control column angular displacement of the control column.

To measure the fore and aft angle of the control column, attach the protractor perpendicular to the face of the control wheel. The angle of the control column is read from the pendulum on the protractor.

S 865-170

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (5) Supply power to the left and center hydraulic systems (AMM 29-11-00/201).

S 865-171

- (6) Move the stabilizer to 6 units of trim.  
E. Electrical Travel Limit and Column Cutoff Switch Test With the Right STCM

S 725-261

- (1) Do the test of the nose down electrical limit:
- (a) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel to the CUTOUT position.
  - (b) Open this circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:
    - 1) 11C12, STAB TRIM SHUTOFF L
  - (c) Make sure this circuit breaker on the P11 panel is closed:
    - 1) 11C13, STAB TRIM SHUTOFF CENTER
  - (d) Make sure that the flaps and slats are retracted and the flap control lever is in the FLAP UP detent.
  - (e) Move the captain's or first officer's stabilizer trim control wheel switches to the APL NOSE DN position and hold until the stabilizer stops.
  - (f) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel to the CUTOUT position.
  - (g) Open this circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:
    - 1) 11C13, STAB TRIM SHUTOFF CENTER
  - (h) Make sure that Dimension A on the stabilizer trim ballscrew actuator is 3.00 +0.15/-0.42 inches (76.2 +3.8/-10.7 millimeters) (Fig. 502).

EFFECTIVITY

ALL

27-41-00

- (i) Do the steps that follow for the nose down electrical limit test with the flaps in the 5 unit detent:
- 1) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel to the NORM position.
  - 2) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
    - a) 11C13, STAB TRIM SHUTOFF CENTER

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- 3) Move the flap control lever to the 5-unit detent to extend the TE flaps to the 5 unit position.
- 4) Move the captain's or first officer's stabilizer trim control wheel switches to the APL NOSE DN position and hold until the stabilizer stops.
- 5) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel in the CUTOUT position.
- 6) Open this circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:
  - a) 11C13 STAB TRIM SHUTOFF CENTER
- 7) Make sure that Dimension A on the stabilizer trim ballscrew actuator is 0.92 +0.15/-0.42 inches (23.4 +3.8/-10.7 millimeters) (Fig. 502).
- 8) Put the flap lever in the FLAP UP detent to retract the flaps.

S 725-262

- (2) Do the steps that follow for the column forward cutoff test:
- (a) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
    - 1) 11C13, STAB TRIM SHUTOFF CENTER
  - (b) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.
  - (c) Move the captain's or first officer's stabilizer trim control wheel switches to the APL NOSE UP position.
  - (d) With the stabilizer trim switches held in the APL NOSE UP position, slowly push the control column forward until the stabilizer stops.
  - (e) Measure the angle of the control column from the column neutral position.
    - 1) Make sure that the angle is between 2.2 and 2.7 degrees.
  - (f) Let the control column go to the neutral position and let the stabilizer move until it stops.
  - (g) Release the stabilizer trim control wheel switches.

S 725-263

- (3) Do the steps that follow for the nose up electrical limit test:
- (a) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel to the CUTOUT position.
  - (b) Open this circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:
    - 1) 11C13, STAB TRIM SHUTOFF CENTER
  - (c) Make sure that Dimension A on the stabilizer trim ballscrew actuator is 22.43 +0.42/-0.15 inches (569.7 +10.7/-3.8 millimeters) (Fig. 502).

S 725-680

- (4) 767-200;  
Do the steps that follow for the column/neutral shift cutoff test:

NOTE: Do this test for 767-200 airplanes only.

767-300 airplanes do not have neutral shift and cutoff components.

- (a) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
  - 1) 11C13, STAB TRIM SHUTOFF CENTER
- (b) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.
- (c) Move the captain's or first officer's stabilizer trim control wheel switches to the APL NOSE DN position.
- (d) While the switches are held in the APL NOSE DN position, slowly pull the control column aft until the stabilizer stops.

NOTE: The control column must be pulled aft while the stabilizer is at 11.00 or more units of trim.

- (e) Measure the angular displacement of the control column from the neutral position.
  - 1) Make sure that the angular displacement is between 3.0 and 3.5 degrees.
- (f) Move the control column forward just enough (control column is more than 2.0 degrees aft of neutral) to let the stabilizer move.

Page 573  
Aug 22/01

- (g) When the stabilizer stops (at the electrical limit), release the control wheel switches and then release the control column.
- (h) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel in the CUTOFF position.
- (i) Open this circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:
  - 1) 11C13, STAB TRIM SHUTOFF CENTER
- (j) Make sure that Dimension A on the stabilizer trim ballscrew actuator is 14.61 +0.21/-0.41 inches (371.1 +5.3/-10.4 millimeters) (Fig. 502).

S 725-265

- (5) Do the steps that follow for the column aft cutoff test:
  - (a) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
    - 1) 11C13, STAB TRIM SHUTOFF CENTER
  - (b) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.
  - (c) Move the captain's or first officer's stabilizer trim control wheel switches to the APL NOSE DN position.
  - (d) While the stabilizer trim control wheel switches are held in the APL NOSE DN position, slowly pull the control column aft until the stabilizer stops.
  - (e) Measure the angular displacement of the control column from the neutral position.
    - 1) Make sure that the angular displacement is between 2.0 and 2.5 degrees.
  - (f) Release the stabilizer trim control wheel switches and then release the control column.

F. Electrical Travel Limit and Column Cutoff Switch Test With the Left STCM

S 725-266

- (1) Do the steps that follow for the column forward cutoff test:
  - (a) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel in the CUTOFF position.
  - (b) Open this circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:
    - 1) 11C13, STAB TRIM SHUTOFF CENTER
  - (c) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
    - 1) 11C12, STAB TRIM SHUTOFF L
  - (d) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.
  - (e) Move the captain's or first officer's stabilizer trim control wheel switches to the APL NOSE UP position.
  - (f) While the stabilizer trim control switches are held in the APL NOSE UP position, slowly push the control column forward until the stabilizer stops.

- (g) When the stabilizer stops (at the electrical limit), release the stabilizer trim control switches and then release the control column.
- (h) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel in the CUTOFF position.
- (i) Open this circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:
  - 1) 11C12, STAB TRIM SHUTOFF L
- (j) Make sure that Dimension A on the stabilizer trim ballscrew actuator is 14.61 +0.21/0.41 inches (371.1 +5.3/-10.4 millimeters) (Fig. 502).

S 725-269

- (4) Do the steps that follow for the column aft cutoff test:
  - (a) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
    - 1) 11C12, STAB TRIM SHUTOFF L
  - (b) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.
  - (c) Move the captain's or first officer's stabilizer trim control wheel switches to the APL NOSE DN position.
  - (d) While the switches are held in the APL NOSE DN position, slowly pull the control column aft until the stabilizer stops.
  - (e) Measure the angular displacement of the control column from the neutral position.
    - 1) Make sure that the angle is between 2.0 and 2.5 degrees.
  - (f) Let the control column go to the neutral position.
  - (g) Release the control wheel switches when the stabilizer stops.

S 725-270

- (5) Do the steps that follow for the nose down electrical limit test:
  - (a) Make sure that the flaps and slats are retracted and the flap control lever is in the FLAPS UP detent.
  - (b) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel in the CUTOFF position.
  - (c) Open this circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:
    - 1) 11C12, STAB TRIM SHUTOFF L
  - (d) Make sure that Dimension A on the stabilizer trim ballscrew actuator is 3.00 +0.15/-0.42 inches (76.2 +3.8/-10.7 millimeters) (Fig. 502).
  - (e) Do the steps that follow to do the nose down electrical limit with the flaps in the 5 unit detent test:
    - 1) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.
    - 2) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
      - a) 11C12, STAB TRIM SHUTOFF L
