- 7) Make sure that Dimension A on the stabilizer trim ballscrew actuator is 0.92 +0.15/-0.42 inches (23.4 +3.8/-10.7 millimeters) (Fig. 502).
- 8) Put the flap lever in the FLAP UP detent to retract the flaps.

G. Put the Airplane Back to Its Usual Condition

S 085-175

- (1) Remove the power from the left and center hydraulic systems (AMM 29-11-00/201).

S 865-177

- (2) Make sure that these circuit breakers on the P11 panel are closed:
  - (a) 11C12, STAB TRIM SHUTOFF L
  - (b) 11C13, STAB TRIM SHUTOFF CENTER

S 865-178

- (3) Make sure that the LEFT and CENTER STAB TRIM SHUTOFF valve switches on the P10 panel are in the NORM position.

S 085-179

- (4) Remove the control wheel adapter equipment.

S 865-180

- (5) Remove electrical power (AMM 24-22-00/201).

S 415-181

- (6) Close the access door, 312AR (AMM 06-42-00/201).

TASK 27-41-00-715-284

8. Stabilizer Trim Control Column Cut-off Switch Test

27-41-00

TASK 27-41-00-725-327

10. Stabilizer Trim Relief Valve Test

NOTE: This is a scheduled maintenance task.

A. Equipment

- (1) Hand Pump, Positive Displacement - Commercially Available
- (2) Shutoff Valve (2 Necessary) - Commercially Available
- (3) Pressure Gauge, 200 psi (1400 kPa) capacity - Commercially Available
- (4) Hose, 1/4 inch (6.4 millimeter) diameter - Commercially Available
- (5) Union, Flareless Tube - MS21902
- (6) Beaker with 1/4 cc graduations - Commercially Available

B. References

- (1) AMM 06-42-00/201, Empennage Access Doors and Panels
- (2) AMM 24-22-00/201, Electrical Power - Control
- (3) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic System
- (4) AMM 34-11-00/201, Pitot Static Systems

C. Access

- (1) Location Zones
  - 211/212 Control Cabin
  - 312 Area Aft of Pressure Bulkhead to BS 1725 (Right)
- (2) Access Panel
  - 312AR Stabilizer Trim Ballscrew Actuator

D. Prepare for the Test

S 865-195

- (1) Supply electrical power (AMM 24-22-00/201).

S 015-196

WARNING: STAY OFF THE SERVICE ACCESS DOOR, 312AR, AND THE ACCESS DOOR FOR THE CONTROLS BAY, 313AL. YOUR WEIGHT CAN CAUSE THE SPRING-LOADED LATCHES TO RELEASE. IF YOU FALL THROUGH THE DOOR, INJURY CAN OCCUR.

- (2) Open the access panel, 312AR, for the stabilizer trim ballscrew actuator (AMM 06-42-00/201).

EFFECTIVITY

ALL

27-41-00

12

Page 580C  
Dec 22/01

S 865-197

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (3) Supply power to the left hydraulic system (AMM 29-11-00/201).

S 865-677

- (4) Make sure the RIGHT and CENTER FLT CONT SHUTOFF TAIL valve switches on the P61 panel are OFF.

S 865-678

- (5) Put the LEFT FLT CONT SHUTOFF TAIL valve switch on the P61 panel to the ON position.

E. Stabilizer Trim Relief Valve Test

S 735-228

- (1) Do the steps that follow to make sure the relief valve is open in the free flow direction:
- (a) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.
  - (b) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel in the CUTOUT position.
  - (c) Open this circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:
    - 1) 11C13, STAB TRIM SHUTOFF CENTER
  - (d) Make sure that this circuit breaker on the P11 panel is closed:
    - 1) 11C12, STAB TRIM SHUTOFF L
  - (e) Do the steps that follow while the stabilizer is operated through one full up/down cycle (approximately 1 unit of trim to 12 units of trim and back):
    - 1) Slowly pressurize auxiliary pitot system No. 1 to change the simulated air speed from zero to 300 knots (AMM 34-11-00/201).
    - 2) Make sure that the stabilizer trim rate decreases as the pitot-static pressure increases.
    - 3) Slowly remove the pressure from auxiliary pitot system No. 1 until the pressure is zero (AMM 34-11-00/201).
    - 4) Make sure that the stabilizer trim rate increases as the pitot-static pressure decreases.

S 735-229

- (2) Do the steps that follow to make sure there is no leakage through the relief valve below the re-seat pressure:

EFFECTIVITY

ALL

27-41-00

S 215-509

- (3) Make sure that LEFT, RIGHT, and CENTER FLT CONT SHUTOFF TAIL valve switches on the P61 panel are OFF.
- (a) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel in the CUTOFF position.
  - (b) Open this circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:
    - 1) 11C12, STAB TRIM SHUTOFF L
  - (c) Remove the power from the left and center hydraulic systems (AMM 29-11-00/201).

**WARNING:** CAREFULLY LOOSEN THE HYDRAULIC RETURN LINE ON THE LEFT STCM. THE PTU SYSTEM CAN CAUSE A PRESSURE AS HIGH AS 100 PSI AND A FLUID VOLUME AS MUCH AS 5 CUBIC INCHES TO STAY IN THE LINE. A SPRAY OF FLUID FROM THE CONNECTION CAN CAUSE INJURY TO PERSONS.

- (d) At the relief valve end, slowly loosen the retaining nut of the hydraulic line which connects the left STCM to the relief valve and let the pressure decrease.
- (e) Disconnect the hydraulic line at the relief valve and seal the hydraulic line with a cap.
- (f) Connect the hand pump with a shutoff valve to the relief valve inlet as shown (Fig. 506).
- (g) Disconnect the other hydraulic line connected to the relief valve and move it out of the way.
- (h) AIRPLANES WITH RELIEF VALVES S/N 516 AND BEFORE;  
Do the steps that follow:
  - 1) Use the hand pump to pressurize the relief valve until it opens (105 - 110 psi (724 - 758 kPa)).
  - 2) Allow the pressure to reduce to 90 +/- 5 psi (621 +/- 34 kPa), and use the hand pump to maintain this pressure.
- (i) AIRPLANES WITH RELIEF VALVES S/N 517 OR GREATER;  
Do the steps that follow:
  - 1) Use the hand pump to pressurize the relief valve until it opens (130 psi (896 kPa)).
  - 2) Allow the pressure to reduce to 105 psi (724 kPa), and use the hand pump to maintain this pressure.
- (j) Maintain pressure on the valve for 10 minutes. Use a beaker to capture the hydraulic fluid that drips from the relief valve.
- (k) Make sure the amount of hydraulic fluid captured in the beaker is less than 1.5 cc's.
- (l) If the amount of hydraulic fluid captured in the beaker is more than 1.5 cc's, replace the pressure relief valve (AMM 27-41-19/401).

F. Put the Airplane Back to Its Usual Condition

S 085-231

- (1) Remove the hand pump from the relief valve inlet.

EFFECTIVITY

ALL

27-41-00

12

Dec 22/01

- S 435-232
- (2) Connect the hydraulic line to the relief valve.
  
- S 865-233
- (3) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:
  - (a) 11C12, STAB TRIM SHUTOFF L
  - (b) 11C13, STAB TRIM SHUTOFF CENTER
  
- S 865-234
- (4) Put the LEFT and CENTER STAB TRIM SHUTOFF valve switches on the P10 panel in the NORM position.
  
- S 865-236
- (5) Remove electrical power (AMM 24-22-00/201).
  
- S 415-237
- (6) Close the access door, 312AR (AMM 06-42-00/201).

TASK 27-41-00-715-328

11. Horizontal Stabilizer Secondary Brake Test

NOTE: This is a scheduled maintenance task.

A. References

- (1) AMM 06-42-00/201, Empennage Access Doors and Panels
- (2) AMM 24-22-00/201, Electrical Power - Control
- (3) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic System

B. Access

- (1) Location Zones
  - 211/212 Control Cabin
  - 311/312 Area Aft of Pressure Bulkhead to BS 1725
  
- (2) Access Panel
  - 312AR Stabilizer Trim Ballscrew Actuator

C. Prepare for the Test

- S 865-198
- (1) Supply electrical power (AMM 24-22-00/201).

EFFECTIVITY

ALL

27-41-00

S 015-199

**WARNING:** STAY OFF THE SERVICE ACCESS DOOR, 312AR, AND THE ACCESS DOOR FOR THE CONTROLS BAY, 313AL. YOUR WEIGHT CAN CAUSE THE SPRING-LOADED LATCHES TO RELEASE. IF YOU FALL THROUGH THE DOOR, INJURY CAN OCCUR.

- (2) Open the access panel, 312AR, for the stabilizer trim ballscrew actuator (AMM 06-42-00/201).

S 865-200

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (3) Supply power to the left and center hydraulic systems (AMM 29-11-00/201).

S 865-201

- (4) Move the stabilizer to 6 units of trim.

D. Secondary Brake Reaction Torque Test

S 735-202

- (1) Do the steps that follow to make sure that the stabilizer trim secondary brake reaction torque is correct (Fig. 501):
  - (a) Make sure this circuit breaker on the P11 panel is closed:
    - 1) 11C12, STAB TRIM SHUTOFF L
  - (b) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.
  - (c) Make sure the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel is in the CUTOUT position.
  - (d) Open this circuit breaker on the P11 panel and install a DO-NOT-CLOSE tag:
    - 1) 11C13, STAB TRIM SHUTOFF CENTER
  - (e) Use the captain's or first officer's stabilizer trim control wheel switches to move the stabilizer at least three units of trim away from the ends of the travel range.
  - (f) Press and hold the BRAKE BYPASS valve button on the left STCM (Fig. 502).

**NOTE:** The BRAKE BYPASS valve button is on the bottom of the STCM.

- (g) Move the captain's or first officer's stabilizer trim control switches full travel in the same direction and hold for 10 seconds.
  - 1) Make sure that the stabilizer does not move.

EFFECTIVITY

ALL

27-41-00

- (h) Release the control wheel switches and then release the BRAKE BYPASS valve button.
  - (i) Move the control wheel switches full travel in one direction and then in the other direction.
    - 1) Make sure that the stabilizer moves correctly.
  - (j) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel in the CUTOFF position.
  - (k) Open this circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:
    - 1) 11C12, STAB TRIM SHUTOFF L
  - (l) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
    - 1) 11C13, STAB TRIM SHUTOFF CENTER
  - (m) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel in the NORM position.
  - (n) Press and hold the BRAKE BYPASS valve button on the right STCM.
  - (o) Move the captain's or first officer's stabilizer trim control wheel switches full travel in the same direction and hold for 10 seconds.
    - 1) Make sure that the stabilizer does not move.
  - (p) Release the control wheel switches and then release the BRAKE BYPASS valve button.
  - (q) Move the control wheel switches full travel in one direction and then in the other direction.
    - 1) Make sure the stabilizer moves correctly.
- E. Put the Airplane Back to Its Usual Condition

S 865-203

- (1) Remove the power from the left and center hydraulic systems (AMM 29-11-00/201).

S 865-206

- (2) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 Panel:
  - (a) 11C12, STAB TRIM SHUTOFF L

S 865-207

- (3) Put the LEFT and CENTER STAB TRIM SHUTOFF valve switches on the P10 panel in the NORM position.

S 865-209

- (4) Remove electrical power (AMM 24-22-00/201).

S 415-210

- (5) Close the access door, 312AR (AMM 06-42-00/201).

EFFECTIVITY

ALL

**CAUTION:** DO NOT LET THE BALLSCREW ACTUATOR HIT THE MECHANICAL STOPS.  
DAMAGE TO THE BALLSCREW ACTUATOR AND THE STABILIZER CAN OCCUR.

- (23) Move the alternate stab trim switches full forward and full aft.
  - (a) Make sure that the stabilizer moves smoothly and freely through full travel.
  - (b) Make sure that the stabilizer position indicator correctly shows the position of the stabilizer (0.25 - 14.0 pilot units).
- D. Put the Airplane Back to Its Usual Condition

S 865-458

- (1) Remove the power from the left and center hydraulic systems if it is not necessary (AMM 29-11-00/201).

S 865-491

- (2) Remove the electrical power if it is not necessary (AMM 24-22-00/201).

TASK 27-41-00-725-696

14. Stabilizer Trim Actuator Bearing Friction - Test

A. General

- (1) The following procedure can be used to detect high levels of corrosion in the stabilizer differential. This procedure will not detect water in the stabilizer differential, which can freeze at high altitudes. Any horizontal stabilizer trim actuator that fails this test is not a serviceable unit. A horizontal stabilizer trim actuator may contain water or corrosion and still pass this test.

D. Procedure

S 865-688

- (1) Remove the power from the left and center hydraulic systems (AMM 29-11-00/201).

S 865-689

- (2) Remove the electrical power (AMM 24-22-00/201).

S 025-690

- (3) Remove the stabilizer left hydraulic motor and brake assemblies (AMM 27-41-11/401, AMM 27-41-13/401).
  - (a) Cover the brake input to avoid contamination of the gearbox.

S 485-691

- (4) Attach a 1/2 inch (13 mm) inside diameter plastic tube, approximately 3 inches (76 mm) long, over the motor spline.

S 485-692

- (5) Attach the plastic tube to the motor spline with a hose clamp.

S 485-693

- (6) Attach the other end of the plastic tube to a torque wrench with a hose clamp.
  - (a) If the torque necessary to move the motor shaft is more than 15 inch-pounds (1.70 Nm), the differential bearings may be corroded and should be inspected or overhauled.

S 425-694

- (7) Install the motor and brake assemblies that you removed (AMM 27-41-11/401, AMM 27-41-13/401).

S 725-695

- (8) Repeat the test with the right motor and brake assemblies removed.

E. Put the Airplane Back to Its Usual Condition

S 865-697

- (1) Remove the power from the left and center hydraulic systems, if it is not necessary (AMM 29-11-00/201).

S 865-698

- (2) Remove electrical power, if it is not necessary (AMM 24-22-00/201).

STABILIZER TRIM CONTROL WHEEL SWITCH – REMOVAL/INSTALLATION

1. General

- A. This procedure contains steps to remove and install the control wheel switches for the stabilizer trim operation.
- B. The control wheel switch is attached to an electrical cable that goes through the control wheel handles. The electrical cable is connected to a wire bundle in the control wheel hub. The wire bundle goes through the control column. If a control wheel switch is defective, the switch and cable are replaced as an assembly.

TASK 27-41-01-024-001

2. Remove the Control Wheel Switch for the Stabilizer (Fig. 401)

A. Equipment

- (1) Extraction/Insertion Tool – M15570-20,  
(Deutsu Company, Engineered Connection  
Devices, 36033 Whittier Ave, Hemet, CA 92545)

B. References

- (3) Pull the cable through the switch hole in the control wheel handle.

S 094-014

- (4) Disconnect the cable from the wire guide.

S 434-015

- (5) Put the insulator between the cable for the control wheel switch and the interphone switch wires.

S 424-016

- (6) Pull the cable through the control wheel until the control wheel switch and the guard assembly are set correctly.

S 434-017

**CAUTION:** DO NOT TIGHTEN THE SCREWS TOO MUCH. DAMAGE TO THE SWITCH HOUSING CAN OCCUR.

- (7) Install the screws that attach the control wheel switch to the control wheel handle.

S 434-034

**CAUTION:** ENSURE THAT WIRE GUARD ASSEMBLY SLIDES SMOOTHLY IN GROOVE OF WHEEL ASSEMBLY DURING INSTALLATION. KEEP ALL WIRES AND CONNECTORS CLEAR OF PLANE OF GROOVE TO PREVENT POSSIBLE WIRE INSULATION DAMAGE DURING ASSEMBLY.

- (8) Attach the cables for the control wheel switches to the connectors in the control wheel hub.

E. Control Wheel Switch Test

S 864-019

- (1) Turn the control wheel through five cycles of full travel.

S 214-020

- (2) Make sure that the cables for the control wheel switches do not get pulled when you turn the control wheel.

S 834-021

- (3) Supply electrical power (AMM 24-22-00/201).

(8) Install the left seal assembly.

F. STAB TRIM Levers Adjustment (Fig. 402)

S 214-027

**CAUTION:** DO NOT MOVE THE STABILIZER WITH THE RIG PINS INSTALLED. THIS CAN CAUSE DAMAGE TO THE AIRPLANE STRUCTURE.

(1) Make sure rig pins ST4 and ST5 are installed in the STCM quadrants.

S 824-028

(2) Adjust the turnbuckles in the main deck compartment ceiling (Fig. 403).

S 824-029

(3) Adjust the turnbuckles on cables ST1A and ST1B until the conditions that follow are correct:  
(a) The STAB TRIM control levers align with each other by 0.02 inch (0.51 mm) and the base of the levers are positioned within the index marks of the limit position decal.

**NOTE:** Thermal expansion of the control cables during flight can cause the difference between the levers to be more than 0.02 inch (0.51 mm) while in flight. If the difference between the levers is more than 0.25 inch (6.35 mm) while in flight, the levers can be adjusted on the ground. You can adjust the TRIM lever, forward or aft of the STAB lever, one half of the in-flight displacement to a maximum of 0.25 inch (6.35 mm).

(b) The STAB TRIM levers are in the decal for the adjustment limit position.

S 094-030

(4) Remove rig pins ST4 and ST5.

S 214-031

(5) Operate the STAB TRIM levers through one complete cycle and do the checks that follow:  
(a) Make sure the cable tension and STAB TRIM lever positions are correct.

EFFECTIVITY  
AIRPLANES WITH STAB TRIM LEVERS ON THE  
CONTROL STAND

27-41-02

- (b) Make sure that the STAB TRIM levers align correctly.
- (c) Make sure that rig pins ST4 and ST5 can be freely installed in the STCM quadrants.

S 494-032

- (6) Install lock clips on the turnbuckles.

S 624-033

- (7) Apply corrosion preventive compound to the threads that can be seen.

S 094-034

- (8) Remove rig pins ST4 and ST5.

G. STAB TRIM Levers Test

S 934-035

- (1) Put a piece of masking tape (approximately 6.70 inches (170 mm) long) on the right STAB TRIM lever decal.

S 864-036

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (2) Pressurize the left hydraulic system (AMM 29-11-00/201).

S 864-037

- (3) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
  - (a) 11C12, STAB TRIM SHUTOFF L

S 864-038

- (4) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel to the NORM position.

S 864-039

- (5) Pull the STAB TRIM levers slowly aft until the stabilizer starts to move and do the steps that follow:
  - (a) Make a mark on the masking tape at the aft edge of the right STAB TRIM lever at this position.

(b) Put a "1" by this mark.

S 864-040

- (6) Push the STAB TRIM levers slowly forward until the stabilizer starts to move and do the steps that follow:
- (a) Make a mark on the masking tape at the forward edge of the right STAB TRIM lever at this position.
  - (b) Put a "2" by this mark.

S 864-041

- (7) Release the STAB TRIM levers.

S 864-042

- (8) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel to the CUTOUT position.

S 864-043

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (9) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 864-044

- (10) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
- (a) 11C13, STAB TRIM SHUTOFF CENTER

S 864-045

- (11) Put the CENTER STAB TRIM SHUTOFF valve switch on the P10 panel to the NORM position.

S 864-046

- (12) Pull the STAB TRIM levers slowly aft until the stabilizer starts to move and do the steps that follow:
- (a) Make a mark on the masking tape at the aft edge of the right STAB TRIM lever at this position.
  - (b) Put a "3" by this mark.

S 864-047

- (13) Push the STAB TRIM levers slowly forward until the stabilizer starts to move and do the steps that follow:
- (a) Make a mark on the masking tape at the forward edge of the right STAB TRIM lever at this position.
  - (b) Put a "4" by this mark.

S 864-048

- (14) Release the STAB TRIM levers.

EFFECTIVITY  
AIRPLANES WITH STAB TRIM LEVERS ON THE  
CONTROL STAND

27-41-02

S 224-049

- (15) Make sure that these measured distances are between 1.15 and 1.40 inches:
- (a) The distance from the forward boundary of the white area on the decal to the farthest forward mark on the tape
  - (b) The distance from the aft boundary of the white area on the decal to the farthest aft mark on the tape.

S 864-050

- (16) Put the LEFT STAB TRIM SHUTOFF valve switch on the P10 panel to the NORM position.

S 864-051

- (17) Move the left STAB TRIM lever forward.
- (a) Make sure the stabilizer does not move.

S 864-052

- (18) Move the right STAB TRIM lever forward.
- (a) Make sure the stabilizer does not move.

S 864-053

- (19) Move the left STAB TRIM lever aft.
- (a) Make sure the stabilizer does not move.

S 864-054

- (20) Move the right STAB TRIM lever aft.
- (a) Make sure the stabilizer does not move.

S 864-055

- (21) Move each STAB TRIM lever through full travel in opposite directions at approximately the same rate.
- (a) Make sure the stabilizer does not move.

S 864-056

- (22) Move each STAB TRIM lever to the opposite position.

**NOTE:** Make sure the STAB TRIM levers go through the neutral position at the same time.

- (a) Make sure the stabilizer does not move.

S 864-057

- (23) Let the STAB TRIM levers go to the neutral position at approximately the same rate.
- (a) Make sure the stabilizer does not move.

S 864-058

- (24) Put the LEFT and CENTER STAB TRIM SHUTOFF valve switches on the P10 panel to the CUTOUT position.

S 724-059

- (25) Do these steps for one STAB TRIM lever at a time:
- (a) Apply a force to the bottom of the STAB TRIM lever knob to move each lever to positions "2" and "4" on the masking tape.
  - (b) Measure the maximum force applied to each STAB TRIM lever while you move it.
  - (c) Make sure the maximum force is not larger than 9.9 pounds (44 newtons).

S 724-060

- (26) Do these steps for one STAB TRIM lever at a time:
- (a) Apply a force to the upper edge of the STAB TRIM lever knob to move each lever to positions "1" and "3" on the masking tape.
  - (b) Measure the maximum force applied to each STAB TRIM lever while you move it.
  - (c) Make sure the maximum force is not larger than 7.8 pounds (34.7 newtons).

H. Put the Airplane Back to Its Usual Condition

S 864-061

- (1) Remove the power from the left and center hydraulic systems (AMM 29-11-00/201).

S 864-062

- (2) Put the LEFT and CENTER STAB TRIM SHUTOFF valve switches on the P10 panel to the NORM position.

S 214-063

- (3) Make sure these circuit breakers on the P11 panel are closed:
- (a) 11C12, STAB TRIM SHUTOFF L
  - (b) 11C13, STAB TRIM SHUTOFF R

S 414-064

- (4) Close the access door for the forward equipment bay, 113AL (AMM 06-41-00/201).

S 414-065

- (5) Close the access door for the forward stabilizer compartment, 312AR (AMM 06-42-00/201).

ALTERNATE STABILIZER TRIM SWITCH - REMOVAL/INSTALLATION

1. General

- A. This procedure contains steps to remove and install the alternate stabilizer trim switches.

TASK 27-41-03-024-001

2. Remove the Alternate Stabilizer Trim Switch (Fig. 401)

A. References

- (1) AMM 24-22-00/201, Electrical Power - Control
- (2) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems
- (3) AMM 25-11-01/201, Captain's Seat.

B. Access

- (1) Location Zones  
211/212 Control Cabin

C. Prepare for the Removal

S 864-002

- (1) Remove the pressure from the left and center hydraulic systems (AMM 29-11-00/201).

S 864-003

- (2) Put the LEFT and CENTER STAB TRIM SHUTOFF valve switches on the control stand, P10, to the CUTOFF position.

S 864-004

- (3) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
  - (a) 11C12, STAB TRIM SHUTOFF L
  - (b) 11C13, STAB TRIM SHUTOFF CENTER
  - (c) 11H11, LEFT STAB TRIM CONT
  - (d) 11H20, STAB TRIM CONT R
  - (e) 11A36, STAB TRIM ALT

S 864-029

**WARNING:** REMOVE ELECTRICAL POWER FROM THE FLIGHT COMPARTMENT SEAT. THE ACCIDENTAL ELECTRICAL OPERATION OF THE FLIGHT COMPARTMENT SEAT CAN CAUSE INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT.

- (4) AIRPLANES WITH POWER SEATS;  
Open these circuit breakers on the main power distribution panel, P6, and attach DO-NOT-CLOSE tags:
  - (a) 6H15 or 6J15 CAPT SEAT

SWITCHES ON THE CONTROL STAND

27-41-03

(b) 6H15 or 6J21, F/O SEAT

D. Remove the Alternate Stabilizer Trim Switch

S 014-005

- (1) Remove the left seal assembly for access to the speed brake lever and the alternate stabilizer trim switch.

S 014-006

- (2) Remove the access panel on the left side of the control stand.

S 034-007

- (3) Remove the screws that hold the clamps to the control stand.

S 034-008

- (4) Disconnect the electrical connectors for the alternate stabilizer trim switch.

S 034-009

- (5) Remove the screw and washer (2 locations) that hold the alternate stabilizer trim switch to the P10 panel.

S 024-010

- (6) Remove the alternate stabilizer trim switch.

TASK 27-41-03-424-011

3. Install the Alternate Stabilizer Trim Switch (Fig. 401)

A. References

- (1) AMM 24-22-00/201, Electrical Power - Control
- (2) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems
- (3) AMM 25-11-01/201, Captain's Seat
- (4) Access
  - (a) Location Zones  
211/212 Control Cabin

B. Install the Alternate Stabilizer Trim Switch

S 424-012

- (1) Install the alternate stabilizer trim switch on the control stand panel, P10, with the screw and the washer (2 locations).

S 434-013

- (2) Connect the electrical connector for the alternate stabilizer trim switch.

S 434-014

- (3) Connect the clamp (2 locations) to the control stand with the screw, nut, and washer.

EFFECTIVITY  
ON AIRPLANES WITH ALTERNATE STAB TRIM  
SWITCHES ON THE CONTROL STAND

27-41-03

S 414-015

- (4) Install the access panel for the left side of the control stand.

S 414-016

- (5) Install the left seal assembly that you removed for access.

C. Alternate Stabilizer Trim Switch Test

S 864-017

- (1) Supply electrical power (AMM 24-22-00/201).

S 864-018

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (2) Supply power to the left and center hydraulic systems (AMM 29-11-00/201).

S 864-019

- (3) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel, P11:
  - (a) 11C12, STAB TRIM SHUTOFF L
  - (b) 11C13, STAB TRIM SHUTOFF CENTER
  - (c) 11H11, LEFT STAB TRIM CONT
  - (d) 11H20, STAB TRIM CONT R
  - (e) 11A36, STAB TRIM ALT

S 864-020

- (4) Put the LEFT and CENTER STAB TRIM SHUTOFF valve switches on the P10 panel to the NORM position.

S 864-021

- (5) Use the alternate stab trim switches to move the stabilizer to the APL NOSE UP and APL NOSE DN travel limits three to four times.

S 214-022

- (6) Make sure that the stabilizer moves as follows:
  - (a) The stabilizer leading edge moves down when the alternate stab trim switches are at the APL NOSE UP position
  - (b) The stabilizer leading edge moves up when the alternate stab trim switches are at the APL NOSE DOWN position.

D. Put the Airplane Back to Its Usual Condition

S 864-023

- (1) Remove the power from the left and center hydraulic systems (AMM 29-11-00/201).

STABILIZER TRIM CUTOFF SWITCHES - REMOVAL/INSTALLATION

TASK 27-41-04-024-001

1. Remove the Stabilizer Trim Cutoff Switches (Fig. 401)

A. References

- (1) AMM 06-42-00/201, Empennage Access Doors and Panels
- (2) AMM 27-41-00/501, Horizontal Stabilizer Trim Control System

B. Access

- (1) Location Zone
  - 113 Area Forward of NLG Wheel Well (Left)
- (2) Access Panel
  - 113AL Forward Equipment Bay

C. Prepare for Removal

S 864-002

- (1) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
  - (a) 11H11, LEFT STAB TRIM CONT
  - (b) 11H20, STAB TRIM CONT R

S 014-004

- (2) Open the access door, 311AL, for the forward equipment bay (AMM 06-42-00/201).

D. Remove Stabilizer Trim Cutoff Switch

S 034-005

- (1) Remove the screws, spacers, washers, and nuts that hold the switch to the bracket.

**NOTE:** Be sure to note the location and number of each cutoff switch before removal.

S 034-006

- (2) Remove the switch guard and the spacer next to the switch.

STABILIZER TRIM CONTROL MODULE – REMOVAL/INSTALLATION

1. General

- A. This procedure contains steps to remove and install the stabilizer trim control modules (STCMs).

TASK 27-41-05-024-001

2. Remove the STCM

A. References

- (1) AMM 06-42-00/201, Empennage Access Doors and Panels  
(2) AMM 29-11-00/201, Main (Left, Right, Center) Hydraulic Systems

B. Access

- (1) Location Zones  
211/212 Control Cabin  
311/312 Area Aft of Pressure Bulkhead to BS 1725
- (2) Access Panels  
312AR Forward Stabilizer Compartment

C. Prepare for the Removal

S 864-002

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (1) Supply power to the left hydraulic system (AMM 29-11-00/201).

S 014-003

**WARNING:** STAY OFF THE SERVICE ACCESS DOOR, 312AR AND THE CONTROLS BAY ACCESS DOOR, 313AL. YOUR WEIGHT CAN RELEASE THE SPRING-LOADED LATCHES ON THE DOOR. IF YOU FALL THROUGH THE DOOR, INJURIES CAN OCCUR.

- (2) Open the access door for the forward stabilizer compartment, 312AR (AMM 06-42-00/201).

S 864-005

- (3) AIRPLANES WITH STAB TRIM LEVERS ON THE CONTROL STAND;  
Use the STAB TRIM levers to move the stabilizer until the condition that follows is correct:  
(a) The rig pin slots in the STCM quadrant and the quadrant crank align with the slots in the support structure.

AIRPLANES WITH ALTERNATE STAB TRIM SWITCHES ON THE CONTROL STAND

27-41-05

S 864-006

- (4) AIRPLANES WITH ALTERNATE STAB TRIM SWITCHES ON THE CONTROL STAND;  
Use the alternate stab trim switches to move the stabilizer until Dimension A on the stabilizer ballscrew actuator is 3.84 +/- 0.03 inches (97.5 +/- 0.8 mm) (neutral position).

S 864-008

- (5) Remove the pressure from the left hydraulic system and make sure the center hydraulic system is not pressurized (AMM 29-11-00/201).

S 864-009

- (6) Put the LEFT and CENTER STAB TRIM SHUTOFF switches on the control stand panel, P10, to the CUTOUT position.

S 864-010

- (7) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:  
(a) 11C12, STAB TRIM SHUTOFF L  
(b) 11C13, STAB TRIM SHUTOFF C

S 864-011

- (8) Do the steps that follow to remove pressure from the STCM and stop inputs to the STCM:

S 864-012

- (9) AIRPLANES WITH STAB TRIM LEVERS ON THE CONTROL STAND;  
Do the steps that follow to remove pressure from the STCM and stop inputs to the STCM:  
(a) Move the STAB TRIM levers to the APL NOSE UP and APL NOSE DOWN positions 4 to 5 times to remove remaining hydraulic pressure in the STCM.  
(b) Attach a DO-NOT-OPERATE tag to the STAB TRIM levers.

S 864-013

- (10) AIRPLANES WITH ALTERNATE STAB TRIM SWITCHES ON THE CONTROL STAND;  
Do the steps that follow to remove pressure from the STCM and stop inputs to the STCM:  
(a) Move the alternate stab trim switches to the APL NOSE UP and APL NOSE DOWN positions 4 to 5 times to remove the remaining hydraulic pressure in the STCM.  
(b) Open this circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:  
1) 11A36, STAB TRIM ALT (if installed)

D. Remove the STCM

S 034-016

- (1) AIRPLANES WITH STAB TRIM LEVERS ON THE CONTROL STAND;  
Do the steps that follow to disconnect the input rods from the arm and control pushrods:

EFFECTIVITY

ALL

27-41-05

03

Page 404  
Dec 22/01

- (a) Remove the bolt that connects the arm pushrod to the arm servo lever.
- (b) Hold the arm pushrod away from the STCM.
- (c) Remove the bolt that connects the control pushrod to the control servo lever.
- (d) Hold the control pushrod away from the STCM.

S 034-059

- (2) Do these steps if you remove the left STCM:

**WARNING:** CAREFULLY LOOSEN THE HYDRAULIC RETURN LINE ON THE LEFT STCM. A PRESSURE AS HIGH AS 100 PSI (689 KPA) AND A FLUID VOLUME AS MUCH AS 5 CUBIC INCHES (82 CUBIC CENTIMETERS) CAN REMAIN IN THE LINE. THIS IS CAUSED BY THE PTU SYSTEM. A SPRAY OF FLUID FROM THE CONNECTION CAN CAUSE INJURY TO A PERSON.

- (a) Slowly loosen the return line connection on the left STCM and let the pressure decrease.

S 034-038

- (3) Disconnect the electrical connectors from the STCM.

S 034-039

- (4) Disconnect the hydraulic lines from the STCM.
  - (a) Put caps on the ports and plugs in the lines.

S 034-040

- (5) Hold the STCM and remove the bolts that attach it to the airplane structure.

S 024-041

- (6) Remove the STCM.

TASK 27-41-05-424-042

### 3. Install the STCM

#### A. Consumable Materials

- (1) The lubricants that follow are permitted:
  - (a) C00174 Compound - Corrosion Preventive MIL-PRF-16173 Grade 2
  - (b) C00308 Compound - Corrosion Preventive MIL-C-11796 Class III

**D. Install the STCM**

- S 434-043
  - (1) Hold the STCM in position and install the bolts, washers, and nuts that hold it to the airplane structure.
- S 434-044
  - (2) Remove the plugs and caps, and connect the hydraulic lines to the STCM.
- S 434-045
  - (3) Connect the electrical connectors to the STCM.
- S 434-048
  - (4) AIRPLANES WITH STAB TRIM LEVERS ON THE CONTROL STAND;  
Do the steps that follow to connect the input rods to the arm and the control pushrods:
    - (a) Install the bolt that connects the control pushrod to the control servo lever.
    - (b) Install the bolt that connects the arm pushrod to the arm servo lever.
    - (c) Lubricate the arm and control rod ends.
- S 864-049
  - (5) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel, P11:
    - (a) 11A36, STAB TRIM ALT (if installed)

- (c) 11C13, STAB TRIM SHUTOFF C

S 864-050

- (6) Put the LEFT and CENTER STAB TRIM SHUTOFF switches on the control stand panel, P10, to the NORM position.

S 824-053

- (7) AIRPLANES WITH STAB TRIM LEVERS ON THE CONTROL STAND;  
Do the steps that follow:
  - (a) Remove the DO-NOT-OPERATE tag from the STAB TRIM levers.
  - (b) Do the adjustment for the control rod for the STCM lever (AMM 27-41-00/501).

S 874-058

- (8) Do this step if you replaced the left STCM:
  - (a) Bleed the air from the return line to the PTU pump (AMM 29-22-00/201).

NOTE: A UNSCHED STAB TRIM message will appear on the EICAS display when you bleed air from the hydraulic line. This message will erase when you operate the control wheel switches in the Operational Test for the Horizontal Stabilizer Trim System.

S 714-054

- (9) Do the Operational Test for the Horizontal Stabilizer Trim System (AMM 27-41-00/501).

E. Put the Airplane Back to Its Usual Condition

S 864-055

- (1) Remove electrical power if it is not necessary (AMM 24-22-00/201).

S 414-056

- (2) Close the access door for the forward stabilizer compartment, 312AR (AMM 06-42-00/201).

STABILIZER TRIM CONTROL MODULE QUADRANT – REMOVAL/INSTALLATION

1. General

- A. This procedure contains steps to remove and install the stabilizer trim control module (STCM) quadrants.
- B. The procedure to remove and install the left and right stabilizer trim control module quadrant is equivalent.

TASK 27-41-06-024-004

2. Remove the STCM Quadrant

A. Equipment

- (1) Rig pins from Set A20004-XX (AMM 20-10-24/201):
  - (a) ST4 – P/N A20004-17
  - (b) ST5 – P/N A20004-17

B. References

- (1) AMM 06-42-00/201, Empennage Access Doors and Panels
- (2) AMM 20-10-24/201, Rig Pins
- (3) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems

C. Access

- (1) Location Zones
  - 211/212 Control Cabin
  - 311/312 Area Aft of Pressure Bulkhead to BS 1725
- (2) Access Panel
  - 312AR Forward Stabilizer Compartment

D. Prepare for the Removal

S 014-005

**WARNING:** STAY OFF THE SERVICE ACCESS DOOR, 312AR AND THE CONTROLS BAY ACCESS DOOR, 313AL. YOUR WEIGHT CAN RELEASE THE SPRING-LOADED LATCHES ON THE DOOR. IF YOU FALL THROUGH THE DOOR, INJURIES CAN OCCUR.

- (1) Open the service access door for the forward stabilizer compartment, 312AR (AMM 06-42-00/201).

S 864-006

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (2) Pressurize the left and center hydraulic systems (AMM 29-11-00/201).

S 864-007

- (3) Use the alternate STAB TRIM levers to move the stabilizer until Dimension A on the stabilizer ballscrew actuator is  $3.84 \pm 0.03$  inches (97.5 +/- 0.8 millimeters) (neutral position) (Fig. 401).

- S 864-008
- (4) Remove the power from the left and center hydraulic systems (AMM 29-11-00/501).
- S 864-009
- (5) Put the LEFT and CENTER STAB TRIM SHUTOFF valve switches on the control stand panel, P10, to the CUTOUT position.
- S 864-010
- (6) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
- (a) 11C12, STAB TRIM SHUTOFF L
  - (b) 11C13, STAB TRIM SHUTOFF CENTER
- E. Remove the STCM Quadrant (Fig. 402)
- S 024-002
- (1) Do the steps that follow to remove the STCM quadrant:
- (a) Install rig pins ST4 and ST5.
  - (b) Loosen the tension in cables ST1A, ST1B, ST2A, and ST2B at the aft turnbuckles.
  - (c) Disconnect these cables from the STCM quadrant:
    - 1) Cables ST1A and ST1B for the left STCM quadrant.
    - 2) Cables ST2A and ST2B for the right STCM quadrant.
  - (d) Remove rig pins ST4 and ST5.
  - (e) Disconnect the rod from the STCM quadrant crank.
  - (f) Remove the bolt that connects the crank to the shaft.
  - (g) Remove the bolts that connect the STCM quadrant to the shaft.
  - (h) Remove these nuts and washers from the shaft:
    - 1) The nut and washers on the bottom of the support for the left STCM quadrant
    - 2) The nut and washers on the top of the support for the right STCM quadrant.
  - (i) Remove the STCM quadrant from the shaft.

TASK 27-41-06-424-011

3. Install the STCM Quadrant

A. Equipment

- (1) Rig pins from Set A20004-XX (AMM 20-10-24/201):
  - (a) ST4 - P/N A20004-17
  - (b) ST5 - P/N A20004-17

- (2) Cable Tensiometer - Commercially Available

B. Consumable Materials

- (1) D00633 Grease - BMS 3-33 (Preferred)
- (2) D00013 Grease - MIL-PRF-23827 (Supersedes MIL-G-23827) (Alternate)
- (3) C00308 Compound - Corrosion Preventive MIL-C-11796

C. References

|-------|--------------------------------|
- E. Install the STCM Quadrant (Fig. 402)
- S 424-003
- (1) Do the steps that follow to install the STCM quadrant:
- (a) Apply a layer of grease to all of the internal and external splines or threads.
  - (b) Put the STCM quadrant and the crank in their correct positions and install the shaft.
  - (c) Install the nut and washers on the shaft.
  - (d) Install the bolts to connect the STCM quadrant to the shaft.
  - (e) Install the bolt to connect the crank to the shaft.
  - (f) Apply grease to all splines, threads, and relief grooves that you can see.
  - (g) Connect the rod to the crank.
  - (h) Connect these cables to the STCM quadrant:
    - 1) The cables ST1A and ST1B for the left STCM quadrant
    - 2) The cables ST2A and ST2B for the right STCM quadrant.
  - (i) Install rig pins ST4 and ST5.
  - (j) Adjust the turnbuckles in cables ST1A, ST1B, ST2A, and ST2B until the tension is correct (Fig. 402).
  - (k) Make sure the STAB TRIM levers align within 0.020 inch (0.5 millimeter) and are in the decal for the adjustment limit position.
  - (l) Remove rig pins ST4 and ST5.
  - (m) Operate the STAB TRIM levers through one full cycle.
  - (n) Make sure the cable tension and lever position are correct.
  - (o) Install lock clips on the turnbuckles.
  - (p) Apply corrosion preventive compound to the turnbuckle threads that you can see.

F. STCM Quadrant Test

S 864-012

- (1) Supply electrical power (AMM 24-22-00/201).

S 864-013

- (2) Remove the DO-NOT-CLOSE tags and close these circuit breakers on overhead panel, P11:  
(a) 11C12, STAB TRIM SHUTOFF L  
(b) 11C13, STAB TRIM SHUTOFF CENTER

S 864-015

- (3) Put the LEFT and CENTER STAB TRIM SHUTOFF valve switches on the control stand panel, P10, to the NORM position.

S 864-001

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (4) Supply power to the left and center hydraulic systems (AMM 29-11-00/201).

S 864-016

- (5) Use the STAB TRIM levers to move the stabilizer through full travel and do the check that follows:  
(a) Make sure the STCM quadrant operates smoothly through the full travel range.  
(b) Make sure the STAB TRIM levers go to the neutral position when you release them.

G. Put the Airplane Back to Its Usual Condition

S 864-017

- (2) Access Panel  
312AR Forward Stabilizer Compartment

D. Install the Solenoid Valve

S 424-011

- (1) Do the steps that follow to install the solenoid valve:
  - (a) Apply a thin layer of assembly lubricant or hydraulic fluid on the sides of the new plate and packing.
  - (b) Install the packing on the solenoid valve.
  - (c) Put the plate on the STCM.
  - (d) Install the screws and washers to attach the solenoid valve to the STCM. Tighten the screws 30-35 pound-inches (3.4-4.0 newton-meters).

E. Solenoid Valve Operation Test

S 864-012

- (1) Supply electrical power (AMM 24-22-00/201).

S 864-013

- (2) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel, P11:
  - (a) 11A36, ALT STAB TRIM (if installed)
  - (b) 11C12, STAB TRIM SHUTOFF L
  - (c) 11C13, STAB TRIM SHUTOFF CENTER
  - (d) 11H11, LEFT STAB TRIM CONT
  - (e) 11H20, STAB TRIM CONT R

S 864-014

- (3) Put the LEFT and CENTER STAB TRIM SHUTOFF switches on the control stand panel, P10, to the NORM position.

S 864-015

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (4) Pressurize the applicable hydraulic system (AMM 29-11-00/201).

**NOTE:** The left hydraulic system supplies power to the left STCM and the center hydraulic system supplies power to the right STCM. With the left and center hydraulic systems supplied with pressure, you cannot do a test for only one of the STCM solenoid valves. Only pressurize the hydraulic system for the STCM that has the new solenoid valve.

- (5) Do the steps that follow to make sure the STCM solenoid valves operate correctly with the control wheel switches:
- (a) Move the captain's or first officer's control wheel switches up and then down.
  - (b) Make sure that the stabilizer leading edge moves up and then down.
  - (c) Make sure that the stabilizer stops when you release the control wheel switches.
  - (d) Make sure that there are no hydraulic leaks at the STCM solenoid valve.

S 714-021

- (6) AIRPLANES WITH ALTERNATE STAB TRIM SWITCHES ON THE CONTROL STAND; Do the steps that follow to make sure the STCM solenoid valves operate correctly with the alternate-electric stab trim switches:
- (a) Move the alternate stab trim switches up and then down.
  - (b) Make sure that the stabilizer leading edge moves up and then down.
  - (c) Make sure that the stabilizer stops when you release the alternate stab trim switches.
  - (d) Make sure that there are no hydraulic leaks at the STCM solenoid valve.

F. Put the Airplane Back to Its Usual Condition

S 864-017

- (1) Remove hydraulic power if it is not necessary (AMM 29-11-00/201).

S 864-018

- (2) Remove electrical power if it is not necessary (AMM 24-22-00/201).

S 414-019

- (3) Close the access door for the forward stabilizer compartment, 312AR (AMM 06-42-00/201).

STABILIZER TRIM CONTROL MODULE MOTOR-OPERATED SHUTOFF VALVE -  
REMOVAL/INSTALLATION

1. General

- A. This procedure contains steps to remove and install the motor-operated shutoff valve and the hydraulic supply shutoff valve motor.

TASK 27-41-09-024-001

2. Remove the Motor-Operated Shutoff Valve and the Hydraulic Supply Shutoff Valve Motor

A. General

- (1) This task contains two procedures: one to remove the motor-operated shutoff valve, and one to remove the hydraulic supply shutoff valve motor. Because this task contains two procedures, only the applicable group of steps must be done.
- (2) To start one of these procedures, do the "Prepare for Removal" group of steps. Then, do the group of steps that is necessary to remove the component.
- (3) The procedure to remove the motor-operated shutoff valve on the left STCM is the same as the procedure for the right STCM.

B. References

- (1) AMM 06-42-00/201, Empennage Access Doors and Panels
- (2) AMM 24-22-00/201, Electrical Power - Control
- (3) AMM 27-41-00/501, Horizontal Stabilizer Trim Control System
- (4) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems

C. Access

- (1) Location Zones
  - 211/212 Control Cabin
  - 311/312 Area Aft of the Pressure Bulkhead to BS 1725
- (2) Access Panel
  - 312AR Forward Stabilizer Compartment

D. Prepare for the Removal

S 864-002

- (1) Set the L and C STAB TRIM CUTOUT switches on the control stand panel, P10, to the CUTOUT position.

S 864-003

- (2) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
  - (a) 11A36, ALT STAB TRIM (if installed)

- (e) 11H20, STAB TRIM CONT R

S 864-047

- (3) Remove pressure from the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 864-048

- (4) Remove pressure from the main hydraulic system reservoir (AMM 29-11-00/201).

S 864-039

- (5) Move the STAB TRIM levers or ALTN STAB TRIM switches to the APL NOSE UP and APL NOSE DOWN positions many times.

NOTE: This will decrease the remaining pressure in the STCMs.

S 864-008

- (6) AIRPLANES WITH STAB TRIM LEVERS ON THE CONTROL STAND;  
Attach DO-NOT-OPERATE tags to the STAB TRIM levers.

S 014-010

WARNING: STAY OFF THE SERVICE ACCESS DOOR, 312AR, AND THE ELEVATOR CONTROL ACCESS DOOR, 313AL. YOUR WEIGHT CAN RELEASE THE SPRING-LOADED LATCHES ON THE DOOR. IF YOU FALL THROUGH THE DOOR, INJURIES CAN OCCUR.

- (7) Open the access door for the forward stabilizer compartment, 312AR (AMM 06-42-00/201).

E. Remove the Motor-Operated Shutoff Valve

S 024-011

- (1) Do the steps that follow to remove the motor-operated shutoff valve:
  - (a) Disconnect the electrical connector from the motor-operated shutoff valve.
  - (b) Remove the bolts that attach the motor-operated shutoff valve to the STCM.
  - (c) Remove the motor-operated shutoff valve.
  - (d) Remove and discard the four o-rings and the eight backup retainers from the motor-operated shutoff valve.

F. Remove the Hydraulic Supply Shutoff Valve Motor

S 864-012

- (1) Remove the pressure from the left, right and center hydraulic systems (AMM 29-11-00/201).

S 024-013

- (2) Do the steps that follow to remove the hydraulic supply shutoff valve motor:
  - (a) Disconnect the electrical connector from the valve motor.
  - (b) Move the manual override lever to position 2.
  - (c) Remove the four mounting screws which attach the valve motor to the valve.
  - (d) Remove the valve motor from the valve.
  - (e) If an identification plate is installed on the motor, remove the plate and keep it to install on the replacement motor.

TASK 27-41-09-424-014

3. Install the Motor-Operated Shutoff Valve and Hydraulic Supply Shutoff Valve Motor

A. General

- (1) This task contains two procedures: one to install the motor-operated shutoff valve, and one to install the hydraulic supply shutoff valve motor. Because this task contains two procedures, only the applicable group of steps must be done.
- (2) To start one of these procedures, do the group of steps that is necessary to install the components. Then, do the "Put the Airplane Back to Its Usual Condition" group of steps.
- (3) The procedure to install the motor-operated shutoff valve on the left STCM is the same as the procedure for the right STCM.

STABILIZER TRIM BALLSCREW ACTUATOR – REMOVAL/INSTALLATION

1. General

- A. This procedure contains steps to remove/install the stabilizer trim ballscrew actuator.

**NOTE:** If you replace a worn horizontal stabilizer actuator with a serviceable actuator that is not new or not overhauled, then you must do the ballscrew to ballnut detailed visual inspection, and ballscrew to primary brake housing freeplay check, for the replacement actuator before further flight.

TASK 27-41-10-024-001

2. Remove the Stabilizer Trim Ballscrew Actuator

A. Equipment

- (1) Hoist Equipment, Stabilizer Trim Actuator – A27006-41 (Preferred)
- (2) Hoist Equipment, Stabilizer Trim Actuator – A27006-33 (Alternate)
- (3) Lock Equipment, Horizontal Stabilizer – A55001-22 (Preferred)
- (4) Lock Equipment, Horizontal Stabilizer – A55001-19 (Alternate)
- (5) Fishpole Hoists – Customer furnished (2 required)

B. References

- (1) AMM 06-42-00/201, Empennage Access Panels and Doors
- (2) AMM 24-22-00/201, Electrical Power – Control
- (3) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic System

C. Access

- (1) Location Zone  
312 Area Aft of Pressure Bulkhead to BS 1725 (Right)
- (2) Access Panel  
312AR Stabilizer Trim Ballscrew Actuator

D. Prepare for Removal (Fig. 402)

S 864-002

- (1) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 864-044

- (2) Use the STAB TRIM levers or switches to move the stabilizer to the neutral position (2 units of trim on the position indicator).

S 864-007

- (3) Remove the pressure from the center and left hydraulic systems (AMM 29-11-00/201).

EFFECTIVITY

ALL

27-41-10

03

Page 401  
Aug 22/08

S 864-008

- (4) Set the L and C STAB TRIM shutoff switches on the control stand panel, P10, to CUTOUT.

S 864-009

- (5) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
- (a) 11A36, ALT STAB TRIM (if installed)
  - (b) 11C12, STAB TRIM SHUTOFF L
  - (c) 11C13, STAB TRIM SHUTOFF CENTER

S 014-010

**WARNING:** STAY OFF THE SERVICE ACCESS DOOR, 312AR, AND THE ACCESS DOOR FOR THE CONTROLS BAY, 313AL. YOUR WEIGHT CAN CAUSE THE SPRING-LOADED LATCHES TO RELEASE. IF YOU FALL THROUGH THE DOOR, INJURY CAN OCCUR.

- (6) Open the access door, 312AR, for the stabilizer trim ballscrew actuator (AMM 06-42-00/201).

S 494-011

**CAUTION:** INSTALL THE HOIST EQUIPMENT CAREFULLY. DAMAGE TO THE HOT AIR DUCT COULD OCCUR.

- (7) Do the steps that follow to install the hoist equipment for the ballscrew actuator (Fig. 404):
- (a) Install a ladder.
  - (b) Install the fishpole hoist attach beam on the bulkheads above the actuator.
  - (c) Attach the strap assembly to actuator.
  - (d) Install fishpole hoist No. 1 and 2 (Fig. 404).
  - (e) Connect the hoist cables to the strap assembly.

S 494-012

- (8) Install the horizontal stabilizer lock (Fig. 402).  
E. Remove the Stabilizer Ballscrew Actuator (Fig. 403)

S 824-013

- (1) Adjust the stabilizer lock to remove the load from the lower gimbal pins.

**NOTE:** The lower gimbal pins will not move freely during removal if the stabilizer is not in the correct position. More adjustment will be necessary to release these pins.

S 824-014

**WARNING:** ONLY APPROVED PERSONS MUST OPERATE THE LEVER CHAIN HOISTS. DO NOT USE FORCE TO MOVE THE CONTROL LEVER OR KNOB INTO THE NEUTRAL OR THE FREE CHAIN POSITION. THIS CAN CAUSE A CHAIN HOIST WITH A LIGHT LOAD TO RELEASE ITS LOAD.

- (2) Adjust the hoist so that it holds the weight of the trim drive mechanism.

**NOTE:** The ballscrew actuator weighs approximately 316 pounds (143 kg). A hoist with too much tension will cause the gimbals pins to jam.

S 034-015

- (3) Disconnect the eight hydraulic lines from the supports above the ballscrew actuator (Fig. 401).
  - (a) Plug the lines and cap the ports.

S 034-016

- (4) Disconnect the drain lines from the ballscrew actuator.
  - (a) Plug the lines and cap the ports.

S 034-017

- (5) Disconnect the antirotation cables from the airplane structure.

**NOTE:** The cables are components of the trim drive mechanism.

S 034-018

- (6) Do the steps that follow to disconnect the lower gimbal:
  - (a) Remove the nuts and bolts that hold the left and right lower gimbal pins.
  - (b) Remove the screws from the retaining rings.
  - (c) Divide both of the split retaining rings.
  - (d) Remove both of the lower gimbal pins and the split retaining rings.
  - (e) Keep the bushing on each gimbal pin locating bolt.

S 034-019

- (7) Do the steps that follow to disconnect the upper gimbal:
  - (a) Remove the bolt from one end of the safety shaft.
  - (b) Remove the nuts that attach the upper gimbal pin assemblies.
  - (c) Remove the support brackets as necessary for the hydraulic system configuration.

EFFECTIVITY

ALL

27-41-10

01

Page 410  
Dec 22/01

- (d) Make sure that the hoist holds the weight of the trim drive mechanism.

NOTE: The gimbal pins cannot be removed freely if there is too much tension on the hoist.

CAUTION: DO NOT USE METAL TOOLS TO REMOVE PINS. DAMAGE TO THE DRIVE MECHANISM CASING AND THE PIN FLANGES CAN OCCUR.

- (e) Make sure the ballscrew actuator is stable and then withdraw the upper gimbal pin assemblies and safety shaft.

NOTE: Use hardwood wedges under the pin flanges to start removal then use a rubber mallet to continue removal.

S 024-020

- (8) Move the ballscrew actuator away from the actuator fitting on the stabilizer and the lugs on the actuator attachment bulkhead.

S 864-042

- (9) Do the steps that follow to move the ballscrew actuator above service access door, 312AR:
- (a) Remove the pin below the attach beam and remove the load from fishpole hoist No. 2.
  - (b) Lower fishpole hoist No. 1 until the holder can be installed at the pin holes below the attach beam.
  - (c) Connect the holder to the fishpole No. 1 cable.
  - (d) Attach fishpole hoist No. 2 to the keyhole clip that is forward of access door, 312AR.
  - (e) Connect the fishpole hoist No. 2 sheave to the fishpole hoist No. 1 cable.
  - (f) Use both of the fishpole hoists to position the ballscrew actuator directly above service access door, 312AR.

S 024-021

- (10) Use fishpole hoist No. 1 to lower the actuator onto a stand.

EFFECTIVITY

E. Prepare for Installation (Fig. 402)

**NOTE:** If you replace a worn horizontal stabilizer actuator with a serviceable actuator that is not new or not overhauled, then you must do the ballscrew to ballnut detailed visual inspection, and the ballscrew to primary brake housing freeplay check, for the replacement actuator before further flight.

S 224-023

- (1) Make sure that applicable ballscrew actuator mechanism and attachment fitting locations are in allowable wear tolerances (AMM 27-41-10/601).

S 494-024

- (2) Install fishpole hoist No. 1 and 2 (Fig. 404).

EFFECTIVITY

ALL

27-41-10

03

Page 412  
Aug 22/08

- S 424-025
- (3) Use fishpole hoist No. 1 to lift the ballscrew actuator through access door 312AR onto the empennage.
- S 034-026
- (4) Do the steps that follow to remove the lower gimbal pins:
- (a) Remove the nuts and bolts from the pin assembly.
  - (b) Remove the screws from the retaining rings, divide the halves, and remove rings.
  - (c) Remove the gimbal pins and keep the bushing that is on each gimbal pin assembly.
- S 034-027
- (5) Do the steps that follow to remove the upper gimbal safety shaft and pin assemblies:
- (a) Remove the bolt from one end of the safety shaft.
  - (b) Remove the bolts which hold the gimbal pins.
  - (c) Remove the gimbal pins and safety shaft.
- S 494-028
- (6) Install fishpole hoist No. 2 in the position shown (Fig. 404).
- S 424-029
- (7) Move fishpole hoists No. 1 and 2 to put the upper gimbal in the correct position in relation to its attachment lugs.
- F. Install Ballscrew Actuator (Fig. 403)
- S 424-030
- (1) Do the steps that follow to attach the upper gimbal:
- (a) Lightly apply grease to the bearing surfaces of the upper gimbal pin assemblies.
  - (b) Lightly apply grease to the bearing surface of safety shaft.
  - (c) Align the upper gimbal with the actuator attachment lugs and put in the gimbal pins and safety shaft.
  - (d) Install the bolts, washers, and nuts which hold the shaft.
  - (e) Tighten the nuts on the upper gimbal pin assemblies and the safety shaft bolts.
- S 424-031
- (2) Do the steps that follow to attach the lower gimbal:
- (a) Turn the lower gimbal assembly on the jackscrew to approximately align with the stabilizer lug attachments.
  - (b) Adjust the stabilizer lock and position the jackscrew to align the lower gimbal with the stabilizer actuator fitting.
  - (c) Lightly apply grease to the bearing surfaces of the lower gimbal pins.
  - (d) Put the split retaining rings in position.
  - (e) Install each lower gimbal pin such that the hole in the flange engages the bushing on the locating screw. Install the washer and nut.

EFFECTIVITY

ALL

27-41-10

02

Page 413  
Aug 22/07

(f) Install and tighten the screws which attach the retaining ring halves.

S 424-032

(3) Attach the antirotation cables to the airplane structure.

S 434-033

(4) Connect the hydraulic lines and the plastic drain tubes (Fig. 401).

S 614-034

(5) Do the steps that follow to service the stabilizer trim ballscrew actuator:

(a) Lubricate the grease fittings (AMM 12-21-05/301).

(b) Add hydraulic oil (AMM 12-13-06/301).

S 094-035

(6) Remove the hoist equipment (Fig. 404).

S 094-051

(7) Remove the horizontal stabilizer lock (Figure 402).

S 864-040

(8) Do the steps that follow to make sure there is free movement of the ballscrew actuator:

(a) Supply electrical power (AMM 24-22-00/201).

(b) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the overhead circuit breaker panel, P11:

1) 11C12, STAB TRIM SHUTOFF L

2) 11C13, STAB TRIM SHUTOFF CENTER

**WARNING:** KEEP ALL PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

(c) Supply pressure to the left and center hydraulic systems (AMM 29-11-00/201).

(d) Set the L STAB TRIM shutoff switch to the NORM position.

(e) Set the C STAB TRIM shutoff switch on the control stand panel, P10 to the CUTOUT position.

(f) Put the flaps to the 5 position.

(g) Move the Captain's or the First Officer's stabilizer trim control wheel switches to the APL NOSE DN direction.

(h) Make sure the stabilizer leading edge moves up.

(i) While the stabilizer moves in the APL NOSE DN direction, release the control wheel switch.

(j) Make sure the stabilizer stops in 1 second.

(k) Continue to move the stabilizer in the APL NOSE DN direction.

(l) Make sure the stabilizer starts to move in 1 second.

EFFECTIVITY

ALL

27-41-10

03

Page 414  
Dec 22/07

- (m) Make sure the stabilizer stops at the FLAPS NOT RETRACTED APL NOSE DN limit.
- (n) Move the Captain's or the First Officer's stabilizer trim control wheel switches to the APL NOSE UP direction.
  - 1) Make sure the stabilizer leading edge moves down.
  - 2) While the stabilizer moves in the APL NOSE UP direction, release the control wheel switch.
  - 3) Make sure the stabilizer stops in 1 second.
  - 4) Continue to move the stabilizer in the APL NOSE UP direction.
  - 5) Make sure the stabilizer starts to move in 1 second.
  - 6) Make sure the stabilizer stops at the APL NOSE UP limit.
- (o) Set the LEFT STAB TRIM shutoff switch to the CUTOFF position.
- (p) Set the C STAB TRIM shutoff switch to the NORM position.
- (q) Move the Captain's or the First Officer's stabilizer trim control wheel switches in the APL NOSE DN direction.
  - 1) Make sure the stabilizer leading edge moves up.
  - 2) While the stabilizer moves in the APL NOSE DN direction, release the control wheel switch.
  - 3) Make sure the stabilizer stops in one second.
  - 4) Continue to move the stabilizer in the the APL NOSE DN direction.
  - 5) Make sure the stabilizer starts to move in 1 second.
  - 6) Make sure the stabilizer stops at the FLAPS NOT RETRACTED APL NOSE DN limit.

G. Put the Airplane Back to Its Usual Condition

S 864-037

- (1) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:
  - (a) AIRPLANES WITH ALTERNATE STAB TRIM SWITCHES ON THE CONTROL STAND;  
11A36, ALT STAB TRIM (if installed)
  - (b) 11C12, STAB TRIM SHUTOFF L
  - (c) 11C13, STAB TRIM SHUTOFF CENTER

STABILIZER BALLSCREW ACTUATOR WEAR LIMITS AND FREEPLAY - INSPECTION/CHECK

1. General

- A. This section contains illustrations and a wear limit chart for the stabilizer trim ballscrew actuator and gimbal pins, a check of the stabilizer ballscrew to ballnut freeplay and a visual inspection of the stabilizer ballscrew and ballnut for obvious signs of corrosion or wear. The tests are as follows:
- (1) Inspection of the Wear Limits for the Stabilizer Trim Ballscrew Actuator and Gimbal Pins
  - (2) Stabilizer Ballscrew to Ballnut Freeplay Check
  - (3) Stabilizer Ballscrew/Ballnut Detailed Visual Inspection
  - (4) Stabilizer Ballscrew to Primary Brake Housing Freeplay Check

TASK 27-41-10-226-001

2. Wear Limits for the Stabilizer Trim Ballscrew Actuator and Gimbal Pins (Fig. 601)

A. Equipment

- (1) Lock Equipment Horizontal Stabilizer - A55001-19

NOTE: Use the lock equipment to measure the backlash at the stabilizer ballscrew.

B. Access

- (1) Location Zones  
311/312 Area Aft of Pressure Bulkhead to BS 1725
- (2) Access Panel  
312AR Service Access Door

TASK 27-41-10-226-003

3. Stabilizer Ballscrew to Ballnut Freeplay Check (Figs. 602 & 603)

NOTE: This is a scheduled maintenance task.

- (4) AMM 12-21-05/301, Stabilizer Trim Control System - Lubrication
- (5) AMM 24-22-00/201, Electrical Power - Control.

**C. Access**

- (1) Location Zones  
311/312 Area Aft of the Pressure Bulkhead to BS 1725
- (2) Access Panel  
312AR Service Access Door

**D. Prepare for the Check**

S 866-005

- (1) Supply electrical power (AMM 24-22-00/201).

S 866-006

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (2) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 866-007

- (3) Use the STAB TRIM levers or switches to move the stabilizer to approximately 4 units of trim, as shown on the stabilizer position indicators that are on the control stand panel.

EFFECTIVITY

ALL

27-41-10

02

Page 606  
Aug 22/08

- S 866-008
- (4) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).
- S 866-009
- (5) Put the L and C STAB TRIM shutoff switches on the P10 panel to the CUTOUT position.
- S 866-010
- (6) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
- (a) 11A36, ALT STAB TRIM (IF INSTALLED)
  - (b) 11C12, STAB TRIM SHUTOFF L
  - (c) 11C13, STAB TRIM SHUTOFF CENTER

- S 866-098
- (7) Remove Electrical Power (AMM 24-22-00/201).

S 016-011

**WARNING:** STAY OFF THE SERVICE ACCESS DOOR, 312AR. YOUR WEIGHT CAN RELEASE THE SPRING-LOADED LATCHES ON THE DOOR. IF YOU FALL THROUGH THE DOOR, INJURIES CAN OCCUR.

- (8) Get access to the stabilizer trim actuator through the Service Access Door, 312AR (AMM 06-42-00/201).

S 496-012

- (9) Do the steps that follow to install the test equipment A55001-47, between the horizontal stabilizer and the upper fuselage structure (Fig. 602):
- (a) Install the clamp assembly, A55001-17, and clamp fitting, A55001-6, on the upper bulkhead.
  - (b) Install the test equipment A55001-47, between the stabilizer and the upper bulkhead fitting using the quick release pins.

S 866-013

- (10) Do the steps that follow to install the dial indicator between the stabilizer ballscrew and the ballnut (Fig. 603):
- (a) Install the magnetic base for the dial indicator on the ballscrew above the ballnut.
  - (b) Install the dial indicator to the magnetic base so that the tip of the dial indicator touches the flat spot on the top of the ballnut.

**NOTE:** The dial indicator is installed to measure the downward movement of the ballnut relative to the ballscrew.

#### E. Stabilizer Ballnut Freeplay Procedure (Fig. 603)

EFFECTIVITY

ALL

27-41-10

S 826-014

**CAUTION:** DO NOT APPLY MORE THAN THE SPECIFIED LOADS TO THE STABILIZER WHILE USING THE TEST EQUIPMENT A55001-47. DO NOT APPLY POWER TO THE STABILIZER TRIM ACTUATOR WITH THE TEST ASSEMBLY INSTALLED. IF YOU DO, DAMAGE TO THE EQUIPMENT OR AIRCRAFT CAN OCCUR.

- (1) Use the test equipment A55001-47, to slowly apply an upward force of 750 +/- 50 pounds (3340 +/- 220 newtons) to the ballscrew, as shown on the load cell.

**NOTE:** At 4 units of trim, the aft stabilizer center of gravity loads the ballscrew in the upward direction, putting the ballscrew in compression.

To apply the upward force to the ballscrew, the stabilizer tool must be turned in the direction that shortens the tool length. This will apply an upward force on the ballnut and move the leading edge of the stabilizer up, thus assuring that there is no residual system freeplay in the upward direction.

S 826-016

- (2) Zero the dial indicator.

S 826-017

- (3) Use the test equipment A55001-47, to slowly release the upward force applied in the previous step and continue adjusting the load tool to apply a downward force of 2450 +/- 50 pounds (10,900 +/- 220 newtons).

**NOTE:** To apply a downward force on the stabilizer, the tool must be turned in a direction that lengthens the tool. This will apply a downward force on the ballnut and move the leading edge of the stabilizer down.

- (a) Make a note of the quantity shown on the dial indicator.

EFFECTIVITY

ALL

27-41-10

02

Page 610  
Aug 22/08

- S 086-096  
(4) Remove the dial indicator and the magnetic base from the ballscrew.

- S 486-097  
(5) Do the steps that follow for installation of the dial indicator between the stabilizer ballscrew and the ballnut:  
(a) Install the magnetic base for the dial indicator on the ballscrew above the ballnut 180 degrees from the position the first indication is taken.  
(b) Install the dial indicator to the magnetic base until the tip of the dial indicator touches the flat spot on the top of the ballnut (Fig. 603, View B).  
(c) Repeat steps 1 through 3.  
(d) Use the average of the two dial indicator indications that you recorded. This is the stabilizer ballscrew to ballnut free play.

- S 846-018  
(6) Use the test equipment A55001-47, to slowly release the downward force that was applied.

- S 826-019  
(7) If the ballscrew to ballnut freeplay is less than 0.001 inch (0.03 mm), then the measurement may be in error. Do the following to verify that the measurement was not made in error:  
(a) Check that the stabilizer was loaded in the correct direction for each of the previous steps.  
(b) Make sure the dial indicator is functioning properly.

- S 826-020  
(8) If the ballscrew to ballnut free play is more than or equal to 0.001 inch (0.03 mm), and less than or equal to 0.012 inch (0.30 mm), the ballscrew to ballnut free play is in the satisfactory limits.

EFFECTIVITY

ALL

27-41-10

02

Page 611  
Aug 22/08

S 826-021

- (9) If the ballscrew to ballnut free play is more than 0.012 inch (0.30 mm), the stab trim actuator wear is more than the maximum permitted worn limits. Do the steps that follow:

NOTE: If the ballscrew to ballnut freeplay is greater than 0.035 inch (0.89 mm), the stabilizer trim actuator has excessive wear, or is damaged. Please notify The Boeing Company of any freeplay measurements beyond 0.035 inch (0.89 mm).

- (a) Remove the old stabilizer trim actuator and replace it with a known good unit (AMM 27-41-10/401).

NOTE: If you replace a worn horizontal stabilizer actuator with a serviceable actuator that is not new or not overhauled, then you must do the Ballscrew to Ballnut Detailed Visual Inspection and the Ballscrew to Primary Brake Housing Freeplay Check, for the replacement actuator before further flight.

F. Put the Airplane Back to Its Usual Condition

S 486-022

- (1) Remove the test equipment A55001-47, from the horizontal stabilizer and the upper fuselage (Fig. 602).

S 486-023

- (2) Remove the clamp fittings from the attach points on the bulkheads.

S 486-024

- (3) Remove the dial indicator and the magnetic base from the ballnut and ballscrew.

S 646-004

- (4) Lubricate the stabilizer ballscrew and ballnut (AMM 12-21-05/301).

S 416-025

- (5) Close the Service Access Door for the forward stabilizer compartment, 312AR (AMM 06-42-00/201).

S 866-026

- (6) Set the C STAB TRIM shutoff switch and L STAB TRIM shutoff switch to the NORM position.

S 866-027

- (7) Remove the DO-NOT-CLOSE tags and close the following circuit breakers:

(a) 11A36, ALT STAB TRIM (IF INSTALLED)

S 016-036

**WARNING:** STAY OFF THE SERVICE ACCESS DOOR, 312AR. YOUR WEIGHT CAN RELEASE THE SPRING-LOADED LATCHES ON THE DOOR. IF YOU FALL THROUGH THE DOOR, INJURIES CAN OCCUR.

- (1) Get access to the stabilizer trim actuator through the Service Access Door, 312AR (AMM 06-42-00/201).

S 216-103

- (2) Inspect the ballscrew and ballnut for signs of corrosion.
  - (a) Look for metallic dust particles on or around the ballscrew and ball nut.
  - (b) Examine the grease on the ballscrew for metal debris.

**NOTE:** Metallic debris in the grease may indicate degradation of the balls in the ballnut.

- (c) If you find metal debris or corrosion, replace the stabilizer trim ballscrew actuator (AMM 27-41-10/401).

S 216-099

- (3) Small amounts of grease may come out of the ballnut at other locations than the grease vent, or bottom seal for Umbra Ballnuts, and from the top and bottom seal on the Beaver Ballnuts.
  - (a) If more than a small amount of grease is visible at these other locations, replace the stabilizer trim ballscrew actuator (AMM 27-41-10/401).

S 216-105

- (4) Clean the ballscrew by wiping any old grease and dirt from the ballscrew threads.

**NOTE:** Use a clean, dry, non-abrasive cloth.

27-41-10

S 216-056

- (5) Visually inspect the stabilizer ballscrew ballnut.  
(a) If you find damage, cracking, corrosion, or obvious signs of wear, replace the stabilizer trim actuator (AMM 27-41-10/401).

S 216-100

- (6) Inspect the ballscrew for the following:  
(a) Check the ballscrew threads for cross-threading, distortion, or stripping.  
(b) Check the ballscrew threads for metal debris, pitting, gouging, corrosion, spalling, or brinelling.  
(c) Check for obvious differences in thread shape between the thread grooves in the lower, middle, and upper portions of the ballscrew.  
(d) Check the ballscrew for damage or cracking.

S 866-106

- (7) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel:  
(a) 11A36, ALT STAB TRIM (IF INSTALLED)  
(b) 11C12, STAB TRIM SHUTOFF L  
(c) 11C13, STAB TRIM SHUTOFF CENTER

S 866-108

- (8) Set the L STAB TRIM and C STAB TRIM shutoff switch to the NORM position.

S 866-107

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (9) Supply pressure to the center hydraulics system (AMM 29-11-00/201).

EFFECTIVITY

ALL

27-41-10

02

Page 616  
Aug 22/08

S 866-109

- (10) Use the STAB TRIM levers or switches to Move the stabilizer up and down from 4 units of trim.

NOTE: This will expose the covered threads of the ballscrew.

- (a) Repeat the steps above to examine the newly exposed threads of the ballscrew.

S 866-110

- (11) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).

S 866-111

- (12) Put the L and C STAB TRIM shutoff switches on the P10 panel to the CUTOUT position.

S 866-112

- (13) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
- (a) 11A36, ALT STAB TRIM (IF INSTALLED)
  - (b) 11C12, STAB TRIM SHUTOFF L
  - (c) 11C13, STAB TRIM SHUTOFF CENTER
  - (d) If you find any problems listed above, replace the stabilizer trim ballscrew actuator (AMM 27-41-10/401).

S 216-047

- (14) Inspect the ballnut return tubes for the following:
- (a) Visually inspect the ballnut return tubes to see if they have lifted from the ballnut or are damaged in a way that would restrict free movement of the ball bearings.
    - 1) If any of the return tubes have lifted from the ballnut, or are dented or damaged, replace the stabilizer trim ballscrew actuator (AMM 27-41-10/401).
  - (b) Check the exterior of the ballnut, stabilizer actuator, and the area below the actuator for ball bearings.

NOTE: The ball bearings used inside the ballnut are 0.375 inch (9.53 millimeters) diameter.

- 1) If any ball bearings are found, replace the stabilizer trim ballscrew actuator (AMM 27-41-10/401).

S 216-062

- (15) Visually examine the upper and lower gimbals for cracks, corrosion, and parts that are worn or loose.
- (a) If it is necessary, replace or repair the gimbals.

02

Page 620  
Apr 22/08

- (9) Get access to the stabilizer trim actuator through the Service Access Door, 312AR (AMM 06-42-00/201).

S 486-074

- (10) Do the steps that follow to install the test equipment A55001-47, between the horizontal stabilizer and the upper fuselage structure (Fig. 602):
- (a) Install the clamp assembly, A55001-17, and clamp fitting, A55001-6, on the upper bulkhead.
  - (b) Install the test equipment A55001-47, between the stabilizer and the upper bulkhead fitting using the quick release pins.

S 866-075

- (11) Do the steps that follow to install the dial indicator between the stabilizer ballscrew and the primary brake housing (Fig. 605):
- (a) Install the magnetic base for the dial indicator on the ballscrew below the primary brake housing.
  - (b) Install the dial indicator to the magnetic base until the tip of the dial indicator touches a flat hard area on the primary brake housing.

**NOTE:** The dial indicator is installed to measure the downward movement of the ballscrew relative to the primary brake housing.

E. Stabilizer Primary Brake Freeplay Procedure (Fig. 605)

S 826-076

**CAUTION:** DO NOT APPLY MORE THAN THE SPECIFIED LOADS TO THE STABILIZER WHILE USING THE TEST EQUIPMENT A55001-47. DO NOT APPLY POWER TO THE STABILIZER TRIM ACTUATOR WITH THE TEST ASSEMBLY INSTALLED. IF YOU DO, DAMAGE TO THE EQUIPMENT OR AIRCRAFT CAN OCCUR.

- (1) Use the test assembly to slowly apply an upward force of 750 +/- 50 pounds (3340 +/- 220 newtons) to the ballscrew, as shown on the load cell.

**NOTE:** At 4 units of trim, the aft stabilizer center of gravity loads the ballscrew in the upward direction, putting the ballscrew in compression.

To apply the upward force to the ballscrew, the stabilizer tool must turn the direction that decreases tool length. This will apply the upward force on the primary brake and move the leading edge of the stabilizer to the up direction. Making sure that there is no remaining system freeplay in the up direction.

EFFECTIVITY

ALL

27-41-10

02

Page 621  
Aug 22/08

S 826-077

- (2) Zero the dial indicator.

S 826-078

- (3) Use the test equipment A55001-47, to slowly release the upward force applied in the previous step and continue adjusting the load tool to apply a downward force of 2450 +/- 50 pounds (10,900 +/- 220 newtons).

**NOTE:** To apply a down force on the stabilizer the tool must turn in a direction that increases the tool length. This will apply a down force on the primary brake and move the leading edge of the stabilizer down.

- (a) Make a note of the quantity shown on the dial indicator.

S 486-089

- (4) Remove the dial indicator and the magnetic base from the ballscrew.

S 486-080

- (5) Do the steps that follow to install the dial indicator on the ballscrew.
- (a) Install the magnetic base for the dial indicator on the ballscrew above the primary brake, 180 degrees from the position that the first reading is taken.
- (b) Install the dial indicator to the magnetic base, until the tip of the dial indicator touches a flat, hard area on the primary brake housing.

S 826-082

- (6) Use the test equipment to slowly apply an upward force of 750 +/- 50 pounds (3340 +/- 220 newtons) to the ballscrew, as shown on the load cell.

**NOTE:** At 4 units of trim, the aft stabilizer center of gravity loads the ballscrew in the upward direction, putting the ballscrew in compression.

To apply the upward force to the ballscrew, the stabilizer tool must turn the direction that decreases tool length. This will apply the upward force on the primary brake and move the leading edge of the stabilizer in the up direction. Make sure that there is no remaining system freeplay in the up direction.

S 826-083

- (7) Zero the dial indicator.

EFFECTIVITY

ALL

27-41-10

02

Page 622  
Aug 22/08

S 826-084

- (8) Use the test equipment A55001-47, to slowly release the upward force applied in the previous step and continue adjusting the load tool to apply a downward force of 2450 +/- 50 pounds (10,900 +/- 220 newtons).

**NOTE:** To apply a down force on the stabilizer the tool must turn in a direction that increases the tool length. This will apply a down force on the primary brake and move the leading edge of the stabilizer down.

- (a) Make a note of the quantity shown on the dial indicator.  
(b) Average the two dial indicator readings. This is the stabilizer ballscrew to primary brake housing freeplay.

S 846-085

- (9) Use the test equipment A55001-47, to slowly release the down force that was applied.

S 826-095

- (10) If the ballscrew to primary brake freeplay is less than 0.001 inch (0.03 mm), then it is possible that the measurement is incorrect. Do these steps to make sure that the measurement is correct:  
(a) Make sure that the stabilizer is put in the correct direction in each of the previous steps.  
(b) Make sure that the dial indicator operates correctly.

S 826-086

- (11) If the ballscrew to primary brake freeplay is more than or equal to 0.001 inch (0.03 mm), and less than or equal to 0.0250 inch (0.635 mm), the ballscrew to primary brake freeplay is in the permitted limits.

S 826-087

- (12) If the ballscrew to primary brake freeplay is more than 0.0250 inch (0.635 mm), the stabilizer trim actuator worn area is more than the maximum in-service worn area limits. Do the steps that follow:  
(a) Remove the old stabilizer trim actuator and replace it with a known good unit (AMM 27-41-10/401).

F. Put the Airplane Back to its Usual Condition

S 486-088

- (1) Remove the test equipment A55001-47, from the horizontal stabilizer and the upper fuselage (Figure 602).

S 486-090

- (2) Remove the clamp fittings from the attach points on the bulkheads.

S 486-091

- (3) Remove the dial indicator and the magnetic base from the ballscrew.

STABILIZER TRIM DRIVE HYDRAULIC MOTORS – REMOVAL/INSTALLATION

1. General

- A. This procedure contains steps to remove and install the hydraulic motor for the stabilizer trim drive system.

TASK 27-41-11-024-001

2. Remove the Hydraulic Motors for the Stabilizer Drive System

A. References

- (1) AMM 06-42-00/201, Empennage Access Doors and Panels
- (2) AMM 24-22-00/201, Electrical Power – Control
- (3) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems

B. Access

(1) Location Zones

- 211/212 Control Cabin
- 311/312 Area Aft of Pressure Bulkhead to BS 1725

(2) Access Panels

- 312AR Forward Stabilizer Compartment

C. Prepare for the Removal

S 864-002

- (1) Supply electrical power (AMM 24-22-00/201).

S 864-003

- (2) Remove the pressure from the left and center hydraulic systems (AMM 29-11-00/201).

S 864-004

- (3) Put the L and C STAB TRIM shutoff valve switches on the control stand panel, P10, to the CUTOUT position.

S 864-005

- (4) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:  
(a) 11A36, ALT STAB TRIM (if installed)

D. Remove the Stabilizer Trim Standby Switch (Fig. 401)

S 034-007

- (1) Disconnect the switch wires from the terminal block, TB217, at the G1 pin and the electrical ground.

S 024-008

- (2) Remove the fasteners that hold the switch to the structure and remove the standby switch.

TASK 27-41-14-424-009

3. Install the Stabilizer Trim Standby Switch (Fig. 401)

A. Equipment

- (1) Volt-ohmmeter - Commercially Available

B. Consumable Materials

- (1) G02104 Tubing - Heat shrink

C. References

- (1) AMM 24-22-00/201, Electrical Power - Control
- (2) AMM 27-61-00/201, Spoiler/Speedbrake Control System

D. Access

- (1) Location Zones  
211/212 Control Cabin

E. Procedure

S 434-010

- (1) Put heat shrink tubing on the full length of the switch wire on the replacement switch.

**NOTE:** Do not put heat shrink tubing on the switch wire at connections.

S 424-011

- (2) Hold the switch in its correct position and install the fasteners.

S 434-012

- (3) Connect the switch wires to the terminal block, TB217, at the G1 pin and the electrical ground.

S 214-013

- (4) Make sure that the switch operates freely.

S 224-014

- (5) Make sure that the roller will move down a minimum of 0.04 inch (1.0 millimeter).

S 764-015

- (6) Make sure that there is continuity between the G1 pin on the terminal block, TB217, and the airplane electrical ground.

Apr 22/01

- S 714-022
- (7) Connect one of the volt ohmmeter wires to the G1 pin and connect the other wire to the electrical ground.
- S 214-023
- (8) Make sure that there is no continuity between the G1 pin and the electrical ground.
- S 864-024
- (9) Move and hold the right lever of the STAB TRIM levers at 10 degrees from the neutral trim position (0.70 to 0.90 inches (17.8 to 22.9 millimeters) measured on the control stand surface).
- S 214-025
- (10) Make sure that there is continuity between the G1 pin and the electrical ground.
- S 214-026
- (11) Make sure that the switch operates correctly when you move the right lever of the STAB TRIM levers as follows:
- (a) Move the lever 10 degrees forward and aft of the neutral position.
- F. Put the Airplane Back to Its Usual Condition
- S 864-016
- (1) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:
- (a) 11C6, FLT CONT ELEC 1L AC
- (b) 11C7, FLT CONT ELEC 1L DC
- (c) 11C8, FLT CONT ELEC 2L AC

HORIZONTAL STABILIZER ALIGNMENT TABS – REMOVAL/INSTALLATION

1. General

- A. This section contains the procedure to install alignment tabs for the stabilizer neutral position, and the manual control upper and lower limit positions.

TASK 27-41-17-424-002

2. Install the Stabilizer Alignment Tabs

A. References

- (1) AMM 20-10-15/401, Stencil Markings – Removal/Installation
- (2) AMM 20-10-14/401, Aluminum Foil Markers
- (3) AMM 27-41-00/501, Horizontal Stabilizer Trim Control System

B. Access

- (1) Location Zones
  - 211/212 Area Aft of Pressure Bulkhead to BS 1725
  - 332 Horizontal Stabilizer Leading Edge (Left)

C. Install the Alignment Tabs

S 214-003

- (1) Find the alignment tab on the stabilizer leading edge. It is on the center of the inboard leading edge of the left stabilizer (Fig. 401).

S 424-001

- (2) If an alignment tab is not installed on the stabilizer, install an alignment tab by stencil or bonding aluminum tabs (AMM 20-10-15/401 or AMM 20-10-14/401).

S 864-004

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES BEFORE THE STABILIZER IS MOVED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR.

- (3) Move the stabilizer such that Dimension A on the stabilizer ballscrew actuator is correct for installation of the alignment tabs (Fig. 401 and 402).

**NOTE:** For the procedures to move the stabilizer and to measure Dimension A, refer to AMM 27-41-00/501.

S 934-005

- (4) Put the alignment tab on the side of the airplane such that the conditions that follow are correct:
  - (a) The alignment tab is one inch (25 millimeters) in front of the stabilizer leading edge.

STABILIZER TRIM BALLSCREW ACTUATOR ICE SCRAPER – REMOVAL/INSTALLATION

1. General

- A. This procedure contains steps to remove/install the lower ice scraper on the stabilizer trim ballscrew actuator.

TASK 27-41-18-024-001

2. Remove the Ice Scraper (Fig. 401)

A. Equipment

- (1) Socket, Safety Rod Nut - A27062-13

B. References

- (1) AMM 06-42-00/201, Empennage Access Panels and Doors  
(2) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems  
(3) AMM 32-71-05/401, Tail Skid Shock Strut/Actuator

C. Access

(1) Location Zone

311 Area Aft of Pressure Bulkhead to BS 1725 (Left)

(2) Access Panel

311BL Stabilizer Ballscrew Safety Rod Access Door

312AR Service Access Door

D. Prepare for the Removal

S 864-002

- (1) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 864-047

- (2) Use the STAB TRIM levers or switches to move the stabilizer until Dimension A on the stabilizer ballscrew actuator is  $1.73 \pm 0.05$  inches (43.9 +/- 1.3 millimeters).

S 864-007

- (3) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).

S 864-008

- (4) Put the C STAB TRIM shutoff valve switches on the control stand panel, P10, to CUTOUT.

S 864-009

- (5) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:  
(a) 11C12, STAB TRIM SHUTOFF L  
(b) 11C13, STAB TRIM SHUTOFF CENTER

27-41-18

S 024-042

- (6) Do the tail skid shock strut/actuator removal procedure (AMM 32-71-05/401).

S 014-010

- (7) Open the stabilizer ballscrew safety rod access door, 311BL (AMM 06-42-00/201).

E. Remove the Ice Scraper

**NOTE:** If you make a mark to show where the safety rod and lower stop are aligned to the ballscrew, the installation can be easier.

S 034-011

- (1) Remove the safety rod.  
(a) Remove the retaining bolts (6) for the safety rod (8) from the lower stop (7) of the ballscrew assembly.  
(b) Remove the lock bolt (2) from the safety rod nut (1).  
(c) Using the socket A27062-13, loosen the safety rod nut (1) from the end of the safety rod (8).  
(d) Remove the safety rod (8) from the ballscrew.

S 034-012

- (2) Remove the lower stop (7) from the lower end of the ballscrew.

S 864-013

- (3) Pressurize the center hydraulic systems (AMM 29-11-00/201).

S 864-014

- (4) Put the CENTER STAB TRIM SHUTOFF valve switches on the P10 panel to NORM.

S 864-015

- (5) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:  
(a) 11C12, STAB TRIM SHUTOFF L  
(b) 11C13, STAB TRIM SHUTOFF CENTER

S 864-016

**WARNING:** DO NOT OPERATE THE BALLSCREW ACTUATOR SUCH THAT DIMENSION A IS LARGER THAN 26.46 INCHES (672.1 MILLIMETERS). THIS CAN CAUSE DAMAGE TO THE BALLSCREW ACTUATOR.

- (6) Slowly move the stabilizer such that Dimension A on the ballscrew actuator is  $26.41 \pm 0.05$  inches (670.8 +/- 1.3 millimeters) (Fig. 401).

S 864-017

- (7) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).

- (1) Location Zone
  - 311 Area Aft of Pressure Bulkhead to BS 1725 (Left)
- (2) Access Panel
  - 312BL Stabilizer Ballscrew Safety Rod Access Door
  - 312AR Service Access Door

D. Install the Ice Scraper

- S 434-023
- (1) Install the two ice scraper retaining pins (4).
- S 424-040
- (2) Install the ice scraper (5) in the secondary nut housing.
- (a) AIRPLANES WITH ICE SCRAPER P/N B-18834-7R;  
Make sure that the ice scraper (5) is installed with the felt seal toward the secondary nut housing (Fig. 401).
  - (b) AIRPLANES WITH ICE SCRAPER P/N B-18834B-7R;  
Make sure that the ice scraper (5) is installed with the chamfered end toward the secondary nut housing (Fig. 401).
  - (c) Make sure the leading edge of the scraper touches the lower edge of the threads in the secondary nut.

- S 864-024
- (3) Pressurize the center hydraulic system (AMM 29-11-00/201).
- S 864-025
- (4) Put the C STAB TRIM shutoff valve switches on the control stand panel, P10, to NORM.
- S 864-026
- (5) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel, P11:
- (a) 11C12, STAB TRIM SHUTOFF
  - (b) 11C13, STAB TRIM SHUTOFF CENTER
- S 864-027
- WARNING:** DO NOT OPERATE THE BALLSCREW ACTUATOR SUCH THAT DIMENSION A IS LARGER THAN 26.46 INCHES (672.1 MILLIMETERS). THIS CAN CAUSE DAMAGE TO THE BALLSCREW ACTUATOR.
- (6) Use the STAB TRIM levers or switches to move the stabilizer until Dimension A on the stabilizer ballscrew actuator is 1.73 ±0.05 inches (43.9 +/- 1.3 millimeters).
- (a) Make sure the threads in the ice scraper engage with the ballscrew threads.
- S 864-038
- (7) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).
- S 864-031
- (8) Put the C STAB TRIM shutoff valve switches in the P10 panel to CUTOUT.
- S 864-032
- (9) Open these circuit breakers on the P11 panel and attach DO-NOT-CLOSE tags:
- (a) 11C12, STAB TRIM SHUTOFF L
  - (b) 11C13, STAB TRIM SHUTOFF CENTER
- S 224-033
- (10) Make sure the distance from the bottom of the secondary nut to the lower end of the engaged ice scraper is between 0.157 to 0.239 inches (3.99 to 6.07 millimeters) (Fig. 401, Sheet 3).
- S 434-034
- (11) Install the lower stop (7) on the ballscrew.
- (a) Install the lower stop (7) aligned with the ballscrew mark made during the removal.

EFFECTIVITY  
AIRPLANES WITH THE SAFETY  
ROD ACCESS DOOR

27-41-18

05

Page 407  
Apr 22/04

- (b) To ensure maximum stop surface contact, set the gap between the lower stop (7) and the secondary ballnut (3) stop to 0.010 - 0.040 inches (0.25 - 1.02 millimeters) with the stops in line (180 degrees rotation from full stop engagement, as shown in Fig. 401, Sheet 3.)

S 434-035

- (12) Install the safety rod.
  - (a) Put the safety rod (8) in the ballscrew.
  - (b) Using socket A27062-13, tighten the safety rod nut onto the end of the safety rod. Torque the safety rod nut to 100 - 130 pound-inches (11.3 - 14.7 newton-meters) and back off the safety rod nut to align the hole for the lock bolt (2).
  - (c) Install the lock bolt into the safety rod nut.
  - (d) Install the retaining bolt for the safety rod (8) in the lower stop (7) of the ballscrew assembly.

S 024-044

- (13) Do the tail skid shock strut/actuator installation procedure (AMM 32-71-05/401).

E. Put the Airplane Back to Its Usual Condition

S 864-036

- (1) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:
  - (a) 11C12, STAB TRIM SHUTOFF L
  - (b) 11C13, STAB TRIM SHUTOFF CENTER

S 864-039

- (2) Move the L and C STAB TRIM shutoff valve switch on the P10 panel to NORM.

S 414-037

- (3) Close the stabilizer ballscrew safety rod access door, 311BL (AMM 06-42-00/201).

S 014-059

- (4) Close the service access door, 312AR (AMM 06-42-00/201).

STABILIZER TRIM RELIEF VALVE – REMOVAL/INSTALLATION

1. General

- A. This procedure has two tasks. The first task removes the Stabilizer Trim Relief Valve from between the Left STCM and the elevator PCA. The other task installs the Stabilizer Trim Relief Valve.

TASK 27-41-19-004-001

2. Remove the Stabilizer Trim Relief Valve

A. General

- (1) This task contains the procedures to remove the component which follows:

(a) Stabilizer Trim Relief Valve

B. References

- (1) AMM 06-42-00/201, Empennage Access Doors and Panels  
(2) AMM 12-12-01/301, Hydraulic Systems – Servicing  
(3) AMM 24-22-00/201, Electrical Power – Control  
(4) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems

C. Access

- (1) Location Zone  
311/312 Area Aft of Pressure Bulkhead to BS 1725
- (2) Access Panels  
312 AR Forward Stabilizer Compartment

D. Prepare for the Removal

S 864-006

- (1) Remove the pressure from the left and center hydraulic systems (AMM 29-11-00/201).

S 864-076

- (2) Supply electrical power (AMM 24-22-00/201).

S 864-077

- (3) Put the L and C STAB TRIM shutoff valve switches on the control stand panel, P10, to the CUTOUT position.

S 014-078

**WARNING:** STAY OFF OF THE SERVICE ACCESS DOOR, 312AR. YOUR WEIGHT CAN CAUSE THE SPRING-LOADED LATCHES TO RELEASE. IF YOU FALL THROUGH THE DOOR, INJURY CAN OCCUR.

- (4) Open the access door for the forward stabilizer compartment, 312AR (AMM 06-42-00/201).

EFFECTIVITY

ALL

27-41-19

01

Page 401  
Apr 22/04

S 864-002

- (5) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
- (a) 11A36, ALT STAB TRIM (if installed)
  - (b) 11C12, STAB TRIM SHUTOFF L
  - (c) 11C13, STAB TRIM SHUTOFF CENTER

E. Remove the Stabilizer Trim Relief Valve (Fig. 401)

S 034-007

- (1) Disconnect the hydraulic lines from the relief valve.

S 034-008

- (2) Seal the hydraulic lines with caps and put plugs in the ports of the stabilizer trim relief valve, as necessary.

S 034-079

- (3) Remove the retainer bracket screw from the retainer bracket and then remove the stabilizer trim relief valve from the retainer bracket.

F. Install the Relief Valve (Fig. 401).

S 434-062

- (1) Install the relief valve in the retainer bracket.

S 424-063

- (2) Install the retainer bracket on the airplane structure using the retainer bracket screw.

S 034-080

**CAUTION:** REMOVE ANY CAPS OR PLUGS FROM THE HYDRAULIC LINES AND THE RELIEF VALVE.

- (3) Apply hydraulic lubricant or hydraulic fluid to the threads of the relief valve.

S 434-064

- (4) Install the hydraulic lines on the relief valve.

**NOTE:** When installing the relief valve, make sure that the arrow is pointing down.

G. Put the Airplane Back to Its Usual Condition

S 864-067

- (1) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel, P11:
  - (a) 11A36, ALT STAB TRIM (if installed)
  - (b) 11C12, STAB TRIM SHUTOFF L
  - (c) 11C13, STAB TRIM SHUTOFF CENTER

S 864-084

- (2) Put the L and C STAB TRIM shutoff valve switches on the control stand panel, P10, to the NORM position.

S 614-068

- (3) Fill the reservoirs in the left and center hydraulic systems, as necessary (AMM 12-12-01/301).

S 864-069

- (4) Pressurize the left and center hydraulic systems (AMM 29-11-00/201).

S 794-070

- (5) Make sure there are no leaks on the relief valve connections.

S 114-071

**CAUTION:** QUICKLY CLEAN THE INSTALLATION AREA OF ALL HYDRAULIC FLUID.  
THE HYDRAULIC FLUID CAN CAUSE DAMAGE TO THE AIRPLANE EQUIPMENT.

- (6) Clean all the hydraulic fluid from the installation area (AMM 12-25-01/301).

S 864-074

- (7) Remove hydraulic power if it is not necessary (AMM 29-11-00/201).

S 864-083

- (8) Remove electrical power if not necessary (AMM 24-22-00/201).

S 864-082

Stabilizer Trim Ballscrew Safety Rod Installation  
Figure 401 (Sheet 2)

EFFECTIVITY  
AIRPLANES WITH THE SAFETY  
ROD ACCESS DOOR

27-41-20

01

Page 403  
Aug 22/05

S 024-013

- (6) Do the tail skid shock strut/actuator removal procedure (AMM 32-71-05/401).

S 014-014

- (7) Open the stabilizer ballscrew safety rod access door, 311BL (AMM 06-42-00/201).

E. Remove the Safety Rod

**NOTE:** If you make a mark to show where the safety rod and lower stop are aligned to the ballscrew, the installation can be easier.

S 034-015

- (1) Remove the safety rod.
- (a) Remove the safety pin nuts (9), washers (11), and bolts (12).
    - 1) Remove the safety pin (10) and safety sleeve (13).
  - (b) Remove the safety rod retaining bolts (6) from the lower stop (7) of the ballscrew assembly.
  - (c) Remove the lock bolt (14) and nut (15) from the safety rod nut (16).
  - (d) Using the socket A27062-13, loosen the safety rod nut assembly (16) from the end of the safety rod (8).
  - (e) Remove the safety rod (8) from the ballscrew.

S 864-017

- (2) Pressurize the center hydraulic systems (AMM 29-11-00/201).

S 864-018

- (3) Put the CENTER STAB TRIM SHUTOFF valve switches on the P10 panel to NORM.

S 864-020

- (4) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:
- (a) 11C12, STAB TRIM SHUTOFF L
  - (b) 11C13, STAB TRIM SHUTOFF CENTER

S 864-021

**WARNING:** DO NOT OPERATE THE BALLSCREW ACTUATOR SUCH THAT DIMENSION A IS LARGER THAN 26.46 INCHES (672.1 MILLIMETERS). THIS CAN CAUSE DAMAGE TO THE BALLSCREW ACTUATOR.

- (5) Slowly move the stabilizer such that Dimension A on the ballscrew actuator is  $26.41 \pm 0.05$  inches (670.8 +/- 1.3 millimeters) (Fig. 401).

S 864-022

- (6) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).

S 864-023

- (7) Put the C STAB TRIM shutoff valve switches on the P10 panel to CUTOUT.

S 864-025

- (8) Open these circuit breakers on the P11 panel and attach DO-NOT-CLOSE tags:  
(a) 11C12, STAB TRIM SHUTOFF L  
(b) 11C13, STAB TRIM SHUTOFF CENTER

TASK 27-41-20-424-028

3. Install the Safety Rod (Fig. 401)

A. Equipment

- (1) Socket - A27062-13

B. References

- (1) AMM 06-42-00/201, Empennage Access Panels and Doors  
(2) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems  
(3) AMM 32-71-05/401, Tail Skid Shock Strut/Actuator

C. Access

- (1) Location Zone  
311 Area Aft of Pressure Bulkhead to BS 1725 (Left)
- (2) Access Panel  
312BL Stabilizer Ballscrew Safety Rod Access Door  
312AR Service Access Door

D. Install the Safety Rod

S 864-031

- (1) Pressurize the center hydraulic system (AMM 29-11-00/201).

EFFECTIVITY  
AIRPLANES WITH THE SAFETY  
ROD ACCESS DOOR

27-41-20

02

Page 405  
Aug 22/05

S 864-032

- (2) Put the C STAB TRIM shutoff valve switches on the control stand panel, P10, to NORM.

S 864-034

- (3) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel, P11:
- (a) 11C12, STAB TRIM SHUTOFF
  - (b) 11C13, STAB TRIM SHUTOFF CENTER

S 864-035

**WARNING:** DO NOT OPERATE THE BALLSCREW ACTUATOR SUCH THAT DIMENSION A IS LARGER THAN 26.46 INCHES (672.1 MILLIMETERS). THIS CAN CAUSE DAMAGE TO THE BALLSCREW ACTUATOR.

- (4) Use the STAB TRIM levers or switches to move the stabilizer until Dimension A on the stabilizer ballscrew actuator is  $1.73 \pm 0.05$  inches (43.9 +/- 1.3 millimeters).

S 864-036

- (5) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).

S 864-037

- (6) Put the C STAB TRIM shutoff valve switches in the P10 panel to CUTOUT.

S 864-039

- (7) Open these circuit breakers on the P11 panel and attach DO-NOT-CLOSE tags:
- (a) 11C12, STAB TRIM SHUTOFF L
  - (b) 11C13, STAB TRIM SHUTOFF CENTER

S 434-041

- (8) Install the lower stop (7) on the ballscrew.
- (a) Install the lower stop (7) aligned with the ballscrew mark made during the removal.
  - (b) To ensure maximum stop surface contact, set the gap between the lower stop (7) and the secondary ballnut (3) stop to 0.010 - 0.040 inches (0.25 - 1.02 millimeters) with the stops in line (180 degrees rotation from full stop engagement, as shown in Fig. 401, Sheet 2.)

S 434-042

- (9) Install the safety rod.
- (a) Put the safety rod (8) in the ballscrew.
  - (b) Using socket A27062-13, tighten the safety rod nut (16) onto the end of the safety rod (8). Torque the safety rod nut to 100 - 130 pound-inches (11.3 - 14.7 newton-meters) and back off the safety rod nut (16) to align the hole for the lock bolt (14).
  - (c) Install the lock bolt (14) and lock bolt nut (15) into the safety rod nut (16).
  - (d) Install the retaining bolts (6) for the safety rod (8) in the lower stop (7) of the ballscrew assembly.
  - (e) Install the safety sleeve (13) in the safety nut assembly (16).
  - (f) Install the safety pin (10) through the pin assemblies (17) and safety sleeve (13) and secure with the bolts (12), washers (11), and nuts (9).

S 024-044

- (10) Do the tail skid shock strut/actuator installation procedure (AMM 32-71-05/401).

E. Put the Airplane Back to Its Usual Condition

S 864-045

- (1) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:
- (a) 11C12, STAB TRIM SHUTOFF L
  - (b) 11C13, STAB TRIM SHUTOFF CENTER

S 864-046

- (2) Move the L and C STAB TRIM shutoff valve switch on the P10 panel to NORM.

S 414-048

- (3) Close the stabilizer ballscrew safety rod access door, 311BL (AMM 06-42-00/201).

S 014-050

- (4) Close the service access door, 312AR (AMM 06-42-00/201).

EFFECTIVITY  
AIRPLANES WITH THE SAFETY  
ROD ACCESS DOOR

STABILIZER TRIM POSITION INDICATING SYSTEM -  
DESCRIPTION AND OPERATION

1. General (Fig. 1 and 2)

- A. The stabilizer trim position indicating system provides indication of stabilizer trim position and motion.
- B. There are two stabilizer position indicators on the control stand, one for the captain and one for the first officer. Both indicate stabilizer position and motion.
- C. Three Limit Switch and Position Transmitter Modules (LSTMs) provide electrical data to the indication system, and also provide the following:
  - (1) Electrical travel limits to the stabilizer trim.
  - (2) Data for takeoff configuration warning and annunciation.
  - (3) Stabilizer position data for Flap/Stabilizer Position Modules (FSPMs), Flight Control Computers (FCCs), Stabilizer Trim/Aileron Lockout Modules (SAMs), and the Flight Data Recorder.
  - (4) 767-200 AIRPLANES;  
Selection of the appropriate control column cutoff switches according to elevator neutral shift status.

NOTE: 767-300 AIRPLANES;

Elevator neutral shift is deleted and this function does not apply.

- D. Stabilizer position input to the LSTM's is provided by three cable systems, which are driven by stabilizer motion.

2. Component Details

- A. Limit Switch and Position Transmitter Modules (LSTMs) (Fig. 2)
  - (1) The three LSTMs are identical and interchangeable, but each LSTM provides different functions, as determined by its location and the airplane wiring connected to it.
  - (2) Each LSTM includes a housing with an input shaft on one end, which drives these internal components:
    - (a) Two cam-actuated stabilizer electrical travel limit switches.
      - 1) The electrical travel limit switches interrupt the trim signal from the SAMs (Stabilizer Trim/Aileron Lockout Modules) to the STCM (Stabilizer Trim Control Module) at the stabilizer up and down electrical travel limits.

-------------	-----

**27-48-00**

- 2) 767-300 AIRPLANES;  
The stabilizer up electrical travel limit is controlled by two switches, according to the position of the flaps. When the flaps are not retracted, the trim limit relays will select the 0.25 units of trim limit switch. If the flaps are retracted, the trim UP limit relays will select the 1.5 units of trim UP limit switch.
  - (b) One cam-actuated neutral shift switch. (767-200 Airplanes)
    - 1) 767-200 AIRPLANES;  
A neutral shift switch selects the appropriate of two control column aft cutoff switches to be functional in the event of a runaway stabilizer. Prior to neutral shift (AMM 27-31-00/501), the 2 to 2.5 degree control column aft cutoff switch is selected. After neutral shift, the 3 to 3.5 degree control column aft cutoff switch is selected.
    - 2) 767-300 AIRPLANES;  
There is no neutral shift, and no neutral shift switch exists.
  - (c) One cam-actuated greenband switch.
    - 1) The greenband switch signals the takeoff configuration card to issue a takeoff configuration warning and annunciation if the stabilizer trim position is outside the greenband range and the airplane is in a takeoff configuration.
  - (d) A gear driven rotary variable differential transducer (RVDT).
    - 1) The gear driven RVDT signals stabilizer position to the FSPM which relays the data to FCC, SAM, and other systems.
  - (e) A gear driven position transmitter synchro.
    - 1) The gear driven position transmitter synchro drives the stabilizer position indicator and signals the flight data recorder.
  - (3) The right LSTM drives the right stabilizer position indicator and signals data to the right SAM. The left LSTM drives the left stabilizer position indicator and signals data to the left SAM.
  - (4) The center LSTM signals the takeoff configuration card and the FSPM.
  - (5) The three LSTM's are mounted just forward of and below the stabilizer. Access to the LSTM's is through the forward stabilizer compartment door.
- B. Stabilizer Trim Position Indicators (Fig. 2)
- (1) The position indicators are powered by 28 volts ac.
  - (2) The captain's indicator is driven by the left LSTM. The first officer's indicator is driven by the right LSTM.
  - (3) The indicating tape reflects stabilizer trim values in units of trim. One unit of trim is approximately one degree of stabilizer movement. The position indicator scale covers the range of 0.0 to 14.2 units of trim.
  - (4) The position indicator greenband shows the stabilizer trim limits for safe takeoff. The greenband range is 0.25 to 7 units of trim.
  - (5) The indicators can be replaced on the control stand without affecting their calibration.

EFFECTIVITY

ALL

27-48-00

3. Operation

A. Functional Description

- (1) The LSTM quadrants are connected to the stabilizer with cables. Stabilizer movement causes the cables to turn the LSTM quadrants.
- (2) As the LSTM quadrants rotate, switches, RVDTs, and synchros within the LSTMs are actuated to drive the stabilizer position indicators, limit the stabilizer electrical trim, select the appropriate control column cutoff switches, signal the configuration warning card, and provide stabilizer position to the FSPMs, SAMs, FCCs, and flight data recorder.
- (3) The system is on whenever these circuit breakers on overhead circuit breaker panel P11 are closed:
  - (a) 11H10, LEFT STAB TRIM POS IND
  - (b) 11H19, STAB TRIM POS IND RIGHT
- (4) The indicating tapes of the stabilizer trim position indicators show stabilizer position and movement during normal operation.
- (5) Loss of input signal from an LSTM to its position indicator causes that indicating tape to be all black, but no OFF indication flag will appear.
- (6) Loss of 28V DC power to a position indicator causes the indicating tape to be all black, and an OFF indication flag will appear.

STABILIZER TRIM POSITION INDICATING SYSTEM – ADJUSTMENT/TEST

1. General

- A. This procedure refers to the position indicating system for the horizontal stabilizer trim system only.
- B. This procedure contains the operational tests, adjustment, and system tests for the position indicating system.

TASK 27-48-00-715-006

2. Operational Test – Position Indicating System

A. General

- (1) No ground support equipment is necessary to do the operational test for the position indicating system. This test lets you monitor all functions of the position indicating system to make sure it operates correctly.

B. References

- (1) AMM 24-22-00/201, Electrical Power – Control

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (4) Pressurize the left and center hydraulic systems (AMM 29-11-00/201).

S 225-011

- (5) Make sure that Dimension A on the stabilizer ballscrew actuator is  $3.84 \pm 0.03$  inches (97.5 +/- 0.8 millimeters) (the stabilizer is at the neutral position).

S 715-012

- (6) AIRPLANES WITH STAB TRIM LEVERS ON THE CONTROL STAND;  
Do the steps that follow to make sure the position indicating system shows stabilizer movement correctly:
- (a) Make sure that the STAB TRIM levers on the P10 panel are in the neutral position.
  - (b) Move the STAB TRIM levers full forward and hold.

**NOTE:** Do not hit the mechanical stops with the stabilizer.

- 1) Make sure that the stabilizer position indicator shows the stabilizer movement correctly.
  - 2) Make sure that the STAB TRIM levers go to the neutral position when you release them.
- (c) Move the STAB TRIM full aft and hold.

**NOTE:** Do not hit the mechanical stops with the stabilizer.

- 1) Make sure that the stabilizer position indicator shows the stabilizer movement correctly.
- 2) Make sure that the STAB TRIM levers go to the neutral position when you release them.

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (2) Pressurize the left hydraulic system (AMM 29-11-00/201).

S 215-026

- (3) Make sure that the speed brake lever is in the down-and-locked position.

S 215-027

- (4) Make sure that the flaps are in a takeoff position (5, 15, or 20 unit detent).

S 215-028

- (5) Make sure that the parking brakes are released.

EFFECTIVITY

ALL

27-48-00

02

Page 509  
Aug 10/98

S 865-029

- (6) Use the control wheel switches to move the stabilizer to the greenband range shown on the position indicators.

S 865-030

- (7) Push and hold the CONFIG T/O switch on the right side panel, P61, up for the entire test (Fig. 503).

S 215-031

- (8) Make sure that these takeoff configuration warnings are not on (Fig. 503):

**NOTE:** These takeoff configuration warnings are monitored in other steps of this test.

- (a) The red CONFIG light on the EICAS display.
- (b) The captain's and first officer's master warning lights on the glare shield panel, P7
- (c) The EICAS message (STABILIZER)
- (d) The aural warning siren

**NOTE:** AIRPLANES WITH HIGH THRUST ENGINES; (52,501 pounds of thrust, or more). The takeoff configuration warnings will not come on at the upper travel limits.

S 865-041

- (9) Move the control wheel switches up (Airplane nose down).
- (a) Make sure the above takeoff configuration warnings do not come on when the stabilizer moves out of the APL NOSE DN greenband range.

S 865-043

- (10) Use the control wheel switches to move the stabilizer into the greenband range.

S 215-044

- (11) Make sure that all of the above takeoff configuration warnings go off when the stabilizer moves into the greenband range:

**NOTE:** The STABILIZER message will not go out of view for approximately 8 seconds after the stabilizer moves into the greenband range. If the stabilizer moves out of the greenband range during the 8 seconds, the message will not go off.

S 865-045

- (12) Move the control wheel switches down (Airplane nose up).

EFFECTIVITY

ALL

27-48-00

S 215-046

- (13) Make sure all of the above takeoff configuration warnings come on when the stabilizer moves out of the greenband range upper limit.

S 865-047

- (14) Move the stabilizer into the greenband range.

S 215-048

- (15) Make sure that all of the above takeoff configuration warnings go off when the stabilizer moves into the greenband range.

S 865-049

- (16) Release the CONFIG T/O switch on the P61 panel (Fig. 503).

S 865-050

- (17) Remove the power from the left hydraulic system (AMM 29-11-00/201).

S 865-051

- (18) Remove electrical power (AMM 24-22-00/201).

TASK 27-48-00-825-052

3. Adjustment - Position Indicating System

A. Limit Switches and Position Transmitter Modules (LSTM's) Adjustment

S 825-003

- (1) Do the adjustment for the LSTM's (AMM 27-41-00/501).

TASK 27-48-00-735-053

4. System Test - Position Indicating System

A. General

- (1) The tests in this procedure make sure the position indicating system for the stabilizer operates correctly.

B. References

- (1) AMM 06-42-00/201, Empennage Access Doors and Panels

C. Access

- (1) Location Zones  
211/212 Control Cabin

D. Prepare for the System Tests

S 865-054

- (1) Supply electrical power (AMM 24-22-00/201).

S 015-055

**WARNING:** STAY OFF THE SERVICE ACCESS DOOR, 312AR, AND THE ACCESS DOOR FOR THE CONTROLS BAY, 313AL. YOUR WEIGHT CAN CAUSE THE SPRING-LOADED LATCHES TO RELEASE. IF YOU FALL THROUGH THE DOOR, INJURY CAN OCCUR.

- (2) Open the service access door for the forward stabilizer compartment, 312AR (AMM 06-42-00/201).

S 215-056

- (3) Make sure that these circuit breakers on the overhead panel, P11, are closed:

- (a) 11A36, ALT STAB TRIM (if installed)
- (b) 11C12, STAB TRIM SHUTOFF L
- (c) 11C13, STAB TRIM SHUTOFF CENTER
- (d) 11H10, LEFT STAB TRIM POS IND
- (e) 11H19, STAB TRIM POS IND R

S 215-057

- (4) Make sure the L and C STAB TRIM shutoff valve switches on the control stand panel, P10, are in the NORM position.

S 865-058

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (5) Pressurize the left hydraulic system (AMM 29-11-00/201).

S 865-059

- (6) Move the horizontal stabilizer until Dimension A on the stabilizer ballscrew actuator is  $3.84 \pm 0.03$  inches (97.5 +/- 0.8 millimeters) (neutral position) (Fig. 501).

EFFECTIVITY

ALL

27-48-00

- (7) AIRPLANES WITH STAB TRIM LEVERS ON THE CONTROL STAND;  
make sure that the STAB TRIM levers are in the neutral position  
(Fig. 502).

- S 215-062
- (8) AIRPLANES WITH ALTERNATE STAB TRIM SWITCHES ON THE CONTROL STAND;  
make sure that the alternate stab trim switches are in the neutral  
position (Fig. 502).

- S 215-064
- (9) Make sure that the position indicators show that the stabilizer is  
at the neutral position (2 units of trim) (Fig. 502).
- E. Position Indicators Test

- S 735-065
- (1) AIRPLANES WITH STAB TRIM LEVERS ON THE CONTROL STAND;  
do the steps that follow to make sure the position indicators  
operate correctly:
- (a) Move the STAB TRIM levers forward until Dimension A is  
approximately 1.0 inch (25 millimeters).

NOTE: Do not hit the mechanical stops with the stabilizer.

- (b) Make sure that the position indicators show the stabilizer  
movement correctly.
- (c) Continue to move the levers forward approximately 1 second at a  
time until the stabilizer touches the mechanical stop.
- (d) Make sure that the position indicators show  $0 \pm 1/4$  unit of  
trim.
- (e) Move the STAB TRIM levers aft until Dimension A is  
approximately 13.0 inches (330 millimeters).

NOTE: Do not hit the mechanical stops with the stabilizer.

- (f) Make sure that the position indicators show the stabilizer  
movement correctly.
- (g) Continue to move the levers aft approximately 1 second at a  
time until the stabilizer touches the mechanical stop.
- (h) Make sure that the position indicators show  $14.2 \pm 0.3$  units of  
trim.
- (i) Remove power from the left hydraulic system (AMM 29-11-00/201).
- (j) Put the LEFT and CENTER STAB TRIM SHUTOFF valve switches on the  
P10 panel to the CUTOUT position.
- (k) Move the STAB TRIM levers through the full travel range and  
release them.
- (l) Make sure that the stabilizer does not move.
- (m) Make sure that the position indicators show that the stabilizer  
did not move.

STABILIZER TRIM POSITION INDICATOR – REMOVAL/INSTALLATION

1. General

- A. This procedure contains steps to remove and install the position indicator for the stabilizer trim system.
- B. The removal/installation procedures are the same for the captain's and the first officer's position indicators.

TASK 27-48-06-024-001

2. Remove the Position Indicator for the Stabilizer Trim System (Fig. 401)

A. References

- (1) AMM 24-22-00/201, Electrical Power – Control
- (2) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems

B. Access

- (1) Location Zone  
211/212 Control Cabin

C. Prepare for the Removal

S 864-004

- (1) Supply electrical power (AMM 24-22-00/201).

S 864-005

- (2) Remove the power from the left and center hydraulic systems (AMM 29-11-00/201).

S 864-006

- (3) Put the LEFT and CENTER STAB TRIM SHUTOFF valve switches on the control stand panel, P10, to the CUTOUT position.

S 864-007

- (4) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
  - (a) 11A36, ALT STAB TRIM (if installed)
  - (b) 11C12, STAB TRIM SHUTOFF L
  - (c) 11C13, STAB TRIM SHUTOFF CENTER
  - (d) 11H10, STAB TRIM POS IND R

FLAP CONTROLS – CORROSION PROTECTION

1. General

- A. Flaps are secondary controls that increases the angle of attack of the wings that results in increase lift and consists of:
  - (1) Control handle.
  - (2) Cables and Linkages.
  - (3) Actuators.
  - (4) Warning systems and Position indicators.
- B. Corrosion can occur over the entire surface of the outboard deflection control flap track.

TRAILING EDGE FLAP SYSTEM – DESCRIPTION AND OPERATION

1. General (Fig. 1)

- A. The trailing edge flaps provide additional lift during takeoff and landing. When extended, the flaps operate in conjunction with leading edge slats to effectively increase camber and area of the wings.
- B. The trailing edge flap system drives an inboard and outboard flap on each wing. The inboard flap is made up of a main flap and an aft flap. A single flap is located at the outboard position. The flaps are faired with the wing when retracted.
- C. During normal operation the flaps are powered by the center hydraulic system. Flap operation is controlled by the flap control lever on the aisle control stand. The flap lever is connected by cables and linkages to the flap power drive unit.
- D. During alternate operation, the flaps are powered electrically. Flap operation is controlled by ALTN switches in the flight compartment. These switches control an electric motor which drives the flap power drive unit.
- E. The flap power drive unit (PDU) drives the flaps through attached drive shafts. The drive shafts rotate to power two rotary actuators on each flap. Each rotary actuator moves a drive arm which moves a linkage system, causing the flaps to extend or retract.
- F. Gearboxes are installed to allow angular changes in the drive shaft system. An aileron droop gearbox drives the inboard ailerons to a position up to 10 degrees below normal, as flaps extend between 5 and 15 degrees.
- G. A flap position indicating system shows flap position during extension and retraction.
  - (1) A combined flaps and slats dial indicator is located on the main instrument panel (P3). The dial indicator has two needles, one for left and one for right flap position indication.
  - (2) An amber TRAILING EDGE light on the center panel will illuminate when flap system failure exists.
  - (3) A red CONFIG light comes on when flap/slat position is not in commanded landing or takeoff configuration.
  - (4) Master caution/warning lights mounted on the glareshield assist in indicating flap system failures.
- H. A flap/slat electronics unit (FSEU) provides flap and slat annunciation and control. The FSEU is divided into 3 physically and functionally isolated sections.

- I. 767-200 AIRPLANES;  
A flap load alleviation system reduces aerodynamic loads on the flaps. If safe airspeed is exceeded when flaps are fully extended, the flaps automatically retract to the 25-unit position.
- J. 767-300 AIRPLANES;  
A flap load alleviation system reduces aerodynamic loads on the flaps. If safe airspeed is exceeded when flaps are at the 25-unit or 30-unit position, the flaps automatically retract to the 20-unit position.
- K. The flap hydraulic drive system will automatically shut down if an asymmetry condition occurs, or if flaps move without command or opposite to command. The flaps will hold at the position where automatic shutdown occurred. The flaps can then be moved only by the alternate drive system.

2. Component Details

- A. Flap Control Lever (Fig. 4)
  - (1) The flaps are normally operated by a flap control lever located on the aisle control stand. The lever assembly consists of a spring-loaded telescoping handle bolted to a cable quadrant.
  - (2) The control stand has detents at the 0-, 1-, 5-, 15-, 20-, 25- and 30-degree positions. The spring-loaded flap control lever locks into each of these detents. Pulling the lever releases the lever from each detent to allow lever rotation.
  - (3) Gates are provided at detents 1 and 20 to prevent inadvertent movement past these position. At the 1-unit position the slats are at the intermediate (take-off) position and the flaps are fully retracted. The 20-unit gate indicates the greatest extension of flaps and slats recommended for takeoff.
  - (4) The flap control lever position is monitored by two RVDT's (rotary variable differential transformers). The RVDT's are installed in a flap control lever position sensor (RVDT) gearbox below the flap control lever. The gearbox is operated by a link from the flap control lever. The RVDT's send flap control lever position signals to the FSEU for control of system components and failure detection and protection.
  - (5) The flap control lever is attached to a cable quadrant which actuates four micro switches inside the control stand. The micro switches are operated by a spring-loaded arm and roller that follow a cam on the cable quadrant. The switches provide position signals to the following systems:
    - (a) Autopilot flight director system (AMM 22-11-00/001).
    - (b) Thrust management system (AMM 22-32-00/001).
  - (6) The flap control lever cable quadrant is connected to the flap aft quadrant by cables. Movement of the flap control lever causes rotation of the flap aft quadrant and an attached aft quadrant crank.

- (7) The aft quadrant crank is connected by rods to the flap load alleviation mechanism, and to the pilot input crank of the flap power drive unit.
- B. Flap Load Alleviation Mechanism (Fig. 5)
- (1) 767-200 AIRPLANES;  
The flap load alleviation mechanism is controlled by the FSEU to reduce aerodynamic loads on the flaps. When the flap control lever is extended beyond the 25-unit detent, and airspeed exceeds 30-unit safe airspeed, the FSEU energizes the flap load relief actuator to retract the flaps to the 25-unit position. The flap control lever will not move with the flaps, but will stay in the same selected position. The FSEU will energize the flap load relief actuator to return the flaps to the commanded position when airspeed has decreased to at least 4 knots below the 30-unit safe airspeed.
- (2) 767-300 AIRPLANES;  
The flap load alleviation mechanism is controlled by the FSEU to reduce aerodynamic loads on the flaps. When the flap control lever is in the 25-unit or 30-unit position, and airspeed exceeds safe airspeed for that flap position, the FSEU energizes the flap load relief actuator to retract the flaps to the 20-unit position. The flap control lever will not move. The FSEU will energize the flap load relief actuator to return the flaps to the 25-unit or 30-unit position, respectively, when airspeed has decreased to at least 4 knots slower than safe airspeed at those positions.
- (3) The flap load relief actuator retracts the flaps by repositioning the two rods connecting the aft quadrant crank on the flap aft quadrant to the pilot input arm on the PDU control unit. The actuator acts through a bellcrank and link mechanism. The actuator is an electric motor with internal brake, gear train, and clutch assembly. The actuator will operate in one direction until either internal retract or extend limit switch is reached. If a limit switch is inoperative, the actuator will operate until an internal mechanical stop is reached.
- C. Power Drive Unit (PDU) (Fig. 6)
- (1) The power drive unit (PDU) powers the flap drive system. It stops automatically when the selected flap position is reached. The unit is made up of 5 major components: a control unit, control valve module, gearbox, and electric and hydraulic motors. Normal operation is through the hydraulic motor. Alternate operation is through the electric motor.
- (2) The control unit is operated by command from the flap control lever. An input and follow up cam mechanism controls the direction and extent of flap travel.
- (3) The control valve module contains a control valve and a bypass valve. The control valve determines the direction of hydraulic flow through the hydraulic motor. It is controlled by an output from the control unit. The bypass valve allows the hydraulic motor to be backdriven when the alternate electric drive motor is used.

- (4) The gearbox transmits rotary power from either hydraulic or alternate electric drive motor to the flap drive shafts. The hydraulic motor is directly geared to the gearbox output shaft. The alternate electric drive motor contains reduction gearing. The PDU gearbox is bolted to the control unit. The follow up cam, located in the control unit, is joined to the gearbox by a short splined section called a quill shaft. A worm gear on the gearbox output shaft drives the quill shaft through follow up gears. For maintenance there is provision for locking out both hydraulic and electric operation of the PDU through the gearbox.

D. Control Unit (Fig. 7)

- (1) The control unit selects flap direction, and automatically removes power to the flap drive system when the flaps reach the selected position. The pilot input crank receives flap position commands from the flap control lever to cause the control valve module input crank to select the direction of hydraulic flow through the control valve module. Hydraulic power from the control valve module operates the PDU hydraulic motor.
- (2) The control unit contains an input cam, which is operated by the pilot input crank, and a follow up cam, which is driven by the PDU gearbox as it drives the flap system. The two cams are joined by a summing lever. The summing lever has a roller inside each cam. The lever is also connected to the control valve module input crank, inside the control unit. A command from the flap lever rotates both the pilot input crank and the input cam. The summing lever rotates causing the control valve module input crank to rotate to select the direction of hydraulic flow through the control valve module. Looking aft, rotation of the pilot input crank in a clockwise direction causes the flaps to retract. Rotation in a counterclockwise direction causes the flaps to extend.

E. Hydraulic Power Drive (Fig. 8)

- (1) The trailing edge flaps are powered by the center hydraulic system. Hydraulic power is sent to the PDU control valve module from the flap/slat shutoff valve module. The flap/slat shutoff valve module is mounted in the main gear wheel well, on the aft bulkhead, outboard of the power drive unit.

- (2) The control valve module input crank selects the direction of hydraulic flow out of the control valve. When the control valve is in neutral position, fluid flow is blocked. Movement of the input crank repositions the control valve to port hydraulic pressure to one side or the other of the hydraulic motor to drive the motor. The PDU gearbox transmits rotary power from the hydraulic motor to the flap drive shafts.
  - (3) The flap/slat shutoff valve module (Fig. 8 and 21) provides center system hydraulic power to flap and slat power drive units. The flap/slat shutoff valve module consists of a priority valve, a flow limiting valve, and two solenoid-operated shutoff valves, one for flaps and one for slats.
  - (4) The priority valve permits flow only when hydraulic pressure exceeds 1200 psi. The flow limiting valve, installed downstream of the priority valve, limits hydraulic flow to the flap and slat hydraulic motors. This regulates maximum motor speed and the rate of flap and slat extension or retraction. The flow limiter permits a flow of 24 gpm.
  - (5) The shutoff valves are spring-loaded open and powered closed. The FSEU provides control logic for shutoff valve operation.
  - (6) The bypass valve is bolted to the control valve module (Fig. 8 and 9). It is operated by a 28v dc motor. The bypass valve normally allows hydraulic fluid to reach the hydraulic motor. When the valve is in bypass, fluid flow to the hydraulic motor is blocked, and hydraulic fluid is ported from one motor port to the other and to the hydraulic return line. The bypass valve can be operated manually by a lever. Normally the lever is in position two. In position one, the valve is in the bypass position.
  - (7) The hydraulic motor is a standard piston-type that operates in either direction with 3000 psi system pressure.
- F. Alternate Power Drive (Fig. 9)
- (1) The alternate power drive system provides an independent backup to the hydraulic power drive system. The alternate system is powered by an electric motor located on the power drive unit. The motor assembly consists of an electric motor, clutch, torque limiter, brake, and reduction gearing. The electric motor is a 115 volt ac, 3-phase, 400 Hz, reversible, induction motor. During normal operation, the clutch allows the power drive unit to back-drive the motor reduction gearing without rotating the motor. When the alternate power drive system energizes the clutch solenoid, the clutch engages the motor with its output shaft, so the motor can drive the flap. The torque limiter protects the motor from a jammed flap. The torque limiter restores itself to a positive connection once the load drops below the slip torque limit. An electromagnetic brake releases the motor when the motor is powered. When power is cut off, the brake stops motor rotation.

- (2) The alternate power drive is operated by switches located on the flap/slat alternate control module. The module is mounted in the main instrument panel P3. The flap position is selected by a rotary switch with eight graduated position markings: NORM, UP, 1, 5, 15, 20, 25, and 30. The trailing edge arming switch activates the flap alternate drive system.

G. Flap Drive Shafts (Fig. 10)

- (1) A single drive shaft system operates 4 rotary actuators on each wing. Drive shafts from both wings are driven by a rotary output from the power drive unit gearbox. Safety straps are installed along the drive shafts. They prevent damage to surrounding structure if a drive shaft breaks. Intermediate support bearings are installed at points where two drive shafts are connected.
- (2) The system has two drive shaft types, floating and non-floating. Floating drive shafts have a spline coupling at each end. They are installed between mechanisms with internal support bearings such as a gearbox or rotary actuator. Non-floating drive shafts have an idler bearing at one end and a spline coupling at the opposite end. They provide a support bearing where two drive shafts are connected.
- (3) A lubrication point is provided at each spline coupling and support bearing.
- (4) Drive shafts are located on the main gear wheel well aft bulkhead. Power from the power drive unit is transmitted through a support bearing to the bulkhead tee gearbox which divides power between the body-mounted rotary actuator and the 3 wing-mounted actuators.
- (5) The bulkhead angle gearbox joins the bulkhead tee gearbox to the actuator input angle gearbox. A safety strap is located between the bulkhead angle gearbox and the bulkhead tee gearbox.
- (6) The side-of-body angle gearbox is driven by the bulkhead tee gearbox. It transmits power out to the three actuators mounted on the wing.
- (7) Rotary power is transmitted to the offset gearbox mounted on the main landing gear beam.
- (8) A drive shaft support bearing is located on the spoiler beam at W.S. 215.46. A safety strap, mounted on the spoiler beam, is outboard of the support bearing.

- (9) The offset tee gearbox is bolted to the outboard actuator of the inboard flap. A drive shaft attached outboard to the offset tee gearbox extends through a hole in the spoiler beam and powers the outboard flap.
  - (10) The aileron droop angle gearbox is mounted on the wing rear spar. Its input drive shaft is covered by a vapor seal. The seal fastens to the gearbox and adjacent rib. It protects the trailing edge from possible fuel vapor leaks.
  - (11) The droop angle gearbox (Fig. 8 and 9) consists of an angle gearbox and a cam-operated crank arm mechanism. The gearbox is connected to input and output drive shafts. Rotary motion from the gearbox drives a worm and gear mechanism which is connected to a cam. A cam roller rides in the cam. The cam roller is part of a lever arm which is connected to the crank arm. The crank arm provides a rotary input to the aileron summing lever. As the cam rotates, the cam roller rides along the cam allowing the lever arm and crank arm to rotate. A timing disc on the gearbox housing provides a reference for adjusting the gearbox.
  - (12) As the flap moves from the 5 to 15-unit position, the inboard aileron droops to a maximum of 10 degrees. For a more detailed description of aileron droop, see 27-11-00.
  - (13) A drive shaft support bearing is located on the rear spar at W.S. 517.70.
  - (14) The inboard rotary actuator for the outboard flap is mounted on a rib at W.S. 616.20. The actuator transmits power from its input drive shaft, through the rib, to the output drive shaft. A safety strap is located on the inboard end of the actuator.
  - (15) A drive shaft support bearing is installed at W.S. 701.48. A safety strap is located inboard of the bearing.
  - (16) The outboard rotary actuator for the outboard flap is mounted on a rib at W.S. 798.20. A safety strap is located on the inboard end of the actuator.
- H. Rotary Actuators (Fig. 11)
- (1) The rotary actuators are driven by their flap drive shafts. Two rotary actuators drive each inboard and outboard flap. There is a total of 8 actuators, 4 on each wing.
  - (2) The rotary actuator fits over a reaction ring that is bolted to a support rib on the wing. Spline teeth inside the actuator engage the reaction ring splines. Missing teeth on both actuator and reaction ring align when correctly installed. The actuator clamps against the rib with 3 hold-down clamps.
  - (3) There are two actuator sizes. The largest is 10.5 inches in diameter and drives the outboard end of the inboard flap. The three 9.5 inch (241.3 mm) diameter actuators drive the outboard flap and the inboard end of the inboard flap.
  - (4) The rotary actuator consists of planetary reduction gearing, a no-back brake and a torque limiter. An overload trip indicator is installed on the torque limiter. The no-back brake prevents airloads from retracting the flap if a drive shaft becomes disconnected.

(5) The torque limiter protects the actuator from an overload. The torque limiter is located at the outboard end of the actuator. It transmits an overload to the no-back brake output cam shaft. At the inboard end of the output cam shaft is the disc cam drive which actuates the overload indicator. A push on a tripped overload indicator will reset an indicator.

I. Inboard TE Flap (Fig. 12, 13, and 14)

(1) The inboard flap is driven by two rotary actuators. Each actuator rotates a crank arm. The crank arm drives the main flap aft and down, opening a slot at the wing trailing edge. When the flap is extended beyond the 20-unit position, a slot opens between the main and aft flaps.

- (2) The inboard mechanism has an upper and lower crank arm (Fig. 13). The lower crank arm is driven by the actuator. The upper crank arm is driven by the lower crank arm through a connecting link.
- (3) The upper crank arm drives the main flap along a track through a link and support beam mechanism. The main flap rolls along the track on a carriage. The carriage is bolted to the support beam.
- (4) Overtravel extend and retract stops are located on the lower crank arm. The retract overtravel stop is formed with a recess on the forward end of the actuator support fitting. The extend overtravel stop is formed with a recess in the aft upper end of the actuator support fitting.
- (5) The lower crank arm drives the fairing door when the flap extends beyond the 10-unit position. The opening allows the main flap support tube to pass through the wing-body fairing. The door is driven by a cam mounted on the lower crank arm. A cam roller mounted on the door drive bellcrank rides inside the cam and sequences the door open and closed. The bellcrank is connected to the fairing door by a drive rod.

- (6) The outboard mechanism has a single crank arm driven by a rotary actuator. The crank arm drives a linkage that operates the main flap and a separate linkage that operates the aft flap (Fig. 14).
    - (a) The crank arm is connected by a link to a four bar mechanism that drives the main flap up and down. The four bar mechanism has a support beam that bolts to the main flap rear spar and to a fitting on the main flap leading edge.
  - (7) An aerodynamic fairing covers the outboard mechanism for the inboard flap. The fairing consists of three sections. The forward section is fixed to the wing lower surface. The center fairing is movable and rotates around a hinge inside the forward fairing. The movable fairing is lowered as the flap extends. It is actuated by a linkage and rod system that connects the flap support beam to the fairing. The aft fairing is fixed to the aft flap hinge. Access panels are located in each fairing section to allow flap system adjustment.
- J. Aft Flap Mechanism (Fig. 15)
- (1) The aft flap is operated by a bellcrank and cam mechanism connected by pushrods. As the main flap moves, a pushrod connected to the actuator support rib drives the bellcrank. A pushrod from the bellcrank rotates a cam mounted on the main flap hinge fitting. Rollers mounted on the aft flap hinge fitting ride in the cam and sequence the aft flap up and down. The aft flap extends after the main flap moves beyond the 20-unit position (Figure 14).
  - (2) A slave drive mechanism is mounted on the main flap rear spar, and connects to the aft flap leading edge at 2 places. When the aft flap cam and roller system extends the aft flap, the outboard and inboard slave drive bellcranks rotate to push the aft flap out. The outboard slave bellcrank is connected by a rod to the inboard slave bellcrank, so that both rotate together.
  - (3) Overtravel extend and retract stops are located on the crank arm. The retract overtravel stop is formed with a flange on the lower aft end of the actuator support rib. The extend overtravel stop is formed by a flange on the 6-9 link.
- K. Outboard TE Flap (Fig. 16)
- (1) The outboard flap is driven by two rotary actuators. Each actuator rotates a crank arm. The crank arm drives a mechanism which moves the flap aft and down, opening a slot at the wing trailing edge. A flap deflection control track and roller are installed at the inboard and outboard ends of the flap.
  - (2) The inboard and outboard mechanisms consist of a four-bar linkage system driven by a link from each crank arm. Two links of the four-bar mechanism connect to a support beam that is bolted to the bottom of the flap (Figure 16).

- (3) 767-200 AIRPLANES;  
Two stops are located 180 degrees apart on the exterior surface of the crank arm shaft. The overtravel stop is formed with two stops located 180 degrees apart on the inboard side of the actuator support rib. The crank arm stops contact both actuator support rib stops when the crank arm is over-rotated in either the retract or extend direction.
  - (4) 767-300 AIRPLANES;  
Overtravel extend and retract stops are located on the crank arm. The retract overtravel stop is formed with a flange on the mid forward side of the 6-9 link. The extend overtravel stop is formed by a flange on the upper forward end of the 6-9 link.
  - (5) An aerodynamic fairing covers both outboard flap mechanisms. The fairing consists of three sections. The forward section is fixed to the wing trailing edge, the aft section is fixed to the flap. The center fairing is fixed to the mechanism and moves only about one inch aft and inboard when flaps are fully extended. Access panels are located in each fairing section to allow flap system adjustment.
- L. Flap/Slat Electronic Unit (FSEU) (Fig. 17)
- (1) Refer to AMM 27-51-01/001, Flap/Slat Electronics Unit - Description and Operation, for details of FSEU related to control of flaps and slats.

M. Position Transmitter (Fig. 18)

- (1) Position transmitters are located adjacent to the rotary actuators at positions 1, 3, 4, 5, and 8. The transmitter at positions 1, 4, 5, and 8 contain resolvers. Each resolver provides an asymmetry signal to the asymmetry detection circuit in section 1 of the FSEU. The two outboard transmitters also contain a synchro. Each synchro provides a flap position signal to the flap position indicating system. See 27-58-00 for details. RVDTs are installed in transmitters at positions 3, 4, and 5. The three RVDTs provide a flap position signal to the flap/stabilizer position module.
- (2) The transmitter mounting housing is fixed to wing structure. A drive housing fits over the mounting housing. Each drive housing has two drive tangs that engage the crank arm input shaft. As each rotary actuator drives its crank arm input shaft, each transmitter drive housing rotates.
- (3) Transmitter rig position (flaps fully extended) is established by inserting a rig pin in a hole on the face of the transmitter.
- (4) A micro adjustment fitting is located inside the cutout in the transmitter mounting housing. The adjustment fitting acts like an off center cam. As the fitting is rotated, it presses against the cutout, slightly rotating the transmitter.

N. Flap/Stabilizer Position Module (FSPM) (Fig. 19)

- (1) The flap/stabilizer position module provide flap and stabilizer position signals to flap and other airplane systems. Logic is contained on circuit cards located in the P50 panel card file. Separate cards make up the center, left and right flap/stab position modules. The P50 card file is mounted inside the aircraft on the right side of the nose gear wheel well.
- (2) The left FSPM receives position signals from the following:
  - (a) Horizontal stabilizer left position transmitter.
  - (b) The outboard transmitter on the inboard flap of the left wing.
- (3) The left FSPM provides signals to the following:
  - (a) TMS mode selector logic.
  - (b) AFDS pitch cruise signals, left channel.
  - (c) TE flap master indication in section 2 of the FSEU.

- (3) An amber TRAILING EDGE light is installed above the position indicator. The TRAILING EDGE light comes on when the flap fail protection system (Fig. 20) is activated for a flap asymmetry condition (Fig. 23), or when flap load alleviation fails (Fig. 22). The TRAILING EDGE light also comes on accompanied by the TE FLAP DISAGREE message, if the alternate flaps/slats position selector switch remains in NORM for seven seconds after the TE flap alternate drive system has been armed.

### 3. Operation

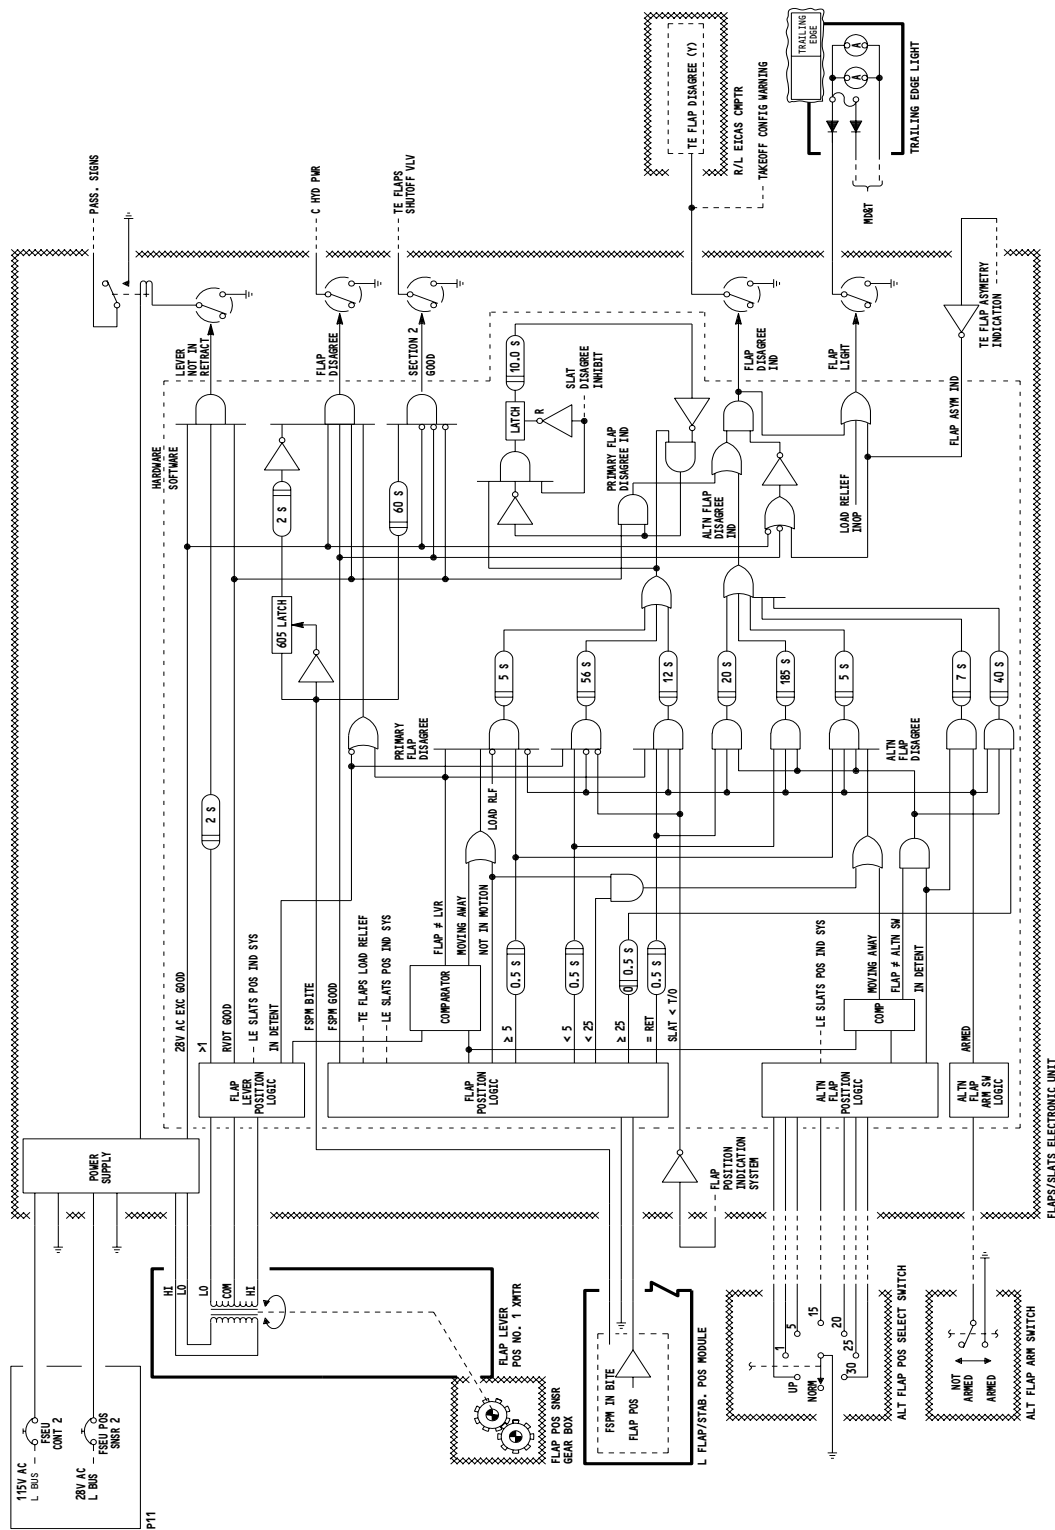

#### A. Functional Description

- (1) Hydraulic Flap Operation (Fig. 8)
- (a) The flap and slat positions are normally controlled by a manually operated flap control lever. The lever is bolted to the forward quadrant. Cables connect the forward quadrant to the slat and flap aft quadrants. Rotating the flap lever to the desired detent selects the aft quadrant position.
- (b) A crank arm from the aft quadrant is attached by connecting rods to the flap load alleviation system and to the pilot input crank on the power drive unit (PDU). The pilot input crank, located on the control unit module, receives flap position command from the aft quadrant crank. The input cam and follow up cam rotate inside the control unit module, allowing the summing lever to actuate the valve input crank. The valve input crank selects the direction of hydraulic flow out of the control valve. A clockwise rotation of the control valve crank allows hydraulic fluid to flow into one side of the hydraulic motor, which retracts the flap. A counterclockwise rotation allows hydraulic fluid to flow into the opposite side of the hydraulic motor, which extends the flap.
- (c) As the flap extends or retracts, the follow up cam is driven by its quill shaft connection to the gearbox. The follow up cam rotates until it catches up with the input cam. The summing lever then rotates back to its original position when it settles into the follow up cam detent. The valve input crank then rotates back to its null position and hydraulic flow through the control valve stops.

Page 37  
Dec 22/01

- (d) The hydraulic motor is geared directly to the PDU gearbox. It transmits power through the PDU reduction gearing to the flap drive shafts. The hydraulic motor can fully extend or retract the flap in about half a minute.
  - (e) Rotary power from the PDU is transmitted by drive shafts and angle gearboxes to the rotary actuators.
  - (f) Two rotary actuators drive each flap. The rotary actuator drives a crank arm that extends the flap on a linkage system.
  - (g) The inboard flap consists of a main and aft flap. As the flaps extend aft and down, a slot opens between the wing and main flap. When the flap is extended beyond the 20-unit position, a slot opens between the main and aft flaps.
  - (h) The outboard flap consists of a single main flap. As the flap extends aft and down, a slot is opened between the wing and main flap, increasing wing lift.
- (2) Alternate Flap Operation (Fig. 9)
- (a) The arming switch is connected through the flap alternate arming relay (P33 panel) to the bypass valve electric motor, and to the alternate extend relay. When the switch is armed, it lights up and the alternate arming relay is activated. This energizes the bypass valve electric motor and engages the clutch on the flap PDU alternate drive electric motor. The bypass valve then interconnects the two ports of the hydraulic motor and connects these ports to the hydraulic return line. The alternate arming relay also makes power available to both ALTERNATE EXTEND and ALTERNATE RETRACT relays. However, both relays remain open until they are closed by a command from the FSEU.
  - (b) When the rotary position selector switch is in the NORM or UP position, the alternate power drive is not operated. When the selector switch is set to position 1 or greater, the signal to retract or extend the flap is sent to the FSEU. The FSEU then commands either the extend relay or the retract relay to close. This allows power from the arming relay to reach the electric motor and drive the flap. The extend and retract relays determine direction of motor rotation by reversing phases.

EFFECTIVITY

ALL

27-51-00

08

Page 38  
Dec 22/01

- (3) TE Flap Shutoff Valve Operation (Fig. 21)
- (a) The flap/slat shutoff valve module provides power from the center hydraulic system to the control valves on the flap and slat PDUs. The flap shutoff valve is spring-loaded open and powered closed. The FSEU provides control logic for shutoff valve operation. The FSEU controls the shutoff valve through the shutoff TE FLAP relay. The FSEU powers the valve closed during normal operation when flaps are retracted. Refer to 27-81-00, Leading Edge Slat System - Description and Operation, for operation of the slat shutoff valve.
- (4) Flap Load Alleviation (Fig. 22)
- (a) 767-200 AIRPLANES;  
The flap load alleviation system automatically reduces aerodynamic loads on the flap. Section 1 of the FSEU contains logic for load alleviation. The logic receives an airspeed signal from the air data computer. A flap lever position signal is received from the No. 2 RVDT. The flap position signal is received from the flap/stabilizer position module. When the flap lever is moved beyond the 25-unit position and airspeed exceeds 30-unit flap lever detent safe airspeed, the FSEU energizes the load alleviation mechanism to retract the flap to the 25-unit position. The flap position indicator needle will move back to 25 units. The flap lever position will not change. The FSEU will automatically extend the flap to match the flap lever position when airspeed is 4 knots below 30-unit flap lever detent safe airspeed.
- (b) 767-300 AIRPLANES;  
The flap load alleviation system automatically reduces aerodynamic loads on the flap. Section 1 of the FSEU contains logic for load alleviation. The logic receives an airspeed signal from the air data computer. A flap lever position signal is received from the No. 2 RVDT. The flap position signal is received from the flap/stabilizer position module. When the flap lever is moved beyond the 20-unit position and airspeed exceeds the 25-unit or 30-unit flap lever detent safe airspeed, the FSEU energizes the load alleviation mechanism to retract the flap to the 20-unit position. The flap position indicator needle will move back to the 20-units. The flap lever position will not change. The FSEU will automatically extend the flap to match the flap lever position when airspeed is 4 knots below the 25-unit or 30-unit flap lever detent safe airspeed.
- (c) In the event of flap load alleviation failure when flaps fail to retract with airspeed above retract airspeed, a FLAP LOAD RELIEF message will be displayed on the EICAS screen and the amber TRAILING EDGE light on P3 will come on. The FLAP LOAD RELIEF message is a level C message.

- (d) 767-200 AIRPLANES;  
In the event that flap load alleviation has occurred with flap retraction to 25-degree position and flaps do not extend to 30-degree position when the requirement for flap load alleviation does not exist any longer, the TE FLAP DISAGREE message will appear on EICAS display and the amber TRAILING EDGE light on P3 will come on. The TE FLAP DISAGREE message is a level B message and is accompanied by aural caution and illuminated master caution lights.
- (e) 767-300 AIRPLANES;  
In the event that flap load alleviation has occurred with flap retraction to 20-degree position and flaps do not extend to 25-degree or 30-degree position when the requirement for flap load alleviation does not exist any longer, the TE FLAP DISAGREE message will appear on EICAS display and the amber TRAILING EDGE light on P3 will come on. The TE FLAP DISAGREE message is a level B message and is accompanied by aural caution and illuminated master caution lights.
- (5) Uncommanded Motion (Flap Motion With No Flap Lever Command Or Flap Motion Opposite To Flap Lever Command)
  - (a) The flap failure protection system automatically shuts down flap operation when uncommanded motion occurs. The FSEU compares the flap lever position signal with the flap position signal from the flap/stab position module. When uncommanded flap motion is detected, the FSEU sends a signal to the flap fail protection and asymmetry relay (Fig. 9). The relay energizes the PDU bypass valve to close. This blocks hydraulic flow to the hydraulic motor. Instead, hydraulic fluid is ported back to the hydraulic return line which stops hydraulic flap operation.
  - (b) If an uncommanded motion condition is detected, a TE FLAP DISAGREE message will show on the EICAS display screen and the amber TRAILING EDGE light will come on (Fig. 20). The TE FLAP DISAGREE message is a level B message and is accompanied by aural caution and illuminated master caution lights.

- (c) When an uncommanded motion condition occurs, the TE FLAP DISAGREE message is accompanied by an advisory TE FLAP SHUTDOWN message to confirm that the trailing edge flap power drive unit bypass valve has moved to BYPASS.
- (d) The advisory TE FLAP SHUTDOWN message may appear by itself to indicate that the trailing edge flap power drive unit bypass valve is in BYPASS.
- (e) The advisory TE FLAP SHUTDOWN message will not appear if a TE FLAP ASYM message is present in EICAS.
- (f) The bypass valve will not return to its normally open position until the following conditions are met:
  - 1) The alternate control arming switch is turned on and then off.
  - 2) An uncommanded motion condition does not exist in the flap drive system.
- (6) Flap Lever/Flap Position Disagreement (No Flap Motion With Flap Lever Command) (Fig. 20).
  - (a) When a flap lever/flap position disagreement occurs, the TE flap PDU bypass valve remains in normal position (POS 2), and the TE FLAP DISAGREE message will appear on EICAS display and the amber TRAILING EDGE Light on P3 will come on. The TE FLAP DISAGREE message is a level B message and is accompanied by aural caution and illuminated master caution lights.
- (7) Flap Asymmetry (Fig. 23)
  - (a) The flap asymmetry system protects the flap system from an asymmetry condition.
    - 1) When an asymmetry condition is detected, the FSEU provides a ground to the TRAILING EDGE caution light and to the flap failure protection and asymmetry relay. The relay energizes the PDU bypass valve to the bypass condition, stopping hydraulic flow to the flap system. The FSEU also transmits a signal to the EICAS computer to display a TE FLAP ASYM message. The TE FLAP ASYM message is a level B message and is accompanied by aural caution and illuminated master caution lights.
- (8) Generation of FLAP/SLAT ELEC EICAS message
  - (a) For a description of the FLAP/SLAT ELEC EICAS message, refer to AMM 27-51-01/001, Flap/Slat Electronics Unit - Description and Operation.
- (9) Takeoff Configuration Warning
  - (a) If the slats and flaps are not in the takeoff position when takeoff thrust is selected on either engine, warnings will be sent to the flight deck requiring immediate action:
    - 1) The aural warning will sound.
    - 2) The red CONFIG warning light will illuminate.
    - 3) The two master warning lights on each side of the P7 panel will illuminate.
    - 4) A red EICAS FLAPS level A warning will appear on the flight compartment display screen.

(10) Control

(a) General

- 1) During maintenance, the flaps are normally operated with hydraulic power. Hydraulic power is required when rigging flap drive system components.

(b) Normal Operation

- 1) Provide electrical control power (AMM 24-22-00/201).

**WARNING:** CLEAR PERSONNEL AND EQUIPMENT FROM PATH OF FLAPS AND SLATS TO PREVENT INJURY OR DAMAGE.

**CAUTION:** BEFORE OPERATING FLAPS OR SLATS, ENSURE THAT ENGINE STRUT ACCESS DOORS, INBOARD FAN COWLING, AND THRUST REVERSER COWLING WILL NOT BE IN PATH OF SLATS, TO PREVENT DAMAGE.

- 2) Provide center system hydraulic power (AMM 29-11-00/201).
- 3) Extend the flap fully by placing the flap control lever in the 30-unit detent.

**NOTE:** It takes approximately 33-42 seconds to move the flaps from the FLAPS UP to the 30-unit position.

- 4) Retract the flap fully by placing the flap control lever in zero (FLAPS UP) detent.

**NOTE:** It takes approximately 33-42 seconds to move the flaps from the 30-unit to the FLAPS UP position.

(c) Alternate Operation

- 1) Provide electrical control power (AMM 24-22-00/201).
- 2) Press the ALTN TE arming switch to arm the alternate system. The white ALTN light will come on. After seven seconds, the TRAILING EDGE light and the TE FLAP DISAGREE message on EICAS will come on.

EFFECTIVITY

ALL

27-51-00

**WARNING:** CLEAR PERSONNEL AND EQUIPMENT FROM THE PATH OF THE FLAPS, THE FLAP DRIVE MECHANISMS AND THE WHEEL WELL TO PREVENT INJURY OR DAMAGE.

**CAUTION:** DO NOT OPERATE THE ALTERNATE DRIVE MOTOR CONTINUOUSLY FOR MORE THAN 4 MINUTES. DO NOT OPERATE THE MOTOR AGAIN UNTIL IT IS COOL FOR AT LEAST 20 MINUTES TO PREVENT DAMAGE TO THE MOTOR.

- 3) Extend the flap fully by turning the alternate flap/slat position selector switch to the 30-unit position. The TRAILING EDGE light and the TE FLAP DISAGREE message on EICAS will go out.

**NOTE:** It takes approximately 4 minutes to move the flaps from the UP to the 30-unit position.

- 4) Retract the flap fully by turning the alternate flap/slat position selector switch to the UP position.

**NOTE:** It takes approximately 4 minutes to move the flaps from the 30-unit to the UP position.

- 5) Turn off the alternate flap system by turning the flap/slat position selector switch to the NORM position. The TRAILING EDGE light and the TE FLAP DISAGREE message on EICAS will come on after seven seconds.

- 6) Press the ALTN TE arming switch to disarm the alternate flap drive system (switch light off). The TRAILING EDGE light and the TE FLAP DISAGREE message on the EICAS will go out.

TRAILING EDGE FLAP SYSTEM – MAINTENANCE PRACTICES

1. General

A. This procedure contains six tasks:

- Trailing Edge Flap Deactivation
- Trailing Edge Flap Activation
- Extend the Trailing Edge Flaps with Primary or Alternate Power
- Retract the Trailing Edge Flaps with Primary or Alternate Power
- Manually extend and retract the TE Flaps without Airplane Power
- Operate the TE Flaps without Movement of the Leading Edge Slats.

B. If the overload indicator on the TE flap rotary actuator trips during normal operation of the flaps, reset the overload indicator and operate the flaps for one full cycle.

If the overload indicator does not trip again, the system is O.K. If the overload indicator trips again without the "TE FLAP DISAGREE" or "TE FLAP ASYM" EICAS message shown on the display in the flight compartment, the system is OK; reset the overload indicator and adjust the indicator to the correct spring tension if it is necessary (Fig. 203).

If the overload indicator trips with the "TE FLAP DISAGREE" or "TE FLAP ASYM" EICAS message shown on the display in the flight compartment, examine the flap linkages operated by the rotary actuator with the tripped indicator for damage or jammed condition. If you cannot find the cause of the problem, examine the flap drive linkages operated by the other seven rotary actuators (two for each flap) for damaged or jammed condition. Correct the problem as necessary.

TASK 27-51-00-042-002

2. Trailing Edge Flap Deactivation

A. Equipment

- (1) TE Flap PDU Lock – A27009-7
- (2) Circuit Breaker Lockout Clip, Commercially Available

B. References

- (1) AMM 24-22-00/201, Electrical Power – Control
- (2) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems
- (3) AMM 32-00-15/201, Landing Gear Door Lock
- (4) AMM 32-00-20/201, Landing Gear Downlock

C. Access

(1) Location Zones

144	Right MLG Wheel Well
211/212	Control Cabin
730/740	Main Landing Gear and Doors

D. Flap System Deactivation (Fig. 201)

S 212-003

- (1) Make sure the landing gear downlocks are installed (AMM 32-00-20/201).

S 492-004

**WARNING:** MAKE SURE THAT THE DOOR LOCKS FOR THE MAIN LANDING GEAR ARE INSTALLED. IF THE DOOR LOCKS ARE NOT INSTALLED CORRECTLY, THE DOOR CAN CLOSE QUICKLY AND CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Open the main gear doors and install the door locks (AMM 32-00-15/201).

S 212-005

- (3) If the flap alternate drive is armed (ALTN switch light on), make sure the position selector switch for the flap/slat alternate drive on the first officer's main instrument panel, P3, agrees with the flap position on Table 201.  
(a) Install a DO-NOT-OPERATE tag on the position selector switch.

S 212-006

- (4) If the flap alternate drive is not armed (ALTN switch light off), make sure the position on the flap control lever agrees with the flap position on Table 201.  
(a) Install a DO-NOT-OPERATE tag on the flap control lever.

S 862-007

- (5) Open these circuit breakers on the main power distribution panel, P6, and attach circuit breaker locks and DO-NOT-CLOSE tags:  
(a) 6D21, ALTN SLAT INBD PWR  
(b) 6D24, ALTN FLAP PWR  
(c) 6F24, ALTN SLAT OUTBD PWR

S 862-008

- (6) Open these circuit breakers on the overhead panel, P11, and attach circuit breaker locks and DO-NOT-CLOSE tags:  
(a) 11H23, SLAT ALTN CONT INBD  
(b) 11H24, SLAT ALTN CONT OUTBD  
(c) 11J24, FLAPS ALTN CONT

27-51-00

- S 862-009
- (7) Remove the power from the center hydraulic system if it is not necessary (AMM 29-11-00/201).
- S 862-109
- (8) If the power from the center hydraulic system is necessary to operate other systems, move the manual override lever on the PDU bypass valve to the No. 1 (bypass) position and attach a DO-NOT-OPERATE tag:
- S 492-010
- (9) Install the PDU lock in the TE flap PDU (Fig. 202).
- S 862-055
- (10) Remove electrical power if it is not necessary (AMM 24-22-00/201).

TASK 27-51-00-442-001

3. Trailing Edge Flap Activation

A. References

- (1) AMM 24-22-00/201, Electrical Power - Control  
(2) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems  
(3) AMM 32-00-15/201, Landing Gear Door Lock

B. Access

- (1) Location Zones
- |         |                             |
|---------|-----------------------------|
| 144     | Right MLG Wheel Well        |
| 211/212 | Control Cabin               |
| 730/740 | Main Landing Gear and Doors |

C. Flap System Activation (Fig. 201)

- S 212-126
- (1) Make sure the landing gear downlocks are installed.
- S 212-127
- (2) Make sure the door locks for the main gear are installed.
- S 212-011
- (3) If the flap alternate drive is armed (ALTN switch light on), make sure the position selector switch for the flaps/slats alternate drive on the first officer's main instrument panel, P3, agrees with the flap position on Table 201.

TASK 27-51-00-862-056

4. Extend the Trailing Edge (TE) Flaps with Primary or Alternate Power

A. General

- (1) This task contains the instructions to extend the trailing edge (TE) flaps with primary hydraulic power, or with alternate electric power (Fig. 201 and Fig. 202). Only do the steps that is applicable to your maintenance.

B. References

- (1) AMM 24-22-00/201, Electrical Power - Control  
(2) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems

C. Access

- (1) Location Zones  
144 Right MLG Wheel Well  
211/212 Control Cabin

D. Extension of the TE Flaps with Primary (Hydraulic) Power (Fig. 201)

NOTE: Refer to Table 201 to do this procedure.

S 212-048

- (1) Make sure that the positions of the flaps and slats agree with the position of the flap control lever (Table 201).

S 212-049

- (2) Make sure the PDU locks for the TE flap PDU and the LE slat PDUs are not installed.

S 862-050

- (3) Supply electrical power (AMM 24-22-00/201).

S 862-022

WARNING: KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

CAUTION: MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. MAKE SURE THE THRUST REVERSER HALVES ARE CLOSED. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (4) Pressurize the center hydraulic system and reservoir (AMM 29-11-00/201).

EFFECTIVITY

ALL

27-51-00

04

Page 209  
Aug 22/06

S 862-051

- (5) Move the flap control lever to a detent (Detail B, Fig. 201) and permit the TE flaps and the LE slats to get to the positions that you set on the flap control lever.

E. Extension of the TE Flaps with Alternate (Electric) Power (Fig. 201)

NOTE: Refer to Table 201 to do this procedure.

S 212-057

- (1) Make sure that the positions of the flaps and slats agree with the position of the flap control lever (Table 201).

S 212-058

- (2) Make sure that the positions of the flaps and slats agree with the position of the position selector switch for the flap/slat alternate drive on the first officer's main instrument panel, P3 (Table 201).

S 212-059

- (3) Make sure the PDU locks for the TE flap PDU and the LE slat PDUs are not installed.

S 212-133

- (4) Make sure these circuit breakers are closed on the overhead panel, P11:
  - (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD
  - (c) 11J24, FLAPS ALTN CONT

S 212-134

- (5) Make sure these circuit breakers are closed on the main power distribution panel, P6:
  - (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6D24, ALT FLAP PWR
  - (c) 6F24, ALTN SLAT OUTBD PWR

S 212-131

- (6) Make sure these circuit breakers are closed on the overhead panel, P11:
  - (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD
  - (c) 11J24, FLAPS ALTN CONT

S 212-132

- (7) Make sure these circuit breakers are closed on the main power distribution panel, P6:
  - (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6D24, ALT FLAP PWR
  - (c) 6F24, ALTN SLAT OUTBD PWR

EFFECTIVITY

ALL

27-51-00

03

Page 210  
Aug 22/06

- S 862-060
- (8) Supply electrical power (AMM 24-22-00/201).
- S 212-061
- (9) Make sure the arming switches (in the flight compartment) for the flap and slat alternate drives are not in the armed position (ALTN switch lights are off).
- S 862-062
- (10) Push the TE arming switch for the flap alternate drive to arm the flap alternate drive (ALTN switch light comes on).
- S 212-063
- (11) Make sure that the TRAILING EDGE light (in the flight compartment) comes on and the EICAS display shows the "TE FLAP DISGREE" message after seven seconds.
- S 212-064
- (12) Do a check to see that the bypass valve on the TE flap PDU (in the right wheel well) moves from the No. 2 (normal) position to the No. 1 (bypass) position.
- S 862-065

**CAUTION:** DO NOT OPERATE THE ALTERNATE DRIVE MOTOR CONTINUOUSLY FOR MORE THAN 4 MINUTES. DO NOT OPERATE THE MOTOR AGAIN UNTIL IT IS COOL FOR AT LEAST 20 MINUTES TO PREVENT DAMAGE TO THE MOTOR.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. MAKE SURE THE THRUST REVERSER HALVES ARE CLOSED. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (13) Operate the position selector switch (on the P3 panel) for the flap/slat alternate drive to extend the TE flaps (Table 201). Make sure the TRAILING EDGE light goes off, and the TE FLAP DISAGREE message does not show on the EICAS display.

**NOTE:** The LE amber light will go on and the LE SLAT DISAGREE message will show on the EICAS. This is because the LE slats are not armed and thus do not move.

EFFECTIVITY

ALL

27-51-00

- (14) Make sure the flap control lever is placed in the detent to agree with the selected position of the alternate flap/slat drive position selector (Figure 201).

TASK 27-51-00-862-067

5. Retract the Trailing Edge (TE) Flaps with Primary or Alternate Power

A. General

- (1) This task contains the instructions to retract the trailing edge (TE) flaps by primary hydraulic power, or by alternate electric power (Fig. 201 and Fig. 202). Only do the steps that is applicable for your maintenance.

B. References

- (1) AMM 24-22-00/201, Electrical Power - Control
- (2) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems

C. Access

- (1) Location Zones

144	Right MLG Wheel Well
211/212	Control Cabin

D. Retraction of the TE Flaps with Primary (Hydraulic) Power (Fig. 201)

NOTE: Refer to Table 201 to do this procedure.

S 212-069

- (1) Make sure that the positions of the flaps and slats agree with the position on the flap control lever (Table 201).

S 212-068

- (2) Make sure the PDU locks for the TE flap PDU and the LE slats PDUs are not installed.

S 362-070

- (3) Supply electrical power (AMM 24-22-00/201).

Apr 22/09

S 862-071

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, FLAPS, SLATS, SPOILERS, RUDDER, ELEVATORS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. MAKE SURE THE THRUST REVERSER HALVES ARE CLOSED. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (4) Pressurize the center hydraulic system and reservoir (AMM 29-11-00/201).

S 862-072

- (5) Move the flap control lever to the zero (FLAPS UP) detent and make sure that the TE flaps and the LE slats move to the fully retracted position.

E. Retract the TE Flaps with Alternate (Electric) Power (Fig. 201)

**NOTE:** Refer to Table 201 to do this procedure.

S 212-129

- (1) Make sure that the positions of the flaps and slats agree with the position of the flap control lever (Table 201).

S 212-075

- (2) Make sure the positions of the flaps and slats agree with the position on the position selector switch for the flap/slat alternate drive on the first officer's main instrument panel, P3 (Table 201).

S 212-076

- (3) Make sure the PDU locks for the TE flap PDU and the LE slat PDUs are not installed.

S 212-083

- (4) Make sure these circuit breakers are closed on the overhead panel, P11:
- (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD
  - (c) 11J24, FLAPS ALTN CONT

EFFECTIVITY

ALL

27-51-00

02

Aug 22/06

S 212-084

- (5) Make sure these circuit breakers are closed on the main power distribution panel, P6:
- (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6D24, ALT FLAP PWR
  - (c) 6F24, ALTN SLAT OUTBD PWR

S 862-077

- (6) Supply electrical power (AMM 24-22-00/201).

S 862-085

- (7) If the flap alternate drive is not armed (ALTN switch light off), push the TE arming switch (in the flight compartment) to arm the flap alternate drive (ALTN switch light comes on).

S 862-124

**CAUTION:** DO NOT OPERATE THE ALTERNATE DRIVE MOTOR CONTINUOUSLY FOR MORE THAN 4 MINUTES: DO NOT OPERATE THE MOTOR AGAIN UNTIL IT IS COOL FOR AT LEAST 20 MINUTES TO PREVENT DAMAGE TO THE MOTOR.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. MAKE SURE THE THRUST REVERSER HALVES ARE CLOSED. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (8) Turn the position selector switch for the flap/slat alternate drive to the UP detent, and make sure the flaps move to the fully retracted position.

**NOTE:** The flap movement is not as accurate when the flaps are retracted by the flap alternate drive. Flap movement with electrical power has a greater position tolerance than the flap movement with the use of hydraulic power. The flap position indicator should remain in the white band except at flaps 30 in alternate electric drive.

S 862-123

- (9) Turn the position selector switch to the NORM detent, and make sure the TRAILING EDGE light comes on, and the TE FLAP DISAGREE message shows on the EICAS display.

S 862-080

- (10) Push the TE arming switch for the flap alternate drive to disarm the flap alternate drive (ALTN switch light goes off).

S 212-081

- (11) Make sure that the TRAILING EDGE light on the P3 panel is off and the TE FLAP DISAGREE message is not shown on the EICAS.

S 212-082

- (12) Do a check to see that the bypass valve on the TE flap PDU (in the right wheel well) moves from the No. 1 (bypass) position to the No. 2 (normal) position.

S 212-138

- (13) Make sure the flap control lever is placed in the flaps up detent to agree with the selected position of the alternate flap/slat drive position selector (Figure 201).

TASK 27-51-00-862-087

6. Manually Extend and Retract the Trailing Edge Flaps without Airplane Power

A. General

- (1) This task contains the instructions to manually extend and retract the inboard and/or the outboard flaps when airplane power is not available.
- (2) Follow these instructions carefully. You can manually move the flaps away from the position that is set on the flap control lever on the position selector switch. The flaps will automatically move back to the commanded position when hydraulic or electrical power is supplied.

B. Equipment

- (1) Circuit Breaker Lockout Clip Commercially Available
- (2) Adapter - Flap Drive - A27102-7
- (3) Air Motor with a 1/2-inch drive - commercially available

C. References

S 862-097

**CAUTION:** MAKE SURE YOU MOVE THE MANUAL OVERRIDE LEVER ON THE PDU BYPASS VALVE TO POSITION 1 (BYPASS) BEFORE YOU MANUALLY OPERATE THE FLAPS. IF THE BYPASS VALVE IS NOT IN POSITION 1, HYDRAULIC FLUID WILL NOT BYPASS IN THE TE FLAP PDU, AND MAY CAUSE DAMAGE TO THE PDU.

- (9) Move the manual override lever on the flaps PDU to position 1 (bypass), and install a DO-NOT-OPERATE tag on the manual override lever (Fig. 202).

F. Manually Operate the Inboard/Outboard Flaps (Fig. 204)

**NOTE:** Use the A27102-7 flap drive adapter to manually operate the flaps in this procedure.

S 422-098

- (1) To manually operate the flaps, put the flap drive adapter in the PDU drive (Detail A).

S 422-099

**CAUTION:** DO NOT USE AN AIR MOTOR WITH AN OUTPUT GREATER THAN 500 POUND-INCHES TO PREVENT DAMAGE TO THE PDU.

**CAUTION:** DO NOT PERMIT THE ROTARY ACTUATOR TO HIT THE EXTEND OR RETRACT OVERTRAVEL STOPS AT FAST SPEED, TO PREVENT DAMAGE TO THE AIRPLANE.

- (2) Attach an air motor to the flap drive adapter, and move the flaps to the necessary position.

S 022-100

- (3) Remove the flap drive adapter and the air motor from the airplane.

G. Put the Airplane Back to its Usual Condition

S 862-101

**WARNING:** MAKE SURE THE PRESSURE IS REMOVED FROM THE CENTER HYDRAULIC SYSTEM BEFORE YOU PUT THE MANUAL OVERRIDE LEVER BACK TO THE POSITION 2 (NORMAL). THE SLATS CAN MOVE ACCIDENTALLY WHEN THE CENTER HYDRAULIC SYSTEM IS PRESSURIZED, AND CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (1) Make sure the pressure is removed from the center hydraulic system and reservoir (AMM 29-11-00/201).

S 862-102

- (2) Remove the DO-NOT-OPERATE tags, and move the manual override lever on the flap PDU to position 2 (normal) (Fig. 202).

S 862-103

- (3) Remove the circuit breaker locks and DO-NOT-CLOSE TAGS, and close these circuit breakers on the P11 panel:
- (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD
  - (c) 11J24, FLAPS ALTN CONT

S 862-104

- (4) Remove the circuit breaker locks and DO-NOT-CLOSE tags, and close these circuit breakers on the P6 panel:
- (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6D24, ALTN FLAP PWR
  - (c) 6F24, ALTN SLAT OUTBD PWR

S 862-105

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM THE FLAPS , WHEEL WELLS AND FLAP DRIVE SYSTEMS IN THE STEP THAT FOLLOWS. THE FLAPS WILL MOVE QUICKLY TO THE POSITION SET ON THE FLAP CONTROL LEVER WHEN THE CENTER HYDRAULIC SYSTEM IS PRESSURIZED. ACCIDENTAL FLAP MOVEMENT CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. MAKE SURE THE THRUST REVERSER HALVES ARE CLOSED. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (5) Pressurize the center hydraulic system (AMM 29-11-00/201), and permit the flaps to move the position set on the flap control lever.

S 862-031

- (6) Open this circuit breaker on the overhead panel, P11, and attach a circuit breaker lock and a DO-NOT-CLOSE tag:
- (a) 11J14, FLAP SHUTOFF

S 862-033

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. MAKE SURE THE THRUST REVERSER HALVES ARE CLOSED. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (7) Pressurize the center hydraulic system and reservoir (AMM 29-11-00/201).

S 862-034

- (8) If you want to extend the TE flaps to the 25 or 30 unit detent, first move the flap control lever to the 1-unit detent and make sure that the LE slats do not move.

S 862-108

- (9) Move the flap control lever to the necessary position. Make sure that the TE flaps move to the position in Table 201.

S 492-035

- (10) Attach DO-NOT-OPERATE tags on the flap control lever, the arming switches and the position selector switch for the flap/slat alternate drive .

S 862-036

- (11) Remove the power from the center hydraulic system if it is not necessary (AMM 29-11-00/201).

EFFECTIVITY

ALL

27-51-00

S 042-037

- (12) Do the deactivation procedure for the TE flaps (Ref this subject) and the LE slats (AMM 27-81-00/201) when necessary.

**NOTE:** Use the PDU locks for the inboard and outboard LE slat PDUs. Do not use the "activation" or "Put the Airplane Back to Its Usual Condition" paragraph for this step.

S 862-038

- (13) Do these steps to extend and retract the LE slats to agree with the position on the flap control lever, if necessary:
- (a) Remove the PDU locks from the LE slat PDUs, if the PDU locks were installed (AMM 27-81-00/201).
  - (b) Remove the DO-NOT-CLOSE tags and the circuit breaker locks and close these circuit breakers on the P11 panel:
    - 1) 11H23, SLAT ALTN CONT INBD
    - 2) 11H24, SLAT ALTN CONT OUTBD
  - (c) Push the LE arming switch for the slat alternate drive to disarm the slat alternate drive (ALTN switch light goes off).

**WARNING:** KEEP PERSONS AND EQUIPMENT CLEAR FROM THE LEADING EDGE SLATS TO PREVENT INJURY AND DAMAGE. THE LEADING EDGE SLATS WILL MOVE WHEN THE CENTER HYDRAULIC SYSTEM IS PRESSURIZED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. MAKE SURE THE THRUST REVERSER HALVES ARE CLOSED. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (d) Pressurize the center hydraulic system (AMM 29-11-00/201) and make sure that the LE slats move to the position on the flap control lever.
  - (e) Remove the power from the center hydraulic system if it is not necessary (AMM 29-11-00/201).
- F. Put the Airplane Back to Its Usual Condition

S 442-039

- (1) Do the steps that follow to activate the LE slats and TE flaps, if necessary :
- (a) Remove the power from the center hydraulic system (AMM 29-11-00/201).
  - (b) If installed, remove the PDU locks from the inboard and outboard LE slat PDUs (AMM 27-81-00/201).
  - (c) Install the access panels (AMM 06-44-00/201).
  - (d) If installed, remove the PDU locks from the TE flap PDU.

TRAILING EDGE FLAP SYSTEM – ADJUSTMENT/TEST

1. General

- A. This procedure contains the tasks for the adjustment and system tests for the trailing edge (TE) flap system:
- (1) Trailing Edge Flap System – Adjustment
  - (2) Flap Slat Electronics Unit (FSEU) – Test
  - (3) Flap/Stabilizer Position Module (FSPM) – Test
  - (4) Flap Control Lever Load – Test
  - (5) Flap and Slat Primary Drives and Position Indicating Systems – Test
  - (6) Flap Alternate Power and Drive – Test
  - (7) Flap Asymmetry Protection System – Test
  - (8) AIRPLANES WITH A -53 OR EARLIER FSEU;  
– Flap Load Alleviation System – Test
  - (9) Flap Failure Protection System – Test
  - (10) Electrical Power Failure – Test
  - (11) FSEU Power Failure – Test
  - (12) Flap/Slat Shutoff Valve Module – Test
  - (13) AIRPLANES WITH A -63 FSEU;  
– Flap Load Relief Actuator – Test  
– Flap Load Relief System – Test  
– Sensor Check – Test
- B. For a complete SYSTEM TEST of the TE flap system, it is necessary to do all the tests that are in this procedure.
- C. For a complete OPERATIONAL TEST of the TE flap system, it is only necessary to do these tests within this procedure:
- Flap/Slat Electronics Unit (FSEU) – Test
  - Flap/Stabilizer Position Module (FSPM) – Test
  - Flap and Slat Primary Drives and Position Indicating Systems – Test
  - Flap Alternate Power and Drive – Test
  - Flap Failure Protection System – Test
- D. The test for the flap and slat primary drives is a test of the function of these components:
- The leading edge (LE) slats
  - The krueger seal flap
  - The position indicating system for the TE flaps and LE slats
  - The flap/slat shutoff valve module.
- Thus, if you do all the steps in the flap and slat primary drive test, then it is not necessary to do the "Flap/Slat Shutoff Valve Module – Test" task at the end of this procedure.
- E. Refer to AMM 31-51-00/501, Warning System, for a system test of the TE flap takeoff warning.
- F. Refer to AMM 27-81-00/601, for a complete system check of the flap/slat inhibit system (extend and retract interlock).

TASK 27-51-00-825-001

2. Trailing Edge Flap System - Adjustment

A. General

(1) This task contains the adjustment procedure for the trailing edge (TE) flap drive, which contains these topics:

- Flap Control Cables - Adjustment
- Flap PDU (Power Drive Unit) - Adjustment
- Flap Extend Overtravel Stop Clearance - Adjustment
- Flap Retract Overtravel Stop Clearance - Adjustment
- Inboard Flap Retract Overtravel Stop RIG Position - Adjustment
- Outboard Flap Retract Overtravel Stop RIG Position - Adjustment
- Flap Synchronization - Adjustment

To start one of these adjustment procedures, do the steps in the "Prepare for the Adjustment" paragraph, then do the applicable adjustment procedure. Follow the instructions in the "Put the Airplane Back to Its Usual Condition" paragraph after you completed the necessary adjustment.

(2) Refer to AMM 27-51-26/401 to adjust the RVDT for the flap control lever.

TE Flap Torque Tube (Left Wheel Well)  
Figure 504

EFFECTIVITY	ALL
-------------	-----

27-51-00

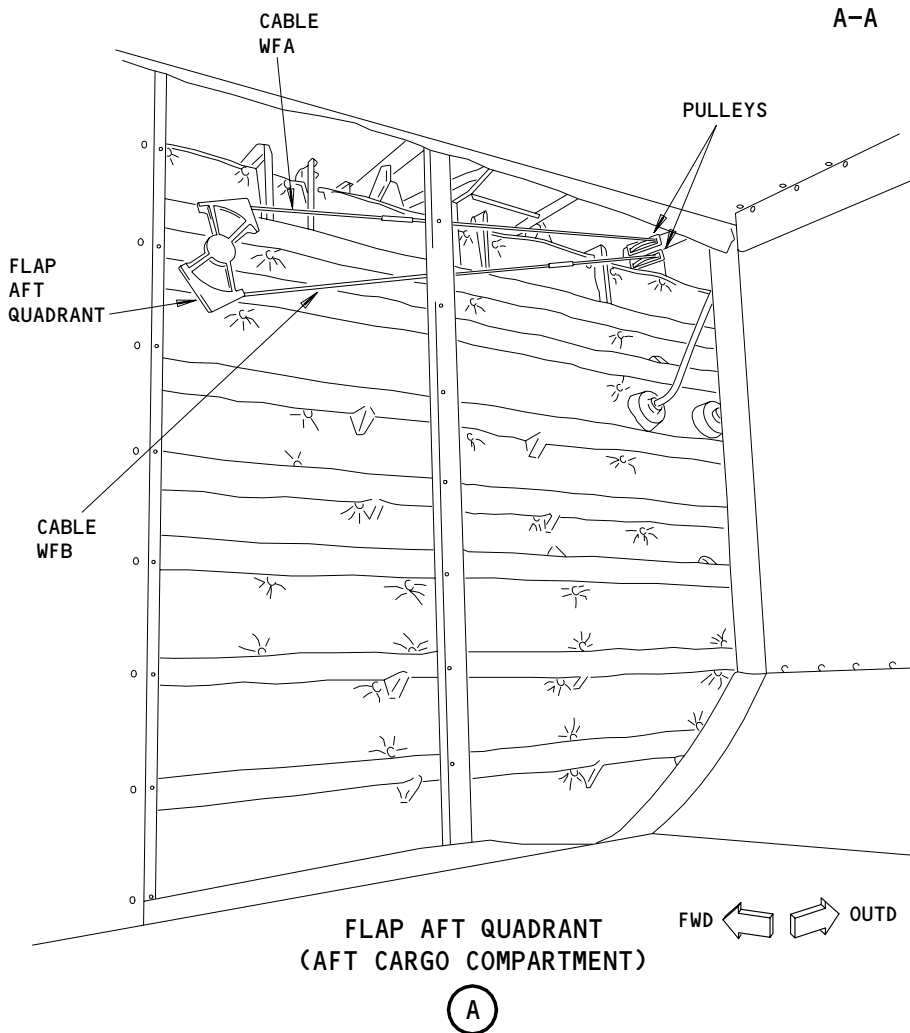

- (3) Refer to AMM 27-51-45/201 to adjust the flap position transmitters.
- (4) The flap drive system between the flap control lever and the TE flap PDU is correctly adjusted when these conditions are satisfactory:
  - (a) The cable tension is in the limits given by the temperature tension chart (Fig. 502)
  - (b) With the aft edge of the flap control level pawl set 0.15 to 0.16 inch (3.81-4.06 mm) aft of the aft upper edge of the zero (FLAPS UP) detent:
    - 1) The rig pin LE1 installs freely into the rig pin hole on the slat aft quadrant. (Detail B, Fig. 501).
    - 2) The flap aft quadrant crank is against its UP stop (Detail D, Fig. 501).
  - (c) With the flap control lever in the zero (FLAPS UP) detent and the power supplied in the center hydraulic system:
    - 1) The rig pins TE1 (Detail E, Fig. 501) and TE2 (Detail G, Fig. 501) install freely into the input and follow-up cam on the TE flap PDU.
- (5) The flap drive system between the TE flap PDU and the rotary actuators is correctly adjusted if these conditions are satisfactory:
  - (a) With the TE flaps fully retracted (zero detent on the flap control lever) by hydraulic power, the clearances for the retract overtravel stop at all eight rotary actuator crank arms must agree with:
    - 1) The clearance specified in Fig. 507 for the inboard flap

Overload Trip Indicator  
Figure 513

EFFECTIVITY	ALL

27-51-00

- 2) The clearance specified in Fig. 508 for the outboard flap.
- (b) With the TE flaps fully extended (30 unit detent on the flap control lever) by hydraulic power, the clearance for the extent overtravel stop at all eight rotary actuator crank arms must agree with:
  - 1) The clearance specified in Fig. 507 for the inboard flap
  - 2) The clearance specified in Fig. 508 for the outboard flap.
- (6) The airplane must be on the landing gear with all the engines or engine weights installed before you can do the flap drive system adjustment.
- (7) If the overload indicator on the TE flap rotary actuator is tripped, reset the overload indicator and operate the flaps for one full cycle.

If the overload indicator does not trip again, the system is OK. If the overload indicator trips again without the "TE FLAP DISAGREE" or "TE FLAP ASYM" EICAS message shown on the EICAS, the system is OK: reset the overload indicator and adjust the indicator to the correct spring tension if it is necessary (Fig. 513).

If the overload indicator trips with the "TE FLAP DISAGREE" or "TE FLAP ASYM" message shown on the EICAS, examine the flap linkages operated by the rotary actuator with the tripped indicator for damage or jammed condition. If you cannot find the cause of the problem, examine the flap linkages operated by the other seven rotary actuators in the flap drive (two for each flap) for damaged or jammed condition. Correct the problem as necessary.

#### B. Equipment

- (1) Rig Pins from Set A20004-XX (AMM 20-10-24/201):
  - (a) TE1 - P/N A20004-9
  - (b) TE2 - P/N A20004-9
  - (c) TE3 - P/N A20004-73
  - (d) TE4 - P/N A20004-7
  - (e) LE1 - P/N A20004-17
- (2) Leading Edge Slat Groundlock - A27007-1  
(2 necessary)
- (3) Circuit Breaker Lockout Clip  
Commercially Available
- (4) Circuit Breaker Lock Set (4 necessary)
- (5) TE Flap PDU Lock - A27009-7
- (6) Clamp, TE Flap Drive Shaft - A27099-1 (2 clamps in set)
- (7) Auxiliary Detent, Flap Adjustment Assy - A27105-9
- (8) Support for the Trailing Edge of the TE Flap

**NOTE:** The support must be sufficient to hold the weight of the trailing edge such that the TE flaps cannot move down while the torque tubes are disconnected from the PDU.

- (2) Access panels
  - 195JL/196JR Left/Right Inboard Flap Mechanism
  - 511BB/611BB LE Slat Power Drive Units

F. Prepare for the Adjustment

S 215-002

- (1) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

**NOTE:** The airplane must be on the landing gear with all the engines or engine weights installed before you can do the flap drive system adjustment.

S 495-003

**WARNING:** USE PROCEDURE AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Open the doors for the landing gear and install the door locks (AMM 32-00-15/201).

S 215-015

- (3) Make sure the TE flaps and the LE slats are in the fully retracted position (AMM 27-51-00/201).

S 215-016

- (4) Make sure the flap control lever is in the zero (FLAPS UP) detent (Fig. 511).

S 495-017

- (5) Install a DO-NOT-OPERATE tag on the flap control lever.

S 865-018

- (6) Remove the power from the center hydraulic system (AMM 29-11-00/201).

S 045-019

- (7) Do the deactivation procedure that follows on the TE flaps for ground maintenance:
  - (a) Open these circuit breakers on the overhead panel, P11, and install circuit breaker locks and DO-NOT-CLOSE tags:
    - 1) 11H23, SLAT ALTN CONT INBD

EFFECTIVITY

ALL

27-51-00

- 2) 11H24, SLAT ALTN CONT OUTBD
  - 3) 11J14, FLAP SHUTOFF
  - 4) 11J24, FLAPS ALTN CONT
- (b) Open these circuit breakers on the main power distribution panel, P6, and install circuit breaker locks and DO-NOT-CLOSE tags:
- 1) 6D21, ALTN SLAT INBD PWR
  - 2) 6D24, ALTN FLAP PWR
  - 3) 6F24, ALTN SLAT OUTBD PWR

G. Flap Control Cables - Adjustment

S 825-004

- (1) Do these steps before you do the final adjustment if you installed new cables (Fig. 501):
- (a) Install rig pin LE1 in slat aft quadrant (Detail B).
  - (b) Make sure the flap control lever is in the zero (FLAPS UP) detent.
  - (c) Install a clamp to hold the aft quadrant crank against its full upstop (Detail D).
  - (d) Tighten the cables WFA and WFB at the turnbuckles (Fig. 506) to approximately twice the value shown in the temperature-tension table (Fig. 502).
  - (e) Remove rig pin LE1 from the slat aft quadrant.
  - (f) Remove the clamp from the aft quadrant crank.
  - (g) Move the flap control lever 20 to 30 times through its full travel to operate the cables.
  - (h) Install the tool (auxiliary detent assembly) on the flap detent plate.
  - (i) Move the flap control lever to the auxiliary detent, which is 2 degrees aft of the zero (FLAPS UP) detent as shown in Fig. 506.

**NOTE:** Using the auxiliary detent is the same as the aft edge of the flap control lever pawl set 0.15 to 0.16 inch (3.81-4.06 mm) aft of the aft upper edge of the zero (flaps up) detent.

- (j) Install rig pin LE1 in the slat aft quadrant.

**NOTE:** Keep rig pin LE1 installed in the slat aft quadrant for the final cable adjustment.

- (k) Keep the aft quadrant crank against the upstop and decrease the tension in the cables WFA and WFB equally to the value shown in Fig. 502.

EFFECTIVITY

ALL

27-51-00

09

Page 524  
Dec 22/01

S 825-020

- (2) Make the final cable adjustments with the steps that follow:  
(a) Make sure the flap control lever is in the auxiliary detent.

NOTE: Do not permit the flap control lever to move back to the zero detent during the final adjustments, or the adjustment will be incorrect.

- (b) If not installed, install rig pin LE1 to the slat aft quadrant (Detail B, Fig. 501) and make sure you can get these conditions to agree:

NOTE: Lightly shake the cables to remove the friction from the cables and to release the tension in the components.

- 1) Make sure the aft quadrant crank for the TE flap touches the upstop (Detail D).

NOTE: It is not necessary to apply force against the upstop.

- 2) Make sure you can turn rig pin LE1 easily in the rig pin hole on the slat aft quadrant (Detail B).

NOTE: Do not remove rig pin LE1 until you complete the adjustment.

- 3) Make sure the tension in the cables WFA and WFB at forward and aft of the slat aft quadrant agrees with the values in Fig. 502.

- (c) If you cannot get the correct tension on the cables, adjust the cables at the turnbuckle as necessary.  
(d) Install the turnbuckle lock clips if you adjusted the cables at the turnbuckles.  
(e) Remove rig pin LE1 from the slat aft quadrant.  
(f) Remove the tool (auxiliary detent assembly) from the flap detent plate.  
(g) Move the flap control lever to the zero (flaps UP) detent.

H. TE Flap PDU - Adjustment

S 215-021

- (1) Make sure the distance between the bolt hole centers of the flap load relief actuator is correct (Detail D, Fig. 501).

S 215-022

- (2) Make sure that the aft quadrant crank for the TE flap touches the upstop (Detail D).

EFFECTIVITY

ALL

27-51-00

08

Page 525  
Apr 22/01

S 495-023

- (3) Hold the weight of the flaps at the trailing edge.

**NOTE:** A support is necessary to hold the weight of the trailing edge. The weight of the flaps can cause a disconnected torque tube to turn and move the flap drive out of the correct adjustment. This will cause the flap drive to be out of symmetry.

S 495-024

- (4) Install the clamps on the torque tubes adjacent to the TE flap PDU (Fig. 509).

S 035-025

- (5) Disconnect the torque tubes adjacent to the TE flap PDU (AMM 27-51-41/401).

**NOTE:** Make a mark on the torque tubes to identify the flaps' fully retracted position. Do not turn the disconnected torque tube.

S 035-005

- (6) Disconnect the control rod from the pilot input arm (Detail E, Fig. 501).

S 825-006

- (7) Do a hydraulic null check on the TE flap PDU with the steps that follow:
- (a) Remove the plugs from the control unit to get to rig pin hole TE1 (Detail E) for the input cam, and rig pin hole TE2 (Detail G) for the follow-up cam.
  - (b) Install rig pin TE1 in the rig pin hole on the input cam.
  - (c) Open the access panels, 511BB and 611BB, to get access to the outboard and inboard slat PDUs (AMM 06-44-00/201).
  - (d) At the outboard and inboard slat PDUs, move the manual override lever on each PDU bypass valve to the No. 1 (bypass) position (AMM 27-81-11/401).
  - (e) Install the groundlocks in the inboard and outboard slat PDUs (AMM 27-81-00/201).
  - (f) At the TE flap PDU, make sure you can connect the adjustable control rod (Detail E) to the pilot input arm, such that the control rod bolt and rig pin TE1 can be free to turn.
  - (g) Adjust the control rod as necessary if you cannot get the step before to agree.
  - (h) If you adjusted the control rod, tighten the jamnuts on the rod and safety it with lockwires.
  - (i) Connect the adjustable control rod to the pilot input arm with the control rod bolt, washer, and nut.

EFFECTIVITY

ALL

27-51-00

07

Page 526  
Apr 22/01

- (j) Remove rig pin TE1.
- (k) Open this circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:
  - 1) 11J14, FLAPS SHUTOFF.

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (l) Pressurize the center hydraulic system (AMM 29-11-00/201), and permit the TE flap PDU to become stable in the fully retracted position.

**NOTE:** It is usual for the output shaft to turn on the TE flap PDU when you pressurize the center hydraulic system.

- (m) Do a check to see that you can install rig pin TE2 fully and freely into the rig pin hole on the follow-up cam (Detail G, Fig. 501).
- (n) You can go directly to the "Do a check on the TE flap PDU adjustment" step if you can easily install rig pin TE2 into the follow-up cam.
- (o) You must use the instructions contained in the step that follows to adjust the PDU mechanical and hydraulic null if you cannot install rig pin TE2 easily into the follow-up cam.

S 825-007

- (8) Adjust the mechanical and hydraulic null for the TE flap PDU with the instructions that follow (Fig. 501):
  - (a) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).
  - (b) Disconnect the adjustable control rod from the control unit output arm (Detail E).

**NOTE:** This will permit free movement of the output shaft for the installation of rig pin TE2.

- (c) Turn the output shaft on the TE flap PDU by small increments until you can easily install rig pin TE2 (Detail G).

EFFECTIVITY

ALL

27-51-00

07

Page 527  
Apr 22/01

- (d) Connect the adjustable control rod to the control unit output arm.
- (e) Try to install rig pin TE3 (Detail E).
- (f) If you cannot install rig pin TE3 fully and easily, adjust the control rod between the control valve module and the control unit with these steps until you can install the rig pin.
  - 1) Loosen the jamnut at each end of the control rod.
  - 2) Turn the loose control rod to adjust the rod length.

**NOTE:** The usual length of the rod before the final adjustment is 6.56 inches (166.6 mm).

- 3) Install rig pin TE3.
  - 4) Tighten the jamnuts on the control rod, but do not install the lockwires.
- (g) Remove rig pins TE2 and TE3.

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (h) Pressurize the center hydraulic system (AMM 29-11-00/201) and permit the TE flap PDU to become stable at the fully retracted position.

**NOTE:** It is usual for the output shaft to turn on the TE flap PDU when you pressurize the center hydraulic system.

**CAUTION:** DO NOT DISCONNECT THE ADJUSTABLE CONTROL ROD TO DO ROD ADJUSTMENT WHILE THE CENTER HYDRAULIC SYSTEM IS PRESSURIZED. DO NOT ADJUST THE CONTROL ROD WITH THE RIG PIN TE2 INSTALLED. ADJUST THE ROD ONLY BY SMALL INCREMENTS TO PREVENT DAMAGE TO THE TE FLAP POWER DRIVE UNIT.

- (i) Try to install rig pin TE2 into the rig pin hole for the follow-up cam (Detail G).

EFFECTIVITY

ALL

27-51-00

06

Page 528  
Dec 22/01

- (j) If you cannot install rig pin TE2 easily, adjust the control rod between the control valve module and the control unit with the steps that follow:

NOTE: Do not adjust the control rod while rig pin TE2 is installed. Install rig pin TE2 only to make sure the rod is adjusted correctly.

- 1) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).
- 2) Loosen the jamnut at each end of the control rod.
- 3) Turn the loose control rod to adjust the rod length until rig pin TE2 can be easily installed.

NOTE: It is not necessary to install rig pin TE3 for this adjustment.

- (k) Tighten the jamnuts on the control rod and safety it with lockwires.
- (l) If installed, remove rig pin TE2 and install the plug in the rig pin hole.

S 215-008

- (9) Do a check on the TE flap PDU adjustment with these steps:
- (a) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).
  - (b) Remove the groundlocks from the inboard and outboard slat PDUs (AMM 27-81-00/201).
  - (c) Move the manual override levers on the (inboard and outboard slat PDU) bypass valves to the No. 2 (normal) position.
  - (d) Remove the clamps from the torque tubes adjacent to the TE flap PDU (Fig. 509).

NOTE: Do not turn the disconnected torque tube if the TE flaps is in the fully retracted position.

- (e) Make sure the TE flaps are in the fully retracted position.
- (f) Do these steps if the flaps are not in the fully retracted position:
- 1) Turn the torque tubes adjacent to the TE flap PDU to retract the flaps manually, or with an air motor and adapter F70300-1. Move the flaps to the fully retracted position.
  - 2) Do a check on the clearance at the retract overtravel stops with the procedure given in the "Adjustment for the Flap Retract Overtravel Stop Clearance" paragraph.

EFFECTIVITY

ALL

27-51-00

02

Page 529  
Apr 22/99

- (g) Connect the torque tube on each side of the TE flap PDU (AMM 27-51-41/401).

**NOTE:** If the flaps are in the fully retracted position, do not turn the torque tube. It will be necessary to adjust the flap drive again if you connected the torque tubes while the flaps are not in the fully retracted position.

- (h) Remove the support from the trailing edge.  
(i) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:  
1) 11J14, FLAPS SHUTOFF  
(j) Make sure the TE flaps and the LE slats are in the fully retracted position.  
(k) Make sure the flap control lever is in the zero (FLAPS UP) detent.  
(l) Remove the DO-NOT-OPERATE tag from the flap control lever.  
(m) Supply electrical power (AMM 24-22-00/201).

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (n) Pressurize the center hydraulic system (AMM 29-11-00/201).  
(o) Move the flap control lever to the 30-unit detent and make sure the TE flaps and the LE slats move to the fully extended position.  
(p) Move the flap control lever to the zero (FLAPS UP) detent and make sure the TE flaps and the LE slats move to the fully retracted position.  
(q) Install a DO-NOT-OPERATE tag on the flap control lever.  
(r) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).  
(s) Install the PDU lock on the TE flap PDU (Fig. 505).  
(t) Install the groundlocks on the inboard and outboard slat PDUs (AMM 27-81-00/201).  
(u) Do a check to see that rig pin TE1 installs freely in TE flap PDU.

EFFECTIVITY

ALL

27-51-00

WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

(6) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 865-009

(7) Move the flap control lever to the 30-unit detent and permit the flaps to move to the fully extended position.

**NOTE:** After the flaps moved to the fully extended position, stop for one minute before you do the next step.

S 865-032

(8) Move the flap control lever to the 15-unit detent and permit the flaps to move to the 15-unit position.

S 865-033

(9) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).

S 975-012

**WARNING:** DO NOT MOVE THE FLAP CONTROL LEVER WHEN YOU MEASURE THE OVERTRAVEL STOP CLEARANCES IN THE STEP THAT FOLLOWS. THE MOVEMENT OF THE FLAP CONTROL LEVER DURING THIS OPERATION CAN CAUSE INJURY TO PERSONS.

(10) Measure the thickness of the modeling clay at all eight extend overtravel stops. Make a written record of the thicknesses you measured.

**NOTE:** The thickness of the modeling clay is the extend overtravel stop clearance.

K. Inboard Flap Retract Overtravel Stop RIG Position - Adjustment

S 845-045

- (1) Make sure that you followed the procedure in the "Adjust the Flap Extend Overtravel Stop Clearance" and "Adjust the Flap Retract Overtravel Stop Clearance" paragraphs to see if this adjustment is necessary.

**NOTE:** If the clearance for the extend or the retract overtravel stop for an inboard (outboard) flap are not correct, go to the procedure to adjust the appropriate flap retract overtravel stops to the RIG position.

S 865-046

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (2) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 865-047

- (3) Move the flap control lever to the zero (FLAPS UP) detent and permit the flaps to move to the fully retracted position.

**NOTE:** After the flaps moved to the fully retracted position, stop for one minute before you do the next step.

S 045-048

- (4) Do the flap deactivation procedure for ground maintenance with the instructions given in the "Prepare for the Adjustment" paragraph.

EFFECTIVITY

ALL

27-51-00

02

Page 536  
Apr 22/99

S 035-049

- (5) Use these steps to disconnect the drive to the inboard flap with the incorrect overtravel stops (Fig. 510):

(a) Disconnect the torque tube at the inboard end of the bulkhead tee gearbox (AMM 27-51-35/401).

NOTE: Do not turn the torque tube that is connected to the TE flap PDU.

(b) Install a clamp on the disconnected torque tube adjacent to the TE flap PDU.

(c) Disconnect the torque tube at the inboard end of the aileron droop angle gearbox (AMM 27-51-40/401).

S 985-050

- (6) Turn the input shaft coupling (on the inboard side of the bulkhead tee gearbox) by hand to extend the inboard flaps, until you can get access to the RETRACT overtravel stop at the outboard mechanism.

NOTE: You can turn the input shaft approximately 270 turns to extend the inboard flap to the 15-unit position.

S 495-051

- (7) Apply the modeling clay to the RETRACT overtravel stop at the outboard mechanism of the inboard flap (Detail A, Fig. 507).

S 985-052

- (8) Turn the input shaft coupling (on the inboard side of the bulkhead tee gearbox) by hand until the retract overtravel stop clearance at the inboard mechanism of the inboard flap is in the RIG position limit (Detail G, Fig. 507).

NOTE: For this and all the subsequent steps, move the crank arm to the direction of the stop to measure the RIG position. If you must move the crank arm away from the stop, move it away for more than one complete turn of the coupling, then move it back again to measure the RIG position.

Turn the coupling counterclockwise to decrease the clearance to the stop. A 1/3 turn of the coupling will change the clearance by 0.010 inch (0.25 mm).

S 985-053

- (9) Extend the flaps manually to get access to the modeling clay at the RETRACT overtravel stop (at the outboard mechanism of the inboard flap).

EFFECTIVITY

ALL

27-51-00

02

Page 537  
Dec 22/01

S 975-054

- (10) Measure the thickness of the modeling clay at the RETRACT overtravel stop. Make a written record of the clay thickness.

S 845-055

- (11) Do the steps that follow only if the RETRACT overtravel stop clearance (the thickness of the clay) is in the RIG position limit at the outboard mechanism of the inboard flap (Detail C, Fig. 507):
- (a) Retract the flaps until the inboard mechanism of the inboard flap is in the RIG position limits (Detail G).
  - (b) Connect the torque tube to the input shaft coupling of the bulkhead tee gearbox (AMM 27-51-35/401) (Fig. 510).

NOTE: Try not to turn the input shaft coupling when you connect the torque tube. If you must turn the input shaft coupling to align the coupling screws, make no more than 1/6 of a turn in the clockwise or counterclockwise direction.

- (c) Remove the clamp from the torque tube adjacent to the TE flap PDU (Fig. 509).

S 825-056

- (12) Adjust the inboard flap drive with these steps if you cannot get the correct RETRACT overtravel stop clearances for the inboard and outboard mechanisms (of the inboard flap) at the same time (Fig. 507):
- (a) Disconnect the torque tube from the outboard coupling on the bulkhead tee gearbox (AMM 27-51-35/401) (Fig. 510).

NOTE: This will disconnect the inboard mechanism from the outboard mechanism.

- (b) Remove the center and the forward sections of the inboard flap outboard fairing (AMM 27-51-15/401) to get access to the RETRACT overtravel stop.

NOTE: The input-to-output gear ratio on the rotary actuator is 1400:1. It is necessary to see the RETRACT overtravel stops in the subsequent steps to make sure that the crank arms are correctly set against the RETRACT stops.

EFFECTIVITY

ALL

27-51-00

02

Page 538  
Apr 22/99

- (c) Manually turn the torque tube that is connected to the outboard rotary actuator (of the inboard flap), until the outboard crank arm touches the RETRACT overtravel stop. Hold the torque tube in this position.

NOTE: Make sure that you can turn the torque tube at least one full turn before the crank arm touches the overtravel stop.

- (d) Manually turn the input shaft coupling on the inboard side of the bulkhead tee gearbox, until the inboard crank arm touches the RETRACT overtravel stop. Hold the coupling in this position.

NOTE: Make sure that you can turn the coupling at least one full turn before the crank arm touches the overtravel stop.

- (e) Connect the torque tube to the outboard side of the bulkhead tee gearbox while you keep the inboard and outboard crank arms against their RETRACT overtravel stops (Fig. 510).

NOTE: Try not to turn the input shaft coupling when you connect the torque tube. If you must turn the input shaft coupling to align the coupling screws, make no more than 1/6 of a turn in the clockwise or counterclockwise direction.

- (f) Make approximately 20 turns on the input shaft coupling (at the inboard side of the bulkhead tee gearbox) to move the crank arms away from the RETRACT overtravel stop.

- (g) Turn the input shaft coupling to move the crank arm to the direction of the stops, until the inboard and outboard crank arms are in the RIG position limits (Detail C and G, Fig. 507).

NOTE: Make sure you can turn the coupling for at least one full turn before you measure the RIG position.

- (h) Connect the torque tube to the inboard side of the bulkhead tee gearbox while you hold the coupling to keep the crank arms in the RIG position.

NOTE: Try not to turn the input shaft coupling when you connect the torque tube. If you must turn the input shaft coupling to align the coupling screws, make no more than 1/6 of a turn in the clockwise or counterclockwise direction.

- (i) Remove the lock from the torque tube adjacent to the TE flap PDU (Fig. 509).

Apr 22/99

- (j) Install the center and the forward sections of the outboard fairing for the inboard flap (AMM 27-51-15/401).

S 435-057

- (13) Connect the torque tube to the aileron droop angle gearbox (AMM 27-51-40/401).

L. Outboard Flap Retract Overtravel Stop RIG Position - Adjustment

S 845-058

- (1) Make sure that you followed the procedure in the "Adjust the Flap Extend Overtravel Stop Clearance" and "Adjust the Flap Retract Overtravel Stop Clearance" paragraphs to see if this adjustment is necessary.

**NOTE:** If the clearance for the extend or the retract overtravel stop for an inboard (outboard) flap are not correct, go to the procedure to adjust the appropriate flap retract overtravel stops to the RIG position.

S 025-059

- (2) Remove the center and the forward sections of the outboard flap (inboard and outboard) fairings to get access to the RETRACT overtravel stops (AMM 27-51-16/401).

S 865-060

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (3) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 865-061

- (4) Move the flap control lever to the zero (FLAPS UP) detent and permit the TE flaps to move to the fully retracted position.

**NOTE:** After the flaps moved to the fully retracted position, stop for one minute before you do the next step.

EFFECTIVITY

ALL

27-51-00

Dec 10/98

- (g) Connect the torque tube to the inboard side of the inboard rotary actuator while you hold the coupling to keep the crank arms in the RIG position (Fig. 510).

NOTE: Try not to turn the input shaft coupling when you connect the torque tube. If you must turn the input shaft coupling to align the coupling screws, make no more than 1/6 of a turn in the clockwise or counterclockwise direction.

S 425-067

- (10) Install the center and forward sections of the inboard and outboard fairings for the outboard flap (AMM 27-51-16/401).

M. Flap Synchronization - Adjustment

S 845-068

- (1) Make sure that you completed the procedure in the "Adjust the Flap Retract Overtravel Stop Clearance" paragraph to make sure the FUNCTIONAL clearances are correct, and to see if this adjustment is necessary.

NOTE: It is not necessary to do this procedure if the conditions that follow are true:

- All eight retract overtravel stop clearances are in the FUNCTIONAL clearance limits,
- The overtravel stop clearances on each flap mechanism at one wing is the same as the symmetrical mechanism on the opposite wing, within  $\pm 0.06$  inch ( $\pm 1.5$  mm).

S 215-069

- (2) Make sure that the TE flaps are in the fully retracted position.

S 045-070

- (3) Do the flap deactivation procedure for ground maintenance with the instructions given in the "Prepare for the Adjustment" paragraph.

S 225-071

- (4) Identify the mechanism with the RETRACT overtravel stop clearance that does not agree with the clearance of the symmetrical mechanism on the opposite wing (a tolerance of  $\pm 0.06$  inch ( $\pm 1.52$  mm) is permitted).

S 825-072

- (5) Adjust the flap mechanisms for the inboard flap with these steps:
- (a) Install a clamp on the torque tube on the outboard side of the aileron droop angle gearbox (Fig. 509).
  - (b) Disconnect the torque tube from the inboard coupling of the aileron droop angle gearbox (AMM 27-51-40/401) (Fig. 510).

EFFECTIVITY

ALL

27-51-00

01

Page 543  
Dec 22/01

(c) If it is necessary to adjust the crank arm on the outboard mechanism (inboard flap), follow these steps to make the adjustment:

- 1) Find the minimum number of turns (and the direction that the coupling has to turn) to make the clearance for the RETRACT overtravel stop equal to the clearance of the symmetrical stop on the opposite wing (a tolerances of  $\pm 0.06$  inch ( $\pm 1.52$  mm) is permitted).

NOTE: Turn the coupling counterclockwise to decrease (or clockwise to increase) the clearance to the stop.

A  $1/3$  turn of the coupling will change the clearance by 0.010 inch (0.25 mm).

- 2) Disconnect the torque tube from the coupling on the outboard side of the bulkhead tee gearbox (AMM 27-51-35/401) (Fig. 510).
- 3) Manually turn the disconnected torque tube for the minimum number of turns calculated in the step before.
- 4) Connect the torque tube to the coupling on the outboard side of the bulkhead tee gearbox (AMM 27-51-35/401) while you hold the coupling to keep the adjusted position.

NOTE: Try not to turn the torque tube when you connect it. If you must turn the torque tube to align the coupling screws, make no more than  $1/6$  of a turn in the clockwise or counterclockwise direction.

(d) If it is necessary to adjust the crank arm on the inboard mechanism (inboard flap), follow these steps to make the adjustment:

- 1) Find the minimum number of turns (and the direction that the coupling has to turn) to make the clearance for the RETRACT overtravel stop equal to the clearance of the symmetrical stop on the opposite wing (a tolerances of  $\pm 0.06$  inch ( $\pm 1.52$  mm) is permitted).

NOTE: Turn the coupling counterclockwise to decrease (or clockwise to increase) the clearance to the stop.

A  $1/3$  turn of the coupling will change the clearance by 0.010 inch (0.25 mm).

- 2) Disconnect the torque tube from the coupling on the inboard and outboard sides of the bulkhead tee gearbox (AMM 27-51-35/401) (Fig. 510).

NOTE: Try not to turn the coupling when you connect it. If you must turn the coupling to align the coupling screws, make no more than 1/6 of a turn in the clockwise or counterclockwise direction.

S 825-253

- (7) Do a check on the flap synchronization adjustment and compare the retract stop clearances to make sure that the flaps on the left and right wing are correctly synchronized.

S 425-254

- (8) Make sure to install a lockwire on the coupling screws for all the torque tubes that you disconnected.

N. Put the Airplane Back to Its Usual Condition

S 865-074

- (1) Remove the power from the center hydraulic system (AMM 29-11-00/201).

S 865-075

- (2) Remove electrical power (AMM 24-22-00/201).

S 415-076

- (3) If removed, install the access panels, 195JL and 196JR, for the left and right inboard flap mechanism (AMM 06-41-00/201).

S 415-077

- (4) If removed, install the access panels, 511BB and 611BB, for the outboard and inboard slat PDUs (AMM 06-44-00/201).

S 865-078

- (5) Remove the circuit breaker locks and the DO-NOT-CLOSE tags and close these circuit breakers on the P6 panel:
  - (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6D24, ALTN FLAP PWR
  - (c) 6F24, ALTN SLAT OUTBD PWR

S 865-079

- (6) Remove the circuit breaker locks and the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:
  - (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD
  - (c) 11J14, FLAP SHUTOFF
  - (d) 11J24, FLAPS ALTN CONT

TASK 27-51-00-735-080

3. Flap Slat Electronics Unit - Test

A. References

- (1) AMM 06-41-00/201, Fuselage Access Doors and Panels
- (2) AMM 24-22-00/201, Electrical Power - Control

B. Access

- (1) Location Zones
  - 120 Main Equipment Center
  - 211/212 Control Cabin
- (2) Access Panel
  - 119AL Main Equipment Center

C. Prepare for the System Test

S 865-258

- (1) Supply electrical power (AMM 24-22-00/201).

S 865-479

- (2) Make sure the COMPUTER switch on the EICAS DISPLAY select panel, P9, is in the L position.

S 215-257

- (3) Make sure the TE flaps and the LE slats are in the fully retracted position.

S 215-259

- (4) Make sure the flap control lever is in the zero (FLAPS UP) detent (Fig. 511).

S 015-088

- (5) Open the access door, 119AL, to get access to the main equipment center (AMM 06-41-00/201).

D. AIRPLANES WITH A -53 OR EARLIER FSEU;

Test the Flap/Slat Electronics Unit (FSEU) (Fig. 503)

S 745-089

- (1) Push the TEST button on the front panel of the FSEU (E2 equipment rack, main equipment center) and make sure that all the lights come on.

EFFECTIVITY

ALL

27-51-00

05

Page 548  
Apr 22/01

S 745-090

- (2) Push the BIT/VERIFY switch and look for the TEST COMPLETE light to come on. Make sure that no fault lights come on.

E. AIRPLANES WITH A -63 FSEU;

Test the Flap/Slat Electronics Unit (FSEU) (Fig. 503)

S 745-330

- (1) Do a test of the BITE display on the FSEU:
  - (a) Push the ON/OFF button on the front panel of the FSEU to turn on the display.

NOTE: The display will show "EXISTING FAULTS?"

- (b) Push the down arrow until GROUND TESTS? shows on the display.
- (c) Push the YES button to select GROUND TESTS? on the FSEU.
- (d) Push the down arrow until DISPLAY TEST? shows on the display.
- (e) Push the YES button to perform the DISPLAY TEST? on the FSEU.
- (f) Make sure the display characters on the front panel of the FSEU turn on in groups of four for approximately 2 seconds.

S 745-326

- (2) Do a check for EXISTING FAULTS with the FSEU:

S 865-421

- (3) Push the LE ALTN and TE ALTN arming switches in the flight compartment to arm the alternate flap/slat drive system and make sure the ALTN switch lights come on.

S 865-519

- (4) Make sure the "Alternate Flaps/Slat" selector switch is turned to the "UP" position.

S 215-422

- (5) Make sure the ALTN switches are in the armed positions.

NOTE: Do not run the test if the flaps are moving. Make sure the flap control lever is in the zero (FLAPS UP) detent (Fig. 511).

- (a) Push the menu button.

NOTE: The display will show EXISTING FAULTS?

EFFECTIVITY

ALL

27-51-00

07

Page 549  
Aug 22/08

(b) Push the YES button to select the EXISTING FAULTS? test.

NOTE: The display will show TEST IN PROGRESS.

(c) The message "NO FAULTS" should show on the display.

NOTE: If "N FLTS FOUND" shows on the FSEU BITE display, where N is the number of faults detected, make a list of all the fault messages and maintenance message numbers. You can use the up and down arrow buttons to scroll through the list of messages.

(d) Do the corrective action shown in table A, for the faults found (FIM 27-51-00/101, Fig. 104A).

F. Put the Airplane Back to Its Usual Condition

S 415-091

- (1) Close the access door, 119AL, for the main equipment center (AMM 06-41-00/201).

S 865-481

- (2) Make sure the alternate flap arming switches for the flap and slat alternate drives in the flight compartment are set to off (ALTN switch lights off).

S 865-252

- (3) Remove electrical power (AMM 24-22-00/201).

TASK 27-51-00-735-232

4. Flap/Stabilizer Position Module (FSPM) - Test

A. References

- (1) AMM 06-41-00/201, Fuselage Access Doors and Panels  
(2) AMM 24-22-00/201, Electrical Power - Control

Aug 22/05

- S 215-267
- (3) Make sure the flaps and slats are in the fully retracted position.
- S 215-268
- (4) Make sure the flap control lever is in the zero (FLAPS UP) detent (Fig. 511).
- D. Test for the Flap/Stabilizer Position Module (FSPM)

**NOTE:** You can ignore the TE FLAP DISAGREE message on the EICAS display and the flap position indicator on the First Officer's Instrument Panel, P3-1, during this test. You can also ignore the TRAILING EDGE light on P3, unless it is identified in the test.

- S 015-093
- (1) Open the access door, 119AL, to get access to the main equipment center (AMM 06-41-00/201).
- S 865-095
- (2) Push the TE arming switch for the flap alternate drive to arm the flap alternate drive (ALTN switch light comes on).
- S 745-096
- (3) Push and hold the BITE/VERIFY test switch on the FSPM M839 (P50, E3, right forward equipment center) for a minimum of 60 seconds while you do these checks:
- (a) Make sure that no amber fault lights come on.
  - (b) Make sure the green TEST GOOD light comes on.
  - (c) Make sure this EICAS message, FLAP/SLAT ELEC, shows on the bottom EICAS display (on P2).
  - (d) Move the COMPUTER switch on the EICAS DISPLAY select panel to the R position and make sure that the FLAP/SLAT ELEC message stays on the EICAS display.
  - (e) Move the COMPUTER switch on the EICAS DISPLAY select panel to the L position.
- S 745-097
- (4) Release the BITE/VERIFY test switch and make sure the green TEST GOOD light goes out, and the FLAP/SLAT ELEC message does not show on the bottom EICAS display.
- S 745-098
- (5) Do the same test procedure for the FSPM M838 and M840.
- S 865-099
- (6) Push the TE arming switch for the flap alternate drive to disarm the flap alternate drive (ALTN switch light goes off).
- S 215-100
- (7) Make sure that the amber TRAILING EDGE light goes off.

EFFECTIVITY

- S 215-101
- (8) Make sure the EICAS message, TE FLAP DISAGREE, does not show on the display screen in the flight compartment.

- S 865-102
- (9) Open these circuit breakers on the overhead panel, P11, and attach D0-NOT-CLOSE tags:
- (a) 11C14, FLAP/STAB POS SENSING C
  - (b) 11J17, FLAP/STAB POS SENSING L
  - (c) 11J26, FLAP/STAB POS SENSING R

- S 745-103
- (10) Push the BIT/VERIFY switch on the FSEU (E2, main equipment center), and do this check:
- (a) Make sure the green TESTING light comes on for 10 seconds, and then only the M838, M839, and M840 (L,C,R) FSPM lights come on at the FSEU.

- S 865-104
- (11) Remove the D0-NOT-CLOSE tags and close these circuit breakers on the P11 panel:
- (a) 11C14, FLAP/STAB POS SENSING C
  - (b) 11J17, FLAP/STAB POS SENSING L
  - (c) 11J26, FLAP/STAB POS SENSING R

- S 415-105
- (12) Close the access door, 119AL, for the main equipment center (AMM 06-41-00/201).

E. Put the Airplane Back to Its Usual Condition

- S 865-317
- (1) Remove electrical power (AMM 24-22-00/201).

TASK 27-51-00-735-233

5. Flap Control Lever Load - Test

- A. Equipment
- (1) Force Gage (0-50 pounds (0-200 newtons))
- B. References
- (1) AMM 24-22-00/201, Electrical Power - Control
  - (2) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems
- C. Access
- (1) Location Zones  
211/212 Control Cabin
- D. Prepare for the System Test

- S 865-269
- (1) Supply electrical power (AMM 24-22-00/201).

EFFECTIVITY

ALL

27-51-00

02

Page 552  
Apr 22/03

S 215-270

- (2) Make sure the TE flaps and the LE slats are in the fully retracted position.

S 215-271

- (3) Make sure the flap control lever is in the zero (FLAPS UP) detent (Fig. 511).

E. Test for the Flap Control Lever Load (Fig. 511)

S 865-107

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (1) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 495-108

- (2) Attach a force gage at the top of the flap control lever (at 90 degree to the flap control lever) and do the steps that follow:
  - (a) Use the force gage to move the flap control lever to each detent from zero (FLAPS UP) to 30.

**NOTE:** Stop at each detent to permit the flaps to move to the position on the flap control lever.

- (b) Make sure the force is not more than 10 pounds (40 newtons) when you move the flap control lever to each detent.

**NOTE:** The force will be different at each detent from zero (FLAPS UP) to 30. The force from 25 to 20 is larger than the force between other positions due to the load produced by the slat power drive unit. The force from 1 to zero (FLAPS UP) is also larger due to the load produced from the cable system.

EFFECTIVITY

ALL

27-51-00

04

Page 553  
Apr 22/03

- (c) Make sure the flap control lever does not move out of a detent without force applied.

NOTE: The lever can move a short distance with no force only at the zero detent, because of the free play in the cables.

- (d) Use the force gage to move the flap control lever to each detent from 30 to zero (FLAPS UP).

NOTE: Stop at each detent to permit the flaps to the move to the position on the flap control lever.

- (e) Make sure that the force is not more than 12 pounds (53 newtons) when you move the flap control lever to each detent.

NOTE: The force will be different at each detent from zero (FLAPS UP) to 30. The force from 25 to 20 is larger than the force between other positions due to the load produced by the slat power drive unit. The force from 1 to zero (FLAPS UP) is also larger due to the load produced from the cable system.

- (f) Make sure the flap control lever does not move out of a detent without force applied.

S 865-109

- (3) Remove the power from the center hydraulic power (AMM 29-11-00/201).  
F. Put the Airplane Back to Its Usual Condition

S 865-318

- (1) Remove electrical power (AMM 24-22-00/201).

TASK 27-51-00-735-234

6. Flap and Slat Primary Drives and Position Indicating Systems - Test

NOTE: This test will also examine the operation of the flap/slat shutoff valve module and the krueger seal flap drive.

When you read the flap position indicator, a position tolerance of 0.03 inch (0.08 centimeter) is permitted for the L and R needles.

Unless it is specified in the test, make sure the amber LEADING EDGE and TRAILING EDGE lights do not show on the first officer's panel, P3, and that no messages associated with the flaps and slats show on the EICAS display during the test.

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM THE FLAPS WHEN YOU OPERATE THE FLAP ALTERNATE DRIVE. THE ACCIDENTAL MOVEMENT OF THE FLAPS CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

**CAUTION:** DO NOT OPERATE THE ALTERNATE DRIVE MOTOR CONTINUOUSLY FOR MORE THAN 4 MINUTES. DO NOT OPERATE THE MOTOR AGAIN UNTIL IT IS COOL FOR AT LEAST 20 MINUTES TO PREVENT DAMAGE TO THE MOTOR.

- (6) Turn the position selector switch for the flap/slat alternate drive to the 5-unit detent, and do the checks that follow:

**NOTE:** The amber TRAILING EDGE light will go off immediately when you turn the position selector switch out of the NORM position. The amber TRAILING EDGE light will stay off if the flaps extend correctly by the alternate drive. If the flaps take longer than the usual time to move to the position on the switch, the amber TRAILING EDGE light will come on again. This light will stay on until the flaps move to the position shown on the switch.

- (a) Make sure the flaps move to the 5-unit position.
- (b) Make sure the flap position indicator moves to the 5-unit mark.
- (c) Make sure the EICAS message, TE FLAP DISAGREE, does not show on the top display screen in the flight compartment.
- (d) Make sure the amber TRAILING EDGE light goes off.

S 215-130

- (7) Turn the position selector switch for the flap/slat alternate drive to the 15, 20, 25, and 30-unit detents, and do the checks that follow:

**NOTE:** Stop at each detent to permit the flaps to move to the position on the switch before you turn the switch to the subsequent detent.

- (a) Make sure the flap position indicator starts to move to the position shown on the selector switch while the flaps extend.

EFFECTIVITY

ALL

27-51-00

03

Page 560  
Apr 22/03

- (b) Make sure the flap position indicator is at the correct position when the flap movement stops.

NOTE: It is usual for the flap position indicator to stop in a position between the 25 and 30-unit marks when the position selector switch is in the 30-unit detent.

S 215-131

- (8) Turn the position selector switch to the 25, 20, 15, 5, and UP-unit detents, and do the checks that follow:

NOTE: Stop at each detent to permit the flaps to move to the position on the switch before you turn the switch to the subsequent detent.

The flaps will not be in the fully retracted position when the flap position selector switch is in the UP position.

- (a) Make sure the flap position indicator starts to move to the position shown on the selector switch while the flaps retract.
- (b) Make sure the flap position indicator is at the correct position when the flap movement stops.

S 215-132

- (9) Turn the position selector switch to the NORM detent, and make sure that these conditions occur after seven seconds:
  - (a) The TRAILING EDGE light comes on
  - (b) The EICAS message, TE FLAP DISAGREE, shows on the top display screen in the flight compartment.

S 215-133

- (10) Push the TE arming switch for the flap alternate drive to disarm the flap alternate drive (ALTN switch light goes off), and do these checks:
  - (a) The amber TRAILING EDGE light goes off
  - (b) The EICAS message, TE FLAP DISAGREE, does not show on the top display screen in the flight compartment.

S 865-134

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

(11) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 865-135

(12) Move the flap control lever to the 5-unit detent and make sure the flaps move to the 5-unit position after the slats move to the intermediate position.

S 865-136

(13) Move the flap control lever to the zero (FLAPS UP) detent and make sure the flaps and slats move to the fully retracted position.

E. Put the Airplane Back to Its Usual Condition

S 865-137

(1) Remove the power from the center hydraulic system (AMM 29-11-00/201).

S 865-320

(2) Remove electrical power (AMM 24-22-00/201).

TASK 27-51-00-735-236

8. Flap Asymmetry Protection System - Test

A. Equipment

- (1) Spare Flap Position Transmitter No. 4 - M476  
(The Transmitter must be locked in the retracted rig position)
- (2) Rig Pin TE4 - P/N A20004-7,  
part of Set A20004-XX (AMM 20-10-24/201)
- (3) TE Flap PDU Lock - A27009-7

B. References

- (1) AMM 20-10-24/201, Rig Pins
- (2) AMM 24-22-00/201, Electrical Power - Control

(1) Location Zones

143/144	Left/Right MLG Wheel Well
211/212	Control Cabin
500/600	Left Wing / Right Wing
730/740	Left/Right Main Landing Gear and Doors

D. Prepare for the System Test

S 865-284

- (1) Supply electrical power (AMM 24-22-00/201).

S 215-288

- (2) Make sure the TE flaps and the LE slats are in the fully retracted position.

S 215-289

- (3) Make sure the flap control lever is in the zero (FLAPS UP) detent (Fig. 511).

S 215-139

- (4) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

S 495-140

**WARNING:** USE THE PROCEDURE IN AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT

- (5) Open the doors for the landing gear and install the door locks (AMM 32-00-15/201).

S 865-141

- (6) Remove the power from the center hydraulic system (AMM 29-11-00/201).

S 495-142

- (7) Install the PDU lock in the TE flap PDU (Fig. 505).

E. Test for the Flap Asymmetry Protection System

S 845-143

- (1) Use the Procedure 1 or the Procedure 2 that follows to prepare the flap drive system for the asymmetry indication test:
- (a) Procedure 1:
- 1) Disconnect the torque tube at the coupling in the left hand MLG (main landing gear) wheel well, between the keel beam and the bulkhead tee gearbox (Fig. 504).

EFFECTIVITY

ALL

27-51-00

03

Page 563  
Apr 22/03

- 2) Make a mark on the torque tube and the adjacent structure. This is to keep a record of the adjusted position for the subsequent installation.
- (b) Procedure 2:
- 1) Open these circuit breakers on the P11 panel:
    - a) 11C14, FLAP/STAB POS SENSING C
    - b) 11C15, FLAP SLAT ELEC UNIT 1 SENSOR
  - 2) Remove the electrical connector from the flap position transmitter, No. 4 (M476), at the inboard rotary actuator on the left inboard flap.
  - 3) Install the electrical connector on a spare flap position transmitter, No. 4 (M476).
  - 4) Lock the spare transmitter in the retracted rig position with rig pin TE4 (Fig. 512).
  - 5) Close these circuit breakers on the P11 panel:
    - a) 11C14, FLAP/STAB POS SENSING C
    - b) 11C15, FLAP SLAT ELEC UNIT 1 SENSOR

S 845-144

- (2) Prepare to count the number of turns of a torque tube with the recommended procedure that follows:

**NOTE:** It will be necessary to count the number of turns of a torque tube for the subsequent test.

- (a) Attach a long piece of string to the torque tube with tape and permit the string to wind around the torque tube when it turns.

**NOTE:** The number of winds of the string around the torque tube is the number of turns of the torque tube. Make sure you make a mark on the torque tube to identify the direction of the string and where to start the count.

If the string come loose or breaks during this test, it will be necessary to adjust the flap overtravel stops with the instructions given in the adjustment task.

S 095-145

- (3) Remove the PDU lock from the TE flap PDU (Fig. 505).

EFFECTIVITY

ALL

27-51-00

S 865-146

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (4) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 865-147

- (5) Move the flap control lever to the 1-unit detent and permit the slats to move to the intermediate position.

S 215-148

- (6) Move the flap control lever to the 5-unit detent, and do the checks that follow:
- (a) Make sure that all flap movement stops after you move the flap control lever to the 5-unit detent.
  - (b) Make sure the amber TRAILING EDGE light comes on at the P3 panel (Fig. 511).
  - (c) Make sure this EICAS message, TE FLAP ASYM, shows on the display screen in the flight compartment.
  - (d) Make sure the EICAS message, TE FLAP DISAGREE, does not show on the display screen in the flight compartment.
  - (e) Turn the COMPUTER switch on the EICAS DISPLAY select panel to the R position and make sure the TE FLAP ASYM message does not change.
  - (f) Turn the COMPUTER switch on the EICAS DISPLAY select panel back to the L position.
  - (g) Make sure the torque tube for the flap drive turned no more than 43 1/4 times before the drive system shutdown.

S 865-154

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM THE FLAPS AND SLATS IN THE SUBSEQUENT STEP. THE FLAPS CAN MOVE ACCIDENTALLY AND CAUSE INJURE TO PERSONS OR DAMAGE TO EQUIPMENT.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (15) Move the manual override lever on the PDU bypass valve to the No. 2 (NORMAL) position and do the check that follows:
- (a) Make sure the torque tube turns no more than 43 1/4 times as the flaps move to the fully retracted position.

**NOTE:** If you disconnected the torque tube (with Procedure 1), make sure that the torque tube turns back the same number of times as the flaps extended before. This is to make sure the flap drive moves back to the adjusted position.

S 865-155

- (16) Do the steps that follow when the flaps stop at the fully retracted position:
- (a) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:
    - 1) 11C16, FLAP SLAT ELEC UNIT 1 CONT
    - 2) 11G16, FLAP SLAT ELEC UNIT 2 CONT
    - 3) 11G23, FLAP SLAT ELEC UNIT 3 CONT

S 865-156

- (17) Push the ALTN TE arming switch for the flap alternate drive in the flight compartment to arm the flap alternate drive, and make sure the ALTN switch light comes on.

S 865-157

- (18) Push the ALTN TE arming switch for the flap alternate drive again to disarm the flap alternate drive, and make sure the ALTN switch light goes off.

Apr 22/03

S 865-158

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM THE FLAPS AND SLATS FOR THE SUBSEQUENT STEP. THE FLAPS AND SLATS CAN ACCIDENTALLY MOVE AND CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

(19) Move the flap control lever to the zero (FLAPS UP) detent and permit the slats to move to the fully retracted position.

S 865-159

(20) Remove the power from the center hydraulic system (AMM 29-11-00/201).

S 495-160

(21) Install the PDU lock on the TE flap PDU.

S 845-161

(22) Put the flap drive system back to the usual condition with the Procedure 1 or Procedure 2:

(a) Procedure 1 (with the torque tube disconnected between the keel beam and the bulkhead tee gearbox):

1) Make sure the torque tube turns back the same number of times as the flaps extended before.

**NOTE:** If the torque tube does not turn back the same number of times, or if you turn the disconnected torque tube accidentally, it will be necessary to adjust the flap retract overtravel stops with the procedures given in the adjustment task.

2) Align the marks that you made on the torque tube and the adjacent structure, and connect the torque tube at the coupling in the left MLG wheel well (Fig. 504).

(b) Method 2 (with the spare flap position transmitter):

1) Open these circuit breakers on the P11 panel:

- a) 11C14, FLAP/STAB POS SENSING C
- b) 11C15, FLAP SLAT ELEC UNIT 1 SENSOR

2) Remove the rig pin TE4 from the spare position transmitter, No. 4 (M476) (Fig. 512).

3) Disconnect the electrical connector from the spare position transmitter No. 4.

4) Connect the electrical connector back to the flap position transmitter on the airplane (No. 4, M476), at the inboard rotary actuator of the left inboard flap.

5) Close these circuit breakers on the P11 panel:

- a) 11C14, FLAP/STAB POS SENSING C
- b) 11C15, FLAP SLAT ELEC UNIT 1 SENSOR

D. Test for the Flap Load Alleviation System

**NOTE:** For this test, a tolerance of two needle widths is permitted when you read the L and R needles on the flap position indicator on P3.

S 865-165

- (1) Open these circuit breakers on the main power distribution panel, P6, and attach DO-NOT-CLOSE tags:
  - (a) 6K14, PITOT PROBE HT CAPT PHASE A
  - (b) 6K15, PITOT PROBE HT CAPT PHASE B
  - (c) 6K16, PITOT PROBE HT R AUX PHASE B
  - (d) 6K17, PITOT PROBE HT R AUX PHASE C
  - (e) 6K20, PITOT PROBE HT L AUX PHASE C
  - (f) 6K21, PITOT PROBE HT L AUX PHASE B
  - (g) 6K22, PITOT PROBE HT F/O PHASE B
  - (h) 6K23, PITOT PROBE HT F/O PHASE A

S 865-166

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (2) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 215-223

- (3) Make sure you follow these precaution steps before you operate the pitot-static system (AMM 34-11-00/201):
  - (a) Do not apply more than 4.75 PSI gaged pressure.
  - (b) The rate that you apply or release the vacuum to a static system must be less than 5000 feet-per-minute.
  - (c) The rate that you apply or release the pressure to a pitot system must be less than 300 knots-per-minute.
  - (d) Install flow restrictors between the cutoff valve and the pitot-static system when it is necessary.

EFFECTIVITY

ALL

27-51-00

01

Page 570  
Apr 22/01

(e) Do not decrease the absolute pressure in the auxiliary pitot systems NO.1 and NO.2 below the ambient pressure. Low pressure in the auxiliary pitot systems can cause damage to the elevator feel computer.

(f) Make sure the autopilot is off for this test.

S 865-167

(4) Pressurize the captain's PT and S1 (left) or the first officer's PT and S1 (right) pitot-static system to 140-150 knots airspeed (AMM 34-11-00/201).

S 445-168

(5) Activate the left ADC (if the captain's pitot static system is pressurized) or the right ADC (if the first officer's pitot-static system is pressurized) (AMM 34-12-00/501).

S 865-251

(6) Isolate the applicable left or right ADC:

**NOTE:** You must isolate the left or the right ADC for this test if you do not pressurize the two pitot static systems.

(a) Make sure the AIR DATA computer switches on the P1-1 and P3-3 panels are not armed in the alternate position.

(b) To isolate the left ADC,  
open this circuit breaker on the P11 panel:  
1) 11F30, AIR DATA COMPUTER R

(c) To isolate the right ADC,  
open this circuit breaker on the P11 panel:  
1) 11A10, AIR DATA COMPUTER L

S 715-169

(7) Do the operational test on the load alleviation system with the procedure that follows:

(a) Move the flap control lever to the 30-unit detent and permit the flaps and slats to move to the fully extended position.

(b) Slowly increase the pitot-static pressure to the airspeed shown in Table 501.

**NOTE:** Monitor the pitot-static pressure and keep a record of the airspeed at which the flaps retract.

1) SAS 050, 051;

Make sure these conditions occur while the airspeed increases:

a) The flaps retract to the 25-unit position.

- (c) Slowly decrease the pitot-static pressure to the airspeed shown in Table 502, and make sure these conditions occur while the airspeed decreases:

**NOTE:** Monitor the pitot-static pressure and keep a record of the airspeed at which the flaps extend.

- 1) The flaps extend to the 30-unit position.
  - 2) The L and R needles move to the 30-unit mark on the flap position indicator.
- (d) Make sure the flaps extend at a pitot-static airspeed 4 knots slower than the flaps retracted during the load relief condition.
- (e) SAS 150-280;  
Do the steps that follow:
- 1) Move the flap control lever to the 25-unit detent and permit the flaps to move to the 25-unit position.
  - 2) Increase the pitot-static pressure to the airspeed shown in Table 503, and do these checks:
    - a) Make sure the flaps retract to the 20-unit position.

**NOTE:** Monitor the pitot-static pressure and keep a record of the airspeed at which the flaps retract.

- b) Make sure that the flap position indicator moves to the 20-unit mark.
- 3) Decrease the pitot-static pressure to the airspeed shown in Table 504, and do these checks:
- a) Make sure the flaps extend to the 25-unit position.
  - b) Make sure the flap position indicator moves to the 25-unit mark.
- 4) Make sure the flaps extend at a pitot-static airspeed four knots slower than the flaps retracted during the load relief condition.
- 5) Decrease the airspeed to 140-150 knots.
- 6) Move the flap control lever to the 30-unit detent and permit the flaps to move to the fully extended position.

EFFECTIVITY

ALL

27-51-00

S 715-170

- (8) Do a test on the load relief failure operation with the procedure that follows:
- (a) Open this circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:
    - 1) 11J13, FLAP LOAD RELIEF
  - (b) Move the flap control lever to the 30-unit detent and permit the flaps and slats to move to the fully extended position.
  - (c) Increase the pitot-static system pressure to the airspeed shown in Table 501 and do the checks that follow:
    - 1) Make sure the amber TRAILING EDGE light comes on.
    - 2) Make sure this EICAS message, FLAP LD RELIEF, shows on the top EICAS display.
    - 3) Make sure that there is no movement on the flaps.
  - (d) Turn the COMPUTER SWITCH on the EICAS DISPLAY select panel to the L position.
    - 1) Make sure the EICAS message, FLAP LD RELIEF, does not change on the EICAS display.
  - (e) Decrease the pitot-static system pressure to the airspeed shown in Table 502.
  - (f) Make sure the amber TRAILING EDGE light goes off.
  - (g) Make sure the EICAS message, FLAP LD RELIEF, does not show on the display in the flight compartment.
  - (h) SAS 150-280;  
Do the steps that follow:
    - 1) Move the flap control lever to the 25-unit detent and permit the flaps to move to the 25-unit position.
    - 2) Increase the pitot-static pressure to the airspeed shown in Table 503.
    - 3) Make sure that the amber TRAILING EDGE light comes on.
    - 4) Make sure this EICAS message, FLAP LD RELIEF, shows on the display in the flight compartment.
    - 5) Make sure the flaps do not move.
    - 6) Turn the COMPUTER SWITCH on the EICAS DISPLAY select panel, P9, to the R position.
    - 7) Decrease the pitot-static pressure to the airspeed shown in Table 504.
    - 8) Make sure the amber TRAILING EDGE Light goes off.
    - 9) Make sure the EICAS message, FLAP LD RELIEF, does not show on the top EICAS display.
  - (i) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
    - 1) 11J13, FLAP LOAD RELIEF
  - (j) SAS 050, 051;  
Do the steps that follow:
    - 1) Move the flap control lever to the 25-unit detent and permit the flaps to retract.
    - 2) Increase the pitot-static system pressure to the airspeed shown in Table 501.
    - 3) Make sure the flaps do not move.

EFFECTIVITY

ALL

27-51-00

- 4) Move the flap control lever to the 20-, 15-, and 5-unit detents and permit the flaps to retract to each position.
  - 5) Make sure the movement of the flaps do not change because of the load relief signal.
- (k) SAS 150-280;
- Do the steps that follow:
- 1) Move the flap control lever to the 20-unit detent and permit the flaps to retract.
  - 2) Increase the pitot-static system pressure to the airspeed shown in Table 503.
  - 3) Make sure the movement of the flaps do not change because of the load relief signal.

S 215-224

- (9) Depressurize the captains PT and S1 (left) or the first officers PT and S1 (right) pitot-static system (AMM 34-11-00/201).

S 865-249

- (10) If you isolated the left ADC to do this test, close this circuit breaker on the P11 panel:
- (a) 11F30, AIR DATA COMPUTER R

S 865-250

- (11) If you isolated the right ADC to do this test, close this circuit breaker on the P11 panel:
- (a) 11A10, AIR DATA COMPUTER L

S 865-226

- (12) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P6 panel:
- (a) 6K14, PITOT PROBE HT CAPT PHASE A
  - (b) 6K15, PITOT PROBE HT CAPT PHASE B
  - (c) 6K16, PITOT PROBE HT R AUX PHASE B
  - (d) 6K17, PITOT PROBE HT R AUX PHASE C
  - (e) 6K20, PITOT PROBE HT L AUX PHASE C
  - (f) 6K21, PITOT PROBE HT L AUX PHASE B
  - (g) 6K22, PITOT PROBE HT F/O PHASE B
  - (h) 6K23, PITOT PROBE HT F/O PHASE A

EFFECTIVITY

ALL

27-51-00

S 865-227

- (13) Move the flap control lever to the zero (FLAPS UP) detent and permit the flaps to move to the fully retracted position.

S 865-228

- (14) Turn the COMPUTER SWITCH on the EICAS DISPLAY select panel, P9, to the L position, if the switch is on the R position.

S 865-229

- (15) Remove the power from the center hydraulic system (AMM 29-11-00/201).

E. Put the Airplane Back to Its Usual Condition

S 865-322

- (1) Remove electrical power (AMM 24-22-00/201).

TASK 27-51-00-735-238

10. Flap Failure Protection System - Test

A. References

- (1) AMM 24-22-00/201, Electrical Power - Control

(4) AMM 32-00-20/201, Landing Gear Downlocks

B. Access

(1) Location Zones

144	Right MLG Wheel Well
211/212	Control Cabin
500/600	Left Wing / Right Wing
710	Nose Landing Gear and Doors
730/740	Left/Right Main Landing Gear and Doors

C. Prepare for the System Test

S 865-296

- (1) Supply electrical power (AMM 24-22-00/201).

S 865-485

- (2) Make sure the COMPUTER switch on the EICAS DISPLAY select panel, P9, is in the L position.

S 215-300

- (3) Make sure the TE flaps and the LE slats are in the fully retracted position.

S 215-301

- (4) Make sure the flap control lever is in the zero (FLAPS UP) detent (Fig. 511).

EFFECTIVITY

ALL

27-51-00

27

Page 576  
Apr 22/09

S 215-173

- (5) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

S 495-174

**WARNING:** USE THE PROCEDURE IN AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT

- (6) Open the doors for the landing gear and install the door locks (AMM 32-00-15/201).

D. Test for the Flap Failure Protection System

S 865-175

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (1) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 865-176

- (2) Move the flap control lever to the 1-unit detent to move the slats to intermediate position while you keep the flap in the fully retracted position.

S 485-255

- (3) Attach a DO-NOT-OPERATE tag to the flap control lever.

S 865-177

- (4) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).

S 035-178

- (5) Remove the nut and washer from the bolt that attaches the control rod to the pilot input arm on the TE flap PDU (Detail E, Fig. 501).

EFFECTIVITY

ALL

27-51-00

S 865-179

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

(6) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 035-180

(7) Remove the bolt that attaches the control rod to the pilot input arm, but do not move the pilot input arm.

S 865-181

(8) Open this circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:  
(a) 11J14, FLAP SHUTOFF

S 985-182

(9) Move the pilot input arm to the extend direction, clockwise (View E, Fig. 501) approximately 15-20 degrees, and do these checks:  
(a) Make sure the flap movement stops when you move the pilot input arm.  
(b) Make sure the manual override lever moves to the No. 1 position (bypass) on the PDU bypass valve (Detail F, Fig. 501).  
(c) Make sure this EICAS message, TE FLAP SHUTDOWN, shows on the display in the flight compartment.  
(d) Turn the COMPUTER switch on the EICAS DISPLAY select panel, P9, to the R position.  
(e) Make sure this EICAS message, TE FLAP SHUTDOWN, stays on the display in the flight compartment.  
(f) Turn the COMPUTER switch on the EICAS DISPLAY select panel back to the L position.

EFFECTIVITY

ALL

27-51-00

02

Page 578  
Dec 22/00

- (g) Make sure the flap position indicator stopped in an area between the 1-unit and 5-unit marks.

S 435-183

- (10) Move the pilot input arm back to the initial position and connect the control rod.

S 865-184

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM THE FLAPS AND SLATS IN THE SUBSEQUENT STEP. ACCIDENTAL MOVEMENT OF THE SLATS CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (11) Remove the DO-NOT-OPERATE tag and move the flap control lever to the 5-unit detent, and do these checks:
  - (a) Make sure the amber TRAILING EDGE light comes on.

**NOTE:** This light and the TE FLAP DISAGREE message may already be on, otherwise they will show up in less than one minute.

- (b) Make sure this EICAS message, TE FLAP DISAGREE, shows on the display screen in the flight compartment.

S 865-185

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM THE FLAPS WHEN YOU OPERATE THE FLAP ALTERNATE DRIVE. ACCIDENTAL MOVEMENT OF THE FLAPS CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (12) Push the TE arming switch for the flap alternate drive to arm the flap alternate drive (ALTN switch light comes on).

S 215-186

- (13) Push the TE arming switch for the flap alternate drive again to disarm the flap alternate drive (ALTN switch light goes off), and do these checks:
  - (a) Make sure the EICAS message, TE FLAP DISAGREE, does not show on the display screen in the flight compartment.
  - (b) Make sure the amber TRAILING EDGE light goes off when the flaps move to the 5-unit position.
  - (c) Make sure the EICAS message, TE FLAP SHUTDOWN, does not show on the display screen in the flight compartment.

(1) Remove electrical power (AMM 24-22-00/201).

TASK 27-51-00-715-241

13. Flap/Slat Shutoff Valve - Test

NOTE: The data given in this task is necessary only for scheduled maintenance .

For this test, the flap degree-position refers to the inboard main flap. The outboard main flap will move approximately to the same degree position as the inboard main flap. When you read the flap position indicator, a position tolerance of 1/32 of an inch is permitted for the L and R needles.

During this test, make sure the amber LEADING EDGE and TRAILING EDGE lights on the first officer's main instrument panel, P3, do not show, and that there are no messages on the EICAS display.

D. Test the Sensor Check BITE with the FSEU (Fig. 503)

S 745-412

- (1) Push the ON/OFF button on the front panel of the FSEU to turn on the display.

NOTE: The display will show "EXISTING FAULTS?"

S 745-413

- (2) Push the NO button until GROUND TESTS? shows on the display.

S 745-414

- (3) Push the YES button to select GROUND TESTS? on the FSEU.

NOTE: LD RELIEF ACTR? will show on the display.

S 745-415

- (4) Push the NO button until "SENSOR CHECK?" shows on the display.

S 745-416

- (5) Push the YES button to perform the Sensor Check BITE test.

NOTE: TEST IN PROGRESS will show on the display.

S 745-417

- (6) If TEST PASSED shows on the display, the test is complete.

S 745-418

- (7) If "N FAULTS FOUND" shows on the display, do a check for EXISTING FAULTS with the FSEU:

NOTE: N is the number of faults detected during the Load Relief System Test. N is a number between 1 to 999.

- (a) Make a list of all the fault messages and maintenance message numbers.

NOTE: You can use the up and down arrow buttons to scroll through the list of messages.

- (b) Record the message number that shows.

NOTE: "FAULT DETAILS?" will show between each fault message.

EFFECTIVITY

ALL

27-51-00

- (c) Push the YES button to select "MORE DETAILS?". The maintenance message number will show. Use the down arrow button to find the flight deck effect, type and status for the message.

NOTE: If you push the YES button with a maintenance message displayed, "SWITCH INACTIVE" will show and then the message name will show again.

- (d) Do the corrective action for the faults shown (FIM 27-51-00/101, Fig. 104, Table A).

E. Put the Airplane Back to Its Usual Condition

S 865-409

- (1) Remove the power from the center hydraulic system (AMM 29-11-00/201).

S 865-408

- (2) Remove electrical power (AMM 24-22-00/201).

FLAP/SLAT ELECTRONICS UNIT – DESCRIPTION AND OPERATION

1. TE Flap and LE Slat Control

A. General

- (1) Flap/Slat Electronics Unit (FSEU) (Fig. 1)
  - (a) The FSEU is a microprocessor controlled unit designed to provide primary system sequencing, interlock, and protection circuits for the trailing edge flap and leading edge slat systems. It also provides for indication of flap and slat position and for system failure indication through EICAS messages. Flap and slat operation are controlled by the FSEU in alternate drive.
  - (b) The unit monitors the position and direction of motion of flaps and slats, and the position of the flap lever and the alternate position select switch. The microprocessor determines validity of the commands and of the movement of the surfaces. Output commands or fault indications are produced accordingly.
  - (c) The FSEU is divided into three sections, each with its own power supply and specific functions. Some crossfeed of data is used but the sections are primarily independent.
  - (d) Section 1 functions:
    - 1) Hydraulic system interlock
    - 2) Flap and slat asymmetry protection and indication
    - 3) Flap and slat failure (uncommanded motion) protection
    - 4) Flap load relief
  - (e) Section 2 functions:
    - 1) Flap and slat disagreement indications
    - 2) Flap load relief failure indication
    - 3) TE and LE light indications
  - (f) Section 3 functions:
    - 1) Flap and slat alternate drive control
  - (g) The 285T0049-53 and subsequent FSEUs have a different connector key arrangement than the 285T0049-50 and earlier FSEUs. The -53 FSEU can replace a -50 but a -50 cannot replace a -53 FSEU for installation in the E2 rack.

EFFECTIVITY

ALL

27-51-01

02

Page 1  
Dec 10/98

- (h) The 285T0049-63 and subsequent FSEUs have a different connector key arrangement than the 285T0049-53 and earlier FSEUs. The -63 FSEU can replace a -53 but a -53 cannot replace a -63 FSEU for installation in the E2 rack.
- (i) ON AIRPLANES WITH FSEU POWER INPUT FILTERS;  
three power input filters are installed on the 28v ac power inputs to the FSEU to decrease high frequency noise and to give cleaner 28v ac inputs to the FSEU. If any of these filters becomes faulty, high frequency noise is transmitted by the 28v ac power inputs to the FSEU and the FLAP/SLAT ELEC message can be shown on the EICAS computer.

B. Control

- (1) Electrical Components Relating to the FSEU (refer to AMM 27-51-00/001, AMM 27-58-00/001, AMM 27-81-00/001, AMM 27-88-00/001, Description and Operation, for component illustrations)
  - (a) Flap Lever Position Transmitters (2) (Fig. 2)
    - 1) Two RVDTs (Rotary Variable Differential Transformers) located on the flap control lever position gearbox sense the position of the flap lever. RVDT #1 sends flap position to section 2 of the FSEU for use in flap disagree logic and flap load relief failure indication logic. RVDT #2 sends flap position to section 1 of FSEU for flap load relief, flap failure and flap asymmetry logic.
    - 2) The 28v ac excitation voltage for RVDTs #1 and #2 comes from FSEU section 2 and section 1 power supplies respectively.
  - (b) Flap Position Transmitters (Fig. 2)
    - 1) Five position transmitters provide inputs to the FSEU and FSPM (Flap Stabilizer Position Module) for flap asymmetry, flap position, and flap position needle indications. Transmitters are located at positions 1, 3, 4, 5, and 8.
    - 2) The transmitters at positions 1, 4, 5, and 8 contain resolvers for flap asymmetry detection. Each resolver has 28v ac applied independently to the rotor windings. A voltage is induced in both pairs of stator windings which is proportional to the angular displacement of the flap system. The induced stator voltages of each resolver are read by the FSEU which compares the signals of #1 to #8 and #4 to #5. The voltage difference of the resolvers being compared is seen by the FSEU as asymmetry.

- 3) Position transmitters 1 and 8 contain synchro windings in addition to the resolver. These windings are connected to the flap position indicator needles to show left and right flap position between 1 and 30. These signals do not pass through the FSEU. Power for the synchros comes from separate circuit breakers.
  - 4) Since there is no flap motion between "0" and "1", and no synchros monitoring slat position, motion from "0" to "1" is simulated by two synchros with fixed position indicating "1/2" or "0". The FSEU selects between flap synchros and reference synchros via relay based on flap and slat positions. The PSEU selects between "1/2" and "0" indication based on slat position.
  - 5) Transmitters 3 thru 5 have rotary variable differential transformers (RVDTs). Transmitters 3, 4, and 5 provide flap position information to the FSPMs (L, C, and R respectively) which changes the AC signal to DC and sends it to the FSEU (sections 2, 1, and 3 respectively).
- (c) Slat Power Drive Unit Position Transmitters (4)
- 1) Two position transmitters (RVDTs) are located on the outboard slat PDU and two on the inboard slat PDU. The #1 inboard and outboard RVDTs receive 28v ac excitation from FSEU section #1. Position data is returned for use in the LE slats shutoff valve logic and L stall warning logic.
  - 2) The #2 RVDTs receive 28v ac excitation from and provide position data to FSEU section 3. This is used in LE Slat Alternate Drive logic and R Stall Warning Logic.
- (d) Flap/Slat Alternate Drive Switches
- 1) Two pushbutton switch/lights are provided on the P3-1 panel, one for LE slats and one for TE flaps. A rotary switch, ALTN FLAPS, selects flap and/or slat position, in alternate drive mode, instead of the flap lever.
  - 2) The alternate arm switches drive the slat or flap bypass valves to bypass and arm external relays. Arm switches interface with the FSEU.

EFFECTIVITY

ALL

27-51-01

07

Page 6  
Apr 22/01

- 3) AIRPLANES WITH A -63 OR SUBSEQUENT FSEU;  
The rotary switch position is monitored by sections two and three of the FSEU and is used whenever flap lever position would be used during primary drive. Flap position logic and alternate switch position are used to develop flap extend or retract commands. Slat extend or retract commands are developed from alternate switch position logic and inboard and outboard slat PDU position logic.
- (2) Electro-Mechanical Components Relating to the FSEU (refer to AMM 27-51-00/001, AMM 27-58-00/001, AMM 27-81-00/001, AMM 27-88-00/001, Description and Operation, for component illustrations)
  - (a) Power Drive Units (3)
    - 1) Three power drive units (PDUs) provide the power to extend and retract flaps and slats. One PDU each is provided for flaps, inboard slats, and outboard slats. Each PDU includes a hydraulic motor, electric motor and bypass valve. The slat PDUs also have position transmitters mentioned above.
    - 2) In Alternate Drive, three phase power is applied to the electric drive motors through relays which are controlled by the FSEU logic. Flap position and alternate switch position determine which direction the motor should turn. Reversal is achieved by swapping 2 phases of the input power. The motor stops when position logic shows the flaps and alternate switch position are equal.
  - (b) Shutoff Valves (2)
    - 1) Solenoid operated hydraulic shutoff valves, one for the slats and one for the flaps, are controlled by the FSEU through relays. The FSEU closes these valves, under certain conditions, to protect hydraulic devices and PDUs against erosion due to high pressure for long periods and to guard against undesirable aerodynamic configurations between flaps and slats. The slat shutoff valve also operates under FSEU control to shut down an uncommanded motion or asymmetry.

EFFECTIVITY

ALL

27-51-01

07

Page 7  
Apr 22/01

- (c) Bypass Valves (3)
  - 1) One motor operated bypass valve is located on each PDU. In the NORM position, the valve allows normal operation of the PDU. In the BYPASS position, hydraulic fluid is routed around the valve. This occurs whenever an uncommanded motion or asymmetry is detected by the FSEU or when alternate drive is selected. The bypass valve is driven by the FSEU via relays for protection function and by the alternate arm switch when alternate drive is selected.
- (d) Load Relief Actuator
  - 1) ON 767-200 AIRPLANES;  
The motor-operated load relief actuator is located at the control cable input to the flap PDU. It is activated by the FSEU via relay when airspeed exceeds 30-unit flap lever detent safe airspeed and flap position is greater than 25. When activated, the load relief actuator retracts the flaps to 25 position. Flaps are extended again if airspeed drops to 4 knots below 30-unit flap lever detent safe airspeed.
  - 2) ON 767-300 AIRPLANES;  
The motor-operated load relief actuator is located at the control cable input to the flap PDU. It is activated by the FSEU via a relay when airspeed exceeds 25-unit or 30-unit flap lever detent safe airspeed and flap position is greater than 20 or 25 respectively. When activated, the load relief actuator retracts the flaps to 20-unit position. Flaps are extended again if airspeed drops to 4 knots below 25-unit or 30-unit flap lever detent safe airspeed.
- (3) Electronic Components Relating to the FSEU (refer to AMM 27-51-00/001, AMM 27-58-00/001, AMM 27-81-00/001, AMM 27-88-00/001, Description and Operation, for component illustration)
  - (a) Flap/Stabilizer Position Module (FSPM) (3)
    - 1) The left, center, and right FSPMs receive flap position information from the RVDT portions of flap position transmitter 3, 4, and 5 respectively. The RVDT excitation voltage (28v ac) comes from the applicable FSPM. This AC voltage is converted to a DC voltage by the FSPM and sent to the FSEU sections 2, 1, and 3 respectively.

EFFECTIVITY

ALL

27-51-01

- (b) Proximity Switch Electronics Unit (PSEU)
  - 1) The PSEU senses slat position from proximity switch configuration and receives slat position commands (retracted, takeoff, landing) from the FSEU. These are compared by PSEU using proximity switch inputs and agreement or disagreement signals sent back to the FSEU. Inboard and outboard slat asymmetry signals are also sent to the FSEU from the PSEU. The PSEU controls the flap indicator needle, via relays and reference transmitters, in the intermediate (1/2 indication) and full up (0 indication) position.
- (c) Air Data Computer (ADC) (2)
  - 1) Both right and left air data computers (ADC) provide airspeed information to the FSEU for use in load relief command logic. Left ADC is primary. FSEU selects right ADC if left is invalid.
- (d) EICAS Display
  - 1) The FSEU logic provides grounds to the EICAS computers to display fault messages. The leading edge or trailing edge light (as applicable) on P3-1 panel is illuminated to alert the pilot to the EICAS message.
  - 2) EICAS Messages
    - a) ON 767-200 AIRPLANES;  
FLAP LD RELIEF - Displayed when load relief is commanded but flaps do not move to 25 position.
    - b) ON 767-300 AIRPLANES;  
FLAP LD RELIEF - Displayed when load relief is commanded but flaps do not move to 20-unit position from 25-unit position, or to 20-unit position from 30-unit position.
    - c) TE FLAP ASYM - Displayed if flaps reach an undesirably asymmetric condition.
    - d) TE FLAP DISAGREE - Displayed if flaps are not in commanded position and are not moving toward the commanded position.

EFFECTIVITY

ALL

27-51-01

 **BOEING**  
767  
MAINTENANCE MANUAL

- e) LE SLAT ASYM - Displayed when asymmetry exists for more than 4 seconds in primary or 10 seconds in alternate drive. Also displayed when slats are shut down due to an asymmetry condition.
- f) LE SLAT DISAGREE - Displayed if slats are not in the commanded position and not moving toward the commanded position.
- g) FLAP/SLAT ELEC - Displayed whenever an RVDT , resolver, or FSPM fails, any FSPM is in BITE, or any section of the FSEU loses its 28V AC excitation voltage. The FLAP/SLAT ELEC message will also appear if one or more of these conditions occur:
  - Flap control lever RVDT misrig
  - Outboard LE slat PDU No.1 or No. 2 RVDT misrig
  - Inboard LE slat PDU No.1 RVDT No. 2 misrig
  - Slat shutoff valve failed, detected by the slat hydraulic pressure switch. - Slat hydraulic pressure switch failed.

NOTE: Misrig detection checks are active at altitude above 20,000 feet or when airspeed exceeds 270 knots.

Faults because of the slat shutoff valve failure, and slat hydraulic pressure switch failure are not latched.

Faults because of failures of the flap Lever RVDT No. 2 and inboard slat No. 2 are not latched.

- h) TE FLAP SHUTDOWN - Displayed whenever FSEU section 1 protection logic makes the TE flap PDU bypass valve move to BYPASS, except inhibited when a TE FLAP ASYM message is present in EICAS.
- i) LE SLAT SHUTDOWN - Displayed whenever FSEU section 1 protection logic makes either inboard or outboard LE slat PDU bypass valve move to BYPASS, except inhibited when a LE SLAT ASYM message is present in EICAS.

EFFECTIVITY

ALL

27-51-01

- j) AIRPLANES WITH -603 AND SUBSEQUENT EICAS COMPUTERS;  
SLAT ISLN VAL - Displayed when the hydraulic pressure downstream of the slat shutoff valve is high while the slat shutoff valve is being commanded closed. This message detects a problem with the slat solenoid valve in the flap/slat shutoff valve module.

NOTE: The Signal Consolidation Card (SCC) must be installed for the EICAS computer to show this message.

- 3) Messages a) thru e) above are yellow caution messages and are displayed on the upper EICAS display; f) thru i) are white advisory messages and appear on the lower display. The following table lists these messages, except flap and slat advisory shutdown messages, and indicates the section of the FSEU responsible for generating the message.

FLAP/SLAT EICAS MESSAGE CHART

EICAS MESSAGE	FSEU SECT	FAULT	COMMENT
TE FLAP ASYM	1	FLAP ASYMMETRY	DISPLAYED IF FLAPS REACH AN UNDESIRABLY ASYMMETRIC CONFIGURATION.
TE FLAP DISAGREE	2	FLAP DISAGREEMENT	DISPLAYED IF FLAPS ARE NOT IN COMMANDED POSITION AND ARE NOT MOVING TO THAT POSITION.
ON 767-200 AIRPLANES, FLAP LD RELIEF	2	LOAD RELIEF INOP	DISPLAYED WHEN LOAD RELIEF IS COMMANDED BUT FLAPS DO NOT RETRACT TO 25 POSITION.

(4) FSEU Logic Description (refer to AMM 27-51-00/001, AMM 27-58-00/001, AMM 27-81-00/001, AMM 27-88-00/001, Description and Operation, for schematics with logic diagrams).

(a) TE Flaps Shutoff Valve Logic

- 1) Flap shutoff logic is generated whenever the flaps and flap lever have been in the full UP position for more than 30 seconds. This does not apply to lever position "1" although it is considered a "flaps up" detent.

EFFECTIVITY

ALL

27-51-01

- 2) Shutoff logic is also generated when the flap lever is moved out of the UP position (to extend flaps) and the inboard or outboard slats have not reached takeoff position.
  - 3) Shutoff logic will not be generated under the above condition if the C FSPM fails (cond 1) or slat PDU RVDTs fail (cond 2). The logic will not be generated if Lever RVDT #2 fails or 28v ac excitation to FSEU (section 1) fails.
  - 4) AIRPLANES WITH A -63 OR SUBSEQUENT FSEU;  
Shutoff logic is generated as a redundant shutdown of flap asymmetry or uncommanded motion.
- (b) Flap Load Relief Logic
- 1) ON 767-200 AIRPLANES;  
Flap load relief logic is generated when the flap lever is greater than 25, the flaps are equal to or greater than 25 and airspeed is greater than 30-unit flap lever detent safe airspeed.
  - 2) ON 767-300 AIRPLANES;  
Flap load relief logic is generated when the flap lever is greater than 25, the flaps are equal to or greater than 20 and airspeed is greater than 30-unit flap lever detent safe airspeed. Or when the flap lever is 25, the flaps are equal to or greater than 20 and airspeed is greater than 25-unit flap lever detent safe airspeed.
  - 3) Load relief logic will not be commanded if data from both ADCs is bad. If already generated when ADCs malfunction, load relief logic will remain until the flap lever is moved.
  - 4) Load relief logic will not be generated if the C FSPM, lever RVDT #2 or 28v ac excitation to FSEU (section 1) fails or when the alternate flap drive system is armed. If one of these conditions occur after load relief logic is generated, the logic will be removed.
- (c) Load Relief Inop Indication Logic
- 1) ON 767-200 AIRPLANES;  
The load relief inop indication logic initiates the EICAS message FLAP LD RELIEF. The logic is generated when load relief is commanded and flaps are greater than 25 and are either extending or not moving.
  - 2) ON 767-300 AIRPLANES;  
The load relief inop indication logic initiates the EICAS message FLAP LD RELIEF. The logic is generated when load relief is commanded and flaps are greater than 20 and are either extending or not moving.
  - 3) Load relief inop logic is inhibited if the L FSPM or 28v ac excitation to FSEU (section 2) fails.

EFFECTIVITY

ALL

27-51-01

19

Page 15  
Aug 22/03

- (d) Flap Asymmetry Indication Logic
- 1) The flap asymmetry indication logic initiates the EICAS message TE FLAP ASYM. The logic is generated when output voltage of any pair of resolvers exceeds the prescribed value. The logic is reset by cycling the TE alternate drive arm switch or by retracting the TE flaps. If asymmetry still exists, logic and EICAS message will be regenerated.
  - 2) Flap asymmetry indication logic will not be generated if 28v ac excitation to FSEU (section 1) has failed or the FSEU has failed.
  - 3) AIRPLANES WITH A -63 OR SUBSEQUENT FSEU; the FSEU will not generate the flap asymmetry indication logic if exactly one resolver on the left, right, or both wings is failed.
- (e) Flap Failure and Asymmetry Protection Logic
- 1) The bypass valve on the flap PDU is controlled by two logic signals from the FSEU. Flap fail and asymmetry logic is generated to drive the valve into the bypass position when an uncommanded motion is detected or asymmetry occurs. Flap bypass in norm logic is generated whenever the fail and asymmetry logic is zero.
  - 2) Asymmetry is detected by resolvers and monitored by flap asymmetry and indication logic (above).
  - 3) Uncommanded motion, or motion away from commanded position, is detected in two ways:
    - a) When flaps and lever agree, a flag is set. (The flag is reset if flap lever is moved.) If a disagree condition is detected and lever position has not changed, the protection logic is generated and PDU is bypassed.
    - b) If flap lever is moved and motion of flaps is in the wrong direction, protection logic is generated and PDU is bypassed.
  - 4) If neither logic signal is generated, external relays latch the bypass valve into its current position.
  - 5) Both logic signals are inhibited if the C FSPM, lever RVDT #2, or 28v ac excitation to FSEU (section 1) have failed or when the alternate flap system is armed.
- (f) Flap and Slat Position Indication Logic
- 1) The FSEU generates reference transmitter select logic when flaps are retracted and inboard or outboard slats are less than takeoff position. Needle indication is at "1/2". This logic is not generated if 28v ac excitation to FSEU (section 3) or R FSPM fails.
  - 2) The PSEU generates all slats retracted logic to select "0" indication, via relay, from the fixed synchro when slats are in fully retracted position.

EFFECTIVITY

ALL

27-51-01

- (g) Flap Disagree Indication Logic
  - 1) Flap disagree indication logic initiates the EICAS message TE FLAP DISAGREE when the flaps are not in the commanded position and not moving toward that position.
  - 2) Flap position cannot be detected between "UP" and "5" so time delays are employed under the following conditions before logic is produced. Time delays differ for type of drive.
    - a) Flaps remain in "UP" position for too long (12 sec, primary; 20 sec, altn) and flap lever or alternate select switch is in some other position.
    - b) Flaps remain between "UP" and "5", or in "UP", for too long (45 sec, primary; 150 sec, alternate) and Lever or alternate select switch is in some other position.
  - 3) Flap disagree indication logic and EICAS message are also generated in alternate flap drive if the alternate select switch is in "NORM" or more than one switch position is grounded for more than 7 seconds.
  - 4) Flap disagree logic and TE FLAP DISAGREE message are inhibited if L FSPM, program pins, the FSEU, or 28v ac excitation to FSEU (section 2) have failed or when the EICAS message TE FLAP ASYM is displayed. In primary mode, the disagree logic is inhibited if the flap lever #1 RVDT is failed. The disagree logic and message are also inhibited when flaps are commanded to extend and the slats have not reached takeoff position. (Slats must deploy first so disagreement in flaps and commanded position is not considered significant at that point.)
- (h) Trailing Edge Light Logic
  - 1) Flap light logic provides a ground to the TE LIGHT to alert the crew to any of the following EICAS messages.
    - a) TE FLAP DISAGREE
    - b) TE FLAP ASYM
    - c) FLAP LD RELIEF
- (i) Flap Alternate Drive Logic
  - 1) Flap extend enable logic or flap retract enable logic is generated in alternate drive when FSPM voltage representing flap position is outside the range for detent selected by the alternate position select switch. The logic signal grounds the alternate flaps extend or alternate flaps retract relay. When one relay is energized the other is locked out.

EFFECTIVITY

ALL

27-51-01

 **BOEING**  
767  
MAINTENANCE MANUAL

- 2) No drive logic can be generated until alternate position switch has been out of NORM for one second. Logic is also inhibited if the FSEU, R FSPM or 28v ac excitation to FSEU (section 3) has failed, or if the R FSPM is in BITE, or if more than one switch position is grounded.
- (j) LE Slat Shutoff Valve Logic
- 1) Slat shutoff logic is generated whenever the slats and flap lever have been in the same position for 30 seconds.
  - 2) Logic is generated when flap lever is moved from "1" to "UP" and flaps are not fully retracted. Shutoff prevents slats from moving until flaps are full up.
  - 3) Shutoff logic is also generated when slats and lever are in a takeoff position other than "1". This prevents slats from moving slightly when flap lever is moved to "UP" position and valve has not closed yet due to condition 2) above. (If movement of slats were to occur under these conditions, an uncommanded motion shutdown would occur using bypass valve. Such a shutdown in this case would be unjustified.)
  - 4) AIRPLANES WITH A -63 OR SUBSEQUENT FSEU;  
Shutoff logic is also generated as a redundant shutdown of slat asymmetry or uncommanded motion.
  - 5) Shutoff valve logic will not be generated in conditions 2) and 3) if C FSPM fails. If Lever RVDT #1, slat PDU RVDTs or 28v ac excitation to FSEU (section 1) fails, shutoff valve logic will not be generated.
- (k) Slat Asymmetry Indication Logic
- 1) Slat asymmetry indication logic initiates EICAS message LE SLAT ASYM. The logic is generated whenever an asymmetry condition exists, as detected by the proximity switches, for more than 4 seconds in primary or 10 seconds in alternate drive. An asymmetry indication does not result in shutdown until the lever is subsequently moved.
  - 2) The logic is inhibited if 28v ac excitation voltage to FSEU (section 1) fails.

EFFECTIVITY

ALL

27-51-01

20

Page 18  
Apr 22/01

- (L) Slat Failure and Asymmetry Protection Logic
- 1) Inboard and outboard slats are driven by separate PDUs, but logic signals and operation of bypass valves is the same for both. Therefore both will be covered together.
  - 2) The bypass valve on the slat PDU is controlled by two logic signals from the FSEU. Inbd (outbd) fail and asymmetry logic is generated to drive the valve into the bypass position when an uncommanded motion is detected or asymmetry occurs. Inbd (outbd) bypass valve in norm logic is generated whenever the fail and asymmetry logic is zero.
  - 3) Asymmetry is detected by the PSEU from proximity switches and passed to FSEU every time a slat position is left or entered. To avoid shutting down the slats under these conditions, a flag is set when slats and flap lever agree and an asymmetry exists (reset when asymmetry is gone). If the flag is still set when flap lever is moved again, the slats are shut down (inbd (outbd) fail and asymmetry logic is generated).
  - 4) Uncommanded motion is related to shutdown of slats as follows:
    - a) Motion for two seconds, away from commanded position is interpreted as uncommanded motion by the FSEU and causes shutdown of slats.
    - b) When flaps have been commanded to UP by flap lever in zero (FLAPS UP) detent, slats will not retract from takeoff position (slat position signal from outboard slats) until flaps are fully retracted, due to closure of slat shutoff valve. If slat shutoff valve fails to close and inboard and outboard slat motion occurs, an uncommanded motion condition exists, but the FSEU will not recognize this and the FSEU will not generate logic to close the bypass valve on the inboard slat PDU and the outboard slat PDU.
  - 5) If neither logic signal is generated, external relays latch the bypass valve into its current position. This would occur when in alternate drive or one of the failures below has occurred.

EFFECTIVITY

ALL

27-51-01

- 6) Both logic signals are inhibited if the FSEU, flap Lever RVDT #2, inbd (outbd) PDU RVDT or 28v ac excitation to FSEU (section 1) has failed. Failure of FSPM also inhibits case b) of uncommanded motion (above).
- (m) Slat Disagree Indication Logic
- 1) Slat disagree indication logic initiates the EICAS message LE SLAT DISAGREE when slats are not in the commanded position and are not moving toward that position.
  - 2) Three slat command outputs (retract, takeoff, landing) from FSEU (section 1) tell the PSEU where the slats should be. The PSEU returns a signal to FSEU (section 2) to indicate agreement/disagreement. The FSEU also determines whether the slat PDUs are at or moving toward the commanded position. The FSEU (section 2) uses this information to enable or inhibit disagree logic and EICAS message as applicable.
  - 3) The slat disagree indication logic and EICAS disagree message are also generated in alternate slat drive if the alternate position switch is in "NORM" or more than one switch position is grounded for more than 7 seconds.
  - 4) The logic and message are inhibited under various conditions:
    - a) When slats are commanded to retract and flaps are not yet fully up.
    - b) When both inboard and outboard slats are moving toward the command, or when one is at the position and the other is still moving (but not when RVDTs indicate both are in commanded position). This allows final agreement determination to rest with the proximity switches.
    - c) When flap lever RVDT #1 or 28v ac excitation to FSEU (section 2) has failed or section 2 excitation has failed in primary or section 3 excitation has failed in alternate.
    - d) When inboard slat PDU RVDT #1 or outboard slat PDU RVDT #1 has failed.

EFFECTIVITY

ALL

27-51-01

- (n) Slat Alternate Drive Logic
  - 1) Inboard and outboard slats are driven by separate PDUs but logic signals and operation of alternate drive system is the same for both. Therefore, both will be covered together.
  - 2) Slat extend enable logic or slat retract enable logic is generated in alternate drive when slat PDU RVDT #2 voltage is outside the range for the detent selected by the alternate position switch and continues until voltage is at or past the center of that range. The logic grounds the alternate slat extend or alternate slat retract relay. When one relay is energized, the other is locked out.
  - 3) No drive logic can be generated until alternate position switch has been out of NORM for one second. Logic is also inhibited if command position is "UP" and flaps have not fully retracted. Slat PDU RVDT #2 failure, loss of 28v ac excitation to FSEU (section 3), or more than one alternate switch position grounded will inhibit slat alternate drive logic.
- (o) Leading Edge Light Logic
  - 1) Slat light logic provides a ground to the LE LIGHT to alert the crew to the following EICAS messages.
    - a) LE SLAT DISAGREE
    - b) LE SLAT ASYM
- (p) FSEU Fail Logic
  - 1) Each section of the FSEU can generate the FSEU fail logic which initiates the FLAP/SLAT ELEC message on EICAS. Each section produces the logic for different reasons.
  - 2) Section 1 produces fail logic for any of the following faults.
    - a) Inboard slat RVDT #1 fail
    - b) Outboard slat RVDT #1 fail
    - c) Flap lever RVDT #2 fail
    - d) Center FSPM fail
    - e) Center FSPM in BITE
    - f) Loss of 28v ac excitation
    - g) AIRPLANES WITH A -32 OR SUBSEQUENT FSEU;  
Flap control lever resolver fail
    - h) Flap control lever resolver fail
    - i) Shutoff valve output fail
    - j) Slat hydraulic pressure switch fail

k) Flap control lever RVDT No. 2 misrig

NOTE: Misrig detection checks are active at altitude above 20,000 feet or when airspeed exceeds 270 knots.

Faults because of the slat shutoff valve failure and slat hydraulic pressure switch failure are not latched.

Faults because of misrigs of the flap lever RVDT No. 2 are latched.

3) Section 2 produces fail logic for any of the following faults.

- a) Left FSPM fail
- b) Left FSPM in BITE
- c) Flap lever RVDT #1 fail
- d) Loss of 28v ac excitation

4) Section 3 produces fail logic for any of the following faults.

- a) Inboard slat RVDT #2 fail
- b) Outboard slat RVDT #2 fail
- c) Right FSPM fail
- d) Right FSPM in BITE
- e) Loss of 28v ac excitation
- f) Outboard slat PDU RVDT No. 2 misrig (RVDT rig check is enabled by in Section 1, the enabling signal is transmitted internally to Section 3 of the FSEU).

FLAP/SLAT ELECTRONICS UNIT – REMOVAL/INSTALLATION

1. General

- A. This procedure gives the data for the removal and installation of the Flap/Slat Electronics Unit.
- B. The Flap/Slat Electronics Unit (FSEU) is found on the E2 equipment rack.
- C. AIRPLANES WITH FSEU POWER INPUT FILTERS;  
This procedure also gives the data for the removal and installation of the FSEU Power Input Filter.

TASK 27-51-01-024-001

2. Remove the Flap/Slat Electronics Unit (FSEU)

A. References

- (1) AMM 20-10-01/401, E/E Rack Mounted Components – Boxes and Cards
- (2) AMM 29-11-00/201, Main (Left, Right and Center) Hydraulic Systems

B. Access

- (1) Location Zone  
120 Main Equipment Center (Right)
- (2) Access Panel  
119AL Main Equipment Center

C. Remove the FSEU

S 214-002

- (1) Make sure that the trailing edge (TE) flaps and the leading edge (LE) slats are in the fully retracted position.

S 214-003

- (2) Make sure that the flap control lever is in zero (FLAPS UP) detent.

S 494-004

- (3) Attach a DO-NOT-OPERATE tag to the flap control lever.

S 864-005

- (4) Remove the power from the center hydraulic system (AMM 29-11-00/201).

S 864-006

- (5) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
  - (a) 11C15, FLAP SLAT ELEC UNIT 1 SENSOR
  - (b) 11C16, FLAP SLAT ELEC UNIT 1 CONT
  - (c) 11G15, FLAP SLAT ELEC UNIT 2 SENSOR

S 864-012

- (5) Supply electrical power (AMM 24-22-00/201).

S 744-122

- (6) AIRPLANES WITH -53 OR EARLIER FSEU;

Do these steps to test the FSEU:

- (a) Push the TEST button on the front panel of the FSEU and make sure all the lights come on.
- (b) Push the BIT/VERIFY button and wait for the test complete light to come on.

NOTE: Make sure that no fault lights come on.

S 744-124

- (7) AIRPLANES WITH -63 FSEU;

Do these tasks to test the FSEU and flap position transmitters:

- (a) Do the BITE test of the FSEU (AMM 27-51-00/501).
- (b) Do the flap position transmitter adjustment check (AMM 27-51-45/201).

NOTE: This check makes sure the flap position transmitters are calibrated to the FSEU within correct limits.

S 214-014

- (8) Make sure the arming switches for the flap and slat alternate drives are not in the armed position (switch lights off).

S 214-015

- (9) Make sure the position selector switch for the flap/slat alternate drive is in the NORM position.

S 864-015

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

(10) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 214-016

(11) Make sure that the amber TRAILING EDGE and LEADING EDGE lights on the P3 panel are off.

S 214-017

(12) Make sure there are no flap/slat messages shown on the EICAS display.

S 214-018

(13) Make sure the flap position indicators are in the UP position.

S 864-019

(14) Push the arming switches for the flap and slat alternate drive to arm the flap/slat alternate drives (the light on each switch comes on).

S 214-020

(15) Make sure that the Flaps/Slats position selector switch is in the NORM position for more than seven seconds and see that:  
(a) The amber TRAILING EDGE and LEADING EDGE lights come on.  
(b) The TE FLAP DISAGREE and LE SLAT DISAGREE EICAS messages show on the flight compartment display.

S 864-016

**CAUTION:** DO NOT OPERATE THE ALTERNATE DRIVE MOTOR CONTINUOUSLY FOR MORE THAN 4 MINUTES. DO NOT OPERATE THE MOTOR AGAIN UNTIL IT IS COOL FOR AT LEAST 20 MINUTES TO PREVENT DAMAGE TO THE MOTOR.

- (16) Turn the position selector switch for the flap/slat alternate drive to the 30-unit detent and do the checks that follow:
- (a) Make sure the TE flaps and the LE slats move to the fully extended position.
  - (b) Make sure the amber TRAILING EDGE and LEADING EDGE lights go off and no flap/slat EICAS messages show on the display.
  - (c) Make sure the flap position indicator moves to the 30-unit position.

S 864-023

- (17) Remove the DO-NOT-OPERATE tag from the flap control lever and move the flap control lever to the 30-unit detent.

S 864-017

- (18) Do the steps that follow to disarm the flap and slat alternate drive:
- (a) Push the arming switches for the flap and slat alternate drive to disarm the flap and slat alternate drive (the light in each switch goes off).
  - (b) In less than seven seconds, turn the position selector switch for the flap/slat alternate drive to the NORM position.

S 214-025

- (19) Make sure that the amber TRAILING EDGE and LEADING EDGE lights are off.

S 214-026

- (20) Make sure there are no flap/slat messages shown on the EICAS display.

S 864-027

- (21) Move the flap control lever to the zero (FLAPS UP) detent and do the checks that follow:
- (a) Make sure the TE flaps and LE slats move to the fully retracted position.
  - (b) Make sure the amber TRAILING EDGE and LEADING EDGE lights are off.
  - (c) Make sure that there are no flap/slat messages on the EICAS display.
  - (d) Make sure the flap position indicator moves to the UP position.

S 864-030

- (22) Remove electrical power (AMM 24-22-00/201).

TE FLAPS FUSE PINS – REMOVAL/INSTALLATION

1. General

- A. This procedure contains the removal and the installation tasks for the inboard and outboard flap fuse pins.

TASK 27-51-02-004-001

2. Remove the Fuse Pin for the Inboard and Outboard Flaps

A. Equipment

- (1) Lock Set – Inboard and Outboard Trailing-Edge Flap Linkage –  
A27074-128 (Optional)  
A27074-146 (Recommended)

B. References

- (1) AMM 24-22-00/201, Electrical Power – Control  
(2) AMM 27-51-00/201, Trailing Edge Flap System  
(3) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems  
(4) AMM 32-00-15/201, Landing Gear Door Lock  
(5) AMM 32-00-20/201, Landing Gear Downlock

C. Access

- (1) Location Zones  
555/565 Inboard Trailing-Edge Flap  
566/666 Outboard Trailing-Edge Flap

D. Prepare for Removal

S 214-011

- (1) Make sure the downlock is installed on the nose and main landing gear (AMM 32-00-20/201).

S 494-012

**WARNING:** USE THE PROCEDURE IN AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Open the doors for the landing gear and install the door locks (AMM 32-00-15/201).

S 864-013

- (3) Supply electrical power (AMM 24-22-00/201).

S 864-002

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE ALL CONTROL SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (4) Pressurize the center hydraulic system and reservoir (AMM 29-11-00/201).

S 864-014

- (5) Move the flap control lever to the 30-unit detent.

S 864-004

- (6) Permit the flap to travel to the fully extended position.

**NOTE:** Make sure that the center fairing is clear of all blockage during flap movement.

S 044-015

- (7) Do the deactivation procedure for the TE flap system (AMM 27-51-00/201).

E. Remove the Fuse Pin for the Inboard Flap (Fig. 401)

S 984-016

- (1) Install a support to hold the weight of the inboard main flap, and to release the load on the outboard support linkage for the No. 3 (Left) or No. 6 (Right) rib.

- S 434-021
- (4) Install the fuse pin through the hole.
- S 434-022
- (5) Install the end caps, bolt, and nut.
- S 434-023
- (6) Tighten the nut to 220-410 inch-pounds (25-46 N-m).
- S 084-032
- (7) If installed, remove the lock sets from the flap linkage (Fig. 403).
- S 084-033
- (8) Remove the support from the inboard flap.
- E. Install the Fuse Pins for the Outboard Flap (Fig. 402)
- S 644-026
- (1) Apply a layer of grease to the fuse pins, bolt, end cap, nuts, and washers.
- S 824-027
- (2) At the forward end of the fitting, align the fitting hole to the hole on the support rib and do these steps (Detail B):
- (a) Install the fuse pin, tab washer, and outer nut.
  - (b) For the outboard linkage, tighten the outer nut to 500-600 pound-inches (56-68 N-m).
  - (c) For the inboard linkage, tighten the outer nut to 350-450 pound-inches (40-51 N-m).
  - (d) Install the bolt, end cap, washer, and inner nut.
  - (e) Tighten the inner nut to 50-75 inch-pounds (5.6-8.5 N-m).
  - (f) Install the cotter pin.
  - (g) Connect the lockwires between the tab washer and the outer nut on the fuse pin at two locations.
- S 824-028
- (3) At the aft end of the side brace link, align the hole to the fitting hole, and do the steps that follow:
- (a) Install the fuse pin, washers, and nut.
  - (b) For the outboard linkage, tighten the nut to 150-200 pound-inches (17-23 N-m).
  - (c) For the inboard linkage, tighten the nut to 370-690 pound-inches (42-78 N-m).
  - (d) Install the cotter pin to the fuse pin.

INBOARD FLAP - REMOVAL/INSTALLATION

1. General

A. This procedure contains these four tasks:

- Remove the Inboard Flap with the Aft Flap Attached to the Main Flap
- Install the Inboard Flap with the Aft Flap Attached to the Main Flap
- Remove the Inboard Main Flap with the Aft Flap Disconnected
- Install the Inboard Main Flap with the Aft Flap Disconnected.

B. Refer to AMM 27-51-06/201 for the procedure to remove and install the inboard aft flap.

C. The airplane must be on the landing gear with all the engines attached before you can adjust the flap drive system to the rig position.

D. The adjustment procedure for the inboard flap contains the procedure to adjust the fit and fair of the inboard flaps.

TASK 27-51-03-024-001

2. Inboard Flap - Removal

A. General

- (1) This task contains the procedure to remove the inboard main and aft flap, together as a unit.

B. Equipment

- (1) Circuit Breaker Lockout Clip - 1012LC-R  
Commercially Available
- (2) Restraint, Aft Flap to Inboard Flap - A27019-8
- (3) Sling Equipment, Inboard TE Flap - A27016-27
- (4) TE Flaps PDU Lock - A27009-7
- (5) Shackles, 3/8 inch (9.525 mm) Diameter - Commercially Available.

C. References

D. Access

(1) Location Zones

144	Right MLG Wheel Well
211/212	Control Cabin
550/650	Wing Trailing Edge - Inboard
571/671	Left/Right Inboard Flap Outboard Fairing
710	Nose Landing Gear and Doors
730/740	Left/Right Main Landing Gear and Doors

E. Prepare for the Removal

S 214-002

- (1) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

S 494-003

**WARNING:** USE THE TASK IN AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Open the doors for the landing gear and install the door locks (AMM 32-00-15/201).

S 024-004

- (3) Remove the flap fairing door (AMM 27-51-07/401).

S 864-005

- (4) Supply electrical power (AMM 24-22-00/201).

S 864-006

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (5) Pressurize the center hydraulic system (AMM 29-11-00/201).

EFFECTIVITY

ALL

27-51-03

01

Page 412  
Apr 22/01

- S 824-205
- (6) If an aileron rigging bar is not available, do the steps as follows:
- (a) Move the flap control lever to the zero detent to retract the flaps.
  - (b) Make sure the ailerons are approximately in the neutral position.
  - (c) Measure the aileron-to-flaps trailing edge mismatch and keep the dimension to use for the installation.
  - (d) Make sure the ailerons do not move during the flap removal/installation.
- S 864-007
- (7) Move the flap control lever to the 30-unit detent, and permit the flaps to extend.
- S 864-008
- (8) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).
- S 864-009
- (9) Open this circuit breaker on the main power distribution panel, P6, and attach a DO-NOT-CLOSE tag:
- (a) 6D24, ALTN FLAP PWR
- S 864-010
- (10) Open these circuit breakers on the P6 panel and install circuit breaker locks:
- (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6F24, ALTN SLAT OUTBD PWR
- S 864-011
- (11) Open this circuit breaker on the overhead panel, P11, and attach a DO-NOT-CLOSE tag:
- (a) 11J24, FLAPS ALTN CONT
- S 864-012
- (12) Open these circuit breakers on the P11 panel and install circuit breaker locks:
- (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD
- S 494-013
- (13) Install the PDU lock in the TE flap power drive unit (PDU) (Fig. 407).

EFFECTIVITY

ALL

27-51-03

01

Page 413  
Dec 10/98

F. Remove the Inboard Flap

S 024-014

- (1) Remove the aft section of the flap fairing on the inboard flap (AMM 27-51-15/401).

**NOTE:** You can keep the flaps at the fully extended position to remove the aft fairing.

S 024-234

- (2) Remove aft flap outboard linkage as follows:
  - (a) Hold the aft flap in position with a support.
  - (b) At the outboard linkage, disconnect the pushrod (60) from the top of the bellcrank (61) (View C-C, Figure 402).
  - (c) Attach the restraint between the aft flap and the main flap (Figure 406).
  - (d) Remove the support from the aft flap.

S 034-018

- (3) At the outboard linkage, disconnect the pushrod (62) from the mid fairing and remove the nut (100), bolt (96), washers (97, 99) and bushing (98) (View D-D, Fig. 402).

**NOTE:** Identify the parts for the subsequent installation.

S 494-019

- (4) Extend the inboard spoilers 5 and 6 (left wing) or 7 and 8 (right wing) as applicable, and install the locks on the spoiler actuators (AMM 27-61-00/201).

S 494-020

- (5) Install the flap sling at the three attach points on the upper surface of the main flap (Fig. 405).

**NOTE:** It is necessary to hold the flap at the 30-unit pitch up attitude to remove the flap from the wing.

Add 3/8-inch diameter shackles to the two aft cables of the flap sling, as necessary, to get the flap pitch up attitude in the 30-unit position.

EFFECTIVITY

ALL

27-51-03

01

Page 414  
Apr 22/04

S 494-021

- (6) Connect the overhead hoist to the flap sling.

**NOTE:** Make sure the hoist can hold the weight of the flap with the aft flap attached. The total weight is approximately 470 pounds.

S 034-022

- (7) At the inboard end of the flap, remove the bolts (51, 56), nuts (55), and washers (52, 53, 54) and disconnect the collar fitting (50) from the support beam (View A-A, Fig. 401).

**NOTE:** Make a record of the shim thickness and keep the shim for the subsequent installation.

S 034-023

- (8) At the outboard linkage, disconnect the forward support fitting (63) from the support beam with these steps (View A-A, Fig. 402):
- (a) Remove the pin (94) from the bolt (70) adjacent to the castellated nut (67).
  - (b) Remove the castellated nut (67), bolt (70), and washers (68).
  - (c) Remove the lockwire between the tab washer (65) and the nut (66).
  - (d) Remove the nut (66), tab washer (65), and outer pin (69).

S 034-024

- (9) At the outboard linkage, disconnect the main flap from the support beam with this step (View B-B, Fig. 402):
- (a) Disconnect the four bolts (71), nuts (76), and washers (72, 73, 74, 75, 95).

**NOTE:** Make a record of the shim thickness and keep the shims (77) for the subsequent installation.

S 034-025

- (10) Disconnect the side strut from the support beam and remove the nut (82), bolt (78), washers (79, 81), and bushing (80) (View E-E, Fig. 402).

**NOTE:** Identify these parts with labels for the subsequent installation.

EFFECTIVITY

ALL

27-51-03

01

Page 415  
Apr 22/04

S 024-026

- (11) Remove the inboard flap from the airplane with these steps:
- Lift the inboard aileron to get more clearance to remove the flap if it is necessary.
  - Lift the outboard end of the inboard flap until the forward support fitting (63) is clear from the support beam (View A-A, Fig. 402).
  - Move the flap to the outboard direction until the flap support tube and the collar fitting (50) is clear from the wing-to-body fairing.
  - Lower the flap from the airplane.
  - Remove the sling from the main flap.

**NOTE:** Keep a record of the quantity and location of the shackles that you added to the flap sling for the subsequent installation.

TASK 27-51-03-424-027

3. Inboard Flap - Installation

A. General

- This task contains the procedure to install the inboard main and aft flap to the wing, together as a unit.
- You can use the instructions given in this task to adjust the fit and fair of the inboard flap after the installation.

B. Equipment

- TE Flap PDU Lock - A27009-7
- Restraint, Aft Flap to Inboard Flap - A27019-8
- Sling Equipment, Inboard TE Flap - A27016-27
- Inboard Aileron Rigging Bar - A27024-47 (Recommended); -2 (Optional)
- Shackles, 3/8 inch (9.525 mm) Diameter - Commercially Available.

C. Consumable Materials

- D00633 Grease - BMS 3-33 (recommended)
- D00013 Grease - MIL-PRF-23827 (Supersedes MIL-G-23827) (Alternate)
- A00247 Sealant - BMS 5-95

  - 710 Nose Landing Gear and Doors
  - 730/740 Left/Right Main Landing Gear and Doors

**G. Install the Inboard Flap**

S 214-028

- (1) Make sure the aft flap is held stable to the main flap with the restraint (Fig. 406).

S 494-029

- (2) Add the 3/8-inch diameter shackles, to the two aft cables of the flap sling, to get the flap attitude in the 30-unit position as you did during the flap removal.

**NOTE:** Use the same quantity of shackles for this installation as you did for the flap removal.

EFFECTIVITY

ALL

**27-51-03**

04

Page 417  
Dec 22/05

S 494-030

- (3) Install the sling to the three attach points on the upper surface of the inboard flap (Fig. 405).

**NOTE:** The flap sling must hold the flap in a pitch-up attitude and align the bottom surface of the flap to the upper surface of the outboard support beam. This will permit you to connect the forward support fitting to the forward end of the main flap (Detail A, Fig. 402).

S 494-031

- (4) Connect the overhead hoist to the sling.

**NOTE:** Make sure the hoist can hold the weight of the flap with the aft flap attached. The total weight is approximately 470 pounds.

S 984-032

- (5) Lift the flap up to its position on the wing.

S 984-033

- (6) Lift the inboard aileron to get more clearance to install the flap if it is necessary.

S 984-034

- (7) Lift the outboard end of the flap up, until the forward support fitting (63) is clear from the support beam (View A-A, Fig. 402).

S 824-035

- (8) Move the flap to the inboard direction and align the collar fitting (50) to the mounting holes on the support beam (View A-A, Fig. 401).

S 984-036

- (9) Lower the outboard end of the flap and put the forward support fitting into the support beam.

S 644-037

- (10) Apply a light layer of grease to all the pins, washers, nuts, bushings, and spacers before each installation.

S 644-038

- (11) Apply grease at the lube points until you can see fresh grease come out at the exit.

EFFECTIVITY

ALL

27-51-03

06

Page 418  
Dec 22/05

S 434-039

- (12) At the inboard end of the flap, connect the collar fitting (50) to the support beam with four temporary slave bolts (51, 56), nuts (55), and washers (52, 53, 54).  
(a) Tighten the nuts (55) to 200-250 pound-inches (22.6-28.2 Nm).

S 434-040

- (13) At the outboard linkage, connect the forward support fitting (63) to the support beam with these steps (View A-A, Fig. 402):  
(a) Install the outer pin (69), tab washer (65), and nut (66). Tighten the nut to 290-510 pound-inches (33-58 N-m).  
(b) Install a lockwire between the nut and the tab washer with the double twist procedure (AMM 20-10-23/401).  
(c) Install the bolt (70) through the outer pin (69) with washers (68) and a castellated nut (67). Tighten the castellated nut to 30-50 pound-inches (3.4-5.6 N-m).  
(d) Install the pin (94) through the bolt (70) adjacent to the castellated nut.

S 094-043

- (14) Hold the aft flap in position and remove the restraint between the aft flap and the main flap.

S 434-224

- (15) At the outboard linkage, connect the main flap to the support beam with shims (77), four temporary slave bolts (71), washers (72, 73, 74, 95, 75), and nuts (76). Tighten the nuts (76) to 200-250 pound-inches (22.6-28.2 N-m) (View B-B, Fig. 402).

**NOTE:** Use the shims that you removed before, or install new shims with the same thickness.

**NOTE:** Make sure there is no gap between the nut or shim and the structure with a 0.010 inch (0.254 mm) feeler gauge.

S 094-042

- (16) Remove the sling from the main flap.

S 984-044

- (17) Release the weight and slowly lower the aft flap to the extended position.

S 434-045

- (18) At the outboard linkage, do these steps to connect the pushrods (Fig. 402):  
(a) Connect the pushrod (60) to the top of the bellcrank (61) with a bolt (84), washers (85, 87), bushing (86), and nut (88) (View C-C).

EFFECTIVITY

ALL

27-51-03

02

Page 419  
Dec 22/07

- (b) Tighten the nut to 290-510 pound-inches (33-58 N-m).
- (c) Connect the pushrod (62) to the mid fairing with a bolt (96), washers (97, 99), bushing (98), and nut (100) (View D-D). Tighten the nut.

S 434-046

- (19) Connect the side strut to the support beam with these steps (View E-E, Fig. 402):
  - (a) Remove the lockwire and adjust the length of the side strut as necessary to connect the strut to the support beam.
  - (b) If you adjusted the side strut, install a lockwire to the jamnut with the double twist procedure (AMM 20-10-23/401).
  - (c) Connect the side strut to the support beam with the bolt (78), bushing (80), washer (79, 81), and nut (82).
  - (d) Tighten the nut to 90-125 pound-inches (10.2-14.1 N-m).

S 094-047

- (20) Remove the PDU lock from the TE flap power drive unit (PDU) (Fig. 407).

S 864-048

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELL WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

**CAUTION:** SECURE TRAILING EDGE FLAP FAIRING DOOR ASSEMBLY TO PREVENT CONTACT WITH THE FLAP TORQUE TUBE DURING FLAP RETRACTION.

- (21) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 864-049

- (22) Move the flap control lever to the zero (FLAPS UP) detent and permit the flaps and slats to move to the fully retracted position.

S 864-050

- (23) Retract the inboard spoilers (AMM 27-61-00/201).

EFFECTIVITY

ALL

27-51-03

03

Page 420  
Dec 22/07

S 864-051

- (24) Remove the power from the center hydraulic system (AMM 29-11-00/201).

S 494-052

- (25) Install the PDU lock in the TE flap PDU (Fig. 407).

S 424-053

- (26) Install the flap fairing door (AMM 27-51-07/401).

S 094-054

- (27) Remove the PDU lock from the TE flap PDU (Fig. 407).

S 224-055

- (28) Do these checks on the inboard flap clearances (AMM 27-51-00/501):

**NOTE:** These checks will make sure that the flap drive system did not get out of the correct adjustment during the flap removal and installation.

- (a) Make sure the extended overtravel stop clearance is correct at the inboard and outboard mechanisms (Details D and H, Fig. 403).  
(b) Make sure the retracted overtravel stop clearance is correct at the inboard and outboard mechanisms (Details C and G, Fig. 403).

S 824-056

- (29) Adjust the fit and fair of the inboard flap with the instruction given in this task.

S 424-057

- (30) Install the aft fairing to the inboard flap (AMM 27-51-15/401).  
H. Adjust the Fit and Fair of the Inboard Flap (Fig. 404).

S 494-058

- (1) Install the PDU lock in the TE flap PDU (Fig. 407).

EFFECTIVITY

ALL

**27-51-03**

01

Page 421  
Dec 22/07

S 224-059

- (2) Do the step that follows to set the trailing edge of the inboard aileron 0.40 inch (10.16 mm) below the wing theoretical trailing edge, and measure the aileron-to-flap mismatch (View D-D, Fig. 404):
- (a) If you use an aileron rigging bar, align the aileron lower surface to the 1.40 inch (3.56 cm) mark on the rigging bar.

**NOTE:** Hold the aileron in this position to measure the aileron-to-flap trailing edge mismatch. Do not adjust the rig position of the aileron.

This measurement will tell you if it is necessary to adjust the flap position.

- (b) If you do not use an aileron rigging bar, measure the aileron-to-flap trailing edge mismatch.
- 1) Compare this to the mismatch dimension you measured before you removed the flaps.

S 824-206

- (3) Make sure the outboard trailing edge of the left flap is symmetrical to the opposite location on the right flap within 0.100 inch (2.5 mm).

**NOTE:** Use the inboard aileron as a reference point.

S 824-086

- (4) If the aileron-to-flap mismatch or the flap symmetry requirement is not within the limit, adjust the outboard mechanism with these steps (Fig. 402):
- (a) Remove the nut (82), bolt (78), washers (79, 81), and bushing (80), and disconnect the side strut from the support beam (View E-E).

**NOTE:** Identify the parts with labels for the subsequent installation.

- (b) Adjust the shims at the outboard mechanism (View A-A and B-B) as necessary to get the aileron and flap trailing edge to align correctly.
- (c) Remove the lockwire and adjust the length of the side strut if it is necessary, until you can easily connect the strut to the support beam (View B-B).
- (d) If you adjusted the side strut, install a lockwire to the jamnut with the double twist procedure (AMM 20-10-23/401).
- (e) Connect the side strut back to the support beam with the bolt (78), bushing (80), washers (79 and 81), and nut (82). Tighten the nut to 90-125 pound-inches (10.2-14.1 N-m) (View E-E).

- S 224-087
- (5) At the inboard trailing edge of the flap, do these checks:
- (a) Make sure the distance between the flap trailing edge to the rigging fastener on the wing/body fairing is within the limit (View G-G, Fig. 404).
- S 824-088
- (6) Adjust the shims at the inboard mechanism if it is necessary to get the correct dimension requirement (View B-B, Fig. 401).
- S 224-089
- (7) Make sure the clearance between the main flap and the inboard aileron is correct (View B-B, Fig. 404).
- S 224-095
- (8) 767-200 AIRPLANES;  
Make sure the clearance between the main flap and the fairing door is below the limit (View F-F, Fig. 404). Adjust the fairing door if it is necessary (AMM 27-51-07/401).
- S 224-096
- (9) Make sure the clearance and the mismatch between the upper surface of the aft flap and the cove panel are below the limits (View C-C, Fig. 404).
- S 824-097
- (10) Adjust the bull nose fairing mismatch (AMM 27-51-07/401).
- S 824-098
- (11) Adjust the nose panel mismatch (AMM 27-51-07/401).
- S 824-099
- (12) Measure and adjust the spoiler-to-flap clearances (AMM 27-61-00/501, Adjust Spoiler Control Actuators).
- S 824-100
- (13) Adjust the vertical mismatch between the inboard main flap and the lower trailing edge panel (AMM 57-51-10/501).
- S 394-101
- (14) Apply sealant to the shims at the inboard mechanism of the inboard flap (View B-B, Fig. 401).
- S 394-102
- (15) Apply sealant to the shims at the outboard mechanism of the inboard flap (View A-A and B-B, Fig. 402).
- S 094-227
- (16) Remove the PDU lock from the TE flap PDU (Fig. 407).

S 864-228

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELL WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

(17) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 864-229

(18) Move the flap control lever to the 25-unit position and permit the flaps to move to the 25-unit position.

S 864-230

(19) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).

S 824-231

- (20) Measure the distance that the upper seal of the main flap touches the side of the body fairing panel.
- (a) Adjust the seal retainer (Fig. 404) if the forward part of the seal does not touch in the limit of  $12.0 \pm 4.0$  inches ( $30.5 \pm 10.1$  centimeters).
  - (b) Make sure that the distance the seal touches on the opposite flap is symmetrical in  $\pm 1$  inch ( $\pm 25.4$  mm).

I. Install Final Bolts to Flaps

S 024-319

(1) Remove the flap fairing door (AMM 27-51-07/401).

S 024-320

(2) Remove the temporary slave bolts (51, 56, 71) and shims (77).

NOTE: Remove and install the slave bolts one at a time.

S 394-283

(3) Fay surface seal the top and bottom shim interfaces on the support beam with PR-1405G or BMS 5-95 sealant. Coverage thickness shall be such that the stacked shim edges are not visible.

S 424-284

(4) Reinstall temporary slave bolts (51, 56, 71) and shims (77) at the noted locations, and retorquing nuts to 200-250 pound-inches (22.6-28.2 newton-meters).

EFFECTIVITY

ALL

27-51-03

02

Page 424  
Dec 22/07

S 024-285

- (5) Remove the temporary slave bolts (51, 56) from the inboard linkage and replace with the final bolts (51, 56), one at a time.

**NOTE:** Make sure the bolts have the correct bolt grip length.  
Bolt grip length is dependent on the number of shims used.

- (a) Before insertion of the final bolts, coat the inside of the hole to its full depth with PR-1405G or BMS 5-95 sealant.  
(b) Insert the final bolts (51, 56) into the carrier beam at the inboard linkage wet with PR-1405G or BMS 5-95 per BAC 5000, method 3. After the bolts have been inserted, remove any excess sealant from the bolt threads and surrounding surface of the support beam.

**NOTE:** Use a dry wiper. Do not use solvents.

S 424-286

- (6) Initially tighten the nuts (55) to the lower value of the torque range of 970-1170 pound-inches (109-133 newton-meters).

S 424-287

- (7) Re-tighten the nuts (55) 20 minutes or more after installation to within torque range of 970-1170 pound-inches (109-133 newton-meters).

**NOTE:** Final torque must be applied before the squeeze out life of the sealant expires.

S 424-288

- (8) Remove the temporary slave bolts (71) from the aft end of the support beam and replace with the final bolts (71), one at a time.

**NOTE:** Make sure the bolts have the correct bolt grip length. Bolt grip length is dependent on the number of shims used.

- (a) Before insertion of the final bolts, coat the inside of the hole to its full depth with PR-1405G or BMS 5-95 sealant.  
(b) Insert the final bolts (71) into the aft end of the support beam wet with PR-1405G or BMS 5-95 per BAC 5000, method 3. After the bolts have been inserted, remove any excess sealant from the bolt threads and surrounding surface of the support beam.

**NOTE:** Use a dry wiper. Do not use solvents.

S 424-289

- (9) Initially tighten the nuts (76) to the lower value of the torque range of 250-300 pound-inches (28.2-33.9 newton-meters).

S 424-303

- (10) Re-tighten the nuts (76) 20 minutes or more after installation to within torque range of 250-300 pound-inches (28.2-33.9 newton-meters).

NOTE: Final torque must be applied before the squeeze out life of the sealant expires.

S 394-317

- (11) Following final torque of all flap attach bolts, fillet seal around shims with PR-1405G or BMS 5-95 per BAC 5000. Option: brush coat application is acceptable. Coverage thickness shall be such that stacked shim edges are not visible.

J. Put the Airplane Back to Its Usual Condition

S 424-339

- (1) Install the flap fairing door (AMM 27-51-07/401).

S 094-103

- (2) Remove the PDU lock from the TE flap PDU (Fig. 407).

S 864-104

- (3) Remove the circuit breaker locks and DO-NOT-CLOSE tags and close these circuit breakers on the main power distribution panel, P6:
- (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6D24, ALTN FLAP PWR
  - (c) 6F24, ALTN SLAT OUTBD PWR

S 864-105

- (4) Remove the circuit breaker locks and DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel, P11:
- (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD
  - (c) 11J24, FLAPS ALTN CONT

S 094-106

**WARNING:** USE THE TASK IN AMM 32-00-15/201 TO REMOVE THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

TASK 27-51-03-024-107

4. Inboard Main Flap - Removal

A. General

- (1) This task contains the procedure to remove the inboard main flap, with the aft flap disconnected from the main flap.

B. Equipment

- (1) Circuit Breaker Lockout Clip - 1012LC-R  
Commercially Available  
(2) Sling Equipment, Inboard TE Flap - A27016-27  
(3) TE Flap PDU Lock - A27009-7  
(4) Shackles 3/8-inch Diameter - Commercially Available.

C. References

- (1) AMM 24-22-00/201, Electrical Power - Control  
(2) AMM 27-51-06/201, Inboard Flap, Aft Flap  
(3) AMM 27-51-07/401, Flap Fairing Door  
(4) AMM 27-61-00/201, Spoiler/Speedbrake Control System  
(5) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems  
(6) AMM 32-00-15/201, Landing Gear Door Lock  
(7) AMM 32-00-20/201, Landing Gear Downlock

D. Access

- (1) Location Zones
- |         |  |
|---------|--|
| 144     | Right MLG Wheel Well                     |
| 211/212 | Control Cabin                            |
| 550/650 | Wing Trailing Edge - Inboard             |
| 571/671 | Left/Right Inboard Flap Outboard Fairing |
| 710     | Nose Landing Gear and Doors              |
| 730/740 | Left/Right Main Landing Gear and Doors   |

E. Prepare for the Removal

S 214-108

- (1) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

S 494-109

**WARNING:** USE THE TASK IN AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Open the doors for the landing gear and install the door locks (AMM 32-00-15/201).

S 034-110

- (3) Remove the flap fairing door (AMM 27-51-07/401).

EFFECTIVITY

ALL

27-51-03

08.101

Page 427  
Dec 22/07

S 024-111

**CAUTION:** MAKE SURE THE DRIVE ROD FOR THE FAIRING DOOR IS CLEAR FROM THE MOVEMENT OF THE INBOARD FLAP MECHANISM BEFORE YOU EXTEND THE FLAP TO REMOVE THE AFT FLAP. IF THE MOVEMENT OF THE MECHANISM IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

(4) Remove the inboard aft flap (AMM 27-51-06/201).

**NOTE:** Keep the flaps in the fully extended position after you remove the aft flap.

F. Remove the Inboard Main Flap

S 034-112

(1) At the outboard linkage, disconnect the pushrod (62) from the mid fairing and remove the nut (100), bolt (96), washers (97, 99) and bushing (98) (View D-D, Fig. 402).

**NOTE:** Identify the parts for the subsequent installation.

S 034-113

(2) At the outboard linkage, disconnect the pushrod (60) from the top of the bellcrank (61) (View C-C, Fig. 402).

**NOTE:** Identify the sleeve and bushing (86) with a label for the subsequent installation.

S 494-114

(3) Extend the inboard spoilers 5 and 6 (left wing) or 7 and 8 (right wing) as applicable, and install the locks on the spoiler actuators (AMM 27-61-00/201).

S 494-115

(4) Install the flap sling at the three attach points on the upper surface of the main flap (Fig. 405).

**NOTE:** It is necessary to hold the flap at the 30-unit pitch up attitude to remove the flap from the wing.

Add 3/8-inch diameter shackles to the two aft cables of the flap sling, as necessary, to get the flap pitch up attitude in the 30-unit position.

EFFECTIVITY

ALL

27-51-03

08.101

Page 428  
Aug 22/09

S 494-116

- (5) Connect the overhead hoist to the flap sling.

**NOTE:** Make sure the hoist can hold the weight of the main flap. The weight of the main flap is approximately 370 pounds (170 kg).

S 034-117

- (6) At the inboard end of the flap, remove the bolts (51, 56), nuts (55), and washers (52, 53, 54) and disconnect the collar fitting (50) from the support beam (View A-A, Fig. 401).

**NOTE:** Make a record of the shim thickness and keep the shim for the subsequent installation.

S 034-118

- (7) At the outboard linkage, disconnect the forward support fitting (63) from the support beam with these steps (View A-A, Fig. 402):
- (a) Remove the pin (94) from the bolt (70) adjacent to the castellated nut (67).
  - (b) Remove the castellated nut (67), bolt (70), and washers (68).
  - (c) Remove the lockwire between the tab washer (65) and the nut (66).
  - (d) Remove the nut (66), tab washer (65), and outer pin (69).

S 034-119

- (8) At the outboard linkage, disconnect the main flap from the support beam with this step (View B-B, Fig. 402):
- (a) Disconnect the four bolts (71), nuts (76), and washers (72, 73, 74, 75, 95).

**NOTE:** Make a record of the shim thickness and keep the shims (77) for the subsequent installation.

S 034-120

- (9) Disconnect the side strut from the support beam and remove the nut (82), bolt (78), washers (79 and 81), and bushing (80) (View E-E, Fig. 402).

**NOTE:** Identify these parts with labels for the subsequent installation.

EFFECTIVITY

ALL

27-51-03

07.101

Page 429  
Aug 22/09

S 024-121

- (10) Remove the inboard main flap from the airplane with these steps:
- (a) Lift the inboard aileron to get more clearance to remove the main flap if it is necessary.
  - (b) Lift the outboard end of the main flap until the forward support fitting (63) is clear from the support beam (View A-A, Fig. 402).
  - (c) Move the flap to the outboard direction until the flap support tube and the collar fitting (50) is clear from the wing-to-body fairing.
  - (d) Lower the flap from the airplane.
  - (e) Remove the sling from the main flap.

**NOTE:** Keep a record of the quantity and location of the shackles that you added to flap sling for the subsequent installation.

TASK 27-51-03-424-122

5. Inboard Main Flap - Installation

A. General

- (1) This task contains the procedure to install the inboard main flap with the aft flap disconnected from the main flap.
- (2) Follow the instruction given in this task to adjust the fit and fair of the inboard flap after the installation.

B. Equipment

- (1) Sling Equipment, Inboard TE Flap - A27016-27
- (2) Inboard Aileron Rigging Bar - A27024-47 (Recommended); -2 (Optional)
- (3) TE Flap PDU Lock - A27009-7
- (4) Shackles 3/8-inch Diameter - Commercially Available.

C. Consumable Materials

- (1) D00633 Grease - BMS 3-33 (recommended)
- (2) D00013 Grease - MIL-PRF-23827 (Supersedes MIL-G-23827) (Alternate)
- (3) A00247 Sealant - BMS 5-95

**G. Install the Inboard Main Flap**

S 494-123

- (1) Add the 3/8-inch diameter shackles, to the two aft cables of the flap sling, to get the flap attitude in the 30-unit position as you did during the flap removal.

**NOTE:** Use the same quantity of shackles for this installation as you did for the flap removal.

EFFECTIVITY

ALL

**27-51-03**

13.101

Page 431  
Dec 22/07

S 494-124

- (2) Install the sling to the three attach points on the upper surface of the inboard flap (Fig. 405).

**NOTE:** The flap sling must hold the flap in a pitch-up attitude and align the bottom surface of the flap to the upper surface of the outboard support beam. This will permit you to connect the forward support fitting to the forward end of the main flap (Detail A, Fig. 402).

S 494-125

- (3) Connect the overhead hoist to the sling.

**NOTE:** Make sure the hoist can hold the weight of the main flap. The weight of the main flap is approximately 370 pounds (170 kg).

S 984-126

- (4) Lift the main flap up to its position on the wing.

S 984-127

- (5) Lift the inboard aileron to get more clearance to install the flap if it is necessary.

S 984-128

- (6) Lift the outboard end of the main flap up, until the forward support fitting (63) is clear from the support beam (View A-A, Fig. 402).

S 824-129

- (7) Move the flap to the inboard direction and align the collar fitting (50) to the mounting holes on the support beam (View A-A, Fig. 401).

S 984-130

- (8) Lower the outboard end of the main flap and put the forward support fitting into the support beam.

S 644-131

- (9) Apply a light layer of grease to all the pins, washers, nuts, bushings, and spacers before each installation.

S 644-132

- (10) Apply grease at the lube points until you can see fresh grease come out at the exit.

EFFECTIVITY

ALL

27-51-03

11.101

Page 432  
Aug 22/09

S 434-223

- (11) At the inboard end of the flap, connect the collar fitting (50) to the support beam with four temporary slave bolts (51, 56), nuts (55), and washers (52, 53, 54). Torque the nuts (55) to 200-250 pound-inches (22.6-28.2 N-m) (View A-A, Fig. 401).

S 434-134

- (12) At the outboard linkage, connect the forward support fitting (63) to the support beam with these steps (View A-A, Fig. 402):
- (a) Install the outer pin (69), tab washer (65), and nut (66). Tighten the nut to 290-510 pound-inches (32.8-57.6 N-m).
  - (b) Install a lockwire between the nut and the tab washer with the double twist procedure (AMM 20-10-23/401).
  - (c) Install the bolt (70) through the outer pin (69) with washers (68) and a castellated nut (67). Tighten the castellated nut to 30-50 pound-inches (3.4-5.6 N-m).
  - (d) Install the pin (94) through the bolt (70) adjacent to the castellated nut.

S 434-135

- (13) At the outboard linkage, connect the main flap to the support beam with shims (77), four temporary slave bolts (71), washers (72, 73, 74, 95, 75), and nuts (76). Tighten the nuts (76) to 200-250 pound-inches (22.6-28.2 N-m) (View B-B, Fig. 402).

**NOTE:** Use the shims that you removed before, or install new shims with the same thickness.

**NOTE:** Make sure there is no gap between the nut or shim and the structure with a 0.010 inch (0.254 mm) feeler gauge.

S 094-136

- (14) Remove the sling from the main flap.

EFFECTIVITY

10.101

Page 433  
Aug 22/09

S 434-137

- (15) At the outboard linkage, do these steps to connect the pushrods (Fig. 402):
- (a) Connect the pushrod (60) to the top of the bellcrank (61) with a bolt (84), washers (85, 87), bushing (86), and nut (88) (View C-C).
  - (b) Tighten the nut to 290-510 pound-inches.
  - (c) Connect the pushrod (62) to the mid fairing with a bolt (96), washers (97, 99), bushing (98), and nut (100) (View D-D). Tighten the nut.

S 434-138

- (16) Connect the side strut to the support beam with these steps (View E-E, Fig. 402):
- (a) Remove the lockwire and adjust the length of the side strut as necessary to connect the strut to the support beam.
  - (b) If you adjusted the side strut, install a lockwire to the jamnut with the double twist procedure (AMM 20-10-23/401).
  - (c) Connect the side strut to the support beam with the bolt (78), bushing (80), washer (79, 81), and nut (82).
  - (d) Tighten the nut to 90-125 pound-inches (10.2-14.1 N-m).

S 424-139

**CAUTION:** MAKE SURE THE DISCONNECTED DRIVE ROD FOR THE FAIRING DOOR IS CLEAR FROM THE MOVEMENT OF THE INBOARD FLAP MECHANISM BEFORE YOU EXTEND OR RETRACT THE FLAPS TO INSTALL THE AFT FLAP. IF THE MOVEMENT OF THE MECHANISM IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (17) Install the inboard aft flap (AMM 27-51-06/201), but DO NOT close these circuit breakers:
- (a) On the P6 panel:
    - 1) 6D21, ALTN SLAT INBD PWR
    - 2) 6D24, ALTN FLAP PWR
    - 3) 6F24, ALTN SLAT OUTBD PWR
  - (b) On the P11 panel:
    - 1) 11H23, SLAT ALTN CONT INBD
    - 2) 11H24, SLAT ALTN CONT OUTBD
    - 3) 11J24, FLAPS ALTN CONT

S 494-140

- (18) Install the PDU lock in the TE flap PDU (Fig. 407).

S 864-142

- (19) Retract the inboard spoilers (AMM 27-61-00/201).

EFFECTIVITY

ALL

27-51-03

13.101

Page 434  
Aug 22/09

S 864-143

- (20) Lower the inboard aileron to its usual position.

S 094-144

- (21) Remove the PDU lock from the TE flap PDU (Fig. 407).

S 224-145

- (22) Do these checks on the inboard flap clearances (AMM 27-51-00/501):

**NOTE:** These checks will make sure that the flap drive system did not get out of the correct adjustment during the flap removal and installation.

- (a) Make sure the extended overtravel stop clearance is correct at the inboard and outboard mechanism (Details D and H, Fig. 403).
- (b) Make sure the retracted overtravel stop clearance is correct at the inboard and outboard mechanism (Details C and G, Fig. 403).

S 824-146

- (23) Adjust the fit and fair of the inboard flap with the instruction given in this task.

H. Adjust the Fit and Fair of the Inboard Flap (Fig. 404).

S 494-147

- (1) Install the PDU lock in the TE flap PDU (Fig. 407).

S 224-148

- (2) Do the step that follows to set the trailing edge of the inboard aileron 0.40 inch (10.2 mm) below the wing theoretical trailing edge, and measure the aileron-to-flap mismatch (View D-D, Fig. 404):
- (a) Use the aileron rigging bar and align the aileron lower surface to the 1.40 inch (35.56 mm) mark on the rigging bar.

**NOTE:** Hold the aileron in this position to measure the aileron-to-flap trailing edge mismatch. Do not adjust the rig position of the aileron.

This measurement will tell you if it is necessary to adjust the flap position.

S 824-207

- (3) Make sure the outboard trailing edge of the left flap is symmetrical to the opposite location on the right flap within 0.100 inch (2.5 mm).

**NOTE:** Use the inboard aileron as a reference point.

Page 435  
Aug 22/09

S 824-175

- (4) If the aileron-to-flap mismatch or the flap symmetry requirement is not within the limit, adjust the outboard mechanism with these steps (Fig. 402):

(a) Remove the nut (82), bolt (78), washers (79, 81), and bushing (80), and disconnect the side strut from the support beam (View E-E).

NOTE: Identify the parts with labels for the subsequent installation.

- (b) Adjust the shims at the outboard mechanism (View A-A and B-B), as necessary, to get the aileron and flap trailing edge to align correctly.
- (c) Remove the lockwire and adjust the length of the side strut if it is necessary, until you can easily connect the strut to the support beam (View B-B).
- (d) If you adjusted the side strut, install a lockwire to the jamnut with the double twist procedure (AMM 20-10-23/401).
- (e) Connect the side strut to the support beam with the bolt (78), bushing (80), washers (79, 81), and nut (82). Tighten the nut to 90-125 pound-inches (10.16-14.12 newton-meters) (View E-E).

S 224-176

- (5) At the inboard edge of the flap, do these checks:
- (a) Make sure the distance between the flap trailing edge to the rigging fastener on the wing/body fairing is correct (View G-G, Fig. 404).

S 824-177

- (6) Adjust the shims at the inboard mechanism if it is necessary to get the correct dimension requirement (View B-B, Fig. 401).

S 224-178

- (7) Make sure the clearance between the main flap and the inboard aileron is correct (View B-B, Fig. 404).

S 224-184

- (8) 767-200 AIRPLANES;  
Make sure the clearance between the main flap and the fairing door is below the limit (View F-F, Fig. 404). Adjust the fairing door if it is necessary (AMM 27-51-07/401).

- (9) Make sure the clearance and the mismatch between the upper surface of the aft flap and the cove panel are below the limits (View C-C, Fig. 404).
- S 824-186
- (10) Adjust the Bull Nose fairing mismatch (AMM 27-51-07/401).
- S 824-187
- (11) Adjust the Nose Panel mismatch (AMM 27-51-07/401).
- S 824-188
- (12) Measure and adjust the spoiler-to-flap clearances (AMM 27-61-00/501, Adjust Spoiler Control Actuators).
- S 824-189
- (13) Adjust the vertical mismatch between the inboard main flap and the lower trailing edge panel (AMM 57-51-10/501).
- S 394-190
- (14) Apply sealant to the shims at the inboard mechanism of the inboard flap (View B-B, Fig. 401).
- S 394-191
- (15) Apply sealant to the shims at the outboard mechanism of the inboard flap (View A-A and B-B, Fig. 402).
- S 094-192
- (16) Remove the PDU lock from the TE flap PDU (Fig. 407).
- S 864-199

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELL WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (17) Pressurize the center hydraulic system (AMM 29-11-00/201).
- S 864-201
- (18) Move the flap control lever to the 25-unit position and permit the flaps to move to the 25-unit position.
- S 864-202
- (19) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).

S 824-204

- (20) Measure the distance that the upper seal of the main flap touches the side of the body fairing panel.
- (a) Adjust the seal retainer (Fig. 404) if the forward part of the seal does not touch in the limit of 12.0 ±4.0 inches (30.5 +/- 10.1 centimeters).
  - (b) Make sure that the distance the seal touches on the opposite flap is symmetrical in ± 1 inch (+/- 25.4 mm).

S 864-197

- (21) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 864-203

- (22) Move the flap control lever to the zero (FLAPS UP) detent and permit the flaps to move to the fully retracted position.

I. Install Final Bolts to Flaps

S 024-237

- (1) Remove temporary slave bolts (51, 56, 71) and shims (77), noting the location of each bolt and shim.

S 394-238

- (2) Fay surface seal the top and bottom shim interfaces on the support beam with PR-1405G or BMS 5-95 sealant. Coverage thickness shall be such that the stacked shim edges are not visible.

S 424-239

- (3) Reinstall temporary slave bolts (51, 56, 71) and shims (77) at the noted locations, and retorque nuts to 200-250 pound-inches (22.6-28.2 newton-meters).

S 024-240

- (4) Remove the temporary slave bolts (51, 56) from the inboard linkage and replace with the final bolts (51, 56), one at a time.

**NOTE:** Make sure the bolts have the correct bolt grip length.  
Bolt grip length is dependent on the number of shims used.

- (a) Before you put in the final bolts, coat the hole to its full depth with PR-1405G or BMS 5-95 sealant.
- (b) Put the final bolts (51, 56) into the carrier beam at the inboard linkage (wet with PR-1405G or BMS 5-95 per BAC 5000, method 3). After you put in the bolts, remove the sealant from the bolt threads and surface of the support beam.

**NOTE:** Use a dry wiper. Do not use solvents.

EFFECTIVITY

ALL

27-51-03

Page 438  
Aug 22/09

S 424-241

- (5) Initially tighten the nuts (55) to the lower value of the torque range of 970-1170 pound-inches (109-133 newton-meters).

S 424-242

- (6) Re-tighten the nuts (55) 20 minutes or more after installation to within torque range of 970-1170 pound-inches (109-133 newton-meters).

NOTE: Final torque must be applied before the squeeze out life of the sealant expires.

S 424-243

- (7) Remove the temporary slave bolts (71) from the aft end of the support beam and replace with the final bolts (71), one at a time.

NOTE: Make sure the bolts have the correct bolt grip length. Bolt grip length is dependent on the number of shims used.

- (a) Before insertion of the final bolts, coat the inside of the hole to its full depth with PR-1405G or BMS 5-95 sealant.  
(b) Insert the final bolts (71) into the aft end of the support beam wet with PR-1405G or BMS 5-95 per BAC 5000, method 3. After the bolts have been inserted, remove any excess sealant from the bolt threads and surrounding surface of the support beam.

NOTE: Use a dry wiper. Do not use solvents.

S 424-244

- (8) Initially tighten the nuts (76) to the lower value of the torque range of 250-300 pound-inches (28.2-33.9 newton-meters).

S 424-258

- (9) Re-tighten the nuts (76) 20 minutes or more after installation to within torque range of 250-300 pound-inches (28.2-33.9 newton-meters).

NOTE: Final torque must be applied before the squeeze out life of the sealant expires.

S 394-272

- (10) Following final torque of all flap attach bolts, fillet seal around shims with PR-1405G or BMS 5-95 per BAC 5000. Option: brush coat application is acceptable. Coverage thickness shall be such that stacked shim edges are not visible.

INBOARD FLAP MECHANISM – MAINTENANCE PRACTICES

1. General

- A. This procedure contains five tasks. The first task is the removal of the Actuator Crank Arm and the Inboard 6-7 and 6-9 Drive Arms. The second task is the installation of the Actuator Crank Arm and the Inboard 6-7 and 6-9 Drive Arms. The third task is the removal of the 3-10 link. The fourth task is the installation of the 3-10 link. The fifth task contains approved repairs for the Reaction Link Support on the inboard flap drive.

TASK 27-51-04-002-134

2. Remove the Actuator Crank Arm and Inboard 6-7 and 6-9 Drive Arms

A. General

- (1) This task gives information for the removal of the Actuator Crank Arm and the Inboard 6-7 and 6-9 Drive Arms. Because this task contains two procedures, do only the applicable group of steps.
- (2) To start one of these procedures, do the "Prepare for Removal" group of steps. Then, do the group of steps that is necessary to remove the component.

B. Equipment

- (1) Adapter – Flap Drive – F70300-1  
(Torque Tube Manual Drive Tool)
- (2) Air Motor with 1/2 inch square drive  
(Commercially Available)

NOTE: A motor to turn the torque tubes to manually extend and retract the flaps.

- (3) TE Flap PDU Lock – A27009-7
- (4) Circuit Breaker Lockout Clip – 1012LC-4  
Commercially Available
- (5) Locks, Inboard Flap, Left and Right Inboard Linkages from Inboard and Outboard TE Flap Lock Set – A27074-128
- (a) Lock, Inboard Linkage, Left Inboard Flap – A27074-123
- (b) Lock, Inboard Linkage, Right Inboard Flap – A27074-124
- (c) Lock, Outboard Linkage, Inboard Flaps – A27074-6

- S 862-150
- (8) Open these circuit breakers on P6 and install circuit breaker locks:
- (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6F24, ALTN SLAT OUTBD PWR

- S 862-151
- (9) Open this circuit breaker on the overhead panel, P11, and attach a DO-NOT-CLOSE tag:
- (a) 11J24, FLAPS ALTN CONT

- S 862-142
- (10) Open these circuit breakers on the P11 panel and install circuit breaker locks:
- (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD

- S 492-011
- (11) Install the PDU lock on the TE Flap Power Drive Unit (PDU) (Fig. 206).

- S 012-012
- (12) For access to the inboard flap mechanism, remove the aft wing/body panel (195JL left flap or 195JR right flap) below the fairing door (AMM 06-41-00/201).

- S 012-013
- (13) For access to the outboard flap mechanism, remove the fixed TE panel (552FB left flap or 652FB right flap) below the offset tee gearbox (AMM 06-44-00/201).

- S 032-014
- (14) Disconnect the torque tube which connects the PDU to the bulkhead tee gearbox (AMM 27-51-41/401).

- S 032-015
- (15) Disconnect the outboard torque tube from the offset tee gearbox (View C-C, Fig. 203) (AMM 27-51-41/401).

NOTE: Do not turn the torque tubes. It is necessary to adjust the flap drive system if you turn the torque tube while it is disconnected (AMM 27-51-00/501).

- S 982-016
- (16) Turn the gearbox couplings in the retract direction until the main flap lower surface is parallel to the ground.

- S 862-017
- (17) Hold the weight of the main flap to decrease the load on the linkages.

S 492-018

- (18) If the actuator crank arm is removed, install the flap linkage lock sets when necessary (Fig. 205).

S 032-019

- (19) Remove the locknut, washer and bolt to disconnect the fairing door drive rod from the aft hinge fitting (AMM 27-51-07/401).

F. Remove the Actuator Crank Arm

S 022-020

- (1) Remove the applicable rotary actuator (AMM 27-51-05/401) inboard or (AMM 27-51-11/401) outboard.

S 022-021

- (2) Remove the flap position transmitter (AMM 27-51-45/201).

S 032-022

- (3) Do the steps that follow to disconnect the inboard actuator crank arm from the 5-7 link (Fig. 202):
- (a) Disconnect the retaining pin and remove the castellated nut and washer to remove the inner pin.
  - (b) Remove the wire, nut and tab washer from the outer pin.
  - (c) Hold the 5-7 link and remove the outer pin.

S 032-023

- (4) Do the steps that follow to disconnect the outboard actuator crank arm from the 5-7 link (Fig. 204):
- (a) Remove the locknut, bolt, and both end caps.
  - (b) Remove the wire, nut and tab washer from outer pin.
  - (c) Hold the 5-7 link and remove the outer pin.

S 032-024

- (5) Do the steps that follow at the outboard actuator location (Fig. 203):
- (a) Remove the six bolts which attach the transmitter housing and the inner and outer retaining rings on the outboard support rib.
  - (b) Remove the 14 bolts which attach the inner retaining ring and the outer reaction ring to the inboard support rib.
  - (c) Remove the transmitter housing with the outer retaining ring.
  - (d) Remove the reaction ring.

NOTE: The inner retaining rings are removed with the crank arm.

EFFECTIVITY

ALL

27-51-04

Dec 22/01

S 022-025

- (6) Do the steps that follow at the inboard actuator location (Fig. 201):
- (a) Remove the six bolts which attach the transmitter housing and the inner and outer retaining rings on the outboard support rib.
  - (b) Remove the six bolts which attach the inner retaining ring and the outer reaction ring to the inboard support rib.
  - (c) Remove the transmitter housing retaining ring.

NOTE: The inner retaining rings are removed with the crank arm.

- (d) Remove the reaction ring.

S 032-026

- (7) At the applicable location inboard (Fig. 201) or outboard (Fig. 203), loosen and remove the input shaft nut and the tab washer.

S 032-027

- (8) Hold the crank arm and inner retaining rings and move the input shaft inboard to remove it.

S 022-028

- (9) Remove the crank arm and retaining rings from the airplane.  
G. Remove the 6-7 and 6-9 Drive Arm from the Inboard Linkage (Fig. 201)

S 032-045

- (1) Do the steps that follow to disconnect the 6-7 drive arm from the 5-7 link (Fig. 202):
- (a) Disconnect the retaining pin and remove the castellated nut and washer, and remove the inner pin.
  - (b) Remove the wire, nut and tab washer from the outer pin.
  - (c) Hold the 5-7 link and remove the outer pin.

S 032-046

- (2) Do the steps that follow to disconnect the 6-9 drive arm from the support beam (Fig. 202):
- (a) Disconnect the retaining pin and remove the castellated nut and washer, and remove the inner pin.
  - (b) Remove the wire, nut and tab washer from the outer pin.
  - (c) Remove the outer pin.

S 032-047

- (3) Do these steps to remove the failsafe fitting (View A-A):
- (a) Disconnect the four locknuts, bolts, and washers.
  - (b) Write the shim thickness dimension and save the shims for installation.

Dec 22/01

- S 032-048
- (4) Do this step to remove the nut from the outboard end of the inner shaft:
- (a) Disconnect the wire between the nut and the tab washer, and remove the nut and the tab washer.
- S 032-049
- (5) Move the inner shaft inboard and remove it from the airplane.
- S 032-050
- (6) Remove the bushings from the inboard and the outboard ends of the outer shaft.
- S 032-051
- (7) Disconnect the nut, remove the bolt, and disconnect the inboard and the outboard reaction link support from the support fitting.
- S 032-052
- (8) At the inboard and the outboard ends of the outer shaft, disconnect the wire between the nut and the tab washer.
- (a) Remove the nuts and tab washers.
- S 022-053
- (9) Slide the inboard reaction link support and bushing off the outer shaft.
- S 022-054
- (10) Slide the 6-7 drive arm off the outer shaft.
- S 032-055
- (11) Slide the outboard reaction link support off the outer shaft.
- S 032-056
- (12) Remove the nut, bolt, clampup bushing, and the washers and disconnect the flap track from the track support fitting.
- S 032-057
- (13) Do this step to remove the inboard and the outboard bearing retainers from the side support strut:
- (a) Disconnect and remove the eight nuts, bolts, and washers.
- S 022-058
- (14) Hold the 6-9 drive arm and slide the outer shaft inboard, and remove it from the airplane.
- S 022-059
- (15) Remove the 6-9 drive arm with the track support fittings from the airplane.

TASK 27-51-04-402-135

3. Install the Actuator Crank Arm and Inboard 6-7 and 6-9 Drive Arms

A. General

- (1) This task contains two procedures, one to install the actuator crank arm and one to install the 6-7 and 6-9 drive arms. Because this task contains two procedures, only the applicable group of steps must be done.
- (2) To start one of these procedures, do the group of steps that is necessary to install the components. Then do the "Put the Flaps to the Adjusted Position" and "Put the Airplane Back to Its Usual Condition" groups of steps.

B. Equipment

- (1) Adapter - Flap Drive - F70300-1  
(Torque Tube Manual Drive Tool)
- (2) Air Motor with 1/2 inch square drive  
(Commercially Available)

**NOTE:** A motor to turn the torque tubes to manually extend and retract the flaps.

- (3) TE Flap PDU Lock - A27009-7

C. Consumable Materials

- (1) D00633 Grease - BMS 3-33 (Alternate)
- (2) D00013 Grease - MIL-PRF-23827 (Supersedes MIL-G-23827) (Alternate)
- (3) D00015 Grease - BMS 3-24 (Alternate)
- (4) C00174 Corrosion Preventive Compound -  
MIL-C-16173, Grade 2
- (5) G02020 Modeling Clay

D. References

F. Install the Actuator Crank Arm (Fig. 201)

NOTE: Examine the Actuator Crank Arm for permitted wear (AMM 27-51-04/601).

S 622-029

- (1) Apply corrosion preventive compound to the outer diameter of the inner thrust spacer and install it in the crank arm.

S 622-030

- (2) Apply corrosion preventive compound to the outer thrust spacer and install it in the outboard support rib bearing.

S 622-031

- (3) Apply corrosion preventive compound to the inner and outer surfaces of the input shaft, and to the cavities and splines between the input shaft and the crank arm.

S 422-032

- (4) Install new seals in the inner retaining rings.

NOTE: Make sure you install the seals such that you can correctly lubricate the bearings (Fig. 203).

S 422-033

- (5) Install the inner retaining rings over the crank arm.

S 862-034

- (6) Position the crank arm assembly between the support ribs.

S 422-035

- (7) Install the input shaft.

S 422-036

- (8) Install the new seals in the outboard retaining ring and the reaction ring.

NOTE: Make sure you install the seals such that you can correctly lubricate the bearings.

S 422-037

- (9) At the inboard and outboard (Fig. 203) locations, install a tab washer and nut on the input shaft. Safety the nut to the tab washer with wire at two places.

EFFECTIVITY

ALL

27-51-04

01

Page 220  
Dec 22/01

S 422-038

- (10) At the outboard actuator location, do these steps (Fig. 203):
- (a) Put the outer retaining ring and the transmitter housing on the outboard support rib.
  - (b) Apply a layer of BMS 3-24 grease to the six bolts and washers.
  - (c) Install the six bolts with washers under the head and attach the six washers with nuts. Tighten the nuts to 150-250 pound-inches (17-28 newton-meters).
  - (d) Put the reaction ring on the inboard support rib.
  - (e) Apply a coat of BMS 3-24 to 14 attach bolts and washers.
  - (f) Install the 14 bolts with washers under the head and attach the 14 nuts with washers.
  - (g) Tighten the nuts at 4 locations to 260-425 pound-inches (29-48 newton-meters) and at 10 locations to 290-510 pound-inches (33-58 newton-meters).

S 422-039

- (11) At the inboard actuator location, do these steps (Fig. 201):
- (a) Put the outer retaining ring and the transmitter housing on the outboard support rib.
  - (b) Apply a coat of BMS 3-24 grease to the six attach bolts and washers.
  - (c) Install the six bolts with washers under the head and attach the six nuts with washers (View C-C).
  - (d) Put the reaction ring on the inboard support rib.
  - (e) Apply a coat of BMS 3-24 grease to six attach bolts with washers.
  - (f) Install the six bolts with washers under the head and attach the six nuts with washers (View D-D).

S 422-040

- (12) Do these steps to connect the outboard actuator crank arm to the 5-7 link (Fig. 204):
- (a) Put the crank arm in the 5-7 link and install the outer pin (View B-B).
  - (b) Install the tab washer and nut on the outer pin.
  - (c) Tighten the nut to 3000-3700 pound-inches (339-418 newton-meter).
  - (d) Safety the nut to the tab washer with a wire.
  - (e) Install the end caps, bolt and nut. Tighten the nut to 150-250 pound-inches (17-28 newton-meters).

S 422-136

- (13) Do these steps to connect the inboard actuator crank arm to the 5-7 link (Fig. 202):
- (a) Put the crank arm in the 5-7 link and install the outer pin (View B-B).
  - (b) Install the tab washer and the nut on the outer pin.
  - (c) Tighten the nut to 800-1500 pound-inches (90-169 newton-meters).

EFFECTIVITY

ALL

27-51-04

01

Page 221  
Dec 22/01

- (d) Safety the nut to the tab washer with a wire.
- (e) Install the inner pin with a washer and a castellated nut.
- (f) Put the retaining pin through the castellated nut and bolt, and safety the retaining pin with a wire.

S 642-041

- (14) Lubricate the crank arm input shaft with BMS 3-33 grease (no alternatives permitted). Apply until you see fresh grease at the grease exit.

NOTE: Lubricate the crank arm before you install the rotary actuator to make sure the seal is correctly installed for lubrication.

S 422-042

- (15) Install the rotary actuator (AMM 27-51-05/401) inboard or (AMM 27-51-11/401) outboard.

S 422-043

- (16) For the inboard mechanism, install the drive shaft which connects the actuator input angle gearbox to the bulkhead angle gearbox (AMM 27-51-41/401).

S 422-044

- (17) For the outboard mechanism, install the drive shaft which connects the inboard and outboard actuators (AMM 27-51-41/401).

- G. Install the 6-7 and 6-9 Drive Arm on the Inboard Linkage (View A-A, Fig. 201)

NOTE: Examine the 6-7 and 6-9 drive arm for permitted wear (Ref 27-51-04).

S 622-060

- (1) Apply corrosion preventive compound to the inner and outer surfaces of the 6-7 drive arm, outer shaft, inner shaft, and the 6-9 drive arm.

S 642-061

- (2) Assemble all the pins, washers, nuts, bushings, and spacers with a thin layer of BMS 3-33 grease on all of the surfaces before installation.

EFFECTIVITY

ALL

Dec 22/01

- S 642-062
- (3) Apply BMS 3-33 grease to all of the lube points until you see fresh grease at the exit.
- S 432-063
- (4) Install new seals in the reaction links, the flap track support fittings, and the bearing retainers.
- NOTE:** Make sure you install the seals such that you can correctly lubricate the bearings.
- S 422-064
- (5) Install the flap track support fittings over the 6-9 drive arm.
- S 422-065
- (6) Move the 6-9 drive arm with the track support fittings between side support struts.
- S 422-066
- (7) Put the outer shaft in the side support struts. Align the missing spline on the outer shaft with the missing spline in the 6-9 drive arm.
- S 432-067
- (8) Connect the inboard and outboard bearing retainers and the flap track support fitting to the side support strut with eight bolts and locknuts.
- S 422-124
- (9) Install a washer under all the bolts and nuts that come out of the side support strut.
- S 432-068
- (10) Connect the flap track support fitting to the flap track.

27-51-04

01

Page 223  
Apr 22/01

S 422-125

- (11) Install a bolt with a washer under the head, bushing, and a nut with a washer. Tighten nut to 2400-2600 pound-inches (271-294 newton-meters).

S 432-069

- (12) Move the outboard reaction link on the outer shaft.

S 432-070

- (13) Move the 6-7 drive arm onto the outer shaft.

**CAUTION:** MAKE SURE TO INSTALL THE DRIVE ARM CORRECTLY. INCORRECT INSTALLATION CAN CAUSE DAMAGE TO THE FORE FLAP LEADING EDGE.

- (a) Make sure that you install the drive arm with the lube fitting pointed outboard on the left flap and pointed inboard on the right flap.

S 822-126

- (14) Align the missing spline on the outer shaft with the missing spline in the 6-7 drive arm.

S 422-071

- (15) Install a bushing in the inboard reaction link and move the reaction link onto the outer shaft.

S 432-072

- (16) Connect the inboard and outboard reaction link to the support fitting (Fig. 202, View A-A).

S 422-127

- (17) Install a bolt with a washer under the head, and a nut with a washer. Tighten the nut to 3200-3500 pound-inches (362-395 newton-meters).

S 432-073

- (18) At the inboard and outboard ends of the outer shaft, install a nut and tab washer (Fig. 201, View A-A). Tighten the nut to 2500-3000 pound-inches (280-340 newton-meters).

S 432-128

- (19) Safety the tab washer and the nut with a wire.

S 432-074

- (20) Put the bushings in the outboard and inboard ends of the outer shaft.

EFFECTIVITY

ALL

27-51-04

01

Page 224  
Apr 22/00

S 432-075

- (21) Move the inner shaft into the outer shaft and install a tab washer and nut at the outboard end.

S 432-129

- (22) Tighten the nut to 3000-3700 pound-inches (340-420 newton-meters). Install the safety wire on the tab washer and the nut.

S 432-076

- (23) Install the failsafe fitting and shims.

S 432-130

- (24) Install the four mounting bolts with a sufficient number of washers so that the nuts do not turn to the end of the threads on the mounting bolts. Install the safety wire.

S 432-077

- (25) Do the steps that follow to connect the 6-9 drive arm to the support beam (Fig. 202, View C-C):
- (a) Put the outer pin and install a tab washer and a nut. Tighten nut to 800-1500 pound-inches (90.4-169.4 newton-meters). Safety the tab washer to the nut with wire.
  - (b) Put the inner pin into the outer pin and install a castellated nut. Safety the nut with the retaining pin.

S 432-078

- (26) Connect the 6-7 drive arm to the 5-7 link as follows (Fig. 202, View B-B):
- (a) Install the outer pin and install the tab washer and nut. Tighten nut to 800-1500 pound-inches (90-169 newton-meters). Safety the tab washer to the nut with a wire.
  - (b) Install the inner pin and the castellated nut. Safety the nut with the retaining pin.

H. Put the Flap Back to the Adjusted Position

S 862-079

- (1) Remove the main flap supports and, if installed, the flap linkage lock sets (Fig. 205).

S 862-080

- (2) Apply clay to the retract overtravel stops.

EFFECTIVITY

ALL

27-51-04

01

Page 225  
Dec 22/01

S 822-131

- (3) Turn the torque tube with an air motor and adapter F70300-1, or use your hand to retract the inboard flap at the tee gearbox/torque tube coupling to the retract stops.

S 032-081

- (4) Disconnect the torque tube at the offset tee gearbox and adjust the inboard stop dimension.

**NOTE:** 1/3 torque tube turn = 0.010 inch (0.25 mm) travel at the inboard stop.

S 432-082

- (5) Connect the torque tube at the offset tee gearbox.

S 862-083

- (6) Turn the torque tube with an air motor and adapter F70300-1, or use your hand to extend the inboard flap until the outboard overtravel stop makes contact, then retract for 5 turns on the torque tube.

S 432-084

- (7) Connect the torque tube to the outboard coupling of the offset tee gearbox (Fig. 203, View C-C) and install the torque tube which connects the power drive unit (PDU) to the bulkhead tee gearbox (AMM 27-51-41/401).

S 862-085

- (8) Make sure that the flap control lever is in the 30-unit detent and agrees with the flap position.

S 092-086

- (9) Remove the TE flap PDU lock (Fig. 206).

S 862-138

**WARNING:** WHEN THE FLAP AND THE SLAT ARE POWERED BY THE CENTER HYDRAULIC SYSTEM, THE AILERON, SPOILER, RUDDER, ELEVATOR, AND STABILIZER ARE ALSO POWERED. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. KEEP PERSONS AND EQUIPMENT CLEAR OF ALL CONTROL SURFACES AND THE WHEEL WELL TO PREVENT INJURY AND EQUIPMENT DAMAGE.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (10) Supply power to the center hydraulic system (AMM 29-11-00/201).

Page 230  
Dec 22/01

- S 862-166
- (5) Move the flap control lever to the 25-unit detent to extend the flaps.
- S 862-167
- (6) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).
- S 862-168
- (7) Open this circuit breaker on the main power distribution panel, P6, and attach a DO-NOT-CLOSE tag:
- (a) 6D24, ALTN FLAP PWR
- S 862-169
- (8) Open these circuit breakers on the P6 panel and install circuit breaker locks:
- (a) 6D21, ALTN SLAT INBD PWR  
(b) 6F24, ALTN SLAT OUTBD PWR
- S 862-189
- (9) Open this circuit breaker on the overhead panel, P11, and attach a DO-NOT-CLOSE tag:
- (a) 11J24, FLAPS ALTN CONT
- S 862-170
- (10) Open these circuit breakers on the P11 panel and install circuit breaker locks:
- (a) 11H23, SLAT ALTN CONT INBD  
(b) 11H24, SLAT ALTN CONT OUTBD
- S 422-171
- (11) Install the PDU lock in the TE flap power drive unit (PDU) (Fig. 206).
- S 422-172
- (12) Install the flap sling at the three attach points on the upper surface of the main flap (Fig. 208).

**NOTE:** It is necessary to hold the flap at the 25-unit pitch up attitude to secure the flap at the three attach points.

Add 3/8-inch diameter shackles to the two aft cables of the flap sling, as necessary, to get the flap pitch up attitude in the 25-unit position.

EFFECTIVITY

ALL

Page 231  
Dec 22/01

S 422-173

- (13) Connect the overhead hoist to the flap sling and make sure all of the cables are in tension.

**NOTE:** Make sure the hoist can hold the weight of the flap with the aft flap attached. The total weight is approximately 470 pounds.

F. Remove the Inboard Flap Outboard Mechanism 3-10 Link

S 022-155

- (1) Remove the mid section of the flap fairing on the inboard flap (AMM 27-51-15/401).

S 022-154

- (2) Disconnect the 3-10 link from the 1-3 beam at the No. 3 joint (Fig. 204, View G-G):

**NOTE:** Identify the parts that you will remove in this task for subsequent installation.

- (a) Remove the cotter pin, inner nut, washer and inner pin.
- (b) Cut and remove the lockwires between the outer nut and the tab washer.
- (c) Remove the outer nut and tab washer from the outer pin.
- (d) Hold the 3-10 link and remove the outer pin.

S 022-153

- (3) Disconnect the 3-10 link from the 9-10 support beam at the No. 10 joint (Fig. 204, View F-F):
  - (a) Remove the cotter pin, inner nut and washer from the inner pin.
  - (b) Cut and remove the lockwires between the outer nut and the tab washer.
  - (c) Remove the outer nut and tab washer from the outer pin.
  - (d) Remove the outer pin to remove the 3-10 link from the main beam fitting assembly.

TASK 27-51-04-402-174

5. Inboard Flap Outboard Mechanism 3-10 Link - Installation

A. General

- (1) This task contains the steps to install the inboard flap outboard No. 3 and No. 6 mechanism, 3-10 link (Fig. 204).

B. Equipment

- (1) Sling Equipment, Inboard TE Flap - A27016-27
- (2) TE Flaps PDU Lock - A27009-7
- (3) Shackles, 3/8 inch (9.525 mm) Diameter - Commercially Available.

EFFECTIVITY

ALL

27-51-04

01

Page 232  
Aug 22/06

C. Consumable Materials

- (1) D00633 Grease - BMS 3-33 (Preferred)
- (2) D00013 Grease - MIL-PRF-23827 (Supersedes MIL-G-23827) (Alternate)
- (3) A00247 Sealant - BMS 5-95

D. References

- (1) AMM 12-21-09/301, Trailing Edge Flap - Lubrication
- (2) AMM 24-22-00/201, Electrical Power - Control
- (3) AMM 27-51-15/401, Inboard TE Flap Track Fairings
- (4) AMM 27-61-00/201, Spoiler/Speedbrake Control System
- (5) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems
- (6) AMM 32-00-15/201, Landing Gear Door Lock
- (7) AMM 32-00-20/201, Landing Gear Downlock

E. Access

(1) Location Zones

144	Right MLG Wheel Well
211/212	Control Cabin
550/650	Wing Trailing Edge - Inboard
571/671	Left/Right Inboard Flap Outboard Fairing
710	Nose Landing Gear and Doors
730/740	Left/Right Main Landing Gear and Doors

F. Install the Inboard Flap Outboard Mechanism 3-10 Link

S 862-177

- (1) Make sure the power is removed from the center hydraulic system (AMM 29-11-00/201).

S 422-178

- (2) Make sure the PDU lock is installed in the TE flap PDU (Fig. 206).

S 422-179

- (3) Make sure the inboard flap sling is attached to the hoist and is installed in tension at the three flap attach points.

S 422-156

- (4) Install the 3-10 link to the 1-3 beam and support beam (Fig. 204):
  - (a) Put the 3-10 link in its location on the 1-3 beam and support beam.
  - (b) Install the outer pins that attach the 3-10 link to the 1-3 beam and the support beam.
  - (c) Install the tab washer and nut on the outer pin.
  - (d) Tighten the outer nut to 2000-3000 inch-pounds (226-339 newton-meters).
  - (e) Install lockwires between the outer nut and tab washer at two locations (AMM 20-10-23/401).
  - (f) Install the inner pin in the outer pin with the washer and inner nut.

**NOTE:** Use a maximum of three washers.

EFFECTIVITY

ALL

27-51-04

01

Page 233  
Aug 22/07

- (g) Tighten the inner nut to 800-1500 inch-pounds (90-169 newton-meters) and install the cotter pin.

S 842-157

- (5) Remove the sling from the main flap and install the bolts to the flap with sealant.

S 642-158

- (6) Lubricate the 3-10 link (AMM 12-21-09/301).

S 422-180

- (7) Install the mid section of the flap fairing (AMM 27-51-15/401).

S 842-181

- (8) Remove the PDU lock from the TE flap PDU (Fig. 206).

G. Put the Airplane Back to Its Usual Condition

S 022-192

- (1) Remove the circuit breaker locks and DO-NOT-CLOSE tags and close these circuit breakers on the main power distribution panel, P6:
  - (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6D24, ALTN FLAP PWR
  - (c) 6F24, ALTN SLAT OUTBD PWR

S 022-193

- (2) Remove the circuit breaker locks and DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel, P11:
  - (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD
  - (c) 11J24, FLAPS ALTN CONT

S 022-194

**WARNING:** USE THE TASK IN AMM 32-00-15/201 TO REMOVE THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (3) Remove the door locks from the landing gear doors and close the doors (AMM 32-00-15/201).

EFFECTIVITY

TASK 27-51-04-352-137

6. Inboard Drive Reaction Link Support – Approved Repairs (Fig. 202)

A. General

- (1) This procedure gives approved repairs if a reaction link support moves apart in the area of the bearing hub after you lubricate the hub.

B. Equipment

- (1) Leading Edge Slats Groundlock – A27007-1  
(2 Necessary)
- (2) TE Flap PDU Lock – A27009-7
- (3) Circuit Breaker Lockout Clip – 1012LC-4  
Commercially Available

C. Consumable Materials

- (1) A00247 Sealant – BMS 5-95

D. References

- (1) AMM 24-22-00/201, Electrical Power – Control
- (2) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic System
- (3) AMM 32-00-15/201, Landing Gear Door Locks
- (4) AMM 32-00-20/201, Landing Gear Downlocks

E. Access

- (1) Location Zones  
555/655 Inboard Trailing Edge Flap

F. Prepare for Repair

S 862-106

- (1) Make sure that the trailing edge flaps and the leading edge slats are in fully retracted position, and that the flap lever is in the zero (FLAPS UP) detent.

S 492-107

- (2) Attach a DO-NOT-OPERATE tag to the flap control lever.

S 492-108

- (3) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

EFFECTIVITY

G. Repair the Reaction Link Support

S 032-111

- (1) Remove the lube fitting (Fig. 202).

S 492-112

- (2) Use a C-clamp or equivalent to connect the link support halves together.

S 162-113

- (3) Clean the outside surface of the link support in the area of the separation.

S 392-114

- (4) Fillet seal the link support in the area of the separation.

S 422-115

- (5) Install the lube fitting.

S 092-116

- (6) Remove the DO-NOT-OPERATE tag from the flap control lever.

S 092-117

- (7) Remove the locks from the trailing edge flap, inboard leading edge slat, and the outboard leading edge slat power drive units.

H. Put the Airplane Back to Its Usual Condition

S 092-133

**WARNING:** USE THE PROCEDURE IN AMM 32-00-15/201 TO REMOVE THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (1) Remove the door locks from the landing gear doors and close the doors (AMM 32-00-15/201).

INBOARD FLAP MECHANISM – INSPECTION/CHECK

1. General

- A. This document has illustrations and wear limit charts. This section gives no procedure to get access, to remove, or to replace the components during inspection for wear. Refer to Inboard Flap Mechanism – Maintenance Practices for this information.

TASK 27-51-04-726-001

2. Inboard Flap Inboard Mechanism Wear Limits (Fig. 601)

A. Access

- (1) Location Zones  
555/655 Inboard Trailing Edge Flap

B. Procedure

S 226-004

- (1) Use the supplied data (Fig. 601) to examine the inboard flap inboard mechanism for too much wear.

TASK 27-51-04-726-002

3. Inboard Flap Outboard Mechanism Wear Limits (Fig. 602).

A. Access

- (1) Location Zones  
555/655 Inboard Trailing Edge Flap

B. Procedure

S 226-005

- (1) Use the supplied data (Fig. 602) to examine the inboard flap outboard mechanism for too much wear.

INBOARD TE FLAP, INBOARD ROTARY ACTUATOR – REMOVAL/INSTALLATION

1. General

- A. This procedure contains the removal and the installation tasks for the inboard rotary actuator of the inboard flap.

TASK 27-51-05-024-001

2. Inboard Flap Inboard Rotary Actuator – Removal

A. Equipment

- (1) TE Flap PDU Lock – A27009-7

B. References

- (1) AMM 06-41-00/201, Fuselage Access Doors and Panels  
(2) AMM 24-22-00/201, Electrical Power – Control  
(3) AMM 27-51-00/501, Trailing Edge Flap System  
(4) AMM 27-51-41/401, TE Flap Drive Shafts  
(5) AMM 27-51-42/401, Actuator Input Angle Gearbox  
(6) AMM 29-11-00/201, Main Hydraulic Systems  
(7) AMM 32-00-15/201, Landing Gear Door Locks  
(8) AMM 32-00-20/201, Landing Gear Downlock

C. Access

(1) Location Zones

- |         |  |
|---------|--|
| 143/144 | Left/Right MLG Wheel Well              |
| 211/212 | Control Cabin                          |
| 710     | Nose Landing Gear and Doors            |
| 730/740 | Left/Right Main Landing Gear and Doors |

(2) Access Panels

- |             |                                   |
|-------------|-----------------------------------|
| 195JL/196JR | Left/Right Inboard Flap Mechanism |
|-------------|-----------------------------------|

D. Prepare for the Removal

S 214-002

- (1) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

S 494-003

**WARNING:** USE THE TASK IN AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Open the doors for the landing gear and install the door locks (AMM 32-00-15/201).

S 864-004

- (3) Supply electrical power (AMM 24-22-00/201).

Page 403  
Feb 10/91

S 864-005

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

(4) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 864-006

(5) Move the flap control lever to the zero unit detent (flaps up), and permit the flaps to move to the fully retracted position.

S 864-007

(6) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).

S 864-008

(7) Open these circuit breakers on the main power distribution panel and attach DO-NOT-CLOSE tags:  
(a) 6D21, ALTN SLAT INBD PWR  
(b) 6D24, ALTN FLAP PWR  
(c) 6F24, ALTN SLAT OUTBD PWR

S 864-009

(8) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:  
(a) 11H23, SLAT ALTN CONT INBD  
(b) 11H24, SLAT ALTN CONT OUTBD  
(c) 11J24, FLAP ALTN CONT

S 014-010

(9) Remove the aft wing-to-body access panel, 195JL (left side) or 196JR (right side), below the flap fairing door (AMM 06-41-00/201).

S 494-011

(10) Install the PDU lock in the TE flap power drive unit (PDU) (Fig. 404).

Feb 10/91

E. Remove the Inboard Rotary Actuator

S 864-052

- (1) Hold the flaps in the fully retracted position (you can use devices like a tripod and rubber blocks to keep the flaps up).

**NOTE:** Flaps may roll down by the force of gravity after the removal of the rotary actuator.

S 034-012

- (2) Disconnect the torque tube from the actuator input angle gearbox (AMM 27-51-41/401).

**NOTE:** Do not turn the torque tube. It will be necessary to adjust the flap drive if you turn the torque tube while it is disconnected (AMM 27-51-00/501).

S 984-013

- (3) Manually turn the gearbox coupling, in the retract direction, until the actuator crank arm touches the retract overtravel stop (View A, Fig. 402). Keep a count of the number of turns of the coupling for installation.

**NOTE:** Stop the turns when the crank arm touches the overtravel stop to prevent preload. Preload on the actuator will make the actuator difficult to remove.

When you look to the outboard direction, the retract direction is clockwise for the left wing, and counterclockwise for the right wing.

S 024-014

- (4) Remove the input angle gearbox from the actuator (AMM 27-51-42/401).

S 034-015

- (5) Remove the six nuts at the three hold-down clamps that hold the actuator to the support fitting (View D-D and E-E, Fig. 401).

**NOTE:** A channel washer below each bolthead prevents the bolt to turn.

EFFECTIVITY

ALL

27-51-05

02

Page 410  
Apr 22/05

S 034-016

- (6) Remove the three hold-down clamps.

**NOTE:** Keep the bolts in the support fitting when you remove the clamps.

S 034-017

**WARNING:** BE CAREFUL WHEN YOU REMOVE THE ROTARY ACTUATOR. BECAUSE THE ACTUATOR WEIGHS 56 POUNDS (25.4 Kg), INJURY CAN OCCUR.

- (7) Hold the weight of the rotary actuator and pull the actuator 2.5 inches out from the support fitting to disengage the splines.

S 024-018

- (8) Remove the rotary actuator from the airplane.

TASK 27-51-05-424-019

3. Inboard Flap Inboard Rotary Actuator - Installation

A. Consumable Materials

- (1) D00633 Grease - BMS 3-33 (Recommended)
- (2) D00013 Grease - MIL-PRF-23827 (Supersedes MIL-G-23827) (Alternate)
- (3) G02020 Modeling Clay

B. References

- (1) AMM 06-41-00/201, Fuselage Access Doors and Panels
- (2) AMM 12-21-09/301, Lubrication
- (3) AMM 20-10-23/401, Lockwires
- (4) AMM 24-22-00/201, Electrical Power - Control
- (5) AMM 27-51-00/501, Trailing Edge Flap System
- (6) AMM 27-51-41/401, TE Flap Drive Shafts
- (7) AMM 27-51-42/401, Actuator Input Angle Gearbox
- (8) AMM 29-11-00/201, Main Hydraulic Systems
- (9) AMM 32-00-15/201, Landing Gear Door Locks

C. Access

- (1) Location Zones
  - 143/144 Left/Right MLG Wheel Well
  - 211/212 Control Cabin
  - 710 Nose Landing Gear and Doors
  - 730/740 Left/Right Main Landing Gear and Doors
- (2) Access Panels
  - 195JL/196JR Left/Right Inboard Flap Mechanism

D. Install the Inboard Rotary Actuator (Fig. 401)

S 644-020

- (1) Apply a layer of grease to the splines and the mating surfaces on the rotary actuator.

EFFECTIVITY

ALL

27-51-05

02

Page 411  
Dec 22/07

S 214-021

- (2) Make sure the overload trip indicator on the actuator is pushed in (Detail A).

S 104-022

- (3) Clean the input shaft, the reaction ring, and the actuator spline drain holes (View A-A) and remove unwanted grease or dirt.

S 434-023

**WARNING:** BE CAREFUL WHEN YOU INSTALL THE ROTARY ACTUATOR. BECAUSE THE ACTUATOR WEIGHS 56 POUNDS (25.4 Kg), INJURY CAN OCCUR.

- (4) Put the actuator output shaft into the input shaft, and align the missing spline tooth on the actuator rim to the missing spline tooth on the reaction ring (View C-C).

S 434-024

- (5) Move the actuator on to the reaction ring.

**NOTE:** Turn the actuator input shaft if it is necessary to engage the actuator to the reaction ring splines.

S 434-025

- (6) Install the three hold-down clamps with washers and locknuts (View D-D and E-E).

S 214-026

- (7) Make sure the actuator crank arm touches the retract overtravel stop (View A, Fig. 402).

S 424-027

- (8) Install the input angle gearbox on the actuator (AMM 27-51-42/401).

S 984-028

- (9) Turn the gearbox coupling in the extend direction the same number of turns that you made during the actuator removal procedure.

**NOTE:** If you did not write the number of turns that you made during the removal procedure, turn the gearbox coupling five full turns in the extend direction and adjust the retract overtravel stop clearance to the RIG position (AMM 27-51-00/501).

When you look to the outboard direction, the extend direction is counterclockwise for the left wing, and clockwise for the right wing.

EFFECTIVITY

ALL

27-51-05

02

Page 412  
Dec 22/01

S 434-029

- (10) Connect the torque tube to the actuator input angle gearbox (AMM 27-51-41/401).

**NOTE:** Do not turn the gearbox coupling while you connect the torque tube. It will be necessary to adjust the flap drive if you turn the coupling or the torque tube.

S 644-030

- (11) Fill the gearbox coupling with grease.

S 094-031

- (12) Remove the PDU lock from the TE flap power drive unit (PDU) (Fig. 404).

S 214-032

- (13) Make sure the flap control lever is in the zero-unit (flaps up) detent.

S 084-053

- (14) Remove the devices used to hold the flaps up (tripod and rubber blocks).

S 864-033

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (15) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 864-034

- (16) Move the flap control lever to the 20-unit detent, and make sure the flaps move to the 20-degree position.

S 864-035

- (17) Remove power from the center hydraulic system (AMM 29-11-00/201).

EFFECTIVITY

ALL

27-51-05

02

Page 413  
Apr 22/05

S 494-036

**WARNING:** DO NOT MOVE THE FLAP CONTROL LEVER WHEN YOU APPLY THE MODELING CLAY IN THE STEP THAT FOLLOWS. MOVEMENT OF THE FLAP CONTROL LEVER DURING THIS OPERATION CAN CAUSE INJURY TO PERSONS.

(18) Apply modeling clay to all eight retract overtravel stops in the left and right wings.

S 864-037

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

(19) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 864-038

(20) Move the flap control lever to the zero (FLAPS UP) detent and permit the flaps to move to the fully retracted position.

**NOTE:** After the flaps moved to the fully retracted position, stop for one minute before you do the subsequent step.

S 864-039

(21) Move the flap control lever to the 20-unit detent.

S 864-040

(22) Remove power from the center hydraulic system (AMM 29-11-00/201).

Page 414  
Dec 10/98

S 094-041

**WARNING:** DO NOT MOVE THE FLAP CONTROL LEVER WHEN YOU MEASURE THE OVERTRAVEL STOP CLEARANCES IN THE STEP THAT FOLLOWS. THE MOVEMENT OF THE FLAP CONTROL LEVER DURING THIS OPERATION CAN CAUSE INJURY TO PERSONS.

- (23) Remove the clay from each retract overtravel stop, measure the clay thickness, and do these checks:
- (a) Make sure each clay thickness agrees with the correct retract overtravel clearance as shown for the inboard flap (Fig. 402).
  - (b) Make sure each clay thickness agrees with the correct retract overtravel clearance as shown for the outboard flap (Fig. 403).

S 824-042

- (24) If the retract overtravel clearance is not correct, adjust the retract overtravel clearance to the RIG position (AMM 27-51-00/501).

S 434-043

- (25) Make sure you install a lockwire to the coupling screws on each coupling with the double twist procedure (AMM 20-10-23/401).

S 864-044

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (26) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 864-045

- (27) Operate the flap control lever through a full cycle and make sure the flaps operate correctly.

E. Put the Airplane Back to Its Usual Condition

S 414-046

- (1) Install the aft wing-to-body access panels, 195JL and 196JR, below the flap fairing door (AMM 06-41-00/201).

EFFECTIVITY

ALL

S 864-047

- (2) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the main power distribution panel, P6:
- (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6D24, ALTN FLAP PWR
  - (c) 6F24, ALTN SLAT OUTBD PWR

S 864-048

- (3) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel, P11:
- (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD
  - (c) 11J24, FLAPS ALTN CONT

S 094-049

**WARNING:** USE THE PROCEDURE IN AMM 32-00-15/201 TO REMOVE THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (4) Remove the door locks from the landing gear doors and close the doors (AMM 32-00-15/201).

S 864-050

- (5) Remove power from the center hydraulic system (AMM 29-11-00/201).

S 864-051

- (6) Remove electrical power if it is not necessary (AMM 24-22-00/201).

INBOARD FLAP, AFT FLAP – MAINTENANCE PRACTICES

1. General

A. This procedure contains these tasks:

- Aft Flap Slave Drive Bellcrank Removal
- Aft Flap Slave Drive Bellcrank Installation
- Aft Flap Removal
- Aft Flap Installation
- Aft Flap Drive Bellcrank Removal
- Aft Flap Drive Bellcrank Installation
- Aft Flap Adjustment.

TASK 27-51-06-022-001

2. Aft Flap Slave Drive Bellcrank – Removal

A. Equipment

- (1) Circuit Breaker Lockout Clip – 10121C-R,  
Commercially Available
- (2) Sling Set, Inboard TE Flap – A27016-27
- (3) TE Flap PDU Lock – A27009-7
- (4) Inboard Aileron Rigging Bar – A27024-47  
(recommended); -2 (optional)

B. References

- (1) AMM 06-44-00/201, Wing Access Doors and Panels
- (2) AMM 24-22-00/201, Electrical Power – Control
- (3) AMM 27-51-03/401, Inboard Flap
- (4) AMM 27-51-15/401, Inboard Trailing Edge Flap Track Fairing
- (5) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems
- (6) AMM 32-00-15/201, Landing Gear Door Lock
- (7) AMM 32-00-20/201, Landing Gear Downlock

C. Access

(1) Location Zones

- |         |  |
|---------|--|
| 143/144 | Left/Right MLG Wheel Well              |
| 211/212 | Control Cabin                          |
| 555/655 | Inboard Trailing Edge Flap             |
| 710     | Nose Landing Gear and Doors            |
| 730/740 | Left/Right Main Landing Gear and Doors |

(2) Access Panels

- |             |  |
|-------------|--|
| 555FB/655FB | Main Spar Inspar Structure               |
| 555HB/655HB | Area Aft of Main Flap Mid Spar Structure |

D. Prepare for the Removal

S 212-002

- (1) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

S 492-003

**WARNING:** USE THE TASK IN AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Open the doors for the landing gear and install the door locks (AMM 32-00-15/201).

S 862-004

- (3) Supply electrical power (AMM 24-22-00/201).

S 862-005

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (4) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 862-177

- (5) If an aileron rigging bar is not available, do the steps as follows:
  - (a) Move the flap control lever to the zero detent to retract the flaps.
  - (b) Make sure the ailerons are approximately in the neutral position.

EFFECTIVITY

ALL

27-51-06

01

Page 212  
Apr 22/01

- (c) Measure the aileron-to-flap trailing edge mismatch and keep the dimension to use for the installation.
- (d) Make sure the ailerons do not move during the flap removal/installation.

S 862-006

- (6) Move the flap control lever to the 30-unit detent and permit the flaps to move to the fully extended position.

S 862-007

- (7) Remove power from the center hydraulic system (AMM 29-11-00/201).

S 862-008

- (8) Open this circuit breaker on the main power distribution panel, P6, and attach a DO-NOT-CLOSE tag:
  - (a) 6D24, ALTN FLAP PWR

S 862-009

- (9) Open these circuit breakers on the P6 panel and install circuit breaker locks:
  - (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6F24, ALTN SLAT OUTBD PWR

S 862-010

- (10) Open this circuit breaker on the overhead panel, P11, and attach a DO-NOT-CLOSE tag:
  - (a) 11J24, FLAPS ALTN CONT

S 862-011

- (11) Open these circuit breakers on the P11 panel and install circuit breaker locks:
  - (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD

S 492-012

- (12) Install the PDU lock in the TE flap power drive unit (PDU) (Fig. 207).

EFFECTIVITY

ALL

27-51-06

01

Page 213  
Apr 22/01

S 022-196

- (13) Do the removal of the aft flap with the instructions given in the "Aft Flap - Removal" task, if necessary.

E. Remove the Slave Drive Bellcrank (Fig. 202)

S 032-013

- (1) Remove the locknut, bolt, washers, and clampup bushing, and disconnect the link from the slave drive bellcrank (View C-C).

S 012-199

- (2) Remove the bolts, strap, seal and seal retainers from the lower cove panel of the inboard main flap assembly.

S 032-014

- (3) Remove the locknut, bolt, washers, and clampup bushing and disconnect the slave drive rod from the bellcrank (View B-B).

S 012-015

- (4) To remove the inboard bellcrank, open the access panel, 555HB (left wing) or 655HB (right wing), at the lower surface of the main flap to get access to the four bolts that attach the inboard bellcrank support fitting to the rear spar (AMM 06-44-00/201).

S 012-016

- (5) To remove the outboard bellcrank, open the access panel, 555FB (left wing) or 655FB (right wing), to get access to the four bolts that attach the outboard bellcrank support fitting to the rear spar (AMM 06-44-00/201).

S 032-017

- (6) Remove the four bolts, locknuts, and washers to disconnect the bellcrank support fitting from the rear spar.

TASK 27-51-06-422-018

3. Aft Flap Slave Drive Bellcrank - Installation

A. Equipment

- (1) Sling Set, Inboard TE Flap - A27016-27  
(2) Inboard Aileron Rigging Bar - A27024-47 (recommended); -2 (optional)

B. Consumable Materials

- (1) C00259 Primer - BMS 10-11, Type 1

730/740	Left/Right Main Landing Gear and Doors

(2) Access Panels

555FB/655FB	Main Spar Inspar Structure
555HB/655HB	Area Aft of Main Flap Mid Spar Structure

E. Install the Slave Drive Bellcrank (Fig. 202)

S 432-019

- (1) Connect the bellcrank support fitting to the main flap rear spar with four bolts, washers, and locknuts. Install the bolts with wet sealant.

S 642-020

- (2) Lubricate the bellcrank with grease at the location shown (View A-A).

S 432-021

- (3) Connect the slave drive rod to the bellcrank with these steps (View B-B):
  - (a) Install the bolts with washers, clampup bushing, and nut.
  - (b) Install the cotter pin in the nut.

S 412-198

- (4) Install the bolts, strap, seal and seal retainers on the lower cove panel of the inboard main flap assembly.

S 422-197

- (5) Do the installation of the aft flap with the instructions given in the "Aft Flap - Installation" task, if necessary.

EFFECTIVITY

ALL

27-51-06

01

Page 215  
Dec 22/07

S 432-022

- (6) Connect the link to the slave drive bellcrank with these steps (View C-C):
- Apply grease to the mating surfaces between the bolt and the bushing.
  - Install the bolt with washers, clampup bushing, and nut.

**NOTE:** Remove unwanted grease on the bolt threads before you install the nut.

S 412-023

- (7) Install the access panels, 555FB and 555HB (left wing) or 655FB and 655HB (right wing), at the lower surface of the main flap (AMM 06-44-00/201).

S 092-024

- (8) Remove the PDU lock from the TE flap power drive unit (PDU) (Fig. 207).

S 862-025

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (9) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 862-026

- (10) Move the flap control lever to the zero (FLAPS UP) detent and permit the flaps to move to the fully retracted position.

S 862-027

- (11) Remove power from the center hydraulic system (AMM 29-11-00/201).

EFFECTIVITY

ALL

27-51-06

01

Page 216  
Apr 22/01

S 222-192

- (12) Do a check at the lower surfaces of the main and aft flap and make sure the mismatch dimension is correct (Fig. 204).

NOTE: If the mismatch dimension is out of tolerance, add or remove shims at the front and rear fittings between the aft flap and the aft flap hinges support (Fig. 203).

S 222-028

- (13) Do a check, at the inboard and outboard ends, of the inboard aft flap and make sure the distance between the upper cove panel to the trailing edge (TE) of the aft flap is correct (Fig. 204).

S 822-029

- (14) If the dimension is not correct, adjust the slave drive rod for the aft flap (Fig. 202).

S 222-030

- (15) Make sure the aileron-to-flap TE mismatch is within the limit as shown (Fig. 205).

S 222-178

- (16) If you do not use an aileron rigging bar, measure the aileron-to-flap trailing edge mismatch.  
(a) Compare this to the mismatch dimension you measured before you removed the flap.

S 822-031

- (17) If the aileron-to-flap TE mismatch is not correct, adjust the fit and fair of the inboard flap (AMM 27-51-03/401).

F. Put the Airplane Back to Its Usual Condition

S 862-032

- (1) Remove the circuit breaker locks and DO-NOT-CLOSE tags and close these circuit breakers on the main power distribution panel, P6:  
(a) 6D21, ALTN SLAT INBD PWR  
(b) 6D24, ALTN FLAP PWR  
(c) 6F24, ALTN SLAT OUTBD PWR

S 862-033

- (2) Remove the circuit breaker locks and DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel, P11:

- (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD

S 862-045

- (10) Remove power from the center hydraulic system (AMM 29-11-00/201).

S 492-046

- (11) Install the PDU lock in the TE flap power drive unit (PDU) (Fig. 207).

E. Remove the Aft Flap

S 492-047

- (1) Install the sling set at the two attach points on the upper surface of the aft flap (Fig. 206).

S 492-048

- (2) Connect the overhead hoist to the aft flap sling.

**NOTE:** Make sure the hoist can hold the weight of the aft flap. The aft flap weighs approximately 99 pounds (44.9 Kg).

S 032-049

- (3) Remove the bolt, washers, and clampup bushing to disconnect the inboard and outboard links from the aft flap attach points (Detail A, Fig. 202).

S 032-050

- (4) Remove the stop from the aft end of the inboard deflection control track (View E-E, Fig. 202).

S 032-051

- (5) Disengage the aft flap from the outboard deflection control track (View D-D, Fig. 202) with these steps:

**NOTE:** It is easier to disengage the aft flap from the outboard deflection control track by the steps that follow, without the removal of the stop on the outboard track.

- (a) Remove the track bolts to disconnect the outboard deflection control track from the track support fitting (View F-F and G-G, Fig. 202).

EFFECTIVITY

ALL

27-51-06

01

Page 220  
Dec 22/01

- (b) Turn the outboard deflection control track to disengage the track from the rollers on the aft flap.

NOTE: Turn and move the track forward and aft as necessary to disengage the track from the rollers.

- (c) Remove the outboard deflection control track from the airplane.

S 022-052

- (6) Remove the aft fairing (AMM 27-51-15/401).

NOTE: You can keep the flaps at the 30-unit position to remove the aft fairing.

S 032-053

- (7) Remove the nut, clampup bushing, sleeve, washers, and bolt to disconnect the aft pushrod from the aft flap cam (Joint 13) (View E-E, Fig. 201).

NOTE: Hold the aft flap in position while you disconnect the pushrod.

S 982-054

- (8) Lower the aft flap to the extend direction until the rollers disengage from the inboard deflection control track (View D-D, Fig. 202).

S 032-055

- (9) Turn the aft flap to disengage the rollers from the aft flap cam at the outboard hinge (View G-G, Fig. 201).

S 032-056

- (10) Disconnect the aft flap from the main flap at the inboard and outboard hinge points (Joint 14) with these steps (View F-F, Fig.201):
  - (a) Remove the plug from the hinge.
  - (b) Remove the cotter pin, nut, clamp-up bushing, and bolt from the hinge.

S 022-057

- (11) Lower the aft flap from the airplane.

S 092-058

- (12) Remove the sling from the aft flap.

TASK 27-51-06-422-059

## 5. Aft Flap - Installation

### A. Equipment

- (1) Sling Set, Inboard TE Flap - A27016-27

EFFECTIVITY

ALL

27-51-06

01

Page 221  
Aug 22/06

B. Consumable Materials

- (1) D00633 Grease - BMS 3-33 (recommended)
- (2) D00013 Grease - MIL-PRF-23827 (Supersedes MIL-G-23827) (Alternate)
- (3) A00247 Sealant - BMS 5-95

C. References

- (1) AMM 06-44-00/201, Wing Access Doors and Panels
- (2) AMM 20-10-23/401, Lockwires
- (3) AMM 24-22-00/201, Electrical Power - Control
- (4) AMM 27-51-03/401, Inboard Flap
- (5) AMM 27-51-15/401, Inboard Trailing Edge Flap Track Fairings
- (6) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems
- (7) AMM 32-00-15/201, Landing Gear Door Lock

D. Access

- (1) Location Zones
  - 143/144 Left/Right MLG Wheel Well
  - 211/212 Control Cabin
  - 555/655 Inboard Trailing Edge Flap
  - 710 Nose Landing Gear and Doors
  - 730/740 Left/Right Main Landing Gear and Doors

E. Install the Aft Flap

S 492-060

- (1) Install the aft flap sling to the two attach points on the upper surface of the aft flap (Fig. 206).

S 492-061

- (2) Connect the overhead hoist to the aft flap sling and lift the aft flap up to the wing.

**NOTE:** Make sure the hoist can hold the weight of the aft flap. The aft flap weighs approximately 99 pounds (44.9 Kg).

S 432-062

- (3) Connect the aft flap to the main flap at the inboard and outboard hinge points (Joint 14) with these steps (View F-F, Fig. 201):
  - (a) Connect each hinge with the bolt, washers, clamp-up bushing, nut and cotter pin.
  - (b) Tighten the nut to 85-140 pound-inches (9.6-15.8 newton-meters).
  - (c) Install the plug.

S 432-063

- (4) Turn the aft flap to engage the rollers in the aft flap cam at outboard hinge (View G-G, Fig.201).

S 432-064

- (5) At the inboard end of the aft flap, engage the rollers to the deflection control track (View D-D, Fig. 202).

EFFECTIVITY

ALL

27-51-06

01

Page 222  
Aug 22/08

S 422-065

- (6) Hold the aft flap into position while you install the outboard deflection control track with these steps:
- (a) Engage the outboard deflection control track to the rollers at the outboard end of the aft flap.

NOTE: Turn and move the track forward and aft as necessary to engage the rollers to the track.

- (b) Connect the deflection control track to the track support fitting with the bolts, washers, bushings, and nuts (View F-F and G-G, Fig. 202).

S 432-066

- (7) Connect the aft pushrod to the aft flap cam (Joint 13) with these steps (View E-E, Fig. 201):
- (a) Lubricate the mating surfaces of the bolt and the bushings with grease before the installation.
  - (b) Install the bolt, washers, clampup bushing, and nut.

NOTE: Remove unwanted grease on the bolt threads before you install the nut.

- (c) Tighten the nut to 290-510 pound-inches (32.8-57.6 newton meters).

S 432-067

- (8) Install the stop at the end of the inboard deflection control track with these steps (View E-E, Fig. 202):
- (a) Install the stop with a bolt, washer, and shim.

NOTE: Apply wet sealant to the shim.

- (b) Install a lockwire with the double twist procedure (AMM 20-10-23/401).

S 422-201

CAUTION: MAKE SURE THAT YOU INSTALL THE DRIVE LINKS ONTO THE AFT FLAP WITH THE AFT LUBRICATION FITTINGS POINTED DOWN. IF THE LUBRICATION FITTINGS ARE POINTED UP, THEY CAN CONTACT THE ACCESS PLATE AND CAUSE DAMAGE TO THE AIRPLANE.

- (9) Connect the inboard and outboard drive links to the aft attach points with these steps (Detail A, Fig. 202):
- (a) Apply grease on the mating surfaces between the bolt and the bushing.

EFFECTIVITY

ALL

27-51-06

01

Page 223  
Dec 22/01

- (b) Install the bolt, washers, clampup bushing, and nut. Tighten the nut.

**NOTE:** Remove unwanted grease from the bolt threads before you install the nut.

S 092-069

- (10) Remove the sling from the aft flap.

S 422-070

- (11) Install the aft flap fairing (AMM 27-51-15/401).

S 092-071

- (12) Remove the PDU lock from the TE flap power drive unit (PDU) (Fig. 207).

S 862-072

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (13) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 862-073

- (14) Move the flap control lever to the zero (FLAPS UP) detent, and make sure the flaps move to the fully retracted position.

S 862-074

- (15) Remove power from the center hydraulic system (AMM 29-11-00/201).

S 222-193

- (16) Do a check at the lower surfaces of the main and aft flap and make sure the mismatch dimension is correct (Fig. 204).

**NOTE:** If the mismatch dimension is out of tolerance, add or remove shims at the front and rear fittings between the aft flap and the aft flap hinges support (Fig. 203).

EFFECTIVITY

ALL

27-51-06

01

Page 224  
Apr 22/01

S 222-075

- (17) Do a check, at the inboard and outboard ends, of the inboard aft flap and make sure the distance between the upper cove panel to the trailing edge (TE) of the aft flap is correct (Fig. 204).

S 822-076

- (18) If the dimension is not correct, adjust the slave drive rod for the aft flap (Fig. 202).

S 222-077

- (19) Make sure the aileron-to-flap TE mismatch is below the limit as shown (Fig. 205).

S 822-078

- (20) If the aileron-to-flap TE mismatch is not correct, adjust the fit and fair of the inboard flap (AMM 27-51-03/401).

S 822-079

- (21) Do the adjustment for the aft flap with the instruction given in the "Aft Flap - Adjustment" task if necessary.

F. Put the Airplane Back to Its Usual Condition

S 862-080

- (1) Remove the circuit breaker locks and DO-NOT-CLOSE tags and close these circuit breakers on the main power distribution panel, P6:  
(a) 6D21, ALTN SLAT INBD PWR  
(b) 6D24, ALTN FLAP PWR  
(c) 6F24, ALTN SLAT OUTBD PWR

S 862-081

- (2) Remove the circuit breaker locks and DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel, P11:  
(a) 11H23, SLAT ALTN CONT INBD  
(b) 11H24, SLAT ALTN CONT OUTBD  
(c) 11J24, FLAPS ALTN CONT

S 092-082

**WARNING:** USE THE TASK IN AMM 32-00-15/201 TO REMOVE THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (3) Remove the door locks from the landing gear doors and close the doors (AMM 32-00-15/201).

TASK 27-51-06-022-131

6. Aft Flap Drive Bellcrank - Removal

A. Equipment

- (1) Circuit Breaker Lockout Clip, 1012LC-R  
Commercially Available

EFFECTIVITY

ALL

C. Access

(1) Location Zones

143/144	Left/Right MLG Wheel Well
211/212	Control Cabin
555/655	Inboard Trailing Edge Flap
710	Nose Landing Gear and Doors
730/740	Left/Right Main Landing Gear and Doors

D. Prepare for the Removal

S 212-132

- (1) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

S 492-133

**WARNING:** USE THE TASK IN AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Open the doors for the landing gear and install the door locks (AMM 32-00-15/201).

S 862-134

- (3) Supply electrical power (AMM 24-22-00/201).

S 862-135

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (4) Pressurize the center hydraulic system (AMM 29-11-00/201).

211/212	Control Cabin
555/655	Inboard Trailing Edge Flap
710	Nose Landing Gear and Doors
730/740	Left/Right Main Landing Gear and Doors

D. Prepare for the Adjustment

S 212-084

- (1) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

S 212-085

- (2) Make sure the flaps and slats are in the fully retracted position.

S 212-086

- (3) Make sure the flap control lever is in the zero detent.

S 862-087

- (4) Open this circuit breaker on the main power distribution panel, P6, and attach a DO-NOT-CLOSE tag:  
(a) 6D24, ALTN FLAP PWR

S 862-088

- (5) Open these circuit breakers on the P6 panel and install circuit breaker locks:  
(a) 6D21, ALTN SLAT INBD PWR  
(b) 6F24, ALTN SLAT OUTBD PWR

S 862-089

- (6) Open this circuit breaker on the overhead panel, P11, and attach a DO-NOT-CLOSE tag:  
(a) 11J24, FLAPS ALTN CONT

S 862-090

- (7) Open these circuit breakers on the P11 panel and install circuit breaker locks:  
(a) 11H23, SLAT ALTN CONT INBD  
(b) 11H24, SLAT ALTN CONT OUTBD

S 212-091

- (8) Make sure the power is removed from the center hydraulic system (AMM 29-11-00/201).

E. Adjust the Aft Flap

S 822-092

- (1) Adjust the retract overtravel stop clearance to the RIG Position (AMM 27-51-00/501).

EFFECTIVITY

ALL

27-51-06

01

Page 232  
Apr 22/05

S 032-093

- (2) Disconnect the forward pushrod from the top of the bellcrank (View D-D, Fig. 201).

**NOTE:** Hold the aft flap into position while you disconnect the pushrod.

S 492-094

- (3) Install rig pin TE5 into the bellcrank (View A-A, Fig. 201):
  - (a) 767-200 AIRPLANES WITH 2 RIG PIN HOLES;  
Install the rig pin TE5 into the top rig pin hole in the bellcrank.
  - (b) 767-300 AIRPLANES WITH 2 RIG PIN HOLES;  
Install the rig pin TE5 into the bottom rig pin hole in the bellcrank.

S 822-095

- (4) Remove the lockwire and adjust the length of the forward pushrod until you can easily connect the pushrod to the top of the bellcrank.

S 432-096

- (5) Tighten the jamnut on the pushrod and install a lockwire with the double twist procedure (AMM 20-10-23/401).

S 432-097

- (6) Connect the forward pushrod to the top of the bellcrank (View D-D, Fig. 201), and tighten the nut to 290-510 pound-inches (32.8-57.6 newton-meters).

S 822-105

- (7) Adjust the length of the aft pushrod (View A-A, Fig. 201) until the dimension between the aft flap cam and the aft flap support is correct as shown in Fig. 204.

S 222-106

- (8) Make sure the aileron-to-flap trailing edge mismatch is below the limit (Fig. 205).

S 822-122

- (9) If the aileron-to-flap mismatch is not correct, do the adjustment that follows:
  - (a) Remove rig pin TE5 from the bellcrank (View A-A, Fig. 201).
  - (b) Get access to the slave drive rod (Fig. 202).
  - (c) Adjust the length of the slave drive rod until you can get the trailing edge, between the inboard aileron and the aft flap, to align below the limit (Fig. 205).
  - (d) Install rig pin TE5 and make sure it installs easily in the rig pin hole.

EFFECTIVITY

ALL

27-51-06

02

Page 233  
Apr 22/05

- (e) If the aileron-to-flap TE mismatch is still not correct, adjust the fit and fair of the inboard flap (AMM 27-51-03/401).

S 092-123

- (10) If installed, make sure you remove rig pin TE5 from the bellcrank before you operate the flap drive.

S 862-124

- (11) Supply electrical power (AMM 24-22-00/201).

S 862-125

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (12) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 862-126

- (13) Operate the flaps with the flap control lever through a complete cycle, and make sure that the flaps can move freely.

F. Put the Airplane Back to Its Usual Condition

S 862-127

- (1) Remove the circuit breaker locks and DO-NOT-CLOSE tags and close these circuit breakers on the main power distribution panel, P6:
- (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6D24, ALTN FLAP PWR
  - (c) 6F24, ALTN SLAT OUTBD PWR

S 862-128

- (2) Remove the circuit breaker locks and DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel, P11:
- (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD
  - (c) 11J24, FLAPS ALTN CONT

S 862-129

- (3) Remove power from the center hydraulic system (AMM 29-11-00/201).

EFFECTIVITY

ALL

27-51-06

FLAP FAIRING DOOR – REMOVAL/INSTALLATION

1. General

A. This procedure has two tasks:

- (1) The removal of the flap fairing door.
- (2) The installation of the flap fairing door.

TASK 27-51-07-904-036-001

2. Flap Fairing Door – Removal

A. Equipment

- (1) Circuit Breaker Lockout Clip, 1012LC-R  
Commercially Available
- (2) TE Flap PDU Lock – A27009-7

B. Consumable Materials

- (1) D00633 Grease – BMS 3-33 (Preferred)
- (2) D00013 Grease – MIL-PRF-23827 (Supersedes MIL-G-23827) (Alternate)
- (3) A00247 Sealant – BMS 5-95

C. Parts

AMM		NOMENCLATURE	AIPC

F. Prepare for Removal

S 214-002-001

- (1) Make sure the downlocks are installed on the nose and main landing gear (Ref 32-00-20).

S 494-034-001

**WARNING:** USE THE PROCEDURE IN AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Open the doors for the landing gear and install the door locks (Ref 32-00-15).

S 214-003-001

- (3) Make sure that the TE flaps and LE slats are in the fully retracted position.

S 214-004-001

- (4) Make sure that the flap control lever is in the UP detent.

S 214-005-001

- (5) Make sure that the power is removed from the center hydraulic system (Ref 29-11-00).

S 864-006-001

- (6) Open this circuit breaker on the main power distribution panel, P6, and attach a DO-NOT-CLOSE tag:
  - (a) 6D24, ALTN FLAP PWR

S 864-007-001

- (7) Open these circuit breakers on the P6 panel and attach circuit breaker locks and DO-NOT-CLOSE tags:
  - (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6F24, ALTN SLAT OUTB PWR

- S 864-008-001
- (8) Open this circuit breaker on the overhead panel, P11, and attach a DO-NOT-CLOSE tag:
- (a) 11J24, FLAPS ALTN CONT
- S 864-009-001
- (9) Open these circuit breakers on the P11 panel and attach circuit breaker locks and DO-NOT-CLOSE tags:
- (a) 11H23, SLAT ALTN CONT INBD
- (b) 11H24, SLAT ALTN CONT OUTBD
- S 494-010-001
- (10) Install the PDU lock on the TE flap PDU (Fig. 403).
- S 014-011-001
- (11) Remove the 195JL and 196JR panels below the fairing doors (AMM 06-41-00/201).
- G. Fairing Door Removal (Fig. 401)
- S 034-012-001
- (1) Disconnect the electrical bonding jumper (12) from the forward hinge fitting (10).
- S 034-013-001
- (2) Disconnect the door drive rod (2) from the aft hinge fitting (6).
- S 034-014-001
- (3) Remove the bolt (23) that connects the aft hinge fitting (6) to the aft support fitting (5).
- S 034-015-001
- (4) Hold the aft end of the fairing door (1), and disconnect the forward hinge fitting (10) from the forward support fitting (11).
- S 024-016-001
- (5) Remove the fairing door (1) from the airplane.

F. Procedure

S 644-017-001

- (1) Apply a layer of grease to all pins, washers, nuts, bushings and spacers before installation.

S 434-018-001

- (2) Hold and connect the fairing door (1) to the forward support fitting (11).

NOTE: Do not tighten the locknut at this time.

S 434-019-001

- (3) Connect the fairing door (1) to the aft support fitting (5).

NOTE: Do not tighten the locknut at this time.

S 224-020-001

- (4) Do a check on the gaps for the aft hinge fitting (Detail C).

S 434-021-001

- (5) Install washers (21) as necessary to adjust the gaps shown in Detail C.

S 434-022-001

- (6) Tighten the locknuts at the forward and aft hinge fittings (10, 6).

S 424-023-001

- (7) Install the door drive rod (2) to the aft hinge fitting (6) with a bolt (38), two washers (39, 40), and a locknut (41) (Section E-E).

NOTE: The preload stops must touch the fairing door.

S 824-024-001

- (8) Adjust the length of the drive rod (2) until you get a clearance of 0.003 inch (0.076 mm) between the preload stop and the fairing door.

S 824-025-001

- (9) Make one turn (+/- 0.25 turn) to the drive rod adjustment to move the fairing door against the preload stop.

S 224-026-001

- (10) Do a check on the fairing door (1) clearances (Fig. 402).

S 824-027-001

- (11) Adjust the fairing door clearance if necessary, with the steps that follow:

- (a) Disconnect the door drive rod (2) from the fairing door (1).
- (b) Loosen the bolts (25, 30) that attaches the forward (10) and aft (6) hinge fittings to the airplane structure (Fig. 401).
- (c) Adjust the hinge fittings as necessary to get the correct door clearance.

NOTE: The fairing door must touch the preload stops when you make the adjustment.

- (d) Connect the door drive rod (2) to the fairing door (1).
- (e) Adjust the length of the drive rod (2) until you get a 0.003 inch (0.076 mm) gap between the preload stop and fairing door.
- (f) Make one turn on the drive rod adjustment (+/-0.25 turn) to move the fairing doors against the preload stop.
- (g) Make sure that there is no gap between the nose panel and fairing door (1) (Section B-B, Fig. 402).
- (h) Adjust the nose panel as necessary.
- (i) Make sure that the bullnose fairing clearance is below the limits (Fig. 402).

(j) Adjust the bullnose fairing clearance if necessary.

S 434-028-001

- (12) Connect the electrical bonding jumper (12) between the fairing door (1) and the forward hinge fitting (10).

G. Put the Airplane back to Its Usual Condition

S 414-029-001

- (1) Install the 195JL and 196JR panels below the fairing door (AMM 06-41-00/201).

**NOTE:** Make sure that the upper edge of the fairing panel is located outboard of the lower edge of the fairing door when you install the panel (Fig. 402, View C-C).

S 214-038-001

**CAUTION:** MAKE SURE THAT THE GUIDE FOR THE FAIRING DOOR IS IN THE CORRECT POSITION WITH THE INBOARD END OF THE BODY PANEL. THIS WILL PREVENT DAMAGE TO THE FAIRING DOOR OR BODY PANEL.

- (2) Make sure that the guide for the fairing door is in the correct position (Fig. 402, View C-C)

S 094-030-001

- (3) Remove the PDU lock from the TE flap PDU (Fig. 403).

S 094-031-001

**WARNING:** USE THE PROCEDURE IN AMM 32-00-15/201 TO REMOVE THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (4) Remove the door locks from the landing gear doors and close the doors (Ref 32-00-15).

S 864-032-001

- (5) Remove the DO-NOT-CLOSE tags and circuit breaker locks and close these circuit breakers on the P6 panel:
- (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6D24, ALTN FLAP PWR
  - (c) 6F24, ALTN SLAT OUTBD PWR

S 864-033-001

- (6) Remove the DO-NOT-CLOSE tags and circuit breaker locks and close these circuit breakers on the P11 panel:
- (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT

FLAP FAIRING DOOR – REMOVAL/INSTALLATION

1. General

A. This procedure has two tasks:

- (1) The removal of the flap fairing door.
- (2) The installation of the flap fairing door.

TASK 27-51-07-904-001-002

2. Flap Fairing Door – Removal

A. Equipment

- (1) Circuit Breaker Lockout Clip, 1012LC-R  
Commercially Available
- (2) TE Flap PDU – A27009-7

B. References

- (1) AMM 06-41-00/201, Fuselage Access Doors and Panels
- (2) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic System
- (3) AMM 32-00-15/201, Landing Gear Door Lock
- (4) AMM 32-00-20/201, Landing Gear Downlock

C. Access

(1) Location Zones

- 144 Right MLG Wheel Well
- 211/212 Control Cabin
- 410 No. 1 Power Plant
- 420 No. 2 Power Plant
- 570/670 Wing Trailing Edge Flap Track Fairing – Inboard
- 730/740 Left/Right Main Landing Gear and Doors

(2) Access Panel

- 195JL Left Inboard Flap Mechanism
- 196JR Right Inboard Flap Mechanism

D. Prepare for Removal

S 484-080-002

**WARNING:** MAKE SURE THE DOWNLOCKS ARE INSTALLED ON ALL THE LANDING GEAR (BEFORE YOU MOVE THE CONTROL LEVER). WITHOUT THE DOWNLOCKS, THE LANDING GEAR COULD RETRACT AND CAUSE INJURIES TO PERSONS AND DAMAGE TO EQUIPMENT.

- (1) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20).

S 014-075-002

**WARNING:** OBEY THE INSTALLATION PROCEDURE FOR THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY. THE MOVEMENT OF THE DOORS CAN CAUSE INJURIES TO PERSONS AND DAMAGE TO EQUIPMENT.

- (2) Open the doors for the landing gear and install the door locks (AMM 32-00-15).

S 214-052-002

- (3) Make sure that the TE flaps and LE slats are in the fully extended position.

S 214-053-002

- (4) Make sure that the flap control lever is in the 30-unit detent.

S 214-054-002

- (5) Make sure that the power is removed from the center hydraulic system (AMM 29-11-00).

S 864-055-002

- (6) Open these circuit breakers and attach DO-NOT-CLOSE tags:
  - (a) On the main power distribution panel, P6,
    - 1) 6D24, ALTN FLAP PWR
  - (b) On the overhead panel, P11,
    - 1) 11J24, FLAPS ALTN CONT

S 864-056-002

- (7) Open these circuit breakers and attach circuit breaker locks and DO-NOT-CLOSE tags:
  - (a) On the main power distribution panel, P6,
    - 1) 6D21, ALTN SLAT INBD PWR
    - 2) 6F24, ALTN SLAT OUTBD PWR
  - (b) On the overhead panel, P11,
    - 1) 11H23, SLAT ALTN CONT INBD
    - 2) 11H24, SLAT ALTN CONT OUTBD

S 494-057-002

- (8) Install the PDU lock on the TE flap PDU (Fig. 403).

S 014-058-002

- (9) Remove the 195JL or 196JR panels below the fairing doors (AMM 06-41-00/201).

E. Fairing Door Removal (Fig. 401)

S 024-059-002

- (1) Disconnect the electrical bonding jumper (14) from the forward hinge fitting (15) of the mid fairing door.

- S 024-060-002
- (2) Disconnect the door drive rod (29) from the aft arm assembly of the mid fairing door.
- S 024-061-002
- (3) Disconnect the drive rod for the forward/aft fairing door (30) from the aft arm assembly of the mid fairing door.
- S 024-062-002
- (4) Remove the bolt (28) that connects the aft hinge fitting of the mid fairing door (24) to the aft arm assembly of the mid fairing door.
- S 024-063-002
- (5) Hold the aft end of the mid fairing door (13) and disconnect the forward hinge fitting of the mid fairing door (15) from the forward arm assembly.
- S 024-064-002
- (6) Remove the mid fairing door (13).
- S 024-065-002
- (7) Remove the bolt (20) that connects the forward/aft fairing door (1) to the aft hinge fitting (19).
- S 024-066-002
- (8) Hold the after end of the forward/aft fairing door (1), and disconnect the door from the forward hinge fitting (16).
- S 024-067-002
- (9) Remove the forward/aft fairing door (1).

TASK 27-51-07-404-076-002

- 196JR Right Inboard Flap Mechanism

F. Procedure

S 824-092-002

- (1) Prepare to adjust the serrated fitting on the cam assembly (Fig. 401, View A).

**NOTE:** Measure the relative position of point "A" at the flaps down and flaps up position. The relative waterline difference of these two measurements is not to exceed 0.05 inches. Clamp a pointer to an adjacent frame as an aid to measure the relative waterline difference.

(a) Extend the TE flap with electrical power:

- 1) Make sure that the position selector switch for the flap/slat alternate drive (on the first officer instrument panel, P3) is in the NORM position.

- 2) Remove the PDU lock from the TE flap PDU.
- 3) Remove the DO-NOT-CLOSE tag, and close these circuit breakers:
  - a) On the main power distribution panel, P6.  
6D24, ALTN FLAP PWR
  - b) On the overhead panel, P11  
11J24, FLAPS ALTN CONT
- 4) Remove the DO-NOT-CLOSE tag, and close this circuit breaker on the P11 panel:
  - a) 11J24, FLAPS ALTN CONT
- 5) Supply electrical power (AMM 24-22-00/201).
- 6) Make sure that the arming switches for the flap and slat alternate drive (on the P3 panel) are not in the armed position (switch lights off).
- 7) Push the arming switch for the flap alternate drive to arm the flap alternate drive (switch light on).
- 8) Make sure that the TRAILING EDGE light on the P3 panel comes on.

**CAUTION:** MAKE SURE THE ALTERNATE (ELECTRIC) DRIVE MOTOR IS LIMITED TO 4 MINUTES OPERATION AND 20 MINUTES OFF. FAILURE TO DO THIS CAN CAUSE DAMAGE TO THE MOTOR.

- 9) To extend the TE flaps, turn the position selector switch for the flap/slat alternate drive to the 30-unit position.
- 10) Make sure the TE flaps are extended fully.
- (b) Record the vertical distance from point "A" to the pointer.
  - 1) Retract the TE flaps with electrical power with the steps that follow:
    - a) Move the position selector switch for the flap/slat alternate drive to the UP position.
    - b) Make sure that the TE flaps move to the fully retracted position.
    - c) Move the position selector switch to the NORM position.
- (c) Record the vertical distance from point "A" to the pointer.

 **BOEING**  
767  
MAINTENANCE MANUAL

- (d) Compare the recorded value of the location of point "A" with the flaps at the UP position and at the 30-unit position.

NOTE: The relative waterline difference between the measurements cannot exceed 0.05 inches (1.27 mm).

- (e) Do the deactivation procedure with the steps that follow:
- 1) Push the arming switch for the flap alternate drive to disarm the flap alternate drive (switch light goes off).
  - 2) Make sure that the TRAILING EDGE light goes off, and that the TE FLAP DISAGREE message does not show on the EICAS.
  - 3) Remove electrical power if it is not necessary (AMM 24-22-00/201).
  - 4) Open these circuit breakers and attach DO-NOT-CLOSE tags:
    - a) On the main power distribution panel, P6, 6D24, ALTN FLAP PWR
    - b) On the overhead panel, P11, 11J24, FLAP ALTN CONT
  - 5) Install the PDU lock on the TE flap PDU.
- (f) If the relative waterline difference between the two measurements is greater than 0.05 inches (1.27 mm), adjust the cam assembly as follows:
- 1) Loosen the two bolts that connect the cam assembly to the crank arm and the two bolts that connect the serrated fitting to the cam.
  - 2) Adjust the serrated fitting as required.

NOTE: Each serration of adjustment away from the crank arm will move the uprig point "A" down and the downrig point "A" up. This will result in a change of relative position of point "A" of 0.08 inches (2.03 mm) .

- 3) Tighten the four bolts.
- (g) Repeat the above steps to cycle the flaps and recheck the relative waterline position of point "A" at the flaps UP position and at the 30-unit position.

(h) Repeat the cam adjustment if required.

S 644-051-002

- (2) Apply a layer of grease to all pins, washers, nuts, bushings and spacers before installation.

S 424-052-002

- (3) Connect the forward/aft fairing door (1) to the forward hinge fitting (16), and the aft hinge fitting (19).

S 424-053-002

- (4) Hold the mid fairing door (13) and do the steps that follow:  
(a) Connect the forward arm assembly to the forward hinge fitting (15).  
(b) Connect the aft arm assembly to the aft hinge fitting (24).

S 224-054-002

- (5) Do a check on the clearances around the mid fairing door (Detail A, Fig. 402).

NOTE: The clearance between the mid fairing door and the lower body panel (194JL or 194JR) is not to be measured since the body panel is removed.

S 824-055-002

- (6) If necessary, adjust the clearances around the mid fairing door with the steps that follow:  
(a) Add washers (27) at the aft hinge fitting of the mid fairing door (24) and forward/aft fairing door (19) as necessary (Detail D, Fig. 401).

NOTE: Make sure that the total washer thickness is not more than 0.25 inch (6.35 mm).

S 424-056-002

- (7) Tighten the nuts (12.6) at the forward hinge fittings (15,16) of the mid and forward/aft fairing doors.

S 224-057-002

- (8) Make sure clearance for the forward fairing door is in tolerance (Detail A, Fig. 402).

S 824-058-002

- (9) Use the slotted fastener holes on the pivot arm of the forward fairing door to adjust the clearance around the forward fairing door.

NOTE: The aft fairing door is not adjusted at this time.

S 424-059-002

- (10) Tighten the nuts (25,23) at the aft hinge fittings of the mid and forward/aft fairing door hinges (24,19).

S 214-060-002

- (11) Make sure that the forward fairing door can turn freely through 90 degrees of movement.

S 214-061-002

- (12) Make sure that the mid fairing door can turn freely through 40 degrees of movement.

S 424-062-002

- (13) Install the drive rod (30) for the forward/aft fairing door with the steps that follow:
- (a) Hold the forward fairing door closed.
  - (b) Open the mid fairing door and hold a 0.40-0.46 inch (10.16-11.68 mm) clearance between the fairing panel and the mid fairing door (View A-A, Fig. 402).

NOTE: To aid in holding the clearance, make and install a 0.40-0.46 inch (10.16-11.68 mm) block between the mid fairing door and the mid fairing panel. The block will hold the mid door on the correct position while adjusting the drive rod (30).

- (c) Install and adjust the drive rod (30) for the forward/aft fairing door as necessary to allow free installation of the (31 and 39) drive rod bolts (View E-E, Fig. 401).

NOTE: This step will supply the necessary preload for the forward/aft fairing doors.

- (d) Remove the 0.40-0.46 inch (10.16-11.68 mm) block.

S 424-063-002

- (14) Connect the door drive rod (29) to the aft arm assembly of the mid fairing door.

S 824-083-002

(15) Fairing door drive rod adjustment:

- (a) Make sure the lower bolt on the door drive rod (29) is in the center bolt hole on the door drive bellcrank.

NOTE: If you install the drive rod (29) into the forward hole of the door drive crank, it will decrease the range of travel. If you install the drive rod (29) into the aft hole of the door drive crank, it will increase the range of travel.

- (b) Hold the forward fairing door rod closed and adjust the door drive rod (29) to get 0.20 ±0.06 inch (5.0 +/- 1.5 mm) clearance between the top of the mid fairing door and the fairing panel.

S 824-084-002

(16) Do a check on the clearance around the aft fairing door.

- (a) Apply upward hand pressure to the aft fairing door to counteract the spring load and make sure that the door can be moved to give a minimum of 0.4 inch (10.16 mm) clearance.
- (b) If more clearance is necessary, lengthen the drive rod (30) (Fig. 401).

NOTE: Make sure the forward fairing door will fully close.

S 414-065-002

(17) Install the 195JL or 196JR panel (AMM 06-41-00/201).

NOTE: Make sure that the upper edge of the fairing panel is located outboard of the lower edge of the mid door when you install the panel (Fig. 402, View C-C).

S 864-077-002

CAUTION: MAKE SURE THAT THE GUIDE FOR THE MID FAIRING DOOR IS IN THE CORRECT POSITION WITH THE INBOARD END OF THE BODY PANEL. THIS WILL PREVENT DAMAGE TO THE MID FAIRING DOOR OR BODY PANEL.

(18) Make sure that the guide for the mid fairing door is in the correct position (View C-C, Fig. 402).

 **BOEING**  
767  
MAINTENANCE MANUAL

S 224-066-002

- (19) Make sure the clearance between the lower body panel (194JL or 194JR) and the mid fairing door is in tolerance.
- (a) Keep a clearance of 0.002-0.050 inch (0.050-1.27 mm) between the lower body panel and the formed fairing strip on the mid fairing door (View C-C, Fig. 402).

S 824-067-002

- (20) If the clearance is not in tolerance, adjust as follows:

S 014-089-002

- (21) Remove the lower body panel, 195JL or 196JR (AMM 06-41-00/201).
- (a) Adjust the door drive rod (29) to decrease its length.

**NOTE:** If the rod adjustment is not sufficient to get the required clearance, the rod (29) may be machined shorter by a maximum of 0.25 inch (6.35 mm).

- (b) Install the 195JL or 196JR panel (AMM 06-41-00/201).

**CAUTION:** MAKE SURE THAT THE GUIDE FOR THE MID FAIRING DOOR IS IN THE CORRECT POSITION WITH THE INBOARD END OF THE BODY PANEL. THIS WILL PREVENT DAMAGE TO THE MID FAIRING DOOR OR BODY PANEL.

- (c) Make sure that the guide for the mid fairing door is in the correct position (View C-C, Fig. 402).
- (d) Make sure the clearance between the lower body panel (195JL or 196JR) and the mid fairing door is in tolerance.
- 1) Keep a clearance of 0.002-0.050 inch (0.050-1.27 mm) between the lower body panel and the formed fairing strip on the mid fairing door (View C-C, Fig. 402).

S 864-078-002

**WARNING:** MAKE SURE THAT THE LOWER EDGE OF THE MID FAIRING DOOR IS LOOSE AND IS NOT PRELOADED TIGHTLY AGAINST THE FAIRING PANEL. A TIGHT DOOR AT THIS LOCATION CAN SLOW THE DOOR MECHANISM AND THIS CAN CAUSE THE DOOR TO INTERFERE WITH THE FLAP SUPPORT TUBE.

- (22) Do a check on the movement of the aft fairing door with the steps that follow:
- (a) Make sure that the position selector switch for the flap/slat alternate drive (on the first officer instrument panel, P3) is in the NORM position.

MAINTENANCE MANUAL

- (b) Remove the PDU lock from the TE flap PDU.
- (c) Remove the DO-NOT-CLOSE tag, and close these circuit breakers:
  - 1) On the main power distribution panel, P6:  
6D24, ALTN FLAP PWR
  - 2) On the overhead panel, P11.  
11J24, FLAPS ALTN CONT
- (d) Remove the DO-NOT-CLOSE tag, and close this circuit breaker on the P11 panel:
  - 1) 11J24, FLAPS ALTN CONT
- (e) Supply electrical power (AMM 24-22-00/201).
- (f) Use alternate electric power to retract the inboard TE flap to a position 5.5-7.0 inches (140-177 mm) away from the fully retracted position.
- (g) Make sure that the edge of the mid fairing door is 0.40 inch (10.16 mm) minimum away from the inboard flap support tube (View B-B, Fig. 402).

NOTE: The forward/aft fairing door will ride on the flap support tube when the inboard flap is near the limit of travel.

S 824-090-002

- (23) If the clearance is not in tolerance, change the travel of the door drive bellcrank:
  - (a) Supply electrical power (AMM 24-22-00/201).
  - (b) Push the arming switch for the flap alternate drive, to arm the flap alternate drive (switch light on).
  - (c) Make sure the TRAILING EDGE light on the P3 panel comes on.

CAUTION: MAKE SURE THE ALTERNATE (ELECTRIC) DRIVE MOTOR IS LIMITED TO 4 MINUTES OPERATION AND 20 MINUTES OFF. FAILURE TO DO THIS CAN CAUSE DAMAGE TO THE MOTOR.

CAUTION: MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (d) To extend the TE flaps, turn the position selector switch for the flap/slat alternate drive to the 30-unit position.

- (e) Remove electrical power (AMM 24-22-00/201).
- (f) Open these circuit breakers and attach DO-NOT-CLOSE tags:
  - 1) On the main power distribution panel, P6,
    - a) 6D24, ALTN FLAP PWR
  - 2) On the overhead panel, P11,
    - a) 11J24, FLAPS ALTN CONT
- (g) Open these circuit breakers and attach circuit breaker locks and DO-NOT-CLOSE tags:
  - 1) On the main power distribution panel, P6,
    - a) 6D21, ALTN SLAT INBD PWR
    - b) 6F24, ALTN SLAT OUTBD PWR
  - 2) On the overhead panel, P11,
    - a) 11H23, SLAT ALTN CONT INBD
    - b) 11H24, SLAT ALTN CONT OUTBD
- (h) Install the PDU lock on the TE flap PDU (Fig. 403)
- (i) Install the lower bolt of the drive rod (29) into the aft hole of the door drive bellcrank to increase the travel, or the forward hole to decrease the travel.

NOTE: You will have to adjust the drive rod to install the bolt.

- (j) Return to the "Fairing door drive rod adjustment" steps and do the drive rod adjustment steps again.

S 844-082-002

- (24) Extend the TE flap with electrical power:
  - (a) Make sure that the position selector switch for the flap/slat alternate drive (on the first officer instrument panel, P3) is in the NORM position.
  - (b) Remove the PDU lock from the TE flap PDU.
  - (c) Remove the DO-NOT-CLOSE tag, and close these circuit breakers:
    - 1) On the main power distribution panel, P6.
      - 6D24, ALTN FLAP PWR
    - 2) On the overhead panel, P11
      - 11J24, FLAPS ALTN CONT

Dec 10/98

01

- (d) Remove the DO-NOT-CLOSE tag, and close this circuit breaker on the P11 panel:
  - 1) 11J24, FLAPS ALTN CONT
- (e) Supply electrical power (AMM 24-22-00/201).
- (f) Make sure that the arming switches for the flap and slat alternate drive (on the P3 panel) are not in the armed position (switch lights off).
- (g) Push the arming switch for the flap alternate drive to arm the flap alternate drive (switch light on).
- (h) Make sure that the TRAILING EDGE light on the P3 panel comes on.

**CAUTION:** MAKE SURE THE ALTERNATE (ELECTRIC) DRIVE MOTOR IS LIMITED TO 4 MINUTES OPERATION AND 20 MINUTES OFF. FAILURE TO DO THIS CAN CAUSE DAMAGE TO THE MOTOR.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (i) To extend the TE flaps, turn the position selector switch for the flap/slat alternate drive to the 30-unit position.
- (j) Make sure the TE flaps are extended fully.
- (k) Make sure that the forward fairing door turns freely through 90 degrees of movement as the TE flaps extend.
- (l) Do a check on the clearance around the forward fairing door. If necessary, adjust this clearance by using the slotted fastener holes on the pivot arm of the forward fairing door.
- (m) Retract the TE flaps with electrical power with the steps that follow:
  - 1) Move the position selector switch for the flap/slat alternate drive to the UP position.
  - 2) Make sure that the TE flaps move to the fully retracted position.

- 3) Do a check on the clearance around the forward fairing door.
  - a) Apply upward hand pressure to the forward fairing door to counteract the spring load and make sure the door can be moved to give a minimum of 0.4 inch (10.16 mm) clearance.
- 4) Move the position selector switch to the NORM position.

S 224-087-002

- (25) Make sure the forward/aft and mid fairing door clearances are correct during the complete flap cycle (Detail A, Fig. 402).

NOTE: Make sure that the mid door does not touch the upper fairing panel when the flaps are in the fully retracted position.

S 824-086-002

- (26) If the mid door does touch the upper fairing panel, adjust the length of the drive rod so the door does not touch the panel.

S 224-085-002

- (27) Cycle the flaps again and make sure clearance exists between the mid fairing door and the upper fairing panel.

S 824-088-002

- (28) Do the deactivation procedure with the steps that follow:
  - (a) Push the arming switch for the flap alternate drive to disarm the flap alternate drive (switch light goes off).
  - (b) Make sure that the TRAILING EDGE light goes off, and that the TE FLAP DISAGREE message does not show on the EICAS.
  - (c) Remove electrical power if it is not necessary (AMM 24-22-00/201).
  - (d) Open these circuit breakers and attach DO-NOT-CLOSE tags:
  - (e) On the main power distribution panel, P6,  
6D24, ALTN FLAP PWR
  - (f) On the overhead panel, P11,  
11J24, FLAP ALTN CONT
  - (g) Install the PDU lock on the TE flap PDU.

S 224-068-002

- (29) Make sure the forward/aft and mid fairing door clearances are correct during the complete flap cycle (Detail A, Fig. 402).

S 424-069-002

- (30) Install the countersunk rivets (17) on the forward and aft fairing doors (2 on each door) to the pivot arms (Detail A, Fig. 401).

S 824-070-002

- (31) Make adjustments to the bullnose fairing when necessary.

S 424-071-002

- (32) Connect the electrical bonding jumper to the forward hinge fitting of the mid fairing door (Fig. 401).

G. Put the Airplane Back to Its Usual Condition

S 084-072-002

- (1) Remove the PDU lock from the TE flap PDU.

S 084-079-002

**WARNING:** OBEY THE REMOVAL PROCEDURE FOR THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY. THE MOVEMENT OF THE DOORS CAN CAUSE INJURIES TO PERSONS AND DAMAGE TO EQUIPMENT.

- (2) Remove the door locks from the landing gear doors and close the doors (AMM 32-00-15).

S 864-073-002

- (3) Remove the DO-NOT-CLOSE tags and circuit breaker locks, and close these circuit breakers:

- (a) On the main power distribution panel, P6,  
1) 6D21, ALTN SLAT INBD PWR  
2) 6D24, ALTN FLAP PWR  
3) 6F24, ALTN SLAT OUTBD PWR  
(b) On the overhead panel, P11,  
1) 11H23, SLAT ALTN CONT INBD  
2) 11H24, SLAT ALTN CONT OUTBD  
3) 11J24, FLAPS ALTN CONT

INBOARD TE FLAP, OUTBOARD ROTARY ACTUATOR – REMOVAL/INSTALLATION

1. General

- A. This procedure contains the removal and the installation tasks for the outboard rotary actuator of the inboard flap.

TASK 27-51-11-024-001

2. Inboard Flap Outboard Rotary Actuator – Removal

A. Equipment

- (1) Circuit Breaker Lockout Clip – 1012LC-4  
Commercially Available  
(2) TE Flap PDU Lock – A27009-7

B. References

- (1) AMM 06-44-00/201, Wing Access Doors and Panels  
(2) AMM 24-22-00/201, Electrical Power – Control  
(3) AMM 27-51-39/401, TE Flap Offset Tee Gearbox  
(4) AMM 27-51-41/401, TE Flap Torque Tubes  
(5) AMM 29-11-00/201, Main Hydraulic Systems  
(6) AMM 32-00-15/201, Landing Gear Door Locks  
(7) AMM 32-00-20/201, Landing Gear Downlock

C. Access

(1) Location Zones

144	Right MLG Wheel Well
211/212	Control Cabin
550/650	Wing Trailing Edge – Inboard
571/671	Inboard Flap Outboard Fairing
710	Nose Landing Gear and Doors
730/740	Left/Right Main Landing Gear and Doors

(2) Access Panels

552FB/652FB	Spoiler Beam, Flap Installation
-------------	---------------------------------

D. Prepare for the Removal

S 214-002

- (1) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

S 494-003

**CAUTION:** USE THE TASK IN AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Open the doors for the landing gear and install the door locks (AMM 32-00-15/201).

S 864-004

- (3) Supply electrical power (AMM 24-22-00/201).

S 864-005

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

(4) Pressurize the center system hydraulic (AMM 29-11-00/201).

S 864-006

(5) Move the flap control lever to the 30-unit detent and permit the flaps to move to the fully extended position.

S 864-007

(6) Remove pressure from the center hydraulic system (AMM 29-11-00/201).

S 864-008

(7) Open this circuit breaker on the main power distribution panel, P6, and attach a DO-NOT-CLOSE tag:  
(a) 6D24, ALTN FLAP PWR

S 864-009

(8) Open these circuit breakers on the P6 panel and install circuit breaker locks:  
(a) 6D21, ALTN SLAT INBD PWR  
(b) 6F24, ALTN SLAT OUTBD PWR

S 864-010

(9) Open this circuit breaker on the overhead panel, P11, and attach a DO-NOT-CLOSE tag:  
(a) 11J24, FLAP ALTN CONT

S 864-011

(10) Open these circuit breakers on the P11 panel and install circuit breaker locks:  
(a) 11H23, SLAT ALTN CONT INBD  
(b) 11H24, SLAT ALTN CONT OUTBD

EFFECTIVITY

ALL

27-51-11

01

Page 406  
Dec 10/98

S 014-012

- (11) Remove the access panel, 552FB (left wing) or 652FB (right wing), at the inboard side of the flap fairing to get access to the rotary actuator (AMM 06-44-00/201).

S 494-013

- (12) Install the PDU lock in the TE flap power drive unit (PDU) (Fig. 403).

E. Remove the Rotary Actuator

S 034-014

- (1) Disconnect the torque tubes from the input and output couplings on the offset tee gearbox (AMM 27-51-41/401).

**NOTE:** Do not turn the torque tube. It will be necessary to adjust the flap drive if you turn the torque tube while it is disconnected.

S 944-015

- (2) Make a mark on the gearbox coupling and the offset tee gearbox, and prepare to count the number of turns you will make on the coupling in the subsequent step.

S 984-016

- (3) Manually turn the gearbox coupling in the extend direction until the crank arm on the rotary actuator touches the extend overtravel stop (Detail B, Fig. 402). Keep a count on the number of turns for the subsequent installation.

**NOTE:** Stop the turns when the crank arm touches the extend overtravel stop to prevent preload. Preload on the actuator spline will make the actuator not easy to remove.

When you look to the outboard direction, the extend direction is counterclockwise for the left wing, and clockwise for the right wing.

S 024-017

- (4) Remove the offset tee gearbox (AMM 27-51-39/401).

S 034-018

- (5) Remove the six nuts on the hold-down clamps that hold the rotary actuator to the structure (View E-E and F-F, Fig. 401).

EFFECTIVITY

ALL

27-51-11

01

Page 407  
Apr 22/99

S 034-019

- (6) Remove the three hold-down clamps.

**NOTE:** Keep the bolts in the structure and rotary actuator when you remove the clamps.

S 034-020

**WARNING:** BE CAREFUL WHEN YOU REMOVE THE ROTARY ACTUATOR. BECAUSE THE ACTUATOR WEIGHS 82 POUNDS (37.2 Kg), INJURY CAN OCCUR.

- (7) Hold the weight of the rotary actuator and pull the actuator 2.5 inches away from the structure to disengage the spline.

S 024-021

- (8) Remove the rotary actuator from the airplane.

TASK 27-51-11-424-022

3. Inboard Flap Outboard Rotary Actuator - Installation

A. Equipment

- (1) TE Flap PDU Lock - A27009-7

B. Consumable Materials

- (1) D00633 Grease - BMS 3-33 (Preferred)  
(2) D00013 Grease - MIL-PRF-23827 (Supersedes MIL-G-23827) (Alternate)  
(3) G02020 Modeling Clay

Aug 22/07

E. Install the Rotary Actuator

S 644-023

- (1) Apply a layer of BMS 3-33 grease to the splines and mating surfaces of the rotary actuator.

S 214-024

- (2) Make sure the overload trip indicator is pushed in (Detail A, Fig. 401).

S 104-025

- (3) Clean the input shaft, the reaction ring, and the actuator spline drain holes (Section A-A, Fig. 401) and remove unwanted grease or dirt.

S 824-052

**WARNING:** BE CAREFUL WHEN YOU INSTALL THE ROTARY ACTUATOR. BECAUSE THE ACTUATOR WEIGHS 82 POUNDS (37.2 Kg), INJURY CAN OCCUR.

- (4) Put the rotary actuator output shaft into the input shaft, and align the missing spline tooth on the actuator rim to the missing spline tooth on the reaction ring (View A-A and C-C, Fig. 401).

S 434-027

- (5) Move the actuator on to the reaction ring.

**NOTE:** Turn the actuator input shaft if it is necessary to engage the actuator to the reaction ring splines.

S 434-028

- (6) Install the three hold-down clamps with the spacers and locknuts (View E-E and View F-F, Fig. 401). Tighten the nuts.

S 424-029

- (7) Install the offset tee gearbox (AMM 27-51-39/401).

S 214-030

- (8) Make sure the actuator crank arm touches the extend overtravel stop (Detail B, Fig. 402).

EFFECTIVITY

ALL

27-51-11

01

Page 409  
Dec 22/01

S 984-031

- (9) Turn the gearbox coupling in the retract direction the same number of turns you made during the actuator removal procedure.

**NOTE:** If you did not write down the number of turns that you made during the removal procedure, turn the coupling five full turns in the retract direction and adjust the extend overtravel stop clearance to the RIG position (AMM 27-51-00/501).

When you look to the outboard direction, the retract direction is clockwise for the left wing, and counterclockwise for the right wing.

S 434-032

- (10) Connect the torque tubes to the input and output couplings of the offset tee gearbox (AMM 27-51-41/401).

**NOTE:** Do not turn the torque tube while you connect the torque tube. It will be necessary to adjust the flap drive if you turn the torque tube.

S 224-053

- (11) Make sure the torque tubes can move from end to end, and that the end clearances are satisfactory (AMM 27-51-41/401).

S 644-054

- (12) Fill the gearbox coupling with BMS 3-33 grease.

S 094-033

- (13) Remove the PDU lock from the TE flap PDU (Fig. 403).

S 864-034

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

(14) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 864-035

(15) Move the flap control lever to the 20-unit detent, and make sure the flaps move to the 20-degree position.

S 864-036

(16) Remove power from the center hydraulic system (AMM 29-11-00/201).

S 494-037

**WARNING:** DO NOT MOVE THE FLAP CONTROL LEVER WHEN YOU APPLY THE MODELING CLAY IN THE STEP THAT FOLLOWS. MOVEMENT OF THE FLAP CONTROL LEVER DURING THIS OPERATION CAN CAUSE INJURY TO PERSONS.

(17) Apply modeling clay to all eight retract overtravel stops in the left and right wings.

EFFECTIVITY

ALL

INBOARD TRAILING EDGE FLAP TRACK FAIRINGS – REMOVAL/INSTALLATION

1. General

- A. This procedure contains the removal and the installation tasks for the outboard fairing of the inboard trailing edge (TE) flap. The installation task also contains the adjustment/test steps for the fairing installation.
- B. The outboard fairing contains a forward, mid, and aft section.
- C. Refer to AMM 27-51-16/401 for the removal and the installation procedures for the fairings on the Outboard TE flap.

TASK 27-51-15-024-001

2. Inboard Flap Outboard Fairing – Removal

A. Equipment

- (1) TE Flap PDU Lock – A27009-7

B. References

- (1) AMM 06-44-00/201, Wing Access Doors and Panels
- (2) AMM 24-22-00/201, Electrical Power – Control

  - (b) 11H24, SLAT ALTN CONT OUTBD
  - (c) 11J24, FLAPS ALTN CONT

S 494-011

- (10) Install the PDU lock in the TE flap power drive unit (PDU) (Fig. 405).

E. Fairing Removal - Aft Section (Fig. 404)

S 014-012

- (1) Remove the access panels 571GL and 571GR (left wing), or 671GL and 671GR (right wing), on the aft fairing (AMM 06-44-00/201).

S 494-013

- (2) Hold the weight of the aft fairing to release the load on the fairing attach points.

S 034-014

- (3) Remove the bolt that connects the horizontal link to the aft fairing (Detail A).

NOTE: Do not change the adjustment on the horizontal link.

S 034-015

- (4) Remove the bolt at the aft attach point (Detail B).

S 034-016

- (5) Remove the bolts that attach the two vertical links (Detail A), and remove the aft fairing.

NOTE: Do not change the adjustment on the vertical links.

F. Fairing Removal - Mid Section (Fig. 403)

S 014-017

- (1) Remove the access panels, 571EL and 571ER (left wing), or 671EL and 671ER (right wing), on the mid fairing (AMM 06-44-00/201).

S 494-018

- (2) Hold the weight of the mid fairing to release the load on the fairing connection points.

S 034-019

- (3) Remove the bolt that connects the pushrod to the mid fairing (Detail A).

S 034-020

- (4) Remove the nut and special washer from each end of the inner pin, at the forward end of the mid fairing (Section B-B).

S 034-021

- (5) Pull the inner pin out from the mid fairing.

S 024-022

- (6) Remove the mid fairing.

G. Fairing Removal - Forward Section (Fig. 402)

S 014-023

- (1) Remove the access panels, 571BB, 571CL and 571CR (left wing), or 671BB, 671CL and 671CR (right wing), on the forward fairing (Section A-A) (AMM 06-44-00/201).

S 494-024

- (2) Hold the weight of the forward fairing to release the load on the fairing attach points.

S 034-025

- (3) Remove the bolt that connects the horizontal link to the forward fairing (Detail C).

NOTE: Do not change the adjustment on the horizontal link.

S 034-026

- (4) Remove the bolts that connect the vertical links to the forward fairing (Detail B).

NOTE: Do not change the adjustment on the vertical links.

S 034-027

- (5) Remove the nut and washer on the fairing stud, at the forward end of the fairing (Detail A).

S 024-028

- (6) Pull the fairing away from the fairing stud and remove the forward fairing.

NOTE: Be careful not to cause damage to the threads on the fairing stud.

TASK 27-51-15-424-029

3. Inboard Flap Outboard Fairing - Installation

A. Consumable Materials

- (1) D00633 Grease - BMS 3-33 (Preferred)

571ER/671ER	Flap Fairing Mid Adjustment
571GL/671GL	Flap Aft Adjustment
571GR/671GR	Flap Aft Adjustment

D. Fairing Installation - Mid Section (Fig. 403)

S 214-030

- (1) Make sure the flaps are in the 25-degree position, and that the flap control lever is in the 25-unit detent.

S 034-031

- (2) Remove the end caps from the outer pin (Section B-B).

S 644-032

- (3) Clean the end caps and apply a light layer of grease to the inner and outer diameters.

S 434-033

- (4) Install the end caps at each end of the outer pin.

S 644-034

- (5) Apply a light layer of grease to the inner pin, special washers, and nuts.

S 434-035

- (6) Put the forward end of the mid fairing into its position and install the inner pin.

S 434-036

- (7) Install the special washers and nuts on each end of the inner pin.

EFFECTIVITY

ALL

27-51-15

01

Page 410  
Apr 22/01

S 434-037

- (8) Tighten the nut on each end of the inner pin to 660-980 pound-inches, and install a lockwire with the double twist procedure (AMM 20-10-23/401).

S 644-038

- (9) Apply a layer of grease to the bolt for the push rod.

S 434-039

- (10) Lift the aft end of the mid fairing into its position, and attach the push rod to the fairing with the bolt. Tighten the nut.

S 824-040

- (11) Do the adjustment for the mid fairing:

NOTE: If you installed the same fairing that you removed, subsequent adjustment is not necessary if the fairing was correctly adjusted before the removal.

S 714-041

- (12) Do a test on the fairing installation.

E. Fairing Adjustment - Mid Section (Fig. 403).

NOTE: It is necessary to remove the aft fairing to get access to adjust the mid fairing.

S 094-042

- (1) Remove the PDU lock from the TE flap PDU (Fig. 405).

S 864-043

- (2) Supply electrical power (AMM 24-22-00/201).

S 864-044

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (3) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 864-045

**CAUTION:** MONITOR THE MOVEMENT OF THE FAIRING WHEN THE FLAPS MOVE. COMPONENTS THAT ARE INCORRECTLY INSTALLED CAN CAUSE DAMAGE TO THE AIRPLANE.

- (4) Remove the DO-NOT-OPERATE tag from the flap control lever and move the lever to the zero (FLAPS UP) detent.

S 214-046

- (5) Make sure the flaps move to the fully retracted position.

S 864-047

- (6) Remove power from the center hydraulic system (AMM 29-11-00/201).

S 494-048

- (7) Attach a DO-NOT-OPERATE tag to the flap control lever.

S 224-049

- (8) Make sure the clearance between the mid fairing and the lower surface of the wing is correct as shown (Section A-A, Fig. 401).

S 824-050

- (9) If the clearance is not correct, remove the lockwire and adjust the pushrod to get the correct clearance.

S 224-051

- (10) Make sure the clearance between the mid fairing roller and the shims on the flap track is correct as shown (Detail A, Fig. 403).

EFFECTIVITY

ALL

27-51-15

01

Page 412  
Dec 10/98

S 824-052

- (11) If the clearance is not correct, add or remove the shims to get the correct clearance.

S 824-053

- (12) Turn the rod end three full turns to the direction that will apply a load to the mid fairing rollers.

S 434-054

- (13) Tighten the jamnut and install a lockwire with the double twist procedure (AMM 20-10-23/401).

S 434-055

- (14) Tighten the bolt that attaches the push rod to the fairing.

F. Fairing Installation - Forward Section (Fig. 402)

S 214-056

- (1) Make sure the flaps are in the 25-degree position, and that the flap control lever is in the 25-unit detent.

S 014-057

- (2) Open the access panel, 571BB or 671BB, on the forward fairing to get access to the forward attach point (AMM 06-44-00/201).

S 424-058

- (3) Put the forward fairing on the fairing stud at the forward end of the fairing (Detail A).

S 434-059

- (4) Install the washer and nut to the stud. Tighten the nut.

S 644-060

- (5) Apply a light layer of grease to the bolts, washers, bushings, and nuts for the horizontal and vertical links.

S 434-061

- (6) Connect the vertical links (Detail B) and the horizontal link (Detail C) to the fairing with the bolts, washers, and nuts. Tighten the nut.

S 824-062

- (7) Adjust the vertical and horizontal links if it is necessary to connect the fairing.

EFFECTIVITY

ALL

27-51-15

01

Page 413  
Apr 22/01

S 824-063

- (8) Do the adjustment on the forward fairing.

**NOTE:** If you installed the same fairing that you removed, subsequent adjustment is not necessary if the fairing was correctly adjusted before the removal.

S 714-064

- (9) Do a test on the fairing installation.

G. Fairing Adjustment - Forward Section (Fig. 402)

S 034-065

- (1) Loosen the bolts that attach the vertical and horizontal links to the fairing.

S 094-066

- (2) Remove the PDU lock from the TE flap PDU (Fig. 405).

S 864-067

- (3) Supply electrical power (AMM 24-22-00/201).

S 864-068

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (4) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 864-069

**CAUTION:** MONITOR THE MOVEMENT OF THE FAIRING WHEN THE FLAPS MOVE. COMPONENTS THAT ARE INCORRECTLY INSTALLED CAN CAUSE DAMAGE TO THE AIRPLANE.

- (5) Remove the DO-NOT-OPERATE tag from the flap control lever and move the lever to the zero (FLAPS UP) detent.

Apr 22/01

- S 214-070
- (6) Make sure the flaps move to the fully retracted position.
- S 864-071
- (7) Remove power from the center hydraulic system (AMM 29-11-00/201).
- S 494-072
- (8) Attach a DO-NOT-OPERATE tag to the flap control lever.
- S 224-073
- (9) Make sure the forward fairing aligns correctly with the mid fairing (Section B-B, Fig. 401).
- S 824-074
- (10) Remove the lockwire and adjust the horizontal and vertical links if it is necessary, until you can get the forward fairing to align correctly (Section B-B, Fig. 401).
- S 214-075
- (11) Make sure the forward fairing seal touches the lower surface of the wing at all locations (View A-A, Fig. 401).
- S 434-076
- (12) Tighten the jamnut and install a lockwire to the jamnut on the horizontal and vertical links, after you completed the adjustment (AMM 20-10-23/401).
- S 434-077
- (13) Make sure all the nuts are tighten at the links and the fairing stud.

H. Fairing Installation - Aft Section (Fig. 404)

**NOTE:** Do all the necessary adjustments for the mid fairing before you install the aft fairing.

- S 214-078
- (1) Make sure the flaps are in the 25-degree position, and that the flap control lever is in the 25-unit detent.
- S 984-079
- (2) Lift the aft fairing into its position for installation.
- S 644-080
- (3) Apply a light layer of grease to all the bolts.
- S 434-081
- (4) Attach the two vertical links (Detail A).

OUTBOARD TRAILING EDGE FLAP TRACK FAIRINGS – REMOVAL/INSTALLATION

1. General

- A. This procedure contains the removal and the installation tasks for the outboard trailing edge (TE) flap fairings. The installation task also contains the steps for the fairing adjustment, and the test for the fairing installation.
- B. The outboard flap has an inboard and an outboard fairing. Each inboard and outboard fairing contains a forward, a mid, and an aft section.
- C. Refer to AMM 27-51-15/401 for the removal and the installation procedures for the inboard flap fairing.

TASK 27-51-16-024-001

2. Outboard Flap Fairings – Removal

A. Equipment

- (1) TE Flap PDU Lock – A27009-7

B. References

- (1) AMM 06-44-00/201, Wing Access Doors and Panels
- (2) AMM 20-10-21/401, Bonding Jumpers and Ground Leads
- (3) AMM 24-22-00/201, Electrical Power – Control
- (4) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems
- (5) AMM 32-00-15/201, Landing Gear Door Locks
- (6) AMM 32-00-20/201, Landing Gear Downlock

C. Access

(1) Location Zones

144	Right MLG Wheel Well

D. Fairing Installation - Forward Section (Fig. 402)

S 214-030

- (1) Make sure the flaps are in the 25-degree position, and that the flap control lever is in the 25-unit detent.

S 984-031

- (2) Put the fairing into its position for installation.

S 434-032

- (3) Install the bolts at the aft attach points.

**NOTE:** The bushing in the floating wing attachment assembly is longer than the bushing in the location wing attachment assembly.

S 434-033

- (4) Install the bolt at the forward attach point.

S 824-034

- (5) Do the adjustment for the Forward Fairing.

**NOTE:** If you installed the same fairing that you removed, subsequent adjustment is not necessary if the fairing was correctly adjusted before the removal.

S 434-035

- (6) If no fairing adjustment is necessary, do these steps:
  - (a) Tighten the nuts at the aft attach points to 90-125 pound-inches.

EFFECTIVITY

ALL

27-51-16

06

Page 412  
Aug 10/98

(b) Tighten the bolt at the forward attach point to 110-140 pound-inches.

S 434-036

(7) Install the bonding jumper wire (AMM 20-10-21/401).

S 714-037

(8) Do a test on the fairing installation.

E. Fairing Adjustment - Forward Section (Fig. 402)

S 094-038

(1) Remove the PDU lock from the TE flap PDU (Fig. 405).

S 864-039

(2) Supply electrical power (AMM 24-22-00/201).

S 864-040

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

(3) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 864-041

**CAUTION:** MONITOR THE MOVEMENT OF THE FAIRING WHEN THE FLAPS MOVE. COMPONENTS THAT ARE INCORRECTLY INSTALLED CAN CAUSE DAMAGE TO THE AIRPLANE.

(4) Remove the DO-NOT-OPERATE tag from the flap control lever and move the lever to the zero (FLAPS UP) detent.

EFFECTIVITY

ALL

27-51-16

Apr 22/01

- S 214-042
- (5) Make sure the flaps move to the fully retracted position.
- S 864-043
- (6) Remove power from the center hydraulic system (AMM 29-11-00/201).
- S 494-044
- (7) Attach a DO-NOT-OPERATE tag to the flap control lever.
- S 224-098
- (8) Make sure the clearance is correct between the forward fairing and the wing lower surface (View B-B).
- S 214-097
- (9) Make sure the fairing seal touches the lower surface of the wing at all locations.
- S 824-047
- (10) If it is necessary, add or remove shims at the forward attach point to adjust the fairing vertically.
- S 824-048
- (11) If it is necessary, add or remove shims at the inboard aft attach point in the forward fairing.

**NOTE:** This adjustment applies only to the outboard fairing of the outboard flap.

F. Fairing Installation - Mid Section (Fig. 403)

- S 214-049
- (1) Make sure the flaps are in the 25-degree position, and that the flap control lever is in the 25-unit detent.
- S 644-050
- (2) Apply the grease to the forward attach points.
- S 434-051
- (3) Put the forward end of the mid fairing into its position and attach the bolts at the forward attach points.
- S 434-052
- (4) Lift the aft end of the mid fairing into its position and install the two aft attach rods with bolts.

EFFECTIVITY

ALL

27-51-16

06

Page 414  
Apr 22/08

S 824-053

- (5) Do the adjustment for the mid fairing

**NOTE:** If you installed the same fairing that you removed, subsequent adjustment is not necessary if the fairing was correctly adjusted before the removal.

S 434-054

- (6) If no adjustment is necessary, tighten the nuts at all the fairing attach points with these steps:
- (a) Tighten the nuts at the forward attach points to 90-125 pound-inches.
  - (b) Tighten the nuts that connect the aft attach rods to 90-125 pound-inches.

S 434-055

- (7) Install the bonding jumper wire (AMM 20-10-21/401).

S 714-083

- (8) Do a test on the fairing installation.

G. Fairing Adjustment - Mid Section (Fig. 403)

S 094-056

- (1) Remove the PDU lock from the TE flap PDU (Fig. 405).

S 864-057

- (2) Supply electrical power (AMM 24-22-00/201).

S 864-058

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (3) Pressurize the center hydraulic system (AMM 29-11-00/201).

EFFECTIVITY

ALL

27-51-16

06

Page 415  
Apr 22/01

S 864-059

**CAUTION:** MONITOR THE MOVEMENT OF THE FAIRING WHEN THE FLAPS MOVE. COMPONENTS THAT ARE INCORRECTLY INSTALLED CAN CAUSE DAMAGE TO THE AIRPLANE.

- (4) Remove the DO-NOT-OPERATE tag from the flap control lever and move the lever to the zero (FLAPS UP) detent.

S 214-060

- (5) Make sure the flaps move to the fully retracted position.

S 864-061

- (6) Remove power from the center hydraulic system (AMM 29-11-00/201).

S 494-062

- (7) Attach a DO-NOT-OPERATE tag to the flap control lever.

S 224-063

- (8) Make sure the clearance between the mid fairing and the wing lower surface is correct (View C-C).

S 214-064

- (9) Make sure the seal on the upper edge of the mid fairing touches the lower wing surface at all locations.

S 224-065

- (10) Make sure the seal on the forward fairing is compressed against the mid fairing correctly as shown (View B-B).

S 824-066

- (11) If it is necessary, adjust the aft attach rod to get the correct clearance and seal compression for the mid fairing.

#### H. Fairing Installation - Aft Section (Fig. 404)

S 214-067

- (1) Make sure the flaps are in the 25-degree position, and that the flap control lever is in the 25-unit detent.

S 984-068

- (2) Lift the fairing into its position for installation.

S 434-069

- (3) Install the bolt at the forward attach point (Detail A).

S 434-070

- (4) Install the bolts at the two aft attach points (Detail B).

EFFECTIVITY

ALL

27-51-16

06

Page 416  
Dec 10/98

S 824-071

- (5) Do the adjustment for the aft fairing.

**NOTE:** If you installed the same fairing that you removed, subsequent adjustment is not necessary if the fairing was correctly adjusted before the removal.

S 434-072

- (6) If no fairing adjustment is necessary, do these steps:  
(a) Tighten the bolt at the forward attach point to 110-140 pound-inches.  
(b) Tighten the bolts at the aft attach points to 110-140 pound-inches.

S 434-073

- (7) Install the bonding jumper wire (AMM 20-10-21/401).

S 714-084

- (8) Do a test on the fairing installation.

I. Fairing Adjustment - Aft Section (Fig. 404)

S 094-074

- (1) Remove the PDU lock from the TE flap PDU (Fig. 405).

S 864-075

- (2) Supply electrical power (AMM 24-22-00/201).

S 864-076

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (3) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 864-077

**CAUTION:** MONITOR THE MOVEMENT OF THE FAIRING WHEN THE FLAPS MOVE. COMPONENTS THAT ARE INCORRECTLY INSTALLED CAN CAUSE DAMAGE TO THE AIRPLANE.

- (4) Remove the DO-NOT-OPERATE tag from the flap control lever and move the lever to the zero (FLAPS UP) detent.

S 214-078

- (5) Make sure the flaps move to the fully retracted position.

S 864-079

- (6) Remove power from the center hydraulic system (AMM 29-11-00/201).

S 494-080

- (7) Attach a DO-NOT-OPERATE tag to the flap control lever.

S 224-081

- (8) Make sure the clearance between the aft fairing and the lower surface of the flap is correct (View B-B and View C-C).

S 824-082

- (9) If it is necessary, add or remove shims at the forward and aft attach points to make horizontal and vertical adjustments on the aft fairing.

J. Test for the Fairing Installation

S 094-085

- (1) Remove the PDU lock from the TE flap PDU (Fig. 405).

S 864-086

- (2) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the main power distribution panel, P6:
  - (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6D24, ALTN FLAP PWR
  - (c) 6F24, ALTN SLAT OUTBD PWR

S 864-087

- (3) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel, P11:
  - (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD
  - (c) 11J24, FLAPS ALTN CONT

S 864-088

- (4) Supply electrical power (AMM 24-22-00/201).

D. Prepare for the Removal

S 214-002

- (1) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

S 494-003

**WARNING:** USE THE TASK IN AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Open the doors for the landing gear and install the door locks (AMM 32-00-15/201).

S 864-004

- (3) Supply electrical power (AMM 24-22-00/201).

S 864-005

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (4) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 824-084

- (5) If an aileron rigging bar is not available, do the steps as follows:
  - (a) Move the flap control lever to the zero detent to retract the flaps.
  - (b) Make sure the ailerons are approximately in the neutral position.
  - (c) Measure the aileron-to-flap trailing edge mismatch and keep the dimension to use for the installation.
  - (d) Make sure the ailerons do not move during the flap removal/installation.

S 864-006

- (6) Move the flap control lever to the 30-unit detent, and permit the flaps and slats to extend to the fully extended position.

EFFECTIVITY

ALL

27-51-20

01

Page 413  
Dec 22/03

- S 864-007
- (7) Remove pressure from the center hydraulic system (AMM 29-11-00/201).
- S 864-008
- (8) Open this circuit breaker on the main power distribution panel, P6, and attach a DO-NOT-CLOSE tag:
- (a) 6D24, ALTN FLAP PWR
- S 864-009
- (9) Open these circuit breakers on the P6 panel and install circuit breaker locks:
- (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6F24, ALTN SLAT OUTBD PWR
- S 864-010
- (10) Open this circuit breaker on the overhead panel, P11, and attach a DO-NOT-CLOSE tag:
- (a) 11J24, FLAPS ALTN CONT
- S 864-011
- (11) Open these circuit breakers on the P11 panel and install circuit breaker locks:
- (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD
- S 494-012
- (12) Install the PDU lock in the TE flap power drive unit (PDU) (Fig. 404).
- S 014-013
- (13) Remove the access panels on the upper surface of the outboard flap (AMM 06-44-00/201).
- S 014-014
- (14) Remove the eight access screws from the upper surface of the outboard flap (Fig. 406).
- S 494-015
- (15) Extend the outboard spoilers 1 thru 4 (left wing) or 9 thru 12 (right wing) as applicable, and install the locks on the spoiler actuators (AMM 27-61-00/201).

EFFECTIVITY

ALL

27-51-20

01

Page 414  
Dec 22/03

E. Remove the Outboard Flap

S 494-016

- (1) Install the flap sling at the three attach points on flap upper surface (Fig. 405).

**NOTE:** Adjust the center strap of the sling as necessary to get the flap pitch up attitude in the 30-unit position. Add 3/8-inch diameter (9.53 millimeters) shackles to the forward inboard cable on the flap sling as necessary to get the flap dihedral attitude in the 30-unit position.

- (a) If necessary, remove the vortex generator near the outboard attach point to install the sling (AMM 57-53-01/401).

S 494-017

- (2) Connect the overhead hoist to the flap sling.

**NOTE:** Make sure the hoist can hold the weight of the outboard flap. The flap weighs approximately 422 pounds (191.4 Kg).

S 014-018

- (3) Get access to the bolts that connect the outboard flap to the inboard and outboard support beams, from the top surface of the flap (Detail A, Fig. 401).

S 024-096

- (4) Remove the bolts, washers, nuts (1 thru 6 and 8 thru 12), shims and fillers (15 thru 22 and 25, 26) and washers (23 and 24) that connect the flap to the support beams ( Fig. 401, Sheet 2, View B).

**NOTE:** Keep a record of the length and location of each bolt for the subsequent installation. Also make a record of the shim thickness at each location, and keep the shims and fillers for the subsequent installation.

**NOTE:** Forward attachment bolts may be required for installation on replacement flaps. To remove bolts, it may be necessary to retain the bathtub fitting and clip (Fig. 401, View D).

S 034-020

- (5) Move the flap to the aft and down direction to disengage the deflection control track rollers from the track at the outboard end of the flap (Detail A, Fig. 401).

EFFECTIVITY

ALL

27-51-20

S 024-021

- (6) Lower the flap from the airplane.

**NOTE:** The inboard and outboard fairings will stay attached to the flap during and after the removal. Put the flap on stable support. Be careful not to cause damage to the fairing and flap surfaces.

S 094-022

- (7) Remove the sling from the outboard flap.

**NOTE:** Keep a record of the quantity and location of the shackles that you added to the flap sling for the subsequent installation.

TASK 27-51-20-424-023

3. Outboard Flap - Installation

A. Equipment

- (1) Circuit Breaker Lockout Clip - 1012LC-R  
Commercially Available
- (2) Sling Equipment, Outboard TE Flap - A27027-53
- (3) Inboard Aileron Rigging Bar - A27024-47
- (4) Outboard Aileron Rigging Bar - A27024-31  
(Recommended); A27024-29 (Optional)
- (5) TE Flap PDU Lock - A27009-7
- (6) Shackles, 3/8 inch (9.53 millimeters) Diameter - Commercially Available

B. Consumable Materials

- (1) D00633 Grease - BMS 3-33 (recommended)
- (2) D00013 Grease - MIL-PRF-23827  
(Supersedes MIL-G-23827) (Alternate)
- (3) A00247 Sealant - BMS 5-95

F. Install the Outboard Flap

S 214-024

- (1) Make sure the PDU lock is installed on the TE flap PDU (Fig. 404).

S 214-025

- (2) Make sure access panels and the eight access screws are removed from the upper surface of the flap (Fig. 406).

S 494-026

- (3) Add the 3/8-inch (9.53 millimeters) diameter shackles to the forward inboard cable of the flap sling to get the flap dihedral attitude in the 30-unit position as you did during the flap removal.

S 494-027

- (4) Install the flap sling at the three attach points on the flap upper surface (Fig. 405).

**NOTE:** Adjust the center strap of the sling as necessary to get the flap pitch-up attitude in the 30-unit position.

S 494-028

- (5) Connect the overhead hoist to the sling.

**NOTE:** Make sure the hoist can hold the weight of the outboard flap. The flap weighs approximately 422 pounds (191.4 Kg).

S 984-029

- (6) Lift the outboard flap (14) to the wing, above the inboard and outboard support beams (Detail A, Fig. 401).

EFFECTIVITY

ALL

27-51-20

09

Page 418  
Dec 22/05

S 424-094

- (7) Apply BMS10-11, Type 1 primer in the bolt hole to all bare metal surfaces to restore the finish.

S 244-092

- (8) Install the washers (2) in the temporary slave bolts (1, 10) and put the bolts through the flap, from the flap upper surface (View B, Fig. 401).

S 354-103

- (9) Chamfer bathtub fitting as required to permit installation of temporary slave bolts (1, 10) (View D, Fig. 401).

S 434-031

- (10) Put the shims and fillers (15, 16, 17, 18) over the bolts at the bottom surface of the flap and hold them into position.

NOTE: Use the old shims, or new shims with the same thickness.

S 424-097

- (11) Install the flap onto the support beams (Fig. 401, Sht. 2).

NOTE: Bolts part marked B30LE and B30US can be used in combination with each other in a support beam.

- (a) Hold the shims and fillers (15, 16, 17, 18) against the flap bottom surface and lower the flap onto the support beams.

NOTE: Align the bolts (1,10) at the forward end of the flap flap with the holes on the support beams.

- (b) At the inboard support beam, install the washers (23, 24) and nuts (4) on the temporary slave bolts (10) below the support beam. Hand-tighten the nuts.
- (c) Engage the rollers into the deflection control track (Detail A, Fig. 401).
- (d) At the outboard support beam, install the washers (23, 24) and nuts (4) on the temporary slave bolts (1) below the support beam. Hand-tighten the nuts.

EFFECTIVITY

ALL

27-51-20

10

Page 419  
Apr 22/06

- (e) Use the center adjustable strap on the sling to lift the aft end of the flap to get access to install the aft shims (19 thru 22) (View B, Fig. 401).
- (f) Install the shims and fillers (19 thru 22) between the flap and the support beams. Align the holes in shims with holes in support beams.

NOTE: Use the old shims, or new shims with the same thickness.

- (g) Put the washers (6) on the temporary slave bolts (5, 9, 11, 12) and put the bolts through the flap, shims, and support beams.
- (h) Install the nuts (8) with washers (23 and 24) and radius fillers (25 and 26) on the temporary slave bolts (5, 9, 11, 12). Hand-tighten the nuts (View B, Fig. 401).
- (i) Tighten the nuts (4) to 200–250 pound-inches (22.6–28.2 newton-meters).

NOTE: Make sure the bolts have the correct bolt grip length.

- (j) Tighten the nuts (8) to 200–250 pound-inches (22.6–28.2 newton-meters).

NOTE: Make sure the bolts have the correct bolt grip length.

- (k) Disconnect the sling from the flap (Fig. 405).

S 414-043

- (12) Install the access doors and the eight access screws to the upper surface of the outboard flap.

S 824-044

- (13) Adjust the fit and fair of the outboard flap with the instructions given in this task.

G. Adjust the Fit and Fair of the Outboard Flap

S 094-045

- (1) Remove the PDU lock from the TE flap PDU (Fig. 404).

EFFECTIVITY

ALL

27-51-20

09

Page 420  
Dec 22/07

S 864-046

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (2) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 864-047

- (3) Remove the circuit breaker locks and DO-NOT-CLOSE tags and close these circuit breakers on the main power distribution panel, P6:
- (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6D24, ALTN FLAP PWR
  - (c) 6F24, ALTN SLAT OUTBD PWR

S 864-048

- (4) Remove the circuit breaker locks and DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel, P11:
- (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD
  - (c) 11J14, FLAP ALTN CONT

S 864-049

**CAUTION:** USE THE ALTERNATE (ELECTRICAL) POWER FOR THE FIRST TIME YOU OPERATE THE FLAPS AFTER THE FLAP INSTALLATION. THE ALTERNATE DRIVE WILL MOVE THE FLAPS SLOWER THAN THE PRIMARY (HYDRAULIC) DRIVE. YOU CAN CAUSE DAMAGE TO THE AIRPLANE IF THE FLAPS RETRACT WITHOUT SUFFICIENT CLEARANCE TO THE ADJACENT STRUCTURE.

- (5) Retract the flaps to the zero detent with alternate (electrical) power (AMM 27-51-00/201).

**NOTE:** Monitor the flaps while they retract and make sure the flaps retract freely, and that they do not hit the adjacent structure.

EFFECTIVITY

ALL

27-51-20

S 864-050

- (6) Extend the flaps to the 15-unit detent with alternate (electrical) power (AMM 27-51-00/201).

S 864-051

- (7) Retract the flaps to the zero (FLAPS UP) detent with primary (hydraulic) power (AMM 27-51-00/201).

**NOTE:** It is necessary to retract the flaps with hydraulic power to do the fit-and-fair adjustment. The alternate power does not retract the flaps as accurate as with the primary power.

S 864-052

- (8) After the flaps move to the fully retracted position, stop for one minute before you continue to the subsequent steps.

S 864-053

- (9) Remove pressure from the center hydraulic system (AMM 29-11-00/201).

S 494-054

- (10) Install the PDU lock in the TE flap PDU (Fig. 404).

S 864-055

- (11) Open these circuit breakers on the P6 panel and install circuit breaker locks:  
(a) 6D21, ALTN SLAT INBD PWR  
(b) 6F24, ALTN SLAT OUTBD PWR

S 864-056

- (12) Open this circuit breaker on the P6 panel and attach a DO-NOT-CLOSE tag:  
(a) 6D24, ALTN FLAP PWR

S 864-057

- (13) Open these circuit breakers on the P11 panel and install circuit breaker locks:  
(a) 11H23, SLAT ALTN CONT INBD

EFFECTIVITY

ALL

27-51-20

08

Page 422  
Dec 22/07

(b) 11H24, SLAT ALTN CONT OUTBD

S 864-058

(14) Open this circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:

(a) 11J24, FLAPS ALTN CONT

S 224-059

(15) Make sure the clearance between the flap and the upper surface of the wing fixed trailing edge (TE) is correct (View C-C and D-D, Fig. 402).

S 224-060

(16) Make sure the flap aligns correctly with the lower surface of the wing fixed TE (View E-E and F-F).

S 824-061

(17) If the clearance between the flap and the wing fixed TE is not correct, or if the surfaces are not aligned, adjust the shims (15 thru 22) to correct the clearance and align the surfaces (View A-A, Fig. 401).

**NOTE:** Adjust the forward shims (15 thru 18) to change the height of the flap leading edge. Make sure the thickness of the forward shim does not exceed 0.50 inch (1.27 cm). Adjust the aft shims (19 thru 22) to correct the aileron-to-flap trailing edge mismatch.

S 974-062

(18) If you use an aileron rigging bar, measure the aileron-to-flap trailing edge mismatch (Fig. 403).

**NOTE:** Set and hold the ailerons in the position shown in Fig. 403 to measure the aileron-to-flap trailing edge mismatch. Do not adjust the rig position of the ailerons.

This measurement will tell if it is necessary to adjust the flap position.

EFFECTIVITY

ALL

27-51-20

S 824-085

- (19) If you do not use an aileron rigging bar, measure the aileron-to-flap trailing edge mismatch.
- (a) Compare this to the mismatch dimension you measured before you removed the flap.

S 224-083

- (20) Make sure the trailing edge of the left flap is symmetrical to the trailing edge of the right flap, within 0.06 inch (1.5 mm).

**NOTE:** Use the inboard and outboard ailerons as a reference point.

If you used the flaps to make a lateral trim correction, it is not necessary for the trailing edges of the outboard flaps to be symmetric.

S 824-063

- (21) If the aileron-to-flap trailing edge mismatch or the flap symmetry requirement is not within the limit, adjust the shims (15 thru 22, View B, Fig. 401) to get the correct fit-and-fair.

**NOTE:** Do not adjust the rig position of the ailerons to correct the aileron-to-flap mismatch or flap symmetry. Hold the ailerons in the positions shown in (Fig. 403), and adjust the shims (15 thru 22) to change the position of the flap.

Adjust the forward shims (15 thru 18) to change the height of the flap leading edge. Make sure the thickness of the forward shim does not exceed 0.50 inch (1.27 cm). Adjust the aft shims (19 thru 22) to correct the aileron-to-flap trailing edge mismatch.

EFFECTIVITY

ALL

27-51-20

15

Page 424  
Aug 22/06

S 824-064

- (22) If you cannot get the correct fit-and-fair dimensions with the shims, adjust the clearance between the retract overtravel stops and the rotary actuator crank arms with these steps:

**NOTE:** If you decrease the retract overtravel stop clearance at the outboard linkage, the outboard end of the flap will move forward and up, and the inboard end of the flap will move aft and down. The opposite result will occur if you increase the clearance.

- (a) Remove the aft, mid, and forward sections of the inboard and outboard flap fairing on the outboard flap (AMM 27-51-16/401).

**NOTE:** You can remove the fairings at the flaps fully retracted position. Remove the aft fairing first.

- (b) Disconnect the torque tube from the inboard coupling of the outboard rotary actuator (AMM 27-51-41/401).

**NOTE:** This will disconnect the inboard mechanism from the outboard mechanism.

- (c) Disconnect the torque tube from the inboard coupling of the inboard rotary actuator (AMM 27-51-41/401).

**NOTE:** This will disconnect the outboard flap drive from the inboard flap drive.

- (d) To get the correct flap LE mismatch and clearances (Fig. 402), turn the actuator input shaft to adjust the rig position of the retract overtravel stops at the inboard and outboard flap linkages (Fig. 407).

**NOTE:** Do not adjust the overtravel stop clearance out of the rig position limits (Fig. 407).

Always move the crank arm to the direction of the stop to measure the RIG position. If you must move the crank arm away from the stop, move it away from more than one complete turn of the coupling, then move it back again to measure the RIG position.

Turn the coupling counterclockwise to decrease the clearance to the stop. A 1/3 turn of the coupling will change the clearance by 0.005 inch (0.127 mm).

EFFECTIVITY

ALL

27-51-20

06

Page 425  
Dec 22/01

- (e) Connect the torque tube to the inboard side of the outboard rotary actuator.

NOTE: Try not to turn the coupling or torque tube when you connect the torque tube. If you must turn the coupling to align the coupling screws, make no more than 1/6 of a turn in the clockwise or counterclockwise direction.

- (f) Connect the torque tube to the inboard side of the inboard rotary actuator.

NOTE: Try not to turn the coupling or torque tube when you connect the torque tube. If you must turn the coupling to align the coupling screws, make no more than 1/6 of a turn in the clockwise or counterclockwise direction.

S 224-065

- (23) Do a check on the flap fit and fair dimensions again to make sure all the dimensions are below the limits (Fig. 402).

S 224-066

- (24) Measure the aileron-to-flap mismatch again and make sure that the trailing edges align (Fig. 403).

NOTE: Hold the ailerons in the positions shown in Fig. 403 to measure the aileron-to-flap trailing edge mismatch. Do not adjust the rig position of the ailerons.

S 824-067

- (25) Measure the clearance between the seal retainers and the leading edge of the flap. Adjust the seal retainers if the clearance is not correct (View E-E and F-F, Fig. 402).

S 224-068

- (26) Make sure that the clearances between the flap and the inboard and outboard ailerons are correct (View A-A and B-B, Fig. 402). Adjust the seal retainers as necessary by loosening the fasteners and using the slotted holes to obtain the correct clearances.

EFFECTIVITY

ALL

27-51-20

S 094-069

- (27) Remove the PDU lock on the TE flap PDU (Fig. 404).

S 094-071

- (28) Remove the locks on the spoiler actuators and retract the outboard spoilers 1 thru 4 (left wing) or 9 thru 12 (right wing) (AMM 27-61-00/201).

S 824-072

- (29) Measure and adjust the spoiler-to-flap clearances (AMM 27-61-00/501, Adjust Spoiler Control Actuators).

S 864-073

- (30) Remove the circuit breaker locks and DO-NOT-CLOSE tags and close these circuit breakers on the P6 panel:
- (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6D24, ALTN FLAP PWR
  - (c) 6F24, ALTN SLAT OUTBD PWR

S 864-074

- (31) Remove the circuit breaker locks and DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:
- (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD
  - (c) 11J24, FLAPS ALTN CONT

S 864-075

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (32) Pressurize the center hydraulic system (AMM 29-11-00/201).

EFFECTIVITY

ALL

27-51-20

13

Page 427  
Apr 22/06

S 864-076

- (33) Move the flap control lever to the 30-unit detent, and make sure the flaps move to the fully extended position easily.

S 864-077

- (34) Move the flap control lever to the zero detent and make sure the flaps move to the fully retracted position.

S 214-078

- (35) Make sure there is no damage to the fixed wing structure adjacent to the outboard flaps.

H. Install Final Bolts to Flaps

S 024-375

- (1) Remove temporary slave bolts (1, 5, 9, 10, 11, 12) and shims (17, 18, 21, 22), noting the location of each shim and bolt.

S 394-382

- (2) Fay surface seal the top and bottom shim interfaces only at the forward and aft locations on the support beam with PR-1405G or BMS 5-95 sealant. Coverage thickness shall be such that the stacked shim edges are not visible.

S 424-389

- (3) Reinstall temporary slave bolts (1, 5, 9, 10, 11, 12) and shims (17, 18, 21, 22) at the noted locations, and retorquing nuts to 200-250 pound-inches (22.6-28.2 newton-meters).

S 424-410

- (4) Remove the temporary slave bolts (5, 9, 11, 12) from the aft end of the support beam and replace with the final bolts (5, 9, 11, 12), one bolt at a time.

**NOTE:** Make sure the bolts have the correct grip length. Bolt grip length is dependent on the number of shims used.

- (a) Before insertion of the final bolt, coat the inside of the hole to its full depth with PR-1405G or BMS 5-95 sealant.

EFFECTIVITY

ALL

27-51-20

- (b) Insert the final bolts (5, 9, 11, 12) into the aft end of the carrier support beam wet with PR-1405G or BMS 5-95 per BAC 5000, method 2. After the bolt has been inserted, remove any excess sealant from the bolt threads and surrounding surface of the support beam.

NOTE: Use a dry wiper. Do not use solvents.

S 424-424

- (5) Initially tighten the nuts (8) to the lower value of the torque range of 475-525 pound-inches (53.7-59.3 newton-meters).

S 424-431

- (6) Re-tighten the nuts (8) 20 minutes or more after installation to within torque range of 475-525 pound-inches (53.7-59.3 newton-meters).

NOTE: Final torque must be applied before the squeeze out life of the sealant expires.

S 424-438

- (7) Remove the temporary slave bolts (1, 10) from the carrier beam and replace with the final bolts (1, 10) one bolt at a time.

NOTE: Make sure the bolts have the correct grip length. Bolt grip length is dependent on the number of shims used.

- (a) Before insertion of the final bolt, coat the inside of the hole to its full depth with PR-1405G or BMS 5-95 sealant.  
(b) Insert the final bolts (1, 10) into the carrier beam wet with PR-1405G or BMS 5-95 per BAC 5000, method 2. After the bolt has been inserted, remove any excess sealant from the bolt threads and surrounding surface of the swivel plate.

NOTE: Use a dry wiper. Do not use solvents.

EFFECTIVITY

ALL

27-51-20

09

Page 429  
Apr 22/06

S 424-452

- (8) Initially tighten the nuts (4) to the lower value of the torque range of 750-850 pound-inches (85.0-96.0 newton-meters).

S 424-459

- (9) Re-tighten the nuts (4) 20 minutes or more after installation to within torque range of 750-850 pound-inches (85.0-96.0 newton-meters).

**NOTE:** Final torque must be applied before the squeeze out life of the sealant expires.

S 394-344

- (10) Following final torque of all flap attach bolts, fillet seal around shims with PR-1405G or BMS 5-95 per BAC 5000. Option: brush coat application is acceptable. Coverage thickness to be such that stacked shim edges are not visible.

S 414-351

- (11) Install the access doors and the eight access screws to the upper surface of the outboard flap (14).

S 414-466

- (12) If removed, install the vortex generator near the outboard attach point for the sling (AMM 57-53-01/401).

I. Put the Airplane Back to Its Usual Position

S 424-079

- (1) If removed, install the inboard and outboard flap fairings for the outboard flap (AMM 27-51-16/401).

S 094-080

**WARNING:** USE THE TASK IN AMM 32-00-15/201 TO REMOVE THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Remove the door locks from the landing gear doors and close the doors (AMM 32-00-15/201).

S 864-081

- (3) Remove power from the center hydraulic system (AMM 29-11-00/201).

S 864-082

- (4) Remove electrical power (AMM 24-22-00/201).

EFFECTIVITY

- (3) Supply electrical power (AMM 24-22-00/201).

S 866-005

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THAT THE SLATS WILL NOT HIT THE ACCESS DOOR ON THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING. THE SLATS CAN CAUSE DAMAGE TO THESE COMPONENTS.

- (4) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 866-007

- (5) Move the flap control lever to the 30-unit detent, and permit the flaps and slats to extend to the fully extended position.

S 866-008

- (6) Remove pressure from the center hydraulic system (AMM 29-11-00/201).

S 866-009

- (7) Open this circuit breaker on the main power distribution panel, P6, and attach a DO-NOT-CLOSE tag:  
(a) 6D24, ALTN FLAP PWR

S 866-010

- (8) Open these circuit breakers on the P6 panel and install circuit breaker locks:  
(a) 6D21, ALTN SLAT INBD PWR

S 286-083

**CAUTION:** IF AN EXTENSION BAR IS USED WITH THE TORQUE WRENCH MAKE SURE YOU DO NOT OVER TIGHTEN THE NUT. ADJUST THE WRENCH SETTING TO GET THE CORRECT TORQUE. IF YOU OVER TIGHTEN THE NUTS, DAMAGE TO HARDWARE COULD OCCUR.

- (1) Apply a torque of 375.0 pound-inches (42.0 newton-meters) to the bolt (1 and 10) at the forward location of the beam without using a wrench on the nut (4) (Fig. 601, View B).

**NOTE:** Watch the nut (4) to see if it moves.

S 216-086

- (2) If a nut moves, put a tag on the nut/bolt combination for identification.

S 426-155

- (3) Apply a torque of 237.5 pound-inches (26.8 newton-meters) to the bolt (5, 9, 11 and 12) at the aft location of the beam without using a wrench on the nut (8) (Fig. 601, View B).

**NOTE:** Watch the nut (8) to see if it moves.

S 216-089

- (4) If a nut moves, put a tag on the nut/bolt combination for identification.

S 216-090

- (5) If a nut moved when you applied the required torque to the bolt, do the following visual inspection:

**WARNING:** MAKE SURE NO MORE THAN TWO BOLTS ARE REMOVED AT THE SAME TIME FROM THE SAME SUPPORT BEAM. DO NOT REMOVE BOTH FORWARD BOLTS FROM A SUPPORT BEAM AT THE SAME TIME. IF YOU REMOVE MORE THAN TWO BOLTS OR BOTH FORWARD BOLTS, INJURY TO PERSONS OR DAMAGE TO HARDWARE COULD OCCUR.

- (a) Remove the nut that moved and the bolt.

MAINTENANCE MANUAL

- (b) Clean all bolt surfaces with a soft bristle brush to remove tough material from the bolt shank and threads.
- (c) Visually inspect all surfaces of the bolt with 10X magnification or greater.
- (d) If a bolt was removed and no evidence of cracking is found on the bolt shank or threads, then reinstall the bolt as follows (View B, Fig. 601):

NOTE: If a bolt was removed and evidence of cracking was found, then replace the bolt with an authorized steel bolt with the correct grip length. Reinstall the bolt as follows.

- 1) Install the (6) washer onto the (5, 9, 11 or 12) aft bolt and apply BMS 5-95 sealant to the bolt shanks only. Install the bolt wet into the hole.

NOTE: Do not use solvent to remove excess sealant from the bolt threads. Remove excess sealant from the bolt threads with a dry wiper.

- 2) Install the nut (8) with washers (23 and 24) and radius fillers (25 and 26) on the bolt (5, 9, 11 or 12). Hand-tighten the nuts.
- 3) Install the (2) washer onto the (1 or 10) fwd bolt and apply BMS 5-95 sealant per BAC 5000, method 2, to the bolt shanks only. Install the bolt wet into the hole.

NOTE: Do not use solvent to remove excess sealant from the bolt threads. Remove excess sealant from the bolt threads with a dry wiper.

- 4) Install the nut (4) with washers (23 and 24) on the bolt (1 or 10). Hand-tighten the nut.
- 5) Initially tighten the nut (4) at the forward end of the flap to the lower value of the torque range of 750-850 pound-inches (84.7-96.0 newton-meters).

EFFECTIVITY

ALL

27-51-20

03

Page 610  
Aug 22/05

- 6) Initially tighten the nut (8) at the aft end of the flap to the lower value of the torque range of 475-525 pound-inches (53.7-59.3 newton-meters).
- 7) Tighten the nut (4) at the forward end of the flap to 750-850 pound-inches (84.7-96.0 newton-meters).

NOTE: Make sure the bolts have the correct grip length.

- 8) Tighten the nut (8) at the aft end of the flap to 475-525 pound-inches (53.7-59.3 newton-meters).

NOTE: Make sure the bolts have the correct grip length.

S 426-251

CAUTION: IF AN EXTENSION BAR IS USED WITH THE TORQUE WRENCH, MAKE SURE YOU DO NOT OVER TIGHTEN THE NUT. ADJUST THE WRENCH SETTING TO GET THE CORRECT TORQUE. IF YOU OVER TIGHTEN THE NUTS, DAMAGE TO HARDWARE COULD OCCUR.

- (6) If the nut did not move when you applied the torque, then re-torque the nut as follows (View B, Fig. 601):
  - (a) Tighten the nuts (4) at the forward end of the flap to at least the middle of the 750-850 pound-inches (84.7-96.0 newton-meters) torque range.
  - (b) Tighten the nuts (8) at the aft end of the flap to at least the middle of the 475-525 pound-inches (53.7-59.3 newton-meters) torque range.

S 416-042

- (7) Install the access doors and the eight access screws to the upper surface of the outboard flap.

H. Put the Airplane Back to Its Usual Position

S 426-079

- (1) If removed, install the inboard and outboard flap fairings for the outboard flap (AMM 27-51-16/401).

EFFECTIVITY

OUTBOARD FLAP ACTUATOR CRANK ARM MECHANISM – REMOVAL/INSTALLATION

1. General

- A. This procedure contains the removal and the installation tasks for the actuator crank arms in the outboard flap.
- B. Each outboard flap contains two crank arms, one on the inboard linkage, and one on the outboard linkage. You can remove and install each crank arm independently.
- C. Refer to AMM 27-51-27/401 for the removal and installation procedure for the outboard flap linkage assembly.

TASK 27-51-21-024-001

2. Outboard Flap Actuator Crank Arm Mechanism – Removal

A. Equipment

- (1) TE Flap PDU Lock – A27009-7
- (2) Circuit Breaker Lockout Clip – 1012LC-R  
(5 Necessary) Commercially Available
- (3) Locks from the Inboard and Outboard TE Flap Lock Set – A27074-128
  - (a) Lock, Outbd Linkage, Outbd Flap – A27074-2
  - (b) Lock, Inbd Linkage, Outbd Flap – A27074-3
  - (c) Bracket Assy, Outbd Linkage, Outbd Flap – A27074-7
  - (d) Bracket Assy, Inbd Linkage, Outbd Flap – A27074-8

D. Prepare for the Removal

S 214-002

- (1) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

S 494-003

**WARNING:** USE PROCEDURE AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Open the doors for the landing gear and install the door locks (AMM 32-00-15/201).

S 864-004

- (3) Supply electrical power (AMM 24-22-00/201).

S 864-005

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (4) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 864-006

- (5) Move the flap control lever to the 30-unit detent and permit the flaps to move to the fully extended position.

S 864-007

- (6) Remove the power from the center hydraulic system (AMM 29-11-00/201).

S 494-008

- (7) Attach a DO-NOT-OPERATE tag to the flap control lever.

S 864-009

- (8) Open these circuit breakers on the main power distribution panel, P6, and install the circuit breaker locks and DO-NOT-CLOSE tags:

(a) 6D21, ALTN SLAT INBD PWR

EFFECTIVITY

ALL

27-51-21

02

Page 409  
Apr 22/00

- (b) 6D24, ALTN FLAP PWR
- (c) 6F24, ALTN SLAT OUTBD PWR

S 864-010

- (9) Open these circuit breakers on the overhead panel, P11, and install circuit breaker locks and DO-NOT-CLOSE tags:
  - (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD
  - (c) 11J24, FLAPS ALTN CONT

S 494-011

- (10) Install the PDU lock in the TE flap power drive unit (PDU) (Fig. 405).

S 014-012

- (11) Remove these access panels from the lower surface of the wing trailing edge that is applicable (AMM 06-44-00/201):
  - (a) For the inboard actuator crank arm, remove access panels 561EB, 561FB, 561GB, and 572BB (left wing) or access panels 661EB, 661FB, 661GB, and 672BB (right wing).
  - (b) For outboard actuator crank arm, remove access panels 561JB, 561HG, 561GB, and 573BB (left wing) or access panels 661JB, 661HB, 661GB, and 673BB (right wing).

E. Remove the Rotary Actuator Crank Arm

S 034-013

- (1) Disconnect the four bolts that attach the safety strap bracket to the actuator (Detail A, Fig. 401), and remove the safety strap.

S 934-014

- (2) Make a reference mark between the coupling on the inboard rotary actuator and the torque tube on the inboard side of the actuator.

S 034-015

- (3) Disconnect the inboard torque tube from the inboard rotary actuator (AMM 27-51-41/401).

**NOTE:** Do not turn the torque tube. It will be necessary to adjust the flap drive if you turn the torque tube while it is disconnected.

S 984-016

- (4) Manually turn the coupling on the inboard rotary actuator in the extend direction, until the inboard actuator crank arm touches the extend overtravel stop (View A-A, Fig. 401).

**NOTE:** Count and keep a record on the number of turns of the coupling from the reference mark.

EFFECTIVITY

ALL

27-51-21

02

Page 410  
Aug 22/06

S 984-017

- (5) Manually turn the actuator coupling in the retract direction, until the flap lower surface is parallel to the ground.

S 494-018

- (6) Hold the weight of the main flap to release the load on the linkages with the flap linkage lock set (Fig. 404).

S 024-019

- (7) Remove the applicable rotary actuator (AMM 27-51-22/401).

NOTE: Keep the actuator attach bolts in the retainers.

S 034-020

- (8) Remove the position transmitter (AMM 27-51-45/201).

S 034-021

- (9) Do these steps to disconnect the actuator crank arm from the 5-8 link (Fig. 402 and Fig. 403):
- (a) At joint 5,  
remove the cotter pin, nut, washer, bolt, and end cap.
  - (b) Cut the lockwires and remove the inner pin and tab washer from the outer pin.
  - (c) Hold the 5-8 link and remove the outer pin.

S 024-025

- (10) For the inboard linkage,  
remove the transmitter housing cover.

S 024-023

- (11) For the outboard linkage,  
remove the transmitter housing (AMM 27-51-45/201).

S 034-026

- (12) Disconnect the nuts and remove the retaining ring on the outboard side of the outboard support rib (View C-C, Fig. 401).

NOTE: You will remove the inner retaining ring at the outboard support rib when you remove the crank arm.

NOTE: Make a note or write down location of removed washers and nuts. During installation, the washers and nuts should be placed in their original locations to prevent any damage.

EFFECTIVITY

ALL

27-51-21

03

Page 411  
Aug 22/06

S 034-027

- (13) Disconnect the nuts and remove the reaction ring at the inboard side of the inboard support rib (View D-D, Fig. 401).

**NOTE:** You will remove the inner retaining ring at the inboard support rib when you remove the crank arm.

S 034-028

- (14) Remove the nut and tab washer on the input shaft.

S 034-029

- (15) Hold the crank arm and the two inner retaining rings, and move the input shaft to the inboard direction, out of the support ribs.

S 024-030

- (16) Lower the crank arm and the two inner retaining rings from the airplane.

S 034-031

- (17) Remove and clean the thrust spacers in the crank arm and the outboard support rib if it is necessary.

TASK 27-51-21-424-032

3. Outboard Flap Actuator Crank Arm Mechanism - Installation

A. Equipment

- (1) TE Flap PDU Lock - A27009-7

B. Consumable Materials

(6) Put the crank arm assembly between the inboard and outboard support ribs.

- S 434-039  
(7) Put the input shaft through the inboard support rib, the crank arm assembly, and the outboard support rib.

- S 434-040  
(8) Install new seals in the outer retaining ring and the reaction ring with wet primer (View B-B, Fig. 401).

**NOTE:** Make sure you install the seal in the position shown to permit correct lubrication to the bearing.

- S 434-041  
(9) Install the tab washer and the nut to the outboard end of the input shaft (View B-B, Fig. 401).

- S 434-042  
(10) Tighten the nut on the input shaft to 2000-3500 pound-inches, and install lockwires at two locations (AMM 20-10-23/401).

- S 644-043  
(11) Apply BMS 3-24 grease to the bolts, nuts, and washers for the installation of the retaining rings.

- S 434-044  
(12) For the outboard linkage of the outboard flap, put the outer retaining ring and the transmitter housing on the outboard support rib and install the six bolts and nuts, with a washer below each bolt and each nut (View C-C, Fig. 401).

**NOTE:** Install washers in their original location. Washers vary and if installed in incorrect location, damage can occur to unit.

- S 434-045  
(13) For the inboard linkage of the outboard flap, put the outer retaining ring and the transmitter housing cover on the outboard support rib and install the six bolts and nuts, with a washer below each bolt and each nut (View C-C, Fig. 401).

EFFECTIVITY

ALL

27-51-21

S 434-048

- (14) Tighten the nuts (6 locations) on the retaining ring to 220-240 pound-inches (25-27 newton-meters).

**NOTE:** The same torque value applies to the inboard or outboard linkages of the outboard flap.

S 434-049

- (15) Put the reaction ring on the inboard side of the inboard support rib and install the 16 bolts and nuts, with a washer below each bolt and each nut.

S 434-050

- (16) Tighten the nuts on the reaction ring to these values (View D-D, Fig. 401).  
Nut A, 220-410 pound-inches (25-46 newton-meters)  
Nut B, 370-690 pound-inches (42-79 newton-meters)

S 434-051

- (17) Do these steps to connect the 5-8 link to the actuator crank arm (Fig. 402 and Fig. 403):  
(a) Align the 5-8 link in the crank arm and install the outer pin.  
(b) Install the tab washer and the inner pin on the outer pin.  
(c) Tighten the inner pin to 800-1500 pound-inches (90-170 newton-meters), and install two lockwires between the inner pin and tab washer with the double twist procedure (AMM 20-10-23/401).  
(d) Install the end cap, bolt, and the inner nut.  
(e) Tighten the inner nut to 150-200 pound-inches (17-23 newton-meters) and install the cotter pin.

S 644-052

- (18) Lubricate the input shaft of the crank arm with BMS 3-33 grease at the fitting, until you see grease come out at the grease exit.

**NOTE:** Lubricate the input shaft before the rotary actuator installation to make sure the seals are installed correctly. Do not use an alternative grease.

S 424-053

- (19) Install the rotary actuator (AMM 27-51-22/401).

EFFECTIVITY

ALL

27-51-21

S 434-054

- (20) Connect the torque tube between the inboard and outboard rotary actuators of the outboard flap (AMM 27-51-41/401).

**NOTE:** Keep the torque tube disconnected at the inboard side of the inboard rotary actuator for the subsequent adjustments.

S 094-055

- (21) If installed, remove the flap linkage lock sets from the flap linkages (Fig. 404).

S 984-056

- (22) Turn the actuator coupling to extend the outboard flap, until the two crank arms touch the extend overtravel stops (View A-A, Fig. 401).

**NOTE:** If you cannot get the inboard and outboard crank arms to touch the extend overtravel stops at the same time, disconnect the torque tube between the actuators. Then turn each coupling independently until each crank arm touches the stop, and connect the torque tube between the two actuators.

S 984-057

- (23) Turn the inboard actuator coupling in the retract direction for the same number of turns that you did during the removal procedure, and align the reference mark that you made between the coupling and torque tube.

**NOTE:** If you did not keep a record on the number of turns you made during the removal procedure, turn the coupling back 5-1/2 turns and adjust the retract overtravel stop clearance to the RIG dimension (AMM 27-51-00/501, "Outboard Flap Retract Overtravel Stop RIG Position - Adjustment").

S 434-058

- (24) Connect the torque tube to the inboard side of the inboard rotary actuator (AMM 27-51-41/401).

S 434-059

- (25) Install the safety strap bracket with the four attach bolts (Fig. 401).

S 424-060

- (26) Install the flap position transmitters (AMM 27-51-45/201).

S 094-061

- (27) Remove the PDU lock from the TE flap PDU (Fig. 405).

EFFECTIVITY

ALL

27-51-21

09

Page 416  
Aug 22/06

S 214-062

- (28) Make sure the flap control lever is in the 30-unit detent, and remove the DO-NOT-OPERATE tag from the flap control lever.

S 864-063

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (29) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 864-064

- (30) Move the flap control lever to the 20-unit detent, and make sure the flaps move to the 20-degree position.

S 864-065

- (31) Remove the power from the center hydraulic system (AMM 29-11-00/201).

S 494-066

- (32) Install the PDU lock in the TE flap PDU (Fig. 405).

S 494-067

- (33) Apply modeling clay to all the retract overtravel stops for the outboard flap, in the left and right wings.

**NOTE:** If it is necessary, put a piece of tape on the retract stop so that it will be easier to remove the clay.

S 094-068

- (34) Remove the PDU lock in the TE flap PDU (Fig. 405).

OUTBOARD FLAP ACTUATOR CRANK ARM MECHANISM – INSPECTION/CHECK

1. General

- A. This procedure only has illustrations and wear limit tables, which show the data for wear limits. There are no procedures for access, removal, or installation of the parts. Refer to the Outboard Flap – Removal/Installation for procedures to do these tasks.

TASK 27-51-21-226-001

2. Wear Limits for the Outboard Flap Outboard Linkage (Fig. 601)

A. Access

- (1) Location Zone  
560/660 Left/Right Wing Trailing Edge – Outboard

B. Procedure

S 226-004

- (1) Use the supplied data (Fig. 601) to examine the outboard flap outboard linkage for too much wear.

TASK 27-51-21-226-002

3. Wear Limits for the Outboard Flap Inboard Linkage (Fig. 602)

A. Access

- (1) Location Zone  
560/660 Left/Right Wing Trailing Edge – Outboard

B. Procedure

S 226-005

- (1) Use the supplied data (Fig. 602) to examine the outboard flap inboard linkage for too much wear.

OUTBOARD TE FLAP ROTARY ACTUATORS – REMOVAL/INSTALLATION

1. General

- A. This procedure contains the removal and the installation tasks for the rotary actuators on the outboard flap.
- B. Each outboard flap contains two rotary actuators, one on the inboard linkage, and one on the outboard linkage. You can remove and install each rotary actuator independently.

TASK 27-51-22-024-001

2. Outboard Flap Rotary Actuator – Removal

A. Equipment

- (1) Circuit Breaker Lockout Clip – 1012LC-R  
Commercially Available
- (2) Spoiler Actuator Lock – A27108-13
- (3) TE Flap PDU Lock – A27009-7
- (4) Spanner Wrench F72959-33 (recommended), -3 (optional)

B. References

- (1) AMM 06-44-00/201, Wing Access Door and Panels
- (2) AMM 24-22-00/201, Electrical Power – Control
- (3) AMM 27-51-41/401, TE Flap Torque Tubes
- (4) AMM 27-61-00/201, Spoiler/Speedbrake Control System
- (5) AMM 29-11-00/201, Main Hydraulic Systems
- (6) AMM 32-00-15/201, Landing Gear Door Locks
- (7) AMM 32-00-20/201, Landing Gear Downlock

C. Access

(1) Location Zones

- |         |  |
|---------|--|
| 144     | Right MLG Wheel Well                   |
| 211/212 | Control Cabin                          |
| 560/660 | Wing Trailing Edge – Outboard          |
| 572/672 | Outboard Flap Inboard Fairing          |
| 573/673 | Outboard Flap Outboard Fairing         |
| 710     | Nose Landing Gear and Doors            |
| 730/740 | Left/Right Main Landing Gear and Doors |

(2) Access Panels

- |             |   |
|-------------|---|
| 561EB/661EB | Wing TE Structure, Outboard Flap Installation |
| 561HB/661HB | Wing TE Structure, Outboard Flap Installation |
| 572BB/672BB | Flap Mechanism – No. 2 (LH) and No. 7 (RH)    |
| 573BB/673BB | Flap Mechanism – No. 1 (LH) and No. 8 (RH)    |

D. Prepare for the Removal

S 214-002

- (1) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

May 10/96

S 494-003

**WARNING:** USE THE TASK IN AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Open the doors for the landing gear and install the door locks (AMM 32-00-15/201).

S 864-004

- (3) Supply electrical power (AMM 24-22-00/201).

S 864-005

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (4) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 864-006

- (5) Move the flap control lever to the 30-unit detent and permit the flaps to move to the fully extended position.

S 864-007

- (6) Remove power from the center hydraulic system (AMM 29-11-00/201).

S 494-008

- (7) Attach a DO-NOT-OPERATE tag to the flap control lever.

EFFECTIVITY

ALL

27-51-22

01

Page 408  
Apr 22/01

- S 494-014
- (8) Install the PDU lock on the TE flap PDU (Fig. 403).
- S 864-009
- (9) Open this circuit breaker on the main power distribution panel, P6, and install a DO-NOT-CLOSE tag:
- (a) 6D24, ALTN FLAP PWR
- S 864-010
- (10) Open these circuit breakers on the P6 panel and install circuit breaker locks:
- (a) 6D21, ALTN SLAT INBD PWR
- (b) 6F24, ALTN SLAT OUTBD PWR
- S 864-011
- (11) Open this circuit breaker on the overhead panel, P11, and attach a DO-NOT-CLOSE tag:
- (a) 11J24, FLAPS ALTN CONT
- S 864-012
- (12) Open these circuit breakers on the P11 panel and install circuit breaker locks:
- (a) 11H23, SLAT ALTN CONT INBD
- (b) 11H24, SLAT ALTN CONT OUTBD
- S 014-013
- (13) Remove these access panels from the lower surface of the wing trailing edge that is applicable (AMM 06-44-00/201):
- (a) For the rotary actuator on the outboard linkage, remove the access panels 561HB, and 573BB (left wing) or access panels 661BB and 673BB (right wing).
- (b) For the rotary actuator on the inboard linkage, remove the access panels 561EB and 572BB (left wing) or access panels 661EB and 672BB (right wing).

EFFECTIVITY

ALL

27-51-22

01

Page 409  
Aug 22/02

S 484-160

- (14) Do the spoiler actuator lock installation procedure (AMM 27-61-00/201).

E. Remove the Rotary Actuator (Fig. 401)

S 034-015

- (1) Disconnect the four bolts that attach the safety strap bracket to the actuator and remove the safety strap.

S 034-019

- (2) 767-200 AIRPLANES;  
Disconnect the torque tube from the inboard side of the inboard rotary actuator in the outboard flap (AMM 27-51-41/401).

**NOTE:** Do not turn the torque tube while you disconnect it from the rotary actuator.

S 034-022

- (3) 767-300 AIRPLANES;  
Disconnect the torque tubes at the inboard side of the inboard and outboard rotary actuators in the outboard flap (AMM 27-51-41/401).

**NOTE:** Do not turn the torque tubes while you disconnect them from the rotary actuators.

S 984-027

- (4) 767-200 AIRPLANES;  
Manually turn the actuator coupling in the extend direction, until the crank arm touches the extend overtravel stop (Fig. 402). Count and keep a record of the number of turns of the actuator coupling.

**NOTE:** Approximately  $6 \pm 3$  turns will be sufficient to close the  $0.12 \pm 0.06$  clearance at the extend overtravel stop. Stop the turns when the crank arm touches the overtravel stop to prevent preload. Preload on the actuator will make the actuator difficult to remove.

When you look to the outboard direction, the extend direction is counterclockwise for the left wing, and clockwise for the right wing.

EFFECTIVITY

ALL

27-51-22

09

Page 410  
Aug 22/03

S 984-030

- (5) 767-300 AIRPLANES;

At the actuator that you will remove, manually turn the actuator coupling in the extend direction, until the crank arm touches the extend overtravel stop (Fig. 402). Count and keep a record of the number of turns of the actuator coupling.

**NOTE:** For the outboard linkage, approximately  $16\text{-}1/2 \pm 3$  turns will close the  $0.33 \pm 0.21$  inch ( $8.4 \pm 5.3$  mm) clearance at the overtravel stop. For the inboard linkage, approximately  $19\text{-}1/2 \pm 3$  turns will close the  $0.39 \pm 0.27$  inch ( $9.9 \pm 6.8$  mm) clearance at the overtravel stop. When you look to the outboard direction, the extend direction is counterclockwise for the left wing, and clockwise for the right wing.

S 034-035

- (6) 767-200 AIRPLANES;

Disconnect the torque tube between the inboard and the outboard rotary actuator (AMM 27-51-41/401).

S 034-036

- (7) Remove the six nuts at the three hold-down clamps that hold the rotary actuator to the rib (View B-B, Fig. 401).

**NOTE:** A channel washer on the opposite side of the rib prevents the bolthead to turn.

S 034-037

- (8) Remove the three hold down clamps.

**NOTE:** Do not remove the bolts from the rib when you remove the hold-down clamps.

S 034-038

**WARNING:** BE CAREFUL WHEN YOU REMOVE THE ROTARY ACTUATOR. BECAUSE THE ACTUATOR WEIGHS 56 POUNDS (25.4 Kg), INJURY CAN OCCUR.

- (9) Hold the weight of the rotary actuator and pull the actuator 2.5 inches out from the support fitting to disengage the splines.

S 024-039

- (10) Remove the rotary actuator from the airplane.

EFFECTIVITY

ALL

S 034-131

(11) If you will replace the rotary actuator, remove the torque tube coupling:

(a) Remove the retaining nut and washer from the shaft on the rotary actuator.

**NOTE:** Use the spanner wrench (with 3/8 drive breaker bar) to hold the sleeve coupling (Fig. 404).

(b) Remove the splined coupling, torque tube coupling, spacer-splined, and the sleeve from the rotary actuator.

TASK 27-51-22-424-040

3. Outboard Flap Rotary Actuator - Installation

A. Equipment

(1) Spanner Wrench F72959-33 (recommended), -3 (optional)

B. Consumable Materials

(1) D00633 Grease - BMS 3-33 (Preferred)

(2) D00013 Grease - MIL-PRF-23827 (Supersedes MIL-G-23827) (Alternate)

(3) G02020 Modeling Clay

E. Install the Rotary Actuator (Fig. 401)

S 644-041

- (1) Apply grease to all the splines and mating surfaces of the rotary actuator.

S 434-132

- (2) Install the torque tube coupling on the rotary actuator if it is necessary:
- (a) Install the sleeve, torque tube coupling, spacer-splined, and the splined coupling on the rotary actuator.
  - (b) Install the retaining nut and washer on the rotary actuator.

**NOTE:** Use the spanner wrench (with 3/8 drive breaker bar) to hold the sleeve coupling (Fig. 404).

- (c) Tighten the nut to 400-480 pound-inches (45.2-54.2 Nm).

S 214-042

- (3) Make sure the overload trip indicator on the actuator is pushed in (Detail A).

S 104-043

- (4) Clean the input shaft, the reaction ring, and the actuator spline drain holes (View A-A) and remove unwanted grease or dirt.

S 434-044

**WARNING:** BE CAREFUL WHEN YOU INSTALL THE ROTARY ACTUATOR. BECAUSE THE ACTUATOR WEIGHS 56 POUNDS (25.4 Kg), INJURY CAN OCCUR.

- (5) Put the actuator output shaft into the input shaft, and align the missing spline teeth on the actuator rim to the missing spline teeth on the reaction ring (View B-B).

S 434-045

- (6) Put the actuator on to the reaction ring.

**NOTE:** Turn the actuator input shaft if it is necessary to engage the actuator splines to the reaction ring splines.

S 434-046

- (7) Install the three hold-down clamps with washers and locknuts (View C-C and D-D).

S 214-083

- (8) Make sure the crank arm touches the extend overtravel stop at the rotary actuator that you installed (Fig. 402).

- S 434-087  
(9) 767-200 AIRPLANES;  
Connect the torque tube between the inboard and the outboard rotary actuators.

- S 984-091  
(10) 767-200 AIRPLANES;  
Turn the coupling in the retract direction for the same number of turns that you made during the actuator removal procedure.

**NOTE:** If you did not write the number of turns that you made during the removal procedure, turn the coupling for 5 1/2 turns and adjust the retract overtravel stop clearance to the RIG dimension (Fig. 402).

When you look to the outboard direction, the retract direction is clockwise for the left wing, and counterclockwise for the right wing.

- S 984-094  
(11) 767-300 AIRPLANES;  
Turn the coupling in the retract direction for the same number of turns that you made during the actuator removal procedures.

**NOTE:** If you did not write the number of turns that you made during the removal procedure, turn the coupling for 16 turns for the inboard linkage, or 19 turns for the outboard linkage, and adjust the overtravel stop clearance to the RIG dimension (Fig. 402).

When you look to the outboard direction, the retract direction is clockwise for the left wing, and counterclockwise for the right wing.

- S 434-098  
(12) 767-300 AIRPLANES;  
Connect the torque tube to the inboard end of the outboard rotary actuator (AMM 27-51-41/401).

- S 424-133  
(13) Connect the torque tube to the inboard side of the inboard rotary actuator (AMM 27-51-41/401).

- S 434-100  
(14) Install the safety strap bracket with the four attach bolts (Detail A, Fig. 401).

EFFECTIVITY

ALL

27-51-22

S 094-101

- (15) Remove the PDU lock from the TE flap PDU (Fig. 403).

S 024-161

- (16) Do the Spoiler Actuator Lock Removal procedure (AMM 27-61-00/201).

S 094-102

- (17) Make sure the flap control lever is in the 30-unit detent, and remove the DO-NOT-OPERATE tag from the flap control lever.

S 864-103

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (18) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 864-104

- (19) Move the flap control lever to the 20-unit detent and permit the flaps to move to the 20-degree position.

S 864-105

- (20) Remove power from the center hydraulic system (AMM 29-11-00/201).

S 494-106

- (21) Install the PDU lock in the TE flap PDU (Fig. 403).

S 494-107

- (22) Apply modeling clay to the retract overtravel stops at the inboard and outboard rotary actuators in the outboard flap, at the wing where the maintenance was done (Fig. 402).

**NOTE:** If it is necessary, put a piece of tape on the retract stop so that it will be easier to remove the clay.

S 094-108

- (23) Remove the PDU lock from the TE flap PDU (Fig. 403).

Aug 22/02

S 864-109

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

(24) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 864-110

(25) Move the flap control lever to the zero (FLAPS UP) detent, and make sure the flaps move to the fully retracted position.

**NOTE:** After the flaps moved to the fully retracted position, stop for one minute before you continue to the subsequent step.

S 864-111

(26) Move the flap control lever to the 20-unit detent, and permit the flaps to move to the 20-degree position.

S 864-112

(27) Remove power from the center hydraulic system (AMM 29-11-00/201).

S 494-113

(28) Install the PDU lock in the TE flap PDU (Fig. 403).

S 094-114

(29) Carefully remove the clay from each retract overtravel stop.

S 224-115

(30) Measure and make a record of the clay thickness at each retract overtravel stop, and make sure each overtravel stop clearance (the clay thickness) is correct as shown (Fig. 402).

S 824-116

(31) If the overtravel stop clearance is not correct, adjust the overtravel stop clearance to the RIG position (AMM 27-51-00/501, "Adjust the Outboard Flap Retract Overtravel Stops to the RIG Position").

EFFECTIVITY

ALL

27-51-22

01

Page 416  
Aug 22/02

S 434-117

- (32) Make sure you install a lockwire with the double twist procedure for the couplings on the torque tubes that you connected (AMM 20-10-23/401).

S 094-118

- (33) Remove the PDU lock from the TE flap PDU (Fig. 403).

S 864-119

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (34) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 864-120

- (35) Move the flap control lever to the zero (FLAPS UP) detent, and permit the flaps to move to the fully retracted position.

S 864-121

- (36) Remove the circuit breaker locks and DO-NOT-CLOSE tags and close these circuit breakers on the main power distribution panel, P6:
- (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6D24, ALTN FLAP PWR
  - (c) 6F24, ALTN SLAT OUTBD PWR

S 864-122

- (37) Remove the circuit breaker locks and DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel, P11:
- (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD
  - (c) 11J24, FLAPS ALTN CONT

OUTBOARD TE FLAP DEFLECTION CONTROL TRACK – REMOVAL/INSTALLATION

1. General

- A. This procedure contains the removal and the installation tasks for the outboard flap deflection control track.

TASK 27-51-23-024-001

2. Outboard Flap Deflection Control Track – Removal

A. Equipment

- (1) Circuit Breaker Lockout Clip – 1012LC-R  
Commercially Available  
(2) TE Flap PDU Lock – A27009-7

B. References

- (1) AMM 24-22-00/201, Electrical Power – Control  
(2) AMM 27-51-24/401, Outboard TE Flap Deflection Control Carriage  
(3) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems  
(4) AMM 32-00-15/201, Landing Gear Door Lock  
(5) AMM 32-00-20/201, Landing Gear Downlock

C. Access

(1) Location Zones

144	Right MLG Wheel Well
211/212	Control Cabin
566/666	Outboard Trailing Edge Flap
710	Nose Landing Gear and Doors
730/740	Left/Right Main Landing Gear and Doors

D. Prepare for the Removal

S 214-002

- (1) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

S 494-003

**WARNING:** USE THE PROCEDURE IN AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Open the doors for the landing gear and install the door locks (AMM 32-00-15/201).

OUTBOARD TE FLAP DEFLECTION CONTROL CARRIAGE – REMOVAL/INSTALLATION

1. General

- A. This document contains data for the removal and installation of the outboard TE flap Deflection Control Carriage.

TASK 27-51-24-004-019

2. Remove the Outboard Trailing Edge Flap Deflection Control Carriage  
(Fig. 401)

A. Equipment

- (1) Circuit Breaker Lockout Clip – 1012LC-R  
Commercially Available  
(2) TE Flap PDU Lock – A27009-7

B. References

- (1) AMM 24-22-00/201, Electrical Power – Control  
(2) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems  
(3) AMM 32-00-20/201, Landing Gear Downlock

C. Access

- (1) Location Zone  
566/666 Outboard Trailing Edge Flap (Left)/(Right)

D. Prepare for Removal

S 214-002

- (1) Make sure that the landing gear downlocks are installed (AMM 32-00-20/201).

S 844-003

- (2) Put the flaps in the 30-unit position, as follows:

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN THE CENTER HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE ALL FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN THE CENTER HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** TO PREVENT EQUIPMENT DAMAGE, MAKE SURE THAT THE ENGINE STRUT ACCESS DOORS, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE NOT IN THE PATH OF SLATS BEFORE THE FLAPS OR SLATS ARE OPERATED.

- (a) Pressurize the center hydraulic system (AMM 29-11-00/201).  
(b) Supply electrical power (AMM 24-22-00/201).  
(c) Put the flap control lever in the 30-unit detent, and let the flaps extend.

EFFECTIVITY

ALL

27-51-24

01

Page 401  
Apr 22/01

S 034-004

- (3) Remove the power to the flap system for maintenance, as follows:
  - (a) Remove the power from the center hydraulic system (AMM 29-11-00/201).
  - (b) Open this circuit breaker on the main power distribution panel, P6, and attach DO-NOT-CLOSE tag:
    - 1) 6D24, ALTN FLAP PWR
  - (c) Open these circuit breakers on the P6 panel and install circuit breaker locks:
    - 1) 6D21, ALTN SLAT INBD PWR
    - 2) 6F24, ALTN SLAT OUTBD PWR
  - (d) Open this circuit breaker on the overhead panel, P11, and attach a DO-NOT-CLOSE tag:
    - 1) 11J24, FLAPS ALTN CONT
  - (e) Open these circuit breakers on the P11 panel and install circuit breaker locks:
    - 1) 11H23, SLAT ALTN CONT INBD
    - 2) 11H24, SLAT ALTN CONT OUTBD
  - (f) Install the PDU lock (Fig. 402).

S 024-005

- (4) Remove the access panel on the flap (Fig. 403).
- E. Remove Outboard Flap Deflection Control Carriage (Fig. 401)

S 034-006

- (1) Remove bolt, washers, and nut and identify the parts with a label for installation.

S 024-022

- (2) Move the deflection control carriage aft and down to disengage the carriage from deflection control track.

S 024-024

- (3) If rub blocks require replacement, continue.
  - (a) Remove the nuts and bolts from the rub block and deflection control carriage.

C. Access

- (1) Location Zone  
566/666 Outboard Forward Flap

D. Install the Outboard Flap Deflection Control Carriage (Fig. 401)

S 424-025

- (1) If rub blocks require installation, do these steps.
  - (a) Position shims and rub block on deflection control carriage.
  - (b) Remove laminations to obtain required dimension (Fig. 401).
  - (c) Apply primer to shims after delamination.
  - (d) Install shims and rub block on deflection control carriage with bolts and nuts.

S 424-007

- (2) Put the deflection control carriage on the deflection control track.

S 394-008

- (3) Fill the cavity with grease.

S 424-009

- (4) Move the deflection control carriage to install the bolt.

**NOTE:** It may require a preload on the flap and/or track to make the carriage fitting and flap fitting holes line up to install the carriage bolt.

S 434-010

- (5) Place the washer onto the bolt and insert the bolt through the holes in the outboard flap and the deflection control carriage.

S 164-001

- (6) Remove any excess grease from the bolt.

EFFECTIVITY

ALL

27-51-24

FLAP CONTROL LEVER – REMOVAL/INSTALLATION

1. General

- A. This procedure contains two tasks. The first task removes the flap control lever for the trailing edge (TE) flap and leading edge (LE) slat systems. The second task installs the flap control lever.

TASK 27-51-25-024-001

2. Remove the Flap Control Lever

A. Equipment

- (1) Circuit Breaker Lockout Clip – 1012LC-R  
(6/necessary) Commercially Available

B. References

- (1) AMM 27-48-06/401, Stabilizer Trim Position Indicator  
(2) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems  
(3) AMM 32-00-15/201, Landing Gear Door Locks  
(4) AMM 32-00-20/201, Landing Gear Downlock  
(5) AMM 34-22-02/201, EFIS Control Panel

C. Access

- (1) Location Zones  
211/212 Control Cabin  
710 Nose Landing Gear and Doors  
730/740 Main Landing Gear and Doors

D. Prepare for the Removal

S 214-002

- (1) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

S 014-003

**WARNING:** USE THE PROCEDURE IN AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Open the doors for the landing gear and install the door locks (AMM 32-00-15/201).

S 214-004

- (3) Make sure the TE flaps and LE slats are fully retracted and the flap control lever is in the zero (FLAPS UP) detent.

S 864-005

- (4) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).

EFFECTIVITY

  - (f) 11G15, FLAP SLAT ELEC UNIT SENSOR 2
  - (g) 11G16, FLAP SLAT ELEC UNIT CONT 2

S 864-007

- (6) Open these circuit breakers on the P11 panel, and install circuit breaker locks and DO-NOT-CLOSE tags:
- (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD
  - (c) 11J24, FLAPS ALTN CONT

S 864-008

- (7) Open these circuit breakers on the main power distribution panel, P6, and install circuit breaker locks and DO-NOT-CLOSE tags:
- (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6D24, ALTN FLAP PWR
  - (c) 6F24, ALTN SLAT OUTBD PWR

S 864-009

**WARNING:** REMOVE ELECTRICAL POWER FROM THE FLIGHT COMPARTMENT SEAT. THE ACCIDENTAL ELECTRICAL OPERATION OF THE FLIGHT COMPARTMENT SEAT CAN CAUSE INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT.

- (8) Open these circuit breakers on the main power distribution panel, P6, and attach DO-NOT-CLOSE tags:
- (a) 6H15, CAPT SEAT
  - (b) 6J21, F/O SEAT

E. Remove the Flap Control Lever (Fig. 401)

S 034-010

- (1) Remove the lower access panel on the right side of the control stand.

S 014-012

- (2) Remove the EFIS module (AMM 34-22-02/201).

S 034-013

- (3) Remove the position indicator for the right stabilizer trim system (AMM 27-48-06/401).

211/212	Control Cabin
710	Nose Landing Gear and Doors
730/740	Main Landing Gear and Doors

D. Install the Flap Control Lever

S 014-035

- (1) Move the gearbox link in the aft direction until it is out of the area to install the flap control lever (Fig. 402).

S 424-036

- (2) Install the flap control lever and quadrant into the control stand with the three bolts, locknuts, and washers.

S 434-037

- (3) Connect the gearbox link to the quadrant plate with a bolt, locknut, and a washer.

S 434-038

- (4) Install the cable on the quadrant and hold it in its position with two cotter pins (Fig. 402).

S 434-039

- (5) Do these steps to connect and adjust the WFA and WFB cables (Fig. 402):
- (a) Remove the tag you installed to identify the cables.
  - (b) Move the flap control lever two degrees aft of the zero (FLAPS UP) detent and hold the lever in this position (approximately 0.15 to 0.16 inches (3.81-4.06 mm) from the zero detent).
  - (c) Install rig pin LE1 in the slat aft quadrant.
  - (d) Connect the WFA and WFB cables at the turnbuckles and tighten to approximately two times the load in the temperature-tension table.
  - (e) Make sure rig pin LE1 can easily turn in the rig pin hole.
  - (f) Remove rig pin LE1 from the slat aft quadrant.
  - (g) Move the flap control lever 20 to 30 times through its full travel to operate the cables.
  - (h) Move the flap control lever back to the position two degrees aft of the zero (FLAPS UP) detent and hold it in this position (approximately 0.15 to 0.16 inches (3.81-4.06 mm) aft of the zero detent).
  - (i) Install rig pin LE1 in the slat aft quadrant.
  - (j) Adjust the cable tension to the loads shown in the temperature-tension table.
  - (k) Make sure rig pin LE1 can easily be removed and installed in the slat aft quadrant.

**NOTE:** Keep the rig pin installed in the slat aft quadrant.

EFFECTIVITY

ALL

27-51-25

04

Page 409  
Aug 22/06

(l) Lightly shake the WFA and WFB cables to remove the friction from the cables and to release the tension in the components, and do this check:

- 1) Make sure the flap control lever is 0.15 to 0.16 inches (3.81-4.06 mm) aft of the zero (FLAPS UP) detent on the control stand lightplate.

NOTE: This is approximately 2 degrees aft of the zero (FLAPS UP) detent.

- (m) Install the turnbuckle locking clips.
- (n) Make sure rig pin LE1 can easily turn in the rig pin hole.
- (o) Remove rig pin LE1 from the slat aft quadrant.
- (p) Move the flap control lever back to the zero (FLAPS UP) detent.

S 424-040

- (6) Install the engine start module with seven screws (Fig. 401).

S 434-041

- (7) Attach the aft end of the throttle rail assembly to the engine start module with two screws.

S 434-042

- (8) Install the four seals.

S 434-043

- (9) Install the flap lever lightplate with two screws.
  - (a) Connect the wires at the terminal block.

S 434-044

- (10) Install the speedbrake lightplate with two screws.
  - (a) Connect the wires at the terminal block.

S 414-045

- (11) Install the cover aft of the flap detent plate with two screws.

S 414-046

- (12) Install the EFIS module (AMM 34-22-02/201).

S 424-047

- (13) Install the position indicator for the right stabilizer trim system (AMM 27-48-06/401).

S 414-048

- (14) Install the access panel on the right side of the control stand.

S 704-049

- (15) Do a test on the flap lever load (AMM 27-51-00/501).

FLAP CONTROL LEVER – INSPECTION/CHECK

1. General

- A. This procedure only has an illustration and a wear limit table, which show the data for wear limits. There are no procedures for access, removal, or installation of the parts. Refer to the Flap Control Lever – Removal/Installation for procedures to do these tasks.

TASK 27-51-25-226-001

2. Wear Limits for the Flap Control Lever (Fig. 601)

A. Access

- (1) Location Zones  
211/212 Control Cabin

B. Procedure

S 226-003

- (1) Use the supplied data (Fig. 601) to examine the flap control lever for too much wear.

FLAP CONTROL LEVER POSITION RVDT AND GEARBOX – REMOVAL/INSTALLATION

1. General

- A. This procedure contains steps to remove and install the position RVDT and the position gearbox for the flap control lever.

TASK 27-51-26-024-001

2. Remove the Position RVDT and the Position Gearbox for the Flap Control Lever

A. General

- (1) This task contains two procedures, one to remove the position RVDT and one to remove the position gearbox. Because this task contains two procedures, only the applicable group of steps must be done.

To start one of these procedures, do the "Prepare for the Removal" group of steps. Then, do the group of steps that is necessary to remove the component.

B. Equipment

- (1) Circuit Breaker Lockout Clip – 1012LC-R  
Commercially available

C. References

- (1) AMM 24-22-00/201, Electrical Power – Control  
(2) FIM 27-51-00/101, Fault Isolation Manual  
(3) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems  
(4) AMM 32-00-20/201, Landing Gear Downlock

D. Access

- (1) Location Zones
- |         |                             |
|---------|-----------------------------|
| 120     | Main Equipment Center       |
| 211/212 | Control Cabin               |
| 710     | Nose Landing Gear and Doors |
| 730/740 | Main Landing Gear and Doors |

E. Prepare for the Removal (Fig. 401)

S 214-002

- (1) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

S 214-003

- (2) Make sure the trailing edge (TE) flaps and leading edge (LE) slats are in the fully retracted position, with the flap control lever in the zero (FLAPS UP) detent.

S 494-004

- (3) Install a DO-NOT-OPERATE tag on the flap control lever.

S 864-005

- (4) Remove pressure from the center hydraulic system (AMM 29-11-00/201).

S 864-041

- (3) Supply electrical power (AMM 24-22-00/201).

S 824-042

- (4) (Voltmeter Method) Do these steps to adjust RVDT No. 1 (M604):
- Make sure the flap control lever is in the zero (FLAPS UP) detent and the TE flaps and LE slats are fully retracted.
  - Read the excitation voltage, V1, with a voltmeter between connections FA4 and FC4 on terminal block TB215 (Fig. 402).

NOTE: Select a range on the voltmeter with three digits displayed after the decimal point.

- (c) Read the signal voltage, V2, between connections G6 and FC5 on terminal block TB215 (Fig. 402).
- Make sure the signal voltage, V2, is in the tolerance range as shown in Table 1 (Fig. 402).
  - If the signal voltage, V2, is out of the tolerance range, loosen the two clamp screws slowly and turn the RVDT until the signal voltage, V2, is in the tolerance range.

NOTE: To possibly avoid nuisance indication, adjust the RVDT as high as possible toward the upper end of the tolerance band.

- 3) Tighten the two clamp screws.

NOTE: The RVDT position is in direct relationship to the voltage readings. To make sure the voltage V2 stays in the tolerance range, monitor the voltage setting as you tighten the clamp screws.

- (d) Read the voltage, V3, between connections FA5 and FC5 and voltage V4 between connections FA5 and G6.
- Make sure that voltage V3 is more than voltage V4.

NOTE: This will make sure that the phase on the voltages are correct.

EFFECTIVITY

ALL

27-51-26

01

Page 410  
Aug 22/05

- 2) If voltage V3 is not more than voltage V4, do the removal and installation procedure of the RVDT again.
- (e) Move the flap control lever from the zero (FLAPS UP) detent to the 30-unit detent and from the 30-unit detent back to the zero (FLAPS UP) detent.
- (f) Stop in each detent and make sure the signal voltage, V2, is as shown in reference to the excitation voltage, V1, for all of the positions of the flap control lever per Table 2 (Fig. 402).
  - 1) If a signal voltage V2 is out of the tolerance, adjust the RVDT with the flap control lever in that particular position.

NOTE: If there is more than one voltage readings out of the tolerance range, adjust the RVDT that has a larger "out of tolerance" first.

- 2) Make sure you tighten the RVDT clamp screws before you check the voltage readings at other flap lever positions.
- 3) Continue to adjust the RVDT, if it is necessary.

S 824-088

- (5) (FSEU Method) Do these steps to adjust RVDT No. 1 (M604):
  - (a) Place the flap control lever in the 15 detent.
  - (b) Turn the FSEU display on and navigate through the menus to monitor analog inputs to be able to read the RVDT voltage values on the FSEU BITE display.
  - (c) Press the down arrow until the screen displays the RVDT you want to check and push the YES key to display the RVDT reading.

NOTE: The display will turn off in 5 minutes if no further keys are pressed. To keep the screen active, press the YES key periodically to reset the 5-minute limit.

- (d) Read the voltage displayed on the FSEU.
  - 1) Make sure the voltage is in the tolerance range as shown below.
  - 2) If the voltage is out of the tolerance range, loosen the two clamp screws slowly and turn the RVDT until the voltage is in the tolerance range.

NOTE: To possibly avoid nuisance indication, adjust the RVDT as high as possible toward the upper end of the tolerance band.

EFFECTIVITY

ALL

27-51-26

01

Page 411  
Aug 22/05

3) Tighten the two clamp screws.

NOTE: The RVDT position is in direct relationship to the voltage readings. To make sure the voltage stays in the tolerance range, monitor the voltage as you tighten the clamp screws.

- (e) Move the flap control lever from the zero (FLAPS UP) detent to the 30-unit detent and back to zero.
- (f) Stop in each detent and make sure that the voltages are in the tolerance ranges shown below.
- (g) Repeat adjustments as necessary to make sure the voltage is in the tolerance range for each position.

Detent	Funct Min	Rig Min	Nominal Vrms	Rig Max	Funct Max
Up	10.88	N/A	11.160	N/A	11.75
1	7.183	N/A	7.593	N/A	8.003
5	3.877	N/A	4.287	N/A	4.697
15	0.525	0.610	0.935	1.260	1.345
20	-2.82	N/A	-2.407	N/A	-2.00
25	-6.069	N/A	-5.659	N/A	-5.249
30	-9.202	N/A	-8.717	N/A	-8.307

S 824-043

- (6) Do this step to adjust RVDT No. 2 (M603):
  - (a) Adjust RVDT No. 2 with the same procedure as you did for RVDT No. 1.
  - (b) If you used the voltmeter method, measure the voltages at these connections (Fig. 402):
 

FA1 and FC1 = V1	FC2 and G3 = V2
FA2 and FC2 = V3	FA2 and G3 = V4

I. Test of the Position RVDT Installation

S 214-044

- (3) AIRPLANES WITH A -53 OR EARLIER FSEU;  
Do these steps to do the FSEU BITE:
- (a) Push the TEST button on the front panel of the FSEU (E2 equipment rack in the main equipment center) and make sure that all the lights come on.
  - (b) Push the BIT/VERIFY button.
    - 1) Stop and let the test complete light come on.
    - 2) Make sure that no lights come on.
      - a) If the M603 FLAP LEVER MISRIG (SECT 1) light comes on, adjust the RVDT again as necessary.
      - b) If other than the M603 FLAP LEVER MISRIG (SECT 1) light comes on, do the procedure in FIM 27-51-00/101.

- S 744-082
- (4) AIRPLANES WITH A -63 FSEU;  
Do a test of the BITE display on the FSEU:
- (a) Push the ON/OFF button on the front panel of the FSEU to turn on the display.

NOTE: The display will show "EXISTING FAULTS?"
  - (b) Push the down arrow until GROUND TESTS? shows on the display.
  - (c) Push the YES button to select GROUND TESTS? on the FSEU.
  - (d) Push the down arrow until DISPLAY TEST? shows on the display.
  - (e) Push the YES button to perform the DISPLAY TEST? on the FSEU.
  - (f) Make sure the display characters on the front panel of the FSEU turn on in groups of four for approximately 2 seconds.

- S 744-083
- (5) AIRPLANES WITH A -63 FSEU;  
Do a check for EXISTING FAULTS with the FSEU:
- (a) Push the menu button.

NOTE: The display will show EXISTING FAULTS?
  - (b) Push the YES button to select the EXISTING FAULTS? test.

NOTE: The display will show TEST IN PROGRESS.

Page 413  
Aug 22/05

(c) The message "NO FAULTS" should show on the display.

NOTE: If "N FLTS FOUND" shows on the FSEU BITE display, where N is the number of faults detected, make a list of all the fault messages and maintenance message numbers. You can use the up and down arrow buttons to scroll through the list of messages.

(d) Do the corrective action for the faults found (FIM 27-51-00/101, Fig. 104, Table A).

S 864-049

WARNING: KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

CAUTION: MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

(6) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 864-050

(7) Move the flap control lever from the zero (FLAPS UP) detent to the 30-unit detent and from the 30-unit detent back to the zero (FLAPS UP) detent.

S 214-051

- (8) Stop in each detent and do these checks:
- (a) Make sure no EICAS messages show on the display screen in the flight compartment.
  - (b) Make sure the amber TRAILING EDGE and LEADING EDGE lights, on the first officer's main instrument panel, P3, do not come on.

J. Put the Airplane Back to Its Usual Condition

S 864-052

(1) Remove power from the center hydraulic system (AMM 29-11-00/201).

S 864-053

(2) Remove the electrical power if it is not necessary (AMM 24-22-00/201).

OUTBOARD FLAP MECHANISM – REMOVAL/INSTALLATION

1. General

- A. This procedure contains four tasks. The first task is the removal of the outboard flap mechanisms (linkages). The second task is the installation of the outboard flap mechanisms (linkages). The third task is the removal of the 2-8 and 3-10 links. The fourth task is the installation of the 2-8 and 3-10 links.
- B. Each outboard flap is moved by an inboard linkage and an outboard linkage.
- C. Refer to AMM 27-51-21/601 for wear limit inspection of the joints in the outboard flap linkages.
- D. Refer to AMM 27-51-21/401 to replace the actuator crank arm.
- E. It is not necessary to remove the outboard flap linkage assembly to remove the fuse pins at joint 1 of the linkage assembly, and the connection to the side brace link. Refer to AMM 27-51-02/401 to replace the fuse pins.
- F. It is not necessary to remove the outboard flaps to remove the 2-8 and 3-10 flap mechanism links.

TASK 27-51-27-024-001

2. Outboard Flap Linkage – Removal

A. General

- (1) This task is applicable to outboard flap mechanisms No. 1, No. 2, No. 7 and No. 8.

B. Equipment

- (1) TE Flap PDU Lock – A27009-7
- (2) Circuit Breaker Lockout Clip – 1012LC-R  
Commercially Available

C. References

- (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD
  - (c) 11J24, FLAPS ALTN CONT

S 494-011

- (10) Install the PDU lock in the TE flap power drive unit (PDU) (Fig. 403).

S 014-012

- (11) Remove the wing lower trailing edge access panels as necessary to get access to the linkages (AMM 06-44-00/201).

F. Remove the Outboard Flap Linkages

**NOTE:** Refer to Fig. 401 for the inboard linkage removal.  
Refer to Fig. 402 for the outboard linkage removal.

Identify the parts that you will remove in this procedure for the subsequent installation.

S 024-013

- (1) Remove the outboard flap from the airplane (AMM 27-51-20/401).

S 494-014

- (2) Put a support below the flap linkage assembly that you will remove, to hold the weight of the linkage assembly.

S 034-015

- (3) Disconnect the actuator crank arm from the 5-8 link at Joint 5 with these steps:
- (a) Remove the cotter pin, nut, washer, bolt, and end cap (View A-A).
  - (b) Cut the lockwires and remove the inner pin and tab washer from the outer pin.
  - (c) Hold the 5-8 link and remove the outer pin.

S 024-016

- (4) Remove the side brace link with these steps (View C-C):
- (a) Remove the cotter pin, nut, washers, and fuse pin at the aft connection, between the side brace link and the 1-3 link (fitting) (View D-D).
  - (b) Remove the nut, washers, bushing, and bolt at the forward connection, between the side brace link and the wing structure (View E-E).

- (5) Disconnect the 1-3 link from the rib structure at joint 1 with these steps (View C-C):

**NOTE:** Hold the weight of the 1-3 link during these steps.

- (a) Remove the cotter pin, inner nut, washer, bolt, and end cap.
- (b) Cut and remove the lockwires between the outer nut and the tab washer.
- (c) Remove the outer nut, tab washer, and fuse pin.

S 034-018

- (6) Disconnect the 6-9 link (main drive assembly) from the rib structure at joint 6 with these steps (View B-B):

- (a) Remove the cotter pin, inner nut, washer, and inner pin.
- (b) Cut and remove the lockwires between the outer nut and the tab washer.
- (c) Remove the outer nut, tab washer, washer, and outer pin.

S 024-019

- (7) Remove the flap linkage assembly from the airplane.

TASK 27-51-27-424-021

### 3. Outboard Flap Linkages - Installation

**NOTE:** Refer to AMM 27-51-21/601 for data on the wear limit inspection of the components installed in this procedure.

#### A. General

- (1) This task is applicable to outboard flap mechanisms No. 1, No. 2, No. 7 and No. 8.
- (2) To install the 2-8 or 3-10 link, it is only necessary to connect the applicable joints on the outboard flap mechanisms (linkages).

#### B. Equipment

- (1) TE Flap PDU Lock - A27009-7

#### C. Consumable Materials

- (1) D00633 Grease - BMS 3-33 (Preferred)
- (2) D00013 Grease - MIL-PRF-23827 (Supersedes MIL-G-23827) (Alternate)
- (3) D00015 Grease - BMS 3-24 (Alternate)
- (4) G02020 Modeling Clay

F. Install the Outboard Flap Linkages

**NOTE:** Refer to Fig. 401 for the inboard linkage installation.  
 Refer to Fig. 402 for the outboard linkage installation.

S 214-022

- (1) Make sure the power is removed from the center hydraulic system (AMM 29-11-00/201).

S 214-023

- (2) Make sure the PDU lock is installed in the TE flap PDU (Fig. 403).

S 434-024

- (3) Connect the linkage assembly to the structure at joint 6 with these steps (View B-B):
  - (a) Put joint 6 of the 6-9 link between the structural ribs.
  - (b) Align the hole in the link to the holes in the ribs and install the outer pin, with a washer, tab washer, and outer nut.
  - (c) Tighten the outer nut (inboard or outboard linkage) to 1500 to 2000 pound-inches (169.5-225.9 newton-meters) and install a lockwire between the nut and the tab washer at two locations (AMM 20-10-23/401).
  - (d) Install the inner pin in the outer pin with the washer and inner nut.

EFFECTIVITY

ALL

**27-51-27**

05

Page 415  
 Aug 22/06

- (e) Tighten the inner nut (inboard linkage) to 510–840 pound-inches (57.7–94.9 newton-meters), or to 220–410 pounds-inches (24.9–46.3 newton-meters) (outboard linkage), and install the cotter pin.

S 434-025

- (4) Connect the link assembly to the structural rib at joint 1 with these steps (View C-C):
  - (a) Put joint 1 of the 1-3 link between the structural ribs.
  - (b) Align the hole in the link to the holes in the ribs and install the fuse pin, with a tab washer and outer nut.

NOTE: Make sure the bushings are installed in the link and the ribs.

- (c) For the inboard linkage, tighten the outer nut to 350–450 pound-inches (39.6–50.8 newton-meters).
- (d) For the outboard linkage, tighten the outer nut to 500–600 pound-inches (56.5–67.7 newton-meters).
- (e) Install lockwires between the outer nut and the tab washer at two locations (AMM 20-10-23/401).
- (f) Install the bolt in the fuse pin, with the end cap, washer and inner nut.
- (g) Tighten the inner nut (inboard or outboard linkage) to 50–75 pound-inches (5.7–8.4 newton-meters) and install the cotter pin.

S 424-026

- (5) Install the side brace link with these steps (View C-C):
  - (a) Connect the side brace link to the wing structure with the bolt, washers, bushing, and nut (View E-E).
  - (b) For the inboard linkage, tighten the nut to 800–1500 pound-inches (90.4–169.4 newton-meters).
  - (c) For the outboard linkage, tighten the nut to 510–840 pound-inches (57.7–94.9 newton-meters).
  - (d) Connect the side brace link to the 1-3 link with the fuse pin, washers, bushing, and nut (View D-D).
  - (e) For the inboard linkage, tighten the nut to 370–690 pound-inches (41.8–77.9 newton-meters) and install the cotter pin.
  - (f) For the outboard linkage, tighten the nut to 150–200 pound-inches (17.0–22.5 newton-meters) and install the cotter pin.

EFFECTIVITY

ALL

27-51-27

07

Page 416  
Aug 22/06

S 434-027

- (6) Connect the linkage to the actuator crank arm at joint 5 with these steps (View A-A):
- (a) Put the 5-8 link between the actuator crank arm.
  - (b) Align the hole in the link to the holes in the crank arm and install the outer pin, with the tab washer and inner pin.
  - (c) Tighten the inner pin (inboard or outboard linkage) to 800-1500 pound-inches, and install lockwires between the inner pin and the tab washer at two locations (AMM 20-10-23/401).
  - (d) Install the end cap, bolt, washer, and nut.
  - (e) Tighten the nut (inboard or outboard linkage) to 150-200 pound-inches (17.0-22.5 newton-meters), and install the cotter pin.

S 424-028

- (7) Install the outboard flap (AMM 27-51-20/401).

S 094-029

- (8) Remove the PDU lock from the TE flap PDU (Fig. 403).

S 214-030

- (9) Make sure the flap control lever is in the 30-unit detent, and remove the DO-NOT-OPERATE tag from the flap control lever.

S 864-031

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (10) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 864-032

- (11) Move the flap control lever to the 20-unit detent, and make sure the flaps move to the 20-degree position.

- (21) Carefully remove the clay from each retract overtravel stop.

S 224-043

- (22) Measure and make a record of the clay thickness at each retract overtravel stop, and make sure each overtravel stop clearance (the clay thickness) is correct as shown (Fig. 404).

S 824-044

- (23) If the overtravel stop clearance is not correct, adjust the overtravel stop clearance to the RIG position (AMM 27-51-00/501, "Outboard Flap Retract Overtravel Stop RIG Position - Adjustment").

S 094-045

- (24) Remove the PDU lock from the TE flap PDU (Fig. 403).

S 864-046

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (25) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 864-047

- (26) Move the flap control lever to the zero (FLAPS UP) detent, and permit the flaps and slats to move to the fully retracted position.

G. Put the Airplane Back to Its Usual Condition

S 414-048

- (1) Install the access panels at the lower surface of the wing trailing edge (AMM 06-44-00/201).

S 864-049

- (2) Remove the DO-NOT-CLOSE tags and circuit breaker locks and close these circuit breakers on the main power distribution panel, P6:  
(a) 6D21, ALTN SLAT INBD PWR  
(b) 6D24, ALTN FLAP PWR  
(c) 6F24, ALTN SLAT OUTBD PWR

EFFECTIVITY

ALL

27-51-27

Aug 22/06

S 864-050

- (3) Remove the DO-NOT-CLOSE tags and circuit breaker locks and close these circuit breakers on the overhead panel, P11:
  - (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD
  - (c) 11J24, FLAPS ALTN CONT

S 094-051

**WARNING:** USE THE PROCEDURE IN AMM 32-00-15/201 TO REMOVE THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (4) Remove the door locks from the landing gear doors and close the doors (AMM 32-00-15/201).

S 864-052

- (5) Remove the power from the center hydraulic system (AMM 29-11-00/201).

S 864-053

- (6) Remove electrical power if it is not necessary (AMM 24-22-00/201).

TASK 27-51-27-024-071

4. Outboard Flap 2-8 and 3-10 link - Removal

A. General

- (1) To remove the 2-8 or 3-10 link, it is only necessary to disconnect the applicable joints on the outboard flap mechanisms (linkages) (Fig. 401 and 402).

B. Equipment

- (1) TE Flap PDU Lock - A27009-7
- (2) Circuit Breaker Lockout Clip - 1012LC-R  
Commercially Available
- (3) Sling Equipment, Outboard TE Flap - A27027-53

EFFECTIVITY

ALL

27-51-27

27-51-27

04

Page 421  
Aug 22/06

S 864-062

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

(4) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 864-063

(5) Move the flap control lever to the 30-unit detent, and permit the flaps and slats to move to the fully extended position.

S 864-064

(6) Remove the power from the center hydraulic system (AMM 29-11-00/201).

S 494-065

(7) Attach a DO-NOT-OPERATE tag to the flap control lever.

S 494-072

(8) Open these circuit breakers on the main power distribution panel, P6, and install the circuit breaker locks and DO-NOT-CLOSE tags:

- (a) 6D21, ALTN SLAT INBD PWR
- (b) 6D24, ALTN FLAP PWR
- (c) 6F24, ALTN SLAT OUTBD PWR

S 494-073

(9) Open these circuit breakers on the overhead panel, P11, and install circuit breaker locks and DO-NOT-CLOSE tags:

- (a) 11H23, SLAT ALTN CONT INBD
- (b) 11H24, SLAT ALTN CONT OUTBD
- (c) 11J24, FLAPS ALTN CONT

S 494-074

(10) Install the PDU lock in the TE flap power drive unit (PDU) (Fig. 403).

EFFECTIVITY

ALL

27-51-27

01

Page 422  
Aug 22/02

S 844-092

- (11) Remove the mid section of the flap fairing (AMM 27-51-16/401).

S 494-075

- (12) Install the flap sling at the three attach points on the upper surface of the main outboard flap (Fig. 405).

**NOTE:** It is necessary to hold the flap at the 30-unit pitch up attitude to secure the flap at the three attach points.

Add 3/8-inch diameter shackles to the two aft cables of the flap sling, as necessary, to get the flap pitch up attitude in the 30-unit position.

S 424-076

- (13) Connect the overhead hoist to the flap sling and make sure all of the cables are in tension.

**NOTE:** Make sure the hoist can hold the weight of the flap with the aft flap attached. The total weight is approximately 422 pounds (191 kg).

S 014-067

- (14) Disconnect the 3-10 link from the structure with these steps:

**NOTE:** The 3-10 link connects the flap carrier beam to the 1-3 main beam fitting assembly.

**WARNING:** MAKE SURE YOU HOLD THE AFT END OF THE FLAP CARRIER BEAM WHEN YOU DISCONNECT THE 3-10 LINK. THE AFT END OF THE FLAP CARRIER BEAM WILL MOVE DOWN WHEN YOU DISCONNECT THE 3-10 LINK. THIS CAN CAUSE INJURY TO PERSONS AND DAMAGE TO EQUIPMENT.

- (a) Remove the 3-10 link from the flap carrier beam (View F-F):
- 1) Remove the cotter pin, inner nut, washer and the inner pin.
  - 2) Cut and remove the lockwires between the outer nut and the tab washer.
  - 3) Remove the outer nut and tab washer from the outer pin.
  - 4) Hold the 3-10 link and remove the outer pin.
- (b) Remove the 3-10 link from the 1-3 main beam fitting assembly:
- 1) Remove the cotter pin, inner nut, washer and the inner pin.
  - 2) Cut and remove the lockwires between the outer nut and the tab washer.
  - 3) Remove the outer nut and tab washer from the outer pin.
  - 4) Remove the outer pin to remove the 3-10 link from the 1-3 main beam fitting assembly.

EFFECTIVITY

ALL

27-51-27

04

Page 423  
Aug 22/06

S 024-078

(15) Disconnect the 2-8 link from the structure with these steps:

**NOTE:** The 2-8 link connects the 6-9 link, main drive assembly, to the 1-3 main beam fitting assembly.

**WARNING:** PUT A WOOD BLOCK BETWEEN THE FORWARD END OF THE FLAP CARRIER BEAM AND THE 1-3 MAIN BEAM FITTING ASSEMBLY. THE FLAP CARRIER BEAM CAN MOVE DOWN, CAUSING INJURY TO PERSONS AND DAMAGE TO EQUIPMENT.

**WARNING:** MAKE SURE YOU HOLD THE AFT END OF THE FLAP CARRIER BEAM WHEN YOU DISCONNECT THE 2-8 LINK. THE AFT END OF THE FLAP CARRIER BEAM WILL MOVE DOWN WHEN YOU DISCONNECT THE 2-8 LINK. THIS CAN CAUSE INJURY TO PERSONS AND DAMAGE TO EQUIPMENT.

- (a) Disconnect the 2-8 link from the main beam fitting assembly at joint 2 with these steps (View C-C):
  - 1) Remove the cotter pin, inner nut, washer, and inner pin.
  - 2) Cut and remove the lockwires between the outer nut and the tab washer.
  - 3) Remove the outer nut, tab washer, washer, and outer pin.
- (b) Disconnect the 2-8 link from the 6-9 link, main drive assembly, at joint 8 with these steps (View B-B):
  - 1) Remove the cotter pin, inner nut, washer, and inner pin.
  - 2) Cut and remove the lockwires between the outer nut and the tab washer.
  - 3) Hold the inboard 2-8 link that is at the threaded end of the outer pin.
  - 4) Pull the outer pin only until you can remove the inboard 2-8 link near the threaded end of the pin.
  - 5) Hold the 5-8 link that is between the crank arm assembly and the 6-9 link, main drive assembly.
  - 6) Pull the outer pin only until you can remove the 5-8 link from the middle of the 6-9 link, main drive assembly.
  - 7) Hold the outboard 2-8 link and remove the outer pin.

TASK 27-51-27-424-079

5. Outboard Flap 2-8 and 3-10 Link - Installation

A. General

- (1) This task contains the steps to install the outboard flap 2-8 and 3-10 links (Fig. 401 and 402).

B. Equipment

- (1) Sling Equipment, Outboard TE Flap - A27027-53
- (2) TE Flaps PDU Lock - A27009-7
- (3) Shackles, 3/8 inch (9.525 mm) Diameter - Commercially Available.

710	Nose Landing Gear and Doors
730/740	Left/Right Main Landing Gear and Doors

F. Install the Outboard Flap 2-8 and 3-10 Link

S 864-080

- (1) Make sure the power is removed from the center hydraulic system (AMM 29-11-00/201).

S 844-081

- (2) Make sure the PDU lock is installed in the TE flap PDU (Fig. 403).

S 844-082

- (3) Make sure the outboard flap sling is attached to the hoist and is installed in tension at the three flap attach points.

S 414-069

- (4) Connect the 3-10 link to the structure with these steps:

**NOTE:** The 3-10 link connects the flap carrier beam to the 1-3 main beam fitting assembly.

- (a) Put the 3-10 link in its location on the 1-3 main beam fitting assembly (View C-C):

- 1) Install the outer pin that attaches the 3-10 link to the 1-3 main beam fitting assembly.

EFFECTIVITY

ALL

27-51-27

04

Page 425  
Aug 22/07

- 2) Install the washer, tab washer and outer nut on the outer pin.

NOTE: ON THE OUTBOARD LINKAGE;  
Use a maximum of 3 washers to get the necessary clearance (Fig. 402, sht. 2, f/n 6 and 7).

- 3) Tighten the outer nut to 1900–2600 pound-inches (214.6–293.7 newton-meters) on the inboard linkage or 1500–2000 pound-inches (169.4–226.0 newton-meters) on the outboard linkage and install a lockwire between the nut and the tab washer at two locations (AMM 20-10-23/401).
  - 4) Install the inner pin in the outer pin with the washer and inner nut.
  - 5) Tighten the inner nut to 510–840 pound-inches (57.7–94.9 newton-meters) on the inboard linkage or to 300–500 pound-inches (33.9–56.4 newton-meters) on the outboard linkage, and install the cotter pin.
- (b) Put the 3-10 link in its location on the flap carrier beam (View F-F):
- 1) Install the outer pin that attaches the 3-10 link to the flap carrier beam.
  - 2) ON THE INBOARD LINKAGE;  
Install the washer, tab washer and outer nut on the outer pin.

NOTE: Use a maximum of 3 washers to get the necessary clearance (Fig. 401, sht. 3, f/n 6).

- 3) ON THE OUTBOARD LINKAGE;  
Install the tab washer and outer nut on the outer pin.
- 4) Tighten the outer nut to 2800–3500 pound-inches (316.5–395 newton-meters) on the inboard linkage or to 1500–2000 pound-inches (170.0–225.9 newton-meters) on the outboard linkage.
- 5) Install lockwires between the outer nut and the tab washer at two locations (AMM 20-10-23/401).
- 6) Install the inner pin in the outer pin with the washer and inner nut.

NOTE: ON THE OUTBOARD LINKAGE;  
Use a maximum of 3 washers (Fig. 402, sht. 3, f/n 7).

- 7) Tighten the inner nut to 800–1500 pound-inches (90.4–169.4 newton-meters) on the inboard linkage, or to 300–500 pound-inches (33.9–56.4 newton-meters) on the outboard linkage, and install the cotter pin.

S 414-070

- (5) Connect the 2-8 link to the structure with these steps:

**NOTE:** The 2-8 link connects the 6-9 link, main drive assembly, to the 1-3 main beam fitting assembly.

- (a) Put the outboard 2-8 link in its location on the 6-9 link, main drive assembly (View B-B):
- 1) Install the outer pin through the 2-8 link, but not fully through the 6-9 link, main drive assembly.
  - 2) Put the outboard 5-8 link in its location on the 6-9 link, main drive assembly (View B-B).
  - 3) Push the outer pin through the 5-8 link, and fully through the 6-9 link, main drive assembly.
- (b) Put the inboard 2-8 link in its location on the outer pin on the 6-9 link, main drive assembly (View B-B):
- 1) Install the tab washer and nut on the outer pin.
  - 2) Tighten the outer nut to 1500-2000 pound-inches (169.5-225.9 newton-meters) on the outer linkage or to 1900-2600 pound-inches (214.7-293.7 newton-meters) on the inner linkage and install the lockwire between the nut and the tab washer at two locations (AMM 20-10-23/401).
  - 3) Install the inner pin in the outer pin with the washer and inner nut.
  - 4) Tighten the inner nut to 510-840 pound-inches (57.7-94.9 newton-meters) (inboard and outboard linkages) and install the cotter pin.
- (c) Put the inboard and outboard 2-8 links in their locations on the 1-3 main beam fitting assembly (View C-C):
- 1) Push the outer pin through the outboard 2-8 link, the 1-3 main beam fitting assembly and the inboard 2-8 link.
  - 2) Install the tab washer and nut on the outer pin.
  - 3) Tighten the outer nut to 1500-2000 pound-inches (169.5-225.9 newton-meters) on the outer linkage or to 1900-2600 pound-inches (214.7-293.8 newton-meters) on the inner linkage and install the lockwire between the nut and the tab washer at two locations (AMM 20-10-23/401).
  - 4) Install the inner pin in the outer pin with the washer and inner nut.
  - 5) Tighten the inner nut to 510-840 pound-inches (57.7-94.9 newton-meters) (inboard and outboard linkages) and install the cotter pin.

S 844-083

- (6) Remove the sling from the main flap and install the bolts to the flap with sealant.

TE FLAP AFT QUADRANT AND LOAD ALLEVIATION ACTUATOR - REMOVAL/INSTALLATION

1. General

- A. This procedure contains the removal and the installation tasks for the load alleviation actuator and the flap aft quadrant.

TASK 27-51-30-024-001

2. The Flap Load Relief Actuator and the Flap Aft Quadrant - Removal

A. General

- (1) This task contains the removal procedure for the flap load relief actuator and the flap aft quadrant. Because this task contains two procedures, only do the applicable procedure to remove the component.

To start one of these procedures, do the steps in the "Prepare for the Removal" topic, then do the applicable group of steps to remove the component.

B. Equipment

- (1) Circuit Breaker Lockout Clip - 1012LC-R  
Commercially Available  
(2) LE Slat Groundlock - A27007-1 (2 Necessary)  
(3) TE Flap PDU Lock - A27009-7

  - 511BB LE Slat Power Drive Unit - Outboard (Left)
  - 611BB LE Slat Power Drive Unit - Inboard (Right)

E. Prepare for the Removal

S 214-002

- (1) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

S 494-003

**WARNING:** USE THE TASK IN AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Open the doors for the landing gear and install the door locks (AMM 32-00-15/201).

S 864-004

- (3) Supply electrical power (AMM 24-22-00/201).

S 214-005

- (4) Make sure the flaps and slats are in the fully retracted position.

S 214-006

- (5) Make sure the flap control lever is in the zero (FLAPS UP) detent.

S 494-007

- (6) Attach a DO-NOT-OPERATE tag to the flap control lever.

S 864-008

- (7) Remove power from the center hydraulic system (AMM 29-11-00/201).

S 494-009

- (8) Install the PDU lock in the TE flap power drive unit (PDU) (Fig. 404).

S 014-010

- (9) Open the access doors, 511BB and 611BB, to get access to the outboard and inboard slat PDUs (AMM 06-44-00/201).

S 494-011

- (10) Install the groundlocks in the inboard and outboard slats PDUs (Fig. 405).

S 864-012

- (11) Open this circuit breaker on the main power distribution panel, P6, and attach a DO-NOT-CLOSE tag:
  - (a) 6D24, ALTN FLAP PWR

EFFECTIVITY

ALL

27-51-30

01

Page 410  
Apr 22/01

S 864-013

- (12) Open these circuit breakers on the P6 panel and install circuit breaker locks:
- (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6F24, ALTN SLAT OUTBD PWR

S 864-014

- (13) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
- (a) 11J13, FLAP LOAD RELIEF
  - (b) 11J24, FLAPS ALTN CONT

S 864-015

- (14) Open these circuit breakers on the P11 panel and install circuit breaker locks:
- (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD

F. Remove the Flap Load Relief Actuator (Fig. 401)

S 034-016

- (1) Disconnect the electrical connector on the flap load relief actuator.

S 034-017

- (2) Disconnect the bonding jumper (if installed) from the flap load relief actuator.

S 034-018

- (3) Disconnect the bolts that connect the actuator to the bellcrank and the support structure (Detail A).

S 024-019

- (4) Remove the flap load relief actuator from the airplane.

G. Remove the Flap Aft Quadrant

S 014-020

- (1) Remove the access panels on the forward wall of the aft cargo compartment (AMM 25-52-01/401).

S 034-021

- (2) Loosen the WFA and WFB cables at the STA 1072 and STA 1069 turnbuckles, at the forward wall of the aft cargo compartment (Fig. 403).

**NOTE:** Install an identification tag to each cable. Apply tension to the cables if it is necessary to keep them engaged on the pulleys.

EFFECTIVITY

ALL

27-51-30

Dec 22/05

- S 034-022
- (3) Remove the two quadrant cotter pins, and disconnect the cables from the flap aft quadrant.
- S 034-023
- (4) At the aft wall of the right MLG wheel well, disconnect the bolt that connects the rod to the aft quadrant crank (Detail A, Fig. 401).
- S 034-024
- (5) Remove the nut and washer that hold the aft quadrant crank to the aft quadrant shaft (View A-A).
- S 034-025
- (6) Remove the crank from the quadrant shaft.
- S 034-026
- (7) Disconnect the three screws and washers and remove the forward bearing retainer.
- S 034-027
- (8) In the aft cargo compartment, move the flap aft quadrant to the aft direction, and out of the support bearings.
- S 024-028
- (9) Remove the flap aft quadrant from the airplane.
- S 034-029
- (10) Remove the bearings, seal, and spacer if it is necessary.

TASK 27-51-30-424-030

3. The Flap Load Relief Actuator and the Flap Aft Quadrant - Installation

A. General

- (1) This task contains the installation procedure for the flap load relief actuator and the flap aft quadrant. Because this task contains two different installation procedures, only do the applicable procedure to install the component.

To start one of these procedures, do the applicable group of steps to install the component. Then do the applicable tests and the "Put the Airplane Back to Its Usual Condition" group of steps.

B. Equipment

- (1) LE Slat Groundlock - A27007-1 (2 Necessary)
- (2) TE Flap PDU Lock - A27009-7
- (3) Auxiliary Detent, Flap Adjustment Assy - A27105-9
- (4) Rig Pins from Set A20004-XX (Ref 20-10-24):
- (a) LE1 - P/N A20004-17
  - (b) TE1 - P/N A20004-9

Page 413  
Aug 22/07

- S 214-033
- (3) Make sure the power is removed from the center hydraulic system (AMM 29-11-00/201).
- S 494-034
- (4) Remove the plug from the input cam rig pin hole in the TE flap power drive unit (PDU), and install rig pin TE1 (Detail B).
- S 224-035
- (5) Make sure the distance between the centers of the actuator bolt holes is correct as shown (Detail A).
- NOTE: Do not adjust the length of the actuator rod end.
- S 434-036
- (6) Connect the actuator to the support structure with the bolt, washer, and locknut. Tighten the nut.
- S 214-037
- (7) Make sure you can freely install the bolt that connects the actuator to the bellcrank.
- S 434-038
- (8) If you cannot easily install the bolt that connects the actuator to the bellcrank, do these steps:
- (a) Disconnect the adjustable control rod from the pilot input arm on the TE flap PDU.
  - (b) Turn the bell crank as necessary to connect the actuator to the bellcrank.
- S 434-039
- (9) Connect the actuator to the bellcrank with the bolt, locknut, and washer.
- S 434-040
- (10) If the adjustable control rod was disconnected from the pilot input arm, connect the control rod to the arm with these steps:
- (a) Make sure that rig pin TE1 is installed in the TE flap PDU (Detail B).
  - (b) Adjust the length of the adjustable control rod until you can easily connect the rod to the pilot input arm with the bolt.
  - (c) Connect the adjustable control rod to the pilot input arm.
  - (d) Tighten the jamnut on the adjustable rod and install a lockwire with the double twist procedure (AMM 20-10-23/401).
- S 094-041
- (11) Remove rig pin TE1 from the TE flap PDU.

Dec 22/05

S 434-042

- (12) Connect the electrical connector to the flap load relief actuator.

S 434-043

- (13) Install the bonding jumper to the actuator bonding plate (if installed). See View B-B on Figure 401. Seal bonding jumper terminal and fastener with BMS 5-142 or BMS 5-95.

NOTE: If the actuator to be installed does not have a bonding plate, remove the jumper (if installed) or secure the free end so as to prevent contact with adjacent structure.

NOTE: Make sure the electrical resistance is not more than 0.005 ohms from the bonding plate to the structure (AMM 20-10-21/601).

S 864-044

- (14) Remove the circuit breaker locks and DO-NOT-CLOSE tags and close these circuit breakers on the main power distribution panel, P6:
- (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6D24, ALTN FLAP PWR
  - (c) 6F24, ALTN SLAT OUTBD PWR

S 864-045

- (15) Remove the circuit breaker locks and DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel, P11:
- (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD
  - (c) 11J13, FLAP LOAD RELIEF
  - (d) 11J24, FLAPS ALTN CONT

S 864-046

- (16) Supply electrical power (AMM 24-22-00/201).

S 224-047

- (17) Make sure the dimension between the centers of the actuator attachment bolts is correct as shown (Detail A, Fig. 401).

S 964-048

- (18) If the dimension between the two bolts is more than the permitted tolerance, replace the flap load relief actuator.

S 214-049

- (19) Make sure you can easily remove and install rig pin TE1 in the rig pin hole on the TE flap PDU (Detail B, Fig. 401).

S 824-050

- (20) If you cannot easily remove and install rig pin TE1, adjust the length of the adjustable control rod connected to the pilot input arm.

S 094-051

- (21) Remove rig pin TE1 and install the plug in the input cam rig pin hole on the TE flap PDU.

S 094-052

- (22) Remove the DO-NOT-OPERATE tag from the flap control lever.

S 724-053

- (23) Do the installation test for the flap load relief actuator with the instructions in the "Installation Test" topic.

S 734-054

- (24) Do the system test for the flap load Alleviation System (AMM 27-51-00/501, "Test for the Flap Load Alleviation System").

G. Install the Flap Aft Quadrant (Fig. 401)

S 214-055

- (1) Make sure the flaps and slats are in the fully retracted position, and that the flap control lever is in the zero (FLAPS UP) detent.

S 214-056

- (2) Make sure the flap and slat primary (hydraulic) and alternate (electric) drives are off.

NOTE: Refer to the "Prepare for the Removal" paragraph for instruction if it is necessary.

S 214-057

- (3) Make sure the power is removed from the center hydraulic system (AMM 29-11-00/201).

S 224-058

- (4) Make sure the distance between the centers of the actuator bolt holes is correct as shown (Detail A).

NOTE: Do not adjust the length of the actuator rod end.

S 644-059

- (5) Apply grease to the inner and outer diameters of the aft support bearing, and install the bearing in the fitting at the forward wall of the aft cargo compartment (View A-A).

- S 434-060
- (6) Install the seal in the fitting.
- S 434-061
- (7) Put the aft quadrant shaft through the seal and the support bearings, from the aft cargo compartment side.
- S 434-062
- (8) Install the spacer around the aft quadrant shaft in the fitting , from the aft wall of the right MLG wheel well.
- S 214-063
- (9) Make sure the seal is in the correct position (View A-A).
- S 644-064
- (10) Apply grease to the inner and outer diameters of forward support bearing, and put the bearing around the aft quadrant shaft in the fitting.
- S 434-065
- (11) Install the forward bearing retainer with three screws and washers. Tighten the screws.
- S 644-066
- (12) Apply grease to the splines on the aft quadrant shaft.
- S 434-067
- (13) Engage the aft quadrant crank in the shaft splines, and install the nut and washer to the shaft. Tighten the nut.
- S 434-068
- (14) Connect the rod to the aft quadrant crank with the bolt, locknut, and washer (Detail A). Tighten the locknut.
- S 034-070
- (15) Remove the bolt, nut, and washer that connect the adjustable control rod to the pilot input arm on the TE flap PDU (Detail B).
- NOTE:** This is necessary for the subsequent adjustment.
- S 434-069
- (16) Remove the identification tags and connect the WFA and WFB cables to the aft quadrant with the two cotter pins (Fig. 403).
- S 094-071
- (17) Remove the DO-NOT-OPERATE tag from the flap control lever.

S 484-112

- (18) Install the tool (auxiliary detent assembly) on the flap detent plate.

S 864-114

- (19) Move the flap control lever to the auxiliary detent, which is 2 degrees aft of the zero (FLAPS UP) detent.

**NOTE:** Using the auxiliary detent is the same as the aft edge of the flap control lever pawl set 0.15 to 0.16 inch (3.81-4.06 mm) aft of the aft upper edge of the zero (flaps up) detent.

S 494-073

- (20) Install rig pin LE1 in the slat aft quadrant (Detail C, Fig. 401).

S 494-074

- (21) Install a clamp to hold the flap aft quadrant crank against the upstop (Detail A, Fig. 401).

**NOTE:** Make sure the upstop is clean before you install the clamp.

S 824-075

- (22) Use a tensiometer and adjust the WFA and WFB cables to the rigging loads given in temperature-tension table (Fig. 402).

S 094-076

- (23) Remove the clamp on the upstop of the aft quadrant crank (Detail A, Fig. 401).

S 094-077

- (24) Remove rig pin LE1 from the slat aft quadrant (Detail C, Fig. 401).

S 084-113

- (25) Remove the tool (auxiliary detent assembly) from the flap detent plate.

S 984-078

- (26) Lightly shake the WFA and WFB cables to remove the friction from the cables and to release the tension in the components, and do these checks:

- (a) Make sure the flap control lever stays at 0.15 to 0.16 inch (3.81-4.06 mm) aft of the zero detent, measured on the control stand lightplate.  
(b) Make sure the flap aft quadrant crank touches the upstop

**NOTE:** It is not necessary to apply force against the upstop.

S 864-101

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

(6) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 864-102

(7) Move the flap control lever to the 20-unit detent and make sure the flaps move to the 20-degree position, and the slats move to the intermediate position.

S 864-103

(8) Move the flap control lever to the 30-unit detent, and make sure the flaps and slats move to the fully extended position.

S 864-104

(9) Move the flap control lever to the zero (FLAPS UP) detent, and make sure the flaps and slats move to the fully retracted position.

S 414-105

(10) Install the access panels on the forward wall of aft cargo compartment (AMM 25-52-01/401).

I. Put the Airplane Back to Its Usual Condition

S 414-106

(1) Install the access panels, 511BB and 611BB, for the outboard and inboard slat PDUs (AMM 06-44-00/201).

S 094-107

**WARNING:** USE THE TASK IN AMM 32-00-15/201 TO REMOVE THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

(2) Remove the door locks from the landing gear doors and close the doors (AMM 32-00-15/201).

TE FLAP PDU CONTROL VALVE MODULE AND BYPASS VALVE – MAINTENANCE PRACTICES

1. General

- A. This procedure contains the removal and the installation tasks for the components on the trailing edge (TE) flap power drive unit (PDU).

TASK 27-51-32-022-001

2. Remove the Components for the TE Flap PDU

A. General

- (1) This task contains the removal procedure for these components on the TE flap PDU:

- the Control Valve Module
- the Bypass Valve
- the Rotary Actuator for the Bypass Valve.

Because this task contains three procedures, do the steps in the "Prepare for the Removal", then do the applicable group of steps to remove the component.

B. Equipment

- (1) Circuit Breaker Lockout Clip – 1012LC-R  
Commercially available
- (2) Rig pins from Set A20004-XX (AMM 20-10-24/201):
- (a) TE1 – P/N A20004-9
  - (b) TE2 – P/N A20004-9

C. References

E. Prepare for the Removal

S 212-002

- (1) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

S 492-003

**WARNING:** USE THE TASK IN AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Install the door locks on the landing gear doors (AMM 32-00-15/201).

S 212-004

- (3) Make sure the TE flaps and LE slats are fully retracted and the flap control lever is in the zero (FLAPS UP) detent.

S 492-005

- (4) Install a DO-NOT-OPERATE tag on the flap control lever.

S 862-006

- (5) Remove the pressure from the center hydraulic system and reservoir (AMM 29-11-00/201).

S 862-007

- (6) Open this circuit breaker on the main power distribution panel, P6, and attach a DO-NOT-CLOSE tag:  
(a) 6D24, ALTN FLAP PWR

S 862-008

- (7) Open these circuit breakers on the P6 panel and install circuit breaker locks:  
(a) 6D21, ALTN SLAT INBD PWR  
(b) 6F24, ALTN SLAT OUTBD PWR

- S 862-009
- (8) Open this circuit breaker on the overhead panel, P11, and attach a DO-NOT-CLOSE tag:
- (a) 11J24, FLAPS ALTN CONT
- S 862-010
- (9) Open these circuit breakers on the P11 panel and install circuit breaker locks:
- (a) 11H23, SLAT ALTN CONT INBD
- (b) 11H24, SLAT ALTN CONT OUTBD
- F. Remove the Control Valve Module (Fig. 201)
- S 032-011
- (1) Remove the button plugs (press fit) from the rig pin holes (use a screwdriver or any handtool to pry off plugs).
- S 492-116
- (2) Install the rig pins TE1 (16) and TE2 (15).
- S 032-012
- (3) Disconnect the electrical connector (14) from the control valve module (12) at the bypass valve (1).
- S 032-013
- (4) Disconnect the rod (2) from the control valve input arm (6).
- S 032-014
- (5) Disconnect the hydraulic lines (7) and (8) from the control valve module (12).
- S 032-015
- (6) Disconnect the three tube assemblies (9, 10, and 11) from the control valve module (12).
- S 492-016
- (7) Install plugs in the hydraulic lines and caps in the open ports of the control valve module (12).

EFFECTIVITY

ALL

27-51-32

02

Page 210  
Apr 22/06

S 022-017

- (8) Remove the bolts (20 and 26), and remove the control valve module (12).

G. Remove the Bypass Valve (Fig. 201)

S 492-018

- (1) Remove the button plugs from the rig pin holes (you can use a screwdriver or any handtool to pry off plugs).

S 492-115

- (2) Install the rig pins TE1 (16) and TE2 (15).

S 032-019

- (3) Disconnect the electrical connector (14) from the bypass valve (1).

S 032-020

- (4) Remove the four bolts and washers (27 and 28) from the mounting flange (13).

S 022-021

- (5) Remove the bypass valve (1).

S 492-022

- (6) Install a cover on the mounting surfaces of the control valve module (12) and the bypass valve (1).

H. Remove the Rotary Actuator for the Bypass Valve (Fig. 202)

S 032-023

- (1) Disconnect the electrical connector from the rotary actuator.

S 032-024

- (2) Remove the four bolts.

S 022-025

- (3) Remove the rotary actuator and the pin lock.

EFFECTIVITY

ALL

27-51-32

02

Page 211  
Apr 22/06

S 492-026

- (4) Install a cover on the mounting surfaces of the housing assembly and the rotary actuator.

TASK 27-51-32-422-027

3. Install the Components for the TE Flap PDU

A. General

- (1) This task contains the installation procedure for these components:

- the Control Valve Module
- the Bypass Valve
- the Rotary Actuator for the Bypass Valve.

Because this task contains three procedures, do the steps in the "Prepare for the Installation" before you do the applicable group of steps to install the component. Then do the "Put the Airplane Back to Its Usual Condition" group of steps.

B. Equipment

- (1) LE Slat PDU Locks - A27007-1 (2 Necessary)
- (2) TE Flap Torque Tube Clamp - A27099-1 (2 clamps in set)
- (3) Rig pins from Set A20004-XX (AMM 20-10-24/201):
  - (a) TE1 - P/N A20004-9
  - (b) TE2 - P/N A20004-9
  - (c) TE3 - P/N A20004-73
- (4) Rotary Stainless Steel Brush

**NOTE:** Do not use for heavy oxide particles on aluminum.

F. Access

(1) Location Zones

144	MLG Wheel Well (Right)
211/212	Control Cabin
510/610	Wing Leading Edge
710	Nose Landing Gear and Doors
730/740	Main Landing Gear and Doors

(2) Access Panels

511BB	LE Slat Power Drive Unit - Outboard (Left)
611BB	LE Slat Power Drive Unit - Inboard (Right)

G. Prepare for the Installation

S 212-028

- (1) Make sure the pressure is removed from the center hydraulic system (AMM 29-11-00/201).

S 212-030

- (2) Make sure the flap and slat alternate drives are off.

EFFECTIVITY

ALL

27-51-32

01

Page 213  
Apr 22/08

S 212-029

- (3) Make sure the TE flaps and LE slats are fully retracted and the flap control lever is in the zero (FLAPS UP) detent.

H. Install the Control Valve Module (Fig. 201)

S 032-031

- (1) Remove the button plugs (press fit) from the rig pin holes (use a screwdriver or any handtool to pry off plugs).

S 492-114

- (2) Install the rig pins TE1 (16) in the input cam rig pin hole and TE2 (15) in the follow up-cam rig pin hole (Fig. 201).

S 102-033

- (3) Clean the grounding points on the control valve module with a rotary stainless steel brush.

S 642-034

- (4) Apply a thin layer of grease to all surfaces of the bolts (20 and 26) and bushings (21 and 25).

S 212-035

- (5) Make sure the electric bonding points stay clean and free of grease.

S 422-036

- (6) Install the control valve module (12) on the TE flap PDU (29).
  - (a) Align the connection points for the control valve module (12).
  - (b) Install a bolt (20), washer (24), bushing (21), washer (23) and nut (22).
  - (c) Install a bolt (26), washer (24), bushing (25), washer (23) and nut (22).

S 092-037

- (7) Remove the caps from the ports of the control valve module (12) and the plugs from the hydraulic lines.

EFFECTIVITY

ALL

27-51-32

03

Page 214  
Apr 22/06

- S 212-038
- (8) Make sure the control valve module (12) is filled with hydraulic fluid.
- S 432-039
- (9) Connect the tube assemblies (9, 10, and 11) and the hydraulic lines (7 and 8) to the control valve module (12).
- S 642-040
- (10) Lightly apply Skydrol assembly lube or hydraulic fluid to the packing O-rings and fittings before you install them.
- S 432-041
- (11) Connect the electrical connector (14) to the bypass valve (1).
- S 432-042
- (12) Connect the rod (2) to the control valve input arm (6).
- S 932-043
- (13) Make marks on the torque tubes (19) and the adjacent airplane structure, to align the torque tubes with the adjacent structure, on each side of the TE flap PDU (29).

**NOTE:** These marks will show if the torque tube moved away from the retracted position after the torque tubes are disconnected.

- S 492-044
- (14) Use a support on the TE flaps at the trailing edge, and install a clamp on the torque tubes adjacent to the TE flap PDU (Fig. 205).

**NOTE:** A support is necessary to hold the weight of the flap's trailing edge. The weight of the flaps can cause the disconnected torque tubes to turn and cause flap asymmetry or disagreement problems.

- S 032-045
- (15) Disconnect the torque tubes (19) from each side of the TE flap PDU (29).

**NOTE:** Do not turn the torque tubes. It will be necessary to adjust the flap drive system if you turn the torque tube while disconnected.

EFFECTIVITY

ALL

27-51-32

03

Page 215  
Apr 22/06

S 822-046

- (16) Adjust the TE flap PDU to a hydraulic null, with these steps:
- (a) Remove the access panels, 511BB and 611BB, to get access to the outboard and inboard slat PDUs (AMM 06-44-00/201).
  - (b) Move the manual override lever on the bypass valves of the inboard and outboard LE slat PDUs to the No. 1 (bypass) position (AMM 27-81-11/401).
  - (c) Install a DO-NOT-OPERATE tag on the manual override levers.
  - (d) Install groundlocks in the inboard and outboard LE slat PDUs (Fig. 204).
  - (e) At the TE flap PDU, make sure you can connect the adjustable control rod to the pilot input arm (17), such that the bolt and rig pin TE1 (16) get in easily in the holes.
  - (f) Adjust the control rod if it is necessary.
  - (g) Tighten the jamnuts on the adjustable control rod and safety them with a wire.
  - (h) Connect the adjustable control rod to the pilot input arm (17) with a bolt, washer, and nut.
  - (i) Remove rig pin TE1 (16).
  - (j) Install the button plug in the rig pin hole.
  - (k) Open this circuit breaker on the overhead panel, P11, and attach a DO-NOT-CLOSE tag:
    - 1) 11J14, FLAPS SHUTOFF

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (L) Pressurize the center hydraulic system (AMM 29-11-00/201), and permit the TE flap PDU to become stable in the retracted position.

**NOTE:** It is usual for the output shaft on the PDU to turn when you pressurize the center hydraulic system.

EFFECTIVITY

ALL

27-51-32

03

Page 216  
Apr 22/06

- (m) Make sure that rig pin TE2 (15) gets in easily in the follow-up cam rig pin hole (FIG. 201).
- (n) Do these steps, to adjust the PDU to a mechanical and hydraulic null, only if you cannot install rig pin TE2 (15) easily into the rig pin hole:
  - 1) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).
  - 2) Disconnect the rod (2) from the control unit output arm (30).

NOTE: You will release the fluid pressure lock in the control valve when you disconnect the rod from the output arm. This will permit you to turn the output shaft to find the rig pin hole for rig pin TE2.

- 3) Turn the output shaft on the PDU by small increments, until the rig pin TE2 (15) gets in easily in the cam rig pin hole (FIG. 201).
- 4) Connect the rod (2) to the control unit output arm (30).
- 5) Try to install rig pin TE3 (18) in the rig pin hole on the control valve module input arm (6).
- 6) If you cannot install rig pin TE3 fully and easily, adjust the length of the rod (2) with these steps:
  - a) Loosen the jamnuts at each end of the rod (2).
  - b) Turn the rod to adjust the rod length, until you can easily install rig pin TE3 (18).

NOTE: The usual length of the rod before the last adjustment is 6.56 inches (166.62 mm).

- c) Tighten the jamnuts on the rod (2), but do not safety with a lockwire at this time.

NOTE: It is possible that you will adjust the rod again during the hydraulic null adjustment.

EFFECTIVITY

ALL

27-51-32

03

Page 217  
Apr 22/06

 **BOEING**  
767  
MAINTENANCE MANUAL

7) Remove rig pins TE2 (15) and TE3 (18).

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

8) Pressurize the center hydraulic system (AMM 29-11-00/201) and permit the PDU to become stable in the fully retracted position.

**NOTE:** It is usual for the output shaft to turn when you pressurize the center hydraulic system.

**CAUTION:** DO NOT DISCONNECT THE ROD (2) TO DO THE ROD ADJUSTMENT WHILE THE CENTER HYDRAULIC SYSTEM IS PRESSURIZED. DO NOT TURN THE ROD (2) WITH RIG PIN TE2 (15) INSTALLED. ADJUST THE ROD (2) ONLY BY SMALL INCREMENTS TO PREVENT DAMAGE TO THE TE FLAP PDU.

9) Try to install rig pin TE2 (15) in the follow-up cam rig pin hole.

10) If rig pin TE2 (15) can not get in easily in the rig pin hole, adjust the rod (2) with these steps:

**NOTE:** Do not adjust the rod (2) while rig pin TE2 (15) is installed. Have rig pin TE2 (15) installed only to make sure that the rod (2) is adjusted correctly.

11) Loosen the jamnut at each end of the rod (2).

EFFECTIVITY

ALL

27-51-32

03

Page 218  
Apr 22/06

- 12) Turn the rod (2) to adjust the length until you can easily install rig pin TE2 (15).

NOTE: It is not necessary to install rig pin TE3 (18) for this adjustment.

- 13) Tighten the jamnut on each end of the rod (2).
- 14) Safety the jamnuts on the rod (2) with lockwires.

S 862-047

- (17) Remove pressure from the center hydraulic system (AMM 29-11-00/201).

S 092-108

- (18) Remove rig pin TE2 (15).

S 492-113

- (19) Install the button plug in the rig pin hole.

S 092-048

- (20) Remove the groundlocks from the inboard and outboard LE slat PDUs (Fig. 204).

S 862-049

- (21) Move the manual override levers on the bypass valves on the inboard and outboard LE slat PDUs to the No. 2 (normal) position.

S 212-051

- (22) Examine the marks that you made between the torque tubes (19) and the adjacent airplane structure, and do these checks:

- (a) If the marks align, remove the clamps from the torque tubes (19) and connect them to the PDU (29).

NOTE: Do not turn the torque tubes (19) more than 1/2 spline tooth to connect them to the PDU (29). If the torque tubes turn too much, TE flap disagree and asymmetry problems can occur. The flap mechanism can move very slowly when the torque tubes are disconnected from the PDU. Connect the torque tubes quickly when the torque tube clamps are removed.

- (b) If the marks do not align or do not show, do these steps:
  - 1) Remove the torque tube clamps from the torque tubes (19).
  - 2) Move the torque tubes (19) on each side of the PDU (29) manually, or with an air motor, to the fully retracted position.
  - 3) Do a check on the retract overtravel stop clearance at the rotary actuator crank arms (AMM 27-51-00/501).

EFFECTIVITY

ALL

27-51-32

03

Page 219

  - 611BB LE Slat Power Drive Unit - Inboard (Right)

D. Adjust the TE Flap PDU

S 212-079

- (1) Make sure the TE flaps and LE slats are in the fully retracted position, and the flap control lever is in the zero (FLAPS UP) detent.

S 092-080

- (2) Remove the DO-NOT-OPERATE tag from the flap control lever.

S 862-081

- (3) Supply electrical power (AMM 24-22-00/201).

S 862-082

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (4) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 862-083

- (5) Move the flap control lever to the 30-unit detent, and make sure the TE flaps and LE slats move to the fully extended position.

S 862-084

- (6) Move the flap control lever back to the zero (FLAPS UP) detent, and make sure the TE flaps and LE slats move to the fully retracted position.

S 492-085

- (7) Install a DO-NOT-OPERATE tag on the flap control lever.

S 862-086

- (8) Remove power from the center hydraulic system (AMM 29-11-00/201).

- S 492-088
- (10) Install groundlocks in the inboard and outboard slat PDUs (Fig. 204).
- S 822-089
- (11) If it is necessary, adjust the control rod attached to the pilot input arm (17), until you can easily install rig pin TE1 (16) in the rig pin hole for the PDU input cam.
- S 092-090
- (12) Remove rig pin TE1 (16) and install a plug in the rig pin hole.
- E. Test of the TE Flap PDU
- S 092-091
- (1) If it is installed, remove the DO-NOT-OPERATE tag from the flap control lever.
- S 092-092
- (2) If it is installed, remove the PDU lock from the TE flap PDU (Fig. 203).
- S 092-093
- (3) If they are installed, remove the groundlocks from the inboard and outboard slat PDUs (Fig. 204).
- S 862-094
- (4) Remove the circuit breaker locks and the DO-NOT-CLOSE tags, and close these circuit breakers on the main power distribution panel, P6:
- (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6D24, ALTN FLAP PWR
  - (c) 6F24, ALTN SLAT OUTBD PWR
- S 862-095
- (5) Remove the circuit breaker locks and the DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel, P11:
- (a) 11H23, SLAT ALTN CONT INBD

S 862-096

- (6) Make sure the position selector switch for the flap and slat alternate drive is in the NORM detent.

S 862-097

- (7) Supply electrical power (AMM 24-22-00/201).

S 862-101

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOLLERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (8) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 702-102

- (9) Do these steps to do a test of the TE Flap PDU:
  - (a) Make sure that no messages show on the EICAS display.
  - (b) Make sure the amber TRAILING EDGE light, on the P3 panel, is not on.
  - (c) Move the flap control lever to the 20-unit detent and do these checks:
    - 1) Make sure the LE slats move to the intermediate position.
    - 2) Make sure the TE flaps move to the 20-degree position.
    - 3) Make sure no messages show on the EICAS display.
    - 4) Make sure the amber TRAILING EDGE light, on the P3 panel, does not come on.
  - (d) Move the flap control lever to the 30-unit detent and do these checks:
    - 1) Make sure the TE flaps and LE slats move to the fully extended position.
    - 2) Make sure no messages show on the EICAS display.

EFFECTIVITY

ALL

- 3) Make sure the amber TRAILING EDGE light, on the P3 panel, does not come on.
- (e) Move the flap control lever to the zero (FLAPS UP) detent and do these checks:
  - 1) Make sure the TE flaps and LE slats move to the fully retracted position.
  - 2) Make sure no messages show on the EICAS display.
  - 3) Make sure the amber TRAILING EDGE light, on the P3 panel, does not come on.
- (f) Make sure the position selector switch for the flap/slat alternate drive on the first officer's main instrument panel, is in the NORM detent.
- (g) Push the arming switch for the flap alternate drive, in the flight compartment, to arm the flap alternate drive (ALTN switch light comes on), and do these checks:
  - 1) Make sure the amber TRAILING EDGE light, on the P3 panel, comes on after approximately seven seconds.
  - 2) Make sure the TE FLAP DISAGREE message comes on the EICAS display after seven seconds.
- (h) Move the flap control lever to the 20-unit detent, and do these checks:
  - 1) Make sure the TE flaps stay in the fully retracted position.
  - 2) Make sure the LE slats move to the intermediate position.
- (i) Move the flap control lever to the zero (FLAPS UP) detent, and do this check:
  - 1) Make sure the LE slats move to the fully retracted position.
- (j) Push the arming switch for the flap alternate drive to disarm the flap alternate drive (ALTN switch light goes off), and do these checks:
  - 1) Make sure the amber TRAILING EDGE light, on the P3 panel, goes off.
  - 2) Make sure the TE FLAP DISAGREE message does not show on the EICAS display.
- (k) Move the flap control lever to the 20-unit detent, and do these checks:
  - 1) Make sure the LE slats move to the intermediate position.
  - 2) Make sure the TE flaps move to the 20-degree position.

Page 226  
Apr 22/06

(L) Move the flap control lever to the zero (FLAPS UP) detent, and do this check:

- 1) Make sure the TE flaps and LE slats move to the fully retracted position.

S 212-109

- (10) Make sure there are no leaks at the hydraulic connections to the TE flap PDU.

S 012-110

- (11) Open the access door, 119AL, to get access to the main equipment center (AMM 06-41-00/201).

S 742-111

- (12) Operate the test switch on the front panel of the flap/slat electronics unit (FSEU) at the E2 equipment rack, and look for a no-fault indication.

F. Put the Airplane Back to Its Usual Condition

S 092-112

- (1) If installed, remove the PDU lock from the TE flap PDU (Fig. 203).

S 092-115

- (2) If installed, remove the groundlocks from the inboard and outboard slat PDUs (Fig. 204).

S 862-103

- (3) Remove pressure from the center hydraulic system (AMM 29-11-00/201).

S 862-104

- (4) Remove the electrical power if it is not necessary (AMM 24-22-00/201).

S 412-114

- (5) Close the access door, 119AL, for the main equipment center (AMM 06-41-00/201).

S 412-105

- (6) Install the access panels, 511BB and 611BB, to close the access to the outboard and inboard slat PDUs (AMM 06-44-00/201).

S 612-106

- (7) Do the servicing steps to the reservoir of the center hydraulic system (AMM 12-12-01/301).

B. Access

- (1) Location Zones
  - 144 MLG Wheel Well (Right)
  - 710 Nose Landing Gear and Doors

C. Do the Trailing Edge Flap Bypass Check

S 866-005

- (1) Do the step that follows to use electrical power to extend the flaps:

- (a) Do this task: Extend the trailing edge flaps with alternate power (AMM 27-51-00/201).

NOTE: Alternate power is electrical power.

S 866-006

- (2) Do the step that follows to use electrical power to retract the flaps:

- (a) Retract the trailing edge flaps using alternate power (AMM 27-51-00/201).

NOTE: Alternate power is electrical power.

S 014-003

**WARNING:** USE THE TASK IN AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Open the doors for the landing gear and install the door locks (AMM 32-00-15/201).

S 214-004

- (3) Make sure the TE flaps and LE slats are fully retracted and the flap control lever is in the zero (FLAPS UP) detent.

S 494-005

- (4) Install a DO-NOT-OPERATE tag on the flap control lever.

S 864-006

- (5) Remove power from the center hydraulic system (AMM 29-11-00/201).

S 864-007

- (6) Remove the pressure from the reservoir for the center hydraulic system (AMM 29-11-00/201).

S 864-008

- (7) Open this circuit breaker on the main power distribution panel, P6, and attach a DO-NOT-CLOSE tag:  
(a) 6D24, ALTN FLAP PWR

S 864-009

- (8) Open these circuit breakers on the P6 panel, and install circuit breaker locks:  
(a) 6D21, ALTN SLAT INBD PWR  
(b) 6F24, ALTN SLAT OUTBD PWR

S 864-010

- (9) Open this circuit breaker on the overhead panel, P11, and attach a DO-NOT-CLOSE tag:  
(a) 11J24, FLAPS ALTN CONT

S 864-011

- (10) Open these circuit breakers on the P11 panel, and install circuit breaker locks:  
(a) 11H23, SLAT ALTN CONT INBD

EFFECTIVITY

ALL

27-51-33

(b) 11H24, SLAT ALTN CONT OUTBD

E. Remove the TE Flap PDU (Fig. 401)

S 034-012

- (1) Disconnect the electrical connectors (17, 12) from the bypass valve and the electric motor.

S 034-013

- (2) Remove the wire clamp for the electric motor from the lifting lug (1).

S 034-014

- (3) Disconnect the bonding jumpers (13) from the aft wall of the wheel well.

S 034-015

- (4) Disconnect the hydraulic lines from the pressure and return ports (18, 19) on the control valve module.

S 494-016

- (5) Install the plugs in the hydraulic lines and caps on the open ports on the control valve module.

S 034-017

- (6) Disconnect the adjustable rod (3) from the pilot input crank (4).

S 934-018

- (7) Make marks on the torque tubes (11) and the adjacent airplane structure, to align the torque tubes with the adjacent structure, on each side of the TE flap PDU (10).

NOTE: These marks will show if the torque tube moved away from the retracted position after the torque tubes are disconnected.

S 494-019

- (8) Use a support on the TE flaps at the trailing edge, and install a clamp on the torque tubes on each side of the PDU (Fig. 403).

NOTE: A support is necessary to hold the weight of the flap's trailing edge. The weight of the flaps can cause the disconnected torque tubes to turn and cause flap asymmetry or disagreement problems.

EFFECTIVITY

ALL

27-51-33

S 034-089

**CAUTION:** DO NOT OPERATE THE ELECTRIC MOTOR WHEN THE TORQUE TUBES ARE DISCONNECTED FROM THE TE FLAP PDU. DAMAGE CAN OCCUR TO THE QUILL SHAFT IF YOU OPERATE THE ELECTRIC MOTOR WITH THE TORQUE TUBES DISCONNECTED.

- (9) Remove the torque tubes (11) on each side of the PDU (AMM 27-51-41/401).

**NOTE:** Do not turn the torque tube while it is disconnected. It will be necessary to adjust the flap drive if you turn the torque tube (AMM 27-81-00/501).

S 494-022

- (10) Attach the fishpole hoist to the hinge support beam on the aft bulkhead in the main wheel well and connect the hoist to the lifting lug (1) on the PDU (10) (Fig. 402).

S 034-023

- (11) Remove the bolts (24), washers (21, 23), nuts (20), and bushings (22, 25) from the PDU connection points (View F and G, Fig. 401).

**NOTE:** Identify the bushings for the subsequent installation.

S 024-086

**WARNING:** BE CAREFUL WHEN YOU MOVE THE TE FLAP PDU, BECAUSE THE PDU WEIGHS 90 POUNDS (41 KG), INJURY CAN OCCUR.

- (12) Lower the PDU from the airplane.

**NOTE:** The TE flap PDU weighs approximately 90 pounds (40.8 Kg).

TASK 27-51-33-424-025

3. Install the TE Flap PDU

**NOTE:** Do not mix a 767-200 power drive unit (PDU) with a 767-300 PDU, because the follow-up cams are different. Although you can install a 767-200 PDU on a 767-300 airplane, or a 767-300 PDU on a 767-200 airplane. To prevent a mix, the adjustable rod (3) and the pilot input arm (4) are not interchangeable between the 767-200 and 767-300.

**WARNING:** BE CAREFUL WHEN YOU MOVE THE TE FLAP PDU, BECAUSE THE PDU WEIGHS 90 POUNDS (41 KG), INJURY CAN OCCUR.

- (5) Lift the PDU (10) into its position (Fig. 401).

**NOTE:** The TE flap PDU weighs approximately 90 pounds (40.8 Kg).

S 624-031

- (6) Apply grease to all surfaces of the bolts and bushings.

S 434-032

- (7) Install the bolts (24), washers (21, 23), bushings (22), and nuts (20) (2 locations) (Detail F, Fig. 401).  
(a) Tighten the nuts.

S 434-033

- (8) Install the bolt (24), washers (21, 23), bushing (25), and nut (20) (Detail G, Fig. 401).  
(a) Tighten the nut.

S 094-034

- (9) Disconnect the fishpole hoist and the hoist bracket from the PDU and the aft bulkhead of the right wheel well.

S 104-035

- (10) Clean the bonding jumper connections (13) on the electric motor and the control unit for a good electrical bond (AMM 20-10-22/701).

S 434-036

- (11) Connect the two bonding jumpers (13) to the aft bulkhead of the right wheel well with these steps:

**NOTE:** Add or remove washers as necessary, until the height of the washer is the same height as the adjacent structure, or is above the adjacent structure for no more than one washer thickness.

- (a) Install the screw (14) through the bulkhead with a washer (15) below the head of the screw.  
(b) Install the washer (15), bonding jumper (13), washer (15), and nut (16).  
(c) Tighten the nut.  
(d) Make sure the total resistance across the bond is no more than 0.001 ohm (AMM 20-10-21/601).

Page 414  
Dec 22/01

S 094-039

- (12) Remove the plugs from the hydraulic lines and the caps from the ports on the control valve module.

S 644-040

- (13) Lightly apply Skydrol assembly lube or hydraulic fluid to O-rings and fittings before you install them.

S 434-041

- (14) Connect the hydraulic lines to the pressure and return ports (18, 19) on the control valve module.

S 434-088

**CAUTION:** DO NOT OPERATE THE ELECTRIC MOTOR WHEN THE TORQUE TUBES ARE DISCONNECTED FROM THE TE FLAP PDU. DAMAGE CAN OCCUR TO THE QUILL SHAFT IF YOU OPERATE THE ELECTRIC MOTOR WITH THE TORQUE TUBES DISCONNECTED.

- (15) Connect the electrical connectors (17, 12) to the bypass valve and the electric motor.

S 424-093

- (16) Attach the wire clamp for the electric motor to the lifting lug.

S 214-043

- (17) Make sure the manual override lever on the bypass valve for the TE flap PDU is in the No. 2 (normal) position.

S 824-044

- (18) Do a check for hydraulic null on the PDU as follows:
- (a) Remove the plugs from the PDU to show the TE1 input cam rig pin hole (2) and the TE2 follow-up cam rig pin hole (9).
  - (b) Install rig pin TE1 in the input cam rig pin hole (2).
  - (c) Remove the access panels, 511BB and 611BB, to get access to the outboard and inboard slat PDUs (AMM 06-44-00/201).
  - (d) Move the manual override levers on the bypass valves for the inboard and outboard slat PDUs to the No. 1 (bypass) position (AMM 27-81-11/401).
  - (e) Install a DO-NOT-OPERATE tag on the manual override levers.
  - (f) Install groundlocks in the inboard and outboard slat PDUs (Fig. 405).
  - (g) At the TE flap PDU, make sure you can connect the adjustable rod (3) to the pilot input crank (4) such that the attachment bolt and rig pin TE1 can be installed freely.
    - 1) Adjust the rod if it is necessary.
    - 2) Tighten the jamnuts on the adjustable rod and safety them with a wire.

MAINTENANCE MANUAL

- (h) Connect the adjustable rod (3) to the pilot input crank (4) with a bolt, washer and a nut.
- (i) Remove rig pin TE1.
- (j) Open this circuit breaker on the overhead panel, and attach a DO-NOT-CLOSE tag:
  - 1) 11J14, FLAPS SHUTOFF

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (k) Pressurize the center hydraulic system (AMM 29-11-00/201) and permit the PDU to become stable in the retracted position.

**NOTE:** It is usual for the output shaft on the PDU to turn when you pressurize the center hydraulic system.

- (l) Make sure that you can easily install and remove rig pin TE2 in the follow-up cam rig pin hole (9).
- (m) Do these steps to adjust the PDU to a mechanical and hydraulic null only if you can not install rig pin TE2 easily into the rig pin hole:
  - 1) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).
  - 2) Disconnect the adjustable rod (6) from the control unit output arm (7).

**NOTE:** You will release the fluid pressure lock in the control valve when you disconnect the rod from the output arm. This will permit you to turn the output shaft to find the rig pin hole for rig pin TE2.

- 3) Turn the output shaft of the PDU by small increments until you can install rig pin TE2 freely.
- 4) Connect the adjustable rod (6) to the control unit output arm (7).
- 5) Try to install rig pin TE3 in the rig pin hole (5) on the control valve module input arm.

EFFECTIVITY

Page 416  
Apr 22/04

- 6) If you cannot install rig pin TE3 fully and easily, adjust the length of the rod (6) with these steps:
- Loosen the jamnuts at each end of the rod (6).
  - Turn the rod to adjust the rod length, until you can easily install rig pin TE3.

NOTE: The usual length of the rod before the last adjustment is 6.56 inches (166.62 mm).

- c) Tighten the jamnuts on the rod (6), but do not safety with a lockwire at this time.

NOTE: It is possible that you will adjust the rod again during the hydraulic null adjustment.

- 7) Remove rig pins TE2 and TE3.

WARNING: KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

CAUTION: MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- 8) Pressurize the center hydraulic system (AMM 29-11-00/201) and permit the PDU to become stable in the retracted position.

NOTE: It is usual for the output shaft of the PDU to turn when you pressurize the center hydraulic system.

EFFECTIVITY

08

Page 417  
Apr 22/04

**CAUTION:** DO NOT DISCONNECT THE ADJUSTABLE ROD (6) WHEN YOU ADJUST THE PDU WITH THE CENTER HYDRAULIC SYSTEM PRESSURIZED. DO NOT TURN THE ADJUSTABLE ROD (6) WITH RIG PIN TE2 INSTALLED. ADJUST THE ROD (6) ONLY BY SMALL INCREMENTS TO PREVENT DAMAGE TO THE TE FLAP PDU.

- 9) Try to install rig pin TE2 in the follow-up cam rig pin hole (9).
- 10) If you can not install rig pin TE2 easily, adjust the rod (6) with these steps:

**NOTE:** Do not adjust the rod (6) while rig pin TE2 is installed. Install rig pin TE2 only to make sure that the rod (6) is adjusted correctly.

- a) Loosen the jamnuts at each end of the rod (6).
- b) Turn the rod (6) to adjust the length until you can easily install rig pin TE2.

**NOTE:** It is not necessary to install rig pin TE3 for this adjustment.

- c) Tighten the jamnut on each end of the rod (6).
- d) Safety the jamnuts on the rod (6) with lockwires.

S 864-045

- (19) Remove pressure from the center hydraulic system (AMM 29-11-00/201).

S 094-048

- (20) Remove rig pin TE2 and install a plug in the rig pin hole.

S 094-046

- (21) Remove the groundlocks from the inboard and outboard LE slat PDUs (Fig. 405).

S 864-047

- (22) Move the manual override levers on the bypass valves for the inboard and outboard LE slat PDUs to the No. 2 (normal) position.

Page 418  
Apr 22/04

S 214-049

- (23) At the TE flap PDU, examine the marks you made between the torque tubes (11) and the adjacent airplane structure, and do these checks:
- (a) If the marks do align, remove the clamps from the torque tubes (11) and connect them to the PDU.

NOTE: Do not turn the torque tubes (11) more than 1/2 spline tooth to connect them to the PDU. If the torque tubes turn too much, TE flap disagree and asymmetry problems can occur. The flap mechanism can move very slowly when the torque tubes are disconnected from the PDU. Connect the torque tubes quickly after you remove the torque tube clamps.

- (b) If the marks do not align or do not show, do these steps:
- 1) Remove the torque tube clamps from the torque tubes (11) (Fig. 403).
  - 2) Move the torque tubes (11) on each side of the PDU manually, or with an air motor, to the fully retracted position.
  - 3) Do a check on the retract overtravel stop clearances (AMM 27-51-00/501).
  - 4) Connect the torque tubes (11) to the PDU (AMM 27-51-41/401).

NOTE: Do not turn the torque tubes (11) more than 1/2 spline tooth to connect them to the PDU. If the torque tubes turn too much, TE flap disagree and asymmetry problems can occur. The flap mechanism can move very slowly when the torque tubes are disconnected from the PDU. Connect the torque tubes quickly when the torque tube clamps are removed.

S 094-050

- (24) Remove the supports from the trailing edge of the TE flap.

S 864-051

- (25) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the overhead panel, P11:
- (a) 11J14, FLAPS SHUTOFF

S 824-052

- (26) Do the "Adjust the TE Flap PDU" procedure that follows.

EFFECTIVITY

ALL

TE FLAP POWER DRIVE UNIT COMPONENTS – MAINTENANCE PRACTICES

1. General

- A. This procedure contains the removal and the installation procedures for the components on the trailing edge (TE) flap power drive unit (PDU).

TASK 27-51-34-022-001

2. Trailing Edge Flap Power Drive Unit (PDU) Components – Removal

A. General

- (1) This task contains the removal procedure for these components on the PDU:
- the Control Unit
  - the Hydraulic Motor
  - the Electric Motor
  - the Flap PDU Gearbox.

Because this task contains four procedures, only do the applicable procedure to remove the component.

To start one of these procedures, do the steps in the "Prepare for the Removal" topic, then do the applicable group of steps to remove the component.

B. Equipment

- (1) TE Flap Torque Tube Clamp – A27099-1  
(2 clamps in set)
- (2) Rig Pins from Set A20004-XX (AMM 20-10-24/201):
- (a) TE1 – P/N A20004-9.
  - (b) TE2 – P/N A20004-9

211/212	Control Cabin
710	Nose Landing Gear and Doors
730/740	Main Landing Gear and Doors

E. Prepare for the Removal

S 212-002

(1) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

S 012-003

**WARNING:** USE THE TASK IN AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT.

(2) Open the doors for the landing gear and install the door locks (AMM 32-00-15/201).

S 212-004

(3) Make sure the TE flaps and leading edge (LE) slats are fully retracted and the flap control lever is in the zero (FLAPS UP) detent.

S 492-005

(4) Install a DO-NOT-OPERATE tag on the flap control lever.

S 862-006

(5) Remove the pressure from the center hydraulic system and reservoir (AMM 29-11-00/201).

S 862-007

(6) Open this circuit breaker on the main power distribution panel, P6, and attach a DO-NOT-CLOSE tag:  
(a) 6D24, ALTN FLAP PWR

S 862-008

(7) Open these circuit breakers on the P6 panel, and install circuit breaker locks:  
(a) 6D21, ALTN SLAT INBD PWR  
(b) 6F24, ALTN SLAT OUTBD PWR

S 862-009

(8) Open this circuit breaker on the overhead panel, P11, and attach a DO-NOT-CLOSE tag:  
(a) 11J24, FLAPS ALTN CONT

EFFECTIVITY

ALL

27-51-34

S 862-010

(9) Open these circuit breakers on the P11 panel, and install circuit breaker locks:

- (a) 11H23, SLAT ALTN CONT INBD
- (b) 11H24, SLAT ALTN CONT OUTBD

F. Remove the Control Unit (Fig. 201)

**NOTE:** You can remove the control unit with the flap PDU on or off the airplane. It is easier to remove the control unit with the PDU off the airplane. This procedure gives instructions to remove the control unit with or without the PDU on the airplane.

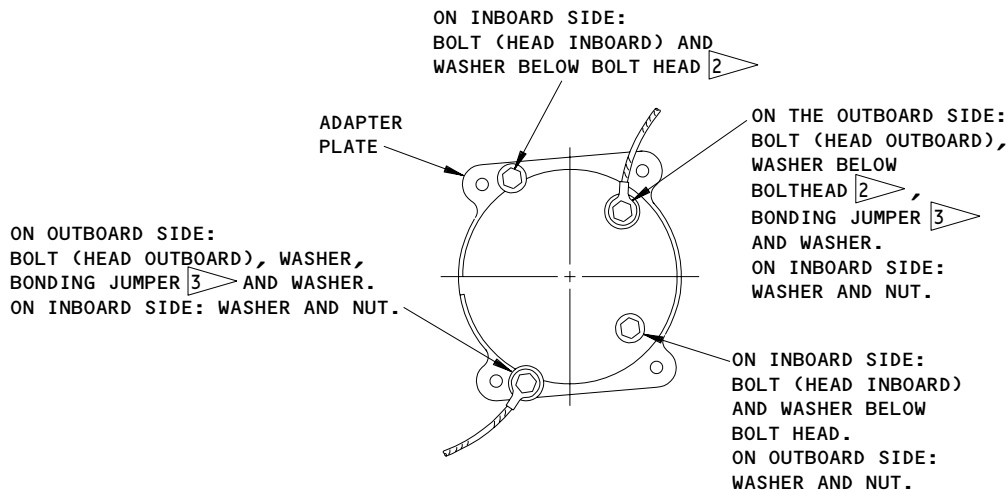

S 022-011

(1) If you want to remove the control unit with the PDU off the airplane, remove the PDU (AMM 27-51-33/401).

S 032-014

(2) If you want to remove the control unit with the PDU on the airplane, do these steps:

- (a) Disconnect the adjustable rod from the pilot input arm.
- (b) Disconnect the bonding jumper that is attached to the control unit from the aft wall of the wheel well.

ELECTRIC MOTOR WITH ADAPTER PLATE

- 2 APPLY BMS 3-24 GREASE TO ALL THE SURFACES BEFORE INSTALLATION
- 3 CLEAN THE BONDING SURFACES WITH A ROTARY STAINLESS STEEL BRUSH. MAKE SURE THE TOTAL RESISTANCE BETWEEN THE BOND IS NOT MORE THAN 0.001 OHM

TE Flap PDU Components  
Figure 201 (Sheet 3)

EFFECTIVITY	ALL
-------------	-----

27-51-34

S 032-013

- (3) Disconnect the adjustable rod (between the control unit and the control valve module) from the control unit output arm.

S 032-012

- (4) Remove the control valve module (AMM 27-51-32/201).

S 022-016

- (5) Disconnect the four mounting bolts and remove the control unit from the gearbox.

**NOTE:** Keep the quill shaft for the subsequent installation. You will disconnect the bonding jumper between the control unit and the electric motor when you remove the mounting bolts.

S 492-017

- (6) Put a cover on the mating surface of the control unit and the PDU gearbox to prevent contamination.

G. Remove the Hydraulic Motor (Fig. 201)

S 032-018

- (1) Disconnect the hydraulic lines from the pressure, case drain and return ports on the hydraulic motor.

S 492-019

- (2) Install plugs in the hydraulic lines and caps on the open ports.

S 032-020

- (3) Disconnect the four mounting bolts and remove the hydraulic motor from the gearbox.

S 492-021

- (4) Put a cover on the gearbox to prevent contamination.

H. Remove the Electric Motor (Fig. 201)

S 032-022

- (1) Disconnect the electrical connector from the electric motor.

S 032-023

- (2) Remove the four mounting bolts.

S 032-024

- (3) Remove the lifting lug, and identify it for subsequent installation.

S 032-025

- (4) Disconnect the bonding jumpers to the bulkhead structure and the control unit.

EFFECTIVITY

ALL

27-51-34

06

Page 206  
Apr 22/01

S 022-026

- (5) Remove the electric motor from the gearbox.
  - (a) Use a cover on the gearbox to prevent contamination.
  - (b) Remove the adapter plate, if installed.

**NOTE:** If the replacement motor is the same as the motor that you removed, it is not necessary to remove the adapter plate.

I. Remove the Flap PDU Gearbox (Fig. 201)

**NOTE:** To remove the flap PDU gearbox from the airplane, you must first remove the PDU, and then disconnect the components from the PDU to get to the gearbox.

S 022-029

- (1) Do these steps to remove the PDU:
  - (a) Remove the plugs from the rig pin holes, and install rig pin TE1 in the input cam rig pin hole, and TE2 in the follow up cam rig pin hole.
  - (b) Disconnect the electrical connectors from the bypass valve and the electric motor.
  - (c) Remove the wire clamp for the electric motor from the lifting lug.
  - (d) Disconnect the bonding jumpers from the aft wall of the wheel well.
  - (e) Disconnect the hydraulic lines from the pressure and return ports on the control valve module.
  - (f) Install plugs in the hydraulic lines and caps on the open ports.
  - (g) Disconnect the adjustable rod from the pilot input arm.
  - (h) Make marks on the torque tubes and the adjacent airplane structure, to align the torque tubes with the adjacent structure, on each side of the TE flap PDU.

**NOTE:** These marks will show if the torque tube moved away from the retracted position after the torque tubes are disconnected.

- (i) Use a support on the TE flaps at the trailing edge, and install a clamp on the torque tubes (Fig. 203) adjacent to the TE flap PDU.

**NOTE:** A support is necessary to hold the weight of the flap's trailing edge. The weight of the flaps can cause the disconnected torque tubes to turn and cause flap asymmetry or disagreement problems.

27-51-34

- (j) Disconnect the torque tubes from each side of the TE flap PDU (AMM 27-51-41/401).

NOTE: Do not turn the adjacent torque tubes. It will be necessary to adjust the flap drive if you turn the torque tube while it is disconnected.

- (k) Attach the fishpole hoist to the hinge support beam, on the aft bulkhead of the right main wheel well, and connect the hoist to the lifting lug on the PDU (Fig. 202).  
(l) Remove the bolt, washers, nut, and bushing at the inboard PDU connection (Detail F, Fig. 201).

NOTE: Identify the bushing for the subsequent installation.

- (m) Remove the bolts, washers, nuts and bushings at the two outboard PDU connections (Detail E, Fig. 201).

NOTE: Identify the bushings for the subsequent installation.

WARNING: BE CAREFUL WHEN YOU MOVE THE TE FLAP PDU, BECAUSE THE PDU WEIGHS 90 POUNDS (41 KG), INJURY CAN OCCUR.

- (n) Lower the PDU from the airplane.

NOTE: The TE flap PDU weighs approximately 90 pounds (40.8 Kg).

S 032-032

- (2) Do these steps to remove the hydraulic motor from the PDU:  
(a) Disconnect the hydraulic lines from the pressure, case drain, and return ports on the hydraulic motor.  
(b) Install caps on the open ports and plugs in the hydraulic lines.  
(c) Disconnect the four mounting bolts, and remove the hydraulic motor from the gearbox.  
(d) Put a cover on the mating surface of the hydraulic motor to prevent contamination.

S 032-031

- (3) Do these steps to remove the electric motor from the PDU:  
(a) Remove the four mounting bolts that hold the electric motor to the PDU gearbox.

NOTE: You will disconnect the bonding jumper between the electric motor and the control unit when you remove the bolts.

EFFECTIVITY

ALL

27-51-34

Page 213  
Dec 22/01

- (b) Remove the lifting lug, and identify it for the subsequent installation.
- (c) Remove the electric motor from the gearbox.
- (d) Put a cover on the mating surface of the electric motor to prevent contamination.

S 032-033

- (4) Do these steps to remove the control unit from the PDU:
  - (a) Disconnect the four mounting bolts, and remove the control unit from the gearbox.

NOTE: Keep the quill shaft for the subsequent installation.

- (b) Put a cover on the mating surfaces of the control unit and the PDU gearbox to prevent contamination.

TASK 27-51-34-422-034

### 3. Trailing Edge Flap Power Drive Unit (PDU) Components - Installation

#### A. General

- (1) This task contains the installation procedures for these components on the PDU:
  - the Control Unit
  - the Hydraulic Motor
  - the Electric Motor
  - the Flap PDU Gearbox.

Because this task contains four procedures, only do the applicable procedure to install the component.

To start one of these procedures, do the steps to install the component. Then, do the group of steps to adjust or to do a test on the TE flap PDU.

#### B. Equipment

- (1) Rig Pins from Set A20004-XX (AMM 20-10-24/201):
  - (a) TE1 - P/N A20004-9.
  - (b) TE2 - P/N A20004-9
  - (c) TE3 - P/N A20004-73
- (2) Bonding Meter, Microhm Bridge Type 2 Bonding Meter - 477W Avtron Meter  
Avtron Manufacturing Inc.  
Cleveland, Ohio
- (3) LE Slat Groundlock - A27007-1 (2 Necessary)
- (4) TE Flap Torque Tube Clamp - A27099-1 (2 Necessary)
- (5) Stainless Steel Rotary Brush

NOTE: Do not use for heavy oxide particles on aluminum.

Apr 22/08

F. Install the Control Unit (Fig. 201)

**NOTE:** You can install the control unit with the PDU on or off the airplane. It is easier to install the control unit with the PDU off the airplane. This procedure has instruction to install the control unit with the PDU on or off the airplane.

S 092-035

- (1) Remove the covers from the control unit and the gearbox.

S 642-036

- (2) Apply grease, BMS 3-33, to the quill shaft splines, and install the quill shaft into the control unit splines.

S 822-037

- (3) Do these steps to adjust the control unit before you install it on the gearbox:
- (a) Turn the pilot input arm to the position shown and install rig pin TE1 in the input cam rig pin hole (Detail A).

**NOTE:** Make sure you can easily install rig pin TE1 in the rig pin hole.

- (b) Turn the quill shaft until the control unit output arm is in the approximate position shown (Detail A), and install rig pin TE2 in the follow-up cam rig pin hole.

**NOTE:** Make sure you can easily install rig pin TE2 in the rig pin hole.

S 622-038

- (4) Apply grease, BMS 3-24, to the control unit mounting bolts.

S 102-039

- (5) Clean the mating surfaces between the control unit and the bonding jumper connections with a rotary stainless steel brush.

S 432-149

- (6) With rig pins TE1 and TE2 installed, put the control unit adjacent to the gearbox and engage the quill shaft. Try to align the bolt holes between the control unit and the PDU gearbox.

**NOTE:** Be careful not to damage the quill shaft when you engage the gearbox splines.

EFFECTIVITY

ALL

27-51-34

04

Page 216  
Apr 22/01

S 022-041

- (7) If the mounting bolt holes on the control unit and the gearbox align, do these steps:
- (a) Install four mounting bolts, washers, and bonding jumpers.

NOTE: Use the support at one mounting bolt location for the bonding jumper connection.

- (b) Add or remove washers, at the mounting bolt with the bonding jumper connection, such that the washer height is the same as or is less than one washer thickness above the control unit surface.
- (c) Safety the bolts with a wire.

S 022-042

- (8) If the mounting bolt holes on the control unit and the gearbox do not align, do these steps:

- (a) Do these steps only if you will install the control unit with the PDU on the airplane:
  - 1) Make marks on the torque tubes and the adjacent airplane structure, to align the torque tubes with the adjacent structure, on each side of the TE flap PDU.

NOTE: These marks will show if the torque tube moved away from the retracted position after the torque tubes are disconnected.

- 2) Use a support on the TE flaps at the trailing edge, and install a clamp on the torque tubes (Fig. 203) adjacent to the TE flap PDU.

NOTE: A support is necessary to hold the weight of the flap's trailing edge. The weight of the flaps can cause the disconnected torque tubes to turn and cause flap asymmetry or disagreement problems.

- 3) Disconnect the torque tubes from the output coupling on each side of the PDU (AMM 27-51-41/401).
- (b) Turn the output shaft on the PDU until the mounting bolt holes on the control unit and the gearbox align.
- (c) Install four mounting bolts, washers and bonding jumpers.

NOTE: Use the support at one mounting bolt location for the bonding jumper location.

- (d) Add or remove washers, at the mounting bolt with the bonding jumper, such that the washer height is the same as or is less than one washer thickness above the control unit surface.
- (e) Safety the bolts with a wire.

EFFECTIVITY

ALL

27-51-34

05

Page 217  
Apr 22/01

- S 622-044
- (9) Fillet seal the mating surface between the gearbox and the control unit.

- S 032-045
- (10) If you removed the control unit with the PDU on the airplane, do these steps:
- (a) Connect the adjustable rod to the pilot input arm with a bolt, washer, and a nut.
  - (b) Adjust the rod length such that rig pin TE1 can easily be installed in the input cam rig pin hole.

- S 412-048
- (11) Install the control valve module (AMM 27-51-32/201).

- S 032-046
- (12) Connect the adjustable rod to the control unit output arm with a bolt, washers, and a nut.

NOTE: Put one washer below the bolthead and the other below the nut.

- S 822-049
- (13) If you removed the control unit with the PDU on the airplane, do these steps to adjust the PDU to a mechanical and hydraulic null:
- (a) With rig pins TE1 and TE2 installed, install rig pin TE3 in the control valve module rig pin hole.
  - (b) If you cannot easily install rig pin TE3, adjust the rod between the control unit and the control valve module until you can install the rig pin.
    - 1) To adjust the rod, loosen the jamnut at each end of the rod and turn the rod body.

NOTE: The correct length of the rod is 6.56 inches (166.6 mm), before the last adjustment.

- 2) Tighten the jamnuts.

NOTE: Do not safety the jamnuts with a wire at this time.

- (c) Remove rig pins TE1, TE2, and TE3.
- (d) Make marks on the torque tubes and the adjacent airplane structure, to align the torque tubes with the adjacent structure, on each side of the TE flap PDU.

NOTE: These marks will show if the torque tube moved away from the retracted position after the torque tubes are disconnected.

 **BOEING**  
767  
MAINTENANCE MANUAL

- (e) Use a support on the TE flaps at the trailing edge, and install a clamp on the torque tubes (Fig. 203) adjacent to the TE flap PDU.

**NOTE:** A support is necessary to hold the weight of the flap's trailing edge. The weight of the flaps can cause the disconnected torque tubes to turn and cause flap asymmetry or disagreement problems.

- (f) Disconnect the torque tubes from the output couplings on each side of the TE flap PDU (AMM 27-51-41/401).
- (g) Open the access doors, 511BB and 611BB, to get access to the outboard and inboard slat PDUs (AMM 06-44-00/201).
- (h) Move the manual override lever on the bypass valves of the inboard and outboard slat PDUs to the No. 1 (bypass) position (AMM 27-81-11/401).
- (i) Attach DO-NOT-OPERATE tags on the manual override levers.
- (j) Install the groundlocks in the inboard and outboard slat PDUs (Fig. 205).

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (k) Pressurize the center hydraulic system (AMM 29-11-00/201), and permit the TE flap PDU to become stable.

**NOTE:** It is usual for the output shaft on the PDU to turn when you pressurize the center hydraulic system.

- (l) Install rig pin TE1 in the TE flap PDU.

**CAUTION:** DO NOT DISCONNECT THE CONTROL ROD BETWEEN THE CONTROL UNIT AND THE CONTROL VALVE MODULE TO DO THE ROD ADJUSTMENT WHILE THE CENTER HYDRAULIC SYSTEM IS PRESSURIZED. DO NOT ADJUST THE CONTROL ROD WITH RIG PIN TE2 INSTALLED. ADJUST THE ROD ONLY BY SMALL INCREMENTS TO PREVENT DAMAGE TO THE TE FLAP PDU.

- (m) Try to install rig pin TE2 in the follow-up cam rig pin hole.

EFFECTIVITY

ALL

Page 219  
Apr 22/01

 **BOEING**  
767  
MAINTENANCE MANUAL

- (n) If you can not install rig pin TE2 easily, adjust the rod between the control unit and the control valve module with these steps:
- 1) Loosen the jamnut at each end of the rod.
  - 2) Turn the rod to adjust the length until you can easily install rig pin TE2.

NOTE: It is not necessary to install rig pin TE3 for this adjustment.

- 3) Tighten the jamnut on each end of the rod.
  - 4) Safety the jamnuts on the rod with lockwires.
- (o) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).
- (p) Remove the groundlocks from the inboard and outboard slat PDUs (Fig. 205).
- (q) Remove the DO-NOT-OPERATE tags and move manual override levers on the bypass valves for the inboard and outboard slat PDUs to the No. 2 (normal) position.
- (r) Examine the marks you made, between the torque tubes and the adjacent airplane structure, and do these checks:
- 1) If the marks align, remove the clamps from the torque tubes and connect them to the PDU (AMM 27-51-41/401).

NOTE: Do not turn the torque tubes more than 1/2 spline tooth to connect them to the PDU. If the torque tubes turn too much, TE flap disagree and asymmetry problems can occur. The flap mechanism will move very slowly when the torque tubes are disconnected from the PDU. Connect the torque tubes quickly when the torque tube clamps are removed.

- 2) If the marks do not align, or do not show, do these steps:
  - a) Remove the torque tube clamps from the torque tubes (Fig. 203).
  - b) Move the torque tubes on each side of the PDU manually, or with an air motor, to the fully retracted position.
  - c) Do a check on the retract overtravel stop clearances (AMM 27-51-00/501).

EFFECTIVITY

ALL

27-51-34

05

Page 220  
Apr 22/01

d) Connect the torque tubes to the PDU (AMM 27-51-41/401).

NOTE: Do not turn the torque tubes more than 1/2 spline tooth to connect them to the PDU. If the torque tubes turn too much, TE flap disagree and asymmetry problems can occur. The flap mechanism can move very slowly when the torque tubes are disconnected from the PDU. Connect the torque tubes quickly when the torque tube clamps are removed.

- (s) Remove the supports from the trailing edges of the TE flap.
- (t) Remove the rig pins TE1 and TE2 and install a plug in the rig pin hole for TE2.

S 422-056

- (14) If you removed the control unit with the PDU off the airplane, install the PDU (AMM 27-51-33/401).

S 822-057

- (15) Adjust the PDU as shown in the "Trailing Edge Flap Power Drive Unit (PDU) - Adjustment/Test".

S 702-058

- (16) Do a test on the PDU as shown in the "Trailing Edge Flap Power Drive Unit (PDU) - Adjustment/Test".

G. Install the Hydraulic Motor (Fig. 201)

S 212-059

- (1) Make sure the pressure is removed from the center hydraulic system (AMM 29-11-00/201).

S 212-060

- (2) Make sure the flap and slat alternate drives are off.

S 092-061

- (3) Remove the caps from the ports on the hydraulic motor.

S 642-062

- (4) Lightly lubricate the backup rings and the O-rings with hydraulic fluid or Skydrol assembly lube.

S 432-070

- (5) Install the backup rings, the O-rings, the reducers, and the elbows in the hydraulic motor.

S 642-064

- (6) Apply grease, BMS 3-33, to the external spline of the hydraulic motor.

Page 222  
Apr 22/01

S 702-085

- (5) Do a test on the PDU as shown in the "Trailing Edge Flap Power Drive Unit (PDU) - Adjustment/Test".

I. Install the Flap PDU Gearbox (Fig. 201)

**NOTE:** To install the PDU gearbox, you must first assemble the control unit, hydraulic motor, electric motor, and control valve module to the PDU gearbox, then install the PDU assembly on the airplane.

The wear limits for the TE flap PDU gearbox are given in AMM 27-51-34/601.

S 432-086

- (1) Do these steps to install the control unit to the gearbox:

**NOTE:** Do not mix a 767-200 power drive unit (PDU) with a 767-300 PDU, because the follow-up cams are different. Although you can install a 767-200 control unit on a 767-300 airplane, or a 767-300 control unit on a 767-200 airplane. To prevent a mix, the adjustable rod and the pilot input arm are not interchangeable between the 767-200 and 767-300 airplanes.

- (a) Apply grease, BMS 3-33, to the quill shaft splines.
- (b) Install the quill shaft into the control unit splines.
- (c) Apply grease, BMS 3-24, to the control unit mounting bolts.
- (d) Clean the mating surfaces between the control unit and the bonding jumper connections with a rotary stainless steel brush.
- (e) Install rig pins TE1 and TE2 in the control unit.
- (f) Put the control unit adjacent to the gearbox and engage the quill shaft. Try to align the bolt holes between the control unit and the gearbox.

**NOTE:** Be careful not to damage the quill shaft when you install it into the gearbox splines.

- (g) If mounting bolt holes on the control unit and the gearbox align, do these steps:
  - 1) Install the mounting bolts, washers, and bonding jumpers.

**NOTE:** Use the supports at two mounting bolt locations for the bonding jumper connections.

- 2) Add or remove washers, at the mounting bolt with the bonding jumper, such that the washer height is the same as or is no more than one washer thickness above the control unit surface.
- 3) Make sure the total resistance across the bond is no more than 0.001 ohm (AMM 20-10-21/601).

Apr 22/01

- 4) Safety the bolts with lockwires.
- (h) If the mounting bolt holes on the control unit and gearbox do not align, do these steps:
  - 1) Turn the output shaft on the gearbox until the mounting bolt holes on the control unit and the gearbox align.
  - 2) Install the mounting bolts, washers, and bonding jumpers.

NOTE: Use the supports at two mounting bolt locations for the bonding jumper connections.

- 3) Add or remove washers, at the mounting bolt with the bonding jumper, such that the washer height is the same as or is no more than one washer thickness above the control unit surface.
- 4) Make sure the total resistance across the bond is no more than 0.001 ohm (AMM 20-10-21/601).
- 5) Safety the bolts with a wire.

S 432-087

- (2) Do these steps to install the electric motor to the gearbox:
  - (a) Clean the mating surfaces between the electric motor and the bonding jumper connections with a rotary stainless steel brush.
  - (b) Apply grease, BMS 3-33, to the electric motor spline.
  - (c) Engage the electric motor splines to the PDU gearbox.
  - (d) Apply grease, BMS 3-24, to the electric motor mounting bolts.
  - (e) Install the four mounting bolts and the lifting lug.
  - (f) Connect the two bonding jumpers.
  - (g) Make sure the total resistance across the bond is no more than 0.001 ohm (AMM 20-10-21/601).

S 432-088

- (3) Do these steps to install the hydraulic motor to the gearbox:
  - (a) Remove the caps from the hydraulic motor ports.
  - (b) Lightly lubricate the backup rings and O-rings with hydraulic fluid or Skydrol assembly lube.
  - (c) Install the backup rings, O-rings, reducers, and elbows in the hydraulic motor.
  - (d) Apply grease, BMS 3-33, to the external spline of the hydraulic motor.
  - (e) Engage the hydraulic motor splines to the PDU gearbox.
  - (f) Apply grease, BMS 3-24, to four mounting bolts, and install the mounting bolts.
  - (g) Remove the plugs from the hydraulic lines and the caps from the ports, and connect the pressure, case drain, and return lines to the hydraulic motor.
  - (h) Make sure the motor is filled with hydraulic fluid.

S 422-089

- (4) Do these steps to install the TE flap PDU assembly in the airplane:

**NOTE:** Do not mix a 767-200 power drive unit (PDU) with a 767-300 PDU, because the follow-up cams are different. Although you can install a 767-200 PDU on a 767-300 airplane, or a 767-300 PDU on a 767-200 airplane. To prevent a mix, the adjustable rod and the pilot input arm are not interchangeable between the 767-200 and 767-300 airplanes.

- (a) Make sure the TE flaps and LE slats are in the fully retracted position and the flap control lever is in the zero (FLAPS UP) detent.
- (b) Make sure the pressure is removed from the center hydraulic system (AMM 29-11-00/201).
- (c) Make sure the flap and slat alternate drives are off.
- (d) Attach the hoist bracket to the aft wall of the right wheel well (Fig. 202).
- (e) Attach the fishpole hoist to the lifting lug on the PDU.

**WARNING:** BE CAREFUL WHEN YOU MOVE THE TE FLAP PDU, BECAUSE THE PDU WEIGHS 90 POUNDS (41 KG), INJURY CAN OCCUR.

- (f) Lift the PDU into its position.

**NOTE:** The TE flap PDU weighs approximately 90 pounds (40.8 Kg).

- (g) Apply grease, BMS 3-24, to all surfaces of the mounting bolts and bushings.
- (h) Install the bolts, washers, bushings, and nuts (Detail E and F, Fig. 201).
  - 1) Tighten the nuts.
- (i) Remove the fishpole hoist and the hoist bracket from the wheel well.
- (j) Connect the two bonding jumpers to the aft wall of the wheel well.
- (k) Add or remove washers, at the spotface surface, such that the washer height is the same as or is no more than one washer thickness above the adjacent surface.
- (l) Make sure the total resistance across the bond is no more than 0.001 ohm (AMM 20-10-21/601).
- (m) Remove the plugs and caps from the hydraulic lines and ports.
- (n) Lightly apply Skydrol assembly lube or hydraulic fluid to the packing O-rings and fittings.
- (o) Connect the hydraulic pressure and return lines to the control valve module.
- (p) Connect the electrical connectors to the bypass valve and the electric motor.

- (q) Make sure the manual override lever on the bypass valve for the TE flap PDU is in the No. 2 (normal) position.
- (r) Attach the wire clamp for the electric motor to the lifting lug.

S 822-090

- (5) Do these steps to do a check for hydraulic null on the PDU:
  - (a) Open the access door, 511BB and 611BB, to get access to the outboard and inboard slat PDUs (AMM 06-44-00/201).
  - (b) Move the manual override lever on the bypass valves for the inboard and outboard slat PDUs to the No. 1 (bypass) position (AMM 27-81-11/401).
  - (c) Install a DO-NOT-OPERATE tag on the manual override levers.
  - (d) Install groundlocks in the inboard and outboard slat PDUs (Fig. 205).
  - (e) At the TE flap PDU, make sure you can connect the adjustable rod to the pilot input arm such that the attachment bolt and rig pin TE1 can be easily installed.
    - 1) Adjust the rod if it is necessary.
    - 2) Tighten the jamnuts on the adjustable rod and safety them with a lockwire.
  - (f) Connect the adjustable rod to the pilot input arm with a bolt, washer, and a nut.
  - (g) Remove rig pins TE1 and TE2.
  - (h) Open this circuit breaker on the overhead panel, P11, and attach a DO-NOT-CLOSE tag:
    - 1) 11J14, FLAPS SHUTOFF

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (i) Pressurize the center hydraulic system (AMM 29-11-00/201), and permit the PDU to become stable in the retracted position.

**NOTE:** It is usual for the output shaft on the PDU to turn when you pressurize the center hydraulic system.

EFFECTIVITY

ALL

27-51-34

- (j) Make sure that rig pin TE2 can easily be installed and removed in the follow-up cam rig pin hole.
- (k) Do these steps to adjust the TE flap PDU to a mechanical and hydraulic null only if you cannot install rig pin TE2 easily into the rig pin hole:
  - 1) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).
  - 2) Disconnect the adjustable rod from the control unit output arm.

NOTE: You will release the fluid pressure lock in the control valve when you disconnect the rod from the output arm. This will permit you to turn the output shaft to find the rig pin hole for rig pin TE2.

- 3) Turn the output shaft of the PDU by small increments until you can install rig pin TE2 freely.
- 4) Connect the adjustable rod to the control unit output arm.
- 5) Try to install rig pin TE3 in the rig pin hole on the control valve module input arm.
- 6) If you cannot install rig pin TE3 fully and easily, adjust the length of the rod with these steps:
  - a) Loosen the jamnuts at each end of the rod.
  - b) Turn the rod to adjust the length, until you can easily install rig pin TE3.

NOTE: The usual length of the rod before the last adjustment is 6.56 inches (166.6 mm).

- c) Tighten the jamnuts on the rod, but do not safety with a lockwire at this time.

NOTE: It is possible that you will adjust the rod again during the hydraulic null adjustment.

- 7) Remove rig pins TE2 and TE3.

EFFECTIVITY

ALL

27-51-34

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- 8) Pressurize the center hydraulic system (AMM 29-11-00/201) and permit the PDU to become stable in the retracted position.

**NOTE:** It is usual for the output shaft of the PDU to turn when you pressurize the center hydraulic system.

**CAUTION:** DO NOT DISCONNECT THE ADJUSTABLE ROD WHEN YOU ADJUST THE PDU WITH THE CENTER HYDRAULIC SYSTEM PRESSURIZED. DO NOT TURN THE ADJUSTABLE ROD WITH RIG PIN TE2 INSTALLED. ADJUST THE ROD ONLY BY SMALL INCREMENTS TO PREVENT DAMAGE TO THE TE FLAP PDU.

- 9) Try to install rig pin TE2 in the follow-up cam rig pin hole.
- 10) If you can not install rig pin TE2 easily, adjust the rod with these steps:

**NOTE:** Do not adjust the rod while rig pin TE2 is installed. Install rig pin TE2 only to make sure that the rod is adjusted correctly.

- a) Loosen the jamnuts at each end of the rod.
- b) Turn the rod to adjust the length until you can easily install rig pin TE2.

**NOTE:** It is not necessary to install rig pin TE3 for this adjustment.

- c) Tighten the jamnut on each end of the rod.
- d) Safety the jamnuts on the rod with lockwires.

Page 228  
Aug 22/99

- S 862-091
- (6) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).
- S 092-094
- (7) Remove rig pin TE2 and install the plug in the rig pin hole.
- S 092-092
- (8) Remove the groundlocks from the inboard and outboard slat PDUs (Fig. 205).
- S 862-093
- (9) Move the manual override levers on the bypass valves for the inboard and outboard slat PDUs to the No. 2 (normal) position.
- S 212-095
- (10) At the TE flap PDU,  
examine the marks you made between the torque tubes and the adjacent airplane structure, and do these checks:
- (a) If the marks do align,  
remove the clamps from the torque tubes and connect them to the PDU.

NOTE: Do not turn the torque tubes more than 1/2 spline tooth to connect them to the PDU. If the torque tubes turn too much, TE flap disagree and asymmetry problems can occur. The flap mechanism can move very slowly when the torque tubes are disconnected from the PDU. Connect the torque tubes quickly after you remove the torque tube clamps.

- (b) If the marks do not align or do not show,  
do these steps:
- 1) Remove the torque tube clamps from the torque tubes (Fig. 203).
  - 2) Move the torque tubes on each side of the PDU manually, or with an air motor, to the fully retracted position.
  - 3) Examine the clearances at the flap overtravel stops (AMM 27-51-00/501).
  - 4) Connect the torque tubes to the PDU.

NOTE: Do not turn the torque tubes more than 1/2 spline tooth to connect them to the PDU. If the torque tubes turn too much, TE flap disagree and asymmetry problems can occur. The flap mechanism can move very slowly when the torque tubes are disconnected from the PDU. Connect the torque tubes quickly after you remove the torque tube clamps.

- (11) Remove the supports from the trailing edge of the TE flap.
- S 862-097
- (12) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
- (a) 11J14, FLAPS SHUTOFF
- S 822-098
- (13) Adjust the PDU with the instructions in the "Trailing Edge Flap Power Drive Unit (PDU) - Adjustment/Test".
- S 702-099
- (14) Do a test on the PDU installation with the instructions in the "Trailing Edge Flap Power Drive Unit (PDU) - Adjustment/Test".

TASK 27-51-34-822-100

4. Trailing Edge Flap Power Drive Unit (PDU) - Adjustment/Test

A. General

- (1) This task contains two procedures, one to adjust the power drive unit (PDU) for the trailing edge flap system, and one to do a test on the installation of the PDU. Because this task contains two procedures, only the applicable group of steps must be done.

To start one of these procedures, do the group of steps that is necessary to adjust or to do a test on the PDU. Then, do the "Put the Airplane Back to Its Usual Condition" group of steps.

B. Equipment

- (1) Rig Pins from Set A20004-XX (AMM 20-10-24/201):
- (a) TE1 - P/N A20004-9.
- (2) LE Slat Groundlock - A27007-1 (2 Necessary)
- (3) TE Flap PDU Lock - A27009-7

  - 611BB LE Slat Power Drive Unit - Inboard (Right)

E. Adjust the TE Flap PDU

S 212-101

- (1) Make sure the TE flaps and LE slats are in the fully retracted position and the flap control lever is in the zero (FLAPS UP) detent.

S 092-102

- (2) Remove the DO-NOT-OPERATE tag from the flap control lever.

S 862-103

- (3) Supply electrical power (AMM 24-22-00/201).

S 862-104

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURIES TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (4) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 862-105

- (5) Move the flap control lever to the 30-unit detent and make sure the TE flaps and LE slats move to the fully extended position.

S 862-106

- (6) Move the flap control lever back to the zero (FLAPS UP) detent and make sure the TE flaps and LE slats move to the fully retracted position.

S 492-107

- (7) Install a DO-NOT-OPERATE tag on the flap control lever.

S 862-108

- (8) Remove power from the center hydraulic system (AMM 29-11-00/201).

S 492-109

- (9) Install a PDU lock in the TE flap PDU (Fig. 204).

EFFECTIVITY

ALL

27-51-34

S 492-110

- (10) Install groundlocks in the inboard and outboard slat PDUs (Fig. 205).

S 822-111

- (11) If it is necessary, adjust the control rod that is attached to the pilot input arm, until you can easily install rig pin TE1 in the rig pin hole for the PDU input cam.

S 092-112

- (12) Remove rig pin TE1 and install the plug in the rig pin hole.

F. Test of the Power Drive Unit

S 092-113

- (1) If installed, remove the DO-NOT-OPERATE tag from the flap control lever.

S 092-114

- (2) If installed, remove the PDU lock from the TE flap PDU (Fig. 204).

S 092-115

- (3) If installed, remove the groundlocks from the inboard and outboard slat PDUs (Fig. 205).

S 862-116

- (4) Remove the circuit breaker locks and the DO-NOT-CLOSE tags, and close these circuit breakers on the overhead panel, P11:
- (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD
  - (c) 11J24, FLAPS ALTN CONT

S 862-117

- (5) Remove the circuit breaker locks and the DO-NOT-CLOSE tags, and close these circuit breakers on the main power distribution panel, P6:
- (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6D24, ALTN FLAP PWR
  - (c) 6F24, ALTN SLAT OUTBD PWR

S 212-118

- (6) Make sure the position selector switch for the flap/slat alternate drive, in the flight compartment, is in the NORM detent.

S 862-119

- (7) Supply electrical power (AMM 24-22-00/201).

S 862-127

- (14) Push the arming switch for the flap alternate drive, in the flight compartment, to arm the flap alternate drive (ALTN switch light comes on) and do these checks:
- (a) Make sure the amber TRAILING EDGE light, on the P3 panel, comes on approximately after seven seconds.
  - (b) Make sure the TE FLAP DISAGREE message shows on the EICAS display approximately after seven seconds.

S 862-128

- (15) Move the flap control lever to the 20-unit detent, and do these checks:
- (a) Make sure the TE flaps stay at the fully retracted position.
  - (b) Make sure the LE slats move to the intermediate position.

S 862-129

- (16) Move the flap control lever to the zero (FLAPS UP) detent, and do this check:
- (a) Make sure the LE slats move to the fully retracted position.

S 862-130

- (17) Move the position selector switch for the flap/slat alternate drive, on the P3 panel, to the UP detent, and do these checks:
- (a) Make sure no messages show on the EICAS display.
  - (b) Make sure the amber TRAILING EDGE light, on the P3 panel, goes off.

S 862-131

- (18) Move the position selector switch for the flap/slat alternate drive, in the flight compartment, to the 20-unit detent and do these checks:
- (a) Make sure the TE flaps move to the 20-degree position.
  - (b) Make sure no messages show on the EICAS display.
  - (c) Make sure the amber TRAILING EDGE light, on the P3 panel, does not come on.

S 862-132

- (19) Move the position selector switch for the flap/slat alternate drive, in the flight compartment, to the UP detent and do these checks:
- (a) Make sure the TE flaps move to the fully retracted position.
  - (b) Make sure no messages show on the EICAS display.
  - (c) Make sure the amber TRAILING EDGE light, on the P3 panel, does not come on.

TE FLAP BULKHEAD TEE GEARBOX - REMOVAL/INSTALLATION

1. General

- A. This procedure contains the removal and the installation tasks for the trailing edge (TE) flap bulkhead tee gearbox.

TASK 27-51-35-024-001

2. TE Flap Bulkhead Tee Gearbox - Removal

A. Equipment

- (1) Circuit Breaker Lockout Clip - 1012LC-R  
Commercially available  
(2) TE Flap PDU Lock - A27009-7

B. References

- (1) AMM 27-51-41/401, TE Flap Torque Tubes  
(2) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems  
(3) AMM 32-00-15/201, Landing Gear Door Locks  
(4) AMM 32-00-20/201, Landing Gear Downlocks

C. Access

- (1) Location Zones
- |         |  |
|---------|--|
| 143/144 | Left/Right MLG Wheel Well              |
| 211/212 | Control Cabin                          |
| 710     | Nose Landing Gear and Doors            |
| 730/740 | Left/Right Main Landing Gear and Doors |

D. Prepare for the Removal

S 214-002

- (1) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

S 494-003

**WARNING:** USE THE TASK IN AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Open the doors for the main landing gear and install the door locks (AMM 32-00-15/201).

S 864-004

- (3) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).

S 864-005

- (4) Open this circuit breaker on the main power distribution panel, P6, and attach a DO-NOT-CLOSE tag:  
(a) 6D24, ALTN FLAP PWR

  - 211/212 Control Cabin
  - 710 Nose Landing Gear and Doors
  - 730/740 Left/Right Main Landing Gear and Doors

D. Install the Bulkhead Tee Gearbox

S 214-014

- (1) Make sure the power is removed from the center hydraulic system (AMM 29-11-00/201).

S 644-015

- (2) Apply a thin layer of BMS 3-24 grease to the gearbox bolts.

S 434-016

- (3) Put the gearbox into its position and install the three gearbox bolts, washers, and locknuts.

NOTE: Install one washer below each bolt head.

S 434-017

- (4) Connect the three torque tubes (AMM 27-51-41/401).

NOTE: Do not turn the torque tube during the installation. It will be necessary to adjust the flap drive if you turn the torque tube.

S 224-018

- (5) Make sure the torque tubes can move from end to end, and that the end clearances are satisfactory (AMM 27-51-41/401).

S 644-019

- (6) Fill the gearbox coupling with BMS 3-33 grease.

S 434-020

- (7) Make sure you install a lockwire to the coupling screws on each coupling with the double twist procedure (AMM 20-10-23/401).

TE FLAP BULKHEAD TEE GEARBOX – INSPECTION/CHECK

1. General

- A. This procedure only has illustrations and a wear limit table, which show the data for wear limits. There are no procedures for access, removal, or installation of the parts. Refer to the TE Flap Bulkhead TEE Gearbox – Removal/Installation for procedures to do these tasks.

TASK 27-51-35-226-001

2. Wear Limits for the TE Flap Bulkhead TEE Gearbox (Fig. 601)

NOTE: Wear limits for other components that are connected to the TEE gearbox on the TE flap bulkhead are in other Inspection/Check Sections of the Maintenance Manual.

A. Access

(1) Location Zones

- |     |                      |
|-----|----------------------|
| 143 | Left MLG Wheel Well  |
| 144 | Right MLG Wheel Well |

B. Procedure

S 226-003

- (1) Use the supplied data (Fig. 601) to examine the TE flap bulkhead tee gearbox for too much wear.

TE FLAP BULKHEAD ANGLE GEARBOX – REMOVAL/INSTALLATION

1. General

- A. This procedure contains the removal and the installation tasks for the trailing edge (TE) flap bulkhead angle gearbox.

TASK 27-51-36-024-001

2. TE flap Bulkhead Angle Gearbox – Removal

A. Equipment

- (1) Circuit Breaker Lockout Clip – 1012LC-R  
Commercially Available  
(2) TE Flap PDU Lock – A27009-7

B. References

- (1) AMM 27-51-41/401, TE Flap Torque Tubes  
(2) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems  
(3) AMM 32-00-15/201, Landing Gear Door Locks  
(4) AMM 32-00-20/201, Landing Gear Downlocks

C. Access

- (1) Location Zones
- |         |  |
|---------|--|
| 143/144 | Left/Right MLG Wheel Well              |
| 211/212 | Control Cabin                          |
| 710     | Nose Landing Gear and Doors            |
| 730/740 | Left/Right Main Landing Gear and Doors |

D. Prepare for the Removal

S 214-002

- (1) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

S 214-003

**WARNING:** USE THE TASK IN AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Open the doors for the landing gear and install the door locks (AMM 32-00-15/201).

S 864-004

- (3) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).

S 864-005

- (4) Open this circuit breaker on the main power distribution panel, P6, and attach a DO-NOT-CLOSE tag:  
(a) 6D24, ALTN FLAP PWR

Nov 10/90

- S 864-006
- (5) Open these circuit breakers on the P6 panel and install circuit breaker locks:
- (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6F24, ALTN SLAT OUTBD PWR
- S 864-007
- (6) Open this circuit breaker on the overhead panel, P11, and attach a DO-NOT-CLOSE tag:
- (a) 11J24, FLAPS ALTN CONT
- S 864-008
- (7) Open these circuit breakers on the P11 panel and install circuit breaker locks:
- (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD
- S 494-009
- (8) Install the PDU lock in the TE flap power drive unit (PDU) (Fig. 402).
- E. Remove Bulkhead Angle Gearbox (Fig. 401)

- S 034-010
- (1) Disconnect the two torque tubes from the bulkhead angle gearbox (AMM 27-51-41/401).

**NOTE:** Do not turn the torque tube. It will be necessary to adjust the flap drive if you turn the torque tube while it is disconnected.

- S 034-011
- (2) Disconnect the four gearbox bolts.

- S 024-012
- (3) Remove the gearbox and the shims.

**NOTE:** Make a record of the shim thickness and keep the shims for the subsequent installation if you will install the same gearbox that you removed.

TASK 27-51-36-404-025

3. TE flap Bulkhead Angle Gearbox - Installation

A. Consumable Materials

- (1) D00633 Grease - BMS 3-33 (Preferred)

EFFECTIVITY

ALL

27-51-36

02

Page 404  
Aug 22/07

- (2) D00013 Grease - MIL-PRF-23827 (Supersedes MIL-G-23827) (Alternate)
- (3) D00015 Grease - BMS 3-24 (Alternate)

B. References

- (1) AMM 20-10-23/401, Lockwires
- (2) AMM 27-51-00/501, Trailing Edge Flap System
- (3) AMM 27-51-41/401, TE Flap Torque Tubes
- (4) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems
- (5) AMM 32-00-15/201, Landing Gear Door Locks

C. Access

- (1) Location Zones
  - 143/144 Left/Right MLG Wheel Well
  - 211/212 Control Cabin
  - 710 Nose Landing Gear and Doors
  - 730/740 Left/Right Main Landing Gear and Doors

D. Install the Bulkhead Angle Gearbox (Fig. 401)

S 644-013

- (1) Apply a light layer of BMS 3-24 grease to the gearbox bolts.

S 424-014

- (2) Do this step to install the gearbox if you kept the old shims for installation, and you know the shim thickness that is necessary:
  - (a) Install the gearbox with the gearbox bolts, shims, washers, and nuts. Tighten the nuts to 100-150 pound-inches (11.3-16.9 newton-meters).

S 424-015

- (3) If you will install the gearbox with new shims, determine the shim thickness and install the gearbox with these steps:
  - (a) Install the gearbox bolts into the two upper lugs without the shims, and tighten the nuts to 100 to 150 pound-inches (11.3-16.9 newton-meters).
  - (b) Measure the clearance at the lower lugs to determine the shim thickness that is necessary.
  - (c) Remove the gearbox bolts at the upper lugs.
  - (d) Install the two lower bolts with the new shims and tighten the bolts to 100-150 pound-inches (11.3-16.9 newton-meters).
  - (e) Measure the clearance at the upper lugs to determine the thickness of shims that is necessary.
  - (f) Add shims to fill the clearance at the upper lugs and install the gearbox bolts. Tighten the bolts to 100-150 pound-inches (11.3-16.9 newton-meters).

TE FLAP SIDE-OF-BODY ANGLE GEARBOX – INSPECTION/CHECK

1. General

A. This procedure only has illustrations and a wear limit table, which show the data for wear limits. There are no procedures for access, removal, or installation of the parts. Refer to the TE Flap Side-of-Body Angle Gearbox – Removal/Installation for procedures to do these tasks.

TASK 27-51-37-226-001

2. Wear Limits for the TE Flap Side-of-Body Angle Gearbox (Fig. 601)

NOTE: Wear limits for other components that are connected to the side-of-body angle gearbox are in other Inspection/Check sections of the Maintenance Manual.

A. Access

(1) Location Zones

143	Left MLG Wheel Well
144	Right MLG Wheel Well

B. Procedure

S 226-003

(1) Use the supplied data (Fig. 601) to examine the TE flap side-of-body angle gearbox for too much wear.

TE FLAP OFFSET GEARBOX – REMOVAL/INSTALLATION

1. General

- A. This procedure contains the removal and the installation tasks for the TE flap offset gearbox.

TASK 27-51-38-024-001

2. TE Flap Offset Gearbox – Removal

A. Equipment

- (1) Circuit Breaker Lockout Clip – 1012LC-R  
Commercially Available
- (2) TE Flap PDU Lock – A27009-7

B. References

- (1) AMM 24-22-00/201, Electrical Power – Control
- (2) AMM 27-51-00/501, Trailing Edge Flap System
- (3) AMM 27-51-41/401, TE Flap Torque Tubes
- (4) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems
- (5) AMM 32-00-15/201, Landing Gear Door Locks
- (6) AMM 32-00-20/201, Landing Gear Downlocks

C. Access

(1) Location Zones

144	Right MLG Wheel Well
211/212	Control Cabin
550/650	Wing Trailing Edge – Inboard
710	Nose Landing Gear and Doors
730/740	Left/Right Main Landing Gear and Doors

D. Prepare for the Removal

S 214-002

- (1) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

S 494-003

**WARNING:** USE THE TASK IN AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Open the doors for the landing gear and install the door locks (AMM 32-00-15/201).

S 864-004

- (3) Supply electrical power (AMM 24-22-00/201).

S 864-005

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

(4) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 864-006

(5) Move the flap control lever to the 30-unit detent and permit the flaps to move to the fully extended position.

S 864-007

(6) Remove pressure from the center hydraulic system (AMM 29-11-00/201).

S 864-008

(7) Open this circuit breaker on the main power distribution panel, P6, and attach a DO-NOT-CLOSE tag:

(a) 6D24, ALTN FLAP PWR

S 864-009

(8) Open these circuit breakers on the P6 panel and install circuit breaker locks:

(a) 6D21, ALTN SLAT INBD PWR

(b) 6F24, ALTN SLAT OUTBD PWR

S 864-010

(9) Open this circuit breaker on the overhead panel, P11, and attach a DO-NOT-CLOSE tag:

(a) 11J24, FLAPS ALTN CONT

S 864-011

(10) Open these circuit breakers on the P11 panel and install circuit breaker locks:

(a) 11H23, SLAT ALTN CONT INBD

(b) 11H24, SLAT ALTN CONT OUTBD

S 494-012

(11) Install the PDU lock in the TE flap power drive unit (PDU) (Fig. 402).

E. Remove the Offset Gearbox (Fig. 401)

S 034-013

- (1) Disconnect the four bolts that attach the safety strap bracket half to the gearbox bracket half.

**NOTE:** Do not remove the four lockwired bolts that is attached to to the offset gearbox.

S 034-014

- (2) Move the safety strap bracket along the torque tube and away from the offset gearbox.

S 034-015

- (3) Disconnect the two torque tubes on the offset gearbox (AMM 27-51-41/401).

**NOTE:** Do not turn the torque tube. It will be necessary to adjust the flap drive if you turn the torque tube while it is disconnected.

S 034-016

- (4) Remove the three gearbox bolts that connect the offset gearbox to the landing gear beam.

S 024-017

- (5) Remove the offset gearbox from the airplane.

TASK 27-51-38-424-018

3. TE Flap Offset Gearbox - Installation

A. Consumable Materials

- (1) D00633 Grease - BMS 3-33 (Preferred)
- (2) D00013 Grease - MIL-PRF-23827 (Supersedes MIL-G-23827) (Alternate)
- (3) D00015 Grease - BMS 3-24 (Alternate)

C. Access

(1) Location Zones

144	Right MLG Wheel Well
211/212	Control Cabin
550/650	Wing Trailing Edge - Inboard
710	Nose Landing Gear and Doors
730/740	Left/Right Main Landing Gear and Doors

D. Install the Offset Gearbox (Fig. 401)

S 644-019

- (1) Apply a thin layer of the grease to the three gearbox bolts.

S 434-020

- (2) Put the offset gearbox into its position and attach it with three bolts, washers, and locknuts.

S 434-021

- (3) Connect the two torque tubes to the offset gearbox (AMM 27-51-41/401).

**NOTE:** Do not turn the torque tube during the installation. It will be necessary to adjust the flap drive if you turn the torque tube.

S 224-022

- (4) Make sure the torque tube on the inboard side of the offset gearbox can move from end to end, and that the end clearances are satisfactory (AMM 27-51-41/401).

S 644-023

- (5) Fill the gearbox coupling with BMS 3-33 grease.

S 434-024

- (6) Make sure you install a lockwire to the coupling screws at each coupling with the double twist procedure (AMM 20-10-23/401).

EFFECTIVITY

ALL

27-51-38

01

Page 406  
Apr 22/08

S 434-025

- (7) Apply grease to four bracket half bolts, and install the bracket half with safety strap to the gearbox bracket half.

**NOTE:** Make sure the safety strap clears the torque tube by a minimum of 0.10 inch (2.54 mm).

S 094-026

- (8) Remove the PDU lock from the TE flap PDU (Fig. 402).

S 224-027

- (9) Do a check on the retract overtravel stop clearances for the inboard flap if it is necessary (AMM 27-51-00/501).

E. Put the Airplane Back to Its Usual Condition

S 864-028

- (1) Remove the circuit breaker locks and DO-NOT-CLOSE tags, and close these circuit breakers on the main power distribution panel, P6:  
(a) 6D21, ALTN SLAT INBD PWR  
(b) 6D24, ALTN FLAP PWR  
(c) 6F24, ALTN SLAT OUTBD PWR

S 864-029

- (2) Remove the circuit breaker locks and DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel, P11:  
(a) 11H23, SLAT ALTN CONT INBD  
(b) 11H24, SLAT ALTN CONT OUTBD  
(c) 11J24, FLAPS ALTN CONT

S 864-030

- (3) Supply electrical power (AMM 24-22-00/201).

S 864-031

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (4) Pressurize the center hydraulic system (AMM 29-11-00/201).

AILERON DROOP ANGLE GEARBOX – REMOVAL/INSTALLATION

1. General

- A. This procedure contains the removal and the installation tasks for the left and right aileron droop angle gearboxes.
- B. The left and right aileron droop angle gearboxes are different, and are not interchangeable.

TASK 27-51-40-024-001

2. Aileron Droop Angle Gearbox – Removal

A. Equipment

- (1) Circuit Breaker Lockout Clip – 1012LC-R  
Commercially Available
- (2) TE Flap PDU Lock – A27009-7

B. References

- (1) AMM 06-44-00/201, Wing Access Doors and Panels
- (2) AMM 27-51-41/401, TE Flap Torque Tubes
- (3) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems
- (4) AMM 32-00-15/201, Landing Gear Door Locks
- (5) AMM 32-00-20/201, Landing Gear Downlocks
- (6) AMM 54-52-01/401, Strut Fairings

C. Access

(1) Location Zones

144	Right MLG Wheel Well
211/212	Control Cabin
410	No. 1 Power Plant
420	No. 2 Power Plant
550/650	Wing Trailing Edge – Inboard
710	Nose Landing Gear and Doors
730/740	Left/Right Main Landing Gear and Doors

(2) Access Panels

561AB/661AB	Left/Right Wing TE Structure, Aileron Controls
-------------	--

D. Prepare for the Removal

S 214-002

- (1) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

S 494-003

**WARNING:** USE THE TASK IN AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Open the doors for the landing gear and install the door locks (AMM 32-00-15/201).

E. Remove the Aileron Droop Angle Gearbox (Fig. 401)

S 034-014

- (1) Disconnect the torque tubes on the aileron droop angle gearbox, at the input and output couplings.
  - (a) At the coupling end of each torque tube, disconnect the lockwire and remove the coupling screws.

NOTE: Do not turn the torque tubes. It will be necessary to adjust the flap drive and check the retract overtravel stop clearances if you turn the torque tubes while they are disconnected.

S 034-015

- (2) Disconnect the center bolt that attaches the aileron summing lever to the crank arm (Detail B for the left gearbox, or Detail E for the right gearbox).

S 984-016

- (3) Move the aileron summing lever away from the crank arm.

S 034-017

- (4) Disconnect the twelve bolts, washers, and nuts on the vapor seal, and remove the vapor seal (Detail D).

S 034-018

- (5) For the left gearbox, disconnect the six gearbox bolts at the rear spar stiffeners (Detail A).

S 034-019

- (6) For the right gearbox, disconnect the four gearbox bolts at the rear spar stiffeners (Detail C).

S 024-020

- (7) Remove the gearbox from the airplane with the gearbox mounting bracket attached.

TASK 27-51-40-424-021

3. Aileron Droop Angle Gearbox - Installation

A. Consumable Materials

- (1) D00633 Grease - BMS 3-33 (Preferred)

EFFECTIVITY

ALL

27-51-40

710	Nose Landing Gear and Doors
730/740	Left/Right Main Landing Gear and Doors

(2) Access Panels

561AB/661AB	Left/Right Wing TE Structure, Aileron Controls
-------------	--

D. Install the Aileron Droop Angle Gearbox (Fig. 401)

S 824-022

- (1) For the left gearbox,  
do this step to adjust the crank arm to the flaps fully retracted position (with no aileron droop):
  - (a) Turn the input shaft coupling until the crank arm moves to the position shown (Detail B), and that the index mark on the timing disc aligns with the index mark on the housing.

S 824-023

- (2) For the right gearbox,  
do this step to adjust the crank arm to the flaps fully retracted position (with no aileron droop):
  - (a) Turn the input coupling until the crank arm moves to the position shown (Detail E), and that the index mark on the timing disc aligns with the index mark on the housing.

S 644-024

- (3) Apply a layer of the grease to the gearbox bolts.

S 434-025

- (4) For the left gearbox,  
attach the gearbox to the rear spar stiffeners with six gearbox bolts.

EFFECTIVITY

ALL

27-51-40

02

Page 407  
Apr 22/08

- S 434-026
- (5) For the right gearbox,  
attach the gearbox to the rear spar stiffeners with four gearbox  
bolts.

- S 644-027
- (6) Apply grease to the center bolt for the aileron summing lever.

- S 434-028
- (7) Put the aileron summing lever in the crank arm and attach it with  
the center bolt, washer, and locknut. Tighten the locknut.

- S 434-029
- (8) Connect the torque tubes to the gearbox at the input and output  
couplings (AMM 27-51-41/401).

**NOTE:** Do not turn the torque tube during the installation. It will  
be necessary to adjust the flap drive and check the retract  
overtravel stop clearances if you turn the torque tube.

- S 224-030
- (9) Make sure the torque tube at the inboard side of the gearbox can  
move from end to end, and that the end clearances are satisfactory  
(AMM 27-51-41/401).

- S 644-031
- (10) Fill the gearbox coupling with BMS 3-33 grease.

- S 434-032
- (11) Make sure you install a lockwire to the coupling screws on each  
coupling with the double twist procedure (AMM 20-10-23/401).

- S 644-033
- (12) Apply a thin layer of grease to twelve bolts for the vapor seal.

EFFECTIVITY

ALL

27-51-40

02

Page 408  
Apr 22/08

S 434-034

**CAUTION:** MAKE SURE YOU INSTALL THE VAPOR SEAL WITH THE FLANGE ALIGNED IN THE DIRECTION OF THE HORIZONTAL PLANE. INCORRECTLY INSTALLED VAPOR SEAL CAN CATCH THE MOVEMENT OF THE AILERON AND CAUSE DAMAGE TO THE AIRPLANE.

- (13) Install the vapor seal around the inboard torque tube with the twelve fasteners, washers, and nuts (Detail D).

**NOTE:** Make sure the flange on the vapor seal aligns with the horizontal plane.

S 094-035

- (14) Remove the PDU lock from the TE flap power drive unit (PDU) (Fig. 402).

S 224-036

- (15) Do a check on the retract overtravel stop clearances if the torque tube has been rotated while disassembled. (AMM 27-51-00/501).

E. Put the Airplane Back to Its Usual Condition

S 414-039

- (1) Install the wing access panels, 561AB (left wing) and 661AB (right wing), above the trailing edge fairing of the engine strut (AMM 06-44-00/201).

S 424-040

- (2) Install the trailing edge fairing for the engine strut (AMM 54-52-01/401).

S 864-037

- (3) Remove the circuit breaker locks and DO-NOT-CLOSE tags and close these circuit breakers on the main power distribution panel, P6:  
(a) 6D21, ALTN SLAT INBD PWR  
(b) 6D24, ALTN FLAP PWR  
(c) 6F24, ALTN SLAT OUTBD PWR

S 864-038

- (4) Remove the circuit breaker locks and DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel, P11:  
(a) 11H23, SLAT ALTN CONT INBD  
(b) 11H24, SLAT ALTN CONT OUTBD

Page 405  
May 10/90

THE MINIMUM CLEARANCE BETWEEN THE TORQUE TUBES AND THE ADJACENT STRUCTURE IS 0.38 INCH. WHERE A NYLON RUBSTRIP IS INSTALLED, THE MINIMUM CLEARANCE IS 0.12 INCH. NYLON MUST EXTEND A MINIMUM OF 0.09 INCH OVER THE ADJACENT STRUCTURE.

**COUPLING JOINT (EXAMPLE)  
(FOR INBOARD OR OUTBOARD FLAP)**

(A)

- 1 THE TORQUE TUBE MUST ALIGN WITH THE CENTER AXIS OF THE ADJACENT GEARBOX OR BEARING SHAFT DURING THE INSTALLATION, WITH A TOLERANCE OF LESS THAN 1 DEGREE IN THE HORIZONTAL AND VERTICAL PLANES. YOU CAN ALIGN THE TORQUE TUBE WITH A TOLERANCE OF LESS THAN 1.25 DEGREE, IF THE AIRPLANE IS ON THE GROUND WITH FUEL IN THE WING.
- 2 EXCEPT THOSE INDICATED BY 1, ALL TORQUE TUBES MUST ALIGN WITH THE CENTER AXIS OF THE ADJACENT GEARBOX OR BEARING SHAFT DURING INSTALLATION, WITH TOLERANCE OF LESS THAN 0.75 DEGREE IN THE HORIZONTAL AND VERTICAL PLANES. YOU CAN ALIGN THE TORQUE TUBE WITH A TOLERANCE OF LESS THAN 1 DEGREE, IF THE AIRPLANE IS ON THE GROUND WITH FUEL IN THE WING.

S 864-007

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

(4) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 864-008

(5) Move the flap control lever to the 30-unit detent and permit the TE flaps to move to the fully extended position.

S 864-009

(6) Remove pressure from the center hydraulic system (AMM 29-11-00/201).

S 864-010

(7) Open this circuit breaker on the main power distribution panel, P6, and attach a DO-NOT-CLOSE tag:

(a) 6D24, ALTN FLAP PWR

S 864-011

(8) Open these circuit breakers on the P6 panel and install circuit breaker locks and DO-NOT-CLOSE tags:

(a) 6D21, ALTN SLAT INBD PWR

(b) 6F24, ALTN SLAT OUTBD PWR

S 864-012

(9) Open this circuit breaker on the overhead panel, P11, and attach a DO-NOT-CLOSE tag:

(a) 11J24, FLAPS ALTN CONT

S 864-013

(10) Open these circuit breakers on the P11 panel and attach circuit breaker locks and DO-NOT-CLOSE tags:

(a) 11H23, SLAT ALTN CONT INBD

(b) 11H24, LAT ALTN CONT OUTBD

S 494-014

(11) Install the PDU lock on the TE flap PDU (Fig. 404).

01

Page 408  
Dec 10/98

S 014-015

- (12) Remove the access panels for the trailing edge as necessary to get access to the torque tubes (AMM 06-44-00/201).

G. TE Flap Torque Tubes Removal Procedure

S 034-016

- (1) Disconnect the safety straps from the torque tubes at the inboard flap drive (Fig. 401).

S 034-017

- (2) Disconnect the safety straps from the torque tubes at the outboard flap drive (Fig. 402).

S 034-018

- (3) At the aileron droop angle gearbox, disconnect the twelve bolts, washers, and locknuts and remove the inboard vapor seal (Fig. 402).

S 034-019

- (4) At the offset gearbox, disconnect the four bolts that attach the safety strap bracket half to the gearbox bracket half (Fig. 401).

**NOTE:** Do not move the four lockwired bolts that is attached to the offset gearbox.

S 024-020

- (5) Do the steps that follow to remove a floating torque tube (Fig. 401, Section A-A):

**NOTE:** A floating torque tube has a coupling sleeve at each end of the torque tube.

- (a) At each end of the torque tube, disconnect the lockwire and remove the coupling screws.
- (b) Move the coupling sleeve along the torque tube and off the coupling half.

**NOTE:** Do not turn the torque tube. It will be necessary to adjust the flap drive if you turn the torque tube while the coupling is loose.

- (c) Remove the floating torque tube from the airplane.

EFFECTIVITY

ALL

27-51-41

01

Page 409  
Apr 22/01

S 024-042

- (6) Do the steps that follow to remove a nonfloating torque tube (Fig. 401, Section A-A):

NOTE: A nonfloating torque tube has a coupling at one end and a support bearing at the opposite end.

- (a) At the coupling end, disconnect the lockwire and remove the coupling screws.
- (b) Move the coupling sleeve along the torque tube and off the coupling half.

NOTE: Do not turn the torque tube. It will be necessary to adjust the flap drive if you turn the torque tube while the coupling is loose.

- (c) At the torque tube end with the support bearing, disconnect the adjacent coupling (at the far side of the support bearing).
- (d) Move the torque tube away from the support bearing.
- (e) Loosen the nut that holds the coupling half to the support bearing.
- (f) Remove the nut, washer, and the coupling half.
- (g) Move the torque tube away from the support bearing and remove it from the airplane.

#### H. TE Flap Torque Tube Installation Procedure

NOTE: Wear Limits for the components identified in this procedure are in AMM 27-51-41/601, TE Flap Torque tubes.

S 864-021

- (1) Move the safety straps into position on the torque tube.

S 644-022

- (2) Apply a layer of BMS 3-33 grease to the spline teeth before the installation.

S 824-023

- (3) Refer to Fig. 403 to align the torque tubes during the installation.

S 424-024

- (4) Do the steps that follow to install a floating torque tube (Fig. 401):

NOTE: A floating torque tube has a coupling sleeve at each end of the torque tube

- (a) Put the torque tube into position in the wing.

EFFECTIVITY

ALL

27-51-41

01

Page 410  
Apr 22/01

- (b) Put the ends of the torque tube in the adjacent coupling halves.

**NOTE:** Do not turn the torque tube during installation. It will be necessary to adjust the flap drive if you turn the torque tube.

- (c) Move the coupling sleeves over the coupling halves.
- (d) Install the three coupling screws with lockwires at both ends of the torque tubes.
- (e) Do a check on the axial end play as follows:
  - 1) Move the torque tube fully to the inboard direction.
  - 2) At the outboard end of the torque tube, move the coupling fully to the outboard direction.
  - 3) Measure and write the distance between the coupling and the support bearing.
  - 4) Move the torque tube fully to the outboard direction.
  - 5) At the outboard end of the torque tube, move the coupling fully to the outboard direction.
  - 6) Again, measure and write (from the same points) the distance between the coupling and the support bearing.
  - 7) Make sure that the difference between the two distances that you measured agrees with the dimension in Fig. 401, Section A-A.

S 424-025

- (5) Do the steps that follow to install a nonfloating torque tube (Fig. 401):

**NOTE:** A nonfloating torque tube has a coupling at one end and a support bearing at the opposite end.

- (a) Apply a layer of BMS 3-33 grease to the these items:
  - 1) The support bearing housing and bore.
  - 2) The external surface of the torque tube where it engages the support bearing.
- (b) Install a thrust washer on the torque tube.
- (c) Put the torque tube through the support bearing.
- (d) Install the second thrust washer through the torque tube.
- (e) Move the torque tube away from the support bearing until the opposite end connects with the adjacent coupling half.

**NOTE:** Do not turn the torque tube during the installation. It will be necessary to adjust the flap drive if you turn the torque tube.

- (f) At the coupling end of the torque tube, move the coupling sleeve over the coupling half.
- (g) Install the three coupling screws with lockwire.

EFFECTIVITY

ALL

27-51-41

01

Page 411  
Apr 22/01

- (h) At the support bearing end of the torque tube, do the checks that follow on the axial end play:

**NOTE:** Do these checks before you install the nut on the torque tube at the support bearing.

- 1) Move the torque tube fully away from the support bearing.
  - 2) Measure and write the distance between the torque tube and the support bearing.
  - 3) Move the torque tube fully to the direction of the support bearing and measure the distance from the same points as you did before.
  - 4) Make sure that the difference between the two distances that you measured agrees with the dimension in Fig. 401, Detail C.
- (i) Install the coupling half, molded sleeve, washer, and nut on the torque tube spline.

**NOTE:** Apply BMS 3-33 (preferred) or BMS 3-24 (alternate) grease to the nut before installation.

- (j) Tighten the nut with a torque value of 400 - 480 pound-inches (45.2-54.2 newton-meters).
- (k) Install the coupling sleeve from the adjacent torque tube over the coupling half.

**CAUTION:** MAKE SURE YOU INSTALL LOCKWIRE ON THE COUPLING SCREWS. IF THE COUPLING SCREWS COME OFF, THE TORQUE TUBE COUPLING WILL DISCONNECT AND CAUSE DAMAGE TO THE AIRPLANE.

- (l) Attach the three coupling screws with lockwire to the coupling sleeve.

S 644-026

- (6) Fill all the coupling sleeves with BMS 3-33 grease until grease comes out at the side opposite to the flange.

S 644-027

- (7) Fill the support bearing with grease until grease comes out at either side of the bearing housing.

S 434-028

- (8) Connect the safety strap to the wing structure.

**NOTE:** Make sure that the clearance between the safety strap and the torque tube is at least 0.15 inch (3.81 mm).

EFFECTIVITY

ALL

27-51-41

01

Page 412  
Apr 22/08

S 434-029

- (9) At the offset gearbox, install the safety strap and bracket half to the gearbox bracket half with four bolts, washers, and locknuts.

**NOTE:** Make sure that the clearance between the safety strap and the torque tube is at least 0.15 inch (3.81 mm).

S 434-043

**CAUTION:** MAKE SURE YOU INSTALL THE VAPOR SEAL WITH THE FLANGE ALIGNED IN THE DIRECTION OF THE HORIZONTAL PLANE. INCORRECTLY INSTALLED VAPOR SEAL CAN CATCH THE MOVEMENT OF THE AILERON AND CAUSE DAMAGE TO THE AIRPLANE.

- (10) At the aileron droop angle gearbox, install the vapor seal with the twelve bolts, washers, and locknuts (Fig. 402).

S 824-031

- (11) Make sure the torque tube is aligned with the center axis of the adjacent gearbox or bearing shaft, as shown in Fig. 403.

S 094-032

- (12) Remove the PDU lock from the TE flap PDU (Fig. 404).

S 864-033

- (13) Remove the circuit breaker locks and DO-NOT-CLOSE tags and close these circuit breakers on the P6 panel:
- (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6D24, ALTN FLAP PWR
  - (c) 6F24, ALTN SLAT OUTBD PWR

S 864-034

- (14) Remove the circuit breaker locks and DO-NOT-CLOSE tags and close these circuit breakers from the P11 panel:
- (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD
  - (c) 11J24, FLAPS ALTN CONT

S 864-035

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

(15) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 214-036

(16) Extend and retract the TE flaps with the flap control lever and monitor the operation of the torque tubes.

S 224-037

(17) Make sure that the clearance between the parts that turn and the closest structure is at least 0.38 inch (9.65 mm).

**NOTE:** The clearance must be at least 0.12 inch (3.04 mm) at the locations where a nylon rubstrip is installed. The nylon strip must extend a minimum of 0.09 inch (2.28 mm) over the structure.

S 214-038

(18) Do a check on the flap overtravel stop clearance (AMM 27-51-00/501).

I. Put the Airplane Back to its Usual Condition

S 414-039

(1) Install the access panels for the trailing edge, if removed (AMM 06-44-00/201).

S 864-040

(2) Remove power from the center hydraulic system (AMM 29-11-00/201).

TRAILING EDGE FLAP TORQUE TUBE - APPROVED REPAIRS

TASK 27-51-41-168-009

1. Approved Repairs for the Trailing Edge Flap Torque Tube

A. General

- (1) This procedure gives instructions for the repair of damaged torque tubes caused by wear on the outer diameter. This procedure does not give instructions to remove or install the torque tube.

B. Consumable Materials

- (1) C00064 Alodine 1200S
- (2) C00699 Primer - BMS 10-11, Type 1
- (3) C00032 Enamel BMS 10-60, Type I, Boeing color 707

C. References

- (1) 27-51-41/401, Trailing Edge Flap Torque Tubes
- (2) 51-21-04/701, Alodine Coating
- (3) 51-21-10/701, Decorative Exterior Finishes

D. Access

- (1) Location Zones
  - 550/650 Wing Trailing Edge - Inboard
  - 560/660 Wing Trailing Edge - Outboard

E. Examine the Torque Tube for Repair or Replacement

S 228-001

- (1) You must replace the torque tube if one or more of these conditions is true (Ref 27-51-41):
  - (a) The full diameter surface at the worn area of the torque tube was repaired before.
  - (b) The worn area is adjacent to the end fitting fasteners.
  - (c) The depth of the repair done before is larger than the repair limits given by the table that follows.

S 228-002

- (2) You can repair the torque tube if the repair is less than the limits given by the table that follows:

EFFECTIVITY

ALL

27-51-41

01

Page 801  
Aug 10/90

OUTER DIAMETER OF THE TORQUE TUBE	AREA OF THE REPAIR *[1]	PERMITTED DEPTH OF THE REPAIR *[1]
1.50 INCH	less than 30% of the torque tube circumference and less than 3 inches long	0.020 inch
	more than 30% of the torque tube circumference or more than 3 inches long	0.010 inch
*[1] THE REPAIR LIMITS ARE THE TOTAL OF THE REPAIR THAT YOU WILL DO, AND THE REPAIR DONE BEFORE.		

S 228-003

- (3) If there are more than two defects on the torque tube, you can repair the torque tube only if the defects are at least 2.25 inches (57.15 mm) apart.

F. Repair the Torque Tube

S 328-004

- (1) Machine the worn area. Use a minimum machined radius of 1.00 inch (25.4 mm). The surface finish of a repaired area must be 63 microinches (1.60 micrometers) or less. The torque tube is structurally satisfactory if the depth of the repair (include the repair done before) is not more than the repair limits given by the table.

S 238-005

- (2) Do a penetrant inspection of the repaired area.

S 378-006

- (3) Apply Alodine to the repaired surface (Ref 51-21-04).

S 378-007

- (4) Apply one layer of primer to the repaired surface (Ref 51-21-10).

S 378-008

- (5) Apply one layer of enamel to the repaired surface (Ref 51-21-10).

E. Remove the Actuator Input Angle Gearbox (Fig. 401)

S 034-014

- (1) Disconnect the torque tube from the gearbox (AMM 27-51-41/401).

**NOTE:** Do not turn the torque tube. It will be necessary to adjust the flap drive if you turn the torque tube while it is disconnected.

S 034-015

- (2) Remove the four gearbox bolts that attach the gearbox to the actuator.

S 024-016

- (3) Remove the gearbox from the airplane.

**NOTE:** Keep the splined coupling with the gearbox.

TASK 27-51-42-424-017

3. Actuator Input Angle Gearbox - Installation

A. Consumable Materials

- (1) D00633 Grease - BMS 3-33 (Preferred)
- (2) D00013 Grease - MIL-PRF-23827 (Supersedes MIL-G-23827) (Alternate)

B. References

- (1) AMM 06-41-00/201, Fuselage Access Doors and Panels

Aug 22/07

D. Install the Actuator Input Angle Gearbox (Fig. 401)

S 644-018

- (1) Apply a light layer of BMS 3-33 grease to the gearbox spline teeth and the gearbox mating surfaces.

S 214-019

- (2) Make sure the splined coupling is on the gearbox.

S 434-020

- (3) Put the gearbox splines into the splines of the rotary actuator.

S 434-021

- (4) Connect the gearbox to the rotary actuator with the four bolts, washers, and locknuts.

S 434-022

- (5) Connect the torque tube to the gearbox (AMM 27-51-41/401).

**NOTE:** Do not turn the coupling or the torque tube during the installation. It will be necessary to adjust the flap drive if you turn the torque tube or the splined coupling.

S 224-023

- (6) Make sure the torque tube can move from end to end, and that the end clearances are satisfactory (AMM 27-51-41/401).

S 644-024

- (7) Fill the splined coupling with BMS 3-33 grease.

S 424-035

- (8) Make sure you install a lockwire to the coupling screws on each coupling with the double twist procedure (AMM 20-10-23/401).

S 094-025

- (9) Remove the PDU lock in the TE flap PDU (Fig. 402).

S 224-026

- (10) Do a check on the retract overtravel stop clearances for the inboard flap, if it is necessary (AMM 27-51-00/501).

E. Put the Airplane Back to Its Usual Condition

S 414-027

- (1) Close the access panels, 195JL and 196JR, for the inboard flap mechanism (AMM 06-41-00/201).

S 864-028

- (2) Remove the circuit breaker locks and DO-NOT-CLOSE tags and close these circuit breakers on the main power distribution panel, P6:  
(a) 6D21, ALTN SLAT INBD PWR

S 864-029

- (3) Remove the circuit breaker locks and DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel, P11:
  - (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD
  - (c) 11J24, FLAPS ALTN CONT

S 864-030

- (4) Supply electrical power (AMM 24-22-00/201).

S 864-031

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (5) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 864-032

- (6) Move the flap control lever to the zero (FLAPS UP) detent and permit the flaps to move to the fully retracted position.

S 094-033

**WARNING:** USE THE TASK IN AMM 32-00-15/201 TO REMOVE THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (7) Remove the door locks from the landing gear doors and close the doors (AMM 32-00-15/201).

S 864-034

- (8) Remove power from the center hydraulic system (AMM 29-11-00/201).

FLAP POSITION TRANSMITTER AND TRANSMITTER GEARBOX –  
MAINTENANCE PRACTICES

1. General

- A. This procedure contains the removal and the installation tasks for the flap position transmitter. The installation task also contains the instructions for the adjustment and test of the position transmitters.

TASK 27-51-45-022-002

2. Flap Position Transmitter – Removal

A. Equipment

- (1) TE Flap PDU Lock – A27009-7
- (2) Circuit Breaker Lockout Clip – 1012LC-R  
Commercially Available

B. References

- (1) AMM 06-41-00/201, Fuselage Access Doors and Panels
- (2) AMM 24-22-00/201, Electrical Power – Control
- (3) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems
- (4) AMM 32-00-15/201, Landing Gear Door Locks
- (5) AMM 32-00-20/201, Landing Gear Downlocks

C. Access

(1) Location Zone

144	Right MLG Wheel Well
211/212	Control Cabin
550/650	Wing Trailing Edge – Inboard
560/660	Wing Trailing Edge – Outboard
570/670	Wing Trailing Edge Flap Track Fairings
710	Nose Landing Gear and Doors
730/740	Left/Right Main Landing Gear and Doors

(2) Access Panels

195JL/196JR	Left/Right Inboard Flap Mechanism
-------------	-----------------------------------

D. Prepare for the Removal

S 212-003

- (1) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

S 492-004

**WARNING:** USE THE TASK IN AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Open the doors for the landing gear and install the door locks (AMM 32-00-15/201).

S 862-005

- (3) Supply electrical power (AMM 24-22-00/201).

S 862-006

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS . IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (4) Pressurize the center hydraulic system and reservoir (AMM 29-11-00/201).

S 862-007

- (5) Move the flap control lever to the 30-unit detent and permit the flaps and slats to move to the fully extended position.

S 862-008

- (6) Remove power from the center hydraulic system (AMM 29-11-00/201).

S 492-010

- (7) Install the PDU lock on the trailing edge (TE) flap power drive unit (PDU) (Fig. 203).

S 492-011

- (8) Install a DO-NOT-OPERATE tag on the flap control lever.

S 862-012

- (9) Open this circuit breaker on the main power distribution panel, P6, and attach DO-NOT-CLOSE tag:  
(a) 6D24, ALTN FLAP PWR

S 862-013

- (10) Open these circuit breakers on the P6 panel and install circuit breaker locks:  
(a) 6D21, ALTN SLAT INBD PWR  
(b) 6F24, ALTN SLAT OUTBD PWR

S 862-014

- (11) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:

  - (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD

E. Remove the Flap Position Transmitter (Fig. 201)

S 012-016

- (1) Remove the access panel, 195JL and 196JR, below the fairing door to get access to the flap position transmitters, position 4 and 5 (AMM 06-41-00/201).

S 032-017

- (2) Disconnect the electrical connector from the transmitter receptacle.

S 032-018

- (3) Disconnect the wire clamps that attach the transmitter wire to the transmitter housing.

S 032-019

- (4) Remove the two transmitter bolts that connect the position transmitter to the transmitter housing.

S 022-020

- (5) Pull the position transmitter out of the transmitter housing.

TASK 27-51-45-422-030

3. Flap Position Transmitter - Installation

A. Equipment

- (1) Rig pin TE4 - P/N A20004-7, part of Set A20004-XX (AMM 20-10-24/201)
- (2) Test Equipment, TE Flap Asymmetry Fault Isolation - A27093-27

NOTE: Use the A27093-27 test cable for airplanes with a -53 FSEU.

- (3) Digital Voltmeter, Fluke Model 8020A or Equivalent

B. Consumable Materials

- (1) D00633 Grease - BMS 3-33 (recommended)
- (2) D00013 Grease - MIL-PRF-23827 (Supersedes MIL-G-23827) (Alternate)

  - 710 Nose Landing Gear and Doors
  - 730/740 Left/Right Main Landing Gear and Doors
- (2) Access Panels
  - 195JL/196JR Left/Right Inboard Flap Mechanism

E. Install the Flap Position Transmitter (Fig. 201)

- S 212-044
  - (1) Make sure you get the transmitter with the correct bolt hole location for the subsequent installation.
- S 642-045
  - (2) Apply grease to the drive tangs on the transmitter and the two machined slots in the input shaft, behind the transmitter housing.
- S 822-046
  - (3) Put the transmitter into the transmitter housing so that the larger tang is in position with the larger machined slot.
- S 822-047
  - (4) Turn the transmitter face to the direction permitted by the internal stops until you get the adjustment fitting to set into the transmitter face cutout.
- S 432-048
  - (5) Install the two transmitter bolts and tighten the bolts to 40-50 pound-inches (4.5 - 5.6 Nm).
- S 822-087
  - (6) Do the mechanical adjustment on the flap position transmitter at positions 1, 3, and 8, with these steps:
    - (a) Loosen the transmitter bolts and the adjustment fitting bolt (Fig. 201).

27-51-45

- (b) Make sure the adjustment fitting can turn freely, and can move the full limit of travel.

NOTE: Remove and clean the adjustment fitting if necessary.

- (c) Install rig pin TE4 in the rig pin hole location shown (Fig. 202 or Fig. 203). Turn the adjustment fitting when necessary to install the rig pin.

NOTE: On some airplanes the rig pin holes are identified by placards on the transmitter housing.

- (d) Turn the adjustment fitting to the left direction until rig pin TE4 is held tight against the rig pin hole. Make a mark on the centerline position of the adjustment fitting (Fig. 201).
- (e) Turn the adjustment fitting to the opposite direction until rig pin TE4 is held tight against the rig pin hole. Make a mark on the centerline position of the adjustment fitting.

NOTE: If you cannot remove the freeplay on rig pin TE4 when the adjustment fitting is at each limit of travel, then do a check of the drive system overtravel stop clearances (AMM 27-51-00/501). If the overtravel stop clearances are correct, then replace the flap position transmitter.

- (f) Turn the adjustment fitting to one-half the distance (Y/2) between the two centerline marks that you found in the steps before.

NOTE: This will put the adjustment fitting to the center of the total freeplay range (Y).

- (g) Tighten the transmitter bolts and the adjustment fitting bolt to 40-50 pound-inches (4.5 - 5.6 Nm).
- (h) Remove rig pin TE4.

S 822-088

- (7) Do the mechanical adjustments on the flap position transmitters at positions 4 and 5 with these steps:
  - (a) Remove the transmitter bolts (Fig. 201).
  - (b) Remove the flap position transmitter.
  - (c) Do a check in the transmitter housing to see if the adjustment fitting bolt (Detail C) is attached with a nut, or with a nutplate.
  - (d) Do these steps if a nutplate is used to attach the adjustment fitting bolt:
    - 1) Install the position transmitter back into the housing with the transmitter bolts, but do not tighten the bolts.

EFFECTIVITY

ALL

27-51-45

08

Page 209  
Apr 22/00

- 2) Adjust the transmitters (position 4 and 5) with the same instructions used for the transmitters at the other positions.
- (e) If a nut is used to attach the adjustment fitting bolt, loosen the adjustment fitting nut and do these steps to adjust the position transmitter (position 4 and 5):
  - 1) Make sure the adjustment fitting can turn freely and can move the full limit of travel.

NOTE: Remove and clean the adjustment fitting if necessary.

- 2) Install the position transmitter back into the housing with the transmitter bolts, but do not tighten the bolts.
- 3) Install rig pin TE4 in the rig pin hole location shown (Fig. 202 or Fig. 203). Turn the adjustment fitting when necessary to install the rig pin.

NOTE: On some airplanes the rig pin holes are identified by placards on the transmitter housing.

- 4) Turn the adjustment fitting to the left direction until rig pin TE4 is held tight against the rig pin hole. Make a mark on the centerline position of the adjustment fitting (Fig. 201).
- 5) Turn the adjustment fitting to the opposite direction until rig pin TE4 is held tight against the rig pin hole. Make a mark on the centerline position of the adjustment fitting.

NOTE: If you cannot remove the freeplay on rig pin TE4 when the adjustment fitting is at each limit of travel, then do a check of the drive system overtravel stop clearances (AMM 27-51-00/501). If the overtravel stop clearances are correct, then replace the flap position transmitter.

- 6) Turn the adjustment fitting to one-half the distance ( $Y/2$ ) between the two centerline marks that you found in the steps before.

NOTE: This will put the adjustment fitting to the center of the total freeplay range ( $Y$ ).

- 7) Make a mark at the center of the total freeplay range of the adjustment fitting.
- 8) Remove the transmitter bolts.
- 9) Remove rig pin TE4.
- 10) Remove the position transmitter from the transmitter housing.

EFFECTIVITY

ALL

27-51-45

05

Page 210  
Aug 22/01

- 11) Tighten the adjustment fitting to 40-50 pound-inches (4.5 - 5.6 Nm), at the center position mark of the freeplay range that you found before.
- 12) Install the position transmitter back into the housing.
- 13) Tighten the transmitter bolts to 40-50 pound-inches (4.5 - 5.6 Nm).

S 762-107

- (8) AIRPLANES WITH A -32 TO -53 FSEU;  
Do a check on the transmitter electrical voltage with these steps after you completed the mechanical adjustment:

NOTE: The voltage check is done by these pairs of transmitters:  
1 and 8, 4 and 5.

NOTE: There are two test cables that can be used to do this test. The following steps give instructions to use either the A27093-27 test equipment (Fig. 205) or the "Test Cable" shown in Fig. 204.

- (a) Make sure the TE flaps are extended to the 30-unit detent.
- (b) Disconnect the airplane electrical connector from the transmitter electrical connector for the transmitter that you adjusted.
- (c) To check voltage with the TE Flap Asymmetry Fault Isolation Test Equipment - A27093-27 (Fig. 205), do these steps:
  - 1) Supply electrical power (AMM 24-22-00/201).
  - 2) Install the A27093-28 test cable between the transmitter electrical connector, the airplane electrical connector and the A27093-34 test box.
  - 3) Connect the voltmeter to the A27093-34 test box and make a written record of the voltage measurement.
  - 4) Repeat the voltage measurement with the test equipment on the other transmitter of the transmitter pair (on the opposite wing).

NOTE: Transmitter no. 4 and 5 are a pair and transmitter no. 1 and 8 are a pair.

- 5) Remove electrical power (AMM 24-22-00/201).
- (d) To check voltage with the "Test Cable" (Fig. 204), do these steps:
  - 1) Install the test cable between the transmitter connector and the airplane wiring.

27-51-45

- (q) Move the flap control lever to the 5-unit detent and retract the flaps to the 5-unit position.

NOTE: The DO-NOT-OPERATE tag can remain on the flap control lever during these operations.

- (r) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).
- (s) Press the "ON/OFF" switch on the FSEU to display the "EXISTING FAULTS?" message.
- (t) Press the down arrow until "I/O Monitor?" is displayed, and select YES.
- (u) Press the YES button in response to "Analog Inputs?".
- (v) Press the down arrow until "FLP RES1 M473?" is displayed and select YES.
- (w) Record the value displayed.
- (x) Press the down arrow to display the next sensor, and select YES.
- (y) Repeat the above FSEU steps for "FLP RES2 M474?" through "FLP RES8 M489?".
- (z) Add the sensor values recorded as shown in the following table.
- (aa) Verify that the added values are greater than the lower limit and less than the upper limit shown in the table.

LOWER LIMIT (DEG.)	MEASURED VALUE (DEG.)	UPPER LIMIT (DEG.)
357 <	#1 (M473) + #8 (M489) = _____	< 363
357 <	#2 (M474) + #7 (M490) = _____	< 363
356 <	#3 (M475) + #6 (M491) = _____	< 364
356 <	#4 (M476) + #5 (M492) = _____	< 364

- (ab) If the measured values for the transmitters are not in the limits in the table, do the flap position sensor check again.

F. Test for the Trailing Edge Flap Drive

S 862-096

- (1) Remove the circuit breaker locks and DO-NOT-CLOSE tags, and close these circuit breakers on the main power distribution panel, P6:
  - (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6D24, ALTN FLAP PWR
  - (c) 6F24, ALTN SLAT OUTBD PWR

S 862-097

- (2) Remove the circuit breaker locks and DO-NOT-CLOSE tags, and close these circuit breakers on the overhead panel, P11:
  - (a) 11C16, FLAP SLAT ELEC UNIT 1 CONT
  - (b) 11G15, FLAP SLAT ELEC UNIT 2 SENSOR
  - (c) 11H23, SLAT ALTN CONT INBD
  - (d) 11H24, SLAT ALTN CONT OUTBD
  - (e) 11J15, FLAP POS IND L
  - (f) 11J16, FLAP POS IND R
  - (g) 11J24, FLAPS ALTN CONT

S 092-099

- (3) Remove the PDU lock from the TE flap PDU (Fig. 203).

S 862-100

- (4) Supply electrical power (AMM 24-22-00/201).

S 862-101

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (5) Pressurize the center hydraulic system (AMM 29-11-00/201).

- S 092-102
- (6) Remove the DO-NOT-OPERATE tag from the flap control lever.
- S 862-103
- (7) Move the flap control lever to the zero (FLAPS UP) detent and permit the flaps to move to the fully retracted position.
- S 722-104
- (8) Do a test on the Trailing Edge Flap Drive with the steps that follow:

**NOTE:** During this test, make sure the amber LEADING EDGE and TRAILING EDGE lights on P3 (first officer instrument panel) are off, and that there are no flap or slat messages on the EICAS display.

- (a) Move the flap control lever to the 5-unit detent and do these checks:
- 1) Do these checks while the slats extend:
    - a) Make sure the flaps stays in the fully retracted position.
    - b) Make sure the flap position indicator, in the flight compartment, moves to a position between the UP-unit and 1-unit mark.
  - 2) Do these checks after the slat movement stops:
    - a) Make sure the slats are in the intermediate position.
    - b) Make sure the flap position indicator is at the 1-unit mark.
    - c) Make sure the flaps start to extend to the 5-degree position.
  - 3) After the flaps stop at the 5-degree position, make sure the flap position indicator is at the 5-unit mark.
- (b) Move the flap control lever to the 20-unit detent and do these checks:
- 1) While the flaps extend, make sure the flap position indicator starts to move to the 20-unit mark.

FLAP/SLAT SHUTOFF VALVE MODULE AND COMPONENTS – MAINTENANCE PRACTICES

1. General

A. This procedure contains these tasks:

- Flap/Slat Shutoff Valve Module and Components – Removal
- Flap/Slat Shutoff Valve Module and Components – Installation
- Slat Hydraulic Pressure Switch – Replacement
- Flap/Slat Shutoff Valve Module – Test

TASK 27-51-48-022-001

2. Flap/Slat Shutoff Valve Module and Components – Removal

A. Equipment

- (1) Circuit Breaker Lockout Clip – 1012LC-R  
(2 necessary) Commercially Available

B. References

- (1) AMM 24-22-00/201, Electrical Power – Control  
(2) AMM 29-11-00/201, Main (Left, Right and Center) Hydraulic Systems  
(3) AMM 32-00-15/201, Landing Gear Door Locks  
(4) AMM 32-00-20/201, Landing Gear Downlocks

C. Access

- (1) Location Zone
- |         |  |
|---------|--|
| 144     | Right MLG Wheel Well                   |
| 211/212 | Control Cabin                          |
| 730/740 | Left/Right Main Landing Gear and Doors |

D. Prepare for Removal

S 212-023

- (1) Make sure the down locks are installed on the nose and main landing gear (AMM 32-00-20/201).

S 492-086

**WARNING:** USE THE PROCEDURE IN AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Open the doors for the landing gear and install the door locks (AMM 32-00-15/201).

Apr 22/06

E. Prepare for the Removal

S 212-050

- (1) Make sure the down locks are installed on the nose and main landing gear (AMM 32-00-20/201).

S 492-051

**WARNING:** USE THE PROCEDURE IN AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Open the doors for the landing gear and install the door locks (AMM 32-00-15/201).

S 212-052

- (3) Make sure the trailing edge (TE) flaps and the leading edge (LE) slats are in the fully retracted position, and the flap control lever is in the zero (FLAPS UP) detent.

S 492-053

- (4) Attach a DO-NOT-OPERATE tag to the flap control lever.

S 862-054

- (5) Remove the pressure from the center hydraulic system and reservoir (AMM 29-11-00/201).

S 862-055

- (6) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
  - (a) 11H14, SLAT SHUTOFF
  - (b) 11J14, FLAP SHUTOFF

F. Remove the Slat Pressure Switch (Fig. 202)

S 032-043

- (1) Disconnect the electrical connector from the switch.

S 032-044

- (2) Turn the switch to loosen the switch from the tee fitting.

S 022-045

- (3) Remove the switch and the O-ring from the airplane.

G. Install the Slat Pressure Switch (Fig. 202)

S 432-105

- (1) Install the O-ring on the pressure switch mating surface with Skydrol assembly lube.

S 422-047

- (2) Turn the switch onto the tee fitting to install the switch, and tighten the switch to the tee fitting.

EFFECTIVITY

ALL

27-51-48

01

Page 213  
Aug 22/01

S 862-048

- (3) Remove the DO-NOT-OPERATE tags and close these circuit breakers on the P11 panel:
- (a) 11H14, SLAT SHUTOFF
  - (b) 11J14, FLAP SHUTOFF

S 862-056

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (4) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 092-057

- (5) Remove the DO-NOT-OPERATE tag from the flap control lever.

S 212-058

- (6) Move the flap control lever to the 5-unit detent and do these checks:
- (a) Make sure the slats extend to the intermediate position before the flaps begin to extend.
  - (b) Make sure the flaps extend to the 5-degree position after the slats move to the intermediate position.

S 212-060

- (7) Move the flap control lever to the zero (FLAPS UP) detent and do these checks:
- (a) Make sure the flaps retract to the fully retracted position before the slats begin to retract.
  - (b) Make sure the slats retract to the fully retracted position after the flaps fully retract.

S 212-059

- (8) Do a check at the area around the switch and make sure there is no leakage of hydraulic fluid.

H. Put the Airplane Back to Its Usual Condition

EFFECTIVITY

ALL

27-51-48

- (a) 11H14, SLAT SHUTOFF
  - (b) 11H23, SLAT ALTN CONT INBD
  - (c) 11H24, SLAT ALTN CONT OUTBD
  - (d) 11J14, FLAP SHUTOFF
  - (e) 11J24, FLAPS ALTN CONT

S 862-079

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES TO PREVENT INJURY AND DAMAGE. THE TRAILING EDGE FLAPS AND LEADING EDGE SLATS ARE SUPPLIED WITH POWER. THE MOVEMENT OF THE FLAPS AND SLATS DOES NOT ALWAYS OCCUR AT THE SAME TIME. THE FLAP MOVEMENT BETWEEN THE 5-UNIT AND 15-UNIT DETENTS CAN CAUSE THE INBOARD AILERONS TO MOVE. THE AILERONS, SPOILERS, RUDDER, ELEVATOR, AND STABILIZER SURFACES ARE ALSO SUPPLIED WITH POWER.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (7) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 212-079

- (8) Move the flap control lever to the 5-unit detent, and do a check on these steps in the sequence that follow:
- (a) Make sure that the LE slats move to the intermediate position.
  - (b) Make sure the flap position indicators in the flight compartment, move to the 1-unit position.
  - (c) Make sure the TE flaps move to the 5-degree position after the LE slats move to the intermediate position.
  - (d) Make sure the flap position indicators in the flight compartment, move to the 5-unit position.

S 212-080

- (9) Move the flap control lever to the zero (FLAPS UP) detent and do a check on these steps in the sequence that follow:
- (a) Make sure the TE flaps move to the fully retracted position.
  - (b) Make sure the flap position indicators in the flight compartment, move to the 1-unit position.
  - (c) Make sure the LE slats move to the fully retracted position after the TE flaps move to the fully retracted position.
  - (d) Make sure the flap position indicators in the flight compartment, move to the UP position.

TRAILING EDGE FLAP POSITION INDICATING SYSTEM -  
DESCRIPTION AND OPERATION

1. General

- A. The trailing edge flap position indicating system provides flap position and flap system failure information to the flight deck.
- B. Flap position is indicated by a dial indicator with needles for indicating right and left wing flap and slat position.
- C. The flap position indicator needles are normally driven by the outboard position transmitters in each wing.
- D. An amber TRAILING EDGE caution light will come on for flap system fault indication.
- E. The Engine Indicating and Crew Alerting System (EICAS) will display flap system fault messages for detected faults.
- F. Position data from position transmitters located outboard of rotary actuators 1, 3, 4, 5 and 8 is monitored by the Flap/Slat Electronic Unit (FSEU). Position data is used by the FSEU for asymmetry detection and protection, uncommanded motion detection and protection, position indication, control in the alternate mode, and flap/slat information to the other systems.
- G. Three Flap/Stabilizer Position Modules (FSPMs) process data from the flap and the stabilizer position transmitters to control the operation of various airplane systems. The three FSPMs installed on 767-200 airplanes are different than those installed on 767 airplanes with low speed landing capability. The FSPMs are not interchangeable between these airplane configurations.
- H. Position indication is identical for both normal and alternate control.

2. Component Details

- A. Flap/slat Position Indicator (Fig. 1)
  - (1) The primary source of flap and slat position information is the flap/slat position indicator located on the P3 panel.
  - (2) The position indicator uses two needles, "L" and "R" to indicate flap and slat position between the 1-unit and the 30-unit positions.
  - (3) The position indicator shows operation of the slats between the UP and the takeoff position.
    - (a) When any slat leaves the retracted position the position indicator needles move halfway to the 1-unit mark.
    - (b) When the slats reach the takeoff position the needles move to the 1-unit position.
- B. Trailing Edge Light
  - (1) The amber TRAILING EDGE light is described in 27-51-00, Trailing Edge Flap System - Description and Operation.

C. Position Transmitters

- (1) Position transmitters are located at rotary actuators 1, 3, 4, 5, and 8. Transmitters 1, 4, 5, and 8 contain resolvers which provide position signals to the asymmetry detection circuits in the FSEU.
  - (a) The nominal voltage outputs from the transmitters to the FSEU are given in the following table.

NOMINAL VOLTAGE (VAC ± 0.70 VAC)							
		Detent					
	Transmitter P/N Dash #	30	25	20	15	5	1
767-200	-9, -12, -15	0.30	9.70	12.03	12.66	5.83	0.00
	-11, -13, -16	0.11	9.59	11.99	12.67	5.93	0.00
767-300	-9, -12, -15	0.30	9.70	12.03	12.50	10.87	0.00
	-11, -13, -16	0.11	9.59	11.98	12.53	10.94	0.00
	-17	5.89	1.19	9.43	12.03	12.50	0.00
	-19, -20	6.08	1.00	9.32	11.98	12.53	0.00

- (2) The two outboard transmitters contain synchros. Each synchro drives a needle in the flap position indicator.
- (3) A rotary variable differential transformer (RVDT) is installed in both transmitters on the left inboard flap. An RVDT is also installed in the inboard transmitter on the right wing. The three RVDT's provide flap position signals to the flap/stabilizer position module.

D. Flap/Stabilizer Position Module (FSPM)

- (1) Three flap/stabilizer position modules (FSPMs) provide flap and stabilizer position signals to flap and other airplane systems. Logic is contained on circuit cards located in the P50 panel card file. Separate cards make up the center, left and right flap/stab position modules. The P50 card file is mounted inside the airplane on the right side of the nose gear wheel well.
- (2) The FSPMs have a built-in test, which performs a self-test of the FSPM and of interfacing flap and stabilizer position transmitters.
- (3) The left FSPM receives position signals from the following:
  - (a) Horizontal stabilizer left position transmitter
  - (b) The outboard transmitter on the inboard flap of the left wing
- (4) The left FSPM provides signals to the following:
  - (a) TMS mode selector logic
  - (b) AFDS pitch cruise signals, left channel
  - (c) TE flap master indication in section 2 of the FSEU
  - (d) Left stabilizer trim/aileron lockout module

- (e) Spoiler control
- (f) Ground proximity warning
- (g) Engine ignition
- (h) EEC and flight/ground idle
- (5) The right FSPM receives position signals from the following:
  - (a) Horizontal stabilizer right position transmitter
  - (b) The inboard transmitter of the inboard flap of the right wing
- (6) The right FSPM provides signals to the following:
  - (a) TE flap alternate drive logic in section 3 of the FSEU
  - (b) AFDS pitch cruise signals, right channel
  - (c) Stall warning, right channel
  - (d) Right pack flow control
  - (e) Right stabilizer trim/aileron lockout module
  - (f) Spoiler control
  - (g) Engine ignition
  - (h) EEC and flight/ground idle
- (7) The center FSPM receives position signals from the following:
  - (a) The inboard transmitter of the inboard flap of the left wing
  - (b) Horizontal stabilizer center position transmitter
- (8) The center FSPM provides signals to the following:
  - (a) TE flap shutoff valve logic in section 1 of the FSEU
  - (b) AFDS pitch cruise signals, center channel
  - (c) Stall warning, left channel
  - (d) Spoiler control
  - (e) Center flight control computer
  - (f) Configuration warning module
  - (g) Left pack flow control
- E. Flap/Slat Electronic Unit (FSEU)
  - (1) The FSEU processes information from the high lift system and provides indications and data for display and warning when crew alerting or warning is required. For detailed description of FSEU control of flap and slat systems, refer to 27-51-01, Flap/Slat Electronics Unit - Description and Operation.
  - (2) The FSEU monitors output voltages of flap system resolvers, synchros, and RVDTs to obtain flap system position information. Position data is used by the FSEU for asymmetry detection and protection, uncommanded motion detection and protection, indication, control in the alternate mode, and flap/slat position information to other systems.
  - (3) The FSEU has a built-in test equipment system which performs a self test of the FSEU and interfacing hardware.
- F. Engine Indicating and Crew Alerting System (EICAS)
  - (1) Refer to 27-51-00, Trailing Edge Flap System - Description and Operation, for a description of TE flap system EICAS messages.

3. Operation

A. During normal flap operation the flap/slat position indicator is the only source of flap and slat position information. Under hydraulic or electric power the position indicator needles follow flap and slat position:

LEVER OR SWITCH COMMAND	NORMAL IN-TRANSIT INDICATION	NORMAL STEADY STATE INDICATION
"UP"	-----	NEEDLES AT "UP"
"1"	NEEDLES MOVE HALFWAY TO "1" WHEN ANY SLAT LEAVES RETRACT POSITION	NEEDLES AT "1" WHEN LAST SLAT REACHES POSITION
"5"	NEEDLES MOVE TO "5" AS T. E. FLAPS EXTEND	NEEDLES AT "5"
"15"	NEEDLES MOVE TO "15" AS T. E. FLAPS EXTEND	NEEDLES AT "15"
"20"	NEEDLES MOVE TO "20" AS T. E. FLAPS EXTEND	NEEDLES AT "20"

(1) 767-200 AIRPLANES;  
Use the table that follows:

LEVER OR SWITCH COMMAND	NORMAL IN-TRANSIT INDICATION	NORMAL STEADY STATE INDICATION
"25"	NEEDLES MOVE TO "25" AS L. E. SLATS AND T. E. FLAPS EXTEND	NEEDLES AT "25"
"30"	NO LD RELIEF NEEDLES MOVE TO "30" AS T. E. FLAPS EXTEND	NEEDLES AT "30"
	LD RELIEF NEEDLES MOVE TO "25" AS FLAPS RETRACT	NEEDLES AT "25"

TRAILING EDGE FLAP POSITION INDICATING SYSTEM – ADJUSTMENT/TEST

TASK 27-58-00-715-001

1. Operational Test for the Trailing Edge Flap Position Indicating System

NOTE: Refer to 31-51-00, Warning System, for a test of the trailing edge flap takeoff warning.

A. References

- (1) 24-22-00/201, Electrical Power – Control
- (2) 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems
- (3) 31-51-00/501, Warning System

B. Access

- (1) Location Zones
  - 211/212 Control Cabin
  - 500/600 Left Wing / Right Wing

C. Prepare for the Test

S 215-002

- (1) Make sure the trailing edge (TE) flaps and leading edge (LE) slats are in the fully retracted position.

S 215-003

- (2) Make sure the flap control lever is in the zero (FLAPS UP) detent.

S 865-004

- (3) Supply electrical power (Ref 24-22-00).

S 865-005

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND THE WHEEL WELLS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. WHEN YOU MOVE THE FLAP CONTROL LEVER WITH THE HYDRAULIC SYSTEM PRESSURIZED, THE FLAPS AND FLAP DRIVE MECHANISMS WILL MOVE QUICKLY. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (4) Pressurize the center hydraulic system (AMM 29-11-00/201).

D. Operational Test for the TE Flap Position Indicating System (Fig. 501)

S 215-006

- (1) With the flap control lever in the zero (FLAPS UP) detent, make sure that the L and R needles on the flap position indicator (First Officer's Instrument Panel, P3) point to the UP mark.

S 865-007

- (2) Move the flap control lever to the 1-unit detent and do these checks:
  - (a) During the movement of the LE slats, make sure the L and R needles on the flap position indicator move to one-half of the distance between the UP and 1-unit mark.
  - (b) When the slats stop at the intermediate position, make sure the L and R needles point to the 1-unit mark.

S 865-009

- (3) Move the flap control lever to the 5, 15, 20, 25, and 30-unit detents.

**NOTE:** Stop at each detent to make sure the L and R indicator needles are within 0.045 inch (0.11 centimeter) tolerance of each other at the flap position indicator at the related detent.

Position Indicating System for the Trailing Edge Flap

ALL	

27-58-00

S 865-008

- (4) Move the flap control lever to the 25, 20, 15, 5, and 1-unit detents.

NOTE: Stop at each detent to make sure the L and R indicator needles are within 0.045 inch (0.11 centimeter) tolerance of each other on the flap position indicator at the related detent.

S 215-010

- (5) Move the flap control lever to the zero (FLAPS UP) detent and do these checks:
- (a) During the movement of the slats, make sure the L and R needles move to one-half the distance between the 1-unit and the UP mark on the flap position indicator.
  - (b) With the flap control lever in the FLAP UP detent, check the flap position indicator. The tips of the indicator pointers must both point into the UP area on the indicator dial. Check that the pointer tips for the left and right needles are within 0.045 inch (0.11 centimeters) of each other.

NOTE: Tap the indicator with fingers to remove friction error.

E. Put the Airplane Back to Its Usual Condition

S 865-011

- (1) Remove power from the center hydraulic system (AMM 29-11-00/201).

S 865-012

- (2) Remove electrical power (Ref 24-22-00).

FLAP/STABILIZER POSITION MODULE – REMOVAL/INSTALLATION

TASK 27-58-01-904-001

1. Flap/Stabilizer Position Module Replacement

A. General

- (1) This task contains the procedure for the removal, installation, and test of the flap/stabilizer position module (FSPM).

The three FSPMs are installed in the electrical systems card file, P50. The FSPM modules are given the numbers M838, M839, and M840. Each module has two cards, attached together with bolts. The module is removed and installed in the P50 as a unit. Each FSPM module contains a BITE panel.

B. References

- (1) AMM 20-10-01/401, E/E Rack Mounted Components – Boxes and Cards  
(2) AMM 20-41-01/201, Electrostatic Discharge Sensitive Device  
(3) AMM 22-00-02/201, Autoflight BITE Maintenance Practices  
(4) AMM 24-22-00/201, Electrical Power – Control

C. Access

- (1) Location Zones  
120 Main Equipment Center  
211/212 Control Cabin

- (2) Access Panel  
119AL Main Equipment Center

D. Remove the FSPM

S 864-002

- (1) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:  
(a) 11C14, FLAP/STAB POS SENSING C  
(b) 11J17, FLAP/STAB POS SENSING L  
(c) 11J26, FLAP/STAB POS SENSING R

S 844-003

**CAUTION:** DO NOT TOUCH THE FLAP/STABILIZER POSITION MODULE BEFORE YOU DO THE PROCEDURE FOR DEVICES THAT ARE SENSITIVE TO ELECTROSTATIC DISCHARGE. ELECTROSTATIC DISCHARGE CAN CAUSE DAMAGE TO THE FLAP/STABILIZER POSITION MODULE (AMM 20-41-01/201).

- (2) Do the precautionary procedure for the devices that are sensitive to electrostatic discharge (AMM 20-41-01/201).

S 024-004

- (3) Open the door on the P50 card file and remove the FSPM (AMM 20-10-01/401).

E. Install the FSPM

**CAUTION:** DO NOT TOUCH THE FLAP/STABILIZER POSITION MODULE BEFORE YOU DO THE PROCEDURE FOR DEVICES THAT ARE SENSITIVE TO ELECTROSTATIC DISCHARGE. ELECTROSTATIC DISCHARGE CAN CAUSE DAMAGE TO THE FLAP/STABILIZER POSITION MODULE (AMM 20-41-01/201).

- (1) Do the precautionary procedure for the devices that are sensitive to electrostatic discharge (AMM 20-41-01/201).

S 424-035

**WARNING:** MAKE SURE YOU INSTALL THE CORRECT FSPM. THE FSPM'S ARE NOT INTERCHANGEABLE BETWEEN DIFFERENT 767 MODELS. IF YOU INSTALL AN INCORRECT FSPM, YOU COULD CAUSE THE GPWS SYSTEM OR THE TAKEOFF WARNING SYSTEM TO NOT OPERATE CORRECTLY.

- (2) Install the FSPM.

S 864-018

- (3) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:
  - (a) 11C14, FLAP/STAB POS SENSING C
  - (b) 11J17, FLAP/STAB POS SENSING L
  - (c) 11J26, FLAP/STAB POS SENSING R

S 744-022

- (4) Do a test on the FSPM.
- F. Test for the FSPM

**NOTE:** This test is done on each FSPM that you replaced. During this test, you can ignore the L and R needles on the flap position indicator, at the first officer instrument panel, P3.

S 864-021

- (1) Supply electrical power (AMM 24-22-00/201).

S 214-023

- (2) Make sure the flaps and slats are in the fully retracted position.

TRAILING EDGE FLAP POSITION INDICATOR – REMOVAL/INSTALLATION

1. General

- A. There are two tasks in this procedure. There is a task for the removal and a task for the installation of the position indicator for the trailing edge flap system. The trailing edge flap position indicator is installed on the center instrument panel P3.

TASK 27-58-02-274-002

2. Position Indicator Removal

A. Access

- (1) Location Zones  
211/212 Control Cabin

B. Procedure

S 864-011

- (1) Open these circuit breakers on the overhead panel, P11 and attach DO-NOT-CLOSE tags:  
(a) 11J15, L FLAP POS IND  
(b) 11J16, R FLAP POS IND

S 014-010

- (2) Remove the indicator from the P3 panel.  
(a) Turn the adjustment screw to loosen the clamp.  
(b) Remove the indicator from the front of the panel.  
(c) Disconnect the electrical connector from the flap position indicator.

TASK 27-58-02-274-001

3. Position Indicator Installation

A. References

- (1) AMM 24-22-00/201, Manual Control  
(2) AMM 29-11-00/201, Main (Left, Right and Center) Hydraulic Systems  
(3) AMM 27-58-00/501, Trailing Edge Flap Position Indicating System

B. Access

- (1) Location Zones  
211/212 Control Cabin

C. Procedure

S 414-008

- (1) Install the flap position indicator in the P3 panel:  
(a) Connect the electrical connector to the flap position indicator.  
(b) Put the flap position indicator in its position in the panel.

EFFECTIVITY

SPOILER/SPEEDBRAKE CONTROL SYSTEM – DESCRIPTION AND OPERATION

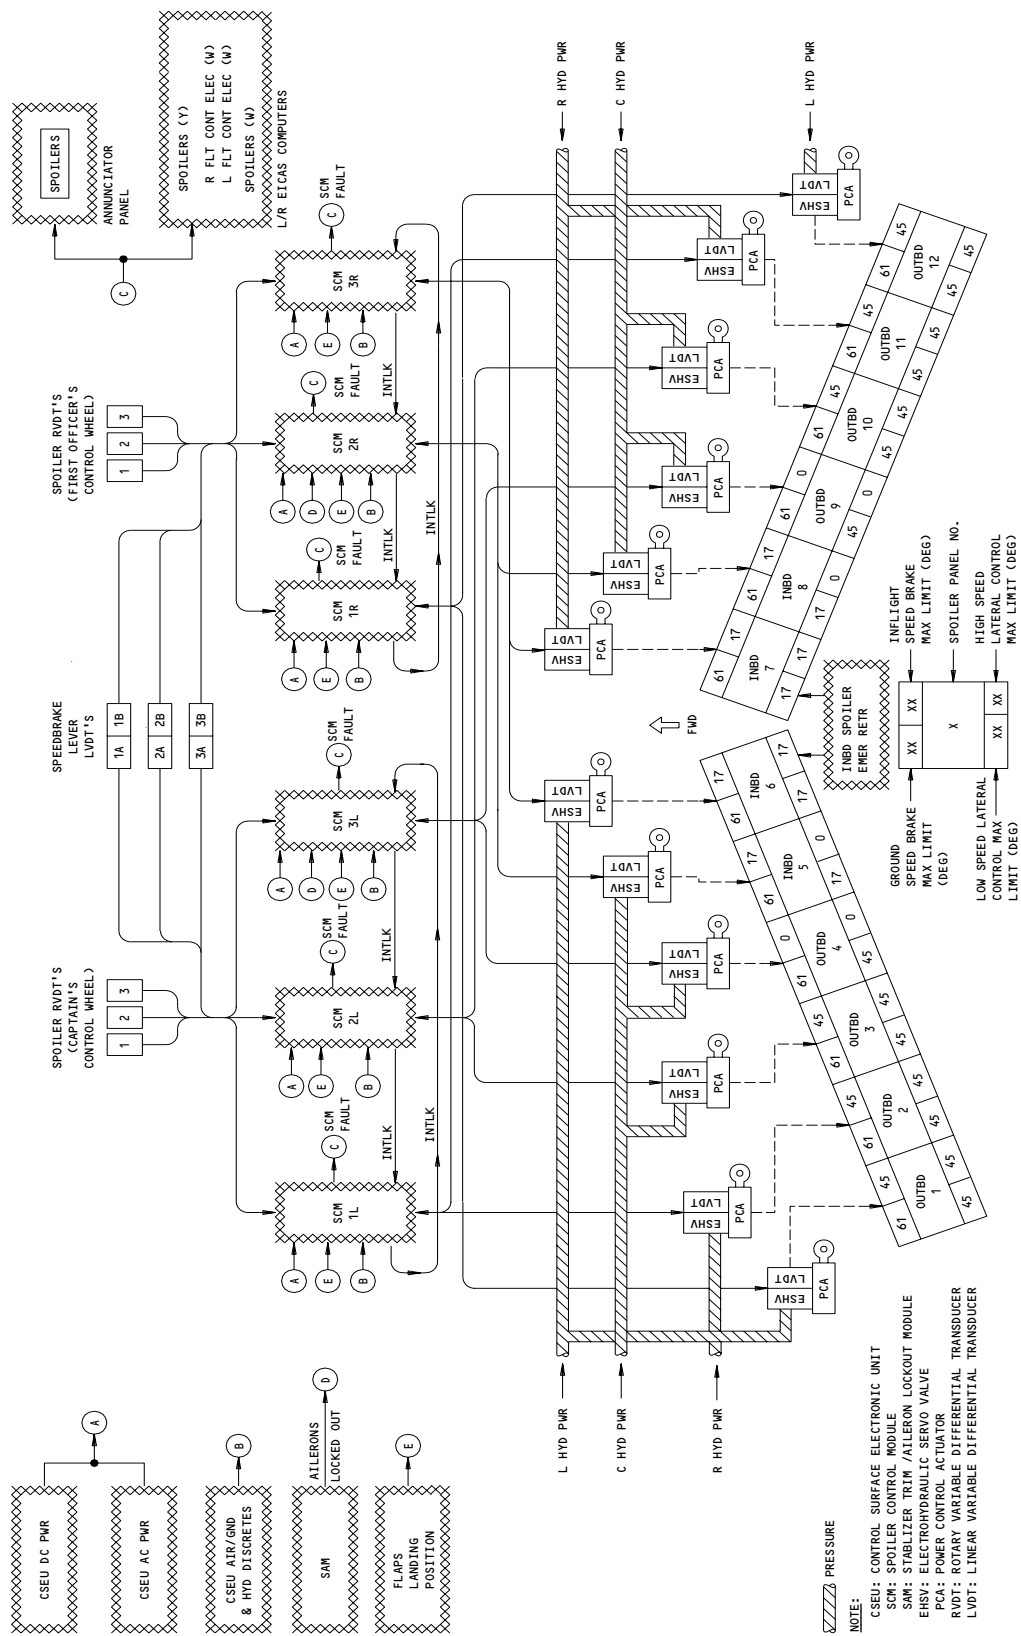

1. General (Figs. 1 and 2)
  - A. The spoiler/speedbrake system uses the same flight control surfaces to perform two functions. The system operates the surfaces as spoilers to provide lateral control of the airplane in conjunction with the ailerons. The system also operates the surfaces as speedbrakes to increase drag and reduce lift in flight and during landing (AMM 27-62-00/001, Description and Operation).
  - B. The spoiler/speedbrake system is electrically controlled and hydraulically powered. Separate power control actuators (PCAs) operate the twelve spoiler/speedbrake surfaces.
  - C. Description and operation of the spoiler control modules (SCMs) is covered in this section. Removal and installation of the modules is covered in AMM 27-09-00/201.
  - D. The warning system provides an amber light and level B EICAS caution message should the spoiler/speedbrake surfaces be extended at altitudes less than 800 feet. The amber SPEED BRAKES light is located on the pilot's main panel, P1. The yellow EICAS caution message reads SPEED BRAKES EXT. Refer to 31-51-00, Warning System – Description and Operation, for more information.

Spoiler/Speedbrake Control Simplified Schematic  
Figure 2

EFFECTIVITY

ALL

2. Component Details

A. Rotary Variable Differential Transducers (RVDTs) (Fig. 3)

- (1) Control wheel inputs are monitored by rotary variable displacement transducers (RVDTs). The RVDTs convert inputs into electrical signals and supply these signals to the spoiler control modules (SCMs).
- (2) The RVDT units are can-shaped; each contain three RVDTs which are driven by a center shaft and gears. The center shaft extends below the RVDT unit into the lateral control drum assembly splines. The unit is mounted to the upper drum support bracket, above the drum assembly. The drum assemblies are accessible from the left and right crawlways outboard of the nose gear wheel well. Enter through door 119AL into the main equipment center to access the crawlways.
- (3) The RVDTs work through the total range of control wheel movement of  $\pm 65^\circ$ .  $65^\circ$  of control wheel movement is equivalent to  $41.5^\circ$  movement at the RVDTs. RVDT output voltage is nulled with the control wheel centered. A null adjustment screw on the mounting flange of each RVDT unit allows minor adjustments.

B. Spoiler Control Modules (SCMs) (Fig. 4)

- (1) Six SCMs control the 12 spoiler surfaces. Each SCM operates two spoiler panels that are symmetrically located on the wings. The SCMs receive signals from the spoiler RVDTs and the speedbrake LVDTs. These signals are processed by logic cards in the module. A command signal is sent to the PCAs at each of the spoiler panels controlled by the module.
- (2) The SCMs are located on the top row of the E1 and E2 shelves in the main equipment center. The modules are identified on the shelf below the module.

C. Power Control Actuators (PCAs) (Fig. 5)

- (1) The inboard PCA is trunnion-mounted to the spoiler beam, with the piston rod attached to the spoiler surface. Each inboard PCA has a line replaceable electrohydraulic servo valve (EHSV). The outboard PCAs are identical to the inboard PCAs except for installation (Fig. 4). Outboard PCAs are cylinder-end mounted to the wing rear spar. Inboard PCAs are accessible through wing lower surface access panels. Outboard PCAs are accessible when the trailing edge flaps are fully extended.
- (2) The PCA cylinder contains a dual acting piston and a LVDT mounted to the piston. The cylinder extends or retracts as commanded to raise or lower the spoiler surface. The LVDT sends an electrical feedback signal to the SCM. This signal cancels out the input signal to the EHSV when the actuator reaches the commanded position.

Page 7  
Nov 01/83

- (3) Each PCA has a manual release cam which is accessible from underneath the PCA. The manual release cam opens the PCA thermal relief valve to release trapped hydraulic fluid after the hydraulic system is depressurized. Releasing trapped fluid is necessary to raise the spoiler panel for maintenance. The manual release cam cannot be used to raise a spoiler panel when power is available to its PCA. Also a spoiler panel which was raised using the manual release cam when hydraulic power was removed will immediately retract if hydraulic power is reapplied. Therefore, the manual release cam should be used with caution, and only when it is certain hydraulic power will not be applied when the panel is raised.
- (4) Hydraulic fluid enters the PCA through a swivel port that allows the actuator to pivot during operation. The fluid is then filtered before entering the EHSV. After the fluid leaves the EHSV it passes through an extension check and thermal relief valve. The valve prevents the spoilers from floating if hydraulic pressure is lost. The valve also protects the actuator from damage due to fluid expansion. When fluid arrives at the actuator cylinder, it passes through a snubber check valve. This valve prevents hydraulic lock of the actuator when the spoilers are in the full down position.

D. Electrohydraulic Servo Valve (EHSV) (Fig. 6)

- (1) The EHSV controls the flow of hydraulic fluid in the PCA in response to command signals from the SCM. The signals operate a jet pipe that supplies hydraulic fluid to the EHSV control bobbin. The EHSV is magnetically biased in the retract position if there is no input command. This allows the spoiler panel to retract if hydraulic power is lost.
- (2) When the control wheels are in the neutral position and the speedbrake lever is in the down position, the SCM commands magnetically position the jet pipe to port hydraulic fluid to the retract side of the control bobbin. When the EHSV receives a command from the SCM to extend the actuator, the magnetic polarity is reversed and the jet pipe deflects to the extend side of the control bobbin. The hydraulic fluid moves the control bobbin, allowing the fluid to flow to the extend side of the PCA piston. If hydraulic pressure is lost while the control bobbin is in the extend position, the bobbin is spring-loaded to return to the retract position.

E. Spoiler Panels (Fig. 7)

(1) Each wing has 6 spoiler panels. The four outboard panels on each wing are identical as are the two inboard panels. Each panel has four hinge points. The inboard panels are hinged to the spoiler beam. The outboard panels are hinged to the wing rear spar. The PCAs are attached at the center of each panel. To gain access to the hinges, the flaps must be partially extended.

F. Speedbrake Lever and Linear Variable Differential Transducers (LVDTs) (Fig. 8)

(1) The speedbrake lever is located on the center control stand between the stabilizer trim levers and the engine thrust levers. The lever is attached to the speedbrake mechanism located in the control stand by an adjustable control rod.

Spoiler Panels  
Figure 7

EFFECTIVITY	ALL
-------------	-----

27-61-00

Speedbrake Lever and LVDTs  
Figure 8

EFFECTIVITY	
	ALL

27-61-00

- (2) Three pairs of speedbrake LVDTs are attached to the speedbrake mechanism at a common point. The speedbrake mechanism is accessible through a panel on the captain's side of the control stand.
  - (3) The speedbrake lever has three marked travel positions. In the DOWN position, the spoiler surfaces are retracted. Pulling up on the speedbrake lever and moving it aft places the lever in the ARMED position. This prepares the speedbrake system for automatic operation (AMM 27-62-00). Pulling the lever all the way back to the UP position will raise the spoilers to full extension. The spoilers may be raised to intermediate positions during flight.
3. Inboard Spoiler Override Actuator (Fig. 9)
- A. The spoiler override actuator is a pyrotechnic device which forces the spoiler to retract for emergency escape slide deployment (AMM 25-65-00). The override actuator is located just on the spoiler beam outboard of spoiler 6 and 7 PCAs. The override actuator must be deactivated before maintenance on the inboard spoilers or PCAs.
4. Spoiler/Speedbrake Fault Indications (Fig. 10)
- A. Flight deck indicators alert the flight crew to failures in the spoiler/speedbrake system. An amber SPOILERS light on the pilot's overhead panel P5 or a yellow SPOILERS message on the EICAS display unit indicates a "second failure". "Second failures" result from any of the following:
    - (1) Failure of a PCA.
    - (2) Failure of two subchannels in an SCM.
    - (3) Failure of two power supplies in either the left or right CSEU rack.
    - (4) Removal of a control module.
    - (5) Grounding of any SCM output to an EHSV.
    - (6) Loss of two inputs to a control module from either the control wheel RVDTs or speedbrake lever LVDTs.
  - B. A failure in the auto-speedbrake system will light an amber AUTO SPDBRK light and display a yellow AUTO SPEEDBRAKE message on the EICAS display unit (Ref 27-62-00).
  - C. "First" failures inflight are stored as maintenance messages in the EICAS computer. Maintenance messages are displayed on the EICAS display unit when the ECS/MSG button on right side panel P61 is pressed. These messages are available to the ground crew only.
  - D. A white SPOILERS message indicates a first failure in the spoiler/speedbrake. A L or R FLT CONT ELEC message indicates a single power supply module failure.
  - E. The standby bus must be on for spoiler control system maintenance message display.

5. Operation

A. Functional Description

(1) Spoiler Command and Feedback Signals (Fig. 11)

- (a) The spoiler RVDTs are mechanically driven by the upper drum of the aileron drum assemblies. Cables connect the drum assemblies to the control wheels. An adjustable bus rod links the drum assemblies. All the RVDTs move any time either control wheel is rotated. The RVDTs sense control wheel position and send a proportional signal to the SCMs. Each module processes and mixes signals from three RVDTs and sends out command signals to a left and/or right PCA. The SCM command signal is received by the electrohydraulic servo valve that controls the direction of fluid flow to the PCA cylinder. As the spoiler panel moves to the commanded position, the LVDT inside the actuator feeds a signal back to the SCM. This signal is compared with the input command. When the two signals agree, spoiler movement is stopped.
- (b) When there is input from both spoiler RVDTs and speedbrake LVDTs, the SCMs combine the two signals. The resultant output to the PCAs is a summation of the two signals.

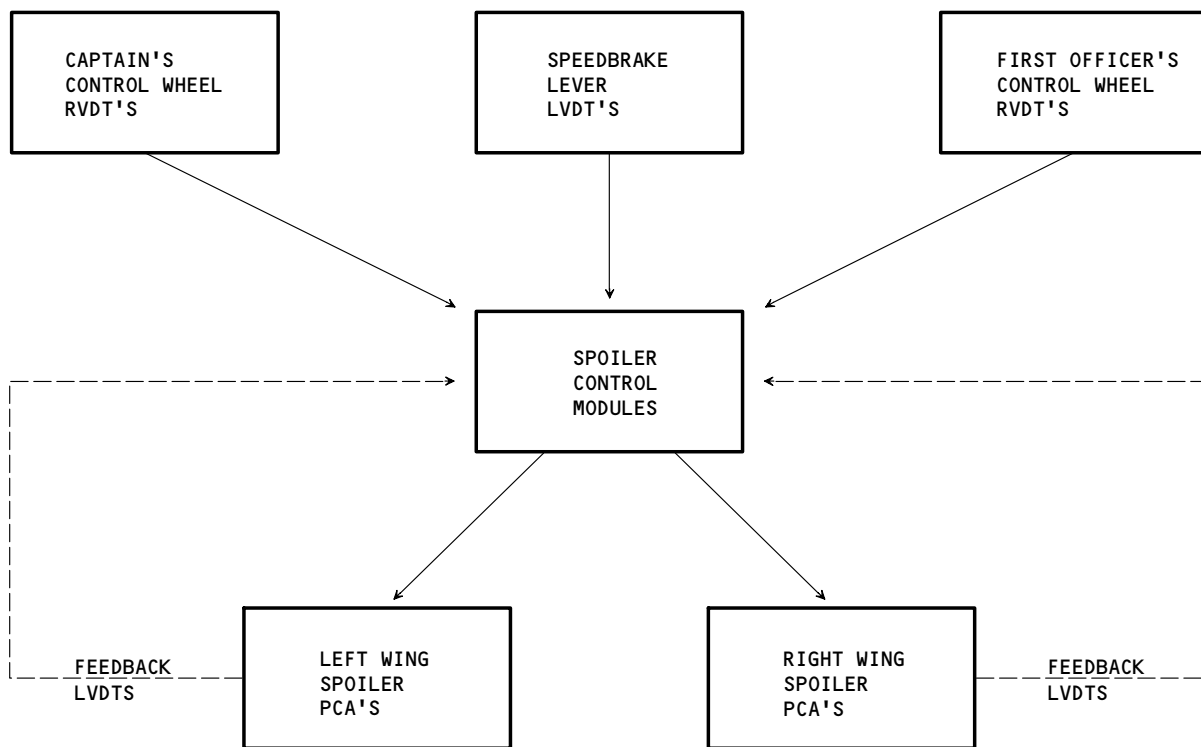

Flight Deck Indications  
Figure 10

EFFECTIVITY	
	ALL

27-61-00

(2) Spoiler Control Module (SCM)

- (a) The spoiler control module contains a redundancy management card, a relay switch card, a maintenance logic card, and three physically, electrically, and functionally isolated sub-channel cards (Fig. 12). The three sub-channel cards are called active (A), standby (B), and model (C). The active sub-channels operate the spoiler panels during normal operation. The standby sub-channel acts as a backup. The model sub-channel, which cannot operate the spoilers, is used to test the active and the standby sub-channels.
- (b) Each sub-channel card receives input from a spoiler RVDT, a speedbrake LVDT, an air/ground relay, a flap/stab position module, a right wing PCA LVDT, and a left wing PCA LVDT. The sub-channels demodulate, process, and mix these inputs to generate command signals. The active sub-channel compares its input command signal to the PCA LVDT feedback signal. The difference between the two signals is sent to the PCA servo valve as a control signal. The standby and model sub-channels send their command signals to the redundancy management card.

Spoiler Command and Feedback Signals

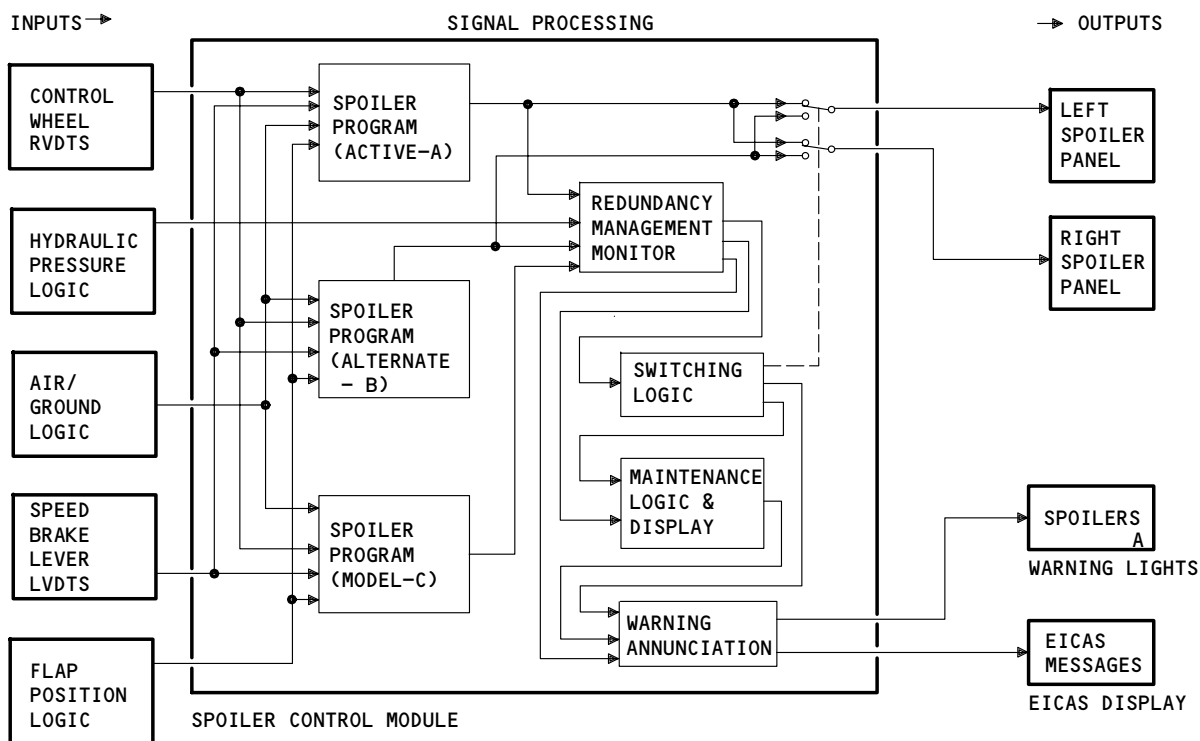

Figure 11

EFFECTIVITY

ALL
-----

27-61-00

- (c) A decision to switch control from the active sub-channel to the standby sub-channel is made on the redundancy management card. A switch decision involves three tests. The first test is made on the servo amplifiers in the standby sub-channel to detect a failed amplifier. If a failed amplifier is detected, the redundancy management card is prevented from switching control from the active sub-channel to the standby sub-channel. The second test is made on the command signal from the standby sub-channel and the active sub-channel PCA LVDT feedback signal. The standby sub-channel threshold monitors check the two signals for disagreement. The third test is made on the command signal from the model sub-channel and the active sub-channel PCA LVDT feedback signal. The model sub-channel threshold monitors check the two signals for disagreement. If the second and third tests indicate disagreement at the same time, the redundancy management card switches control from the active sub-channel to the standby sub-channel.

Figure 12

EFFECTIVITY ————  
ALL

27-61-00

- (d) The SCMs will show you when failures in the spoiler/speedbrake system occur.
    - 1) The -100 series SCMs have small windows (called fault balls) on the front of them that show yellow when a failure occurs. The yellow fault ball identifies the failure. You can push the reset button on the SCM to make the fault ball black. Refer to 27-09-00/001 for more information.
    - 2) The -200 series SCMs have a display to show failures. The failures are shown as words on the display. Refer to AMM 27-09-00/001 for more information.
  - (e) The maintenance logic card monitors the spoiler RVDTs, speedbrake LVDTs, and the PCAs. If any of these units fail, the maintenance logic card causes a fault to show on the front of the SCM. The maintenance logic card also sends a signal to the redundancy management card to store an EICAS maintenance message. The maintenance logic card will cause a fault to show if the redundancy management card finds a failure in one of the SCM channels. The SCM monitors the LVDT input signals to detect a failed LVDT.
- (3) Spoiler/Speedbrake System Schematic (Fig. 13)
- (a) Each of the SCMs receive input from three spoiler RVDTs. The three SCMs in the left main equipment rack receive inputs from the RVDT unit on the captain's drum assembly. The three SCMs in the right main equipment rack receive inputs from the RVDT unit on the first officer's drum assembly. Each module also receives inputs from three speedbrake LVDTs and feedback signals from two power control actuator (PCA) LVDTs. The SCMs process and mix these signals. The resultant output is sent as a command to the PCAs to position the spoiler panels. The spoiler panels are hydraulically powered by the three main hydraulic systems.
  - (b) All twelve spoilers respond to control wheel inputs. At cruise speeds, four spoilers (4, 5, 8, 9) are inhibited from responding to control wheel commands. The outboard spoilers extend to 45° with full control wheel movement. Spoilers 5 through 8 extend to 17° with full control wheel movement.
  - (c) The speedbrake lever is located on the center control stand next to the engine thrust levers. The speedbrake lever is a two-piece, spring-loaded mechanism. Pulling up on the handle lifts a lug on the lever out of a detented plate inside the control stand. The lever can then be placed in the ARMED detent or moved to the full UP stop.

213363

- (d) The speedbrake lever has three positions. In the DOWN position, the spoiler surfaces are retracted. Pulling up on the speedbrake lever and moving it 9° aft places the lever in the ARMED detent. This prepares the speedbrake system for automatic operation. Pulling the lever all the way back to the full UP stop will raise the spoilers to full extension.
  - (e) Ten spoiler panels respond to speedbrake commands in flight. The four inboard panels will extend to 20° when the speedbrake lever is moved to the UP position. Panels 1 through 3 and 10 through 12 will extend to 45° with the lever in the UP position.
  - (f) At touchdown and during ground operations, all spoilers will extend to 60° when the speedbrake lever is in the full UP stop.
- (4) Speedbrake Command (Fig. 13)
- (a) Manual operation of the speedbrakes begins when the speedbrake lever is moved to the ARMED detent. There is no speedbrake panel movement when the lever is moved from the DOWN position to the ARMED position (detent). Moving the speedbrake lever to the ARMED detent activates the auto-speedbrake actuator arming switch. This prepares the speedbrake system for automatic operation during landings. When a touchdown is sensed by the auto-speedbrake relay panel, the auto-speedbrake actuator will move the speedbrake lever to the full UP stop. A clutch in the speedbrake mechanism allows the flight crew to move the speedbrake lever and override the auto-speedbrake actuator (AMM 27-62-00).
  - (b) During a refused takeoff, operation of the reverse thrust levers will lift the speedbrake lever out of the DOWN detent. The auto-speedbrake control circuit will then be armed and the auto-speedbrake actuator will move the speedbrake lever to the UP position.
  - (c) Inputs to the SCMs for the speedbrake system come from the speedbrake LVDT pairs. Speedbrake lever movement is transferred to the LVDTs through a linkage and the speedbrake mechanism. One LVDT in each pair sends a signal to one of the three SCMs in the left main equipment rack and the other LVDT in each pair sends a signal to one of the three SCMs in the right main equipment rack.
  - (d) The SCMs take the input signals from the speedbrake LVDTs and feedback signals from the spoiler PCA LVDTs and combine them according to programs in the modules. The resultant output is sent as a command to the PCA to position the spoiler panels. Speedbrake commands from the SCMs cause opposite spoiler panels to respond symmetrically.

B. Control

- (1) Provide electrical power (Ref 24-22-00).

EFFECTIVITY

01

Page 21  
Apr 22/00

**WARNING:** TO PREVENT INJURY OR DAMAGE, CLEAR PERSONNEL AND EQUIPMENT FROM CONTROL SURFACES BEFORE PROVIDING HYDRAULIC POWER. ISOLATE ANY SYSTEM NOT INTENDED FOR OPERATION.

- (2) Provide left, center, and right hydraulic system power (Ref 29-11-00).
- (3) Spoiler operation (aileron control wheel).
  - (a) Place speedbrake lever in the DOWN position.
  - (b) Rotate either aileron control wheel fully clockwise or counterclockwise to raise the right or left wing spoilers.
  - (c) Return control wheel to the neutral position to lower the spoilers.
- (4) Spoiler operation (speedbrake lever).
  - (a) Place aileron control wheels in the neutral position.
  - (b) Move speedbrake lever to the full UP stop to raise the spoilers.
  - (c) Place speedbrake lever in the DOWN position to lower the spoilers.
  - (d) Remove hydraulic power (AMM 29-11-00/201).
  - (e) Remove electrical power if no longer required (AMM 24-22-00/201) .

SPOILER/SPEEDBRAKE CONTROL SYSTEM – MAINTENANCE PRACTICES

1. General

- A. This procedure contains the deactivation and activation tasks for the spoiler/speedbrake control system. These tasks are used to prevent accidental movement of the spoilers during maintenance.
- B. This procedure also contains the scheduled maintenance tasks to raise and retract the spoilers (tasks 2 and 3).
- C. The procedure also contains the removal and installation of the spoiler actuator lock (tasks 4 and 5).

TASK 27-61-00-042-003

2. Spoiler/Speedbrake Deactivation

A. General

- (1) Use these procedures when you do maintenance near the spoilers or when you do maintenance that can cause the spoilers to operate.
- (2) The spoiler/speedbrake system uses hydraulic power and is electrically controlled. Each of the twelve spoilers is moved by a power control actuator (PCA) that gets power from one of the three main hydraulic systems.
- (3) The spoiler control modules (SCMs) control the spoiler movement and are connected to many airplane systems. If you do maintenance on other systems, it is possible for the spoilers to move accidentally. Be very careful, because the spoilers move very quickly and can cause injury to persons or damage to equipment.
- (4) The spoilers are numbered 1 thru 12 from the outboard left wing spoiler to the outboard right wing spoiler.
- (5) These are the Possible Dangers and the Applicable Spoiler/Speedbrake Deactivation Procedures:
  - (a) The installation of PCA locks is the recommended procedure for spoiler deactivation. In some maintenance procedures you cannot install the PCA locks and you must use a different deactivation procedure. The data that follows will tell you how the spoilers operate and when to use a different deactivation procedure.
  - (b) The spoilers will extend when you operate the reverse thrust levers if these conditions are satisfactory:
    - The speedbrake lever is in its down-and-locked position
    - Electrical power is on
    - Hydraulic power is on.

To prevent injury to persons or damage to equipment, do the "Install the PCA Locks to Deactivate the Spoiler/Speedbrakes" or the "Deactivate the Spoiler/Speedbrakes for Operation of the Forward or Reverse Thrust Levers" group of steps.

EFFECTIVITY

ALL

 **BOEING**  
767  
MAINTENANCE MANUAL

(c) The spoilers will extend when you move the forward thrust levers to less than 10 degrees of total thrust lever movement if these conditions are satisfactory:

- The speedbrake lever is in its ARMED detent position
- Electrical power is on
- Hydraulic power is on.

To prevent injury to persons or damage to equipment, do the "Install the PCA Locks to Deactivate the Spoiler/Speedbrakes" or the "Deactivate the Spoiler/Speedbrakes for Operation of the Forward or Reverse Thrust Levers" group of steps.

(d) The spoilers will retract when you move the forward thrust levers to more than 11.5 degrees of total thrust lever movement if these conditions are satisfactory:

- The speedbrake lever is in its UP detent position
- Electrical power is on
- Hydraulic power is on.

To prevent injury to persons or damage to equipment, do the "Install the PCA Locks to Deactivate the Spoiler/Speedbrakes" or the "Deactivate the Spoiler/Speedbrakes for Operation of the Forward or Reverse Thrust Levers" group of steps.

(e) Spoilers 4 and 9 will retract and the other spoilers will move down if you open an air/ground circuit breaker or simulate the air mode when these conditions are satisfactory:

- The speedbrake lever is in its UP detent position
- Electrical power is on
- Hydraulic power is on.

To prevent injury to persons or damage to equipment, do the "Install the PCA locks to Deactivate the Spoiler/Speedbrakes" or the "Spoiler/Speedbrake Deactivation When You Will Open the Air/Ground Circuit Breakers or Simulate the Air Mode" group of steps.

EFFECTIVITY

ALL

27-61-00

02

Page 202  
Aug 22/06

(f) Spoilers 4 and 9 will move to their full up positions and the other spoilers will move up if you close the AIR/GND circuit breakers when these conditions are satisfactory:

- The speedbrake lever is in its UP detent position
- Electrical power is on
- Hydraulic power is on
- LANDING GEAR POSITION AIR/GND SYS 1 and SYS 2 are open.

To prevent injury to persons or damage to equipment, do the "Install the PCA locks to Deactivate the Spoiler/Speedbrakes" or the "Spoiler/Speedbrake Deactivation When you Will Open the Air/Ground Circuit Breakers or Simulate the Air Mode" group of steps.

(g) The spoilers will retract when you open the FLT CONT ELEC circuit breakers or remove electrical power when these conditions are satisfactory:

- The speedbrake lever is in its UP detent position
- Electrical power is on
- Hydraulic power is on.

To prevent injury to persons or damage to equipment, do the "Install the PCA Locks to Deactivate the Spoiler/Speedbrakes" or the "Spoiler/Speedbrake Deactivation When You Will Open the FLT CONT ELEC Circuit Breakers or Remove Electrical Power" group of steps.

(h) The spoilers will retract if you disconnect the electrical connector from a spoiler PCA when these conditions are satisfactory:

- The speedbrake lever is in its UP detent position
- Electrical power is on
- Hydraulic power is on

To prevent injury to persons or damage to equipment, do the "Install the PCA Locks to Deactivate the Spoiler/Speedbrakes" or the "Deactivate the Spoiler/Speedbrakes When You Will Disconnect the Electrical Connector From a PCA" group of steps.

- (b) Open these circuit breakers and attach DO-NOT-CLOSE tags:
- 1) P11 Circuit Breaker Panel
    - a) 11H15, FLT CONT SHUTOFF WING L
    - b) 11H16, FLT CONT SHUTOFF WING C
    - c) 11H26, FLT CONT SHUTOFF WING R

S 492-015

**WARNING:** MAKE SURE HYDRAULIC POWER IS NOT SUPPLIED TO THE SPOILER PCAS DURING THE PCA LOCK INSTALLATION. THE SPOILERS WILL RETRACT IN LESS THAN 1 SECOND AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

STOP AIRPLANE MAINTENANCE DURING THE SPOILER PCA LOCK INSTALLATION. DO NOT MOVE THE SPEEDBRAKE LEVER OR ENGINE THRUST LEVERS. THE SPOILERS WILL RETRACT IN LESS THAN 1 SECOND AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (13) Be careful, and do the "Spoiler Actuator Lock Installation" , at the end of this procedure, to install the spoiler actuator locks on all twelve spoiler PCAs.

**NOTE:** After you remove hydraulic power, the spoilers can move down a small distance. If it is necessary, use a 5/32 inch allen wrench to operate the manual release cam (to release unwanted hydraulic pressure) and lift the spoilers to install the PCA locks.

S 862-016

**WARNING:** MAKE SURE ALL TWELVE SPOILER LOCKS ARE INSTALLED ON THE TWELVE SPOILER PCAS. MAKE SURE THAT ALL PERSONS AND EQUIPMENT ARE AWAY FROM THE SPOILERS BEFORE YOU CONTINUE THIS PROCEDURE. ACCIDENTAL SPOILER MOVEMENT CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (14) Supply pressure to the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 862-017

- (15) If it is necessary for maintenance, reactivate and retract the trailing edge flaps (AMM 27-51-00/201).

EFFECTIVITY

ALL

27-61-00

02

Page 207  
Aug 22/07

S 862-018

- (16) Remove hydraulic power if it is necessary for maintenance (AMM 29-11-00/201).

S 862-019

**CAUTION:** MAKE SURE YOU REMOVE HYDRAULIC POWER BEFORE YOU REMOVE ELECTRICAL POWER OR OPEN ONE OF THE CIRCUIT BREAKERS SHOWN ABOVE. SPOILERS WITH HYDRAULIC POWER WILL TRY TO RETRACT AND CAN CAUSE DAMAGE TO THE SPOILERS.

- (17) Remove electrical power if it is necessary for maintenance.

**NOTE:** EICAS will store a maintenance message when you remove electrical power.

- F. Deactivate the Spoiler/Speedbrakes for Operation of the Forward or Reverse Thrust Levers

**NOTE:** Use this procedure to prevent spoiler movement when you move the forward or reverse thrust levers.

S 862-020

**WARNING:** MAKE SURE THE SPEEDBRAKE LEVER IS IN ITS DOWN-AND-LOCKED POSITION AND THE SPEEDBRAKE CIRCUIT BREAKER IS OPEN BEFORE YOU OPERATE THE THRUST LEVERS. ACCIDENTAL SPOILER MOVEMENT CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (1) Move the speedbrake lever to its down-and-locked position.

S 862-021

- (2) Open this circuit breaker on the overhead panel, P11, and attach a DO-NOT-CLOSE tag:  
(a) 11G11, AUTO SPEED BRAKE

S 212-022

- (3) Make sure all persons and equipment are away from the spoilers.

S 862-023

- (4) Move the forward thrust levers if it is necessary for maintenance.

S 862-024

- (5) Move the reverse thrust levers if it is necessary for maintenance.

G. Spoiler/Speedbrake Deactivation When You Will Open the FLT CONT ELEC Circuit Breakers or Remove Electrical Power

**NOTE:** This procedure makes sure the spoilers do not retract when you remove electrical power or open the FLT CONT ELEC circuit breakers.

S 862-025

**WARNING:** MAKE SURE THE SPEEDBRAKE LEVER IS IN ITS DOWN-AND-LOCKED POSITION BEFORE YOU OPEN THE FLT CONT ELEC CIRCUIT BREAKERS OR REMOVE ELECTRICAL POWER. THE SPOILERS WILL RETRACT IN LESS THAN ONE SECOND AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (1) Move the speedbrake lever to its down-and-locked position.

S 862-026

- (2) If it is necessary for maintenance, open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
- (a) 11C6, FLT CONT ELEC 1L AC
  - (b) 11C7, FLT CONT ELEC 1L DC
  - (c) 11C8, FLT CONT ELEC 2L AC

  - (g) 11G26, FLT CONT ELEC 2R AC
  - (h) 11G27, FLT CONT ELEC 2R DC

S 862-033

- (3) Remove the power from the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 032-034

- (4) Disconnect the spoiler PCA electrical connectors if it is necessary for maintenance.

TASK 27-61-00-442-035

### 3. Spoiler/Speedbrake Activation

#### A. General

- (1) This task contains procedures to activate the spoilers after you have done the applicable deactivation procedure and the necessary airplane maintenance.

EFFECTIVITY

ALL

27-61-00

01

Page 211  
Aug 22/01

- (2) Use these procedures when you do maintenance near the spoilers or when you do maintenance that can cause the spoilers to operate.
- (3) The spoiler/speedbrake system uses hydraulic power and is electrically controlled. Each of the twelve spoilers is moved by a power control actuator (PCA) that gets power from one of the three main hydraulic systems.
- (4) The spoiler control modules (SCMs) control the spoiler movement and are connected to many airplane systems. If you do maintenance on other systems, it is possible for the spoilers to move accidentally. Be very careful, because the spoilers move very quickly and can cause injury to persons or damage to equipment.
- (5) The spoilers are numbered 1 thru 12 from the outboard left wing spoiler to the outboard right wing spoiler.

- (i) 11C30, LANDING GEAR POSITION AIR/GND SYS 1
- (j) 11U23, POS AIR/GND SYS 2

S 042-128

**WARNING:** REFER TO AMM 25-65-00/201 FOR THE PROCEDURE TO DISARM THE OFF-WING ESCAPE SYSTEM. IF YOU INCORRECTLY DISARM THE OFF-WING ESCAPE SYSTEM, THE ESCAPE SLIDE CAN ACCIDENTALLY INFLATE AND CAUSE INJURY OR DAMAGE.

- (4) Make sure the off-wing escape system is disarmed (AMM 25-65-00/201).

S 212-001

- (5) Make sure the speedbrake lever is fully up.

S 212-002

- (6) Make sure the control wheels are in their neutral positions.

EFFECTIVITY

ALL

27-61-00

02

Page 213  
Aug 22/06

S 862-042

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRUALIC POWER IS SUPPLIED.

- (7) Supply pressure to the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 862-043

- (8) Extend the trailing edge flaps (AMM 27-51-00/201).

S 042-044

- (9) Do the deactivation procedure for the trailing edge flaps (AMM 27-51-00/201).

S 862-045

- (10) Remove the power from the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 092-046

**WARNING:** MAKE SURE HYDRAULIC POWER IS NOT SUPPLIED TO THE SPOILER PCAS DURING THE PCA LOCK REMOVAL. THE SPOILERS WILL RETRACT IN LESS THAN 1 SECOND AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

STOP AIRPLANE MAINTENANCE DURING THE SPOILER PCA LOCK REMOVAL. DO NOT MOVE THE SPEEDBRAKE LEVER OR ENGINE THRUST LEVERS, OR OPEN THE CIRCUIT BREAKERS SHOWN ABOVE. THE SPOILERS WILL RETRACT IN LESS THAN 1 SECOND AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (11) Be careful, and do the "Spoiler Actuator Lock Removal", at the end of this procedure, to remove the spoiler actuator locks from all twelve spoiler PCAs.

**NOTE:** When you remove hydraulic power, the spoilers can move down a small distance. If it is necessary, use a 5/32 inch allen wrench to operate the manual release cam to lift the spoiler and remove the PCA lock.

EFFECTIVITY

ALL

27-61-00

NOTE: Stop for 11 seconds to let the EICAS message show.

K. Put the Airplane Back to Its Usual Condition

S 865-069

- (1) Remove the power from the left, right, and center hydraulic systems (Ref 29-11-00).

S 865-070

- (2) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
  - (a) 11G11, AUTO SPEEDBRK

S 865-071

- (3) Remove electrical power if it is not necessary (Ref 24-22-00).

TASK 27-61-00-825-072

3. Adjustment - Spoiler/Speedbrake Control System

A. General

- (1) Before you adjust the spoiler control system, make sure the trailing edge flaps are adjusted correctly. Refer to 27-51-00/501 for the applicable adjustment data.

EFFECTIVITY

ALL

27-61-00

- (2) Before you adjust the speedbrake LVDTs, make sure the speedbrake lever is adjusted correctly. Refer to 27-62-00/501 for the applicable adjustment data.
- (3) Adjust the spoiler PCAs with the airplane on its landing gear and the engines (or equivalent weights) installed on the struts. For other adjustments to the spoiler/speedbrake system, the airplane can be on jacks or its landing gear.

**B. Equipment**

- (1) Breakout Box, Cables - A27063-91 (Preferred)  
Position Transmitter Tester - PTTS-892B  
(Alternate)  
Phase Synchronous Voltmeter - 101-AC5/6/7/8  
(Alternate)
- (2) 10,000 ohm Resistor, Commercially Available
- (3) Power Supply - Powertron Model 5900 (control wheel RVDT adjustment PROCEDURE 1, speedbrake LVDT adjustment PROCEDURE 1), Industrial Test Equipment Corp., Port Washington, New York
- (4) Ratiometric Digital Phase Angle Voltmeter - North Atlantic Model 225-400-400R30 (speedbrake LVDT adjustment PROCEDURE 2), North Atlantic Industries Inc., Hauppauge, New York
- (5) Digital Multimeter - (Commercially Available) (control wheel RVDT adjustment PROCEDURE 1, 2 and 4)(speedbrake LVDT adjustment PROCEDURE 1 or 3).
- (6) Phase Synchronous Voltmeter - Model 101A Electronic Aviation Systems, Renton, Washington (control wheel RVDT adjustment PROCEDURE 3, speedbrake LVDT adjustment PROCEDURE 4)
- (7) Rig Pins from Set A20004-XX (Ref 20-10-24):
  - (a) A1 - P/N A20004-15
  - (b) A2 - P/N A20004-17
- (8) Control Wheel Straightedge - A27020-1

F. Adjust the Captain's (First Officer's) Control Wheel RVDTs (Fig. 501)

**NOTE:** Four procedures are supplied to adjust the control wheel RVDTs.

PROCEDURE 1 - uses a commercially available power supply, a resistor, a digital voltmeter (DVM), and the breakout box equipment.

PROCEDURE 2 - uses airplane power and a DVM with the breakout box equipment.

PROCEDURE 3 - uses a phase synchronous voltmeter only.

PROCEDURE 4 - uses a DVM without the breakout box equipment.

S 015-078

- (1) Open access door 119AL to get access to the aileron drum assemblies (Ref 06-41-00).

S 495-077

- (2) Operate the aileron trim switches on the aft electronic control panel, P8, until you can install these rig pins:
  - (a) A1 (for the captain's drum assembly)
  - (b) A2 (for the first officer's drum assembly)

S 495-079

- (3) Attach the control wheel straightedge across the bottom of the control wheels.

**NOTE:** It is permitted for one surface rest to be 0.03 inch (0.76 mm) away from the straightedge. If it is necessary, refer to 27-11-00 for the applicable adjustment data.

S 865-080

**WARNING:** MAKE SURE THE SPOILERS ARE IN THEIR DOWN POSITIONS BEFORE YOU OPEN THE FLT CONT ELEC CIRCUIT BREAKERS. THE SPOILERS WILL RETRACT IN LESS THAN ONE SECOND AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (4) Open the circuit breakers on the overhead panel, P11, that are shown in Table 501 and attach DO-NOT-CLOSE tags.

S 825-081

- (5) Adjust the Control Wheel RVDTs (PROCEDURE 1)
- (a) Disconnect the RVDT connector, P1, from the airplane connector.
  - (b) Do these steps to connect the breakout box equipment:
    - 1) Connect the breakout box and the -21 cable assembly to the RVDT connector P1.
    - 2) Connect the digital voltmeter (DVM) to the breakout box at pins 3 (SIG HI) and 5 (SIG LO).
    - 3) Connect the power supply to the breakout box at pins 1 (LO) and 2 (HI).
    - 4) Connect the resistor between pins 3 and 5.
    - 5) Adjust the power supply to  $26 \pm 0.02$  volts ac RMS.
  - (c) Loosen the four clamp screws on the bottom of the RVDT.
  - (d) Adjust the null adjustment screw until the output voltage is  $0 \pm 0.050$  volts ac RMS at the DVM.
  - (e) Tighten the clamp screws and do this check:
    - 1) Make sure the output voltage is  $0 \pm 0.050$  volts ac RMS at the DVM.
  - (f) Lock the clamp screws with a wire.
  - (g) Disconnect the RVDT connectors P2 and P3 from the airplane connectors and do this check:
    - 1) Make sure the output voltage for connectors P2 and P3 is  $0 \pm 0.050$  volts ac RMS at the DVM.
  - (h) Do these steps to disconnect the breakout box equipment:
    - 1) Disconnect the power supply, the resistor, and the DVM from the breakout box.
    - 2) Disconnect the breakout box and the -21 cable assembly from the RVDT connector.
  - (i) Connect the airplane connectors to the RVDT.
  - (j) Remove the DO-NOT-CLOSE tags and close the circuit breakers on the P11 panel that are shown in Table 501.

S 825-082

- (6) Adjust the Control Wheel RVDTs (PROCEDURE 2)
- (a) Disconnect the RVDT connector, P1, from the airplane connector.

- (b) Do these steps to connect the breakout box equipment:
  - 1) Connect the breakout box and the -21 cable assembly to the RVDT connector P1.
  - 2) Connect the DVM to the breakout box at pins 3 (SIG HI) and 5 (SIG LO).
  - 3) Connect the breakout box and the -20 cable assembly to the airplane electrical connector.
  - 4) Connect DVM 2 to the breakout box at pins 1 (LO) and 2 (HI) to monitor the airplane power.
- (c) Remove DO-NOT-CLOSE tags and close the circuit breakers on the P11 panel that are shown in Table 501.
- (d) Make sure the airplane input voltage is between 24 and 30 volts ac RMS at DVM 2.
- (e) Loosen the four clamp screws on the bottom of the RVDT.
- (f) Adjust the null adjustment screw until the output voltage is  $0 \pm 0.050$  volts ac RMS at DVM 1.
- (g) Tighten the clamp screws and do this check:
  - 1) Make sure the output voltage is  $0 \pm 0.050$  volts ac RMS at DVM 1.
- (h) Open the circuit breakers on the P11 panel that are shown in Table 501.
- (i) Disconnect the RVDT connectors P2 and P3 from the airplane connectors.
- (j) Connect the breakout box equipment between the RVDT connector P2 and the airplane connector and do these steps:
  - 1) Close the circuit breakers on the P11 panel that are shown in Table 501.
  - 2) Make sure the airplane input voltage is between 24 and 30 volts ac RMS at DVM 2.
  - 3) Make sure the output voltage is  $0 \pm 0.050$  volts ac RMS at DVM 1.
  - 4) Open the circuit breakers on the P11 panel that are shown in Table 501 and attach DO-NOT-CLOSE tags.
- (k) Do the above step again for RVDT connector P3.
- (l) Lock the clamp screws with a wire.
- (m) Do these steps to remove the breakout box equipment:
  - 1) Disconnect the DVMs from the breakout box.
  - 2) Disconnect the breakout box and the -20 cable assembly from the airplane connector.
  - 3) Disconnect the breakout box and the -21 cable assembly from the RVDT connector.
- (n) Connect the airplane connectors to the RVDT.
- (o) Remove the DO-NOT-CLOSE tags and close the circuit breakers on the P11 panel that are shown in Table 501.

S 825-083

- (7) Adjust the Control Wheel RVDTs (PROCEDURE 3)
  - (a) Disconnect the RVDT connector, P1, from the airplane connector.
  - (b) Use the data supplied with the tool to prepare the phase synchronous voltmeter for use.

EFFECTIVITY

ALL

Page 541  
Apr 22/01

- (c) Connect the applicable cable assembly between the voltmeter and the RVDT connector P1.
- (d) Loosen the four clamp screws on the bottom of the RVDT.
- (e) Adjust the null adjustment screw until the voltmeter shows 0 ±0.050 volts.
- (f) Tighten the clamp screws and do this check:
  - 1) Make sure the voltage is 0 ±0.050 volts.
- (g) Lock the clamp screws with a wire.
- (h) Disconnect the RVDT connectors P2 and P3 from the airplane connectors and do this check:
  - 1) Make sure the output voltage for connectors P2 and P3 is 0 ±0.050 volts on the voltmeter.
- (i) Disconnect the voltmeter and its cable assembly from the RVDT connector.
- (j) Connect the airplane connectors to the RVDT.
- (k) Remove the DO-NOT-CLOSE tags and close the circuit breakers on the P11 panel that are shown in Table 501.

S 825-084

- (8) Adjust the Control Wheel RVDTs (PROCEDURE 4)
  - (a) Do these steps to adjust the captain's control wheel RVDT:
    - 1) Remove the spoiler control module (SCM), 1L, from the E1-1 equipment shelf (Ref 27-09-00).
    - 2) Remove the DO-NOT-CLOSE tags and close the circuit breakers on the P11 panel that are shown in Table 501.
    - 3) Use a DVM to measure the RVDT output voltages at these pins on the E1-1 equipment shelf:

<u>CONNECTOR</u>	<u>PINS</u>
D825A	J3 and J4
D825B	J4 and J5
	J12 and J13

- 4) Loosen the four clamp screws on the bottom of the captain's RVDT.
- 5) Turn the null adjustment screw until the output voltage is 0 ±0.050v ac RMS at the DVM.
- 6) Tighten the clamp screws and do this check:
  - a) Make sure the three output voltages are 0 ±0.050v ac RMS at the DVM.
- 7) Lock the clamp screws with a wire.
- 8) Open the circuit breakers on the P11 panel that are shown in Table 501 and attach DO-NOT-CLOSE tags.
- 9) Install SCM 1L (Ref 27-09-00).
- (b) Do these steps to adjust the first officer's control wheel RVDT:
  - 1) Remove SCM 1R from the E2-1 equipment shelf (Ref 27-09-00).
  - 2) Remove the DO-NOT-CLOSE tags and close the circuit breakers on the P11 panel that are shown in Table 501.

EFFECTIVITY

- 3) Use a DVM to measure the output voltages at these pins on the E2-1 equipment shelf:

<u>CONNECTOR</u>	<u>PINS</u>
D831A	J3 and J4
D831B	J4 and J5
	J12 and J13

- 4) Loosen the four clamp screws on the first officer's RVDT.  
5) Turn the null adjustment screw until the output voltage is  $0 \pm 0.050\text{v}$  ac RMS at the DVM.  
6) Tighten the clamp screws and do this check:  
a) Make sure the three output voltages are  $0 \pm 0.050\text{v}$  ac RMS at the DVM.  
7) Lock the clamp screws with a wire.  
8) Open the circuit breakers on the P11 panel that are shown in Table 501 and attach D0-NOT-CLOSE tags:  
9) Install SCM 1R (Ref 27-09-00).  
(c) Remove the D0-NOT-CLOSE tags and close the circuit breakers on the P11 panel that are shown in Table 501.

S 095-149

- (9) Remove the control wheel straightedge.

S 095-150

- (10) Remove rig pins A1 and A2.

G. Adjust the Spoiler Power Control Actuators (PCAs) (Fig. 503)

**NOTE:** This procedure is applicable to all of the spoiler PCAs. Before you do this procedure, make sure the airplane is on its landing gear with the engines (or equivalent weights) installed on the struts.

S 865-085

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (1) Supply pressure to the left, right, and center hydraulic systems (Ref 29-11-00).

S 865-086

- (2) Use hydraulic power and retract the trailing edge flaps (Ref 27-51-00).

S 865-087

- (3) Stop for at least one minute.

EFFECTIVITY

ALL

27-61-00

- S 045-151
- (4) Do the deactivation procedure for the trailing edge flaps (Ref 27-51-00).
- S 215-088
- (5) Make sure the speedbrake lever is in its down-and-locked detent position.
- S 865-089
- (6) Operate the aileron trim switches on the aft electronic control panel, P8, until this condition is satisfactory:
- (a) The trim indicators on the control wheels show zero units of trim.
- S 215-090
- (7) Make sure all the spoilers are in their full down positions.
- S 865-152
- (8) Remove the power from the left, right, and center hydraulic systems (Ref 29-11-00).
- S 865-153
- (9) Move the FLT CONTROL SHUTOFF WING L, R, and C switches on the right side panel, P61, to OFF. Attach DO-NOT-OPERATE tags and make sure the switch position lights come on.
- S 865-154
- (10) Open these circuit breakers on the P11 panel and attach DO-NOT-CLOSE tags:
- (a) 11H15, FLT CONT SHUTOFF WING LEFT
- (b) 11H16, FLT CONT SHUTOFF WING CTR
- (c) 11H26, FLT CONT SHUTOFF WING RIGHT
- S 045-091
- (11) FOR ADJUSTMENTS TO SPOILERS 5, 6, 7, AND 8;  
Do these steps:
- NOTE:** Spoilers are numbered 1 thru 12 from the outboard left wing spoiler to the outboard right wing spoiler.
- (a) Open the applicable access panels (Ref 06-44-00):
- 1) 552BB (for spoiler number 6)
- 2) 552GB (for spoiler number 5)
- 3) 652BB (for spoiler number 7)
- 4) 652GB (for spoiler number 8).

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (13) Supply pressure to the left, center, and right hydraulic systems (AMM 29-11-00/201).

S 225-094

- (14) Measure and record the clearance between the spoiler and flap for each of the spoilers (View A-A and B-B). Make sure the clearance is correct.

S 865-645

- (15) Remove pressure from the left, center, and right hydraulic systems (AMM 29-11-00/201).

S 205-466

- (16) Do these steps to find the spoiler to trailing edge flap preload (View B-B ):

S 865-647

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (17) Supply pressure to the left, right and center hydraulic systems (AMM 29-11-00/201).
- (a) Remove the DO-NOT-OPERATE tags and move the FLT CONTROL SHUTOFF WING L, R, and C switches on the right side panel, P61, to ON.
  - (b) Move the speed brake lever fully up.
  - (c) Retract the trailing edge flaps (AMM 27-51-00/201).
  - (d) Do the deactivation procedure for the trailing edge flaps (AMM 27-51-00/201).
  - (e) Make sure the speedbrake lever is in its down and locked position.
    - 1) Make sure the spoilers are fully down.

EFFECTIVITY

ALL

27-61-00

09

Page 546  
Aug 22/08

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (f) Make sure the left, right, and center hydraulics systems are pressurized (AMM 29-11-00/201).
- (g) Measure and record the gap between the lower trailing edge of the spoiler and the upper surface of the inboard flap (View B-B).
- (h) Remove the power from the left, right, and center hydraulics systems (AMM 29-11-00/201).
- (i) The PCA piston can be rotated to raise or lower the spoiler trailing edge. For the inboard spoilers, rotating the piston through one lock washer serration will result in 0.054 inch (1.37 mm) of adjustment. From the gap measurement, calculate the number of lock washer serrations the PCA piston must be rotated to raise or lower the spoiler trailing edge to achieve the preload (-.10 inch maximum, at the outboard side of the inboard spoilers). Make sure the measurements on the inboard side of the inboard spoilers (View B-B) are still within the limits .

**NOTE:** Since a negative preload cannot be physically measured between the lower trailing edge of the inboard spoilers and the upper surface of the inboard flap, a starting point gap may be necessary between the spoiler and flap. From the positive measurement taken, you can determine how many serrations of the lock washer the PCA piston must be turned to achieve a negative value on the outboard side of the spoiler (-.10 inch maximum).

S 825-095

- (18) If it is necessary, do these steps to adjust the spoiler to flap clearance (View A-A, View B-B):
  - (a) Extend the trailing edge flaps (AMM 27-51-00/201).
  - (b) Do the deactivation procedure for the trailing edge flaps (AMM 27-51-00/201).
  - (c) Disconnect the electrical connector from the spoiler PCA.
  - (d) Use a 5/32 allen wrench to operate the manual release cam and lift the spoiler.
  - (e) Hold the spoiler in the up position.
  - (f) Loosen the locknut at the rod end of the spoiler PCA.

EFFECTIVITY

ALL

27-61-00

09

Page 547  
Aug 22/08

- (g) Turn the PCA piston to increase or decrease the PCA length.

**NOTE:** FOR THE OUTBOARD SPOILERS,  
an adjustment that is equal to one lock washer serration  
will lift or lower the spoiler trailing edge 0.037 inch  
(0.94 mm).  
FOR THE INBOARD SPOILERS,  
an adjustment that is equal to one lockwasher slot will  
lift or lower the spoiler trailing edge 0.054 inch  
(1.37 mm).

- (h) FOR THE INBOARD SPOILERS;  
Tighten the locknut to 1560–1860 pound-inches  
(176.3–210.2 newton-meters).  
(i) FOR THE OUTBOARD SPOILERS;  
Tighten the locknut to 900–1140 pound-inches  
(101.8–128.8 newton-meters).  
(j) Lower the spoiler.  
(k) Connect the electrical connector to the PCA.

S 865-096

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (19) Supply pressure to the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 865-155

- (20) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:  
(a) 11H15, FLT CONT SHUTOFF WING LEFT  
(b) 11H16, FLT CONT SHUTOFF WING CTR  
(c) 11H26, FLT CONT SHUTOFF WING RIGHT

S 865-156

- (21) Remove the DO-NOT-OPERATE tags and move the FLT CONTROL SHUTOFF WING L, R, and C switches on the P61 panel to ON.

S 865-097

- (22) Remove the DO-NOT-CLOSE tags and close the circuit breakers on the P11 panel that are shown in Table 502.

S 865-098

- (23) Move the speedbrake lever to its full upstop position.

S 225-167

- (37) Make sure the clearance between spoilers 6 or 7 and the override actuator is correct (View C-C).

S 865-168

- (38) Remove the DO-NOT-CLOSE tags and close the P11 panel circuit breakers that are shown in Table 502.

S 445-169

- (39) FOR SPOILERS 5, 6, 7, AND 8;  
Do these steps:

**WARNING:** REFER TO AMM 25-65-00/201 FOR THE PROCEDURE TO ARM THE OFF-WING ESCAPE SYSTEM. IF YOU INCORRECTLY ARM THE OFF-WING ESCAPE SYSTEM, THE ESCAPE SLIDE CAN ACCIDENTALLY INFLATE AND CAUSE INJURY OR DAMAGE.

- (a) Arm the off-wing escape system (AMM 25-65-00/201).

S 865-352

- (40) Retract the trailing edge flaps (AMM 27-51-00/201).

S 045-353

- (41) Do the deactivation procedure for the trailing edge flaps (AMM 27-51-00/201).

H. Adjust the Speedbrake LVDTs (PROCEDURE 1) (Fig. 504)

**NOTE:** Four procedures are supplied to adjust the speedbrake LVDTs.

PROCEDURE 1 - uses a commercially available power supply, a resistor, a digital voltmeter (DVM) and the breakout box equipment.

PROCEDURE 2 - uses airplane power and a ratiometric digital phase angle voltmeter (ratiometric PAV) with the breakout box equipment.

PROCEDURE 3 - uses airplane power and a DVM. The ratio calculation is done manually.

PROCEDURE 4 - uses a phase synchronous voltmeter only.

S 215-103

- (1) Make sure the power is removed from the left, right, and center hydraulic systems (AMM 29-11-00/201).

- (m) Disconnect the breakout box and the cable assembly from the LVDT.

S 825-111

- (10) Do the above step again for the other two dual LVDT units.

S 435-112

- (11) Connect the airplane electrical connectors to the LVDTs.

S 865-172

- (12) Remove the DO-NOT-CLOSE tags and close the circuit breakers on the P11 panel that are shown in Table 503.

S 095-113

- (13) Disconnect the power supply, resistor, and the DVM from the breakout box.

S 425-173

- (14) Install the captain's seat (Ref 25-11-01).

I. Adjust the Speedbrake LVDTs (PROCEDURE 2)

S 215-114

- (1) Make sure the power is removed from the left, right, and center hydraulic systems (Ref 29-11-00).

S 025-115

- (2) Remove the captain's seat (Ref 25-11-01).

S 865-355

**WARNING:** MAKE SURE THE SPOILERS ARE IN THEIR DOWN POSITIONS BEFORE YOU OPEN THE FLT CONT ELEC CIRCUIT BREAKERS. THE SPOILERS WILL RETRACT IN LESS THAN ONE SECOND AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (3) Open the circuit breakers on the P11 panel that are shown in Table 503 and attach DO-NOT-CLOSE tags.

S 035-116

- (4) Disconnect the electrical connectors from the LVDTs.

**NOTE:** The connectors are found under the flight deck floor. Get access through access door 113AL (Ref 06-41-00).

S 495-117

- (5) Do these steps to connect the breakout box equipment:
  - (a) Connect the breakout box and a -21, -23, -25, -33, -35, or -37 cable assembly to one of the LVDT connectors.

EFFECTIVITY

ALL

27-61-00

Page 553  
Apr 22/01

- (b) Connect the ratiometric digital phase angle voltmeter (ratiometric PAV) to the breakout box at pins 3 (SIG HI), 5 (SIG LO), and 6 (GND).
- (c) Connect the breakout box and a -20, -22, -24, -32, -34, or -36 cable assembly to the airplane connector that mates with the LVDT connector.
- (d) Connect the REF pins for the ratiometric PAV to the breakout box at pins 1 (HI) and 2 (LO).

S 215-118

- (6) Remove the DO-NOT-CLOSE tags and close the circuit breakers on the P11 panel that are shown in Table 503.

S 865-119

- (7) Move the speedbrake lever from its down-and-locked detent position to its full upstop position.

S 865-120

- (8) Move the speedbrake lever back to its down-and-locked detent position.

S 215-121

- (9) Move the speedbrake lever to its ARMED position and do this check:
  - (a) Make sure you can feel the cam roller for the detent lever move into its ARMED position.

S 825-122

- (10) Do these steps to adjust the speedbrake LVDT:
  - (a) Loosen the LVDT locknut.
  - (b) Turn the LVDT at the wrench flat until the output voltage is  $0 \pm 0.05$  volts ac RMS at the ratiometric PAV.
  - (c) Tighten the locknut and do this check:
    - 1) Make sure the output voltage is  $0 \pm 0.05$  volts ac RMS at the ratiometric PAV.
  - (d) Move the speedbrake lever to its full upstop position and do this check:
    - 1) Make sure the ratiometric PAV value is between 0.2731 and 0.2962.

NOTE: Use the ratio function on the ratiometric PAV.

TASK 27-61-00-735-191

4. System Test - Spoiler/Speedbrake Control System

A. General

- (1) Do these steps to measure the spoiler movement:

**NOTE:** The spoilers are numbered 1 thru 12, from the outboard left wing spoiler to the outboard right wing spoiler.

- (a) Measure the vertical distance from the trailing edge of spoilers 1, 4, 6, 7, 9, and 12 to the trailing edge of the nearest wing structure.
- (b) Measure the distance between the trailing edges of 2 and 1, 3 and 4, 5 and 6, 8 and 7, 10 and 9, 11 and 12 with the spoilers in their full down positions.
- (c) Add or subtract the distances in step (b) from those in step (a) to get the linear measurements for the spoilers from the faired neutral position.
- (2) During this procedure, make sure the airplane is on its main landing gear or the main gear is in its NOT TILT position.

B. Equipment

D. Access

- (1) Location Zones
  - 211/212 Control Cabin
  - 550/650 Wing Trailing Edge
  - 560/660 Wing Trailing Edge

E. Prepare for the Test

- S 865-192
  - (1) Supply electrical power (Ref 24-22-00).
- S 865-193
  - (2) Move the STBY POWER switch on the overhead panel, P5, to the AUTO  
position.
- S 025-589
  - (3) Remove the stab/trim aileron lockout modules (SAMs) from the E1-1  
and E2-1 equipment shelves (AMM 27-09-00/201).
- S 025-591
  - (4) Remove the yaw damper modules from the E1-1 and E2-1 equipment  
shelves (AMM 27-09-00/201).
- S 025-593
  - (5) Remove the rudder ratio changer modules (RRCMs) from the E1-1 and  
E2-1 equipment shelves (AMM 27-09-00/201).

EFFECTIVITY

ALL

**27-61-00**

- S 865-199
- (6) Open this circuit breaker on the overhead panel, P11, and attach a DO-NOT-CLOSE tag:
- (a) 11G11, AUTO SPEEDBRK

- S 865-574
- (7) Supply hydraulic pressure for flaps (AMM 29-11-00/201).

- S 865-202
- (8) Extend the trailing edge flaps (AMM 27-51-00/201).

- S 045-203
- (9) Do the deactivation procedure for the trailing edge flaps (AMM 27-51-00/201).

- S 215-358
- (10) Make sure the power is removed from the left, right, and center hydraulic systems (AMM 29-11-00/201).

- S 855-575
- (11) Do the disarm procedure for the off wing escape system (AMM 25-65-00/201).

S 865-201

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (12) Supply hydraulic pressure to the left, right, and center hydraulic systems (AMM 29-11-00/201).

F. Spoiler/Speedbrake Control System-Test

- S 865-205
- (1) Move the speedbrake lever to its ARMED position.

- S 865-206
- (2) Do these steps three times:
- (a) Slowly move the speedbrake lever aft to a position that is approximately one-half of full travel.

EFFECTIVITY

ALL

27-61-00

- (20) Move the EICAS computer select switch on the display select panel, P9, to L and do this check:
- (a) Make sure the amber EICAS message SPOILERS shows on the display.

EFFECTIVITY

ALL

27-61-00

S 215-223

- (21) Move the EICAS computer select switch on the P9 panel to R and do this check:
- (a) Make sure the amber EICAS message SPOILERS shows on the display.

S 865-224

- (22) Move the computer select switch on the P9 panel to its AUTO position.

S 865-225

- (23) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:
- (a) 11G17, FLT CONT ELEC 1R AC
  - (b) 11G26, FLT CONT ELEC 2R AC

S 215-226

- (24) Do these checks:
- (a) Make sure the amber SPOILERS light on the P5 panel goes off.
  - (b) Make sure the amber EICAS message SPOILERS does not show on the display.
  - (c) Make sure none of the six spoiler control modules (SCMs) have a fault.

NOTE: The six SCMs are found on the E1-1 and the E2-1 shelves in the main equipment center.

- 1) FOR -100 SERIES SCMs;  
Make sure all the faultballs are black.
- 2) FOR -200 SERIES SCMs;  
Make sure there are no faults in the EXISTING FAULTS.

NOTE: To look for faults do these steps:

- Push the ON/OFF key
- If the display shows SCM IN POS XX?: Push an arrow key (if it is necessary) until the correct position for the SCM is shown and then Push YES two times
- When the display shows EXISTING FAULTS push YES
- The display will show NO FAULTS if there are no faults.

G. Speedbrake Lever Inputs and Spoiler Operation in the Ground Mode - Test

S 215-227

- (1) Make sure the control wheels are in their neutral positions.

S 215-228

- (2) Move the speedbrake lever to its ARMED position and do this check:
- (a) Make sure all the spoilers are in their full down positions.

EFFECTIVITY

ALL

27-61-00

S 225-229

- (3) Move the speedbrake lever in the aft direction until all the spoilers start to move up and do this check:
- (a) Make sure the speedbrake lever is not more than 0.40 inch (10.16 mm) away from its ARMED position.

S 225-230

- (4) Slowly move the speedbrake lever to its full upstop position and do these checks:
- (a) Make sure the spoilers move up smoothly to a position that is  $60.31 \pm 0.78$  degrees away from their neutral positions.

NOTE: Use a bubble protractor to measure the spoiler movement.

- (b) Make sure spoilers 1, 2, 3, 4, 9, 10, 11, and 12 move up  $29.33 \pm 0.29$  inches (745.0 +/- 7.36 mm) and spoilers 5, 6, 7 and 8 move up  $38.12 \pm 0.37$  inches (968.2 +/- 9.4 mm).

S 215-231

- (5) Slowly move the speedbrake lever to its ARMED position and do this check:
- (a) Make sure all the spoilers move smoothly to their full down positions.

S 215-232

- (6) Move the speedbrake lever to its down-and-locked detent position and do these steps:
- (a) Make sure the SPOILERS light on the P5 panel is off.
  - (b) Push the ECS/MSG switch on the P61 panel.
  - (c) Push the AUTOREAD switch on the P61 panel and do this check:
    - 1) Make sure the white EICAS message SPOILERS does not show on the display.

NOTE: Stop for 11 seconds to let the EICAS message show.

- (d) Make sure none of the six spoiler control modules (SCMs) have a fault.

NOTE: The six SCMs are found on the E1-1 and the E2-1 shelves in the main equipment center.

- 1) FOR -100 SERIES SCMs;  
Make sure all the faultballs are black.

EFFECTIVITY

ALL

27-61-00

- 2) FOR -200 SERIES SCMs;  
Make sure there are no faults in the EXISTING FAULTS.

NOTE: To look for faults do these steps:

- Push the ON/OFF key
- If the display shows SCM IN POS XX?: Push an arrow key (if it is necessary) until the correct position for the SCM is shown and then Push YES two times
- When the display shows EXISTING FAULTS push YES
- The display will show NO FAULTS if there are no faults.

H. Control Wheel Inputs and Spoiler Operation, Flaps Up, Airplane-in-Air Mode - Test

S 865-576

- (1) Make sure flaps are fully retracted and do the deactivation procedure (AMM 27-51-00/201).

S 215-233

- (2) Make sure the speedbrake lever is in its down-and-locked detent position.

S 865-234

WARNING: MAKE SURE YOU DO THE FLIGHT MODE SIMULATION CORRECTLY. IF THE PROCEDURE IS NOT DONE CORRECTLY, INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR.

- (3) Do the Flight Mode Simulation procedure for the No. 1 and No. 2 air/ground systems (Ref 32-09-02).

S 025-648

- (4) Remove the medallions and chart holders from the control wheels.  
(a) Remove the two screws from the bottom of the medallion.

EFFECTIVITY

ALL

27-61-00

(b) Remove the medallion and chart holder.

S 495-235

- (5) Install the control wheel adapter equipment and protractor on the control wheel.

S 225-236

- (6) Turn the control wheel counterclockwise to the positions shown in Table 505 and do these checks:

NOTE: Use the sequence, from top to bottom, shown in Table 505 when you move the control wheel.

- (a) Make sure the right wing spoilers stay in their full down positions.
- (b) Make sure the other spoilers move to the positions shown in Table 505.
- (c) Make sure the amber SPOILERS light on the P5 panel is off.

S 225-237

- (7) Turn the control wheel clockwise to the positions shown in Table 505 and do these checks:

NOTE: Use the sequence, from top to bottom, shown in Table 505 when you move the control wheel.

- (a) Make sure the left wing spoilers stay in their full down positions.
- (b) Make sure the other spoilers move to the positions shown in Table 505.
- (c) Make sure the amber SPOILERS light on the P5 panel is off.

S 865-478

- (8) Put the airplane back in the ground mode (AMM 32-09-02/201).

S 865-238

- (9) Push the ECS/MSG switch on the P61 panel.

S 215-239

- (10) Push the AUTOREAD switch on the P61 panel and do these checks:  
(a) Make sure the EICAS message SPOILERS does not show on the display.

NOTE: Stop for 11 seconds to let the EICAS message show.

EFFECTIVITY

ALL

27-61-00

- 1) FOR -100 SERIES SCMs;  
Make sure all the faultballs are black.
- 2) FOR -200 SERIES SCMs;  
Make sure there are only right side PSM faults in the EXISTING FAULTS.

NOTE: To look for faults do these steps:  
- Push the ON/OFF key  
- If the display shows SCM IN POS XX?: Push an arrow key (if it is necessary) until the correct position for the SCM is shown and then Push YES two times  
- When the display shows EXISTING FAULTS push YES  
- The display will show NO FAULTS if there are no faults.

S 215-275

(13) Disconnect electrical connector D5137 on the E2-1 shelf and do these steps:

(a) Turn the control wheel clockwise and move the speedbrake lever at the same time to its full upstop position in less than 1.5 seconds. Do these checks:  
1) FOR -100 SERIES SCMs;  
Do the steps that follow:  
a) Make sure the CW XDCR and SB XDCR faultballs on SCM 1R are yellow.

NOTE: Ignore the MODULE FAULT faultball.

EFFECTIVITY

ALL

- b) Make sure all the other faultballs on the right SCMs are black.
- 2) FOR -200 SERIES SCMs;  
Make sure the CW RVDT FAULT and the S/B LVDT FAULT are in the EXISTING FAULTS of the three right SCMs (R1, R2, and R3).
  - (b) Move the control wheel to its neutral position.
  - (c) Move the speedbrake lever to its ARMED position.
  - (d) Connect connector D5137 to SCM 1R.
  - (e) Push the RESET switch on SCM 1R.
  - (f) FOR -100 SERIES SCMs;  
Make sure the MODULE FAULT faultballs on SCMS 2R and 3R are yellow.
  - (g) Push the RESET switch for SCM 2R and SCM 3R.

S 215-276

- (14) Do the above step again for connector D5141 and SCM 2R.

S 215-277

- (15) Do the above step again for connector D5139 and SCM 3R.

S 865-278

- (16) Move the speedbrake lever to its down-and-locked detent position.

S 865-279

- (17) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:
  - (a) 11G17, FLT CONT ELEC 1R AC
  - (b) 11G18, FLT CONT ELEC 1R DC

M. Spoiler Power Control Actuator (PCA) Failure - Test

S 215-280

- (10) Move the control wheel back to its neutral position and do these steps:
  - (a) Make sure none of the six spoiler control modules (SCMs) have a fault.

NOTE: The six SCMs are found on the E1-1 and the E2-1 shelves in the main equipment center.

- 1) FOR -100 SERIES SCMs;  
Make sure all the faultballs are black.
- 2) FOR -200 SERIES SCMs;  
Make sure there are no faults in the EXISTING FAULTS.

NOTE: To look for faults do these steps:

- Push the ON/OFF key
- If the display shows SCM IN POS XX?: Push an arrow key (if it is necessary) until the correct position for the SCM is shown and then Push YES two times
- When the display shows EXISTING FAULTS push YES
- The display will show NO FAULTS if there are no faults.

- (b) Make sure the amber SPOILERS light on the P5 panel is off.
- (c) Push the ECS/MSG switch on the P61 panel.

EFFECTIVITY

ALL

27-61-00

- (d) Push the AUTOREAD switch on the P61 panel and do this check:  
1) Make sure the white SPOILERS message does not show on the bottom EICAS display.

NOTE: Stop for 11 seconds to let the EICAS message show.

P. Panel Position Monitor - Test

S 215-330

- (1) Make sure these circuit breakers on the P11 panel are closed:  
(a) 11C30, LANDING GEAR POSITION AIR/GND SYS 1  
(b) 11U15, AIR/GND SYS 1  
(c) 11U23, POS AIR/GND SYS 2

S 865-331

- (2) Move the control wheel to its neutral position.

S 215-332

- (3) Move the speedbrake lever to its full upstop position and do this check:  
(a) Make sure all the spoilers move to their full up positions.

S 215-333

- (4) Put an actuator against the proximity sensor (S245) on the left landing gear to operate it (AMM 32-09-02/201). Do these checks:  
(a) Make sure spoilers 5 and 8 move to their full down positions.  
(b) Make sure the other spoilers stay in their up positions.

S 095-334

- (5) Remove the switch actuator from the proximity sensor (S245) on the left landing gear.

S 215-335

- (6) Push the RESET switch on all the SCM's and do this check:  
(a) Make sure spoilers 5 and 8 move to their full up positions.

S 215-336

- (7) Put a switch actuator against the proximity sensor (S267) on the left landing gear to operate it (Ref 32-09-02). Do these checks:  
(a) Make sure spoilers 6 and 7 move to their full down positions.  
(b) Make sure all the other spoilers stay in their up positions.

NOTE: Spoilers 4 and 9 can temporarily move to their full down positions and then go back to their full up positions.

S 095-337

- (8) Remove the switch actuator from the proximity sensor (S267) on the left landing gear.

EFFECTIVITY

ALL

27-61-00

S 215-338

- (9) Push the RESET switch on all the SCM's and do this check:  
(a) Make sure spoilers 6 and 7 go to their full up positions.

S 215-339

- (10) Move the speedbrake lever to its down-and-locked detent position and do these checks:  
(a) Make sure the amber SPOILERS light on the P5 panel is off.  
(b) Make sure none of the six spoiler control modules (SCMs) have a fault.

NOTE: The six SCMs are found on the E1-1 and the E2-1 shelves in the main equipment center.

- 1) FOR -100 SERIES SCMs;  
Make sure all the faultballs are black.
- 2) FOR -200 SERIES SCMs;  
Make sure there are no faults in the EXISTING FAULTS.

NOTE: To look for faults do these steps:  
- Push the ON/OFF key  
- If the display shows SCM IN POS XX?: Push an arrow key (if it is necessary) until the correct position for the SCM is shown and then Push YES two times  
- When the display shows EXISTING FAULTS push YES  
- The display will show NO FAULTS if there are no faults.

- (c) Make sure the white EICAS message SPOILERS does not show on the display.

NOTE: Stop for 11 seconds to let the message show.

Q. Put the Airplane Back to Its Usual Condition

S 425-340

- (1) Install the yaw damper modules and the rudder ratio changer modules (Ref 27-09-00).

S 865-341

- (2) Extend the trailing edge flaps (AMM 27-51-00).

S 045-493

- (3) Do the deactivation procedure for the trailing edge flaps (AMM 27-51-00/201).

EFFECTIVITY

ALL

27-61-00

S 865-509

**WARNING:** REFER TO AMM 25-65-00/201, FOR THE PROCEDURE TO ARM THE ESCAPE SYSTEM. IF YOU INCORRECTLY ARM THE OFF-WING ESCAPE SYSTEM, THE ESCAPE SLIDE CAN ACCIDENTALLY INFLATE AND CAUSE INJURY OR DAMAGE.

- (4) Do the steps that follow:
- (a) Arm the off-wing escape system (AMM 25-65-00/201).
  - (b) Close the EXIT sign panel above the overwing escape hatch.

S 865-345

- (5) Retract the trailing edge flaps (AMM 27-51-00).

S 865-346

- (6) Remove the power from the left, right, and center hydraulic systems (AMM 29-11-00).

S 865-347

- (7) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
- (a) 11G11, AUTO SPEEDBRK

S 865-348

- (8) Remove electrical power if it is not necessary (AMM 24-22-00).

INBOARD AND OUTBOARD SPOILERS - REMOVAL/INSTALLATION

1. General

- A. This task contains the removal and installation tasks for the inboard and outboard spoilers.
- B. The 8 outboard spoilers are interchangeable. However, the four inboard spoilers (5, 6, 7, and 8) are not interchangeable.
- C. The spoilers are numbered 1 thru 12 from the outboard left wing spoiler to the outboard right wing spoiler.

TASK 27-61-01-024-001

2. Spoilers - Removal

A. General

- (1) This task contains these procedures:

- Outboard Spoiler - Removal
- Inboard Spoiler - Removal.

Because this task contains more than one procedure, do only the applicable groups of steps.

To start one of these procedures do the "Prepare for the Removal" group of steps. Then, do the group of steps that is necessary to remove the component.

B. Equipment

- (1) A27108-13 Spoiler Actuator Lock

C. References

- (1) AMM 06-41-00/201, Fuselage Access Doors and Panels
- (2) AMM 06-44-00/201, Wing Access Doors and Panels
- (3) AMM 24-22-00/201, Electrical Power - Control
- (4) AMM 27-51-00/201, Trailing Edge Flap System
- (5) AMM 27-61-00/201, Spoiler/Speedbrake Control System
- (6) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems

D. Access

- (1) Location Zones
  - 211/212 Control Cabin
  - 550/650 Wing Trailing Edge
  - 560/660 Wing Trailing Edge

EFFECTIVITY

ALL

27-61-01

Dec 10/98

- (2) Access Panels
  - 552/652BB Landing Gear Support Beam
  - 552/652GB Area Aft of the Main Flap Mid-Spar Structure

E. Prepare for the Removal

S 864-002

- (1) Supply electrical power (AMM 24-22-00/201).

S 214-003

- (2) Make sure the speedbrake lever is in its down-and-locked detent position.

S 864-004

- (3) Extend the trailing edge flaps.

S 044-005

- (4) Do the deactivation procedure for the trailing edge flaps (AMM 27-51-00/201).

S 864-006

- (5) Remove the power from the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 864-007

- (6) Move the FLT CONTROL SHUTOFF WING L, R, and C switches on the right side panel, P61, to OFF. Attach DO-NOT-OPERATE tags and make sure the switch position lights come on.

S 864-008

- (7) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:

- (a) 11C6, FLT CONT ELEC 1L AC
- (b) 11C7, FLT CONT ELEC 1L DC
- (c) 11C8, FLT CONT ELEC 2L AC
- (d) 11C9, FLT CONT ELEC 2L DC
- (e) 11G11, AUTO SPEEDBRK
- (f) 11G17, FLT CONT ELEC 1R AC
- (g) 11G18, FLT CONT ELEC 1R DC
- (h) 11G26, FLT CONT ELEC 2R AC
- (i) 11G27, FLT CONT ELEC 2R DC
- (j) 11H15, FLT CONT SHUTOFF WING LEFT
- (k) 11H16, FLT CONT SHUTOFF WING CTR
- (l) 11H26, FLT CONT SHUTOFF WING RIGHT

S 864-009

- (8) Use a 5/32 allen wrench to operate the manual release cam (27 or 35) and lift the spoiler (1 or 5).

EFFECTIVITY

ALL

27-61-01

01

Page 402  
Dec 10/98

S 494-010

(9) Install the spoiler actuator lock on the PCA (AMM 27-61-00/201).

F. Outboard Spoiler - Removal (Fig. 401)

S 034-011

- (1) Disconnect these components from the spoiler (1):  
(a) The bonding jumper (15)  
(b) The rod end of the PCA (24).

S 034-012

- (2) Remove the four hinge bolts (11, 3, 3, and 11).

S 024-013

- (3) Remove the outboard spoiler (1).

G. Inboard Spoiler - Removal (Fig. 403)

S 014-014

- (1) Open the applicable access panels (AMM 06-44-00/201):  
(a) 552BB (for spoiler number 6)  
(b) 552GB (for spoiler number 5)  
(c) 652BB (for spoiler number 7)  
(d) 652GB (for spoiler number 8).

S 044-066

**WARNING:** REFER TO AMM 25-65-00/201 FOR THE PROCEDURE TO DISARM THE OFF-WING ESCAPE SYSTEM. IF YOU INCORRECTLY DISARM THE OFF-WING ESCAPE SYSTEM, THE ESCAPE SLIDE CAN ACCIDENTALLY INFLATE AND CAUSE INJURY OR DAMAGE.

- (2) Disarm the off-wing escape system (AMM 25-65-00/201).

S 034-016

- (3) Disconnect these components from the spoiler (5):  
(a) The bonding jumper (15)  
(b) The rod end of the PCA (30).

EFFECTIVITY

ALL

27-61-01

01

Page 403  
Dec 10/98

S 034-017

- (4) Remove the four hinge bolts (16, 17, 17, and 16).

S 024-018

- (5) Remove the inboard spoiler (5).

TASK 27-61-01-424-019

3. Spoilers - Installation

A. General

- (1) This task contains these procedures:

- Outboard Spoiler - Installation
- Inboard Spoiler - Installation
- Inboard/Outboard Spoilers - Adjustment.

Because this task contains more than one procedure, do only the applicable groups of steps.

To start one of these procedures, do the group of steps necessary to install the component. Then, do the "Inboard/Outboard Spoilers - Adjustment" group of steps. And last, do the "Put the Airplane Back to Its Usual Condition" group of steps.

B. Equipment

- (1) A27108-13 Spoiler Actuator Lock  
(2) Milliohmmeter - 0 to 0.1 ohms range

C. Consumable Materials

- (1) D00633 Grease - BMS 3-33 (Preferred)  
(2) D00013 Grease - MIL-PRF-23827 (Supersedes MIL-G-23827) (Alternate)

- (j) 11H16, FLT CONT SHUTOFF WING CTR
- (k) 11H26, FLT CONT SHUTOFF WING RIGHT

S 864-042

- (3) Remove the DO-NOT-OPERATE tags and move the FLT CONTROL SHUTOFF WING L, R, and C switches on the right side panel, P61, to ON.

S 864-043

- (4) Move the speedbrake lever fully up.

S 864-044

- (5) Retract the trailing edge flaps.

S 044-045

- (6) Do the deactivation procedure for the trailing edge flaps (AMM 27-51-00/201).

S 214-046

- (7) Move the speedbrake lever to its down-and-locked position.
  - (a) Make sure the spoilers are fully down.

S 824-047

- (8) FOR THE OUTBOARD SPOILERS;  
Do these steps to examine and adjust the spoiler-to-flap clearance (Fig. 402):
  - (a) Examine the clearance between the spoilers (View B-B) and adjust the seal if necessary.
  - (b) Examine the clearance between the spoiler and the adjacent structure (Views A-A and C-C) and adjust the seals if necessary.
  - (c) Examine the clearance between the leading edge of the spoiler and the aft wing structure (Views D-D and E-E). Adjust the seals if necessary.
  - (d) Examine the spoiler-to-flap clearance (AMM 27-61-00/201, Adjust Spoiler Power Control Actuators) and adjust the PCA if necessary.

S 824-048

- (9) FOR THE INBOARD SPOILERS;  
Do these steps to examine and adjust the spoiler-to-flap clearance (Fig. 404):
  - (a) Examine the clearance between the spoilers (View A-A) and adjust the seal if necessary.

- (c) Examine the clearance between the leading edge of the spoiler and the aft wing structure (Views D-D and E-E). Adjust the seals if necessary.
- (d) Examine the spoiler-to-flap clearance (AMM 27-61-00/201, Adjust Spoiler Power Control Actuator) and adjust the PCA if necessary.

S 444-071

**WARNING:** REFER TO AMM 25-65-00/201 FOR THE PROCEDURE TO ARM THE OFF-WING ESCAPE SYSTEM. IF YOU INCORRECTLY ARM THE OFF-WING ESCAPE SYSTEM, THE ESCAPE SLIDE CAN ACCIDENTALLY INFLATE AND CAUSE INJURY OR DAMAGE.

(10) For the inboard spoilers, arm the off-wing escape system (AMM 25-65-00/201).

J. Put the Airplane Back to Its Usual Condition

S 864-050

- (1) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
  - (a) 11G11, AUTO SPEEDBRK

S 864-051

- (2) Remove the power from the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 864-052

- (3) Remove electrical power if it is not necessary (AMM 24-22-00/201).

S 414-053

- (4) Close the applicable access panels that follow:
  - (a) 552BB (for spoiler number 6)

INBOARD AND OUTBOARD SPOILER - INSPECTION/CHECK

1. General

- A. This procedure only has illustrations and wear limit tables which show the data for wear limits. There are no procedures for access, removal, or installation of the parts. Refer to Outboard or Inboard Spoiler - Removal/Installation for procedures to do these tasks.

TASK 27-61-01-206-001

2. Spoilers - Wear Limits

A. Procedure

S 226-002

- (1) Use the supplied data (Fig. 601) to examine the spoilers for too much wear.

SPOILER POWER CONTROL ACTUATOR (PCA) – REMOVAL/INSTALLATION

1. General

- A. This procedure contains the removal and installation tasks for the spoiler power control actuators (PCA) and their components.
- B. The PCAs for spoilers 1 thru 4 and 9 thru 12 (the outboard spoilers) are the same. The PCAs for spoilers 5 thru 8 are not the same as the PCAs for the outboard spoilers. These procedures are applicable to the two different types of spoiler PCAs.

TASK 27-61-02-024-001

2. Spoiler PCA and Its Components – Removal

A. General

- (1) This task contains these procedures:

- Outboard Spoiler PCA – Removal
- Inboard Spoiler PCA – Removal
- Spoiler PCA Filter – Removal
- Spoiler PCA Electro-Hydraulic Servo Valve (EHSV) – Removal
- Outboard Spoiler PCA Manifold Seal – Removal

- (2) Because this procedure contains more than one procedure, do only the applicable groups of steps.
- (3) To start one of these procedures, do the "Prepare for the Removal" group of steps. Then, do the group of steps that is necessary to remove the component.

B. Equipment

- (1) A27108-13 Spoiler Actuator Lock

C. References

- (1) AMM 06-41-00/201, Fuselage Access Doors and Panels
- (2) AMM 06-44-00/201, Wing Access Doors and Panels
- (3) AMM 24-22-00/201, Electrical Power – Control
- (4) AMM 25-65-00/201, Off-Wing Escape System
- (5) AMM 27-51-00/201, Trailing Edge Flap System
- (6) AMM 27-61-00/201, Spoiler/Speedbrake Control System
- (7) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems

D. Access

- (1) Location Zones
  - 211/212 Control Cabin
  - 550/650 Wing Trailing Edge
  - 560/660 Wing Trailing Edge

EFFECTIVITY

ALL

27-61-02

01

Page 401  
Apr 22/00

- (2) Access Panels
  - 552/652BB Landing Gear Support Beam
  - 552/652GB Area Aft of the Main Flap Mid Spar Structure

E. Prepare for the Removal

S 864-002

- (1) Supply electrical power (AMM 24-22-00/201).

S 864-003

**WARNING:** MAKE SURE THE SPEEDBRAKE LEVER IS IN ITS DOWN-AND-LOCKED POSITION BEFORE YOU OPEN THE CIRCUIT BREAKERS BELOW. THE SPOILERS WILL RETRACT IN LESS THAN ONE SECOND AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
  - (a) 11C6, FLT CONT ELEC 1L AC
  - (b) 11C7, FLT CONT ELEC 1L DC
  - (c) 11C8, FLT CONT ELEC 2L AC
  - (d) 11C9, FLT CONT ELEC 2L DC
  - (e) 11G11, AUTO SPEEDBRK
  - (f) 11G17, FLT CONT ELEC 1R AC
  - (g) 11G18, FLT CONT ELEC 1R DC
  - (h) 11G26, FLT CONT ELEC 2R AC
  - (i) 11G27, FLT CONT ELEC 2R DC

S 864-004

- (3) Extend the trailing edge flaps.

S 044-005

- (4) Do the deactivation procedure for the trailing edge flaps (AMM 27-51-00/201).

S 864-006

- (5) Remove the pressure from the hydraulic system that supplies the PCA you will repair (AMM 29-11-00/201).

**NOTE:** The left hydraulic system supplies power to the PCAs for spoilers 1, 6, and 12.

The center hydraulic system supplies power to the PCAs for spoilers 3, 4, 5, 8, 9, and 10.

The right hydraulic system supplies power to the PCAs for spoilers 2, 7, and 11.

EFFECTIVITY

ALL

27-61-02

01

Page 402  
Aug 22/99

S 864-007

- (6) Move the FLT CONTROL SHUTOFF WING L, R, and C switches on the right side panel, P61, to OFF. Attach DO-NOT-OPERATE tags and make sure the switch position lights come on.

S 864-008

- (7) Open these circuit breakers on the P11 panel and attach DO-NOT-CLOSE tags:
- (a) 11H15, FLT CONT SHUTOFF WING LEFT
  - (b) 11H16, FLT CONT SHUTOFF WING CTR
  - (c) 11H26, FLT CONT SHUTOFF WING RIGHT

S 044-088

- (8) Before you do maintenance on spoilers 5, 6, 7, or 8, do these steps:

**NOTE:** Spoilers are numbered 1 thru 12 from the outboard left wing spoiler to the outboard right wing spoiler.

- (a) Open the applicable access panels that follow (AMM 06-44-00/201):
- 1) 552BB (for spoiler number 6)
  - 2) 552GB (for spoiler number 5)
  - 3) 652BB (for spoiler number 7)
  - 4) 652GB (for spoiler number 8).

**WARNING:** REFER TO AMM 25-65-00/201 FOR THE PROCEDURE TO DISARM THE OFF-WING ESCAPE SYSTEM. IF YOU INCORRECTLY DISARM THE OFF-WING ESCAPE SYSTEM, THE ESCAPE SLIDE CAN ACCIDENTALLY INFLATE AND CAUSE INJURY OR DAMAGE.

- (b) Disarm the off-wing escape system (AMM 25-65-00/201).

F. Outboard Spoiler PCA - Removal (Fig. 401)

S 864-009

- (1) Use a 5/32 allen wrench to operate the manual release cam (9) and lift the spoiler (4).

EFFECTIVITY

ALL

27-61-02

01

Page 403  
Dec 10/98

S 034-010

- (2) Disconnect these components:
- (a) The hydraulic lines (8) from the PCA (1)
    - 1) Install caps on the hydraulic lines (8) and the PCA ports (1).
  - (b) The electrical connector (10) from the PCA (1)
  - (c) The anti-rotation plate (28) from the torque tube (25), if it is necessary
  - (d) The rod end of the PCA (1) from the spoiler (4).

NOTE: The PCA can fall when you remove the bolt. Hold the PCA during this step to prevent an accident.

S 024-011

- (3) Disconnect the PCA (1) at the torque tube (25) and remove it from the airplane.

G. Inboard Spoiler PCA - Removal (Fig. 402)

S 864-012

- (1) Use a 5/32 allen wrench to operate the manual release cam (6) and lift the spoiler (14).

S 034-013

- (2) Disconnect these components:
- (a) The hydraulic lines (21) from the PCA (1)
    - 1) Install caps on the hydraulic lines (21) and the PCA ports (1).
  - (b) The electrical connector (5) from the PCA (1)
  - (c) The rod end of the PCA (1) from the spoiler (14).

NOTE: The PCA can fall when you remove the bolt. Hold the PCA during this step to prevent an accident.

S 024-014

- (3) Remove the four bolts (7) that connect the PCA (1) to the spoiler beam and remove the PCA.

H. Spoiler PCA Filter - Removal

S 864-015

- (1) Use a 5/32 allen wrench to operate the manual release cam (9 or 6) and lift the spoiler (4 or 14).

F. Outboard Spoiler PCA - Installation

S 214-024

**CAUTION:** EACH END OF THE PCA HAS A SPLIT BEARING. THE INNER RACE CAN BE ACCIDENTALLY REMOVED FROM THE OUTER RACE DURING HANDLING. MAKE SURE THE SERIAL NUMBERS ARE THE SAME AND THE INDEX MARKS ALIGN ON THE TWO HALVES OF THE INNER BEARING RACE. DAMAGE TO THE PCA OR THE AIRPLANE CAN OCCUR IF THE SERIAL NUMBERS ARE NOT THE SAME OR IF THE INDEX MARKS DO NOT ALIGN.

- (1) Make sure the serial numbers are the same and the index marks align on the two halves of the inner bearing race.

S 644-025

- (2) Apply some grease to the bolts and bushings before you install them.

S 434-026

- (3) Do these steps to connect the PCA (1) to the torque tube (25):
- (a) Install the bolt (24), washers (21, 23), and bushing (26).
  - (b) Put the nut (27) on the bolt (24).
  - (c) Tighten the nut to 1000-1200 pound-inches (113.0-135.5 newton-meters).

S 434-027

- (4) Do these steps to connect the PCA (1) to the spoiler (4):
- (a) Install the bolt (20), washers (19, 21, 23), and the bushing (22).
  - (b) Put the nut (18) on the bolt (20).
  - (c) Make sure the torque necessary to turn the nut before it touches the spoiler panel actuator fitting is 90-400 pound-inches (10.2-45.1 newton-meters).
  - (d) Tighten the nut to 1000-1200 pound-inches (113.0-135.5 newton-meters).

EFFECTIVITY

ALL

27-61-02

S 434-028

- (5) Connect the electrical connector (10) to the PCA (1).

S 434-029

- (6) Do this step to connect the anti-rotation plate (28) to the torque tube (25):  
(a) Install the bolt (29), washers (30, 31), and nut (32) (2 locations).

S 034-030

- (7) Remove the caps from the hydraulic lines (8) and the PCA ports.

S 434-031

- (8) Connect the hydraulic lines (8) to the PCA (1).

S 644-112

- (9) Apply grease at the PCA lubrication fittings (AMM 12-21-10/301).

S 864-032

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (10) Supply pressure to the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 864-033

- (11) Remove the DO-NOT-OPERATE tags and move the FLT CONTROL SHUTOFF WING L, R, and C switches on the right side panel, P61, to ON.

S 864-034

- (12) Remove the DO-NOT-CLOSE tags and close the circuit breakers shown in Table 401.

EFFECTIVITY

ALL

S 214-035

- (13) Move the speedbrake lever fully up and do these checks:

**NOTE:** Keep the spoilers up to make sure the trailing edge flaps do not hit the spoilers when they retract.

- (a) Make sure there are no hydraulic leaks near the PCA (1).
- (b) Make sure the control wheels are in their neutral positions.

S 864-036

- (14) Retract the trailing edge flaps (AMM 27-51-00/201).

**NOTE:** Make sure you fully retract the flaps with hydraulic power. Keep the flaps fully retracted with full hydraulic power for one minute before you adjust the spoiler-to-flap clearance.

S 864-037

- (15) Move the speedbrake lever to its down-and-locked position.

S 044-038

- (16) Do the deactivation procedure for the trailing edge flaps (AMM 27-51-00/201).

S 864-039

- (17) Move the FLT CONTROL SHUTOFF WING L, R, and C switches on the right side panel, P61, to OFF. Attach DO-NOT-OPERATE tags and make sure the switch position lights come on.

S 864-040

- (18) Open these circuit breakers on the P11 panel and attach DO-NOT-CLOSE tags:

- (a) 11H15, FLT CONT SHUTOFF WING LEFT

S 824-041

- (19) Examine the spoiler-to-flap clearances and adjust them if it is necessary (AMM 27-61-00/501).

G. Inboard Spoiler PCA - Installation (Fig. 402)

S 214-043

**CAUTION:** THE ROD END OF EACH PCA HAS A SPLIT BEARING. THE INNER RACE CAN BE ACCIDENTALLY REMOVED FROM THE OUTER RACE DURING HANDLING. MAKE SURE THE SERIAL NUMBERS ARE THE SAME AND THE INDEX MARKS ALIGN ON THE TWO HALVES OF THE INNER BEARING RACE. DAMAGE TO THE PCA OR THE AIRPLANE CAN OCCUR IF THE SERIAL NUMBERS ARE NOT THE SAME OR IF THE INDEX MARKS DO NOT ALIGN.

- (1) Make sure the serial numbers are the same and the index marks align on the two halves of the inner bearing race.

S 644-111

- (2) Apply grease to the bolt and bushings before you install them.

S 434-044

- (3) Do these steps to connect the PCA trunnion (11) to the spoiler beam (22):
  - (a) Install the bolts (7) and washers (8, 9).
  - (b) Install the nuts (10) and tighten them to 500-550 pound-inches (56.5-62.1 newton-meters).
  - (c) Apply the sealant to the nuts and bolts.

S 434-045

- (4) Do these steps to connect the PCA (1) to the spoiler (14):
  - (a) Install the bolt (16) and bushings (13).
  - (b) Install the nut (15) and tighten it to 1700-2150 pound-inches (192.1-242.9 newton-meters).
  - (c) Install the lock clip (12), bolt (17), and collar (18).

S 434-046

- (5) Connect the electrical connector (5) to the PCA (1).

S 034-047

- (6) Remove the caps from the hydraulic lines (21) and the PCA ports.

S 434-048

- (7) Connect the hydraulic lines (21) to the PCA (1).

Page 419  
Dec 22/06

S 864-057

- (17) Open these circuit breakers on the P11 panel and attach DO-NOT-CLOSE tags:
- (a) 11H15, FLT CONT SHUTOFF WING LEFT
  - (b) 11H16, FLT CONT SHUTOFF WING CTR
  - (c) 11H26, FLT CONT SHUTOFF WING RIGHT

S 824-058

- (18) Examine the spoiler-to-flap clearances and adjust them if it is necessary (AMM 27-61-00/501).

S 434-059

- (19) After the adjustment, tighten the locknut (20) to 1560-1860 pound-inches(176.3-210.2Nm) and install the lockwire.

#### H. Spoiler PCA Filter - Installation

S 434-060

- (1) OUTBOARD SPOILER PCAs P/N 252T1401;  
Install these components (Fig. 401):
- (a) The O-rings (11, 13), retainer back-up rings (12, 14), and the O-ring (15)
  - (b) The filter (16)
  - (c) The filter cap and tighten it to 200-250 pound-inches (22.6-28.2 newton-meters).
  - (d) Lockwire the valve cap to the filter cap (Lockwire P/N MS20995NC20).

S 434-101

- (2) OUTBOARD SPOILER PCAs P/N 1542600;  
Install these components (Fig. 401):
- (a) The filter and o-ring.
  - (b) The filter cap.
    - 1) If the filter cap is aluminum (P/N 1542615), tighten the cap to 340-380 pound-inches (38.4-42.9 newton-meters).
      - a) Lockwire the filter cap to the check and thermal relief valve cap (lockwire P/N MS20995C20).
    - 2) If the filter cap is stainless steel (P/N 1542661), tighten the filter cap to 440-460 pound-inches (49.7-52.0 newton-meters).
      - a) Lockwire the filter cap to the check and thermal relief valve cap (lockwire P/N MS20995C32).

S 434-061

- (3) INBOARD SPOILER PCAs P/N 252T1301;  
Install these components (Fig. 402):
- (a) The O-ring (27, 29), retainer back-up rings (26, 28) and the O-ring (23)
  - (b) The filter (25)
  - (c) The filter cap (24) and tighten it to 200-250 pound-inches (22.6-28.2 newton-meters).

EFFECTIVITY

ALL

27-61-02

03

Page 420  
Dec 22/08

(d) Lockwire the filter cap to the manifold (lockwire P/N MS20995NC32).

S 434-100

(4) INBOARD SPOILER PCAs P/N 1542500;  
Install these components (Fig. 402):

(a) The filter and o-ring.

(b) The filter cap.

1) If the filter cap is aluminum (P/N 1542615), tighten the cap to 340-380 pound-inches (38.4-42.9 newton-meters).

a) Lockwire the filter cap to the cam retainer (lockwire P/N MS20995C20).

2) If the filter cap is stainless steel (P/N 1542661), tighten the filter cap to 440-460 pound-inches (49.7-52.0 newton-meters).

a) Lockwire the filter cap to the cam retainer (lockwire P/N MS20995C32).

S 094-062

(5) Remove the actuator lock from the PCA (1) (AMM 27-61-00/201).

S 864-063

(6) Lower the spoiler (4 or 14).

S 864-064

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

(7) Supply pressure to the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 864-065

(8) Remove the DO-NOT-CLOSE tags and move the FLT CONTROL SHUTOFF WING L, R, and C switches on the P61 panel to ON.

S 864-066

(9) Remove the DO-NOT-CLOSE tags and close the circuit breakers shown in Table 401.

S 864-067

(10) Do these steps three times:

(a) Move the speedbrake lever fully up.

(b) Move the speedbrake lever to its down-and-locked position.

EFFECTIVITY

ALL

27-61-02

06

Page 421  
Aug 22/08

S 214-068

- (11) Move the speedbrake lever fully up and do this check:  
(a) Make sure there are no hydraulic leaks near the PCA filter (16 or 25).

I. Spoiler PCA Electro-Hydraulic Servo Valve (EHSV) - Installation

S 434-069

- (1) Install these components:  
(a) A new gasket plate (7 or 4)  
(b) A new O-ring (33 or 30)

S 434-070

- (2) Install the four screws (6 or 3) that connect the EHSV (5 or 2) to the PCA.

S 434-071

- (3) Install the lockwire.

S 094-072

- (4) Remove the actuator lock from the PCA (1) (AMM 27-61-00/201).

S 864-073

- (5) Lower the spoiler (4 or 14).

S 864-074

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (6) Supply pressure to the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 864-075

- (7) Remove the DO-NOT-OPERATE tags and move the FLT CONTROL SHUTOFF WING L, R, and C switches on the P61 panel to ON.

S 864-076

- (8) Remove the DO-NOT-CLOSE tags and close the circuit breakers shown in Table 401.

S 864-077

- (9) Do these steps three times:  
(a) Move the speedbrake lever fully up.  
(b) Move the speedbrake lever to its down-and-locked position.

EFFECTIVITY

ALL

27-61-02

02

Page 422  
Aug 22/08

S 214-078

- (10) Move the speedbrake lever fully up and do this check:
  - (a) Make sure there are no hydraulic leaks near the EHSV (5 or 22).

J. Outboard Spoiler PCA Manifold Seal – Installation

S 344-093

- (1) Install the swivel washer (37) and seals (39) on the swivel shaft assembly (38).

S 344-094

- (2) Install the swivel shaft assembly (38) on the manifold and secure with the swivel washer (36, 37), washer (35), and nut (34).

K. Put the Airplane Back to Its Usual Condition

S 444-089

- (1) SPOILERS 5, 6, 7, AND 8;  
Do these steps:

**WARNING:** REFER TO AMM 25-65-00/201 FOR THE PROCEDURE TO ARM THE OFF-WING ESCAPE SYSTEM. IF YOU INCORRECTLY ARM THE OFF-WING ESCAPE SYSTEM, THE ESCAPE SLIDE CAN ACCIDENTALLY INFLATE AND CAUSE INJURY OR DAMAGE.

- (a) Arm the off-wing escape system (AMM 25-65-00/201).
  - 1) Remove the shorting cap from the spoiler override actuator.
- (b) Close access panels 552GB, 652GB, 552BB, or 652BB (AMM 06-44-00/201).

S 864-079

- (2) Retract the trailing edge flaps (AMM 27-51-00/201).

S 864-080

- (3) Move the speedbrake lever to its down-and-locked position.

S 864-081

- (4) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
  - (a) 11G11, AUTO SPEEDBRK

S 864-082

- (5) Remove the power from the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 864-083

- (6) Remove electrical power if it is not necessary (AMM 24-22-00/201).

SPOILER RVDT UNIT – REMOVAL/INSTALLATION

1. General

- A. This procedure contains the removal and installation tasks for the captain's and first officer's spoiler RVDT units.

TASK 27-61-04-024-001

2. Spoiler Rotary Variable Differential Transducer (RVDT) Unit – Removal

A. References

- (1) AMM 06-41-00/201, Fuselage Access Doors and Panels
- (2) AMM 24-22-00/201, Electrical Power – Control
- (3) AMM 32-00-20/201, Landing Gear Downlocks

B. Access

- (1) Location Zones  
211/212 Control Cabin
  
- (2) Access Panel  
119AL Main Equipment Center

C. Prepare for the Removal

S 864-002

- (1) Supply electrical power (AMM 24-22-00/201).

S 214-003

- (2) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

S 214-004

- (3) Make sure the speedbrake lever is in its down-and-locked detent position.

S 214-005

- (4) Make sure the control wheels are in their neutral positions.

S 864-006

- (5) Move the FLT CONTROL SHUTOFF WING L, R, and C switches on the right side panel, P61, to OFF. Attach DO-NOT-OPERATE tags and make sure the switch position legend lights come on.

S 864-007

- (6) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
  - (a) 11C6, FLT CONT ELEC 1L AC

- (j) 11H16, FLT CONT SHUTOFF WING CTR
- (k) 11H26, FLT CONT SHUTOFF WING RIGHT

S 014-008

- (7) Open the access panels in the flight deck floor (aft of the captain's or the first officer's chair) to get access to the spoiler RVDT units.

S 014-009

- (8) If it is necessary, open access door 119AL and crawl forward to get access to the spoiler RVDT units (AMM 06-41-00/201).

D. Spoiler RVDT Unit - Removal (Fig. 401)

S 034-010

- (1) Disconnect the electrical connectors for the RVDT units.

S 224-011

- (2) Do these steps if shims are installed between the RVDT units and the support:
  - (a) Measure and keep a record of the shim thickness.

NOTE: The shims are bonded to the support.

- (b) Do not remove the shims from the top support.
- (c) If you accidentally removed or damaged the shims, bond new shims with a thickness equal to the old shims to the support.

NOTE: Install the new RVDT while the adhesive is wet.

If you do not know the necessary shim thickness, add or remove shims to get the dimension shown in View C-C.

S 024-012

- (3) Do these steps to remove the RVDT unit:
  - (a) Remove the four screws and washers that connect the RVDT unit to the support.
  - (b) Lift the RVDT unit from the top support.
  - (c) Keep a record of the position of the missing tooth on the RVDT shaft.

AUTO-SPEEDBRAKE CONTROL SYSTEM – DESCRIPTION AND OPERATION

1. General

- A. The auto-speedbrake system automatically deploys the spoilers at touchdown and during a refused takeoff. The system also automatically retracts the spoilers when a go-around is initiated after touchdown.
- B. The warning system provides an amber light and level B EICAS caution message should the speedbrakes be extended at altitudes less than 800 feet. The amber SPEED BRAKES light is located on the pilot's main panel P1. The amber EICAS caution message reads SPEED BRAKES EXT. Refer to 31-51-00, Warning System – Description and Operation, for more information.

2. Component Details

A. Auto-Speedbrake Arming Switch (Fig. 1)

- (1) The auto-speedbrake arming switch is activated when the speedbrake lever is placed in the ARMED detent. The auto-speedbrake actuator circuit is then ready to operate the automatic speedbrake system. The arming switch is located inside the quadrant control stand. It is attached to the speedbrake mechanism support.

B. Auto-Speedbrake Actuator (Fig. 2)

- (1) The auto-speedbrake actuator drives the speedbrake lever and the speedbrake LVDTs through a no-back clutch. The clutch allows the flight crew to move the speedbrake lever without moving the actuator output shaft. Access to the actuator is through a side panel in the captain's side of the control stand.

**NOTE:** DIRECTIONAL ARROWS SHOW AN "EXTEND" INPUT.

Auto-Speedbrake Actuator  
Figure 2

EFFECTIVITY	
	ALL

27-62-00

C. Speed Brake Retract Switches (Fig. 3)

- (1) The speed brake retract switches are located under the flight deck floor in the microswitch pack. The switches are electrically connected to the speedbrake relay panel. If the switches are activated at any time when the auto-speedbrake actuator is extended, the actuator will retract and the speedbrake lever will return to the DOWN position.

3. Operation

A. Functional Description

(1) Refused Takeoff Override (Fig. 4)

- (a) The spoilers are automatically deployed during a refused takeoff. The reverse thrust levers (RTLs) mechanically lift the speedbrake lever from the down-and-locked position and actuate the reverse thrust lever position switch. Pulling the RTL's aft rotates two cams connected to the lever. The cams slide against a shaft that is connected by rod to a lever arm. The lever arm lifts the speedbrake lever detent lug out of the down-and-locked position. The lever arm also depresses the RTL position switch. When the RTL position switch is actuated, it engages the auto-speedbrake logic system. The auto-speedbrake logic system will deploy the spoilers if the airplane is on the ground.

(2) Auto-Speedbrake Relay Panels (Fig. 5)

- (a) The auto-speedbrake relay panels contain relays and switches that control the operation of the auto-speedbrake system. The panels use 28 volt dc power from the left bus.
- (b) The logic system allows the auto-speedbrake system to operate the spoilers in one of the three sequences below.
  - 1) During a normal landing, the flight crew arms the system by moving the speedbrake lever from the down-and locked position to the ARMED detent. When the following conditions are met, the speedbrake lever is moved to the UP position by the auto-speedbrake actuator.
    - a) Both engine forward thrust levers are set at less than 50 percent engine thrust.

Figure 3

EFFECTIVITY	
	ALL

27-62-00

- b) Both truck tilt position actuator hydraulic inlet pressure switches signal high pressure.
  - c) All truck tilt air/ground proximity switches signal that the landing gear is not tilted.
- 2) After a normal landing sequence described above, the auto-speedbrake system will retract the spoilers during a go-around when either of the forward thrust levers is placed at greater than 50 percent thrust.
- 3) During an emergency landing or refused takeoff with the system unarmed, the spoilers will extend when the reverse thrust levers are applied. Operating the reverse thrust levers mechanically releases the speedbrake lever from the down-and-locked position. When the following conditions are met, the speedbrake lever is moved to the full UP stop by the auto-speedbrake actuator.
- a) Both truck tilt position actuator hydraulic inlet pressure switches signal high pressure.

- b) All truck tilt air/ground proximity switches signal that the landing gear is not tilted.
- (c) An amber AUTO SPDBRK light on the pilot's overhead panel P5 comes on when the speedbrake lever is in the ARMED detent and any of the following occurs. The upper EICAS screen will also display an amber AUTO SPEEDBRAKE message (Fig. 6).
  - 1) One (and only one) truck tilt position actuator hydraulic inlet pressure switch signals low pressure.
  - 2) The truck tilt air/ground proximity switches disagree.
  - 3) Either landing gear trucks are in the not tilt position.
- (3) Auto-Speedbrake System Schematic (Fig. 7)
  - (a) The auto-speedbrake system moves the speedbrake lever to the full UP stop or DOWN position in response to inputs into the system. The inputs are from the reverse thrust levers, speed brake retract switches, proximity switch electronics unit (PSEU), and the truck tilt position actuator hydraulic inlet pressure switches.
  - (b) The auto-speedbrake system operates after the airplane has landed. Touchdown is sensed by the PSEU through gear tilt proximity switches on the main landing gear. A signal from the PSEU closes two relays in the auto-speedbrake relay panel. Two truck tilt position actuator hydraulic inlet pressure switches act as a check on the PSEU input. If pressure is lost in the center hydraulic system before touchdown, the main gear will become untilted. In this case, the PSEU would send a false signal to the auto-speedbrake relay panel. The actuator pressure switches monitor the pressure in the center hydraulic system. If the pressure drops below 1800 psi, the switches open relays in the auto-speedbrake relay panel. The auto-speedbrake actuator will not operate with either of the relays open.
  - (c) Placing the speedbrake lever in the ARMED detent actuates the auto-speedbrake actuator arming switch. The arming switch arms the auto-speedbrake system for operation when a touchdown is sensed by the PSEU and the forward thrust levers are moved to less than 10 degrees of total thrust lever movement.

Aug 22/03

- (d) Both forward thrust levers must be at less than 10 degrees of total thrust lever movement before the spoilers will deploy. If either forward thrust lever is moved past 11.5 degrees of total thrust lever movement, the spoilers will retract. A switch on each lever signals the relay panel when the levers are placed at less than 10 degrees of total thrust lever movement.
- (e) If the speedbrake lever is in the ARMED detent, the PSEU senses a touchdown, and the actuator pressure switches sense high pressure, the auto-speedbrake actuator will move the speedbrake lever to the full UP stop.
- (f) When the airplane is on the ground, operating either reverse thrust lever to command reverse thrust will lift the speedbrake lever from the down-and-locked position. The auto-speedbrake actuator will then move the speedbrake lever to the full UP stop.

B. Control

- (1) Provide electrical power (Ref 24-22-00).

**WARNING:** TO PREVENT INJURY OR DAMAGE, CLEAR PERSONNEL AND EQUIPMENT FROM CONTROL SURFACES AND THRUST REVERSERS BEFORE PROVIDING HYDRAULIC POWER. ISOLATE ANY SYSTEM NOT INTENDED FOR OPERATION.

- (2) Provide left, center, and right hydraulic system power (Ref 29-11-00).
- (3) Place control wheels in the neutral position.
- (4) Speedbrake operation (speedbrake lever).
  - (a) Move speedbrake lever to the full UP stop. All of the spoilers will extend to the 60 degree position.
  - (b) Return speedbrake lever to the down-and-locked position. All of the spoilers will return to the faired position.
- (5) Speedbrake operation (auto-speedbrake).
  - (a) Place forward thrust levers at greater than 11.5 degrees of total thrust lever movement.
  - (b) Move speedbrake lever to the ARMED detent.

AUTO-SPEEDBRAKE CONTROL SYSTEM - ADJUSTMENT/TEST

1. General

A. This procedure contains these tasks:

- Auto-speedbrake - Operational Test
- Auto-speedbrake - Adjustment
- Auto-speedbrake - System Test

If it is necessary, refer to 27-61-00/5 to get adjustment and test data for the spoilers.

TASK 27-62-00-715-002

2. Auto-Speedbrake - Operational Test

A. References

- (1) AMM 24-22-00/201, Electrical Power - Control
- (2) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic System

B. Access

- (1) Location Zones  
211/212 Control Cabin

C. Prepare for the Test

S 215-003

- (1) Make sure the speedbrake lever is in its down-and-locked detent.

S 865-301

- (2) Make sure the landing gear lever is in the down position.

S 865-004

- (3) Supply electrical power (AMM 24-22-00/201).

S 865-005

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES AND ENGINE THURST REVERSERS WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (4) Supply pressure to the left, right, and center hydraulic systems (AMM 29-11-00/201).

EFFECTIVITY

ALL

02

Page 501  
Apr 22/06

- S 865-290
- (5) Make sure the left, right and center WING FLT CONTROL shutoff valve switches on the P61 HYD/GEN FIELD CONT panel are in the ON position.
- S 865-006
- (6) Move the FUEL CONTROL switches on the control stand panel, P10, to CUTOFF and attach DO-NOT-OPERATE tags.
- S 865-007
- (7) Make sure this circuit breaker on the overhead panel, P11, is closed:
- (a) 11G11, AUTO SPEEDBRK
- S 865-008
- (8) Open these circuit breakers on the P11 panel and attach DO-NOT-CLOSE tags:
- (a) 11L6 or 11D14, LEFT ENGINE T/R CONT
- (b) AIRPLANES WITH HYDRAULIC MOTOR GENERATOR;  
11D4 or 11D5, T/R CONT - ALTN L ENG
- (c) 11L33, RIGHT ENGINE T/R CONT
- (d) 11D33, RIGHT ENGINE T/R CONT ALTN
- S 865-009
- (9) Operate the aileron trim switches until the aileron trim indicator shows zero units of trim.
- D. Auto-Speedbrake - Operational Test
- S 865-010
- (1) Move the forward thrust levers forward until they are a minimum of 15° away from the idle stop.
- S 865-011
- (2) Move the speedbrake lever to its ARMED detent.
- S 215-012
- (3) Move the forward thrust levers rearward until they are less than 8° away from the idle stop.
- (a) Make sure the speedbrake lever moves fully up.
- (b) Make sure all the spoilers move up.
- S 215-013
- (4) Move the forward thrust levers forward until they are a minimum of 15° away from the idle stop.
- (a) Make sure the speedbrake lever moves to its down-and-locked detent.

- S 045-030
- WARNING:** DO THE DEACTIVATION PROCEDURE FOR THE FLIGHT COMPARTMENT SEAT. INJURY TO A PERSON OR DAMAGE TO EQUIPMENT CAN OCCUR IF THE SEAT MOVES ACCIDENTALLY.
- (6) Open these circuit breakers on the main power distribution panel, P6, and attach DO-NOT-CLOSE tags:
- (a) 6H15, CAPT SEAT
  - (b) 6J21, F/O SEAT

EFFECTIVITY

ALL

27-62-00

1 THE CLEARANCE (DIMENSION X) MUST BE 0.01-0.03 INCH WHEN THE POSITION SWITCH FOR THE REVERSE THRUST LEVER IS OPERATED.

2 ON AIRPLANES WITH A STOP WASHER, THERE MUST BE A CLEARANCE OF AT LEAST 0.01 INCH BETWEEN THE STOP WASHER AND THE SPEEDBRAKE ARMING LEVER.

Position Switch for the Reverse Thrust Lever - Adjustment  
Figure 502

EFFECTIVITY	
	ALL

27-62-00

S 015-031

- (7) Remove the access panel from the left side of the control stand.

**NOTE:** You can get access to the control rod for the speedbrake lever from below the flight compartment. Go into the forward equipment bay and get access through the openings in the flight compartment floor.

E. Speedbrake Lever - Adjustment (Fig. 501)

S 985-032

- (1) Move the speedbrake lever until the detent lever roller is in the armed detent on the cam.  
(a) Make sure the aft face of the speedbrake lever aligns with the ARMED mark on the lightplate.

S 825-133

- (2) If the speedbrake lever does not align correctly, adjust the control rod.

S 825-189

- (3) Do these steps to adjust the control rod for the speedbrake lever:

**NOTE:** You can get access to the control rod from below the flight deck. There is an opening in the flight deck floor below the control stand.

- (a) Put the speedbrake lever in it's DOWN, ARMED, and UP positions and do this check:  
1) Make sure the arming switch (S371) and the position switch (S493) rollers are in their correct positions on the cam (Fig. 501).  
(b) If it is necessary, adjust the control rod until the switch rollers are in their correct positions (AMM 27-62-00/501).  
(c) Tighten the control rod lock nut.

S 435-190

- (4) Tighten the nut for the bolt that connects the control rod to the mechanism.

S 215-191

- (5) Make sure you can see control rod threads in at least one-half of the control rod inspection hole.

S 435-192

- (6) Connect these components:  
(a) The electrical connector for the auto-speedbrake actuator.  
(b) The wires for the arming switch (S371).  
(c) The wires for the position switch (S493) in the control stand.

EFFECTIVITY

ALL

27-62-00

04

Page 509  
Apr 22/06

- S 825-193
- (7) Do the adjustment procedure for the speedbrake LVDTs (AMM 27-61-00/501).

- S 435-194
- (8) Connect the electrical connectors to the LVDTs.

- S 225-001
- (9) Do a check of the speedbrake lever adjustment:
- (a) Operate the speedbrake lever through its full travel range.
    - 1) Move the speedbrake lever to its ARMED detent.
    - 2) Make sure the switch rollers for S371 and S493 are in the locations shown (View B, Fig. 501, Auto-Speedbrake System Armed).
    - 3) Move the speedbrake lever to its down-and-locked detent.
    - 4) Make sure the switch rollers for S371 and S493 are in the locations shown (View B, Fig. 501, Speedbrake Lever Down).
  - (b) Move the speedbrake lever fully up.
    - 1) Make sure the switch roller for S493 is in the location shown (View B, Fig. 501, Speedbrake Lever Up).
  - (c) Make sure you can see threads in not less than one half of the inspection hole for the control rod.

- S 865-034
- (10) Move the speedbrake lever to its down-and-locked detent.
- F. Position Switch for the Reverse Thrust Lever - Adjustment (Fig. 502)

S 825-035

**WARNING:** MAKE SURE THE AUTO-SPEEDBRAKE CIRCUIT BREAKER IS OPEN AND THE SPEEDBRAKE LEVER IS IN ITS DOWN-AND-LOCKED DETENT. THE OPERATION OF THE ENGINE THRUST LEVERS CAN CAUSE ACCIDENTAL SPOILER MOVEMENT AND INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (1) Do these steps to adjust the reverse thrust levers:
- (a) Move the left reverse thrust lever rearward to the reverse idle detent.
  - (b) Adjust the control rod for the reverse thrust lever until this condition is satisfactory:
    - 1) The detent lug for the speedbrake lever is out of its detent notch to a Dimension X of 0.03-0.10 inch (0.8-2.5 mm) (View A, Fig. 502).
  - (c) Move the left reverse thrust lever fully forward and down.
  - (d) Move the right reverse thrust lever rearward to its reverse idle detent.
    - 1) Make sure the detent lug moves out of the detent notch to a Dimension X of 0.01-0.03 inch (0.254-0.762 mm) (View A, Fig. 502).
  - (e) Move the two reverse thrust levers to their reverse idle detent.

EFFECTIVITY

ALL

27-62-00

03

Page 510  
Apr 22/06

- (f) Make sure the clearance between the speedbrake arming lever and the stop washer is a minimum of 0.01 inch (0.25 mm) (View A, Fig. 502).
  - (g) Move the reverse thrust levers fully forward and down.
- G. Put the Airplane Back to Its Usual Condition

S 865-038

- (1) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P6 panel:
  - (a) 6H15, CAPT SEAT
  - (b) 6J21, F/O SEAT

S 865-039

- (2) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:
  - (a) 11C6, FLT CONT ELEC 1L AC
  - (b) 11C7, FLT CONT ELEC 1L DC
  - (c) 11C8, FLT CONT ELEC 2L AC
  - (d) 11C9, FLT CONT ELEC 2L DC
  - (e) 11L6 or 11D14, LEFT ENGINE T/R CONT
  - (f) 11L33, RIGHT ENGINE T/R CONT
  - (g) 11D33, RIGHT ENGINE T/R CONT ALTN
  - (h) 11G11, AUTO SPEEDBRK
  - (i) 11G17, FLT CONT ELEC 1R AC

D. Access

- (1) Location Zones
  - 211/212 Control Cabin
  - 551 Rear Spar to MLG Support Beam
- (2) Access Panel
  - 551TB Lower Wing Structure

E. Prepare for the Test

- S 865-045
- (1) Supply electrical power (AMM 24-22-00/201).
- S 865-046
- (2) Move the FLT CONTROL SHUTOFF WING L, R, and C switches on the right side panel, P61, to OFF. Attach DO-NOT-OPERATE tags and make sure the switch position lights come on.
- S 865-048
- (3) Move the FUEL CONTROL switches on the control stand panel, P10, to CUTOFF and attach DO-NOT-OPERATE tags.
- S 865-049
- (4) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
    - (a) 11L6 or 11D14, LEFT ENGINE T/R CONT
    - (b) 11L33, RIGHT ENGINE T/R CONT
    - (c) 11D33, RIGHT ENGINE T/R CONT ALTN
    - (d) 11H15, FLT CONT SHUTOFF WING LEFT
    - (e) 11H16, FLT CONT SHUTOFF WING CTR
    - (f) 11H26, FLT CONT SHUTOFF WING RIGHT
    - (g) 11T36, PROX SW TEST

F. Truck Tilt Pressure Switch Failure - Test

S 045-052

**WARNING:** MAKE SURE YOU DO THE FLIGHT MODE DEACTIVATION PROCEDURE CORRECTLY. THE AIRPLANE WILL BE IN THE FLIGHT MODE WHEN YOU OPEN THE AIR/GROUND CIRCUIT BREAKERS. WITH THE AIRPLANE IN THE FLIGHT MODE, MANY OF THE AIRPLANE SYSTEMS CAN CAUSE INJURY TO PERSONS AND DAMAGE TO EQUIPMENT.

- (1) Do the deactivation procedure for flight mode simulation (AMM 32-09-02/201).

- (2) Open these circuit breakers on the P11 panel and attach DO-NOT-CLOSE tags:
- (a) if installed,  
11C29 or 11E19, LANDING GEAR POSITION AIR/GND SYS 2 ALT
  - (b) 11U15, AIR/GND SYS 1
  - (c) 11U23, LDG GR POS AIR/GND SYS 2

S 865-054

- (3) Make sure these conditions are satisfactory:
- (a) The speedbrake lever is in its down-and-locked detent.
  - (b) The forward thrust levers are at their idle stops.
  - (c) The reverse thrust levers are fully forward and down.

S 015-056

- (4) Open the access panel, 551TB, to get access to the gear tilt pressure switch (AMM 06-44-00/201).

S 035-134

- (5) Disconnect the electrical connector, D2264, from the left gear tilt pressure switch, S452.

NOTE: You will find the pressure switch on the rear spar for the left wing.

S 495-057

- (6) Connect a jumper wire between pins 1 and 2 on the connector, D2264.

S 215-137

- (7) Make sure the center hydraulic system does not have power (AMM 29-11-00/201).

S 215-059

- (8) Make sure the amber AUTO SPDBRK light on the pilots' overhead panel, P5, is off.

S 215-060

- (9) Move the speedbrake lever to its ARMED detent and do these checks:
- (a) Make sure the speedbrake lever stays in its ARMED detent.
  - (b) Make sure the amber AUTO SPDBRK light on the P5 panel comes on.

NOTE: An allowance of 3 seconds is permitted to let the light come on.

S 095-062

- (10) Remove the jumper wire from the connector, D2264.

J. Refused Takeoff – Test

S 215-097

- (1) Move the left reverse thrust lever toward deploy to the reverse idle detent and do this check:
  - (a) Make sure the speedbrake lever moves to its full upstop position.

S 215-158

- (2) Move the left reverse thrust lever back to the stow position.

S 215-159

- (3) Move the speed brake lever back to its down and locked position.

S 215-160

- (4) Move the right reverse thrust lever toward deploy to the reverse idle detent and do this check:
  - (a) Make sure the speedbrake lever moves to its full upstop position.

S 215-161

- (5) Move the right reverse thrust lever back to the stow position.

S 215-162

- (6) Move the speedbrake lever back to its down-and-locked position.

S 215-310

- (7) Move the left and right reverse thrust levers toward deploy to the reverse idle detent and do this check:
  - (a) Make sure the speedbrake lever moves to its full upstop position.

S 215-098

- (8) Move the speedbrake lever forward to the full down stop position.

NOTE: The speedbrake lever will not go in the lock position.

- (a) Make sure the amber AUTO SPDBRK light on the P5 panel comes on.

NOTE: An allowance of 3 seconds is permitted to let the light come on.

S 215-099

- (9) Move the left and right reverse thrust levers to the stow position.
  - (a) Make sure the amber AUTO SPDBRK light on the P5 panel is off.
  - (b) Make sure the speedbrake lever goes into its down-and-locked detent.

SPEEDBRAKE MECHANISM – MAINTENANCE PRACTICES

1. General

- A. This procedure contains these tasks:
  - (1) Speedbrake Mechanism and Its Components – Removal
  - (2) Auto-Speedbrake Actuator – Removal
  - (3) Speedbrake Mechanism and Its Components – Installation
  - (4) Auto-Speedbrake Actuator – Installation.
- B. There are two tasks for the removal of the auto-speedbrake actuator. For the first task, you must remove the auto-speedbrake mechanism. For the second task, you can remove the actuator with the auto-speedbrake mechanism installed in the airplane.

TASK 27-62-04-002-114

2. Speedbrake Mechanism and Its Components – Removal

- A. General
  - (1) This task contains these procedures:
    - (a) Auto-speedbrake Mechanism – Removal
    - (b) Auto-speedbrake Actuator – Removal
    - (c) No-Back Clutch – Removal.
  - (2) For these procedures, you must remove the auto-speedbrake mechanism first. Then, you can remove the auto-speedbrake actuator or the no-back clutch.
  - (3) There is a different procedure to remove the auto-speedbrake actuator with the auto-speedbrake mechanism installed. Refer to the other "Auto-speedbrake Actuator – Removal" task below for the necessary data.
- B. References

E. Prepare for the Removal

S 862-117

- (1) Supply electrical power (AMM 24-22-00/201).

S 862-003

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDREAULIC POWER IS SUPPLIED.

- (2) Supply pressure to the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 212-004

- (3) Make sure these conditions are satisfactory:  
(a) The control wheels are in their neutral positions.  
(b) The speedbrake lever is in its down-and-locked position.

S 862-005

- (4) Remove the power from the left, right, and center hydraulic systems (AMM 29-11-00/201).

S 862-006

- (5) Move the FLT CONTROL SHUTOFF WING L, R, and C switches on the right side panel, P61, to OFF. Attach DO-NOT-OPERATE tags and make sure the switch position lights come on.

S 862-007

- (6) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
- (a) 11B18, WARN ELEX B
  - (b) 11C6, FLT CONT ELEC 1L AC
  - (c) 11C7, FLT CONT ELEC 1L DC
  - (d) 11C8, FLT CONT ELEC 2L AC
  - (e) 11C9, FLT CONT ELEC 2L DC
  - (f) 11G11, AUTO SPEEDBRK

S 022-015

(4) Remove the auto-speedbrake mechanism.

G. Auto-Speedbrake Actuator - Removal (Fig. 201)

**NOTE:** This procedure is for use after you remove the auto-speedbrake mechanism. Refer to the "Auto-Speedbrake Actuator - Removal" task below for the data necessary to remove the actuator with the auto-speedbrake mechanism installed.

S 032-016

(1) Remove the top bolt that connects the spring support bracket to the auto-speedbrake mechanism (View A).

S 022-017

- (2) Do these steps if the head of the actuator connection bolt points into the auto-speedbrake mechanism:
- (a) Turn the spring support bracket in the aft direction and remove the spring.
  - (b) Remove the LVDT pivot support bolt (View B-B).
  - (c) Remove the bolt and bushing that connect the actuator and LVDT support bracket to the detent lever (View B-B).
  - (d) Remove the three bolts that connect the actuator and LVDT support bracket to the auto-speedbrake mechanism.
  - (e) Lift the bracket and the actuator up and forward.

**NOTE:** Be careful to prevent damage to the LVDT rod ends.

- (f) Remove the bolt that connects the auto-speedbrake actuator to the actuator input clevis.
- (g) Remove the auto-speedbrake actuator.
- (h) Remove the bolt that connects the auto-speedbrake actuator to the actuator and LVDT support bracket.

S 022-018

- (3) Do these steps if the head of the aft actuator connection bolt points away from the auto-speedbrake mechanism:
- (a) Turn the spring support bracket in the aft direction and remove the spring.
  - (b) Remove the bolts that connect the actuator to the speedbrake mechanism (2 locations) (View C).

**NOTE:** Move the cam if it is necessary to remove the auto-speedbrake actuator.

- (c) Remove the auto-speedbrake actuator.

H. No-Back Clutch - Removal (Fig. 201)

S 032-019

- (1) Remove these components:
  - (a) The nut and spacer from the inboard end of the shaft (View B).
  - (b) The bolts that hold the two parts of the housing assembly together.
  - (c) The inboard half of the housing from the auto-speedbrake mechanism.

S 032-020

- (2) Make a mark for the position of the no-back output and do this step:
  - (a) Remove the two mounting bolts from the no-back clutch output.

S 032-021

- (3) Remove the no-back clutch from the auto-speedbrake mechanism shaft.

S 022-022

- (4) Remove the clutch assembly and keep the no-back output.

**NOTE:** The holes in the auto-speedbrake shaft must align with the holes in the no-back output. To make sure the holes align during the installation, keep the no-back output.

TASK 27-62-04-422-023

3. Auto-Speedbrake Mechanism and Its Components - Installation

A. References

- (1) AMM 24-22-00/201, Electrical Power - Control
- (2) AMM 27-61-00/201, Spoiler/Speedbrake Control System
- (3) AMM 27-61-00/501, Spoiler/Speedbrake Control System
- (4) AMM 27-62-00/501, Auto-speedbrake Control System
- (5) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems

B. Equipment

- (1) Special tool
  - (a) ST2580-267-10 Spanner wrench adaptor for BACN10RF nuts

C. Access

- (1) Location Zones  
211/212 Control Cabin

D. No-Back Clutch - Installation (Fig. 201)

S 432-118

- (1) Use the no-back output you removed and assemble the no-back clutch.

S 422-025

- (2) Do these steps to connect the no-back clutch to the speedbrake shaft:
  - (a) Put the no-back clutch in its correct position on the speedbrake shaft.

EFFECTIVITY

ALL

27-62-04

01

Page 207  
Apr 22/04

(b) Install the two bolts that connect the clutch to the speedbrake shaft.

S 432-026

(3) Install the bolts that connect the inboard half of the speedbrake housing to the speedbrake mechanism.

**NOTE:** Do not try to adjust the no-back clutch during the installation, there is no adjustment.

S 432-027

(4) Install the spacer, bearing, and nut on the inboard end of the shaft.

S 432-134

(5) Tighten the nut with the special tool to 250-300 inch-pounds (28.24-33.89 Nm).

E. Auto-Speedbrake Actuator - Installation (Fig. 201)

S 212-028

(1) Make sure the auto-speedbrake actuator is fully retracted and has the correct length (View C) before you install it.

(a) Do these steps to retract the actuator:

- 1) Connect a 28 VDC power source to pin 6 of the actuator electrical connector and ground pins 8 and 10.
- 2) After the actuator is retracted, remove the 28 VDC power source and the ground wires from the actuator connector pins.

S 422-029

(2) Do these steps if the head of the bolt at the aft actuator connection point initially pointed into the auto-speedbrake mechanism (Fig. 202):

(a) Install the bolt that connects the auto-speedbrake actuator to the actuator and LVDT support bracket (View C).

**NOTE:** Make sure the head of the bolt points away from the auto-speedbrake mechanism.

(b) Install the bolt that connects the rod end of the auto-speedbrake actuator to its clevis.

(c) Turn the actuator down until the actuator and LVDT support bracket is in its correct position.

**NOTE:** Be careful to prevent damage to the speedbrake LVDTs.

EFFECTIVITY

ALL

27-62-04

01

Page 208  
Apr 22/04

- (d) Use the LVDT pivot support bolt to hold the actuator in the correct position.

**NOTE:** You will complete the bolt installation in a subsequent step.

- (e) Use the index mark on the auto-speedbrake housing to adjust the retracted length of the auto-speedbrake actuator (View C).
- (f) Install the bolt, bushing, washer, and nut that connect the actuator and LVDT support bracket to the detent lever (View B-B).
- (g) Install the bolt, washer, and nut that connect the actuator and LVDT support bracket to the auto-speedbrake mechanism (3 locations).
- (h) Install the LVDT pivot support bolt (View B-B).
- (i) Connect the spring to the spring support bracket.
- (j) Turn the spring support bracket forward and install the bolt that connects the bracket to the auto-speedbrake mechanism (View A).

S 422-030

- (3) Do these steps if the head of the aft actuator connection bolt initially pointed away from the auto-speedbrake mechanism (Fig. 202):

- (a) Put the detent lever in the position shown (View B-B).

**CAUTION:** DO NOT LET THE CAM TURN DOWN AND DAMAGE THE LVDTs. THE LVDTs CAN BECOME DAMAGED IF THE CAM TOUCHES THE LVDTs.

- (b) Hold the actuator clevis and manually turn the speedbrake lever (input) side of the no-back clutch until these conditions are satisfactory:

**NOTE:** Make sure the detent lever roller touches the cam face at all times during the adjustment.

- 1) The detent lever roller is in its armed detent position.
- 2) The actuator clevis is aligned with the rod end of the auto-speedbrake actuator.

- (c) Connect the rod end of the auto-speedbrake to the actuator clevis.
- (d) Turn the auto-speedbrake actuator down until the actuator aft connection points are aligned.

**NOTE:** Be careful to prevent damage to the LVDTs.

- (e) Install the aft actuator connection bolt.

**NOTE:** Make sure the head of the bolt points away from the auto-speedbrake mechanism.

- (f) Connect the spring to the spring support bracket.
- (g) Turn the spring support bracket forward and install the bolt that connects the bracket to the auto-speedbrake mechanism (View A).

F. Speedbrake Mechanism - Installation (Fig. 201)

S 862-031

- (1) Put the speedbrake mechanism in its correct position in the control stand.

S 432-032

- (2) Install the bolts, washers, and nuts that connect the speedbrake mechanism to the airplane.

S 432-033

- (3) Manually turn the clutch until you can connect the control rod for the speedbrake lever).

NOTE: Do not tighten the nut.

S 822-034

- (4) Do these steps to adjust the control rod for the speedbrake lever:

NOTE: You can get access to the control rod from below the flight deck. There is an opening in the flight deck floor below the control stand.

- (a) Put the speedbrake lever in its DOWN, ARMED, and UP positions and do this check:
  - 1) Make sure the arming switch (S371) and the position switch (S493) rollers are in their correct positions on the cam (Fig. 203).
- (b) If it is necessary, adjust the control rod until the switch rollers are in their correct positions (AMM 27-62-00/501).
- (c) Tighten the control rod lock nut.

S 432-035

- (5) Tighten the nut for the bolt that connects the control rod to the mechanism.

S 212-036

- (6) Make sure you can see control rod threads in at least one-half of the control rod inspection hole.

S 432-037

- (7) Connect these components:
  - (a) The electrical connector for the auto-speedbrake actuator
  - (b) The wires for the arming switch (S371).
  - (c) The wires for the position switch (S493) in the control stand.

- (8) Do the adjustment procedure for the speedbrake LVDTs (AMM 27-61-00/501).

S 432-096

- (9) Connect the electrical connectors to the LVDTs.  
G. Auto-Speedbrake Mechanism - Test

S 712-038

- (1) Do these steps to do an operational test for the speedbrake Lever switches:

**NOTE:** This test makes sure the take-off warning configuration system gets the correct inputs from the switches.

**WARNING:** DO THE DEACTIVATION PROCEDURE FOR THE SPOILERS OR MOVE ALL PERSONS AND EQUIPMENT AWAY FROM THE SPOILERS. THE SPOILERS CAN RETRACT QUICKLY AND CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (a) Do the deactivation procedure for the spoilers (AMM 27-61-00/201) or move all persons and equipment away from the spoilers.

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (b) Supply pressure to the left, right, and center hydraulic systems (AMM 29-11-00/201).

- (c) Make sure these circuit breakers on the overhead panel, P11, are closed:

- 1) 11B18, WARN ELEX B
- 2) 11C6, FLT CONT ELEC 1L AC
- 3) 11C7, FLT CONT ELEC 1L DC

- (e) Make sure this circuit breaker on the P11 panel is closed:
  - 1) 11U23, LANDING GEAR POSITION AIR/GND SYS 2
- (f) Make sure the red EICAS message, SPOILERS, does not show on the display.
- (g) Move the speedbrake lever to the DOWN position.
- (h) Move the CONFIG TEST switch to the T/O position and hold it there.
- (i) Move the EICAS select switch to L and do this check:
  - 1) Make sure the red EICAS message, SPOILERS, does not show on the display.
- (j) Move the EICAS select switch to R and do this check:
  - 1) Make sure the red EICAS message, SPOILERS, does not show on the display.
- (k) Release the CONFIG TEST switch.
- (l) Move the speedbrake lever fully up.
- (m) Move the CONFIG TEST switch to the T/O position and hold it there.
- (n) Move the EICAS select switch to L and do this check:
  - 1) Make sure the red EICAS message, SPOILERS, shows on the display.
- (o) Move the EICAS select switch to R and do this check:
  - 1) Make sure the red EICAS message, SPOILERS, shows on the display.
- (p) Move the speedbrake lever to its down-and-locked detent.
- (q) Release the CONFIG TEST switch.

S 212-039

- (2) Make sure these circuit breakers on the P11 panel are closed:
  - (a) 11G11, AUTO SPEEDBRK
  - (b) 11L9, LEFT ENGINE OIL PRESS
  - (c) 11L36, RIGHT ENGINE OIL PRESS

S 862-040

- (3) Move the forward thrust levers to a position that is at least 15° away from IDLE.

S 212-041

- (4) Move the speedbrake lever to its ARMED position and do these checks:
  - (a) Make sure the AUTO SPDBRK light on the overhead panel, P5, is off.
  - (b) Make sure the EICAS message, AUTO SPEEDBRAKE, does not show on the display.

S 212-042

- (5) Move the forward thrust levers to a position that is less than 8° away from IDLE and do these checks:
  - (a) Make sure the speedbrake lever moves to its UP position.
  - (b) Make sure the speedbrakes move to their full up positions.
  - (c) Make sure the AUTO SPDBRK light on the P5 panel is off.
  - (d) Make sure the EICAS message, AUTO SPEEDBRAKE, does not show on the display.

EFFECTIVITY

Page 214  
Apr 22/04

S 212-043

- (6) Move the forward thrust levers to a position that is at least 15° away from IDLE and do these checks:
- (a) Make sure the speedbrake lever moves to its down-and-locked detent position.
  - (b) Make sure the speedbrakes move to their full down positions.

NOTE: The speedbrakes will move to full down when the thrust levers are approximately 11 degrees away from the IDLE position.

- (c) Make sure the AUTO SPDBRK light on the P5 panel is off.
- (d) Make sure the EICAS message, AUTO SPEEDBRAKE, does not show on the display.

S 212-044

- (7) Move the speedbrake lever fully up and do these checks:
- (a) Make sure the force necessary to move the speedbrake lever up is between 2.5 and 6 lbs (1.13–2.72 Kg).

NOTE: The force necessary to move the lever out of the detent position can be more.

- (b) Make sure the speedbrake lever moves smoothly and freely.
- (c) Make sure the speedbrake lever moves to the full UP position.

S 212-045

- (8) Move the speedbrake lever to its DOWN position and do these checks:
- (a) Make sure the force necessary to move the speedbrake lever up is between 2.5 and 6 lbs (1.13–2.72 Kg).

NOTE: The force necessary to move the lever out of the detent position can be more.

- (b) Make sure the speedbrake lever moves smoothly and freely.
- (c) Make sure the speedbrakes move fully down.

H. Put the Airplane Back to Its Usual Condition

S 862-046

- (1) Move the forward thrust levers to their IDLE positions.

S 862-048

- (2) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the main power distribution panel, P6:
- (a) 6H15, CAPT SEAT
  - (b) 6J21, F/O SEAT

Page 222  
Dec 22/99

(b) Make sure the speedbrakes move to their full down positions.

NOTE: The speedbrakes will move to full down when the thrust levers are approximately 11 degrees away from the IDLE position.

(c) Make sure the AUTO SPDBRK light on the P5 panel is off.

(d) Make sure the EICAS message, AUTO SPEEDBRAKE, does not show on the display.

S 212-084

(7) Move the speedbrake lever fully up and do these checks:

(a) Make sure the force necessary to move the speedbrake lever up is between 2.5 and 6 lbs (1.13-2.72 Kg).

NOTE: The force necessary to move the lever out of the detent position can be more.

(b) Make sure the speedbrake lever moves smoothly and freely.

(c) Make sure the speedbrake lever moves to the full UP position.

S 212-085

(8) Move the speedbrake lever to its DOWN position and do these checks:

(a) Make sure the force necessary to move the speedbrake lever up is between 2.5 and 6 lbs (1.13-2.72 Kg).

NOTE: The force necessary to move the lever out of the detent position can be more.

(b) Make sure the speedbrake lever moves smoothly and freely.

(c) Make sure the speedbrakes move fully down.

F. Put the Airplane Back to Its Usual Condition

AUTO-SPEEDBRAKE ACTUATOR ARMING SWITCH - MAINTENANCE PRACTICES

1. General

- A. This procedure contains the removal and installation tasks for the arming switch for the auto-speedbrake (S371).

TASK 27-62-06-022-001

2. Arming Switch for the Auto-Speedbrake - Removal

A. References

- (1) AMM 27-62-00/501, Auto-Speedbrake Control System

B. Access

- (1) Location Zones  
211/212 Control Cabin

C. Prepare for the Removal

S 862-002

- (1) Move the FUEL CONTROL switches on the control stand panel, P10, to their CUTOFF positions and attach DO-NOT-OPERATE tags.

S 862-003

**WARNING:** DO THE DEACTIVATION PROCEDURE FOR THE FLIGHT COMPARTMENT SEAT. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR IF THE SEAT MOVES ACCIDENTALLY.

- (2) Open these circuit breakers on the main power distribution panel, P6, and attach DO-NOT-CLOSE tags:  
(a) 6H15, CAPT SEAT  
(b) 6J21, F/O SEAT

S 012-004

- (3) Remove the access panel from the left side of the control stand.

S 862-005

- (4) Open this circuit breaker on the overhead panel, P11, and attach a DO-NOT-CLOSE tag:  
(a) 11G11, AUTO SPEEDBRK

D. Arming Switch for the Auto-Speedbrake - Removal (Fig. 201)

S 032-007

- (1) Disconnect the electrical connections for the arming switch (S371) and attach an identification tag.

B. Access

- (1) Location Zones  
211/212 Control Cabin

C. Arming Switch for the Auto-Speedbrake - Installation

S 862-011

- (1) Put the arming switch (S371) in its correct position.

S 432-012

- (2) Install the screws, washers and nuts that connect the switch to the auto-speedbrake mechanism.

S 212-039

- (3) Make sure the tracking of the switch roller on the cam is correct (View C and D, Fig. 201).

S 432-014

- (4) Connect the switch to the electrical connectors labeled above.

D. Arming Switch for the Auto-Speedbrake - Test

S 212-038

- (1) Do these steps to do a check of the speedbrake lever adjustment:
  - (a) Move the speedbrake lever to its DOWN detent.
  - (b) Make sure the switch rollers for switches S371 and S493 are in their correct positions ( Fig. 201).
  - (c) If the switch rollers are not in their correct positions, adjust the control rod for the speedbrake lever (AMM 27-62-00/501).
  - (d) Move the speedbrake lever to its ARMED detent.
  - (e) Make sure the aft face of the speedbrake lever aligns with the ARMED mark on the light plate.
  - (f) If the lever is not aligned correctly, adjust the control rod for the speedbrake lever (AMM 27-62-00/501).

S 862-015

- (2) Supply electrical power (AMM 24-22-00/201).

SPEED BRAKE RETRACT SWITCHES – ADJUSTMENT/TEST

1. General

- A. This procedure contains the operational test for the S10 and S14 position switches. Switch S10 is the left SPEEDBRAKE RETRACT switch and S14 is the right SPEEDBRAKE RETRACT switch.
- B. The speedbrake retract switches and some autothrottle switches are found in the microswitch pack assembly. All the switches in the microswitch pack use soldered wire connections and are installed on one of the two shafts. Refer to 22-32-04 for the applicable removal, installation, and adjustment procedures.
- C. Make sure to examine all the switches in the microswitch pack assembly for correct adjustment after you install it. To adjust the switches, push down on the locking bar to release the adjustment bolt. Then, turn the bolt to adjust the switch.  
After the adjustment, make sure the adjustment bolts are aligned with the locking bar. Make sure the bar moves up and engages the bolts.

#### B. Access

- (1) Location Zones  
211/212 Control Cabin

#### C. Install the Position Switch for the Reverse Thrust Levers (Fig. 401)

S 424-013

- (1) Do these steps to install the position switch:
  - (a) Put the position switch in its correct position.
  - (b) Install the screws, shim, washer, and nut that hold the switch in the control stand.
  - (c) Connect the wires for the switch to the above recorded position in the airplane wiring.

S 824-014

- (2) Do these steps to adjust the position switch:
  - (a) Make sure the thrust levers are in their idle positions.
  - (b) Move the left reverse thrust lever to its full reverse thrust position.
  - (c) Adjust the length of the rod for the reverse thrust lever until this condition is satisfactory:
    - 1) The detent lug is pushed out of the down detent notch to a Dimension X of 0.03-0.10 inch (0.762-2.54 mm) (View C).
  - (d) Adjust the switch operation bolt until the position switch roller is in the position shown (View D) and do these steps:
    - 1) Make sure the position switch operates.
    - 2) Tighten the jamnuts on the bolt.
  - (e) Move the left reverse thrust lever to its OFF (idle) position.

S 824-015

- (3) Do the above step again for the right reverse thrust lever.

GEAR TILT PRESSURE SWITCH - REMOVAL/INSTALLATION

1. General

- A. This procedure contains the removal and installation tasks for the gear tilt pressure switch.

TASK 27-62-10-024-002

2. Gear Tilt Pressure Switch - Removal

A. References

- (1) AMM 06-44-00/201, Wing Access Doors and Panels
- (2) AMM 24-22-00/201, Electrical Power - Control
- (3) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems

B. Access

- (1) Location Zone  
551/651 Rear Spar to Trailing Edge
- (2) Access Panels  
551TB/651TB Gear Tilt Pressure Switch

C. Prepare for the Removal

- S 864-003
- (1) Supply electrical power (AMM 24-22-00/201).
- S 864-004
- (2) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).
- S 864-005
- (3) Move the FLT CONTROL SHUTOFF WING switches L, R, and C on the right side panel, P61, to OFF. Attach DO-NOT-OPERATE tags and make sure the switch position lights come on.
- S 864-006
- (4) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:
  - (a) 11G11, AUTO SPEEDBRK
  - (b) 11H15, FLT CONT SHUTOFF WING LEFT
  - (c) 11H16, FLT CONT SHUTOFF WING CTR
  - (d) 11H26, FLT CONT SHUTOFF WING RIGHT
- S 864-007
- (5) Move the FUEL CONTROL switches on the control stand panel, P10, to their CUTOFF positions and attach DO-NOT-OPERATE tags.
- S 014-008
- (6) Open these access panels (AMM 06-44-00/201):
  - (a) 551TB (for the left pressure switch)
  - (b) 651TB (for the right pressure switch).

LEADING EDGE SLAT SYSTEM – DESCRIPTION AND OPERATION

1. General

A. Introduction

- (1) The inboard and outboard leading edge slats are extended during takeoff and landing for increased airplane lift.
- (2) The flap lever on the control stand operates the leading edge slats by a cable system from the flap lever to a quadrant with linkage connected to the slats power drive units. The slats are driven on primary or alternate power by the slat power drive units. There is one power drive unit for the inboard slats and one power drive unit for the outboard slats. The slat power drive units are operated on primary power through a set of drive shafts and cranks rotated by a quadrant in the flap cable system. The slat power drive units are operated on alternate power by a position selector switch. The selector switch also controls trailing edge flaps. The selector switch is operational after arming has been completed.
- (3) The slat power drive units rotate drive shafts. The drive shafts operate rotary actuators to extend or retract the slats.
- (4) Primary power to rotate the slat drive shafts is hydraulic. Alternate power is electrical.
- (5) Slat position indication is covered in AMM 27-88-00/001, Leading Edge Slat Position Indicating System – Description and Operation.

B. L.E. Slat System Purpose

- (1) The slats and the flaps increase airplane lift by increasing the wing surface and the effective curvature. Increased wing surface lowers airplane stall speeds.
- (2) Lower airplane stall speeds allow lower takeoff and landing speeds. This reduces ground roll, increases wheel and brake life, improves climb-out performance, and creates safer operating conditions.
- (3) There are twelve slats, six in each wing. The slats are numbered No. 1 through No. 12, from left to right. The slats are separated into five outboard slats and one inboard slat per wing. The inboard and outboard slats are driven by two separate power drive units.

C. General Description

- (1) L.E. Slat Primary Control (Fig. 1)
  - (a) The flap lever on the control stand operates the flaps by a cable system from the flap lever to the flap aft quadrant. The quadrant is linked to the flap power drive unit.
  - (b) The flap lever and the flap cables will also rotate the slat aft quadrant. The quadrant is in the aft end of the forward cargo compartment.
  - (c) The slat aft quadrant is connected by drive shafts, control rods, and cranks to the inboard slat power drive unit and to the outboard slat power drive unit.
  - (d) Operation of the flap lever will provide a controlled input to the hydraulic control valve on the flap power drive unit, to the hydraulic control valve on the inboard slat power drive unit, and to the hydraulic control valve on the outboard slat power drive unit.

27-81-00

- (e) The Krueger seal flaps are operated by the inboard slat drive.
- (2) L.E. Slat Alternate Control (Fig. 2)
  - (a) Back-up operation of the slats is done with the flap/slat alternate drive control module, the flap/slat electronic unit (FSEU), an electric circuit, the hydraulic bypass valves, and the electric motors.
  - (b) The flap/slat alternate drive control module provides arming and control signals. There is one slat arming switch and one flap arming switch on the module. One position selector switch on the module controls positioning of flaps, inboard slats, and outboard slats.
  - (c) Inboard Leading Edge Slats Alternate Drive
    - 1) The slat arming signal powers the inboard slat PDU hydraulic bypass valve to bypass (closed) and causes the inboard slat PDU electric motor clutch to engage. The control signal from the position selector switch is monitored by the FSEU. The FSEU generates extend or retract signals to activate power to drive the inboard slat PDU electric motor.
  - (d) Outboard Leading Edge Slats Alternate Drive
    - 1) The signal path is the same as for inboard slats alternate drive.
- (3) Primary Power (Fig. 1)
  - (a) The inboard slat drive and the outboard slat drive primary power is from the center hydraulic system. Hydraulic pressure drives the hydraulic motor on the inboard slat power drive unit and the hydraulic motor on the outboard slat power drive unit.
  - (b) One hydraulic control valve module and one control unit are mounted on each slat power drive unit.
  - (c) The hydraulic motor is controlled by the hydraulic control valve module, containing a hydraulic control valve and a hydraulic bypass valve, and by the control unit. The control unit has an input cam rotated by input from the flap lever. The input cam regulates the hydraulic control valve by power drive unit linkage. The follow-up cam returns the hydraulic control valve to null.
- (4) Alternate Power (Fig. 1)
  - (a) The inboard slat drive and the outboard slat drive alternate power is electric. Electric power controlled by switches on the flap/slat alternate drive control module drives two electric motors. The inboard slat power drive unit and the outboard slat power drive unit each have one motor.
  - (b) Each motor has an electromagnetic brake, a torque limiter, and a solenoid actuated clutch. The brake disengages when the motor is energized. The torque limiter protects against system overload.
  - (c) The motor clutch is de-energized during normal hydraulic operation. The clutch engages the motor to the output shaft when the solenoid is energized by arming the alternate drive.

- (5) Drive System (Fig. 1)
  - (a) The inboard and outboard slats are powered by independent power drive units and actuated by independent drives. The drives consist of hollow aluminum drive shafts with couplings or fixed bearing supports at each junction. Offset and angle gearboxes are used to transmit drive shaft rotary power. The offset gearboxes drive two rotary actuators per slat.
  - (b) The Krueger seal flap drive is connected to the outboard rotary actuator for each of the inboard slats.
- (6) FSEU (Fig. 3)
  - (a) The flap/slat electronic unit (FSEU) is on electronic shelf E2 in the main equipment center. The FSEU consists of three physically isolated sections. Replacement of FSEU components is on a failure basis rather than a scheduled or time-controlled basis. No adjustment of the FSEU is required.
  - (b) The FSEU assists in control of leading edge slat functions. For a detailed description of FSEU control of following leading edge slat functions, refer to AMM 27-51-01/001, Flap/Slat Electronics Unit - Description and Operation.
    - 1) Slat position indication on flap/slat position indicator.
    - 2) Slat asymmetry detection, indication and hydraulic shutdown.
    - 3) Slat uncommanded motion (motion without command or motion opposite to command) detection, indication, and hydraulic shutdown.
    - 4) Detection and indication of slat condition when slats do not move when commanded.
    - 5) Slat alternate drive (separate electric motors on inboard and outboard slat PDU's).
    - 6) Slat shutoff valve (in flap/slat shutoff valve module) opening and closure.
  - (c) When an uncommanded motion condition occurs, the LE SLAT DISAGREE message is accompanied by an advisory LE SLAT SHUTDOWN message to confirm that either the inboard or the outboard leading edge slat power drive unit bypass valve has moved to BYPASS.
  - (d) The advisory LE SLAT SHUTDOWN message may appear by itself to indicate that either the inboard or the outboard leading edge slat power drive unit bypass valve is in BYPASS.
  - (e) The advisory LE SLAT SHUTDOWN EICAS message will not appear if an LE SLAT ASYM EICAS message is present.
  - (f) The LE SLAT DISAGREE and LE SLAT ASYM messages are level B EICAS messages and are accompanied by aural caution and illumination of master caution lights.

## 2. Component Details

### A. Aft Quadrant and Control Components (Fig. 1)

- (1) The slat aft control quadrant serves as the mechanical interface between the flap lever cables and the slat power drive units. The aft quadrant is located on the right side of the fuselage under the main deck compartment floor and just inboard from the inboard slat power drive unit. The aft quadrant can be reached from the aft end of the forward cargo compartment.
- (2) The aft quadrant consists of a dual-grooved pulley. The quadrant has a rig pin hole for rigging of the flap lever cables.
- (3) Inboard Leading Edge Slat Power Drive Unit Input
  - (a) A hollow aluminum drive shaft connected to the slat aft quadrant transmits rotary motion through the side-of-body bearing housing seal to a crank on the outside of the fuselage. The crank transmits linear motion to a non-adjustable control rod, a bellcrank, and an adjustable control rod attached to the pilot input crank on the inboard leading edge slat power drive unit.
- (4) Outboard Leading Edge Slat Power Drive Unit Input
  - (a) Input to the outboard slat power drive unit is the same as input to the inboard slat power drive unit, except that four drive shafts are used to transmit rotary motion from the slat aft quadrant.

### B. PDU and Components (Fig. 4)

- (1) The inboard slat power drive unit (PDU) drives inboard slats No. 6 and 7. The outboard slat power drive unit drives outboard slats No. 1-5 and No. 8-12. The inboard slat power drive unit is located aft of the right wing strakelet and is mounted to the right wing front spar. The outboard slat power drive unit is located aft of the left wing strakelet and is mounted to the left wing front spar. Access to both power drive units is through access panels.
- (2) Each power drive unit consists of a control unit, a hydraulic control valve module with a control valve and a bypass valve, a primary power hydraulic motor, an alternate power electric motor, and a gearbox (Fig. 5). The two power drive units are functionally similar, but not interchangeable.
- (3) Three rig pins are used during maintenance, one in the power drive unit input cam, one in the power drive unit follow-up cam, and one in the input crank to the hydraulic control valve module. Plugs protect the rig pin holes in the input and follow-up cam rig pin holes.
- (4) Power output from either power drive unit may be blocked by installing a ground lock in the gearbox.

### C. PDU Control Units and Components (Fig. 4)

- (1) A control unit is mounted on each power drive unit gearbox. It consists of a pilot input crank and an output crank, input and follow-up cams, cam followers (rollers), and two rotary variable differential transformers (RVDTs) and an RVDT drive from the gearbox.

- (2) The control unit provides the mechanical input to the hydraulic control valve in the hydraulic control valve module, performs mechanical follow-up of the hydraulic control valve, and allows mounting of the RVDTs. An input cam and a follow-up cam rig pin hole with plugs provide rigging capability of the control unit.
- D. PDU Hydraulic Control Valve Module (Fig. 4 and Fig. 12)
- (1) A hydraulic control valve module is mounted on each power drive unit control unit. The control valve module performs the power drive unit hydraulic control functions. Each control valve module consists of a flow regulator, a control valve, and a bypass valve. The center hydraulic system is the source of hydraulic power.
  - (2) The flow regulator maintains a design flow rate to the control valve to ensure a desired leading edge slat rate of travel.
  - (3) The control valve controls the direction of rotation of the hydraulic motor according to input at the control unit pilot input crank. The control valve will shut off hydraulic flow when the slats arrive at their selected position as determined by the control unit follow-up cam.
  - (4) The bypass valve is electric-motor operated and serves to bypass hydraulic power when the slats alternate drive is armed and when slat asymmetry or slat uncommanded motion occurs. The bypass valve can also be operated manually by a lever. The bypass mode of the valve is indicated by Position 1. The normal mode is indicated by Position 2.
- E. PDU Hydraulic Motor (Fig. 4 and Fig. 12)
- (1) A hydraulic motor is installed on the gearbox of each slat power drive unit for primary power to drive the slats.
  - (2) Operation of the hydraulic motor will turn the gears in the gearbox and rotate the drive shafts to the slats. Direction of rotation of the hydraulic motor is controlled by the control valve in the hydraulic control valve module.
  - (3) The inboard and outboard slat power drive unit hydraulic motors require 6 GPM at 2620 RPM and 14 GPM at 2080 RPM respectively.
- F. PDU Electric Motor (Fig. 4 and Fig. 13)
- (1) An electric motor is installed on the gearbox of each slat power drive unit. The motor is for alternate power to drive the slats.
  - (2) Operation of the motor turns the gears in the gearbox. The gearbox rotates the drive shafts to the slats. Direction of rotation of the motor is controlled by the flap/slat position selector switch. The switch is on the flap/slat alternate drive control module.
  - (3) Each motor operates from 115-vac, 3-phase, 400-Hz power. Motor speed is 275 RPM.
  - (4) Each motor has the following: an electromagnetic brake (disengages when the motor is energized), a torque limiter (for protection against system overload), and a solenoid actuated clutch (de-energized during normal hydraulic operation). The clutch engages the motor to the output shaft when the solenoid is energized by a circuit activation through a switch in the hydraulic bypass valve. The switch is closed when the alternate drive is armed.

- (5) The clutch circuit must be activated before electric motor drive power is available.
- G. PDU Mechanical Drive (Fig. 5)
- (1) Hydraulic or electric power is converted to mechanical power by the gearbox on each slat power drive unit.
  - (2) On each slat power drive unit the hydraulic motor, the electric motor, and the control unit are mounted directly on the gearbox. The gearbox rotates the drive shafts to the slats.
  - (3) The gearbox output drives the rotary variable differential transformers (RVDTs) in the control unit on each slat power drive unit.
- H. Flaps/Slats Hydraulic Shutoff Valve Module (Fig. 6)
- (1) The flaps/slats hydraulic shutoff valve module is on the aft wall of the right main gear wheel well. Center hydraulic system power flows through the module. The main elements of the module are: A priority valve, a flow regulator, a shutoff valve for the flaps, and a shutoff valve for the slats. The priority valve is hydraulic pressure-operated.
  - (2) The solenoid-operated shutoff valves are energized closed. The slat valve closes when the slats are at their commanded position. The slat valve will also close if the flaps are not fully retracted when the flap lever is positioned from the 1-unit detent to the zero (FLAPS UP) detent. The solenoid gets its control signals from the flap/slat electronic unit (FSEU).

- (3) The solenoid operated shutoff valves are spring-loaded to open. The valves open when electrical power is removed.
- (4) A slat pressure switch is installed downstream of the slat hydraulic shutoff valve. The switch monitors the status of the slat shutoff valve, and provides feedback to the FSEU.

**I. Drive Components (Fig. 1)**

- (1) The slats drive and components extend left and right from the inboard and outboard slat power drive units along the leading edge of both wings. The drive is directly forward of the wing front spar and is mounted to it. The drive components consist of drive shafts, angle gearboxes, offset gearboxes, and rotary actuators which operate the slats by control rods.

**J. Inbd. L.E. Slat Gearboxes and Rotary Actuators (Fig. 7)**

- (1) Angle gearboxes are used in the inboard slat drive. The angle gearboxes change drive shaft alignment. Alignment is changed through bevel gears. Input to the gearboxes is by shafts. The shafts mate with splined couplings. The body angle gearbox has a drain cover. The side-of-body angle gearboxes have an inspection hole cover.

**Inboard Leading Edge Slat Offset Gearboxes and Rotary Actuators  
Figure 7**

**27-81-00**

- (2) Each inboard slat uses two offset gearbox/rotary actuator units. The units drive the slat. Torque is amplified through reduction gearing. The irreversible units will hold the slat in position with the input disconnected for an indefinite period. Input to the offset gearbox is at either end by a through shaft. The shaft mates with splined couplings. The offset gearbox no-back brake prevents air loads and system overloads from driving the system.
  - (3) Offset gearbox/rotary actuator output is a crank arm. The crank arm is on the rotary actuator. Output rotation is opposite to input rotation. An open shield vent is in the lower section of the rotary actuator.
  - (4) The static and dynamic joints of the angle gearboxes, the offset gearboxes, and the rotary actuators have seals. The seals help to keep in lubricant and to prevent entry by contaminants.
- K. Outbd. L.E. Slat Gearboxes and Rotary Actuators (Fig. 8)
- (1) Angle gearboxes are used in the outboard slat drive. The angle gearboxes change drive shaft alignment. Alignment is changed through bevel gears. Input to the gearboxes is by shafts. The shafts mate with splined couplings. The outboard angle gearbox has a drain cover. The side-of-body angle gearboxes have an inspection hole cover.

- (2) Each outboard slat uses two offset gearbox/rotary actuator units. The units drive the slat. Torque is amplified through reduction gearing. The irreversible units will hold the slat in position with the input disconnected for an indefinite period. Input to the offset gearbox is at either end by a through shaft. The shaft mates with splined couplings. The offset gearbox no-back brake prevents air loads and system overloads from driving the system.
  - (3) Offset gearbox/rotary actuator output is a crank arm. The crank arm is on the rotary actuator. Output rotation is opposite to input rotation. An open shield vent is in the lower section of the rotary actuator.
  - (4) The static and dynamic joints of the angle gearboxes, the offset gearboxes, and the rotary actuators have seals. The seals help to keep in lubricant and to prevent entry by contaminants.
- L. Inbd. L.E. Slat Control Surface Drive and Tracks (Fig. 9)
- (1) The drive shafts extending left and right from the inboard slat power drive unit are of hollow aluminum construction. The shafts are held in place by idler bearings. Three types of shafts are used:
    - (a) Drive shafts with splined couplings at both ends.
    - (b) Drive shafts with a splined coupling at one end and a fixed bearing support at the other end.
    - (c) Drive shafts with fixed bearing supports at both ends.
  - (2) Safety straps for the drive shafts are used throughout the slat drive.
  - (3) Ribs attached to the wing front spar provide structural support for the offset gearbox/rotary actuator units and for an extend stop and a retract stop. Each rotary actuator arm drives an adjustable control rod attached to the slat. Each slat is driven by two rotary actuators.

**WARNING:** DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

- (4) The main tracks and the auxiliary tracks provide the cam programming for the main track rollers and the auxiliary track rollers.
  - (5) Each slat is supplied with an alignment fitting.
- M. Outbd. L.E. Slat Control Surface Drive and Tracks (Fig. 10)
- (1) The drive shafts extending left and right from the outboard slat power drive unit are of hollow aluminum construction. The shafts are held in place by idler bearings. Three types of shafts are used:
    - (a) Drive shafts with splined couplings at both ends.
    - (b) Drive shafts with a splined coupling at one end and a fixed bearing support at the other end.
    - (c) Drive shafts with fixed bearing supports at both ends.

- (2) Safety straps for the drive shafts are used throughout the slat drive.
  - (3) Ribs attached to the wing front spar provide structural support for the offset gearbox/rotary actuator units and for an extend stop and a retract stop. Each rotary actuator arm drives an adjustable control rod attached to the slat. Each slat is driven by two rotary actuators.
  - (4) The main tracks and the auxiliary tracks provide the cam programming for the main track rollers and the auxiliary track rollers. One rig pin is used during maintenance at each auxiliary track to check slat preload.
  - (5) Each slat is supplied with an alignment fitting.
- N. Slat Seals
- (1) Aerodynamic seals are provided to reduce drag.
- O. Krueger Seal Flap Drive (Fig. 11)
- (1) The Krueger seal flap consists of a seal door and a bull nose. During extension of the flap, the seal door drives the bull nose by a separate linkage between the seal door and the bull nose. The flap seals the inboard slat to the nacelle and reduces interference drag.

-----

27-81-00

- (2) The Krueger seal flap drive consists of linkage and a rotary actuator between the outboard rotary actuator of the inboard slat and the flap seal door.
- (3) The outboard rotary actuator of the inboard leading edge slat turns a drive shaft with universal joints at both ends. Rotation of the drive shaft drives the Krueger seal flap rotary actuator. The rotary actuator output arm drives a set of linkages connected to the flap.

3. Operation

A. Functional Description

(1) Primary Function (Fig. 12)

- (a) The flap lever on the control stand positions the flap cables. The slat aft quadrant is connected to the flap cables. When the flap lever is moved, the flap cables move and the slat aft quadrant rotates. The slat aft quadrant rotates a set of drive shafts on both sides of the quadrant.

- (b) Inboard Leading Edge Slat Power Drive Unit (PDU)
  - 1) Drive shaft rotation on the right side of the slat aft quadrant is translated to linear motion by means of a crank, a non-adjustable control rod, a bell crank, and an adjustable control rod.
  - 2) The adjustable control rod rotates the pilot input crank on the PDU. An input cam in the PDU control unit is linked to the hydraulic control valve in the hydraulic control valve module.
  - 3) The hydraulic control valve responds to a pilot input and transmits center hydraulic system power to the hydraulic motor. The hydraulic control valve is closed by summing action of the follow-up cam in the PDU control unit.
- (c) Outboard Leading Edge Slat Power Drive Unit (PDU)
  - 1) Control of the outboard slat PDU is the same as the inboard slat PDU. The drive shafts on the left side of the slat aft quadrant control the outboard slat PDU.
- (d) Leading Edge Slat Hydraulic Shutoff Valve
  - 1) Slat position signals from the PDU RVDTs and a flap lever detent signal are sent to the flap/slat electronic unit (FSEU). When there is disagreement present within the FSEU, the FSEU responds by opening the slat hydraulic shutoff valve power circuit. This opens the spring-loaded valve. When there is agreement present within the FSEU for 30 seconds or more, the FSEU responds by closing the slat hydraulic shutoff valve power circuit. This closes the solenoid-operated valve.
  - 2) FSEU control logic will also close the slat hydraulic shutoff valve if the flaps are not fully retracted when the flap lever is in the 1-unit detent or is positioned from the 1-unit detent to the zero (FLAPS UP) detent and the flaps are not fully retracted.
- (2) Alternate Function-Inbd. and Outbd. Slats (Fig. 13)
  - (a) The inboard and outboard PDU electric motors operate on 115 vac, 3-phase, 400 Hz power. The arming and control circuits operate on 28vdc power.
  - (b) Pressing the slat alternate drive arming switch arms the inboard and outboard slat alternate drives (switch lights up ALTN) as follows:
    - 1) The alternate inboard and outboard slat circuits are activated to make electric motor drive power available.
    - 2) The bypass valve in the inboard and outboard PDU control valve modules go to bypass (closed), shutting off center hydraulic system power supply to the inboard and outboard PDU hydraulic motors.
    - 3) The inboard and outboard PDU electric motor clutch solenoids are activated. This engages the motors and the output shafts.

- 4) The amber LEADING EDGE light on P3 and the LE SLAT DISAGREE message in EICAS display come on if the alternate flaps/slats position selector switch is left in the NORM position for more than seven seconds.
- (c) An extend signal to the inboard and outboard slats is given by placing the alternate flaps/slats position selector switch (P3) out of the NORM and UP detents. Placing the selector switch out of NORM causes the amber LEADING EDGE light and LE SLAT DISAGREE message to go out. The extend signal is sent to the flap/slat electronic unit. FSEU logic powers the alternate inboard and outboard slat circuits to allow electric motor drive power to drive the inboard and outboard PDU motors after brake is released. When the inboard and outboard slats are in the commanded position as determined by the No. 2 RVDTs on the inboard and outboard leading edge slat power drive units, the FSEU logic shuts off electric motor drive power in the alternate inboard and outboard slat circuits. The inboard and outboard PDU electric motors are turned off and brake is applied.
- (d) When the alternate flaps/slats position selector switch is selected to retract the inboard and outboard slats, the circuits operate the same as for extension. The FSEU retract logic and the alternate inboard and outboard slat retract circuits are used in this case. Placing the selector switch in NORM causes the amber LEADING EDGE light and LE SLAT DISAGREE message to come on.
- (e) The slat alternate drive arming switch is pressed to disarm the inboard and outboard slat alternate drives (switch light, amber LEADING EDGE light and LE SLAT DISAGREE message go out). Then the inboard and outboard PDU electric motor clutches are disengaged and the inboard and outboard PDU bypass valves open. This makes center hydraulic system power available to the inboard and outboard PDU hydraulic motors.
- (3) L.E. Slat Drive - Inbd. (Fig. 1)
- (a) The gearbox on the inboard slat power drive unit is driven by the hydraulic motor or the electric motor. Drive shafts extend from the left and right sides of the gearbox. The drive shafts are rotated by the gearbox.
- (b) Rotation of the drive shafts on the right side is transmitted through a side-of-body angle gearbox to two offset gearboxes. Each offset gearbox drives a rotary actuator. The arm on each rotary actuator connects to a control rod. The control rods drive slat No. 7.
- (c) Rotation of the drive shafts on the left side is transmitted through the right-side body seal, an angle gearbox, the left-side body seal, a side-of-body angle gearbox to two offset gearboxes. Each offset gearbox drives a rotary actuator. The arm on each rotary actuator is connected to a control rod. The control rods drive slat No. 6.

Page 28  
Dec 22/01

- (4) L.E. Slat Drive - Outbd. (Fig. 1)
  - (a) The outboard slat drive function is similar to the inboard slat drive function. The outboard slat drive operates from the outboard slat power drive unit. The outboard slats are No. 1-5 on the left side and No. 8-12 on the right side.
- (5) Krueger Seal Flap Drive (Fig. 1)
  - (a) The left Krueger seal flap is driven by a rotary actuator and linkage from the outboard rotary actuator of slat No. 6. The right Krueger seal flap is driven the same way from slat No. 7.
- (6) Failure Protection System (Fig. 13)
  - (a) The flap/slat electronic unit (FSEU) generates signals for visual and aural indication of slat faults such as: Asymmetry, uncommanded motion (UCM), and disagreement between flap lever command and slat position (slats do not move when commanded). For a detailed description of FSEU slat control, refer to AMM 27-51-01/001, Flap/Slat Electronics Unit - Description and Operation.
- (7) Built-In-Test Equipment (BITE)
  - (a) The flap/slat electronic unit (FSEU) has BITE for the flap and slat systems. The FSEU BITE control and display panel has a BITE initiate switch, fault indicators, and an indication for successful test completion. Failures are shown by LRU number. In the slat system, failure of any RVDT in the inboard and outboard slat power drive unit and of either of the flap lever RVDT's is shown on the BITE panel. The FSEU contains circuits to check failure within itself.

B. Control

- (1) Primary Control
  - (a) Check that TE flaps and LE slats are in fully retracted position.
  - (b) Check that flap lever is in zero (FLAPS UP) detent.
  - (c) Provide electrical power (AMM 24-22-00).

**WARNING:** KEEP PERSONNEL AND EQUIPMENT CLEAR OF ALL CONTROL SURFACES TO PREVENT INJURY AND DAMAGE. ALL TE FLAPS AND LE SLATS WILL BE POWERED IN PREPARATION FOR CHANGE OF POSITION. FLAP MOVEMENT BETWEEN 5-UNIT AND 15-UNIT FLAP LEVER DETENTS CAUSES INBOARD AILERON MOVEMENT. AILERON, SPOILER, RUDDER, ELEVATOR, AND STABILIZER CONTROL SURFACES WILL ALSO BE POWERED.

**CAUTION:** BEFORE OPERATING FLAPS OR SLATS, ENSURE THAT ENGINE STRUT ACCESS DOORS, INBOARD FAN COWLING, AND THRUST REVERSER COWLING WILL NOT BE IN THE PATH OF SLATS, TO PREVENT DAMAGE.

- (d) Pressurize center hydraulic system (AMM 29-11-00).

EFFECTIVITY

ALL

- (e) Place flap lever in 1-unit detent. Check that LE slats extend to intermediate position, and that TE flaps remain in fully retracted position.
  - (f) Place flap lever in 20-unit detent. Check that TE flaps extend to intermediate position.
  - (g) Place flap lever in 30-unit detent. Check that TE flaps and LE slats move to fully extended position.
  - (h) Place flap lever in 20-unit detent. Check that TE flaps and LE slats retract to intermediate position.
  - (i) Place flap lever in 5-unit detent. Check that TE flaps retract to 5-unit detent position and that LE slats remain in intermediate position.
  - (j) Place flap lever in zero (FLAPS UP) detent. Check that TE flaps move to fully retracted position. After TE flaps have moved to fully retracted position, check that LE slats move to fully retracted position.
  - (k) Remove hydraulic power (AMM 29-11-00).
  - (l) Remove electrical power (AMM 24-22-00).
- (2) Alternate Control
- (a) Check that TE flaps and LE slats are in fully retracted position.
  - (b) Check that flap lever is in zero (FLAPS UP) detent.
  - (c) Provide electrical power (Ref 24-22-00).
  - (d) Check that alternate flaps/slats position selector switch on first officer's main instrument panel P3 is in NORM detent.
  - (e) Press LE slat alternate drive arming switch on P3 to arm inboard and outboard slat alternate drives (switch lights up ALTN immediately and amber LEADING EDGE light on P3 and LE SLAT DISAGREE message come on after seven seconds).

**WARNING:** KEEP PERSONNEL AND EQUIPMENT CLEAR OF LEADING EDGE SLATS TO PREVENT INJURY AND DAMAGE. LEADING EDGE SLATS WILL CHANGE POSITION.

**CAUTION:** BEFORE OPERATING FLAPS OR SLATS, ENSURE THAT ENGINE STRUT ACCESS DOORS, INBOARD FAN COWLING, AND THRUST REVERSER COWLING WILL NOT BE IN THE PATH OF SLATS, TO PREVENT DAMAGE.

**CAUTION:** DO NOT RUN ELECTRIC MOTORS FOR LONGER THAN FOUR MINUTES AT A TIME TO PREVENT OVERHEATING. ALLOW MOTORS TO COOL OFF FOR AT LEAST 20 MINUTES.

- (f) Position alternate flaps/slats position selector switch in 20-unit detent (amber LEADING EDGE light and LE SLAT DISAGREE message go out). Check that LE slats extend to intermediate position.

LEADING EDGE SLAT SYSTEM – MAINTENANCE PRACTICES

1. General

- A. This procedure contains nine maintenance practice tasks for the leading edge (LE) slats:
- "Put the Airplane Back to Its usual condition" task (included in each task below)
  - Leading Edge Slat Deactivation
  - Extend the Leading Edge Slats with Primary (Hydraulic) Power
  - Extend the Leading Edge Slats with Alternate (Electrical) Power
  - Retract the Leading Edge Slats with Primary (Hydraulic) Power
  - Retract the Leading Edge Slats with Alternate (Electrical) Power
  - Manually Extend and Retract the Leading Edge Slats without Airplane Power
  - Operate the Outboard Slats without Movement of the Inboard Slats
  - Extend and Retract the Slats without Movement of the Flaps
  - Remove and Install the fixed lower access panels for the leading edge.
- B. The LE slats are given the numbers 1 thru 12, from the left wing to the right wing. Slats No. 1 to 5 and 8 to 12 are outboard slats. Slats No. 6 and 7 are inboard slats.

TASK 27-81-00-042-001

2. Leading Edge Slat Deactivation

A. Equipment

- (1) Circuit Breaker Lockout Clip,  
(4 necessary) Commercially Available
- (2) Leading Edge Slat Groundlock – A27007-1  
(2 Necessary)

B. References

- (1) 06-44-00/201, Wing Access Doors and Panels
- (2) 24-22-00/201, Electrical Power – Control
- (3) 29-11-00/201, Main (Left, Right, and Center Hydraulic Systems
- (4) 32-00-15/201, Landing Gear Door Locks
- (5) 32-00-20/201, Landing Gear Down Locks

C. Access

(1) Location Zones

211/212 Control Cabin  
510/610 Wing Leading Edge - Inboard  
520/620 Wing Leading Edge - Outboard  
710 Nose Landing Gear and Doors  
730/740 Left/Right Main Landing Gear Doors

(2) Access Panel

511BB LE Slat Power Drive Unit - Outboard (left)  
611BB LE Slat Power Drive Unit - Inboard (right)  
511QB/511RB LE Krueger Flap Rotary Actuator (left)  
611QB/611RB LE Krueger Flap Rotary Actuator (right)

D. Slat Deactivation Procedure

S 212-246

- (1) Make sure the downlocks are installed on the nose and main landing gear (Ref 32-00-20).

S 492-247

**WARNING:** USE AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Open the doors for the landing gear and install the door locks (Ref 32-00-15).

S 212-248

- (3) Make sure the position of the high-lift control surfaces agree with the commanded position as shown in Table 201.

**NOTE:** The commanded position is set by one of these controls:  
- the flap control lever for the flap/slat primary drive, on the quadrant stand, P10  
- the position selector switch for the flap/slat alternate drive, on the first officer's main instrument panel, P3.

S 492-249

- (4) Attach a DO-NOT-OPERATE tag to flap control lever or the position selector switch as applicable.

S 862-252

(7) Remove the power from the center hydraulic system (Ref 29-11-00).

S 012-253

(8) Open the access panels, 511BB, and 611BB, to get access to the inboard and outboard slat power drive units (PDU) (Ref 06-44-00).

S 982-254

(9) Turn the manual override lever on the bypass valve at the inboard and outboard slat PDUs to the No. 1 (bypass) position (Fig. 201).

S 492-255

(10) Attach a DO-NOT-OPERATE tag to each manual override lever.

S 492-256

(11) Install the groundlocks on the inboard and outboard slat PDUs (Fig. 202).

S 012-257

(12) If it is necessary to get access to the LE slat and krueger seal flap drive, remove the applicable fixed lower access panels (511QB/511RB - Left Wing or 611QB/611RB - Right Wing) at the leading edge of the wing (AMM 06-44-00/201).

S 862-258

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

(13) Pressurize the center hydraulic system only if it is necessary for maintenance (Ref 29-11-00).

S 842-259

(14) Put the airplane back to its usual condition after you complete the maintenance in which the slat deactivation was necessary.

EFFECTIVITY

ALL

27-81-00

Apr 22/99

E. Put the Airplane Back to Its Usual Condition

S 212-260

- (1) Make sure the position of the high-lift control surfaces agree with the commanded position as shown in Table 201.

NOTE: The commanded position is set by one of these controls:  
- the flap control lever for the flap/slat primary drive, on the P10 quadrant stand.  
- the position selector switch for the flap/slat alternate drive, on the P3 panel.

S 092-261

- (2) Remove the groundlocks from the inboard and outboard slat PDUs (Fig. 202).

S 092-262

- (3) Remove the DO-NOT-OPERATE tag from the manual override lever at the inboard and outboard slat PDU.

S 982-263

- (4) Turn each manual override lever to the No. 2 (normal) position.

S 412-264

- (5) If removed, install the fixed lower access panels (511QB/511RB - Left Wing or 611QB/611RB - Right Wing) at the leading edge of the wing (AMM 06-44-00/201).

S 412-265

- (6) Install the access panels, 511BB and 611BB, to close the access for the inboard and outboard slat PDUs (Ref 06-44-00/201).

S 862-266

- (7) Remove the circuit breaker locks and close these circuit breakers on the P11 panel:  
(a) 11H23, SLAT ALTN CONT INBD  
(b) 11H24, SLAT ALTN CONT OUTBD

S 862-267

- (8) Remove the circuit breaker locks and close these circuit breakers on the P6 panel:  
(a) 6D21, ALTN SLAT INBD PWR  
(b) 6F24, ALTN SLAT OUTBD PWR

S 092-268

- (9) If installed, remove the DO-NOT-OPERATE tag on the flap control lever or the position selector switch.

EFFECTIVITY

S 092-269

**WARNING:** USE AMM 32-00-15/201 TO REMOVE THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

(10) Remove the door locks from the landing gear doors and close the doors (Ref 32-00-15).

S 862-270

(11) Remove the power from the center hydraulic system (Ref 29-11-00).

S 862-271

(12) Remove electrical power, if it is not necessary (Ref 24-22-00).

TASK 27-81-00-862-272

3. Extend the Leading Edge Slats with Primary (Hydraulic) Power

A. References

- (1) 24-22-00/201, Electrical Power - Control
- (2) 27-51-00/201, Trailing Edge Flap System
- (3) 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems

B. Access

- (1) Location Zones
  - 211/212 Control Cabin
  - 510/610 Wing Leading Edge - Inboard
  - 520/620 Wing Leading Edge - Outboard

C. Extend the Leading Edge Slats

**NOTE:** Refer to Table 201 to extend the slat in this procedure.

S 212-273

(1) Make sure the trailing edge (TE) flaps and the leading edge (LE) slats are in the fully retracted position.

S 212-274

(2) Make sure the flap control lever is in the zero (FLAPS UP) detent.

S 212-275

(3) Make sure the groundlocks are not installed on the inboard and outboard slat PDUs.

S 862-276

(4) Supply electrical power (Ref 24-22-00).

EFFECTIVITY

ALL

**27-81-00**

01

Page 214  
Aug 22/01

S 862-277

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

**CAUTION:** WHILE USING THE ALTERNATE OR THE PRIMARY METHOD TO OPERATE THE LEADING EDGE SLAT DRIVE SYSTEM, MAKE SURE THE SAME METHOD IS USED UNTIL THE CYCLE IS COMPLETED. QUICK TRANSITION OF THE LEADING EDGE SLAT DRIVE SYSTEM FROM THE ALTERNATE MODE TO THE PRIMARY MODE CAN CAUSE INTERNAL FAILURE OF THE ALTERNATE DRIVE MOTOR.

(5) Pressurize the center hydraulic system (Ref 29-11-00).

S 862-278

(6) Move the flap control lever to one of the positions shown in Table 201, and make sure the flaps and slats move to the correct position.

S 862-279

(7) Remove the power from the center hydraulic system, if it is not necessary (Ref 29-11-00).

S 042-280

(8) Do the deactivation procedure for the slats if it is necessary for maintenance.

S 042-281

(9) Do the deactivation procedure for the flaps if it is necessary for maintenance (Ref 27-51-00).

TASK 27-81-00-862-282

4. Retract the Leading Edge Slats with Primary (Hydraulic) Power

(1) Location Zones

211/212 Control Cabin  
510/610 Wing Leading Edge - Inboard  
520/620 Wing Leading Edge - Outboard

C. Retract the Leading Edge Slats

**NOTE:** Refer to Table 201 to retract the slats in this procedure.

S 212-283

- (1) Make sure the position of the flaps and the slats agree with the position of the flap control lever as shown in Table 201.

S 212-284

- (2) Make sure the groundlocks are not installed on the inboard and outboard slat PDUs.

S 862-285

- (3) Supply electrical power (Ref 24-22-00).

S 862-286

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

**CAUTION:** WHILE USING THE ALTERNATE OR THE PRIMARY METHOD TO OPERATE THE LEADING EDGE SLAT DRIVE SYSTEM, MAKE SURE THE SAME METHOD IS USED UNTIL THE CYCLE IS COMPLETED. QUICK TRANSITION OF THE LEADING EDGE SLAT DRIVE SYSTEM FROM THE ALTERNATE MODE TO THE PRIMARY MODE CAN CAUSE INTERNAL FAILURE OF THE ALTERNATE DRIVE MOTOR.

- (4) Pressurize the center hydraulic system (Ref 29-11-00).

S 862-287

- (5) Move the flap control lever to the zero (FLAPS UP) detent, and make sure the flaps and slats move to the fully retracted position.

  - 211/212 Control Cabin
  - 510/610 Wing Leading Edge - Inboard
  - 520/620 Wing Leading Edge - Outboard

C. Extend the Leading Edge Slats

- S 212-291  
(1) Make sure the trailing edge (TE) flaps and the leading edge (LE) slats are in the fully retracted position.
- S 212-292  
(2) Make sure the flap control lever is in the zero (FLAPS UP) detent.
- S 212-293  
(3) Make sure the position selector switch for the flap/slat alternate drive (on the first officer's main instrument panel, P3) is in the NORM detent.
- S 862-294  
(4) Supply electrical power (Ref 24-22-00).
- S 212-295  
(5) Make sure the arming switches for the flap and slat alternate drives (on the P3 panel) are not in the armed position (ALTN switch lights are off).
- S 212-296  
(6) Make sure the amber TRAILING EDGE and LEADING EDGE lights (on the P3 panel) are off.
- S 862-297  
(7) Push the LE arming switch for the slat alternate drive to arm the slat alternate drive for the inboard and outboard slats (ALTN switch light comes on).

- (9) Remove electrical power if it is not necessary (Ref 24-22-00).

TASK 27-81-00-982-316

7. Manually Extend and Retract the Leading Edge Slats without Airplane Power

A. General

- (1) Use this procedure to manually extend and retract the inboard and/or the outboard slats when airplane power is not available.
- (2) In this task, there are two different procedures to manually operate the slats. You can manually extend or retract the slats from the end of the inboard and outboard slat drives, or from the inboard and outboard slat PDUs.

Because there are two different procedures to operate the slats, only do the steps that are applicable to your procedure. Do the steps in the "Prepare for Manual Operation" topic before you start each procedure.

- (3) Follow these procedures carefully. You can manually move the slats away from the position that is set on the flap control lever, or the position selector switch. The slats will automatically move back to the commanded position when hydraulic or electrical power is supplied.

B. Equipment

- (1) Circuit Breaker Lockout Clip,  
(2 necessary) Commercially Available
- (2) Adapter - Leading Edge Slat Drive - A27077-1

NOTE: Use this adapter only if you operate the slats from the end of the slat drivers.

- (3) Adapter - Leading Edge Slat Drive - A27102-7

NOTE: Use this adapter only if you operate the slats from the inboard and outboard slat PDUs.

- (4) Air Motor with a 1/2 inch Drive -  
Commercially Available

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM THE SLATS IN THE STEP THAT FOLLOWS. THE SLATS WILL MOVE TO THE POSITION SET ON THE FLAP CONTROL LEVER WHEN THE CENTER HYDRAULIC SYSTEM IS PRESSURIZED. ACCIDENTAL SLAT MOVEMENT CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (8) Pressurize the center hydraulic system (Ref 29-11-00), and permit the slats to move to the position set on the flap control lever.

S 862-345

- (9) Remove the pressure from the center hydraulic system (Ref 29-11-00).

S 442-346

- (10) Do the activation procedure for the thrust reverser (Ref 78-31-00).

TASK 27-81-00-862-352

8. Operate the Outboard Slats without Movement of the Inboard Slats

A. General

- (1) Use this procedure to operate the outboard slats without movement of the inboard slats. You can operate the outboard slats with primary (hydraulic) power, or with alternate (electric) power. Only do the operation applicable to your maintenance.
- (2) The inboard slats (No. 6 and 7) are deactivated in the fully retracted position. Before you activate the inboard slats, make sure the flap control lever and the position selector switch agree with the position of the inboard slats. The slats can accidentally move to the commanded position when hydraulic or electrical power is supplied.

B. Equipment

- (1) Circuit Breaker Lockout Clip  
(2 necessary) Commercially Available
- (2) Leading Edge Slat Groundlock - A27007-1

S 492-364

- (12) Install caps to the wire plugs and sockets.

S 492-365

- (13) Install the groundlock in the inboard slat PDU (Fig. 202).

F. Operate the Outboard Slats

**NOTE:** You can operate the outboard slats with primary (hydraulic) or with alternate (electric) power. Only do the steps applicable for your maintenance.

S 862-366

- (1) Do these steps to operate the outboard slats with primary (hydraulic) power:  
(a) Supply electrical power (Ref 24-22-00/201).

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (b) Pressurize the center hydraulic system (Ref 29-11-00/201).  
(c) Remove the DO-NOT-OPERATE tag from the flap control lever, and move the lever to the applicable position shown in Table 201.  
(d) Make sure the outboard slats move to the correct position that you selected.

**NOTE:** The inboard slats will not move.

- (e) After you completed the necessary maintenance, move the flap control lever back to the zero (FLAPS UP) detent to fully retract the outboard slats.

S 862-367

- (2) Do these steps to operate the outboard slats with alternate (electric) power:  
(a) Supply electrical power (Ref 24-22-00/201).  
(b) Push the LE arming switch for the slat alternate drive, on the P3 panel, to arm the slat alternate drive (ALTN switch light comes on).

EFFECTIVITY

ALL

27-81-00

Page 230  
Dec 22/04

- (c) Remove the DO-NOT-OPERATE tag from the position selector switch, on the P3 panel, and turn the switch to the applicable position shown in Table 201.
- (d) Make sure the outboard slats move to the correct position that you selected.

NOTE: The inboard slats will not move.

- (e) After you completed the necessary maintenance, turn the position selector switch back to the UP detent to fully retract the outboard slats.
- (f) Turn the position selector switch to the NORM detent.
- (g) Push the LE arming switch for the slat alternate drive to disarm the slat alternate drive (ALTN switch light goes off).

G. Put the Airplane Back to Its Usual Condition

S 212-368

- (1) Make sure the inboard and outboard slats are in the fully retracted position.

S 212-369

- (2) Make sure the flap control lever is in the zero (FLAPS UP) detent.

S 212-370

- (3) Make sure the position selector switch for the flap/slat alternate drives, on the P3 panel, is in the NORM detent.

S 212-371

- (4) Make sure the LE arming switch for the slat alternate drive, on the P3 panel, is not armed (ALTN switch light off).

S 862-372

- (5) Remove the power from the center hydraulic system (Ref 29-11-00/201).

S 092-373

- (6) Remove the groundlock from the inboard slat PDU in the right wing (Fig. 202).

S 092-374

- (7) Remove the caps from the wire plugs and sockets at the inboard slat PDU.

S 432-375

- (8) Connect the electrical connector to the bypass valve on the inboard slat PDU (Fig. 201).

S 432-376

- (9) Connect the electrical connector to the electric (alternate drive) motor on the inboard slat PDU (Fig. 201).

EFFECTIVITY

ALL

27-81-00

04

Page 231  
Dec 22/04

S 982-377

- (10) Remove the DO-NOT-OPERATE tag from the PDU bypass valve, and turn the bypass valve to the No. 2 (normal) position.

S 412-378

- (11) Install the access panel, 611BB, to close the access to the inboard slat PDU (Ref 06-44-00/201).

S 862-379

- (12) Remove the circuit breaker lock and DO-NOT-CLOSE tag, and close this circuit breaker on the P11 panel:
  - (a) 11H23, SLAT ALTN CONT INBD

S 862-380

- (13) Remove the circuit breaker lock and DO-NOT-CLOSE tag, and close this circuit breaker on the P6 panel:
  - (a) 6D21, ALTN SLAT INBD PWR

S 092-381

- (14) If installed, remove the DO-NOT-OPERATE tag from the flap control lever or the position selector switch.

TASK 27-81-00-862-382

9. Extend and Retract the Slats without Movement of the Flaps

A. General

- (1) Use this procedure to operate the leading edge (LE) slats without the movement of the trailing edge (TE) flaps.
- (2) Refer to 27-51-00, Trailing Edge Flap System, to move the TE flaps without the movement of the LE slats.

B. Equipment

- (1) Circuit Breaker Lockout Clip  
(5 necessary) Commercially Available
- (2) TE Flap PDU Lock - A27009-7

C. References

- (1) 06-44-00/201, Wing Access Doors and Panels
- (2) 24-22-00/201, Electrical Power - Control

- (6) 32-00-20/201, Landing Gear Downlocks

D. Extend and Retract the Slats without Flap Movement

S 212-383

- (1) Make sure the downlocks are installed on the nose and main landing gear (Ref 32-00-20).

EFFECTIVITY

ALL

27-81-00

04

Page 232  
Dec 22/04

S 492-384

**WARNING:** USE AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Open the doors for the landing gear and install the door locks (Ref 32-00-15).

S 212-385

- (3) Make sure the position selector switch for the flap/slat alternate drive is in the NORM detent.

S 862-386

- (4) Supply electrical power (Ref 24-22-00).

S 862-387

- (5) Push the arming switch for the flap alternate drive (on the first officer's instrument panel, P3) to arm the flap alternate drive only (ALTN switch light comes on under the TE side).

S 212-388

- (6) Make sure the amber TRAILING EDGE light comes on.

S 212-420

- (7) Make sure the TE FLAP DISAGREE message shows on the EICAS display.

S 862-389

- (8) Open this circuit breaker on the overhead panel, P11 and install a circuit breaker lock and a DO-NOT-CLOSE tag:  
(a) 11J24, FLAPS ALTN CONT

S 862-390

- (9) Open this circuit breaker on the main power distribution panel, P6, and install a circuit breaker lock and a DO-NOT-CLOSE tag:  
(a) 6D24, ALT FLAP PWR

S 862-391

- (10) Open these circuit breakers on the P11 panel and install circuit breaker locks:  
(a) 11H14, SLAT SHUTOFF  
(b) 11H23, SLAT ALTN CONT INBD  
(c) 11H24, SLAT ALTN CONT OUTBD

S 492-392

- (11) Install the PDU lock in the TE flap PDU (Fig. 205).

EFFECTIVITY

ALL

27-81-00

04

Page 233  
Dec 22/04

S 862-393

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

(12) Pressurize the center hydraulic system (Ref 29-11-00).

S 862-394

(13) Move the flap control lever to the necessary position.

S 212-395

(14) Make sure the slats move to the correct position as shown in Table 201, and that the flaps do not move.

S 492-396

(15) Attach a DO-NOT-OPERATE tag to the flap control lever, the arming switch and the position selector switch for the flap alternate drive.

S 862-397

(16) Remove the power from the center hydraulic system if it is not necessary (Ref 29-11-00).

S 042-398

(17) Do the deactivation procedure for the slats if it is necessary for maintenance.

E. Put the Airplane Back to Its Usual Condition

S 862-399

(1) Remove the power from the center hydraulic system (Ref 29-11-00).

S 442-400

(2) Do these steps if you did the deactivation procedure for the slats:

(a) Remove the groundlocks from the inboard and outboard slat PDUs (Fig. 202).

(b) Remove the DO-NOT-OPERATE tags and move the manual override levers on the inboard and outboard slat PDUs to position 2 (normal).

(c) Install the access panels, 611BB and 511BB, for the inboard and outboard slat PDUs (Ref 06-44-00).

LEADING EDGE SLAT SYSTEM - ADJUSTMENT/TEST

1. General

- A. This procedure contains tasks for the adjustment and tests of the leading edge (LE) slat system:
- Leading Edge Slat System - Adjustment
  - Slat Alternate Power and Drive System - Test
  - Slat Asymmetry Protection System - Test
  - Slat Failure Protection System - Test
- B. For a complete SYSTEM TEST of the LE Slat System, it is necessary to do all the tests that are in this procedure. If you will do all the tests, it is not necessary to repeat the same steps in the "Prepare for the Test" paragraph. Put the airplane back to its usual condition after you completed all the necessary tests.
- C. For a complete OPERATIONAL TEST of the leading edge slat system, it is necessary to do these tests:
- Flap and Slat Primary Drives and Position Indicating System - Test (Ref 27-51-00/501)
  - Slat Alternate Power and Drive System - Test
  - Slat Failure Protection System - Test
- D. The slats are identified by the number 1 through 12, from the left wing to the right wing (Fig. 501).
- (1) The left and right inboard slats are identified by the number 6 and 7, and are moved by the inboard slat power drive unit (PDU) and drive.
  - (2) The outboard slats are identified by the numbers 1 through 5 for the left wing, and 8 through 12 for the right wing. All the outboard slats are moved by the outboard slat PDU and drive.
- E. During the extension of the inboard slats, all the torque tubes in the inboard slat drive turn clockwise as seen from the left side. The rotary actuator arms turn in the direction opposite to the torque tubes. The torque tubes are connected to the offset gearboxes for the inboard slat drive.

EFFECTIVITY

ALL

27-81-00

02

Page 501  
Aug 22/01

- F. During the extension of the outboard slats, all the torque tubes for the outboard slat drive turn counterclockwise as seen from the left side. The rotary actuator arms turn in the direction opposite to the torque tubes. The torque tubes are connected to the offset gearboxes for the outboard slat drive.
- G. These systems must operate correctly before the LE slat system can operate correctly:
  - LE Slat Position Indicating System
  - TE Flap System
  - TE Flap Position Indicating System
  - Proximity Switch Electronic Unit (PSEU)
  - Flap/Slat Electronic Unit (FSEU).
- H. For a test of the primary LE slat drive and the krueger seal flap drive, refer to the "Flap and Slat Primary Drives and Position Indicating Systems - Test" task in the Trailing Edge Flap System, AMM 27-51-00/501, procedure.
- I. The flaps and slats operate in a controlled sequence. The movement of the flaps and slats do not always occur at the same time. Refer to the system tests in AMM 27-51-00/501 to examine the flap movement and the flap position indicating system.
- J. Refer to AMM 27-88-00/501 for the system test of the slat sensor switches.
- K. Refer to AMM 31-51-00/501 for the system test of the slat takeoff warning system.
- L. Refer to AMM 27-81-00/601 for a system test of the flap/slat inhibit system (extend and retract interlock).

TASK 27-81-00-825-437

2. Leading Edge Slat System - Adjustment

A. General

- (1) This task contains the adjustment procedure for the leading edge (LE) slat drive system, which contains these topics:
  - Inboard Slat PDU
  - Outboard Slat PDU
  - Inboard Slat Drive
  - Outboard Slat Drive
  - Krueger Seal Flap Drive
- (2) To start one of these procedures, follow the instructions in the "Prepare for the Adjustment" topic before you do the applicable procedure to adjust the component. Follow the instructions in the "Put the Airplane Back to Its Usual Condition" topic after you completed the necessary adjustment procedures.

EFFECTIVITY

Apr 22/01

- (3) These conditions must be satisfactory before you can adjust the LE slat system in this procedure:
  - (a) The trailing edge (TE) flap system, the flap position transmitters, and the RVDTs on the flap control lever must be correctly adjusted (AMM 27-51-00/501).
  - (b) The LE slat sensor switches must be correctly adjusted (AMM 27-88-00/501).
- (4) The inboard slat drive must be correctly adjusted before you can adjust the Krueger seal flap drive on the left and the right wing.
- (5) It is necessary to adjust the two RVDTs in the inboard slat power drive unit (PDU) after you adjust the inboard slat PDU for the mechanical and hydraulic null.
- (6) It is necessary to adjust the two RVDTs in the outboard slat power drive unit (PDU) after you adjust the outboard slat PDU for the mechanical and hydraulic null.
- (7) To adjust the two RVDTs in the control unit of the inboard and outboard slat PDUs, it is necessary to remove the RVDTs (AMM 27-81-11/401).
- (8) Refer to AMM 27-81-01/401 to adjust the inboard slats for fit-and-fair and preload.
- (9) Refer to AMM 27-81-02/501 to adjust the outboard slats for fit-and-fair and preload.
- (10) Refer to AMM 27-81-04/201 for Krueger seal flap adjustment.
- (11) The inboard and outboard slat systems are adjusted correctly when all of these conditions agree:
  - (a) At the inboard slat PDU:
    - 1) You can install rig pin LE5 freely into the rig pin hole on the input cam after the slats are moved to the fully retracted position with hydraulic power (Detail C, Fig. 502).
    - 2) You can install rig pin LE6 freely into the rig pin hole on the follow-up cam after the slats are moved to the fully retracted position with hydraulic power (Detail D, Fig. 502).
  - (b) At the outboard slat PDU:
    - 1) You can install rig pin LE2 freely into the rig pin hole for the input cam after the slats are moved to the fully retracted position with hydraulic power (Detail B, Fig. 503). It is necessary to apply a 15-20 pound load to the pilot input arm in the direction of the input control rod to examine the fit of rig pin LE2.

- (g) When the krueger seal flaps are retracted with hydraulic power to the fully retracted position:
  - 1) The stop screw touches the krueger seal flap as shown (Fig. 508).
- (h) When the krueger seal flaps are extended with hydraulic power to the fully extended position:
  - 1) The links A, B, and C are aligned in a straight line as shown (Fig. 508).

**NOTE:** There are two possible positions to get the links A, B, and C to align. Make sure the links are aligned in position 1 (krueger seal flap fully extended), which is the correct position.

- (12) The airplane must be on the landing gear with all the engines or engine weights installed before you can do the flap drive system adjustment.

**B. Equipment**

- (1) Rig Pins from Set A20004-XX (AMM 20-10-24/201):
  - (a) LE2 - P/N A20004-9  
(for the outboard slat PDU adjustment)
  - (b) LE3 - P/N A20004-9  
(for the outboard slat PDU adjustment)
  - (c) LE4 - P/N A20004-73  
(for the outboard slat PDU adjustment)
  - (d) LE5 - P/N A20004-9  
(for the inboard slat PDU adjustment)
  - (e) LE6 - P/N A20004-9  
(for the inboard slat PDU adjustment)
- (2) Leading Edge Slat Groundlock - A27007-1  
(2 necessary)
- (3) Air Motor with a 1/2-inch Drive -  
Commercially Available
- (4) Adapter - Leading Edge Slat Drive - A27077-1
- (5) Shim: 0.075 ±0.003-inch thick (2 Necessary)
- (6) 50-Pound Weight
- (7) Force Gage (0-25 pounds)(0-111 newtons)
- (8) Rigging Gage (Outboard Leading Edge Slats) -  
A27089-9 (Recommended)
- (9) Circuit Breaker Lockout Clip  
(4 necessary) Commercially Available
- (10) TE Flap PDU Lock - A27009-7

**C. Consumable Materials**

- (1) D00013 Grease - MIL-PRF-23827  
(Supersedes MIL-G-23827) (Alternate)

E. Access

(1) Location Zones

- 144 Right MLG Wheel Well
- 211/212 Control Cabin
- 410 No.1 Power Plant
- 420 No.2 Power Plant
- 510/610 Wing Leading Edge - Inboard
- 520/620 Wing Leading Edge - Outboard
- 710 Nose Landing Gear and Doors
- 730/740 Left/Right Main Landing Gear and Doors

(2) Access Panels

- 511BB LE Slat Power Drive Unit - Outboard (Left)
- 611BB LE Slat Power Drive Unit - Inboard (Right)

F. Prepare for the Adjustment

S 215-001

- (1) Make sure the TE flap system, the flap position transmitters, the RVDTs on the flap control lever is correctly adjusted (AMM 27-51-00/501).

S 215-002

- (2) Make sure the slat sensor switches is correctly adjusted before you start this procedure (AMM 27-88-00/501).

EFFECTIVITY

ALL

**27-81-00**

01

Page 520  
Aug 22/01

S 215-003

- (3) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

S 495-004

**WARNING:** USE THE PROCEDURE IN AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (4) Open the doors for the landing gear and install the door locks (AMM 32-00-15/201).

S 045-005

**WARNING:** DO THE THRUST REVERSER DEACTIVATION PROCEDURE TO PREVENT THE OPERATION OF THE THRUST REVERSER. THE ACCIDENTAL OPERATION OF THE THRUST REVERSER CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (5) Do this procedure: Thrust Reverser Deactivation for Ground Maintenance (AMM 78-31-00/201).

S 215-006

- (6) Make sure the TE flaps and the LE slats are in the fully retracted position.

S 215-007

- (7) Make sure the flap control lever is in the zero (FLAPS UP) detent.

S 495-008

- (8) Attach a DO-NOT-OPERATE tag to the flap control lever.

S 865-009

- (9) Remove the power from the center hydraulic system (AMM 29-11-00/201).

S 495-010

- (10) Install the PDU lock in the TE flap power drive unit (PDU) (Fig. 510).

S 865-011

- (11) Open these circuit breakers on the overhead panel, P11, and install circuit breaker locks and DO-NOT-CLOSE tags:
- (a) 11H14, SLAT SHUTOFF
  - (b) 11H23, SLAT ALTN CONT INBD
  - (c) 11H24, SLAT ALTN CONT OUTBD
  - (d) 11J24, FLAPS ALTN CONT

S 865-012

- (12) Open these circuit breakers on the main power distribution panel, P6, and install circuit breaker locks and DO-NOT-CLOSE tags:
- (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6D24, ALTN FLAP PWR
  - (c) 6F24, ALTN SLAT OUTBD PWR

S 865-013

- (13) At the right main landing gear (MLG) wheel well, turn the manual override lever on the bypass valve for the TE flap PDU to the No. 1 (bypass) position.

S 495-014

- (14) Attach a DO-NOT-OPERATE tag to the manual override lever.

S 015-015

- (15) Remove the access panels, 511BB and 611BB, to get access to the inboard and outboard slat PDUs (AMM 06-44-00/201).

S 015-016

- (16) Remove the lower access panels for the leading edge when it is necessary to get access to the rotary actuators (AMM 06-44-00/201).

EFFECTIVITY

S 295-624

**WARNING:** DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

(17) Keep clean and free of all unwanted objects (FOD), the housing (can) assemblies of the slat main tracks, at all time.

G. Inboard Slat PDU Adjustment (Fig. 502)

S 495-017

(1) Hold the weight of each inboard slat with a support to prevent movement of the slats when you disconnect the torque tubes for the inboard slat drive.

**NOTE:** This is to keep the inboard slats in the adjusted position after you disconnect the torque tubes from the inboard slat PDU. It will be necessary to adjust the inboard slat drive if the inboard slats moved while the torque tubes are disconnected.

S 035-018

(2) Disconnect the torque tube on each side of the inboard slat PDU, (Detail B).

**NOTE:** Do not turn the torque tubes while it is disconnected. It will be necessary to adjust the inboard slat drive if you turn the torque tubes.

S 865-019

(3) At the outboard slat PDU, move the manual override lever on the bypass valve to the No. 1 (bypass) position (Detail B, Fig. 503).

S 495-020

(4) Install a DO-NOT-OPERATE tag to the manual override lever.

S 495-021

(5) Install the groundlock on the outboard slat PDU (Fig. 511).

S 035-022

(6) Remove the plugs from the inboard slat PDU to get access to the rig pin holes for the input cam (LE5) and the follow-up cam (LE6). (Details C and D, Fig. 502).

S 495-023

(7) Install rig pin LE5 in the input cam (Detail C, Fig. 502).

EFFECTIVITY

ALL

27-81-00

02

Page 526  
Apr 22/08

S 215-024

- (8) Make sure the adjustable end of the input control rod is attached to the pilot input arm (Detail C, Fig. 502).

NOTE: You can remove and install the input control rod to get the correct configuration if necessary.

S 035-025

- (9) Loosen the bolt that connects the input control rod to the pilot input arm, but do not remove the nut or bolt.

S 215-026

- (10) Do a check to see if you can turn the bolt easily with your hand.

S 435-027

- (11) If you can turn the bolt easily with your hand, tighten the nut.

S 825-028

- (12) If you cannot turn the bolt easily, do these steps to adjust the input control rod:
- (a) Remove the lockwire and loosen the jamnut on the input control rod.
  - (b) Turn the rod body to adjust the length of the input control rod, until you can turn the bolt freely in the pilot input arm.
  - (c) Make sure that you can see the threads at the adjustable end of the input control rod through the inspection hole.
  - (d) Tighten the control rod jamnut and install a lockwire.
  - (e) Connect the input control rod back to the pilot input arm with the bolt, washer, and nut, and tighten the nut.

S 095-029

- (13) Remove the rig pin LE5.

S 865-030

- (14) Open this circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:
- (a) 11H14, SLATS SHUTOFF VALVE

EFFECTIVITY

ALL

27-81-00

02

Page 527  
May 10/91

S 865-031

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (15) Pressurize the center hydraulic system (AMM 29-11-00/201) and permit the inboard slat PDU to become stable in the fully retracted position.

**NOTE:** It is usual for the output shaft to turn in the inboard slat PDU when you pressurize the center hydraulic system.

S 215-622

**CAUTION:** DO NOT FORCE THE RIG PIN LE6 INTO PLACE. ANY MOVEMENT OF THE FOLLOW-UP CAM CAN RESULT IN PDU MOVEMENT AND DAMAGE TO THE RVDT QUILL SHAFT WILL OCCUR, IF THE RIG PIN LE3 IS IN PLACE.

- (16) Do a check to see that you can install rig pin LE6 easily into the rig pin hole on the follow-up cam (Detail D, Fig. 502).

S 825-033

- (17) Adjust the inboard slat PDU for the mechanical and hydraulic null only if you cannot install rig pin LE6 easily into the rig pin hole.

S 825-034

- (18) Adjust the inboard slat PDU for mechanical null with these steps if necessary (Fig. 502):
- (a) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).
  - (b) Disconnect the control valve control rod from the control unit output arm (Detail C).

**NOTE:** You will release the fluid pressure lock in the control valve when you disconnect the control valve control rod from the output arm. This will permit you to turn the PDU output shafts to align the rig pin hole for rig pin LE6.

EFFECTIVITY

ALL

27-81-00

02

Page 528  
Aug 22/06

- (c) Turn the output shaft for the inboard slat PDU by small increments, until you can install rig pin LE6 freely.
- (d) After you install rig pin LE6, connect the control valve control rod to the control unit output arm.
- (e) Try to install rig pin LE7 in the control valve input arm (Detail C).
- (f) If you cannot install rig pin LE7 fully and easily, adjust the length of the control valve control rod with these steps:
  - 1) Remove the lockwire and loosen the jamnut at each end of the control rod.
  - 2) Turn the control rod body to adjust the rod length, until you can easily install rig pin LE7.

**NOTE:** The usual length of the rod before the final adjustment is 6.56 inches (166.6 mm).

- 3) Tighten the jamnuts on the control rod, but do not install the lockwires.

**NOTE:** It is possible that you will adjust the control valve control rod again during the hydraulic null adjustment.

- (g) Remove rig pins LE6 and LE7.

S 825-035

- (19) Adjust the inboard slat PDU for hydraulic null with these steps after you adjusted the PDU for mechanical null (Fig. 502):

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (a) Pressurize the center hydraulic system (AMM 29-11-00/201) and permit the inboard slat PDU to become stable in the fully retracted position.

**NOTE:** It is usual for the output shaft to turn in the inboard slat PDU when you pressurize the center hydraulic system.

EFFECTIVITY

ALL

27-81-00

02

Page 529  
Dec 22/01

**CAUTION:** DO NOT DISCONNECT THE CONTROL VALVE CONTROL ROD TO DO THE ROD ADJUSTMENT WHILE THE CENTER HYDRAULIC SYSTEM IS PRESSURIZED. DO NOT ADJUST THE CONTROL ROD WITH THE RIG PIN LE6 INSTALLED. ADJUST THE CONTROL ROD ONLY BY SMALL INCREMENTS TO AVOID DAMAGE TO THE INBOARD SLAT PDU.

**CAUTION:** DO NOT FORCE THE RIG PIN LE6 INTO PLACE. ANY MOVEMENT OF THE FOLLOW-UP CAM CAN RESULT IN PDU MOVEMENT AND DAMAGE TO THE RVDT QUILL SHAFT WILL OCCUR, IF THE RIG PIN LE3 IS IN PLACE.

- (b) Try to install rig pin LE6 into the rig pin hole for the follow-up cam (Detail D).
- (c) If you cannot install rig pin LE6 easily, adjust the control valve control rod with these steps:

**NOTE:** Do not adjust the control rod while rig pin LE6 is installed. Install rig pin LE6 only to make sure that the control rod is adjusted correctly.

- 1) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).
- 2) Loosen the jamnut at each end of the control valve control rod.
- 3) Turn the control rod to adjust the rod length until you can easily install rig pin LE6.

**NOTE:** It is not necessary to install rig pin LE7 (or LE4) for this adjustment.

- 4) Tighten the jamnut at each end of the control rod.
- 5) Install lockwires to the jamnuts with the double twist procedure (AMM 20-10-23/401).

S 095-036

- (20) If installed, remove rig pin LE6 and install the plug in the rig pin hole.

EFFECTIVITY

ALL

27-81-00

Aug 22/06

S 865-037

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

(21) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 865-038

(22) Remove the DO-NOT-OPERATE tag from the flap control lever, and move the lever to the 1-unit detent.

S 865-039

(23) Permit the inboard slat PDU to operate until it stops.

S 865-040

(24) Move the flap control lever to the zero (FLAPS UP) detent, and permit the inboard slat PDU to operate until it stops.

S 495-041

(25) Attach a DO-NOT-OPERATE tag to the flap control lever.

S 825-042

(26) If it is necessary to adjust the inboard slat drive, you can go directly to the "Inboard Slat Drive Adjustment" paragraph from this step. Continue with the subsequent steps only if the inboard slat drive adjustment is correct.

S 865-043

(27) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).

S 095-044

(28) Remove the groundlock from the outboard slat PDU (Fig. 511).

S 095-045

(29) Remove the PDU lock from the TE flap PDU (Fig. 510).

S 865-046

(30) Remove the DO-NOT-OPERATE tag from manual override lever on the TE flap PDU and move the override lever to the No. 2 (normal) position.

EFFECTIVITY

ALL

27-81-00

02

Page 531  
Aug 22/06

S 865-047

- (31) Remove the DO-NOT-OPERATE tag from the manual override lever on the outboard slat PDU, and move the override lever to the No. 2 (normal) position (Detail B, Fig. 503).

S 215-048

- (32) Make sure the inboard slats are in the fully retracted position.

S 825-049

- (33) Do these steps if the inboard slats are not in the fully retracted position, or have accidentally moved during the PDU adjustment:
- (a) Turn the torque tubes adjacent to inboard slat PDU to retract the inboard slats to the fully retracted position, with one of the two procedures that follow:
- 1) PROCEDURE A: Turn the torque tube by hand.
  - 2) PROCEDURE B: Turn the torque tube with an air motor and adapter A27077 (AMM 27-81-00/201).

NOTE: It is not necessary to move the manual override lever to the bypass position (No. 1) on the inboard slat PDU when you do this step.

S 225-050

- (34) At the inboard rotary actuator of the slats No. 6 and 7, do a check on the retract overtravel stop clearances and make sure the clearances are correct as shown (Detail A, Fig. 506).

S 825-051

- (35) If the clearance is not correct, adjust the inboard slat drive with the instructions given in the "Inboard Slat Drive Adjustment" paragraph.

S 435-052

- (36) Hold the torque tubes in the adjusted position while you connect them to each side of the inboard slat PDU (AMM 27-81-24/401).

NOTE: Try not to turn the torque tubes while you connect them to the PDU. It will be necessary to adjust the inboard slat drive if you turn the torque tube out of the correct adjustment.

S 095-053

- (37) If installed, remove the supports for the inboard slats.

S 825-054

- (38) Adjust the RVDTs in the control unit of the inboard slat PDU if you adjusted the PDU for mechanical or hydraulic null (AMM 27-81-11/401).

EFFECTIVITY

ALL

27-81-00

02

Page 532  
Aug 22/06

S 865-055

(39) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:

(a) 11H14, SLATS SHUTOFF VALVE

H. Outboard Slat PDU Adjustment (Fig. 503)

S 295-625

**WARNING:** DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

(1) Keep clean and free of all unwanted objects (FOD), the housing (can) assemblies of the slat main tracks, at all time.

S 495-056

(2) Hold the weight of the outboard slats on the left and right wing with some supports to prevent movement of the slats after you disconnect the torque tube.

**NOTE:** This is to keep the outboard slats in the adjusted position after you disconnect the torque tubes from the outboard slat PDU. It will be necessary to adjust the outboard slat drive if the outboard slats moved while the torque tubes are disconnected.

S 035-057

(3) Disconnect the torque tube on each side of the outboard slat PDU (Detail A).

S 865-058

(4) At the inboard slat PDU, move the manual override lever on the bypass valve to the No. 1 (bypass) position (Detail C, Fig. 502).

S 495-059

(5) Attach a DO-NOT-OPERATE tag to the manual override lever.

S 495-060

(6) Install the groundlock on the inboard slat PDU (Fig. 511).

S 035-061

(7) Remove the plugs on the outboard slat PDU to get access to the rig pin holes for the input cam (LE2) and the follow-up cam (LE3) (Detail B and D, Fig. 503).

S 035-063

(8) Loosen the bolt that connects the input control rod to the pilot input arm, but do not remove the nut or bolt (Detail B, Fig. 503).

EFFECTIVITY

ALL

27-81-00

02

Page 533  
Apr 22/08

S 495-064

- (9) Use a force gage to apply 15-20 pound (66.7-88.9 newton) load to the input control rod along the centerline of the rod, to the inboard direction (to remove backlash).

S 215-065

- (10) Make sure that you can easily turn the bolt that connects the input control rod to the pilot input arm while you apply the load to the input control rod.

S 495-062

- (11) With the load applied in the previous steps, install rig pin LE2 into the rig pin hole on the input cam.

S 825-066

**CAUTION:** DO NOT ADJUST THE SUPPORTS FOR THE OUTBOARD SLAT PDU TO MAKE ALLOWANCE FOR THE SHORT LENGTH OF THE INPUT CONTROL ROD. THE TORQUE TUBES WILL NOT ALIGN CORRECTLY AND CAUSE SLAT ASYMMETRY, WHICH WILL INCREASE TORQUE TUBE WEAR IF YOU CHANGE THE ADJUSTMENT ON THE PDU SUPPORTS.

- (12) If you cannot turn the bolt easily or to install rig pin LE2 freely, do these steps to adjust the input control rod:
- (a) If the input control rod is adjustable at one end only, make sure that you can see the threads at the adjustable end through the inspection hole.
  - (b) Do these steps only if the input control rod is adjustable at the two ends of the rod:
    - 1) Make sure the adjustable end without the lockwire is connected to the pilot input arm.
    - 2) If it is necessary to adjust the rod end with the lockwire (away from the pilot input arm), remove the lockwire and loosen the jamnut to adjust the rod.

**NOTE:** Do not adjust the control rod shorter than 1.25 inches between the centerline of the rod end bolt hole and the nearest end of the control rod barrel.

- 3) Make sure that you can see the threads through the inspection holes at the two adjustable ends of the control rod.
- (c) Tighten the jamnut at the end(s) of the control rod that you adjusted.
- (d) Safety the jamnut with a lockwire at the rod end that is away from the pilot input arm.

S 435-067

- (13) Connect the input control rod back to the pilot input arm with the bolt, washer, and nut. Tighten the nut.

EFFECTIVITY

ALL

27-81-00

02

Page 534  
Apr 22/08

S 095-068

- (14) Remove rig pin LE2 from the input cam.

S 865-069

- (15) Open this circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:  
(a) 11H14, SLATS SHUTOFF VALVE

S 215-070

- (16) Make sure the flap control lever is in the zero (FLAPS UP) detent.

S 865-071

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (17) Pressurize the center hydraulic system (AMM 29-11-00/201) and permit the outboard slat PDU to become stable in the fully retracted position.

**NOTE:** It is usual for the output shaft to turn in the outboard slat PDU when you pressurize the center hydraulic system.

S 215-623

**CAUTION:** DO NOT FORCE THE RIG PIN LE3 INTO PLACE. ANY MOVEMENT OF THE FOLLOW-UP CAM CAN RESULT IN PDU MOVEMENT AND DAMAGE TO THE RVDT QUILL SHAFT WILL OCCUR, IF THE RIG PIN LE3 IS IN PLACE.

- (18) Do a check to see that you can install rig pin LE3 easily into the rig pin hole on the follow-up cam (Detail D, Fig. 503).

S 825-073

- (19) Adjust the outboard slat PDU for mechanical and hydraulic null only if you cannot install rig pin LE3 easily into the rig pin hole.

S 825-074

(20) Adjust the outboard slat PDU for mechanical null with these steps if necessary (Fig. 503):

- (a) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).
- (b) Disconnect the control valve control rod from the control unit output arm (Detail B).

NOTE: You will release the fluid pressure lock in the control valve when you disconnect the control valve control rod from the output arm. This will permit you to turn the PDU output shafts to align the rig pin hole for rig pin LE3.

- (c) Turn the output shaft on the outboard slat PDU by small increments, until you can install rig pin LE3 freely.
- (d) After you install rig pin LE3, connect the control valve control rod back to the control unit output arm.
- (e) Try to install rig pin LE4 in the control valve input arm (Detail B).
- (f) If you cannot install rig pin LE4 fully and easily, adjust the length of the control valve control rod with these steps:
  - 1) Remove the lockwire and loosen the jamnut at each end of the control rod.
  - 2) Turn the control rod body to adjust the rod length, until you can easily install rig pin LE4.

NOTE: The usual length of the rod before the final adjustment is 6.56 inches (166.6 mm).

- 3) Tighten the jamnuts on the control rod, but do not install the lockwires.

NOTE: It is possible that you will adjust the control valve control rod again during the hydraulic null adjustment.

- (g) Remove rig pins LE3 and LE4.

S 825-075

(21) Adjust the outboard slat PDU for hydraulic null with these steps after you adjusted the PDU for mechanical null (Fig. 503):

Apr 22/08

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (a) Pressurize the center hydraulic system (AMM 29-11-00/201) and permit the outboard slat PDU to become stable in the fully retracted position.

**NOTE:** It is usual for the output shaft to turn in the outboard slat PDU when you pressurize the center hydraulic system.

**CAUTION:** DO NOT DISCONNECT THE CONTROL VALVE CONTROL ROD TO DO THE ROD ADJUSTMENT WHILE THE CENTER HYDRAULIC SYSTEM IS PRESSURIZED. DO NOT ADJUST THE CONTROL ROD WITH THE RIG PIN LE3 INSTALLED. ADJUST THE CONTROL ROD ONLY BY SMALL INCREMENTS TO AVOID DAMAGE TO THE OUTBOARD SLAT PDU.

**CAUTION:** DO NOT FORCE THE RIG PIN LE3 INTO PLACE. ANY MOVEMENT OF THE FOLLOW-UP CAM CAN RESULT IN PDU MOVEMENT AND DAMAGE TO THE RVDT QUILL SHAFT WILL OCCUR, IF THE RIG PIN LE3 IS IN PLACE.

- (b) Try to install rig pin LE3 into the rig pin hole for the follow-up cam (Detail D).  
(c) If you cannot install rig pin LE3 easily, adjust the control valve control rod with these steps:

**NOTE:** Do not adjust the control rod while rig pin LE3 is installed. Install rig pin LE3 only to make sure that the control rod is adjusted correctly.

- 1) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).
- 2) Loosen the jamnut at each end of the control valve control rod.

EFFECTIVITY

ALL

- 3) Turn the control rod to adjust the rod length until you can easily install rig pin LE3.

**NOTE:** It is not necessary to install rig pin LE4 for this adjustment.

- 4) Tighten the jamnut on each end of the control rod.
- 5) Install lockwires to the jamnuts with the double twist procedure (AMM 20-10-23/401).

S 095-076

- (22) If installed, remove rig pin LE3 and install the plug in the rig pin hole.

S 865-077

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (23) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 865-078

- (24) Remove the DO-NOT-OPERATE tag from the flap control lever and move the lever to the 25-unit detent.

S 865-079

- (25) Permit the outboard slat PDU to operate until it stops.

S 865-080

- (26) Move the flap control lever to a position near the 20-unit detent as shown (Detail C, Fig. 503). Do not move the lever over this detent position.

S 865-081

- (27) Permit the outboard slat PDU to operate until it stops.

S 865-082

- (28) Move the flap control lever to the zero (FLAPS UP) detent and permit the outboard slat PDU to operate until it stops.

S 495-083

- (29) Attach a DO-NOT-OPERATE tag to the flap control lever.

EFFECTIVITY

ALL

27-81-00

Apr 22/08

S 825-084

- (30) If it is necessary to adjust the outboard slat drive, you can go directly to the "Outboard Slat Drive Adjustment" paragraph from this step. Continue with the subsequent steps only if the outboard slat drive adjustment is correct.

S 865-085

- (31) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).

S 095-086

- (32) Remove the groundlock from the inboard slat PDU (Fig. 511).

S 095-087

- (33) Remove the PDU lock from the TE flap PDU (Fig. 510).

S 865-088

- (34) Remove the DO-NOT-OPERATE tag from manual override lever on the TE flap PDU, and move the override lever to the No. 2 (normal) position.

S 865-089

- (35) Remove the DO-NOT-OPERATE tag from the manual override lever on the inboard slat PDU, and move the override lever to the No. 2 (normal) position (Detail C, Fig. 502).

S 215-090

- (36) Make sure the outboard slats are in the fully retracted position.

S 825-091

- (37) Do these steps if the outboard slats are not in the fully retracted position, or have accidentally moved during the PDU adjustment:
- (a) Turn the torque tubes adjacent to the outboard slat PDU to retract the outboard slats to the fully retracted position, with one of the two procedures that follow:
    - 1) PROCEDURE A: Turn the torque tube by hand.
    - 2) PROCEDURE B: Turn the torque tube with an air motor and adapter A27077 (AMM 27-81-00/201).

NOTE: It is not necessary to move the manual override lever to the bypass position (No. 1) on the outboard slat PDU when you do this step.

S 225-092

- (38) At the inboard rotary actuator of the slats No. 5 and 8, do a check on the retract overtravel stop clearances and make sure the clearances are correct as shown (Detail B, Fig. 506).

EFFECTIVITY

ALL

27-81-00

02

Page 539  
Apr 22/08

S 825-093

- (39) If the clearance is not correct, adjust the outboard slat drive with the instructions given in the "Outboard Slat Drive Adjustment" paragraph.

S 435-094

- (40) Hold the torque tubes in the adjusted position while you connect them to each side of the outboard slat PDU (AMM 27-81-24/401).

**NOTE:** Try not to turn the torque tubes while you connect them to the PDU. It will be necessary to adjust the outboard slat drive if you turn the torque tube out of the correct adjustment.

S 095-095

- (41) If installed, remove the supports for the outboard slats.

S 825-096

- (42) Adjust the RVDTs in the control unit of the outboard slat PDU if you adjusted the PDU for mechanical or hydraulic null (AMM 27-81-11/401).

S 865-097

- (43) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:

(a) 11H14, SLATS SHUTOFF VALVE

I. Inboard Slat Drive Adjustment (Slats No. 6 and 7) (Fig. 504)

S 295-626

**WARNING:** DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

- (1) Keep clean and free of all unwanted objects (FOD), the housing (can) assemblies of the slat main tracks, at all time.

S 825-098

- (2) Make sure the inboard slat PDU is correctly adjusted before you start this procedure.

EFFECTIVITY

ALL

27-81-00

Page 540  
Apr 22/08

S 035-099

- (3) Disconnect the slat control rod from the actuator arm at the two rotary actuators on slats No. 6 and 7 (left and right inboard slats).

NOTE: Do not change the length of the control rods during or after you disconnect the control rods.

S 985-100

- (4) Move each inboard slat (left and right) forward to extend the slats along its tracks, until the slats stop against the emergency down stops.

S 495-101

- (5) Use rope to hold the slat control rods to the inboard slat, and to clear away from the movement of the rotary actuator arms.

NOTE: Each actuator arm must be free to move between the retract and the extend positions.

S 035-102

- (6) Disconnect the torque tube from each side of the inboard slat PDU (Fig. 502).

S 035-103

- (7) Disconnect the torque tube from the outboard side of the inboard offset gearbox for the left and right inboard slats (AMM 27-81-24/401).

NOTE: This will permit you to manually turn each torque tube independently to adjust the inboard slat drive.

S 035-104

- (8) Disconnect the drive shaft for the krueger seal flap drive at each (left and right) outboard rotary actuator of the inboard slat (Fig. 507).

S 035-105

- (9) Remove the sleeve from each drive shaft.

S 865-106

- (10) Permit the krueger seal flaps to move forward against the stops.

S 985-107

- (11) Keep the disconnected drive shafts for the krueger seal flaps away from the movement of the inboard slats when you extend and retract the slats.

EFFECTIVITY

Apr 22/08

S 985-108

- (12) Turn the input shaft on each offset gearbox by hand until the rotary actuator arm touches the retract overtravel stop (Fig. 506).

S 435-109

- (13) At each rotary actuator on the inboard slats, keep the actuator arm against the retract overtravel stop and connect the torque tube back to the outboard side of the inboard offset gearbox (AMM 27-81-24/401). Do the steps that follow:
- (a) Apply 10 to 15 pound-inches (1.1-1.7 newton-meters) torque to the offset gearbox to remove the gearbox freeplay and keep the actuator arm against the retract stop.
  - (b) Turn the torque tube to the nearest distance possible to align the spline teeth on the coupling when you connect the torque tube ( $\pm 1/2$  tooth).

S 985-110

- (14) Turn the disconnected torque tubes nearest to the inboard slat PDU to the extend direction, until you can get access to the retract overtravel stops for the inboard slats (approximately 25-30 turns).

S 495-111

- (15) Put a shim of 0.075 +/- 0.003 inch (1.90 +/- 0.0762 mm) thick between the retract overtravel stop and the actuator arm (Detail A, Fig. 506), at each inboard rotary actuator of slats No. 6 and 7.

S 985-112

- (16) Turn the disconnect torque tube on each side of the inboard slat PDU to the retract direction, until the shim is held tightly between the actuator arm and the retract overtravel stop.

**NOTE:** Do not apply more than 50 pound-inches (5.65 newton-meters) of torque to the torque tube.

S 495-113

- (17) Install the groundlock to the outboard slat PDU (Fig. 511).

S 865-114

- (18) Move the manual override lever on the outboard slat PDU to the No. 1 (bypass) position (Detail B, Fig. 503).

S 495-115

- (19) Attach a DO-NOT-OPERATE tag to the manual override lever.

S 035-171

- (8) Disconnect at least one torque tube between each offset gearbox in the outboard slat drive.

NOTE: This will permit you to manually turn each torque tube independently to the adjust the outboard slat drive.

S 985-172

- (9) Turn the input shaft on each offset gearbox by hand until the actuator arm touches the retract overtravel stop (Detail B, Fig. 506).

S 435-173

- (10) Start from the outboard (slats No. 1 and 12) to the inboard direction, connect the torque tubes back to each offset gearbox for the outboard slats drive while you keep the actuator arms against the retract overtravel stops (AMM 27-81-24/401). Do the steps that follow:
- (a) Apply 10 to 15 pound-inches torque (1.12-1.69 newton-meters) to each offset gearbox to remove the gearbox freeplay and to keep each actuator arm against the retract stop.
  - (b) Turn the torque tube to the nearest distance possible to align the spline teeth on the coupling when you connect the torque tube ( $\pm 1/2$  tooth).

S 985-174

- (11) Turn the disconnected torque tube nearest to the outboard slat PDU to the extend direction, until you can get access to the retract overtravel stops at slats No. 5 and 8 (approximately 25-30 turns).

S 495-175

- (12) Put a shim of 0.075  $\pm$ 0.003 inch (1.905  $\pm$  0.0762 mm) thick between the retract overtravel stop and the actuator arm (Detail B, Fig. 506), at each inboard rotary actuator on slats No. 5 and 8.

S 985-176

- (13) Turn the disconnected torque tube on each side of the inboard slat PDU to the retract direction, until each shim is held tightly between the inboard actuator arm and the retract overtravel stop.

NOTE: Do not apply more than 50 pound-inches (5.65 newton-meters) of torque to the torque tubes.

S 495-177

- (14) Install the groundlock to the inboard slat PDU (Fig. 511).

Page 550  
Apr 22/08

S 865-178

- (15) Move the manual override lever on the inboard slat PDU to the No. 1 (bypass) position (Detail C, Fig. 502).

S 495-179

- (16) Attach a DO-NOT-OPERATE tag to the manual override lever on the inboard slat PDU.

S 865-180

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (17) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 095-181

- (18) Remove the DO-NOT-OPERATE tag from the flap control lever.

S 865-182

- (19) Move the flap control lever to the 1-unit detent, and permit the outboard slat PDU to operate until it stops.

S 865-183

- (20) Move the flap control lever to the zero (FLAPS UP) detent, and permit the outboard slat PDU to operation until it stops.

**NOTE:** Stop for one minute before you do the next step.

S 495-184

- (21) Attach a DO-NOT-OPERATE tag to the flap control lever.

S 865-185

- (22) Remove the power from the center hydraulic system (AMM 29-11-00/201).

S 495-186

- (23) Install the groundlock in the outboard slat PDU (Fig. 511).

EFFECTIVITY

ALL

27-81-00

Apr 22/08

S 865-235

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

(5) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 095-236

(6) Remove the DO-NOT-OPERATE tag from the flap control lever.

S 865-237

(7) Move the flap control lever to the 30-unit detent, and make sure the inboard slats move to the fully extended position.

S 495-238

(8) Attach a DO-NOT-OPERATE tag to the flap control lever.

S 865-239

(9) Remove the power from the center hydraulic system (AMM 29-11-00/201).

S 495-240

(10) Install the groundlock in the inboard slat PDU (Fig. 511).

S 035-241

(11) If not done before, disconnect the drive shaft for the krueger seal flap drive at the universal joint, adjacent to the outboard rotary actuator of slats No. 6 and 7 (left and right inboard slats) (View A-A, Fig. 507).

EFFECTIVITY

ALL

27-81-00

02

Page 557  
Apr 22/01

S 035-242

- (12) Remove the sleeve from the drive shaft.

S 825-243

**CAUTION:** MAKE SURE THE KRUEGER SEAL FLAP IS FULLY EXTENDED, AND THAT THE JOINTS A, B, AND C IS STRAIGHT WHILE THE FLAP DRIVE LINK IS IN POSITION 1, AS SHOWN IN FIG. 508. YOU CAN CAUSE DAMAGE TO THE KRUEGER SEAL FLAP DRIVE IF YOU ADJUST THE KRUEGER SEAL FLAP WHEN THE FLAP DRIVE LINK IS IN POSITION 2.

- (13) Move the krueger flap drive mechanism to align joints A, B, and C to a straight line while you move the flap drive link to position 1. Keep this position while you do the adjustments that follow (Detail A, Fig. 508):

**NOTE:** The position 1 is the correct position for maximum flap extension.

- (a) Disconnect the bull nose control rod at joint D (View A-A).
- (b) Remove the lockwire on the jamnut and adjust the length of the bull nose control rod to get the correct dimension as shown (Detail A).
- (c) Tighten control rod jamnut to 90-125 pouzd-inches (10.2-14.1 newton-meters), and install a lockwire with the double twist procedure (AMM 20-10-23/401).
- (d) Apply a light layer of MIL-PRF-23827 grease to the bolt for the bull nose control rod.
- (e) Connect the bull nose control rod at joint D with the bolt, washers, and nut. Tighten the nut to 50-75 pound-inches (5.65-8.47 newton-meters).

S 035-244

- (14) Disconnect joint E in the krueger seal flap mechanism (View B-B, Fig. 508).

**NOTE:** This will permit you to manually close the krueger seal flap.

S 825-245

- (15) Adjust the stop screw to get the flap to align with the fixed leading edge while the stop screw touches the retainer as shown (Detail B and View C-C, Fig. 508).

**NOTE:** Align the surface by  $\pm 0.02$  inch ( $\pm 0.50$  mm) for at least 25% of any edge, and by  $\pm 0.04$  inch ( $\pm 1.0$  mm) for a distance of no more than 25% of any edge.

EFFECTIVITY

D. Test for the Slat Alternate Power and Drive System (Fig. 501)

**NOTE:** When you read the flap position indicator, a tolerance of 1/32 of an inch is permitted on the L and R needle positions.

S 865-604

- (1) Make sure the EICAS messages on the EICAS display and the amber LEADING EDGE light on P3 come on only when it is shown in the test instruction.

S 865-601

**CAUTION:** DO NOT OPERATE THE ALTERNATE DRIVE MOTOR CONTINUOUSLY FOR MORE THAN 4 MINUTES. DO NOT OPERATE THE MOTOR AGAIN UNTIL IT IS COOL FOR AT LEAST 20 MINUTES TO PREVENT DAMAGE TO THE MOTOR.

**CAUTION:** WHILE USING THE ALTERNATE OR THE PRIMARY METHOD TO OPERATE THE LEADING EDGE SLAT DRIVE SYSTEM, MAKE SURE THE SAME METHOD IS USED UNTIL THE CYCLE IS COMPLETED. QUICK TRANSITION OF THE LEADING EDGE SLAT DRIVE SYSTEM FROM THE ALTERNATE MODE TO THE PRIMARY MODE CAN CAUSE INTERNAL FAILURE OF THE ALTERNATE DRIVE MOTOR.

- (2) Get visual assistance from another person to make sure the alternate drive motors shut off when the slats stop moving.

S 865-286

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (3) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 865-287

- (4) Push the arming switch for the slat alternate drive to arm the slat alternate drive (ALTN switch light comes on at the LE side).

ALL

27-81-00

02

Page 565  
Dec 22/03

S 215-288

- (5) Make sure that these conditions occur in seven seconds after you push the arming switch:
- (a) The amber LEADING EDGE light (on P3) comes on.
  - (b) This EICAS message, LE SLAT DISAGREE, shows on the EICAS display.

S 865-289

- (6) Move the flap control lever to the 1-unit detent, and make sure the inboard and outboard slats do not move.

S 865-290

- (7) Move the flap control lever to the zero (FLAPS UP) detent.

S 865-291

- (8) Remove the power from the center hydraulic system (AMM 29-11-00/201).

S 865-292

**CAUTION:** DO NOT OPERATE THE ALTERNATE DRIVE MOTOR CONTINUOUSLY FOR MORE THAN 4 MINUTES. DO NOT OPERATE THE MOTOR AGAIN UNTIL IT IS COOL FOR AT LEAST 20 MINUTES TO PREVENT DAMAGE TO THE MOTOR.

**CAUTION:** WHILE USING THE ALTERNATE OR THE PRIMARY METHOD TO OPERATE THE LEADING EDGE SLAT DRIVE SYSTEM, MAKE SURE THE SAME METHOD IS USED UNTIL THE CYCLE IS COMPLETED. QUICK TRANSITION OF THE LEADING EDGE SLAT DRIVE SYSTEM FROM THE ALTERNATE MODE TO THE PRIMARY MODE CAN CAUSE INTERNAL FAILURE OF THE ALTERNATE DRIVE MOTOR.

- (9) Turn the position selector switch for the flap/slat alternate drive to the 1-unit detent and do these checks:
- (a) Make sure the amber LEADING EDGE light goes off.
  - (b) Make sure the EICAS message, LE SLAT DISAGREE, does not show on the EICAS display.
  - (c) While the slats move, make sure the L and R needles on the flap position indicator (on P3) move to a position between the UP and 1-unit marks.
  - (d) After the slats stop at the intermediate position, make sure the L and R needles point to the 1-unit mark on the flap position indicator.

S 865-294

- (10) Turn the position selector switch for the flap/slat alternate drive to the 5, 15, and 20-unit detents. Stop at each detent to make sure the slats do not move.

S 865-295

- (11) Turn the position selector switch to the 25-unit detent, and make sure the slats move to the fully extended position.

S 865-296

- (12) Turn the position selector switch to the 30-unit detent, and make sure the slats stay in the fully extended position.

S 865-297

- (13) Turn the position selector switch to the 20-unit detent, and make sure the slats move to the intermediate position.

S 865-298

- (14) Turn the position selector switch to the 15, 5, and 1-unit detents. Stop at each detent to make sure the slats do not move.

S 865-299

- (15) Turn the position selector switch to the UP detent to move the slats to the fully retracted position, and do these checks:
- (a) While the slats move, make sure the L and R needles on the flap position indicator move to a position between the UP and 1-unit marks.
  - (b) When the slats stop at the fully retracted position, make sure the L and R needles point to the UP mark on the flap position indicator.

NOTE: The slat movement will not be as accurate when the slats are retracted with the alternate electric power.

S 865-303

- (16) Turn the rotary position selector switch for the slat alternate drive to the NORM detent, and make sure these conditions occur after 7 seconds:
- (a) The amber LEADING EDGE light (on P3) comes on.

F. Test for the Inboard Slat Asymmetry Protection (Fig. 509)

S 865-307

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (1) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 865-308

- (2) Move the flap control lever to the 25-unit detent and permit the slats to move to the fully extended position.

S 495-309

- (3) Attach a DO-NOT-OPERATE tag to the flap control lever.

S 865-310

- (4) Remove the power from the center hydraulic system (AMM 29-11-00/201).

S 015-311

- (5) Remove the access panels, 511BB and 611BB, to get access to the outboard and inboard slat power drive units (PDUs) (AMM 06-44-00/201).

S 495-312

- (6) Install the groundlocks on the inboard and outboard slat PDUs (Fig. 511).

S 495-314

- (7) Do one of the two steps that follow to isolate the sensor switch (S281) from the retract target:
- (a) Remove the access panel (Ref 06-44-00), 511FB, to get access to the sensor switch, S281, on slat No. 6 (Detail D, Fig. 509). Attach the deactuator tool (or the aluminum shim) to the sensor switch (S281).

**NOTE:** You can use double-sided tape to attach the deactuator to the sensor switch.

EFFECTIVITY

ALL

27-81-00

06

Page 571  
Apr 22/04

- (b) Attach the deactuator tool (or the aluminum shim) to the face of the retract target on the inboard auxiliary arm of slat No. 6 (Detail D, Fig. 509).

NOTE: You can use double sided tape to attach the deactuator to the retract target.

S 095-315

- (8) Remove the groundlocks from the inboard and outboard slat PDUs (Fig. 511).

S 865-316

WARNING: KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

CAUTION: MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (9) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 095-317

- (10) Remove the DO-NOT-OPERATE tag from the flap control lever.

S 865-318

- (11) Move the flap control lever to the zero (FLAPS UP) detent and do these checks:

NOTE: If you removed the access panel, 511 FB, to get access to the sensor switch, S281, on slat No. 6 and attached the deactuator tool or the aluminum shim to the sensor switch (S281), then the lights and messages called out in the next steps will already be on. The slats move or do not move to the retracted position.

- (a) Make sure the amber LEADING EDGE light (on P3) comes on (Fig. 501).  
(b) Make sure this EICAS message, LE SLAT ASYM, shows on the EICAS display.

S 865-319

- (12) Turn the COMPUTER switch on the EICAS DISPLAY select panel to the R position and make sure the LE SLAT ASYM message shows on the EICAS display.

EFFECTIVITY

ALL

27-81-00

06

Page 572  
Apr 22/04

S 865-320

- (13) Turn the COMPUTER switch back to the L position and stop for 10 seconds before you continue with the subsequent step.

S 865-321

- (14) Move the flap control lever to the 1-unit detent and do these checks:

NOTE: The outboard slats move (if a -53 or older FSEU is installed) or not move (if a -63 or newer FSEU is installed) to the intermediate position.

- (a) Make sure the inboard slats (No. 6 and 7) do not move.

NOTE: It is normal that the inboard slats move slightly. This is due to the transition of the bypass valve in the power drive unit.

S 865-608

- (15) Move the alternate flap selector switch to the 1-unit position and make sure the inboard slats do not move toward the 1-unit position.

NOTE: If the inboard slats move toward the 1-unit position, it is an indication that the arming relay K226 is failing in the energized state and needs replacement.

S 865-609

- (16) Move the alternate flap selector switch to the NORM position.

S 865-610

WARNING: KEEP PERSONS AND EQUIPMENT AWAY FROM THE OUTBOARD SLATS IN THE SUBSEQUENT STEP. THE OUTBOARD SLATS CAN MOVE TO THE INTERMEDIATE POSITION AND CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (17) Open this circuit breaker on the P11 panel and attach a DO-NOT-CLOSE tag:

- (a) 11C16, FLAP SLAT ELEC UNIT 1 CONT

S 215-325

- (18) Make sure the manual override lever on the inboard slat PDU is in the No. 1 (bypass) position (Detail C, Fig. 502).

S 215-326

- (19) Make sure the manual override lever on the outboard slat PDU is in the No. 2 (normal) position (Detail B, Fig. 503).

EFFECTIVITY

ALL

27-81-00

Aug 22/08

S 865-631

- (21) Move the flap control lever to the 25-unit detent to move the slats to the fully extended position.

S 495-632

- (22) Attach a DO-NOT-OPERATE tag to the flap control lever.

S 865-364

- (23) Remove power from the center hydraulic system (AMM 29-11-00/201).

S 095-365

- (24) Remove the deactuator (or the aluminum shim) from the sensor switch or the retract target.

S 865-367

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (25) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 865-368

- (26) Move the flap control lever to the zero (FLAPS UP) detent.

S 865-369

- (27) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:  
(a) 11C16, FLAP SLAT ELEC UNIT 1 CONT

S 215-370

- (28) Make sure the amber LEADING EDGE light is off.

S 215-371

- (29) Make sure the EICAS message, LE SLAT ASYM, does not show on the EICAS display.

S 215-372

- (30) Make sure the L and R needles point to the UP mark on the flap position indicator.

MAINTENANCE MANUAL

- (f) When the LE SLAT DISAGREE message shows on the EICAS display, do the steps that follow:
- 1) Push the STAT button on the engine display panel located on the center aisle stand to show status messages on the bottom EICAS display.

NOTE: The FLAP/SLAT ELEC and SLAT ISLN VAL messages are possibly shown on the bottom EICAS display because the circuit breaker SLAT SHUTOFF VALVE is open.

- 2) Make sure that the LE SLAT SHUTDOWN message shows on the bottom EICAS display.
- 3) Turn the COMPUTER switch on the EICAS DISPLAY select panel to the R position, and make sure the EICAS messages stay on the EICAS display.

S 435-386

- (12) Move the pilot input arm back to the initial position and connect the input control rod to the pilot input arm with the bolt, washer, and nut (Detail C, Fig. 502).

NOTE: Do not change the length of the input control rod. Keep the the flap control lever in the zero (FLAPS UP) detent when you install the bolt.

S 095-387

- (13) Remove the DO-NOT-OPERATE tag from the flap control lever.

S 865-388

- (14) Move the flap control lever to the 1-unit detent, and make sure the outboard slats move to the intermediate position.

S 865-389

- (15) Push the arming switch (on P3) for the slat alternate drive to arm the slat alternate drive (ALTN switch light comes on at the LE side) (Fig. 501).

S 865-390

- (16) Push the arming switch again to disarm the slat alternate drive (ALTN switch lights goes off), and make sure the inboard slats move to the intermediate position.

S 865-394

- (17) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
- (a) 11H14, SLAT SHUTOFF

S 865-546

- (18) Erase the SLAT ISLN VAL maintenance message because this message is latched (AMM 31-41-00/201).

LEADING EDGE SLAT SYSTEM – INSPECTION/CHECK

1. General

- A. The "Test for the Retract Inhibit System with Alternate Electrical Power" has been removed from here since it is entirely a function of software in the FSEU and it is unnecessary to test it. The "Test for the Extend/Retract Inhibit System with Normal Hydraulic Power" has been removed from here because it is a duplication of the "Flap/Slat Shutoff Valve Module Test" shown in AMM 27-51-48/201.

INBOARD LEADING EDGE SLAT - REMOVAL/INSTALLATION

1. General

- A. This procedure contains the removal and the installation tasks for the inboard leading edge (LE) slats. The installation task also contains the steps for the adjustment and test for the inboard slats. The LE slat adjustment is done in production with the airplane in the "rigging position", that is on jigs. This position, with no engines installed and no weight to account for fuel load, best represents the in-flight configuration of the wing. This "unloaded" configuration is the best on the "ground" configuration for setting the fair of the slats. However, it is also acceptable to do the slat adjustment with the airplane in the loaded condition (with fuel and engines installed) since the weight factor has no effect on the slat adjustment.
- B. The slats are given the numbers from No. 1 through No. 12, from the left wing to the right wing. This procedure contains the adjustment and test steps only for slat No. 6 and No. 7, the inboard slats.

TASK 27-81-01-024-001

2. Inboard Leading Edge Slats - Removal

A. Equipment

- (1) Sling Equipment, Leading Edge Slats - A27017-41:
  - (a) Outboard Sling Arm Assembly, Inboard Slat - P/N A27017-4
  - (b) Inboard Sling Arm Assembly, Inboard Slat - P/N A27017-5
- (2) LE Slats Groundlock - A27007-1  
(2 Necessary)
- (3) TE Flap PDU Lock - A27009-7
- (4) Circuit Breaker Lockout Clip Commercially available.

- (11) Remove the access panels, 511BB and 611BB, to get access to the outboard and inboard slat power drive units (PDUs) (Ref 06-44-00).
- S 494-012
- (12) Install the groundlocks in the inboard and outboard slat PDUs (Fig. 406).
- S 494-013
- (13) Install the PDU lock in the TE flap PDU (Fig. 405).
- S 034-014
- (14) To remove the inboard slat on the left wing (slat No. 6), disconnect the torque tube on the left side of the inboard slat PDU (Ref 27-81-24).
- S 034-015
- (15) To remove the inboard slat on the right wing (slat No. 7), disconnect the torque tube on the right side of the inboard slat PDU (Ref 27-81-24).

**NOTE:** Do not disconnect the torque tubes on the left and right side of the slat PDU at the same time. It will be necessary to adjust the slat drive system if you disconnect the two torque tubes.

**27-81-01**

S 984-016

- (16) Manually turn the torque tubes to extend the inboard slat, until you can get access to the bolts on the aft end of the auxiliary track arms.

S 014-017

- (17) Remove the fixed lower LE access panels if it is necessary to get access to the inboard slat components (Ref 06-44-00).

S 294-167

**WARNING:** DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

- (18) Keep clean and free of all unwanted objects (FOD), the housing (can) assemblies of the slat main tracks, at all time.

E. Remove the Inboard Leading Edge Slat

S 494-135

**CAUTION:** BE CAREFUL WHEN YOU REMOVE THE SLAT. DAMAGE CAN OCCUR TO THE SLAT SENSOR SWITCHES. IF IT IS NECESSARY, REMOVE THE SLAT SENSOR SWITCHES BEFORE YOU REMOVE THE SLAT.

- (1) Remove the inboard slat sensor switches, if it is necessary (AMM 27-88-01/201).

S 014-018

- (2) Remove the center link door and the side brace link door if it is necessary to get access (Ref 57-41-59).

S 494-019

- (3) Apply tape to hold the aerodynamic seals in the retracted position, at the cutouts of the fixed leading edge.

S 494-020

**CAUTION:** BE CAREFUL WHEN YOU INSTALL THE SLING EQUIPMENT TO THE SLAT. DAMAGE CAN OCCUR ON THE POLISHED EXTERNAL SKIN.

- (4) Install the sling equipment on the inboard slat (Fig. 404).

EFFECTIVITY

ALL

27-81-01

02

Page 422  
Apr 22/08

S 494-021

- (5) Connect the overhead hoist to the sling equipment.

**NOTE:** Make sure the hoist can hold the weight of the inboard slat. The inboard slat weighs approximately 170 pounds (77.1 Kg).

S 034-022

- (6) Disconnect the slat control rod (2) from the inboard slat (1) at two locations (View A-A, Fig. 401).

**NOTE:** Do not change the length of the rod (2).

S 034-023

- (7) Disconnect the bolt (14) and remove the roller bearing (13) from each of the three auxiliary tracks (10). Keep disassembled parts together.

**NOTE:** This will disconnect the auxiliary track arms (11) from the auxiliary tracks (10) (View B-B, Fig. 401).

S 034-024

- (8) Disconnect the slat (1) from the center link (2) (View A-A, Fig. 402).

S 034-025

- (9) Disconnect the slat (1) from the side brace link (9) (Detail E, Fig. 402).

S 034-026

- (10) Disconnect the slat (1) from the main track (21) (View B-B, Fig. 402).

S 024-027

- (11) Remove the inboard slat from the airplane.

TASK 27-81-01-424-028

### 3. Inboard Leading Edge Slat - Installation

**NOTE:** The wear limit inspection for the components used in this procedure are given in 27-81-01/601.

#### A. Equipment

- (1) Rigging Spacers from Spacer Kit - A27023-22:  
(a) Rigging Spacer - P/N A27023-3  
(3 Necessary, included in kit)

- (2) Spacer - Preload, L.E. Slat Rigging - A27094-5 (recommended) or A27094-1 (optional)  
(3 Necessary)
- (3) Sling Equipment, Leading Edge Slats - A27017-41:
  - (a) Outboard Sling Arm Assembly, Inboard Slat - P/N A27017-4
  - (b) Inboard Sling Arm Assembly, Inboard Slat - P/N A27017-5
- (4) LE Slats Groundlock - A27007-1  
(2 Necessary)
- (5) TE Flap PDU Lock - A27009-7
- (6) Circuit Breaker Lockout Clip - Commercially available.
- (7) Inboard Slat Adjustment Wrench - A27101-5
- (8) Shim - 0.075 ±0.003 inch (1.90 +/-0.07 mm) thick
- (9) Rivet - BACR15BA5AD (4 on each slat)

**NOTE:** These rivets are used to attach the sensor switch targets to the auxiliary track arm.

**B. Consumable Materials**

- (1) C00259 Primer - BMS 10-11, Type 1
- (2) D00633 Grease - BMS 3-33 (Preferred)
- (3) D00013 Grease - MIL-PRF-23827 (Supersedes MIL-G-23827) (Alternate)
- (4) D00015 Grease, Corrosion Preventive - BMS 3-24 (Alternate)

S 294-168

**WARNING:** DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

- (1) Keep clean and free of all unwanted objects (FOD), the housing (can) assemblies of the slat main tracks, at all time.

S 864-128

- (2) If you install the same removed inboard slat, rigging of the slats is not necessary when these occur:
  - (a) The auxiliary track adjustments have not been changed.
  - (b) The auxiliary arms have not been removed from the slat.
  - (c) The slat and/or auxiliary arm hardware have not been repaired, modified, adjusted or replaced.

S 824-127

- (3) If you install a slat that does not meet the conditions listed above, do these steps:
  - (a) Install the rigging spacers (24) below the support fittings (26) for the forward auxiliary track with these steps (View C-C, Fig. 401):
    - 1) Remove the six bolts (21), washers (22), and nuts (23).
    - 2) Put the rigging spacer (24) between the support fitting (26) for the forward auxiliary track and the shim (25).
    - 3) Tighten the support fitting (26) to the structure.
  - (b) Install the 0.30 inch (7.6 mm) rigging preload spacer at the inboard, center, and the support links (27) for the outboard auxiliary track with these steps (Views A-A and B-B, Fig. 409):
    - 1) Loosen the lower adjustable nut on the support link (Views A-A and B-B) while you hold the upper adjustable nut in position.

**NOTE:** For the inboard and center auxiliary tracks (Detail A, Fig. 409 and Fig. 409A), use the Inboard Slat Adjustment Wrench to hold the upper adjustable nut in position if necessary.

- 2) Install the rigging preload spacer between the upper adjustable nut and the pivot.
- 3) Tighten the lower adjustable nut.

EFFECTIVITY

ALL

27-81-01

02

Page 426  
Apr 22/08

S 494-033

**CAUTION:** BE CAREFUL WHEN YOU INSTALL THE SLING EQUIPMENT TO THE SLAT. DAMAGE CAN OCCUR ON THE POLISHED EXTERNAL SKIN.

- (4) Install the sling equipment on the inboard slat (Fig. 404).

S 494-034

- (5) Connect the overhead hoist to the sling equipment.

**NOTE:** Make sure the hoist can hold the weight of the inboard slat. The inboard slat weighs approximately 170 pounds (77.1 Kg).

S 434-035

**CAUTION:** MAKE SURE THE SPRING LOADED SEAL ON THE OUTBOARD END OF THE SLAT IS PUSHED IN BEFORE YOU MOVE THE SLAT TO ITS POSITION FOR INSTALLATION. DAMAGE CAN OCCUR ON THE SEAL.

- (6) Move the slat (1) to its position for the installation and do these steps:
- (a) Make sure the main track can move freely through the front spar cutout.
  - (b) Make sure the side brace link, center link, main track, auxiliary track arms, and the slat control rods are aligned with the cutouts and doors in the wing fixed leading edge.

S 434-036

- (7) Attach the slat control rod (2) to the lug (7) on the inboard slat at two locations (View A-A, Fig. 401).

**NOTE:** Do not change the length of the slat control rod during the installation.

EFFECTIVITY

ALL

27-81-01

02

Page 427  
Apr 22/08

S 424-169

**CAUTION:** MAKE SURE THAT THE DOWNSTOP SPACERS ARE INSTALLED CORRECTLY AND THE NUT HAS THE CORRECT TORQUE. IF THEY ARE NOT, THE MAIN TRACK/STRUCTURE JOINT CAN BECOME LOOSE. THE DOWNSTOP PARTS CAN DISCONNECT AND CAN CAUSE DAMAGE TO THE SLAT TRACK HOUSING.

- (8) Make sure the parts of the downstop assembly are installed correctly and the nut has the correct torque (IPC 27-81-10-01).

S 434-037

- (9) Connect the slat (1) to the main track (21) with these steps (View B-B, Fig. 402):
- (a) Apply grease to the bolt (27) before installation.
  - (b) Install the bolt (27), washer (26), bushing (25), washer (28) and nut (24) at the main track connection.
  - (c) Tighten the nut (24) to 145-200 pound-inches (16.4-22.5 newton-meters).
  - (d) Install the cotter pin (29) through the nut (24) and bolt (27).

S 434-038

- (10) Connect the slat (1) to the side brace link (9) with these steps (Detail E, Fig. 402):
- (a) Apply grease to the bolt (15).
  - (b) Install the retainer (14), bolt (15), washer (16), bushing (13), washer (17), and nut (12) at the side brace link connection.

**NOTE:** The bolt can be installed with the head in the inboard or outboard direction. It is recommended that the bolt be installed with the head in the inboard direction. This gives easier access to the bolt lube fitting.

- (c) Tighten the nut (12) to 145-200 pound-inches (16.4-22.5 newton-meters).
- (d) Install the cotter pin (18) through the bolt (15) and nut (12).

S 434-039

- (11) Connect the slat (1) to the center link (2) with these steps (View A-A, Fig 402):
- (a) Apply grease to the bolt (3).
  - (b) Install the bolt (3), washer (4), bushing (5), washer (6), and nut (8) to the center link connection.
  - (c) Tighten the nut to 145-200 pound-inches (16.4-22.5 newton-meters).
  - (d) Install the cotter pin (7) through the bolt (3) and nut (8).

EFFECTIVITY

ALL

27-81-01

02

Page 428  
Apr 22/08

S 434-144

**CAUTION:** SL 27-83 RECOMMENDS REDUCTION OF SENSOR TARGET CLEARANCES TO PREVENT NUISANCE INDICATIONS (LE SLAT ASYM EICAS MESSAGE, LE LIGHT ILLUMINATION, TAKE OFF CONFIGURATION WARNING FLAPS OR STICK SHAKER ACTIVATION). THE TARGET WASHERS HAVE DIFFERENT PROFILES. THE EXISTING TARGET WASHER IS INTERCHANGEABLE BY SHIPSET ONLY. TARGET WASHERS ARE NOT INTERMIXABLE. NOTE THAT TARGET WASHERS VARY DEPENDENT ON LOCATION AND THAT INCORRECT PART NUMBER INSTALLATION CAN CAUSE NUISANCE INDICATIONS.

- (12) Connect the auxiliary track arms (11) to the auxiliary tracks (10) with these steps (View B-B, Fig. 401):
- (a) At the center auxiliary track, install the roller bearing (18), bolt (19), washer (20), and nut (17), and tighten the nut (17) to 290-510 pound-inches (32.8-57.6 newton-meters).
  - (b) At the inboard and outboard auxiliary tracks, install the bolt (14), target washer (15), roller bearing (10), washer (16), and nut (12). Tighten the nut (12) to 290-510 pound-inches.

**NOTE:** Install the bolt head and the target washer on the outboard side of the connection.  
SB 57-0052 adds step washers and reworks target washer and bolts.

- (c) Lubricate at the grease fitting on the bolt head or target washer at the auxiliary track/arm joint and make sure that grease goes out of the bearing on at least one side (BMS 3-33 preferred, MIL-PRF-23827 alternate).

**NOTE:** AMM 12-21-08/301 shows the procedure to lubricate the roller bearing that is installed with a solid (without grease fitting) bolt.

S 094-041

**CAUTION:** BE CAREFUL WHEN YOU REMOVE THE SLING EQUIPMENT. DAMAGE CAN OCCUR ON THE POLISHED EXTERNAL SKIN OF THE INBOARD SLAT.

- (13) Remove the sling equipment from the slat (Fig. 404).

EFFECTIVITY

ALL

27-81-01

02

Page 429  
Aug 22/08

S 294-170

**WARNING:** DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

- (14) Keep clean and free of all unwanted objects (FOD), the housing (can) assemblies of the slat main tracks, at all time.

S 984-042

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (15) Manually retract fully the inboard slat with one of these two procedures:

**NOTE:** Make sure the slat trailing edge does not rub against the upper surface of the fixed wing leading edge.

- (a) PROCEDURE A: Turn the torque tube with an air motor and adapter, (AMM 27-81-00, Manually Extend and Retract the Leading Edge Slats without Airplane Power).
- (b) PROCEDURE B: Turn the torque tube by hand.

S 824-043

- (16) If the inboard slat rubs against the wing upper surface while it retracts, do these adjustments:
- (a) If the slat rubs against the wing upper surface from the fully extended position to the takeoff position (Fig. 410), adjust the shims (25) at the support fittings (26) for the forward auxiliary track (View C-C, Fig. 401).
- (b) If the slat rubs against the wing upper surface between the takeoff position (Fig. 410) and the fully retracted position, adjust the support link (27) for the aft auxiliary track (View A-A and B-B, Fig. 409).

**NOTE:** Use the Inboard Slat Adjustment Wrench to turn the upper adjustable nut for the inboard and center auxiliary tracks, if necessary (Detail A, Fig. 409 and Fig. 409A).

S 424-044

- (17) If removed, install the center link door and the side brace link door (Ref 57-41-59).

EFFECTIVITY

ALL

27-81-01

02

Page 430  
Apr 22/08

S 424-140

- (18) Install the inboard slat sensor switches (if removed), after you installed the slat (AMM 27-88-01/201).

S 824-045

- (19) Do this task: Adjust the Inboard Leading Edge Slat.

**NOTE:** This task is not necessary if you installed the same removed slat and did not adjust the auxiliary track, or remove the auxiliary arms, or did not repair, modify, adjust or replace the slat and/or auxiliary arm hardware.

G. Adjust the Inboard Leading Edge Slat

**NOTE:** If you will not adjust the krueger seal flap, disconnect the drive to the krueger seal flap before you adjust the inboard slat (Ref 27-81-04).

S 294-171

**WARNING:** DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

- (1) Keep clean and free of all unwanted objects (FOD), the housing (can) assemblies of the slat main tracks, at all time.

S 214-046

- (2) Make sure the rigging spacer (24) is installed at each support fitting (26) for the forward auxiliary track (View C-C, Fig. 401).

S 214-047

- (3) Make sure the rigging preload spacer is installed at the inboard, center, and outboard support links (27) for the aft auxiliary track (View A-A and B-B, Fig. 409):

S 494-048

- (4) Attach a 0.075 +/- 0.003 inch (1.90 +/- 0.076 mm) shim to the retract overtravel stop at the inboard rotary actuator (Detail A, Fig. 407).

S 984-049

- (5) Manually retract fully the inboard slat with one of these procedures, until the inboard rotary actuator arm touches the shim on the retract overtravel stop:
- (a) PROCEDURE A: Turn the torque tube with an air motor and adapter (AMM 27-81-00, Manually Extend and Retract the Leading Edge Slats without Airplane Power)

EFFECTIVITY

ALL

27-81-01

01

Page 431  
Apr 22/08

(b) PROCEDURE B: Turn the torque tube by hand.

S 224-052

- (6) Make sure the clearance between the lower side of the slat upper trailing edge and the upper surface of the wing fixed leading edge is 0.18 +/- 0.03 inch (4.57 +/- 0.76 mm), (View A-A, Fig. 408).

NOTE: Take measurement at any one point within 6 inches either side of each auxiliary track.

S 824-053

- (7) If the clearance is not correct, adjust the length of the support links (27) for the aft auxiliary track to get the correct clearance (View A-A and B-B, Fig. 409).

NOTE: Keep the rigging preload spacer between the upper adjustable nut and the pivot. Use the Inboard Slat Adjustment Wrench to turn the upper adjustable nut for the inboard and center auxiliary tracks if necessary (Detail B and C, Figs. 409 and 409A).

S 984-054

- (8) Turn the torque tube approximately 94 turns from the fully retracted position to extend the inboard slat to the 20-degrees take-off position, until the distance between the auxiliary track arm and the slot in the auxiliary track is as shown (Detail A, Fig. 410).

S 984-141

- (9) Use one of these procedures to turn the torque tube:  
(a) PROCEDURE A: Turn the torque tube with an air motor and adapter, (AMM 27-81-00, Manually Extend and Retract the Leading Edge Slats without Airplane Power).  
(b) PROCEDURE B: Turn the torque tube by hand.

S 224-055

- (10) Make sure the clearance between the lower side of the slat upper trailing edge and the upper surface of the wing fixed leading edge is 0.002 to 0.020 inch (0.05-0.508 mm) at any one point within six inches of either side of each auxiliary track (View A-A, Fig. 408).

S 824-056

- (11) If the clearance is not correct, adjust the shims (25) at the support fitting (26) for the forward auxiliary track until you get the correct clearance (View C-C, Fig. 401).

NOTE: Apply primer to the shims after dilamination.

EFFECTIVITY

ALL

27-81-01

01

Page 432  
Apr 22/08

S 984-142

- (12) Turn the torque tube 121 revolutions from the fully retracted (cruise) position to fully extend the slat to the 30.3-degree landing position.

S 094-057

- (13) Remove the rigging spacers (24) from the support fittings (26) for the forward auxiliary track (View C-C, Fig. 401), and do these steps:
- (a) Apply primer between and around the shims.
  - (b) At each support fitting, install the bolt with a washer, bushing, and nut at six locations. Tighten the nuts.

S 094-058

- (14) Remove the rigging preload spacers (View A-A and B-B, Fig. 409), from the support link (27) for the aft auxiliary track with these steps:

**NOTE:** A preload is applied to the inboard slat against the wing fixed leading edge when you remove the preload spacer.

- (a) Loosen the lower adjustable nut while you hold the upper adjustable nut in position.
- (b) Remove the rigging preload spacer.
- (c) Tighten the lower adjustable nut until the upper adjustable nut is held against the pivot.

S 224-050

- (15) At the inboard and outboard ends of the inboard slat, do a check on the mismatch dimensions between the slat and the adjacent fixed wing structure, and make sure they are not more than the permitted limits (View B-B, Fig. 408).

**NOTE:** The inboard slat requires a manual retraction/extension to do the check on the mismatch dimensions.

EFFECTIVITY

ALL

27-81-01

01

Page 433  
Aug 22/08

S 824-051

- (16) Do these adjustments if the mismatch dimensions are not correct:
- Install rigging spacers to help get the permitted mismatch dimensions with steps given in the "Install the Inboard Leading Edge Slat" procedure.

NOTE: Rigging spacers are used for initial fair pre-check. The final fair check is done with the rigging spacers removed. Installation of spacers help to align the upper trailing edge of the slat for a consistent mismatch measurement and for even preload condition.

- Remove the slat control rod (2) from the slat lug (7) (View A-A, Fig. 401).
- Adjust the length of the slat control rod (2) to get the slat mismatch below the limit.
- Apply grease to the bolt.
- Connect the slat control rod (2) to the slat lug (7) with the bolt (5), washers (6, 8, 9), bushing (4), and nut (3).

NOTE: Bushing (4) is always installed under the washer (9) and nut (3). If you install the nut in the outboard direction, make sure to have sufficient clearance for the bolt end to prevent interference.

- Remove rigging spacers with steps given before this adjustment task.
- Do this adjustment task until you get the permitted mismatch dimensions.

S 984-059

- (17) Manually retract the inboard slat with one of these procedures, until the inboard rotary actuator arm touches the 0.075 +/- 0.003 inch shim at the retract overtravel stop:
- PROCEDURE A: Turn the torque tube with an air motor and adapter, (AMM 27-81-00, Manually Extend and Retract the Leading Edge Slats without Airplane Power).
  - PROCEDURE B: Turn the torque tube by hand.

S 434-060

- (18) Connect the torque tube to the inboard slat PDU (Ref 27-81-24).

S 094-061

- (19) Remove the 0.075 +/- 0.003 inch (1.90 +/- 0.07 mm) shim from the retract overtravel stop, at the inboard rotary actuator (Detail A, Fig. 407).

EFFECTIVITY

ALL

27-81-01

01

Page 434  
Apr 22/08

S 424-062

- (20) If you installed a new inboard slat, install and adjust the sensor switch targets on the slat auxiliary track arms (Ref 27-88-01).

S 094-063

- (21) Remove the PDU lock from the TE flap PDU (Fig. 405).

S 094-064

- (22) Remove the groundlocks from the inboard and outboard slat PDUs (Fig. 406).

S 864-065

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (23) Pressurize the center hydraulic system (Ref 29-11-00).

S 864-066

- (24) Move the flap control lever to the 20-Unit detent, and make sure the flaps move to the 20-degree position, and the slats move to the intermediate position.

S 864-067

- (25) Remove the power from the center hydraulic system (Ref 29-11-00).

S 494-068

- (26) Install the groundlocks in the inboard and outboard slat PDUs (Fig. 406).

INBOARD LE SLAT - INSPECTION/CHECK

1. General

- A. This procedure has illustrations and wear limit tables, which show the data for wear limits. There are no procedures for access, removal, or installation of the parts. Refer to the Inboard LE Slat - Removal/Installation for procedure to do these tasks.
- B. This procedure has a task to examine the slat control rods if a slat accidentally contacts on open thrust reverser cowl.

TASK 27-81-01-216-002

2. Examine the Slat Control Rods

- A. Examine the slat control rod.

S 426-003

- (1) Replace the control rod if it is damaged.

- B. Examine the auxiliary track and the track arm.

S 426-004

- (1) Replace any component that is damaged.

TASK 27-81-01-226-001

3. Wear Limits for the Inboard LE Slat (Fig. 601)

A. General

- (1) This procedure has illustrations and wear limit tables, which show the data for wear limits. There are no procedures for access, removal, or installation of the parts. Refer to the Inboard LE Slat - Removal/Installation for procedure to do these tasks.

OUTBOARD LEADING EDGE SLAT – REMOVAL/INSTALLATION

1. General

- A. The slats are given the numbers from No. 1 through No. 12, from the left wing to the right wing. This procedure contains the removal and installation tasks for the outboard leading edge slats No. 1 through No. 5, and No. 8 through No. 12.

TASK 27-81-02-024-001

2. Outboard Leading Edge Slat – Removal

A. Equipment

- (1) Sling Equipment, Leading Edge Slats – A27017-41
  - (a) Outboard Slat Arm – A27017-3
- (2) Circuit Breaker Lockout Clip  
(Commercially Available).

B. References

- (1) AMM 06-44-00/201, Wing Access Doors and Panels
- (2) AMM 24-22-00/201, Electrical Power – Control
- (3) AMM 27-81-00/201 Leading Edge Slat – Maintenance Practice
- (4) AMM 27-81-02/601 Outboard Leading Edge – Inspection/Check
- (5) AMM 27-81-16/401 Leading Edge Slat Drive Side-of-Body Angle Gearbox – Removal/installation.
- (6) AMM 27-81-20/201 LE Slat Drive Rotary Actuator and Offset Gearbox – Maintenance Practice
- (7) AMM 27-81-24/401 Leading Edge Slat Torque Tube – Removal/Installation
- (8) AMM 27-88-01/201, Leading Edge Slat Sensor Switches
- (9) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems
- (10) AMM 30-11-05/401, Telescoping Duct
- (11) AMM 30-11-06/401, Interstitial Duct
- (12) AMM 32-00-15/201, Landing Gear Door Locks
- (13) AMM 32-00-20/201, Landing Gear Downlocks
- (14) AMM 78-31-00/201, Thrust Reverser System

C. Access

(1) Location Zones

211/212	Control Cabin
410	No. 1 Power Plant
420	No. 2 Power Plant
520/620	Wing Leading Edge – Outboard
710	Nose Landing Gear and Doors
730/740	Left/Right Main Landing Gear and Doors

(2) Access Panel

511BB	LE Slat Power Drive Unit – Outboard (Left)
-------	--

D. Prepare for the Removal

S 214-002

- (1) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

SLING ARM ATTACH POINT		
INBOARD SLAT NO.	DIMENSION A (INBD END) (INCHES)	DIMENSION B (OUTBD END) (INCHES)
1 AND 12	22.0	22.0
2 AND 11	27.0	27.0
3 AND 10	31.0	31.0
4 AND 9	35.0	35.0
5 AND 8	26.0	32.0

- 1 REMOVE THE PHILLIPS HEAD SCREWS FROM THE SLAT STRUCTURE AT THE LOCATIONS SHOWN AND ATTACH THE SLING ARM WITH THE HEX-HEAD (AN3) BOLTS AND WASHERS
- 2 AFTER YOU CONNECT THE SLING ARM TO THE SLAT, PUT THE STRAP CLIP OVER THE UPPER EDGE OF THE SLAT AND TIGHTEN THE STRAP

Slat Sling Equipment  
Figure 403

EFFECTIVITY

ALL
-----

**27-81-02**

S 494-003

**WARNING:** USE THE PROCEDURE IN AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Open the doors for the landing gear and install the door locks (AMM 32-00-15/201).

S 044-004

**WARNING:** DO THE THRUST REVERSER DEACTIVATION PROCEDURE TO PREVENT THE OPERATION OF THE THRUST REVERSER. THE ACCIDENTAL OPERATION OF THE THRUST REVERSER CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (3) Do this procedure: Thrust Reverser Deactivation for Ground Maintenance (AMM 78-31-00/201).

S 024-018

- (4) To remove slat No. 5 or 8, remove the telescoping duct for the thermal anti-ice system (AMM 30-11-05/401).

**NOTE:** Ignore the step "Put the slat drive system back to its usual condition" in AMM 30-11-05/401 ("Put the airplane back to its usual condition" in AMM 27-81-00/201) to continue with the removal of the interstitial duct with slat drive system deactivated.

S 024-073

- (5) Remove the interstitial ducts for the thermal anti-ice system at each end of the slat to be removed (AMM 30-11-06/401).

**NOTE:** Ignore the step "Put the slat drive system back to its usual condition" in AMM 30-11-06/401 ("Put the airplane back to its usual condition" in AMM 27-81-00/201) to continue with the removal of the slat(s) with slat drive system deactivated.

S 864-077

- (6) Make sure you keep disconnected duct parts and cable assembly parts (staying attached to the structure) out of path of travel of the slats.

S 864-072

- (7) Make sure the groundlocks are removed from the inboard and outboard slat PDUs.

EFFECTIVITY

ALL

27-81-02

06

Page 407  
Dec 22/08

S 864-008

- (8) Supply electrical power (AMM 24-22-00/201).

S 294-119

**WARNING:** DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

- (9) Keep clean and free of all unwanted objects (FOD), the housing (can) assemblies of the slat main tracks, at all time.

S 864-071

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM THE FLAPS AND SLATS IN THE STEP THAT FOLLOWS. THE INBOARD AND OUTBOARD SLATS WILL MOVE TO THE POSITION SHOWN ON THE FLAP CONTROL LEVER WHEN THE CENTER HYDRAULIC SYSTEM IS PRESSURIZED. THE ACCIDENTAL MOVEMENT OF THE SLATS CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (10) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 864-074

- (11) Move the flap control lever to the zero (FLAPS UP) detent, and make sure the flaps and slats move to the fully retracted position, and that the position of the flaps and slats agree with the position of the flap control lever.

S 494-007

- (12) Attach a DO-NOT-OPERATE tag to the flap control lever.

S 864-009

- (13) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).

S 014-075

- (14) Install the groundlocks on the inboard and outboard slat PDUs.

S 214-010

- (15) Make sure the position selector switch for the flap/slat alternate drive, on the first officer's main instrument panel, P3, is in the NORM detent.

EFFECTIVITY

ALL

27-81-02

05

Page 408  
Dec 22/08

S 494-011

- (16) Attach a DO-NOT-OPERATE tag to the position selector switch.

S 864-012

- (17) Push the arming switch, on the P3 panel, for the slat alternate drive, to arm the slat alternate drive (ALTN switch light comes on at the LE side).

S 214-013

- (18) Make sure the amber LEADING EDGE light, on the P3 panel, comes on and the LE SLAT DISAGREE message shows on the EICAS display after 7 seconds.

S 864-014

- (19) Open these circuit breakers on the overhead panel, P11, and install circuit breaker locks:  
(a) 11H23, SLAT ALTN CONT INBD  
(b) 11H24, SLAT ALTN CONT OUTBD

S 864-015

- (20) Open these circuit breakers on the main power distribution panel, P6, and install circuit breaker locks:  
(a) 6D21, ALTN SLAT INBD PWR  
(b) 6F24, ALTN SLAT OUTBD PWR

S 014-016

- (21) Remove the access panel, 511BB, to get access to the outboard slat power drive unit (PDU) (AMM 06-44-00/201).

S 014-017

- (22) Remove the fixed lower LE access panels as necessary to get access to the outboard slat components (AMM 06-44-00/201).

S 864-076

- (23) Remove electrical power if it is not necessary (AMM 24-22-00/201).

S 294-117

**WARNING:** DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

- (24) Keep clean and free of all unwanted objects (FOD), the housing (can) assemblies of the slat main tracks, at all time.

E. Remove the Outboard Leading Edge Slat

EFFECTIVITY

ALL

27-81-02

04

Page 409  
Dec 22/08

S 494-069

**CAUTION:** BE CAREFUL NOT TO DAMAGE THE SENSOR SWITCHES WHEN YOU REMOVE THE SLAT. REMOVE THE SENSOR SWITCHES, IF IT IS NECESSARY.

- (1) Remove the outboard slat sensor switches, if it is necessary (AMM 27-88-01/201).

S 494-020

**CAUTION:** BE CAREFUL WHEN YOU INSTALL THE SLING EQUIPMENT TO THE SLAT. DAMAGE CAN OCCUR ON THE POLISHED EXTERNAL SKIN.

- (2) Install the sling equipment on the outboard slat (Fig. 403).

S 494-021

- (3) Connect the overhead hoist to the sling equipment.

**NOTE:** Make sure the hoist can hold the weight of the outboard slat. The outboard slat weighs approximately 110 pounds (49.9 Kg).

S 864-078

- (4) Make sure the hoist cable has the correct tension and is not loose.

S 984-116

- (5) Manually extend the outboard slat (3), as necessary, in order to get the slat control rods (1) and the tracks disconnected from the slat (AMM 27-81-00/201, Manually Extend and Retract the Leading Edge Slats without Airplane Power). (Fig. 401 and Fig. 402).

S 024-057

**CAUTION:** DO NOT OPERATE THE SLATS WITH THE SUPPORT/ATTACHMENT BRACKETS DOWN (LOOSE AT ONE END) IF THE CONTROL ROD DOOR (ACTUATOR SEAL DOOR) IS REMOVED. MAKE SURE YOU HAVE THE SUPPORT/ATTACHMENT BRACKETS UP (OUT OF THE WAY) . IMPACT DAMAGE TO THE FIXED SPLICE PLATE ON THE LEADING EDGE LOWER SURFACE CAN OCCUR.

- (6) Disconnect the slat control rods (1) from the slat (3) (View A-A, Fig. 401).

**NOTE:** Do not change the length of the slat control rod when you disconnect the rod. Keep the door attached to the rod (1) in the same position.

EFFECTIVITY

ALL

27-81-02

04

Page 410  
Dec 22/08

S 034-024

- (7) Disconnect the bolt (12) and remove the roller bearing (17) from each of the two auxiliary tracks (11). Keep all disassembled parts together.

**NOTE:** This will disconnect the auxiliary track arms (10) from the auxiliary tracks (11) (View B-B, Fig. 401).

S 034-098

**CAUTION:** DO NOT LET THE SLAT TO FALL FREE FORWARD WHEN YOU DISCONNECT THE SLAT FROM THE FORWARD END OF THE MAIN TRACK. DAMAGE TO THE BRACKET OF THE SLAT SKEW SENSOR SWITCH INSTALLED ON MAIN TRACK AND TO THE WING FRONT SPAR CAN OCCUR.

- (8) Disconnect the outboard slat (3) from the main track at two locations (View B, Fig. 402).

S 024-064

- (9) Remove seal and retainer attached to the inboard end of slat which overlap the adjacent slat.

S 024-091

- (10) Remove seal and retainer attached to the slat located outboard of the slat to be removed.

S 024-026

- (11) Remove the outboard slat (3) from the airplane.

S 024-027

- (12) Remove the thermal anti-ice duct from the outboard slat.

S 864-079

- (13) If independent movement of left and right wing slat drive systems is necessary for other maintenance tasks before slat(s) are installed back in their original positions, do the steps that follow:
- (a) Remove control rods and doors at locations where slats were removed, if stayed attached to actuator.
  - (b) Identify all parts to permit installation at their original locations later.
  - (c) Measure retract overtravel stop clearances at all outboard slat actuators (AMM 27-81-20/201).
  - (d) Adjust extend and retract overtravel stop clearances if clearances are not within specified range (0.02 to 0.13 inch (0.50-3.3 mm) for retract and 0.08 inch (2.03 mm) minimum for extend) (AMM 27-81-20/201).
  - (e) Record retract overtravel stop clearances at inboard actuator arms on slats 5 and 8 for use in later steps.

MAINTENANCE MANUAL

- (f) Get access to the right side-of-body angle gearbox for the outboard slats (AMM 27-81-16/401).
- (g) Put a temporary witness mark on the torque tube coupling and the torque tube shaft at the inboard end of each side of body angle gearbox for later alignment.
- (h) Put temporary witness marks on a tooth of the spline coupling and the mating spline root on the output shaft of the side-of-body angle gearbox.
- (i) Get access to the left side-of-body angle gearbox for the outboard slats (AMM 27-81-16/401).
- (j) Put a temporary witness mark on the torque tube coupling and the torque tube shaft at the inboard end of each side of body angle gearbox for later alignment.
- (k) Put temporary witness marks on a tooth of the spline coupling and the mating spline root on the output shaft of the side-of-body angle gearbox.
- (l) Install supports under all outboard slats to prevent sudden extension after torque tubes are disconnected.

**CAUTION:** DO NOT ADJUST/REPLACE AUXILIARY OR MAIN TRACKS UNTIL THIS TASK IS COMPLETED. THIS CAN CAUSE DAMAGE TO THE SLATS AND FIXED LEADING EDGE.

- (m) Remove safety wiring on torque tube couplings and disassemble torque tube joints on inboard side of left and right side-of-body angle gear boxes (AMM 27-81-24/401).

**NOTE:** Do not operate PDU and do not disconnect other torque tubes until this task is completed. If you do, slat drive system adjustment will be necessary.

**CAUTION:** DO NOT USE A NUT RUNNER OF HIGHER CAPACITY. OFFSET GEARBOXES AND ROTARY ACTUATORS WILL HAVE TO BE OVERHAULED IF A LARGER NUT RUNNER IS USED AND THE ACTUATOR ARM MAKES CONTACT WITH ANY OVERTRAVEL STOP.

- (n) Operate manually the slat drive systems on left and right wing separately as needed with a 180 inch-pound (20.3 newton-meters) nut runner and torque tube spline adapter (AMM 27-81-00/201, " Manually Extend and Retract the Leading Edge Slats").

TASK 27-81-02-424-028

3. Install the Outboard Leading Edge Slat

NOTE: The wear limit inspection for the components used in this procedure are given in AMM 27-81-02/601.

A. Equipment

- (1) Sling Equipment, Leading Edge Slats - A27017-41
  - (a) Outboard Slat Arm - A27017-3
- (2) Circuit Breaker Lockout Clip,  
(Commercially Available).
- (3) Rigging Spacers from Spacer Kit - A27023-22:
  - (a) Outboard Slat Rigging Spacer - A27023-19  
(1 Spacer for Each Slat Hinge, 2 Spacers  
for each slat assembly)
  - (b) Torque Tube Spline Adapter

B. Consumable Materials

- (1) C00259 Primer - BMS 10-11, Type 1
- (2) D00633 Grease - BMS 3-33 (Preferred)
- (3) D00013 Grease - MIL-PRF-23827 (Alternate)
- (4) D00015 Grease - BMS 3-24 (Alternate)

-------	--

F. Install the Outboard Leading Edge Slats

S 294-118

**WARNING:** DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

- (1) Keep clean and free of all unwanted objects (FOD), the housing (can) assemblies of the slat main tracks, at all time.

S 864-097

- (2) If you install the same removed outboard slat, rigging of the slats is not necessary when these occur:
  - (a) The auxiliary track adjustments have not been changed.
  - (b) The auxiliary arms have not been removed from the slat.
  - (c) The slat and/or auxiliary arm hardware have not been repaired, modified, adjusted or replaced.

S 864-080

- (3) If the optional procedure for independent operation of left and right wing slat drive systems was used, do the steps that follow to install slat(s):
  - (a) Install metallic shim of exact thickness of the retract overtravel stop clearances recorded earlier in the steps for independent operation of left and right wing drive systems (Outboard Leading Edge Slat - Removal):
    - 1) Put metallic shim on the retract overtravel stop of the actuator arm (inboard actuator for slat 5 on left wing, and inboard actuator for slat 8 on right wing).

EFFECTIVITY

ALL

27-81-02

05

Page 415  
Dec 22/08

**CAUTION:** DO NOT USE A NUT RUNNER OF HIGHER CAPACITY. OFFSET GEARBOXES AND ROTARY ACTUATORS WILL HAVE TO BE OVERHAULED IF A LARGER NUT RUNNER IS USED AND THE ACTUATOR ARM MAKES CONTACT WITH ANY OVERTRAVEL STOP.

- (b) Retract drive system on each wing (AMM 27-81-00/201, "Manually extend and Retract the Leading Edge Slats) with the steps that follow:
  - 1) Use a 180 inch-pound (20.3 newton-meters) nut runner and drive system in the retract direction until shim on arm makes contact with retract overtravel stop.
  - 2) Let drive system relax for 1 minute.
- (c) Align witness mark on torque tube coupling with the mark on the torque tube shaft and engage spline of coupling with spline of torque tube.
- (d) Rotate shaft of left and right side-of-body angle gearbox up to 1/2 turn until marked spline root on gearbox shaft lines up with the marked spline tooth on the torque tube coupling.
- (e) Connect torque tubes to side-of-body angle gearboxes (left and right) (AMM 27-81-24/401).
- (f) Extend slat drive system by hydraulic or electric mode using PDU (AMM 27-81-24/401).
- (g) Remove metallic shim from actuator arm on slats 5 and 8.
- (h) Make sure retract overtravel stop clearances (inboard actuators at slats 5 and 8) are within +/- 0.001 inch (+/- 0.025 mm) from the values that you recorded earlier in the steps for independent operation of left and right wing drive systems (Outboard Leading Edge Slat - Removal).
- (i) Adjust overtravel stop clearances (extend and retract) on actuators if any one of the clearances is out of tolerance (AMM 27-81-20/201).

S 424-029

- (4) Install the thermal anti-ice duct in the outboard slat.

S 494-030

**CAUTION:** BE CAREFUL WHEN YOU INSTALL THE SLING EQUIPMENT TO THE SLAT. DAMAGE CAN OCCUR ON THE POLISHED EXTERNAL SKIN.

- (5) Install the sling equipment on the outboard slat (Fig. 403).

EFFECTIVITY

ALL

27-81-02

02

Page 416  
Dec 22/08

S 434-031

- (6) Connect the outboard slat (3) to the two main tracks with these steps (Detail B, Fig. 402):
- (a) Apply BMS 3-24 grease to the bolt, washers, and bushing.

NOTE: Remove all grease from the bolt threads immediately before installing nut or incorrect torque setting will occur.

- (b) Connect the main track to the slat using these parts, in the sequence that follows:
- bushing (7)
  - washer (8) (under the bolt head)
  - bolt (9) (bolt head pointed inboard)
  - washer (10) (under the nut)
  - nut (11)

- (c) Tighten the nut to the torque value at these locations as applicable:

- 1) At slat No. 1 or 12, tighten the nut to 270-350 pound-inches (30.5-39.5 newton-meters).
- 2) At slat No. 2 or 11, tighten the nut to 290-510 pound-inches (32.8-57.6 newton-meters).
- 3) At slat No. 3, 4, 5, 8, 9, or 10, tighten the nut to 480-850 pound-inches (54.3-96.0 newton-meters).

- (d) Install a cotter pin to the nut at each main track connection (AMM 20-10-23/401).

NOTE: Install the pin with the head parallel to the slot in the nut. The cotter pin eyes must be seated firmly so there is minimum axial movement of the pin after installation. The recommended method shown in Fig. 402 must be used whenever possible to reduce the potential for snags which could cause a damage by the cotter pin coming into contact with the leading edge slat. The optional method shown in Fig./402 is technically acceptable and can be used when the recommended method is not practical or access is limited.

S 984-032

- (7) Manually push the slat (3) to the fully retracted position.

S 984-033

- (8) Manually extend the slat (3) forward 3 to 4 inches (76.2-101.6 mm), until the holes in the aft end of the auxiliary arms (10) align with the slots in the auxiliary tracks (11) (Detail C, Fig. 401).

EFFECTIVITY

ALL

27-81-02

02

Page 417  
Dec 22/08

S 434-115

- (9) Connect the auxiliary track arm (10) to the auxiliary track (11) with these steps at two locations (View B-B, Fig. 401):
- (a) Apply BMS 3-33 grease to the bolt and the roller bearing.

NOTE: Remove all grease from the bolt threads immediately before installing nut or incorrect torque setting will occur.

AMM 12-21-08/301 shows a procedure for the lubrication of the roller bearing installed with the solid bolt (without grease fitting).

CAUTION: THE TARGET WASHERS HAVE DIFFERENT PROFILES. TARGET WASHERS ARE NOT INTERCHANGEABLE. INSTALLATION OF TARGET WASHERS DEPEND ON LOCATION AND INCORRECT PART NUMBER INSTALLATION CAN CAUSE NUISANCE INDICATIONS AND DAMAGE TO EQUIPMENT CAN OCCUR.

- (b) Install the roller bearing (17), bolt (12), target washer (13), washer (16), and nut (14).

NOTE: Install the bolt head and the target washer on the inboard side of the connection.

NOTE: Service Letter 27-83 recommends reduction of sensor target gaps to prevent nuisance indications (LE SLAT ASYM EICAS message, LE light illumination, take off configuration warning flaps, or stick shaker activation).

- (c) Tighten the nut to 30-50 pound-inches (3.4-5.6 newton-meters).  
(d) Install the cotter pin (15) at the nut (14).

S 094-035

- (10) Remove the sling equipment from the outboard slat (Fig. 403).

EFFECTIVITY

ALL

27-81-02

02

Page 418  
Dec 22/08

S 424-058

**CAUTION:** DO NOT OPERATE THE SLATS WITH THE SUPPORT/ATTACHMENT BRACKETS DOWN (LOOSE AT ONE END) IF THE CONTROL ROD DOOR (ACTUATOR SEAL DOOR) IS REMOVED. MAKE SURE YOU HAVE THE SUPPORT/ATTACHMENT BRACKETS UP (OUT OF THE WAY). IMPACT DAMAGE TO THE FIXED SPLICE PLATE ON THE LEADING EDGE LOWER SURFACE CAN OCCUR.

- (11) Attach the slat control rod (1) to the slat lugs (4) on the outboard slat (3) at two locations (View A-A, Fig. 401):

**NOTE:** Do not change the length of the slat control rods (1). Do not change the position of the door that is attached to the slat control rod (1).

- (a) Tighten the nut (8) to 130-200 pound-inches (14.7-22.5 newton-meters).

S 424-065

- (12) Install seal and retainer on the inboard end of slat which overlap the adjacent slat

S 824-037

- (13) Adjust the slat tabs at the main and auxiliary tracks to the down position to prevent damage when you retract the slats.

S 824-038

- (14) If you installed the same outboard slat that you removed, do these steps:
- (a) Do a test of the leading edge slat sensor switch (AMM 27-88-01/201).
- (b) Do an adjustment of the outboard slat if it is necessary (AMM 27-81-02/501).

S 824-039

- (15) If you installed a new outboard slat (or a new part numbered slat with new wedge), do these adjustments:
- (a) Do the adjustment for the Outboard slat (AMM 27-81-02/501).

EFFECTIVITY

ALL

27-81-02

02

Page 419  
Dec 22/08

- (b) Install and adjust the sensor switch targets on the new auxiliary track arms (AMM 27-88-01/201).

S 424-040

- (16) If you installed slat No. 5 or 8, install the telescoping duct for the thermal anti-ice system. Do not "Put the Airplane Back to its Usual Condition per AMM 27-81-00/201" as called out in AMM 30-11-05/401.

S 434-041

- (17) Connect the interstitial ducts for the thermal anti-ice system to the adjacent slats (AMM 30-11-06/401).

NOTE: Keep slats fully extended for the tasks that follow.

S 864-093

- (18) Make sure the flaps and slats are in the fully extended position.

S 864-094

- (19) Make sure the flap control lever is in the 30-unit detent.

S 424-070

- (20) Install the outboard slat sensor switches, if removed (AMM 27-88-01/201).

NOTE: Keep slats fully extended for the task that follow.

S 864-082

- (21) Make sure the groundlocks are not installed on the inboard and outboard slat PDUs.

S 094-083

- (22) Supply electrical power (AMM 24-22-00/201).

EFFECTIVITY

ALL

27-81-02

04

Dec 22/08

S 294-120

**WARNING:** DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

(23) Keep clean and free of all unwanted objects (FOD), the housing (can) assemblies of the slat main tracks, at all time.

S 424-121

**CAUTION:** MAKE SURE THAT THE DOWNSTOP SPACERS ARE INSTALLED CORRECTLY AND THE NUT HAS THE CORRECT TORQUE. IF THEY ARE NOT, THE MAIN TRACK/STRUCTURE JOINT CAN BECOME LOOSE. THE DOWNSTOP PARTS CAN DISCONNECT AND CAN CAUSE DAMAGE TO THE SLAT TRACK HOUSING.

(24) Make sure the parts of the downstop assembly are installed correctly and the nut has the correct torque (IPC 27-81-12-10/-10B).

S 864-084

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM THE FLAPS AND SLATS IN THE STEP THAT FOLLOWS. THE INBOARD AND OUTBOARD SLATS WILL MOVE TO THE POSITION SHOWN ON THE FLAP CONTROL LEVER WHEN THE CENTER HYDRAULIC SYSTEM IS PRESSURIZED. THE ACCIDENTAL MOVEMENT OF THE SLATS CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

(25) Pressurize the center hydraulic system (AMM 29-11-00/201).

EFFECTIVITY

ALL

27-81-02

03

Page 421  
Dec 22/08

S 864-085

- (26) Move the flap control lever to the zero (FLAPS UP) detent, and make sure the flaps and slats move to the fully retracted position, and that the position of the flaps and slats agree with the position of the flap control lever.

S 864-086

- (27) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).

G. Put the Airplane Back to Its Usual Condition

S 864-042

- (1) Remove the circuit breaker locks and close these circuit breakers on the overhead panel, P11:  
(a) 11H23, SLAT ALTN CONT INBD  
(b) 11H24, SLAT ALTN CONT OUTBD

S 864-043

- (2) Remove the circuit breaker locks and close these circuit breakers on the main power distribution panel, P6:  
(a) 6D21, ALTN SLAT INBD PWR  
(b) 6F24, ALTN SLAT OUTBD PWR

S 864-044

- (3) Push the arming switch for the slat alternate drive on the first officer's main instrument panel, P3, to disarm the slat alternate drives (ALTN switch light goes off).

S 214-045

- (4) Make sure the amber LEADING EDGE light, on the P3 panel, goes off and the LE SLAT DISAGREE message does not show on the EICAS display.

S 214-046

- (5) Make sure the position selector switch, on the P3 panel, for the flap/slat alternate drive is in the NORM detent.

EFFECTIVITY

ALL

OUTBOARD LEADING EDGE SLAT - ADJUSTMENT/TEST

1. General

- A. This procedure contains the adjustment and test tasks for the outboard leading edge (LE) slats.
- (1) If you install the same removed outboard slat, rigging of the slats is not necessary when these occur:
    - (a) The auxiliary track adjustments have not been changed.
    - (b) The auxiliary arms have not been removed from the slat.
    - (c) The slat and/or auxiliary arm hardware have not been repaired, modified, adjusted or replaced.
- B. The leading edge slats are given the numbers from 1 through 12, from the left wing to the right wing. This procedure contains the adjustment and test steps for slats No. 1 through No. 5, and No. 8 through No. 12. The leading edge slat adjustment is done in production with the airplane in the "rigging" position, that is on jigs. This position, with no engines installed and no weight to account for fuel load, best represents the in-flight configuration of the wing. This "unloaded" configuration is the best on the "ground" configuration for setting the fair of the slats. However, it is also acceptable to do the slat adjustment with the airplane in the loaded condition (with fuel and engines installed) since the weight factor has no effect on the slat adjustment.

TASK 27-81-02-825-001

2. Outboard Leading Edge Slat - Adjustment

A. Equipment

- (1) Rigging Spacers from Spacer Kit - A27023-22:
  - (a) Outboard Slat Rigging Spacer - A27023-19  
(2 necessary)
- (2) Rig Pin from Set A20004-XX (Ref 20-10-24):
  - (a) LE8 - P/N A20004-6
- (3) LE Slat Groundlock - A27007-1 (2 Necessary)
- (4) TE Flap PDU Lock - A27009-7
- (5) Circuit Breaker Lockout Clip (2 necessary)  
Commercially available
- (6) Rigging Gage (Outboard LE Slat) - A27089-9
- (7) Shim, 0.075 ±0.003 inch (1.90 +/- 0.076 mm) thick
- (8) Rivet - BACR15FT5AD (2 Necessary)

**OUTBOARD SLAT-TO-OUTBOARD SLAT FIT  
(EXAMPLE, SLATS NO. 1-5 AND 8-12)**

$\pm 0.04$  INCH (1.02 mm) MISMATCH PERMITTED AT MAIN TRACK, AUXILIARY TRACK TABS, AND LOWER SLAT TE TO LOWER FIXED LE REMOVABLE PANELS.  
 $\pm 0.06$  INCH (1.52 mm) MISMATCH PERMITTED FOR 5% OF TOTAL SPAN.  
 $\pm 0.08$  INCH (2.03 mm) MISMATCH PERMITTED FOR AN ADDITIONAL 5% OF SPAN.

**PANEL CLEARANCE  
(EXAMPLE, SLATS NO. 1-5 AND 8-12)**

**OUTBOARD SLAT-TO-STRUCTURE FIT  
(EXAMPLE, SLATS NO. 5 AND 8)**

**1** THIS MISMATCH MEASUREMENT IS TAKEN WITH THE SLATS IN THE RETRACTED (CRUISE) POSITION ONLY. MISMATCH OF 0.20 INCH (5.08 mm) MAX PERMITTED BETWEEN THE ADJACENT SLATS AND BETWEEN SLATS NO. 5, NO. 8 AND NACELLE RIB. WHEN THE SLAT-TO-SLAT OR SLAT-TO-NACELLE RIB MISMATCH IS GREATER THAN 0.20 INCH (5.08 mm), IT IS AN INDICATION OF MISRIGGING, DAMAGED PARTS, INCORRECT PARTS, OR WORN PARTS. 0.14 INCH (3.56 mm) MISMATCH PERMITTED BETWEEN ADJACENT SLATS AND BETWEEN SLATS AND NACELLE RIBS ON ALL AIRPLANES. 0.14 INCH (3.56 mm) MISMATCH BETWEEN SLATS 1/12 CASTING AND FIXED LEADING EDGE ON AIRPLANES WITHOUT EXTENDED WING TIPS (STANDARD WING). A SLAT INSTALLATION AND RIGGING MUST HAVE A MISMATCH OF 0.14 INCH (3.56 mm) OR LESS. IF THERE IS A MISMATCH BETWEEN 0.14-0.20 INCH (3.56-5.08 mm) AT MORE THAN 3 OUT OF 10 LOCATIONS BETWEEN THE SLATS OR AT THE NACELLE RIBS, ADJUST THE SLAT AGAIN TO REDUCE THE NUMBER OF LOCATIONS WHERE MISMATCH IS BETWEEN 0.14-0.20 INCH (3.56-5.08 mm) TO 3 LOCATIONS OR LESS. ADJUST THE SLAT CONTROL RODS TO THE DIMENSIONS SHOWN (VIEW D, FIG. 501) TO MINIMIZE THE MISMATCH.

E. Prepare for the Adjustment

S 295-130

**WARNING:** DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

- (1) Keep clean and free of all unwanted objects (FOD), the housing (can) assemblies of the slat main tracks, at all time.

S 215-002

- (2) Make sure the downlocks are installed on the nose and main landing gear (Ref 32-00-20).

S 495-003

**WARNING:** USE THE PROCEDURE IN AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (3) Open the doors for the landing gear and install the door locks (Ref 32-00-15).

S 045-004

**WARNING:** DO THE THRUST REVERSER DEACTIVATION PROCEDURE TO PREVENT THE OPERATION OF THE THRUST REVERSER. THE ACCIDENTAL OPERATION OF THE THRUST REVERSER CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (4) Do this procedure: Thrust Reverser Deactivation for Ground Maintenance (Ref 78-31-00).

S 215-103

**CAUTION:** DO NOT OPERATE THE SLATS WITH THE SUPPORT/ATTACHMENT BRACKETS DOWN (LOOSE AT ONE END) IF THE CONTROL ROD DOOR (ACTUATOR SEAL DOOR) IS REMOVED. MAKE SURE YOU HAVE THE SUPPORT/ATTACHMENT BRACKETS UP (OUT OF THE WAY). IMPACT DAMAGE TO THE FIXED SPLICE PLATE ON THE LEADING EDGE LOWER SURFACE CAN OCCUR.

- (5) Make sure the flaps and slats are fully retracted hydraulically.

S 215-006

- (6) Make sure the flap control lever is in the zero (FLAPS UP) detent.

- S 495-007
- (7) Attach a DO-NOT-OPERATE tag to the flap control lever.
- S 865-008
- (8) Supply electrical power (Ref 24-22-00).
- S 865-009
- (9) Remove the pressure from the center hydraulic system (Ref 29-11-00).
- S 215-010
- (10) Make sure the position selector switch for the flap/slat alternate drive, on the first officer's main instrument panel, P3, is in the NORM detent.
- S 495-011
- (11) Attach a DO-NOT-OPERATE tag to the position selector switch.
- S 865-012
- (12) Push the arming switch, on the P3 panel, for the slat alternate drive to arm the slat alternate drive (ALTN switch light comes on at the LE side).
- S 215-013
- (13) Make sure the amber LEADING EDGE light, on the P3 panel, comes on and the LE SLAT DISAGREE message shows in the EICAS display after 7 seconds.
- S 865-014
- (14) Open these circuit breakers on the main power distribution panel, P6, and install circuit breaker locks:
- (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6F24, ALTN SLAT OUTBD PWR
- S 865-015
- (15) Open these circuit breakers on the overhead panel, P11, and install circuit breaker locks:
- (a) 11H23, SLAT ALTN CONT INBD

(b) 11H24, SLAT ALTN CONT OUTBD

S 015-016

- (16) Open the access panels, 511BB and 611BB, to get access to the inboard and outboard slat power drive units (PDU) (Ref 06-44-00).

S 015-017

- (17) Remove the fixed lower LE access panels as necessary to get access to the outboard slat components (Ref 06-44-00).

S 035-018

- (18) To adjust the outboard slats on the left wing (No. 1 to No. 5), disconnect the torque tube on the left side of the outboard slat PDU (Ref 27-81-24).

S 035-019

- (19) To adjust the outboard slats on the right wing (slat No. 8 to No. 12), disconnect the torque tube on the right side of the outboard slat PDU (Ref 27-81-24).

**NOTE:** Do not disconnect the torque tubes on the left and right side of the slat PDU at the same time. It will be necessary to adjust the slat drive system if you disconnect the two torque tubes at the same time.

S 985-020

- (20) Use one of the two procedures that follow to manually extend the outboard slats as necessary to remove the fixed lower LE access panels and access doors (Ref 06-44-00):
- (a) PROCEDURE A: Turn the torque tube with an air motor and adapter (AMM 27-81-00, Manually Extend and Retract the Leading Edge Slats without Airplane Power).
  - (b) PROCEDURE B: Turn the torque tube by hand.

S 035-021

- (21) Disconnect the interstitial duct for the thermal anti-ice system at each end of the slat that you will adjust (AMM 30-11-06/401).

S 495-022

- (22) Apply tape to hold the aerodynamic seals in the retracted position, at the cutout of the fixed leading edge.

S 825-023

- (23) If not done, adjust the slat tabs at the main and auxiliary tracks to the down position to prevent damage when you retract the slats (Fig. 501).

EFFECTIVITY

ALL

27-81-02

03

Page 518  
Apr 22/08

S 985-024

- (24) Manually retract the outboard slats by hand or with an air motor (Ref 27-81-00), until the rotary actuator arms touch the retract overtravel stops.

F. Adjust the Outboard Slat

S 295-129

**WARNING:** DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

- (1) Keep clean and free of all unwanted objects (FOD), the housing (can) assemblies of the slat main tracks, at all time.

S 985-025

- (2) Turn the torque tube by hand until you get a  $0.075 \pm 0.003$  inch ( $1.90 \pm 0.07$  mm) clearance between the rotary actuator arm and the retract overtravel stop, at the inboard rotary actuator of slat No. 5 (for left wing adjustment) or No. 8 (for right wing adjustment).

**NOTE:** Use a shim with a thickness of  $0.075 \pm 0.003$  inch ( $1.90 \pm 0.07$  mm) to set the correct clearance.

S 225-026

- (3) Use the rigging gage and do a check on the main track roller clearance (Detail D, Fig. 501).

S 225-027

- (4) Do a check on the alignment fitting clearance as shown (Detail C, Fig. 501). Add washers 114T4000-11, as necessary, per the Illustrated Part Catalog to get the required clearance.

S 225-028

- (5) Do a check on the slat mismatch with the fixed leading edge (Detail A, Fig. 503).

S 825-029

- (6) Adjust the length of the slat control rod to get the correct clearances and mismatch if it is necessary.

EFFECTIVITY

ALL

27-81-02

03

Page 519  
Dec 22/08

S 825-030

- (7) Adjust the retracted position of the slats with the steps that follow (Fig. 502):

**NOTE:** The slats are preloaded in the cruise (retracted) position (nominal interference at the slat wedge is 0.14 inch (3.55 mm)). This reduces in-flight clearance between the slats and the forward leading edge.

**CAUTION:** MAKE SURE YOU LOOSEN THE JAMNUTS AND LIFT THE LOCKING TAB WASHERS BEFORE YOU ADJUST THE TURNBUCKLE. YOU CAN CAUSE DAMAGE TO THE LOCKING TAB WASHERS IF YOU ADJUST THE TURNBUCKLE WHILE THE WASHERS ARE NOT LOOSE.

- (a) Adjust the aft link of the auxiliary track (View C-C) to get a 0.002 to 0.020 inch (0.05-0.50 mm) clearance between the slat trailing edge and the fixed LE panels.

**NOTE:** Measure the clearance at a point less than six inches away from one of the two sides of each auxiliary track.

- (b) Turn the aft link turnbuckle (26) by 1.5 to 1.75 turns (0.125 to 0.146 inch (3.2-3.7 mm)) to shorten the length.

**NOTE:** This will apply a preload to the outboard slat (3). Disconnect the lower end of the aft link from the bracket if it is necessary to get access to the jamnut.

- (c) Tighten the jamnut on the aft link and install a lockwire with the double twist procedure (Ref 20-10-23).  
(d) If disconnected, connect the aft link to the bracket (View D-D).

EFFECTIVITY

ALL

27-81-02

02

Page 520  
Apr 22/08

S 825-101

- (8) Adjust the intermediate position of the slats with the steps that follow (Fig. 502):

**CAUTION:** DO NOT OPERATE THE SLATS WITH THE SUPPORT/ATTACHMENT BRACKETS DOWN (LOOSE AT ONE END) IF THE CONTROL ROD DOOR (ACTUATOR SEAL DOOR) IS REMOVED. MAKE SURE YOU HAVE THE SUPPORT/ATTACHMENT BRACKETS UP (OUT OF THE WAY). IMPACT DAMAGE TO THE FIXED SPLICE PLATE ON THE LEADING EDGE LOWER SURFACE CAN OCCUR.

- (a) Extend the outboard slats (3) to the dimension shown (Detail D) with one of these procedures:

**NOTE:** To extend the slats to the take off (intermediate) position, you can turn the slat-drive-torque-tube 87.5 +/- 5 revolutions from the cruise (fully retracted) position.

To move the slats accurately to the position shown, use less than 100 pound-inches (11.3 newton-meters) of torque when you extend the slats.

- 1) PROCEDURE A: Turn the torque tube with an air motor and adapter (AMM 27-81-00, Manually Extend and Retract the Leading Edge Slats without Airplane Power)
- 2) PROCEDURE B: Turn the torque tube by hand.

**CAUTION:** MAKE SURE THE RIGGING SPACER IS REMOVED BEFORE YOU OPERATE THE SLATS. DAMAGE CAN OCCUR IF YOU MOVE THE SLATS WITH THE RIGGING SPACER INSTALLED.

- (b) Install the (0.4375 inch (11.112 mm)) rigging spacer temporarily at the forward bracket with these steps (Fig. 502):

- 1) Remove the bolts (19), nuts (22), and washers (20 and 21) that hold the forward bracket assembly (14, 15, 16) in position.
- 2) Put the rigging spacer between the forward bracket and the bridge support fitting (18).
- 3) Install the forward bracket with the two bolts, nuts, and washers.

- (c) Measure the clearance between the outboard slat trailing edge and the fixed leading edge at a point less than six inches away from each auxiliary track.

EFFECTIVITY

ALL

27-81-02

02

Page 521  
Apr 22/08

 **BOEING**  
767  
MAINTENANCE MANUAL

- (d) If the clearance is 0.002 to 0.200 inch (0.05–5.08 mm) between the trailing edge and the upper skin of the fixed leading edge, remove the rigging spacer and install the forward bracket assembly (14, 15, 16) shown in View D-D, Fig. 502.

NOTE: Follow the CAUTION note in Fig. 502 when you install the forward bracket assembly.

- (e) Do these steps if the clearance is not between 0.002 and 0.200 inch (Fig. 502):
- 1) Remove the forward bracket assembly and drill out the rivets (17) in the forward brackets.
  - 2) Adjust the shims (16) by small increments, until you get a clearance between 0.002 to 0.200 inch (0.05–5.1 mm), with the rigging spacer attached.
  - 3) Remove the rigging spacer when you get the correct clearance.
  - 4) Attach the forward bracket assembly (14), serrated plate (15), and shims (16) together with the two rivets (17) (Detail G).

NOTE: Install the forward bracket assembly (14) with temporary fasteners.

- 5) Install the forward brackets assembly (without the rigging spacer) to the bridge support fitting (18) with the bolts, washers, and nuts.

NOTE: Follow the CAUTION note in Fig. 502 when you install the forward bracket assembly.

S 835-099

- (9) Adjust the extended position of the slats with the steps that follow (Fig. 502):

EFFECTIVITY

ALL

27-81-02

02

Page 522  
Apr 22/08

**CAUTION:** MAKE SURE THE RIGGING SPACER IS REMOVED BEFORE YOU OPERATE THE SLATS. DAMAGE CAN OCCUR IF YOU MOVE THE SLATS WITH THE RIGGING SPACER INSTALLED.

- (a) Extend the outboard slats until you get a 0.03 –0.18 inch (0.76–4.57 mm) clearance between the rotary actuator arm and the extend overtravel stop, at the inboard rotary actuator (this is the extended position of the slats). Use one of these two procedures to extend the slats:

**NOTE:** To extend the slats to the landing (fully extended) position, you can turn the slat-drive-torque-tube 116.25 +/- 0.5 revolutions from the cruise (fully retracted) position.  
The torque increases at the extended position because of the preload between the auxiliary track roller and the auxiliary track.

- 1) PROCEDURE A: Turn the torque tube with an air motor and adapter (AMM 27-81-00, Manually Extend and Retract the Leading Edge Slats without Airplane Power)
  - 2) PROCEDURE B: Turn the torque tube by hand.
- (b) Make sure there is clearance between the main tracks and the slat-rib fail-safe stops as shown in View E, Fig. 501.

**NOTE:** If the clearance is out of tolerance, you can set the auxiliary track adjustment downward while maintaining required dimensions.

- (c) Adjust the auxiliary track support bracket serrations.

**NOTE:** The forward edge of the serrated plate and shims must be in line with the bridge fitting during and after all phases of the adjustment. The forward edge of the forward auxiliary bracket assembly must be in line the bridge fitting within +/-0.111 inch (+/-2.81 mm) (3 serrations) after adjustment. Do not move the bracket more than (3) serrations forward or aft (ref.+/- 0.108 inch (+/- 2.74 mm)) from the middle position.  
The rig pin is used as a no go/go tool for the following two actuator positions.

- (d) Make sure you can install (in the landing position) the rig pin LE8 in the auxiliary arms without interfering with the auxiliary tracks (Detail E, Fig. 502).

EFFECTIVITY

ALL

27-81-02

02

Page 523  
Apr 22/05

- (e) If moving the serrated plates does not permit sufficient adjustment then adjust the push rods, or add to the auxiliary track support bracket the minimum amount of shims needed to get all the required rigging dimensions.

1) If you cannot install rig pin LE8, do these steps:

NOTE: In these steps, try to install the minimum thickness of shims that is necessary to let you install the rig pin.

- a) Add a small thickness of shims (16) at the forward bracket assembly (14) (View D-D, Fig. 502), and do the "Adjust the intermediate position of the slats" task to make sure the clearance is not more than 0.200 inch (5.08 mm).
- b) Put the slats back in the extended position and try to install the rig pin.
- c) Do the above two steps until you can install the rig pin, or the clearance becomes 0.200 inch (5.08 mm).

NOTE: It will be necessary to remove or install the rigging spacer, and extend or retract the slats when you change between the two steps.

- d) If the clearance becomes 0.200 inch (5.08 mm) before you can install the rig pin, adjust the length of the slat control rod (Fig. 501) until you can install the rig pin.
  - e) Make sure the slat control rod adjustment is not more than 0.48-0.58 inch (12.2-14.7 mm) (Detail D, Fig. 501) or the slat mismatch (Detail A, Fig. 503).
  - f) If it is necessary to install the rig pin, remove the rivets (17) from the forward bracket assembly (14) and move the forward bracket assembly (14) forward, but not more than 0.11 inch (2.8 mm) (Fig. 502).
- (f) Remove rig pin LE8.
- (g) Manually turn the torque tubes no more than 5 full turns to retract the outboard slats.
- (h) Make sure that you cannot install rig pin LE8 at the two auxiliary tracks of the adjusted slat (Detail E, Fig. 502).
- (i) If moving the serrated plates does not permit sufficient adjustment then adjust the push rods, or add to the forward bracket the minimum amount of shims needed to get all the required rigging dimensions.

EFFECTIVITY

ALL

27-81-02

02

Page 524  
Aug 22/06

- (j) If you can install rig pin LE8, remove shims (16) by small increments from the forward bracket assembly (14) (View D-D, Fig. 502) until you cannot install rig pin LE8.

NOTE: Make sure the clearance between the slat trailing edge and the fixed leading edge is not below 0.002 inch (0.05 mm) with the rigging spacer installed. Use the same procedure to adjust the shims as you did in the auxiliary track adjustments.

- (k) If it is necessary, adjust the slat control rod to NO GO pin and within 0.48-0.58 inch (12.2-14.7 mm) clearance (Detail D, Fig. 501).
- (l) Install the rivets (17) in the forward bracket assembly (14) as shown in Fig. 502.
- (m) If installed, remove rig pin LE8.

S 985-040

- (10) Manually retract the outboard slats until you get a clearance of 0.075 ±0.003 inch (1.905 +/- 0.076 mm) between the rotary actuator arm and the retract overtravel stop, at the inboard rotary actuator of slat No. 5 (for left wing adjustment) or No. 8 (for right wing adjustment).

NOTE: Use a shim with a thickness of 0.075 ±0.003 inch (1.905 +/- 0.076) to set the correct clearance.

S 435-041

- (11) Connect the torque tubes back to the outboard slat PDU (Ref 27-81-24) while you keep the slats in the position that you set in the step before.

S 865-042

- (12) Remove the circuit breaker locks and close these circuit breakers on the P6 panel:
- (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6F24, ALTN SLAT OUTBD PWR

S 865-043

- (13) Remove the circuit breaker locks and close these circuit breakers on the P11 panel:
- (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD

S 865-044

- (14) Push the arming switch for the slat alternate drive, on the P3 panel, to disarm the slat alternate drive (ALTN switch light goes off at the LE side).

EFFECTIVITY

ALL

27-81-02

Apr 22/08

S 215-045

- (15) Make sure the amber LEADING EDGE light, on the P3 panel, goes off and the LE SLAT DISAGREE message does not show in the EICAS display.

S 865-046

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (16) Pressurize the center hydraulic system (Ref 29-11-00).

S 865-047

- (17) Remove the DO-NOT-OPERATE tag from the flap control lever, and move the lever to the 30-unit detent.

S 215-048

- (18) Make sure the flaps and slats move to the fully extended position.

S 495-049

- (19) Attach a DO-NOT-OPERATE tag to the flap control lever.

S 865-050

- (20) Remove the pressure from the center hydraulic system (Ref 29-11-00).

S 215-051

- (21) Make sure you can install rig pin LE8 at the two auxiliary tracks in the outboard slat that you adjusted (Detail E, Fig. 502).

EFFECTIVITY

ALL

27-81-02

02

Page 526  
Apr 22/08

- S 095-052  
(22) Remove rig pin LE8.
- S 865-053  
(23) Push the arming switch for the slat alternate drive (P3) to arm the slat alternate drive (ALTN switch light comes on at the LE side).
- S 215-054  
(24) Make sure the amber LEADING EDGE light, on the P3 panel, comes on and the LE SLAT DISAGREE message shows on the EICAS display.
- S 865-055  
(25) Open these circuit breakers on the P6 panel and install circuit breaker locks:  
(a) 6D21, ALTN SLAT INBD PWR  
(b) 6F24, ALTN SLAT OUTBD PWR
- S 865-056  
(26) Open these circuit breakers on the P11 panel and install circuit breaker locks:  
(a) 11H23, SLAT ALTN CONT INBD  
(b) 11H24, SLAT ALTN CONT OUTBD
- S 985-057  
(27) Manually turn the torque tubes no more than 5 full turns to retract the outboard slats.
- S 215-058  
(28) Make sure that you CANNOT install rig pin LE8 at the two auxiliary tracks of the adjusted slat (Detail E, Fig. 502).
- S 215-106  
(29) Make sure the auxiliary arms do not touch the auxiliary tracks (View E-E, Fig.502).
- S 215-107  
(30) Make sure the alignment-fitting clearance is correct as shown in Detail C, Fig. 501. Adjust if necessary.

EFFECTIVITY

ALL

27-81-02

02

Page 527  
Apr 22/08

S 215-108

- (31) Make sure the slat tabs have the required flushness as shown in Fig. 501. Adjust if necessary.

S 985-059

- (32) Manually turn the torque tubes no more than 5 full turns to extend the outboard slats.

S 435-060

- (33) Connect the interstitial duct for the thermal anti-ice system to the adjacent slats and install the TAI duct cover doors (AMM 30-11-06/401).

S 865-061

- (34) Remove the circuit breaker locks and close these circuit breakers on the P6 panel:
- (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6F24, ALTN SLAT OUTBD PWR

S 865-062

- (35) Remove the circuit breaker locks and close these circuit breakers on the P11 panel:
- (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD

S 865-063

- (36) Push the arming switch for the slat alternate drive, on the P3 panel, to disarm the slat alternate drives (ALTN switch light goes off at the LE side).

S 215-064

- (37) Make sure the amber LEADING EDGE light, on the P3 panel, goes off and the LE SLAT DISAGREE message does not show in the EICAS display.

S 225-065

- (38) Do these checks on the clearance between the sensor switches and the targets for the adjusted outboard slat (Fig. 507):

EFFECTIVITY

ALL

27-81-02

02

Page 528  
Apr 22/08

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (a) Pressurize the center hydraulic system (Ref 29-11-00).
- (b) Remove the DO-NOT-OPERATE tag from the flap control lever and move the lever to the 20-unit detent.
- (c) Make sure the flaps move to the 20-degree position, and the slats move to the intermediate position.
- (d) Remove the power from the center hydraulic system (Ref 29-11-00).
- (e) Install the groundlocks in the inboard and outboard slat PDUs (Fig. 505).

**CAUTION:** INCORRECT SENSOR TARGET CLEARANCES CAN CAUSE NUISANCE INDICATIONS (LE SLAT ASYM EICAS MESSAGE, LE LIGHT ILLUMINATION, TAKE OFF CONFIGURATION WARNING FLAPS OR STICK SHAKER ACTIVATION). THE TARGET WASHERS HAVE DIFFERENT PROFILES. THE EXISTING TARGET WASHER IS INTERCHANGEABLE BY SHIPSET ONLY. TARGET WASHERS ARE NOT INTERMIXABLE. NOTE THAT TARGET WASHERS VARY DEPENDENT ON LOCATION AND THAT INCORRECT PART NUMBER INSTALLATION CAN CAUSE NUISANCE INDICATIONS.

- (f) At the inboard auxiliary track arm, make sure there is permitted clearance between the sensor switch and the target on the auxiliary track arm (View D, Fig. 507) at the slat intermediate (take-off) position.

**NOTE:** Measure the clearance with the auxiliary track in the center of the auxiliary track arm. Adjust the sensor switch position, if it is necessary, to get the applicable sensor/target clearance (AMM 27-88-01/201). SB 57-0052 adds step washers and reworks target washers and bolts.

- (g) Remove the groundlocks from the inboard and outboard slat PDUs (Fig. 505).

EFFECTIVITY

ALL

Apr 22/04

S 295-131

**WARNING:** DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

- (39) Keep clean and free of all unwanted objects (FOD), the housing (can) assemblies of the slat main tracks, at all time.

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (a) Pressurize the center hydraulic system (Ref 29-11-00).
- (b) Move the flap control lever to the zero (FLAPS UP) detent, and make sure the flaps and slats move to the fully retracted position.
- (c) Remove the power from the center hydraulic system (Ref 29-11-00).
- (d) Install the groundlocks in the inboard and outboard slat PDUs (Fig. 505).

**CAUTION:** INCORRECT SENSOR TARGET CLEARANCES CAN CAUSE NUISANCE INDICATIONS (LE SLAT ASYM EICAS MESSAGE, LE LIGHT ILLUMINATION, TAKE OFF CONFIGURATION WARNING FLAPS OR STICK SHAKER ACTIVATION). THE TARGET WASHERS HAVE DIFFERENT PROFILES. THE EXISTING TARGET WASHER IS INTERCHANGEABLE BY SHIPSET ONLY. TARGET WASHERS ARE NOT INTERMIXABLE. NOTE THAT TARGET WASHERS VARY DEPENDENT ON LOCATION AND THAT INCORRECT PART NUMBER INSTALLATION CAN CAUSE NUISANCE INDICATIONS.

- (e) If you installed a new outboard slat, make sure to install and adjust the sensor switch targets on the slat auxiliary track arms (AMM 27-88-01/201).

EFFECTIVITY

ALL

27-81-02

02

Page 531  
Apr 22/08

- (f) At the inboard and outboard auxiliary track arms, make sure there is permitted clearance between the sensor switch and the target (View E, Fig. 507) at the slat fully retracted (cruise) position.

**NOTE:** Do not adjust the sensor switch. Adjust the retract target on the auxiliary track arm, if it is necessary, to get the permitted sensor/target clearance (AMM 27-88-01/201).  
SB 57-0052 adds step washers and reworks target washers and bolts.

S 095-066

- (40) Remove the tape and release the aerodynamic seals from the retracted position.

S 295-132

**WARNING:** DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

- (41) Keep clean and free of all unwanted objects (FOD), the housing (can) assemblies of the slat main tracks, at all time.

S 415-067

- (42) Install the fixed leading edge lower access panels (Ref 06-44-00).

**NOTE:** Do not close the access panels, 511BB and 611BB, for the inboard and outboard slat PDUs at this time.

S 225-102

**CAUTION:** DO NOT OPERATE THE SLATS WITH THE SUPPORT/ATTACHMENT BRACKETS DOWN (LOOSE AT ONE END) IF THE CONTROL ROD DOOR (ACTUATOR SEAL DOOR) IS REMOVED. MAKE SURE YOU HAVE THE SUPPORT/ATTACHMENT BRACKETS UP (OUT OF THE WAY). IMPACT DAMAGE TO THE FIXED SPLICE PLATE ON THE LEADING EDGE LOWER SURFACE CAN OCCUR.

- (43) Make sure the door attached to the slat control rods aligns (without interference) with the lower fixed leading edge (Detail B, Fig. 506). Adjust the door if it is necessary.

S 225-069

- (44) Do these checks on the outboard slat clearances, mismatch, and seals (Fig. 503):  
(a) Make sure the mismatch is not more than the limit shown (Detail A).

EFFECTIVITY

ALL

27-81-02

02

Page 532  
Apr 22/08

- (b) Make sure the seal clearance between the outboard slats is correct as shown (Detail B).
- (c) Make sure the seal clearance between slat No. 5 (or No. 8) and the adjacent structure is correct as shown (Detail C). Adjust if necessary.

S 095-070

- (45) Remove the groundlocks from the inboard and outboard slat PDUs (Fig. 505).

S 415-071

- (46) Close the access panels, 511BB and 611BB, for the inboard and outboard slat PDUs (Ref 06-44-00).

S 715-072

- (47) Do the steps in the "Outboard Leading Edge Slat - Test" procedure below.

TASK 27-81-02-715-073

3. Outboard Leading Edge Slat - Test

A. References

B. Access

(1) Location Zones

120	Main Equipment Center (Right)
144	Right MLG Wheel Well
211/212	Control Cabin
410	No. 1 Power Plant
420	No. 2 Power Plant
500/600	Left Wing/Right Wing
710	Nose Landing Gear and Doors
730/740	Left/Right Main Landing Gear and Doors

(2) Access Panels

119AL	Main Equipment Center
-------	-----------------------

C. Prepare for the Test

S 215-074

- (1) Make sure the flaps and slats are in the fully retracted position.

S 215-075

- (2) Make sure the flap control lever is in the zero (FLAPS UP) detent.

EFFECTIVITY

ALL

27-81-02

02

Page 533  
Apr 22/08

S 015-076

- (3) Open the access door, 119AL, to get access to the main equipment center (Ref 06-41-00).

S 215-109

- (4) Make sure you close these circuit breakers on the P11 Overhead Panel:

- (a) 11J02, EICAS CMPTR L
- (b) 11J03, EICAS UPPER DISPL
- (c) 11J29, EICAS CMPTR R
- (d) 11J30, EICAS LOWER DSPL
- (e) 11J31, EICAS DSPL SW
- (f) 11J32, EICAS PILOT DISPLAY, or  
DISPLAY SELECT

D. Test for the Outboard Slat

**NOTE:** During this test, make sure the EICAS messages do not show on the EICAS display and LEADING EDGE light on the first officer's instrument panel, P3, does not come on.

S 865-079

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (1) Pressurize the center hydraulic system (Ref 29-11-00).

S 865-080

- (2) Move the flap control lever to the 20-unit detent and make sure the flaps move to the 20-degree position, and the slats move to the intermediate position.

S 865-081

- (3) Move the flap control lever to the 30-unit detent and make sure the flaps and slats move to the fully extended position.

S 865-082

- (4) Move the flap control lever back to the 20 and the zero unit detents and make sure the flaps and slats move to the correct positions as before.

EFFECTIVITY

ALL

27-81-02

02

Page 534  
Apr 22/08

S 725-083

- (5) Operate the test switch on the panel of the flap/slat electronics unit (FSEU) at the E2 equipment rack, and look for a no-fault indication.

S 725-084

- (6) Operate the test switch on the proximity switch electronics unit (PSEU) BITE panel on the E1 equipment rack, and make sure there is a no fault indication (AMM 27-88-01/201, FIM 32-09-03/101, Fig. 103).

E. Put the Airplane Back to Its Usual Condition

S 095-085

- (1) Remove the DO-NOT-OPERATE tag from the position selector switch, on the P3 panel, for the flap/slat alternate drive.

S 215-086

- (2) Make sure the position selector switch is in the NORM detent.

S 415-087

- (3) If removed, install all access panels below the wing (Ref 06-44-00).

S 415-088

- (4) Close the access door, 119AL, to the main equipment center (Ref 06-41-00).

S 095-089

**WARNING: USE THE PROCEDURE IN AMM 32-00-15/201 TO REMOVE THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.**

- (5) Remove the door locks from the landing gear doors and close the doors (Ref 32-00-15).

S 445-090

- (6) Do the activation procedure for the thrust reverser (Ref 78-31-00).

S 865-095

- (7) Remove the power from the center hydraulic system (Ref 29-11-00).

S 865-096

- (8) Remove electrical power if it is not necessary (Ref 24-22-00).

EFFECTIVITY

ALL

KRUEGER SEAL FLAP SEAL – REMOVAL/INSTALLATION

1. General

- A. This procedure contains the removal and the installation tasks for the seals on the krueger seal flap.

TASK 27-81-03-024-001

2. Krueger Seal Flap Seal – Removal

A. Equipment

- (1) Leading Edge Slats Groundlock – A27007-1  
(2 Necessary)
- (2) TE Flap PDU Lock – A27009-7
- (3) Circuit Breaker Lockout Clip  
(4 Necessary) Commercially Available

B. References

- (1) 06-44-00/201, Wing Access Doors and Panels
- (2) 24-22-00/201, Electrical Power – Control
- (3) 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems
- (4) 27-81-04/201, Krueger Seal Flap and Krueger Seal Flap Drive
- (5) 32-00-15/201, Landing Gear Door Locks
- (6) 32-00-20/201, Landing Gear Downlocks
- (7) 78-31-00/201, Thrust Reverser System

C. Access

(1) Location Zones

- 144 Right MLG Wheel Well
- 211/212 Control Cabin
- 410 No. 1 Power Plant
- 420 No. 2 Power Plant
- 510/610 Wing Leading Edge – Inboard
- 710 Nose Landing Gear and Doors
- 730/740 Left/Right Main Landing Gear and Doors

(2) Access Panels

- 511BB LE Slat Power Drive Unit – Outboard (Left)
- 511QB Lower LE Structure (Left)
- 511RB Lower LE Structure (Left)
- 611BB LE Slat Power Drive Unit – Inboard (Right)
- 611QB Lower LE Structure (Right)
- 611RB Lower LE Structure (Right)

D. Prepare for the Removal

S 214-002

- (1) Make sure the downlocks are installed on the nose and main landing gear (Ref 32-00-20).

S 494-003

**WARNING:** USE AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Open the doors for the landing gear and install the door locks (Ref 32-00-15).

S 044-004

**WARNING:** DO THE THRUST REVERSER DEACTIVATION PROCEDURE TO PREVENT THE OPERATION OF THE THRUST REVERSER. THE ACCIDENTAL OPERATION OF THE THRUST REVERSER CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (3) Do this procedure: Thrust Reverser Deactivation for Ground Maintenance (AMM 78-31-00/201).

S 214-005

- (4) Make sure the flaps and slats are in the fully retracted position.

S 214-006

- (5) Make sure the flap control lever is in the zero (FLAPS UP) detent.

S 864-007

- (6) Supply electrical power (Ref 24-22-00).

S 864-008

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (7) Pressurize the center hydraulic system (Ref 29-11-00).

S 864-009

- (8) Move the flap control lever to the 30-unit detent, and make sure the flaps, slats, and the krueger seal flaps move to the fully extended position.

ALL

27-81-03

01

Page 407  
Aug 22/01

- S 494-010
- (9) Attach a DO-NOT-OPERATE tag to the flap control lever.
- S 864-011
- (10) Remove the power from the center hydraulic system (Ref 29-11-00).
- S 494-012
- (11) Install the PDU lock in the TE flap power drive unit (PDU) (Fig. 402).
- S 014-013
- (12) Remove the access panels, 511BB and 611BB, to get access to the outboard and inboard slat PDUs (Ref 06-44-00).
- S 494-014
- (13) Install the groundlocks on the inboard and outboard slat PDUs (Fig. 403).
- S 864-015
- (14) Open these circuit breakers on the overhead panel, P11, and install circuit breaker locks and DO-NOT-CLOSE tags:
- (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD
  - (c) 11J24, FLAPS ALTN CONT
- S 864-016
- (15) Open these circuit breakers on the main power distribution panel, P6, and install circuit breaker locks and DO-NOT-CLOSE tags:
- (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6D24, ALTN FLAP PWR
  - (c) 6F24, ALTN SLAT OUTBD PWR
- S 014-017
- (16) Remove these access panels, 511QB and 511RB (on the left wing), or, 611QB and 611RB (on the right wing), to get access to the krueger seal flap drive and seals.

D. Trim the Krueger Seal Flap (Fig. 401)

**NOTE:** If you installed a new krueger seal flap, do this procedure before you install the seals. It is not necessary to trim the flap if you installed the same flap that you removed before (Ref 27-81-04).

S 214-020

- (1) Make sure the flaps, slats, and the krueger seal flaps are in the fully extended position.

S 214-021

- (2) Make sure the flap control lever is in the 30-unit detent.

S 094-022

- (3) Remove the PDU lock in the TE flap power drive unit (PDU) (Fig. 402).

S 094-023

- (4) Remove the groundlocks from the inboard and outboard slat PDUs (Fig. 403).

S 864-024

- (5) Supply electrical power (Ref 24-22-00).

S 864-025

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (6) Pressurize the center hydraulic system (Ref 29-11-00).

Nov 10/90

S 864-043

(24) Remove the power from the center hydraulic system (Ref 29-11-00).

S 494-044

(25) Install the PDU lock in the TE flap PDU (Fig. 402).

S 494-045

(26) Install the groundlocks in the inboard and outboard slat PDUs (Fig. 403).

E. Install the Seals (Fig. 401)

**NOTE:** The seals for the krueger seal flap are installed with the flap at the fully extended position (flap control lever in the 30-unit detent).

S 214-046

(1) Make sure that the joints A, B, and C are straight as shown (Detail A).

**NOTE:** These joints will align in a straight line when the flap is in the fully extended position.

S 324-047

(2) If you installed a new flap, drill five 0.190-0.199 inch (4.8-5.0 mm) diameter holes on the flap as shown (Detail D) for the installation of Seal II.

**NOTE:** Use Seal II with the retainer as a template to identify the hole locations on the flap.

S 424-048

(3) Install Seal II and retainer to the flap with five bolts, washers, and nuts (View B-B). Install the bolts with wet sealant.

EFFECTIVITY

ALL

27-81-03

01

Page 413  
Dec 22/01

S 424-049

- (4) Attach the seal support plate, Seal I, and retainer to the flap with six bolts, washers, and nuts (View C-C).

**NOTE:** Install the bolts with wet sealant. Apply sealant between the flap surface and the seal support plate.

S 324-050

- (5) Cut the edge of the seal support plate if it is necessary to get the correct clearance as shown (Detail B).

**NOTE:** Make a small chamfer to all sharp corners and edges.

S 214-051

- (6) At the flap fully extended position, make sure the seal touches the fixed leading edge skin along the full length of the seal.

S 424-052

- (7) Install Seal III and retainer with two bolts, washers, and nuts (Detail D).

F. Put the Airplane Back to Its Usual Condition

S 094-053

- (1) Remove the PDU lock from the TE flap PDU (Fig. 402).

S 094-054

- (2) Remove the groundlocks from the inboard and outboard slat PDUs (Fig. 403).

S 864-055

- (3) Supply electrical power (Ref 24-22-00).

S 864-056

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (4) Pressurize the center hydraulic system (Ref 29-11-00).

KRUEGER SEAL FLAP AND KRUEGER SEAL FLAP DRIVE – MAINTENANCE PRACTICES

1. General

A. This procedure contains these four tasks:

- The Krueger Seal Flap and Krueger Seal Flap Drive Removal
- The Krueger Seal Flap and Krueger Seal Flap Drive Installation
- The Krueger Seal Flap and Flap Drive Adjustment/Test
- The Krueger Seal Flap and Flap Drive Inspection Check

TASK 27-81-04-022-001

2. The Krueger Seal Flap and Krueger Seal Flap Drive – Removal

A. General

- (1) This task contains two topics, one to remove the krueger seal flap, and one to remove the krueger seal flap drive. Because this task contains two procedures, it is only necessary do the group of steps applicable to your maintenance.

To start one of these procedures, do the steps in the "Prepare for the Removal" topic before you remove the component.

B. Equipment

- (1) Leading Edge Slats Groundlock – A27007-1  
(2 Necessary)
- (2) TE Flap PDU Lock – A27009-7
- (3) Circuit Breaker Lockout Clip  
(4 Necessary) Commercially Available

C. References

- (1) 06-44-00/201, Wing Access Doors and Panels
- (2) 24-22-00/201, Electrical Power – Control

D. Access

(1) Location Zones

144	Right MLG Wheel Well
211/212	Control Cabin
410	No. 1 Power Plant
420	No. 2 Power Plant
510/610	Wing Leading Edge - Inboard
710	Nose Landing Gear and Doors
730/740	Left/Right Main Landing Gear and Doors

(2) Access Panels

511BB	LE Slat Power Drive Unit - Outboard (Left)
611BB	LE Slat Power Drive Unit - Inboard (Right)

E. Prepare for the Removal

S 212-002

- (1) Make sure the downlocks are installed on the nose and main landing gear (Ref 32-00-20).

S 492-003

**WARNING:** USE AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Open the doors for the landing gear and install the door locks (Ref 32-00-15).

S 042-004

**WARNING:** DO THE THRUST REVERSER DEACTIVATION PRECEDURE TO PREVENT THE OPERATION OF THE THRUST REVERSER. THE ACCIDENTAL OPERATION OF THE THRUST REVERSER CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (3) Do this procedure: Thrust Reverser Deactivation for Ground Maintenance (AMM 78-31-00/201).

S 212-005

- (4) Make sure the trailing edge (TE) flaps and the leading edge (LE) slats are in the fully retracted position.

S 212-006

- (5) Make sure the flap control lever is in the zero (FLAPS UP) detent.

S 862-007

- (6) Supply electrical power (Ref 24-22-00).

EFFECTIVITY

ALL

27-81-04

01

Page 202  
Aug 22/01

S 862-008

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

(7) Pressurize the center hydraulic system (Ref 29-11-00).

S 862-009

(8) Move the flap control lever to the 30-unit detent, and make sure the flaps and slats move to the fully extended position.

S 492-010

(9) Attach a DO-NOT-OPERATE tag on the flap control lever.

S 862-011

(10) Remove the power from the center hydraulic system (Ref 29-11-00).

S 492-012

(11) Install the PDU lock in the TE flap PDU (Fig. 205).

S 012-013

(12) Open the access panels, 511BB and 611BB, to get access to the outboard and inboard slat PDUs (Ref 06-44-00).

S 492-014

(13) Install the groundlocks on the inboard and outboard slat PDUs (Fig. 206).

S 862-015

(14) Open these circuit breakers on the overhead panel, P11, and install circuit breaker locks and DO-NOT-CLOSE tags:

- (a) 11H23, SLAT ALTN CONT INBD
- (b) 11H24, SLAT ALTN CONT OUTBD
- (c) 11J24, FLAPS ALTN CONT

S 862-016

(15) Open these circuit breakers on the main power distribution panel, P6, and install circuit breaker locks and DO-NOT-CLOSE tags:

- (a) 6D21, ALTN SLAT INBD PWR
- (b) 6D24, ALTN FLAP PWR
- (c) 6F24, ALTN SLAT OUTBD PWR

S 012-017

- (16) Remove the fixed lower access panels at the inboard leading edge if it is necessary to get access to the krueger seal flap drive (Ref 06-44-00).

F. Krueger Seal Flap Removal

S 032-018

- (1) Disconnect the flap drive link from the krueger seal flap (View A-A, Fig. 202).

S 032-019

- (2) Disconnect the bull nose drive link from the flap fitting (View A-A, Fig. 201).

S 032-020

- (3) Disconnect the krueger seal flap at the inboard hinge (View C-C) and the outboard hinge (View B-B, Fig. 201).

S 022-021

- (4) Remove the seal from the flap if you will install a new flap that does not have a seal (Ref 27-81-03).

G. Krueger Seal Flap Drive Removal (Fig. 202)

S 032-022

- (1) Disconnect the linkages as necessary to remove the components of the flap drive (View A-A thru E-E).

TASK 27-81-04-422-023

3. The Krueger Seal Flap and Krueger Seal Flap Drive - Installation

A. General

- (1) This task contains two topics, one to install the krueger seal flap, and one to install the krueger seal flap drive. Because this task contains two procedures, it is only necessary do the group of steps applicable to your maintenance.

To start one of these procedures, do the steps in the "Prepare for the Installation" topic before you do the installation procedure.

B. Consumable Materials

- (1) D00633 Grease - BMS 3-33 (Preferred)  
D00013 Grease - MIL-PRF-23827 (Optional)

C. References

- (1) 06-44-00/201, Wing Access Doors and Panels
- (2) 24-22-00/201, Electrical Power - Control
- (3) 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems

- 1 APPLY A LIGHT LAYER OF GREASE BEFORE THE INSTALLATION.
- 2 JOINTS A,B,C MUST BE STRAIGHT WHEN YOU CONNECT THE DRIVE SHAFT TO THE ROTARY ACTUATOR. THE JOINTS ARE ALIGNED WHEN THE FLAP DRIVE LINKAGE IS IN POSITION 1 OR 2, BUT ONLY POSITION 1 IS THE CORRECT POSITION. YOU HAVE SET POSITION 1 CORRECTLY WHEN THE FLAP DRIVE LINK AND ROTARY ACTUATOR ARE FULLY DOWN AND JOINTS A, B AND C ARE ALIGNED.
- 3 INSTALL A LOCKWIRE TO THE JAMNUT WITH THE DOUBLE TWIST PROCEDURE (AMM 20-10-23).
- 4 ADJUST THE BULL NOSE CONTROL ROD TO GET THIS DIMENSION TO AGREE.

D. Access

(1) Location Zones

144	Right MLG Wheel Well
211/212	Control Cabin
410	No. 1 Power Plant
420	No. 2 Power Plant
510/610	Wing Leading Edge - Inboard
710	Nose Landing Gear and Doors
730/740	Left/Right Main Landing Gear and Doors

(2) Access Panels

511BB	LE Slat Power Drive Unit - Outboard (Left)
611BB	LE Slat Power Drive Unit - Inboard (Right)

E. Prepare for the Installation

S 212-024

- (1) Make sure the flaps and slats are in the fully extended position.

S 212-025

- (2) Make sure the flap control lever is in the 30-unit detent.

S 212-026

- (3) Make sure the power is removed from the center hydraulic system (Ref 29-11-00).

S 212-027

- (4) Make sure the flap and slat alternate drives are not armed (ALTN switch lights are off on P3).

S 212-028

- (5) Make sure you deactivate the engine thrust reverser (AMM 78-31-00/201).

F. Krueger Seal Flap Drive Installation

**NOTE:** Refer to the "Krueger Seal Flap and Flap Drive Inspection Check" task for the wear limits of the components used in this installation.

S 432-029

- (1) Install the flap drive linkages that you removed, and tighten the nuts at these locations as shown (Fig. 202):  
(a) View A-A: 100-140 pound-inches (11.3-15.8 mm)

EFFECTIVITY

ALL

27-81-04

02

Page 231  
Aug 22/08

- (b) View B-B: 160-190 pound-inches (18.0-21.4 newton-meters) at the upper connection  
160-190 pound-inches (18.1-21.4 newton-meters) at the middle connection  
50-75 pound-inches (5.7-8.4 newton-meters) at the lower connection.
- (c) View C-C: 160-190 pound-inches (18.1-21.4 newton-meters).
- (d) View D-D: 100-140 pound-inches (11.3-15.8 newton-meters).
- (e) View E-E: 160-190 pound-inches (18.1-21.4 newton-meters) at the aft connection  
320-440 pound-inches (36.2-49.7 newton-meters) at the forward connection.

S 432-030

- (2) Connect the drive shaft to the rotary actuator for the krueger seal flap at the input universal joint (Fig. 203).

**NOTE:** It is not necessary to connect the drive shaft at the output universal joint, adjacent to the outboard rotary actuator of the inboard slat. It will be necessary to disconnect the output universal joint for the subsequent flap drive adjustment.

S 822-031

- (3) Adjust the krueger seal flap drive.

**NOTE:** Put the airplane back to its usual condition after you do the flap drive adjustment. Use the procedure in the "Krueger Seal Flap and Flap Drive Adjustment/Test" task.

#### G. Krueger Seal Flap Installation

**NOTE:** Refer to the "Krueger Seal Flap and Flap Drive Inspection Check" task for the wear limits of the components used in this installation.

S 642-032

- (1) Apply a light layer of grease to the bolts before each installation.

S 432-033

- (2) Connect the flap inboard hinge to the hinge fitting with the bolt, nut, and washers (View C-C, Fig. 201). Tighten the nut to 100-140 pound-inches.

S 432-034

- (3) Connect the flap outboard hinge to the hinge fitting with the bolt, nut, and washers (View B-B, Fig. 201). Tighten the nut to 50-75 pound-inches.

EFFECTIVITY

ALL

Page 232  
Aug 22/08

- S 432-035
- (4) Connect the bull nose drive link to the flap fitting with the bolt, nut, and washers (View A-A, Fig. 201). Tighten the nut to 50-75 pound-inches.
- S 432-036
- (5) Connect the flap drive link to the krueger seal flap with the bolt, nut, and washers (View A-A, Fig. 202). Tighten the nut to 100-140 pound-inches.
- S 822-037
- (6) Adjust the krueger seal flap.

**NOTE:** Put the airplane back to its usual condition after you do the flap adjustment. Use the procedure in the "Krueger Seal Flap and Flap Drive Adjustment/Test" task.

TASK 27-81-04-822-105

4. The Krueger Seal Flap and Krueger Seal Flap Drive - Adjustment/Test

A. General

- (1) This task contains the adjustment/test procedure for the krueger seal flap and the krueger seal flap drive.  
The krueger seal flap and the krueger seal flap drive adjustments are done in production with the airplane in the "rigging" position, that is on jigs. This position, with no engines installed and no weight to account for fuel load, best represents the in-flight configuration of the wing. This "unloaded" configuration is the best on the "ground" configuration for these adjustments. However, it is also acceptable to do these adjustments with the airplane in the loaded condition (with fuel and engine installed) since the weight factor has no effect on the krueger seal flap and krueger seal flap drive adjustments.

B. Equipment

- (1) 50-Pound Weight  
(2) Leading Edge Slats Groundlock - A27007-1  
(2 Necessary)  
(3) TE Flap PDU Lock - A27009-7  
(4) Circuit Breaker Lockout Clip  
(4 Necessary) Commercially Available

C. References

420	No. 2 Power Plant
510/610	Wing Leading Edge - Inboard
710	Nose Landing Gear and Doors
730/740	Left/Right Main Landing Gear and Doors

(2) Access Panels

511BB	LE Slat Power Drive Unit - Outboard (Left)
611BB	LE Slat Power Drive Unit - Inboard (Right)

E. Prepare for the Adjustment

S 492-039

**WARNING:** USE AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (1) Open the doors for the landing gear and install the door locks (Ref 32-00-15).

S 042-041

**WARNING:** DO THE THRUST REVERSER DEACTIVATION PRECEDURE TO PREVENT THE OPERATION OF THE THRUST REVERSER. THE ACCIDENTAL OPERATION OF THE THRUST REVERSER CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Do this procedure: Thrust Reverser Deactivation for Ground Maintenance (AMM 78-31-00/201).

S 862-042

- (3) Open these circuit breakers on the overhead panel, P11, and install circuit breaker locks and DO-NOT-CLOSE tags:
- (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD
  - (c) 11J24, FLAPS ALTN CONT

S 862-043

- (4) Open these circuit breakers on the main power distribution panel, P6, and install circuit breaker locks and DO-NOT-CLOSE tags:
- (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6D24, ALTN FLAP PWR
  - (c) 6F24, ALTN SLAT OUTBD PWR

S 212-044

- (5) Make sure the flaps and slats are in the fully extended position.

EFFECTIVITY

ALL

27-81-04

01

Page 234  
Aug 22/08

- S 212-045
- (6) Make sure the flap control lever is in the 30-unit detent.
- S 212-046
- (7) Make sure the power is removed from the center hydraulic system (Ref 29-11-00).
- S 212-047
- (8) Make sure the flap and slat alternate drives are not armed (ALTN switch lights are off at P3).
- S 492-048
- (9) Install the PDU lock in the TE flap PDU (Fig. 205).
- S 012-049
- (10) If installed, remove the access panels, 511BB and 611BB, to get access to the inboard and outboard slat power drive units (PDU) (Ref 06-44-00).
- S 492-050
- (11) Install the groundlocks in the inboard and outboard slat PDUs (Fig. 206).
- S 012-051
- (12) Remove the fixed lower access panels at the inboard leading edge as necessary to get access to the krueger seal flap drive (Ref 06-44-00).

F. Krueger Seal Flap Drive - Adjustment

- S 032-052
- (1) Disconnect the drive shaft for the krueger seal flap at the output universal joint, adjacent to the outboard rotary actuator of the inboard slat (Section A-A, Fig. 203).

S 032-109

**CAUTION:** MAKE SURE THE KRUEGER SEAL FLAP IS FULLY RETRACTED IF YOU NEED TO CONNECT THE DRIVE SHAFT. DAMAGE TO THE DRIVE SHAFT CAN OCCUR IF THE DRIVE SHAFT IS CONNECTED WITH THE KRUEGER SEAL FLAP EXTENDED.

- (2) Remove the sleeve from the drive shaft splines.

EFFECTIVITY

ALL

27-81-04

02.1

Page 235  
Aug 22/09

S 822-054

**CAUTION:** MAKE SURE THE KRUEGER SEAL FLAP IS FULLY EXTENDED, AND THAT THE JOINTS A, B, AND C, ARE STRAIGHT WHILE THE FLAP DRIVE LINK IS IN POSITION 1, AS SHOWN IN FIG. 204. YOU CAN CAUSE DAMAGE TO THE KRUEGER SEAL FLAP DRIVE IF YOU ADJUST THE FLAP DRIVE WITH THE FLAP DRIVE LINK IN POSITION 2.

- (3) Move the flap drive link to align joints A, B, and C to a straight line while the flap drive link is in position 1. Keep this position while you do the adjustments that follow (Detail A, Fig. 204):

**NOTE:** The position 1 is the correct position for the maximum flap extension.

- (a) Disconnect the bull nose control rod at joint D (View A-A).
- (b) Remove the lockwire on the jamnut and adjust the length of the bull nose control rod to get the correct dimension as shown (Detail A).
- (c) Tighten the control rod jamnut to 90-125 pound-inches (10.2-14.1 newton-meters), and install a lockwire with the double twist procedure (Ref 20-10-23).
- (d) Apply a light layer of grease to the bolt that connects the bull nose control rod to the bull nose fitting.
- (e) Connect the bull nose control rod at joint D with the bolt, washers, and nut. Tighten the nut to 50-75 pound-inches (5.7-8.4 newton-meters) (View A-A).

S 422-055

- (4) Install and adjust the seal for the krueger seal flap if it is necessary (Ref 27-81-03).

S 032-056

- (5) Disconnect joint E in the krueger seal flap mechanism (Detail A, Fig. 204).

**NOTE:** This will permit you to manually open and close the krueger seal flap.

S 822-057

- (6) Adjust the stop screw to get the flap to align with the fixed leading edge while the stop screw touches the retainer as shown (Detail B and View B-B, Fig. 204).

**NOTE:** Align the surface by  $\pm 0.02$  inch ( $\pm 0.50$  mm) for at least 25% of an edge, and by  $\pm 0.04$  inch ( $\pm 1.0$  mm) for a distance of no more than 25% of an edge.

EFFECTIVITY

ALL

27-81-04

02

Page 236  
Aug 22/08

- S 432-058
- (7) Tighten the stop screw jamnut to 100-140 pound-inches (11.3-15.8 newton-meters) and install a lockwire with the double twist procedure (Ref 20-10-23).
- S 642-059
- (8) Apply a light layer of grease to the bolt that connects joint E (Detail A, Fig. 204).
- S 432-060
- (9) Connect joint E with the bolt, washers, and nut as shown (View B-B, Fig. 202). Tighten the nut to 50-75 pound-inches (5.7-8.4 newton-meters).
- S 092-061
- (10) Remove the PDU lock from the TE flap PDU (Fig. 205).
- S 092-062
- (11) Remove the groundlocks from the inboard and outboard slat PDUs (Fig. 206).
- S 982-063
- (12) Keep the drive shaft for the krueger seal flap away from the movement of the inboard slat when you retract the inboard slats in the subsequent steps.
- S 862-064
- (13) Supply electrical power (Ref 24-22-00).
- S 862-065

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (14) Pressurize the center hydraulic system (Ref 29-11-00).
- S 862-066
- (15) Remove the DO-NOT-OPERATE tag from the flap control lever, and move the flap control lever to the zero (FLAPS UP) detent.

EFFECTIVITY

ALL

27-81-04

02

Page 237  
Aug 22/08

S 212-067

- (16) Make sure the flaps and slats move to the fully retracted position.

S 492-068

- (17) Attach a DO-NOT-OPERATE tag to the flap control lever.

S 862-069

- (18) Remove the power from the center hydraulic system (Ref 29-11-00).

S 492-070

- (19) Install the groundlocks in the inboard and outboard slat PDUs (Fig. 206).

S 492-071

- (20) Install the PDU lock in the TE flap PDU (Fig. 205).

S 492-072

- (21) Remove the fastener at the lower inboard corner of the krueger seal flap and attach a 50-pound weight to the flap (Detail B, Fig. 204).

S 982-073

- (22) Manually turn the drive shaft to retract the krueger seal flap, until the flap touches the stop screw.

**NOTE:** Make sure that if you turn the drive shaft in the opposite direction by a small increment, the flap will not touch the stop screw.

S 432-110

**CAUTION:** MAKE SURE THAT THE KRUEGER SEAL FLAP IS FULLY RETRACTED BEFORE YOU CONNECT THE DRIVE SHAFT. DAMAGE TO THE DRIVE SHAFT CAN OCCUR IF YOU CONNECT THE DRIVE SHAFT WHILE THE KRUEGER SEAL FLAP IS EXTENDED.

- (23) Install the sleeve on the drive shaft splines.

S 432-075

- (24) Connect the drive shaft at the output universal joint, adjacent to the outboard rotary actuator of the inboard slat. Keep the krueger seal flap against the stop screw while you connect the drive shaft (Section A-A, Fig. 203).

**NOTE:** Increase the flap contact load on the on the stop screw by no more than one spline when you engage the splines between the sleeve and the drive shaft.

EFFECTIVITY

ALL

27-81-04

01.1

Page 238  
Aug 22/09

S 092-076

- (25) Remove the 50-pound weight from the flap and install the fastener.

S 422-077

- (26) Install and adjust the remaining seals (Ref 27-81-03).

S 092-078

- (27) Remove the groundlocks from the inboard and outboard slat PDUs (Fig. 206).

S 092-079

- (28) Remove the PDU lock from the TE flap PDU (Fig. 205).

S 862-080

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (29) Pressurize the center hydraulic system (Ref 29-11-00).

S 862-081

- (30) Move the flap control lever from the zero (FLAPS UP) detent to the 30-unit detent, then back to the zero detent. Make sure the krueger seal flap moves correctly with the inboard slats.

G. Put the Airplane Back to Its Usual Condition

S 092-083

- (1) If installed, remove the PDU lock from the TE flap PDU (Fig. 205).

S 092-084

- (2) If installed, remove the groundlocks from the inboard and outboard slat PDUs (Fig. 206).

S 412-085

- (3) Install the access panels, 511BB and 611BB, to close the access to the inboard and outboard slat PDUs (Ref 06-44-00).

S 412-086

- (4) Install the fixed lower access panels for the leading edge (Ref 06-44-00).

- (5) Remove the circuit breaker locks and DO-NOT-CLOSE tags, and close these circuit breakers on the P11 panel:
- (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD
  - (c) 11J24, FLAPS ALTN CONT

S 862-088

- (6) Remove the circuit breaker locks and DO-NOT-CLOSE tags, and close these circuit breakers on the P6 panel:
- (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6D24, ALTN FLAP PWR
  - (c) 6F24, ALTN SLAT OUTBD PWR

S 092-089

**WARNING:** USE AMM 32-00-15/201 TO REMOVE THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (7) Remove the door locks from the landing gear doors and close the doors (Ref 32-00-15).

S 442-090

- (8) Do the activation procedure for the thrust reverser (AMM 78-31-00/201).

S 862-095

- (9) Remove the power from the center hydraulic system (Ref 29-11-00).

S 862-096

- (10) Remove electrical power if it is not necessary (Ref 24-22-00).

TASK 27-81-04-202-097

5. Krueger Seal Flap and Flap Drive - Inspection/Check

A. General

- (1) The procedure in this task only has illustrations and wear limit tables, which show the data for wear limits. There are no procedures for access, removal, or installation of the parts. Refer to the krueger seal flap and krueger seal flap drive removal and installation topics to do these tasks.

LEADING EDGE SLAT AFT QUADRANT AND LEADING EDGE SLAT AFT QUADRANT  
CONTROL COMPONENTS - REMOVAL/INSTALLATION

1. General

- A. This procedure contains the removal and the installation tasks for the leading edge slat aft quadrant and the quadrant control components.

TASK 27-81-05-024-001

2. Slat Aft Quadrant and Quadrant Control Components - Removal

A. General

- (1) This task contains the removal procedure for these components:

- the Slat Aft Quadrant
- the Aft Quadrant Drive Shaft
- the Non-Adjustable Control Rod
- the Adjustable Control Rod.

Because this task contains four procedures, only do the applicable procedure to remove the component.

To start one of these procedures, do the steps in the "Prepare for the Removal" topic, then do the applicable group of steps to remove the component.

B. Equipment

- (1) Rig Pins from Set A20004-XX (Ref 20-10-24):  
(a) LE1 - P/N A20004-17  
(b) LE2 - P/N A20004-9  
(c) LE5 - P/N A20004-9  
(d) TE1 - P/N A20004-9  
(2) LE Slat Groundlock - A27007-1 (2 Necessary)  
(3) TE Flap PDU Lock - A27009-7  
(4) Circuit Breaker Lockout Clip,  
(Commercially Available)

C. References

D. Access

(1) Location Zones

- 125/126 Area Aft of the Forward Cargo Compartment
- 144 Right MLG Wheel Well
- 211/212 Control Cabin
- 710 Nose Landing Gear and Doors
- 730/740 Left/Right Main Landing Gear and Doors

(2) Access Panels

- 511BB LE Slant Power Drive Unit - Outboard (Left)
- 611BB LE Slant Power Drive Unit - Inboard (Right)

E. Prepare for the Removal

S 214-002

- (1) Make sure the downlocks are installed on the nose and main landing gear (Ref 32-00-20).

S 494-003

**WARNING:** USE AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Open the doors for the landing gear and install the door locks (AMM 32-00-15/201).

S 214-004

- (3) Make sure the flaps and slats are in the fully retracted position.

S 214-005

- (4) Make sure the flap control lever is in the zero (FLAPS UP) detent.

S 494-006

- (5) Attach a DO-NOT-OPERATE tag to the flap control lever.

S 864-007

- (6) Remove the power from the center hydraulic system (Ref 29-11-00).

S 494-008

- (7) Install the PDU lock in the TE flap power drive unit (PDU) (Fig. 405).

Feb 10/91

S 034-019

- (4) Loosen the WFA and WFB cables aft of the slat aft quadrant, at the turnbuckles in the aft end of the forward cargo compartment.

S 034-020

- (5) Release the cable tension on each side of the slat aft quadrant.

S 034-021

- (6) Disconnect the WFA and WFB cables from the slat aft quadrant (Fig. 401), and install an identification tag to each cable.

**NOTE:** Keep the cables engaged on the pulleys after you remove the cables.

S 034-022

- (7) Disconnect the drive shaft from each side of the slat aft quadrant with the instructions given in the "Remove the Slat Aft Quadrant Drive Shaft" topic (Fig. 401).

S 034-023

- (8) Remove the nut, shaft, washers, and bearings at the slat aft quadrant (Detail B, Fig. 401).

S 024-024

- (9) Remove the quadrant wheel from the bracket.

G. Remove the Slat Aft Quadrant Drive Shaft

S 494-025

- (1) Remove the rig pin hole plugs and install rig pin TE1 in the TE flap PDU, and rig pins LE2 and LE5 in the outboard and inboard slat PDUs (Fig. 404).

S 024-026

- (2) Do these steps to remove the drive shaft with a universal joint at one end, and a splined coupling at the other end (Fig. 402):
  - (a) Disconnect the drive shaft from the universal joint (Detail C).
  - (b) Disconnect the lockwire and remove the screws from the splined coupling (Detail D).
  - (c) Move the coupling sleeve away from the coupling half and remove the drive shaft.

S 024-028

- (3) Do these steps to remove a drive shaft with a support bearing at one end, and a universal joint at the other end (Fig. 402):
  - (a) Disconnect the lockwire and remove the screws from the splined coupling on the adjacent drive shaft, to the direction of the left wing (Detail D).
  - (b) Move the coupling sleeve off the adjacent spline coupling.
  - (c) Disconnect the drive shaft at the universal joint (Detail C).

- (d) Remove the support from the structure near the center of the drive shaft (Detail E).
- (e) Remove the drive shaft.

S 024-029

- (4) Do these steps to remove the outboard drive shaft that is connected to the housing:
  - (a) Disconnect the drive shaft from the housing (Detail C, Fig.403).
  - (b) For the drive shaft at the left side of the fuselage, disengage the drive shaft from the support shaft

NOTE: Disconnect the support shaft from the support if it is necessary (Detail B, Fig. 402).

- (c) For the drive shaft at the right side of the fuselage, disengage the drive shaft from the shaft in the slat aft quadrant (Detail B, Fig. 401).
- (d) Remove the drive shaft.

S 024-030

- (5) Do these steps to remove the support shaft in the support, with an universal joint at one end (Detail B, Fig. 402):
  - (a) Disconnect the support shaft at the universal joint (Detail C).
  - (b) Remove the nut from the support shaft (Detail B).
  - (c) Remove the support shaft with the two washers, two bearings, and a spacer, from the support.

H. Remove the Non-Adjustable Control Rod

S 494-031

- (1) Remove the rig pin hole plugs and install rig pin TE1 in the TE flap PDU, and rig pins LE2 and LE5 in the outboard and inboard slat PDUs (Fig. 404).

S 034-032

- (2) Disconnect the upper crank from the non-adjustable control rod (Detail A, Fig. 403).

S 034-033

- (3) Disconnect the lower crank from the non-adjustable control rod.

NOTE: Disconnect the lower crank from the support if it is necessary (Detail B, Fig.403).

S 024-034

- (4) Remove the non-adjustable control rod.

I. Remove the Adjustable Control Rod

S 494-035

- (1) Remove the rig pin hole plugs and install rig pin TE1 in the TE flap PDU, and rig pins LE2 and LE5 in the outboard and inboard slat PDUs (Fig. 404).

S 034-036

- (2) Disconnect the adjustable control rod from the lower crank (Detail A, Fig. 403).

**NOTE:** Disconnect the lower crank from the support if it is necessary (Detail B).

S 034-037

- (3) Disconnect the adjustable control rod from the pilot input arm on the slat PDU.

S 024-038

- (4) Remove the adjustable control rod.

TASK 27-81-05-404-118

3. Slat Aft Quadrant and Quadrant Control Components - Installation

A. General

- (1) This task contains the installation procedure for these components:
  - the Slat Aft Quadrant
  - the Aft Quadrant Drive Shaft
  - the Non-Adjustable Control Rod
  - the Adjustable Control Rod.

Because this task contains four procedures, only do the applicable procedure to install the component.

To start one of these procedures, do the steps in the "Prepare for the Installation" before you do the applicable group of steps to install the component. Then do the "Installation Test" and the "Put the Airplane Back to Its Usual Condition" group of steps.

S 824-057

- (11) Lightly shake the WFA and WFB cables to remove the friction from the cables and to release the tension in the components, and do these checks:

- (a) Make sure the flap control lever is 0.15 to 0.16 inch (3.8-4.0 mm) aft of the zero detent, measured on the control stand lightplate.
- (b) Make sure the flap aft quadrant crank touches the upstop (Detail E, Fig. 404).

NOTE: It is not necessary to apply force against the upstop.

- (c) Make sure you can install rig pin LE1 easily at the slat aft quadrant (Detail D, Fig. 404).
- (d) Make sure the tension in the WFA and WFB cables agrees with Table I (Fig. 404).

S 824-058

- (12) Adjust the WFA and WFB cables again if it is necessary.

S 434-059

- (13) Install the turnbuckle locking clips and apply corrosion preventive compound, after you completed the cable adjustment that is necessary.

S 094-060

- (14) Remove rig pin LE1 from the slat aft quadrant.

S 864-061

- (15) Move the flap control lever to the zero (FLAPS UP) detent.

S 494-062

- (16) Attach a DO-NOT-OPERATE tag to the flap control lever.

S 434-063

- (17) With the rig pin TE1 installed in the flap PDU input cam, connect the control rods to the pilot input arms on the TE flap PDU (Fig. 404).

EFFECTIVITY

ALL

27-81-05

03

Page 419  
Dec 22/01

S 824-064

- (18) If you cannot connect the control rod to the pilot input arm with rig pin TE1 installed, do these adjustments:
- (a) Adjust the length of the control rod until you can connect the control rod to the pilot input arm.

NOTE: Make sure you can turn rig pin TE1 easily in the rig pin hole.

- (b) Connect the the control rod to the pilot input arm on the TE flap PDU.

NOTE: Make sure you attach the adjustable end of the control rod to the pilot input arm on the PDU.

- (c) Install a lockwire to the jamnut on the adjustable end of the control rod.

S 434-065

- (19) With the rig pins LE2 and LE5 installed in the input cam on the outboard and inboard slat PDUs, connect the control rods to the pilot input arms on the two slat PDUs.

S 824-066

- (20) If you cannot connect the control rod to the pilot input arm with rig pin LE2 installed in the outboard slat PDU, or with rig pin LE5 installed in the inboard slat PDU, do these adjustments (Fig. 404):
- (a) At the inboard slat PDU, adjust the length of the control rod until you can connect the control rod to the pilot input arm with rig pin LE5 installed (Detail B).
  - (b) At the outboard slat PDU, do these steps:
    - 1) Adjust the control rod and connect the control rod to the pilot input arm.

NOTE: Keep rig pin LE2 installed in the input cam.

EFFECTIVITY

ALL

27-81-05

03

Page 420  
Feb 10/91

- 2) Use a force gage and apply a 15–20 pound (66.7–88.9 newtons) load to the control rod, along the centerline of the rod, in the inboard direction.
  - 3) With the load applied, make sure you can easily turn rig pin LE2 in the rig pin hole.
  - 4) Adjust the control rod if it is necessary.
- (c) At the inboard and outboard slat PDUs:  
if the control rod is adjustable only at one end, do a check for these conditions:
- 1) Make sure the adjustable end of the rod is attached to pilot input arm on each slat PDU.
  - 2) Make sure that you can see the threads in the inspection hole at the adjustable end of the control rod.
- (d) At the inboard and outboard slat PDUs:  
if the control rod is adjustable at the two ends of the rod, do a check for these conditions:
- 1) Make sure the adjustable end that has a jamnut without a lockwire is connected to the pilot input arm on the slat PDU.
  - 2) If you adjusted the lockwire end of the control rod (away from the pilot input arm), install a lockwire with the double twist procedure (Ref 20–10–23).

NOTE: Make sure that the dimension between the center of the rod bolt hole and the nearest end of the rod barrel is not less than 1.25 inches (31.75 mm).

- 3) Make sure that you can see the threads in the inspection hole at the two ends of the control rod.

S 094–067

- (21) Remove rig pins TE1, LE2, and LE5 and install the rig pin hole plugs.

S 714–068

- (22) Do an installation test for the slat aft quadrant with the instructions given in the "Installation Test" topic.

H. Install the Slat Aft Quadrant Drive Shafts

S 424-070

- (1) Do these steps to install a drive shaft that connects to a support bearing at one end, and a universal joint at the other end (Fig. 402):
  - (a) Put the splined end of the drive shaft through the bracket (Detail D).
  - (b) Install the bearing and retainer to the bracket with three bolts, washers, and nuts.
  - (c) Engage the splined end of the drive shaft to the splined coupling on the adjacent drive shaft.
  - (d) Tighten the two coupling screws and install a lockwire with the double twist procedure on the splined coupling (Ref 20-10-23).
  - (e) Connect the other end of the drive shaft to the universal joint with a bolt, pin-1, pin-2 (2 locations), washer, and a nut (Detail C). Tighten the nut.
  - (f) Install the support to the structure near the center of the drive shaft with three bolts, washers, and nuts (Detail E).

S 424-071

- (2) Do these steps to install the support shaft in the support, with an universal joint at one end (Detail B, Fig. 402):
  - (a) Install the support shaft through the support with a spacer, two washers, and two bearings.
  - (b) Put the nut on the support shaft and engage the splines of the shaft to the adjacent outboard drive shaft.
  - (c) Tighten the nut on the support shaft to 100-135 pound-inches (11.3-15.2 newton-meters).
  - (d) Connect the adjacent inboard drive shaft at the universal joint with a bolt, pin-1, pin-2 (2 locations), washer, and a nut (Detail C). Tighten the nut.

S 424-072

- (3) Do these steps to install the outboard drive shaft that connects to the housing:
  - (a) For the drive shaft at the left side of the fuselage, engage the splines on the inboard end of the drive shaft to the adjacent support shaft.

**NOTE:** If removed, install the support shaft and bearings into the support before you connect the drive shaft (Detail B, Fig. 402).

EFFECTIVITY

ALL

27-81-05

04

Page 422  
Dec 22/01

- (b) For the drive shaft at the right side of the fuselage, engage the splines on the inboard end of the drive shaft to the shaft in the slat aft quadrant (Detail B, Fig. 401).
- (c) Connect the drive shaft to the housing with a packing, seal, bearing, retainer, retainer screws (5 locations), upper crank, washer, and nut. (Detail C, Fig. 403).

S 424-073

- (4) Do these steps to install a drive shaft with a universal joint at one end, and a splined coupling at the other end (Fig. 402):
  - (a) Engage the splined coupling to the adjacent drive shaft (Detail D).
  - (b) Tighten the two screws and install a lockwire with the double twist procedure on the splined coupling (Ref 20-10-23).
  - (c) Connect the other end of the drive shaft to the universal joint with a bolt, pin-1, pin-2 (2 locations), washer, and a nut (Detail C). Tighten the nut.

S 494-074

- (5) Do a check and make sure that you can easily install these rig pins in the locations that follow (Fig. 404):
  - (a) Rig pin TE1 in the input cam of the TE flap PDU
  - (b) Rig pin LE5 in the input cam of the inboard slat PDU
  - (c) Rig pin LE2 in the input cam of the outboard slat PDU.

**NOTE:** Install rig pin LE2 while you apply a 15-20 pound (66.8-88.9 newtons) load to the control rod, along the center of the rod, to the inboard direction. Apply the load with a force gage.

S 094-075

- (6) If you can easily install rig pins TE1, LE2, and LE5, remove these rig pins and install plugs in the rig pin holes.

S 824-076

- (7) If you cannot easily install rig pin TE1 in the TE flap PDU, rig pin LE5 in the inboard slat PDU, or rig pin LE2 in the outboard slat PDU, do these adjustments:
  - (a) For rig pin TE1, adjust the control rod connected to the TE flap PDU with the instructions given in the "TE Flap PDU Adjustment" topic, Ref 27-51-00.
  - (b) For rig pin LE2, adjust the control rod connected to the outboard slat PDU with the instruction given in the "Outboard Slat PDU Adjustment" topic, Ref 27-81-00.
  - (c) For rig pin LE5, adjust the control rod connected to the inboard slat PDU with the instruction given in the "Inboard Slat PDU Adjustment" topic, Ref 27-81-00.

Page 423  
Dec 22/01

S 094-077

- (8) Remove the DO-NOT-OPERATE tag from the flap control lever.

S 214-078

- (9) Operate the flap control lever, and make sure the slat aft quadrant, drive shafts, and the input mechanisms to the slat PDUs are free to move when you move the flap control lever.

S 984-079

- (10) Move the flap control lever back to the zero (FLAPS UP) detent.

S 714-080

- (11) Do a test on the drive shaft installation with the steps in the "Installation Test" topic.

I. Install the Non-Adjustable Control Rod

S 434-081

- (1) Connect the non-adjustable control rod to the lower crank (Detail A, Fig. 403) with a bolt (head pointed aft), spacer, washer, and nut.

S 434-082

- (2) If removed, install the lower crank to the support (Detail B) with a bolt, 2 bearings, 2 spacers, washer, and a nut.

S 434-083

- (3) Connect the non-adjustable control rod to the upper crank (View A) with a bolt (head pointed outboard), washer, and nut (or the self-locking nutplate).

S 494-084

- (4) Do a check and make sure that you can easily install these rig pins in the locations that follow (Fig. 404):  
(a) Rig pin TE1 in the input cam of the TE flap PDU

EFFECTIVITY

ALL

Feb 10/91

- (b) Rig pin LE5 in the input cam of the inboard slat PDU
- (c) Rig pin LE2 in the input cam of the outboard slat PDU.

NOTE: Install rig pin LE2 while you apply a 15–20 pound (66.8–88.9 newtons) load to the control rod, along the center of the rod, to the inboard direction. Apply the load with a force gage.

S 094–085

- (5) If you can easily install rig pins TE1, LE2, and LE5, remove these rig pins and install plugs in the rig pin holes.

S 824–086

- (6) If you cannot easily install rig pin TE1 in the TE flap PDU, rig pin LE5 in the inboard slat PDU, or rig pin LE2 in the outboard slat PDU, do these adjustments:
  - (a) For rig pin TE1, adjust the control rod connected to the TE flap PDU with the instructions given in the "TE Flap PDU Adjustment" topic, Ref 27–51–00.
  - (b) For rig pin LE2, adjust the control rod connected to the outboard slat PDU with the instruction given in the "Outboard Slat PDU Adjustment" topic, Ref 27–81–00.
  - (c) For rig pin LE5, adjust the control rod connected to the inboard slat PDU with the instruction given in the "Inboard Slat PDU Adjustment" topic, Ref 27–81–00.

S 094–087

- (7) Remove the DO–NOT–OPERATE tag from the flap control lever.

S 214–088

- (8) Operate the flap control lever, and make sure the non-adjustable rods and the fuselage cranks (Detail A, Fig. 403) are free to move while you move the flap control lever.

Dec 22/01

S 864-089

- (9) Move the flap control lever back to the zero (FLAPS UP) detent.

S 714-090

- (10) Do a test on the non-adjustable rod installation with the steps in the "Installation Test" topic.

J. Install the Adjustable Control Rod

S 434-091

- (1) Connect the adjustable control rod to the crank (View A, Fig. 403) with a bolt (head pointed aft), spacer, washer, and nut.

S 434-092

- (2) If removed, install the lower crank to the support (Detail B) with a bolt, 2 bearings, 2 spacers, washer, and a nut.

S 824-093

- (3) Adjust the length of the control rod if it is necessary, until you can easily install the rod to the pilot input arm on the slat PDU (Fig. 404).

S 434-094

- (4) Connect the adjustable control rod to pilot input arm on the slat PDU with a bolt, washer, and nut.

S 494-095

- (5) Do a check and make sure that you can easily install these rig pins in the locations that follow (Fig. 404):
- (a) Rig pin TE1 in the input cam of the TE flap PDU
  - (b) Rig pin LE5 in the input cam of the inboard slat PDU
  - (c) Rig pin LE2 in the input cam of the outboard slat PDU.

**NOTE:** Install rig pin LE2 while you apply a 15-20 pound (66.8-88.9 newtons) load to the control rod, along the center of the rod, to the inboard direction. Apply the load with a force gage.

S 094-096

- (6) If you can easily install rig pins TE1, LE2, and LE5, remove these rig pins and install plugs in the rig pin holes.

S 824-097

- (7) If you cannot easily install rig pin TE1 in the TE flap PDU, rig pin LE5 in the inboard slat PDU, or rig pin LE2 in the outboard slat PDU, do these adjustments:
- (a) For rig pin TE1, adjust the control rod connected to the TE flap PDU with the instructions given in the "TE Flap PDU Adjustment" topic, Ref 27-51-00.

EFFECTIVITY

ALL

27-81-05

05

Dec 22/01

- (b) For rig pin LE2,  
adjust the control rod connected to the outboard slat PDU with  
the instruction given in the "Outboard Slat PDU Adjustment"  
topic, Ref 27-81-00.
- (c) For rig pin LE5,  
adjust the control rod connected to the inboard slat PDU with  
the instruction given in the "Inboard Slat PDU Adjustment"  
topic, Ref 27-81-00.

S 094-098

- (8) Remove the DO-NOT-OPERATE tag from the flap control lever.

S 214-099

- (9) Operate the flap control lever, and make sure the cranks and the  
adjustable control rods (Detail A, Fig. 403) are free to move when  
you move the flap control lever.

S 864-100

- (10) Move the flap control lever back to the zero (FLAPS UP) detent.

S 714-101

- (11) Do a test on the drive shaft installation with the steps in the  
"Installation Test" topic.

K. Installation Test

S 214-102

- (1) Make sure the flaps and slats are in the fully retracted position.

S 214-103

- (2) Make sure the flap control lever is in the zero (FLAPS UP) detent.

S 094-104

- (3) Remove the PDU lock from the TE flap PDU (Fig. 405).

S 094-105

- (4) Remove the groundlocks from the inboard and outboard slat PDUs  
(Fig. 405).

EFFECTIVITY

ALL

S 864-106

- (5) Supply electrical power (Ref 24-22-00).

S 864-107

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (6) Pressurize the center hydraulic system (Ref 29-11-00).

S 864-108

- (7) Move the flap control lever to the 20-unit detent, and make sure the flaps move to the 20-degree position, and the slats move to the intermediate position.

S 864-109

- (8) Move the flap control lever to the 30-unit detent and make sure the flaps and slats move to the fully extended position.

S 864-110

- (9) Move the flap control lever to the zero (FLAPS UP) detent, and make sure the flaps and slats move to the fully retracted position.

S 724-111

- (10) Examine the load on the flap control lever with the instructions given in the "Test for the Flap Control Lever Load" topic (Ref 27-51-00).

L. Put the Airplane Back to Its Usual Condition

S 864-112

- (1) Remove the power from the center hydraulic system (Ref 29-11-00).

S 864-113

- (2) Remove electrical power (Ref 24-22-00).

LEADING EDGE SLAT POWER DRIVE UNIT – REMOVAL/INSTALLATION

1. General

A. This procedure contains the instruction to do these tasks:

- Remove the Leading Edge Slat Power Drive Unit
- Install the Leading Edge Slat Power Drive Unit
- Adjust the Leading Edge Power Drive Unit for Scheduled Maintenance

The slat power drive unit (PDU) installation task (2) contains the steps to adjust the power drive unit. Thus, if you do all the steps in the slat PDU installation task (2), then it is not necessary to do the slat PDU adjustment task (3) at the end of this procedure.

B. The leading edge slats are operated by two slat PDUs. The inboard slat PDU (in the right wing) is to operate the inboard slat drive. The outboard slat PDU (in the left wing) is to operate the outboard slat drive. You can remove and install each PDU independently.

TASK 27-81-10-024-001

2. Leading Edge Slat Power Drive Unit (PDU) – Removal

A. Equipment

- (1) General Boom Hoist - A20001-79
- (2) LE Slat Drive Hoist Adapter - A27004-1, -2
  - (-1 for the Inboard Slat Power Drive Unit)
  - (-2 for the Outboard Slat Power Drive Unit)
- (3) Leading Edge Slats Groundlock - A27007-1
  - (2 Necessary)
- (4) Circuit Breaker Lockout Clip
  - (4 Necessary) Commercially Available
- (5) TE Flap PDU Lock - A27009-7

- (8) AMM 27-81-12/401, Leading Edge Slat Drive Control Valve Module and Bypass Valve
- (9) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems
- (10) AMM 32-00-15/201, Landing Gear Door Locks
- (11) AMM 32-00-20/201, Landing Gear Downlocks

C. Access

(1) Location Zones

144	Right MLG Wheel Well
211/212	Control Cabin
510/610	Wing Leading Edge - Inboard
520/620	Wing Leading Edge - Outboard
710	Nose Landing Gear and Doors
730/740	Left/Right Main Landing Gear and Doors

(2) Access Panels

511BB	LE Slat Power Drive Unit - Outboard (Left)
611BB	LE Slat Power Drive Unit - Inboard (Right)

D. Prepare for the Removal

S 214-002

- (1) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

S 494-003

**WARNING:** USE AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Open the doors for the landing gear and install the door locks (AMM 32-00-15/201).

S 214-004

- (3) Make sure the flaps and slats are in the fully retracted position.

S 214-005

- (4) Make sure the flap control lever is in the zero (FLAPS UP) detent.

S 494-006

- (5) Attach a DO-NOT-OPERATE tag to the flap control lever.

S 864-007

- (6) Remove the pressure from the center hydraulic system and the reservoir (AMM 29-11-00/201).

EFFECTIVITY

ALL

27-81-10

01

Page 410  
Aug 22/01

S 864-008

- (7) Open these circuit breakers on the overhead panel, P11, and install circuit breaker locks and DO-NOT-CLOSE tags:
- (a) 11C15, FLAP SLAT ELEC UNIT 1 SENSOR
  - (b) 11C16, FLAP SLAT ELEC UNIT 1 CONT
  - (c) 11G15, FLAP SLAT ELEC UNIT 2 SENSOR
  - (d) 11G16, FLAP SLAT ELEC UNIT 2 CONT
  - (e) 11G22, FLAP SLAT ELEC UNIT 3 SENSOR
  - (f) 11G23, FLAP SLAT ELEC UNIT 3 CONT
  - (g) 11H23, SLAT ALTN CONT INBD
  - (h) 11H24, SLAT ALTN CONT OUTBD
  - (i) 11J24, FLAPS ALTN CONT

S 864-009

- (8) Open these circuit breakers on the main power distribution panel, P6, and install circuit breaker locks and DO-NOT-CLOSE tags:
- (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6D24, ALTN FLAP PWR
  - (c) 6F24, ALTN SLAT OUTBD PWR

S 014-010

- (9) Remove the access panels, 511BB and 611BB, to get access to the inboard and outboard slat PDUs (AMM 06-44-00/201).

E. Remove the LE Slat PDU

**NOTE:** Refer to Fig. 401 to remove the inboard slat PDU.  
Refer to Fig. 402 to remove the outboard slat PDU.

S 034-011

- (1) Disconnect the electrical connectors from the electric motor, the bypass valve, and the RVDT cover (2 locations).

**NOTE:** Attach an identification tag to each connector.

S 034-012

- (2) Disconnect the bonding jumpers from the airplane structure (2 locations).

S 034-013

- (3) Disconnect the hydraulic pressure line, the case drain, and the hydraulic return line from the control valve module.

S 494-014

- (4) Install plugs in the hydraulic lines, and caps on the hydraulic ports.

S 034-015

- (5) Disconnect the control rod from the pilot input arm.

EFFECTIVITY

ALL

27-81-10

01

Page 411  
Dec 22/99

S 934-016

- (6) Make a mark to align the torque tube to the adjacent airplane structure, at each side of the slat PDU.

**NOTE:** These marks will help keep a record of the torque tube position, before you disconnect the torque tubes from the PDU.

S 494-017

- (7) Install a support to hold the weight of the slats.

**NOTE:** The weight of the slats can cause the torque tube to turn away from the adjusted position by a small increment.

S 034-018

- (8) Remove the screws from the splined coupling and disconnect the torque tube from each side of the slat PDU.

**NOTE:** Do not turn the torque tube. It will be necessary to adjust the slat drive if you turn the torque tube while it is disconnected (AMM 27-81-00/501).

S 024-130

- (9) Remove the LE slat PDU:

**NOTE:** The inboard slat PDU weighs approximately 48 pounds (21 Kg). The outboard slat PDU weighs approximately 84 pounds (38.1 Kg).

- (a) Install the general boom hoist, A20001-79 and the adapter to hold the drive unit on the slat PDU.
- (b) Disconnect the support rod from the slat PDU.
- (c) Remove the two support attachment fasteners (1 and 6) from the support.
- (d) Use the general boom hoist, A20001-79 with the adaptor to remove the slat PDU.

TASK 27-81-10-424-023

3. Leading Edge Slat Power Drive Unit (PDU) - Installation

A. Equipment

- (1) Rig Pins from Set A20004-XX (AMM 20-10-24/201):
  - (a) LE2 - P/N A20004-9
  - (b) LE3 - P/N A20004-9

E. Access

(1) Location Zones

144	Right MLG Wheel Well
211/212	Control Cabin
510/610	Wing Leading Edge - Inboard
520/620	Wing Leading Edge - Outboard
710	Nose Landing Gear and Doors
730/740	Left/Right Main Landing Gear and Doors

(2) Access Panels

119AL	Main Equipment Center
511BB	LE Slat Power Drive Unit - Outboard (Left)
611BB	LE Slat Power Drive Unit - Inboard (Right)

F. Install the LE Slat PDU

NOTE: Refer to Fig. 401 to install the inboard slat PDU.  
Refer to Fig. 402 to install the outboard slat PDU.

S 214-024

- (1) Make sure the flaps and slats are in the fully retracted position.

EFFECTIVITY

ALL

27-81-10

01

Page 414  
Aug 22/05

- S 214-025
- (2) Make sure the flap control lever is in the zero (FLAPS UP) detent.
- S 214-026
- (3) Make sure the pressure is removed from the center hydraulic system and reservoir (AMM 29-11-00/201).
- S 214-027
- (4) Make sure the flap and slat alternate drive is not armed (ALTN switch lights are off at the first officer's main instrument panel).
- S 494-028
- (5) Use the general boom hoist and the adapter and lift the slat PDU to its position for installation.
- S 434-029
- (6) Do these steps to connect the slat PDU to the support (2 locations):
- (a) On the Inboard Slat PDU,  
install these fasteners with BMS 3-33 grease on all the surfaces (Detail B, Fig. 401):
- bolt (1) (bolthead pointed outboard)
  - aluminum washer (5) (below the bolthead)
  - bushing (2)
  - steel washer (4) (below the nut)
  - nut (3)
- (b) On the Outboard Slat PDU,  
install these fasteners with MIL-C-11796 corrosion preventive compound on all the surfaces (Detail A, Fig. 402):
- bolt (1) (bolthead pointed inboard)
  - aluminum washer (4) (below the bolthead)
  - bushing (2)
  - steel washers (5) (below the nut)
  - nut (3)

EFFECTIVITY

ALL

27-81-10

01

Page 415  
Apr 22/08

S 434-030

- (7) Do these steps to connect the support rod to the slat PDU:
- (a) On the Inboard Slat PDU,  
install these fasteners with BMS 3-33 grease on all the  
surfaces (Detail B, Fig. 401):
- bolt (6) (bolthead pointed up)
  - aluminum washer (10) (below the bolthead)
  - bushing (7)
  - steel washer (9) (below the nut)
  - nut (8)
- (b) On the Outboard Slat PDU,  
install these fasteners with MIL-C-11796 corrosion preventive  
compound on all the surfaces (Detail A, Fig. 402):
- bolt (6) (bolthead pointed up)
  - aluminum washer (9) (below the bolthead)
  - bushing (7)
  - steel washers (10) (below the nut)
  - nut (8)

S 094-031

- (8) Remove the hoist and the adapter from the slat PDU.

S 434-032

- (9) Connect the bonding jumpers to the airplane structure at two  
locations.

S 094-033

**CAUTION:** IF YOU INSTALLED A NEW SLAT PDU, MAKE SURE YOU REMOVE THE  
O-RINGS WITH THE SHIPPING CAP FROM THE HYDRAULIC PORTS ON THE  
CONTROL VALVE MODULE. THE O-RINGS ON THE SHIPPING CAPS CAN  
CAUSE INCORRECT CONNECTIONS WITH THE HYDRAULIC LINES AND LEAK  
HYDRAULIC FLUID.

- (10) Remove the plugs from the hydraulic lines, and the caps from the  
hydraulic ports.

**NOTE:** If you installed a new slat PDU or a new control valve  
module, remove the O-rings supplied with the shipping caps  
from the hydraulic ports.

EFFECTIVITY

ALL

27-81-10

01

Page 416  
Apr 22/08

- S 644-034
- (11) Apply Skydrol assembly lube or hydraulic fluid to the packing O-rings and fittings before you connect the hydraulic lines.
- S 434-035
- (12) Connect the hydraulic pressure and return lines to the control valve module on the slat PDU.
- S 434-036
- (13) Remove the identification tags and connect the electrical connectors to the electric motor, the bypass valve, and the RVDT (2 locations).
- S 214-037
- (14) Make sure the manual override lever on the slat PDU bypass valve is in the No. 2 (normal) position.
- S 494-038
- (15) Remove the plug from the rig pin hole for the input cam, and install rig pin LE2 in the outboard slat PDU, or rig pin LE5 in the inboard slat PDU.
- S 864-039
- (16) Move the manual override lever on the TE flap PDU (in the right MLG wheel well) to the No. 1 (bypass) position, and install a DO-NOT-OPERATE tag on the lever.
- S 864-040
- (17) On the slat PDU that was not installed, move the manual override lever on the bypass valve to the No. 1 (bypass) position and install a DO-NOT-OPERATE tag on the lever.
- S 494-041
- (18) Install the PDU lock in the TE flap PDU (Fig. 403).
- S 494-042
- (19) Install the groundlock to the slat PDU that was not installed (Fig. 403).

EFFECTIVITY

ALL

27-81-10

01

Page 417  
Aug 22/05

S 214-043

- (20) Make sure you can align the centerline of the torque tube to the centerline on the PDU splined coupling ( $\pm 0.5^\circ$ ) at the two sides of the PDU.

S 824-044

- (21) If the centerlines do not align, adjust the support rod attached to the PDU with these steps:
- Loosen the jamnut on the support rod and adjust the length of the rod.
  - Tighten the jamnut and apply a thin layer of BMS 3-33 grease to the threads on the rod ends.

S 824-045

- (22) If you installed the inboard slat PDU, adjust and connect the input control rod (one adjustable end) to the pilot input arm with these steps:
- Make sure rig pin LE5 is fully installed in the input cam (Detail C, Fig. 401).
  - Make sure the adjustable end of the input control rod will be connected to the pilot input arm.
  - Adjust the length of the input control rod until you can attach the rod to the slat PDU, and can freely turn the bolt at the rod attach point.
  - Make sure that you can see the threads in the inspection hole at the adjustable end of the input control rod.
  - Tighten the jamnut and install a lockwire with the double twist procedure (AMM 20-10-23/401).
  - Connect the input control rod to the pilot input arm with the bolt, washer, and nut. Tighten the nut.
  - If the input control rod is adjustable at the two ends of the rod, do these steps:
    - Make sure the adjustable end without a lockwire is connected to the pilot input arm.
    - If it is necessary to adjust the rod end with the lockwire (away from the pilot input arm), remove the lockwire and loosen the jamnut to adjust the rod.

**NOTE:** Do not adjust the input control rod shorter than 1.25 inches (31.8 mm) between the centerline of the rod end bolt hole and the nearest end of the control rod barrel.

EFFECTIVITY

ALL

27-81-10

01

Page 418  
Apr 22/08

- 3) Make sure that you can see the threads through the inspection hole at the two adjustable ends of the input control rod.
- 4) Tighten the jamnut at the end(s) of the input control rod that you adjusted.
- 5) Safety the jamnut with a lockwire at the rod end that is away from the pilot input arm.
- 6) Connect the input control rod to the pilot input arm with the bolt, washer, and nut.

S 824-046

- (23) If you installed the outboard slat PDU, adjust and connect the input control rod to the pilot input arm with these steps:
- (a) Make sure rig pin LE2 is fully installed in the rig pin hole on the input cam (Detail B, Fig. 402).
  - (b) Use a force gage and apply a 15 to 20 pound (66.8-88.9 newtons) load to the input control rod, along the centerline of the rod, in the inboard direction (Fig. 406).
  - (c) Make sure that you can easily turn the bolt that connects the input control rod to the pilot input arm, while you apply the load to the rod.

**CAUTION:** DO NOT ADJUST THE SUPPORT ROD FOR THE OUTBOARD SLAT PDU TO MAKE ALLOWANCE FOR THE SHORT LENGTH OF THE INPUT CONTROL ROD. THE TORQUE TUBES WILL NOT ALIGN CORRECTLY AND CAUSE SLAT ASYMMETRY, WHICH WILL INCREASE WEAR ON THE TORQUE TUBE, IF YOU CHANGE THE ADJUSTMENT ON THE PDU SUPPORT.

- (d) Adjust the input control rod with these steps if you cannot turn the bolt easily in the step before:
- 1) If the input control rod is adjustable at one end only, make sure that you can see the threads at the adjustable end through the inspection hole in the control rod. Tighten the jamnut and install a lockwire with the double twist procedure (AMM 20-10-23/401).
  - 2) If the input control rod is adjustable at the two ends of the rod, do these steps:
    - a) Make sure the adjustable end without a lockwire is connected to the pilot input arm.
    - b) If it is necessary to adjust the rod end with the lockwire (away from the pilot input arm), remove the lockwire and loosen the jamnut to adjust the rod.

**NOTE:** Do not adjust the input control rod shorter than 1.25 inches (31.8 mm) between the centerline of the rod end bolt hole and the nearest end of the control rod barrel.

EFFECTIVITY

ALL

27-81-10

01

Page 419

 **BOEING**  
767  
MAINTENANCE MANUAL

- c) Make sure that you can see the threads through the inspection hole at the two adjustable ends of the input control rod.
  - d) Tighten the jamnut at the end(s) of the input control rod that you adjusted.
  - e) Safety the jamnut with a lockwire at the rod end that is away from the pilot input arm.
- 3) Connect the input control rod to the pilot input arm with the bolt, washer, and nut.

S 094-047

- (24) Remove rig pin LE2 or LE5, as applicable, from the input cam rig pin hole.

S 864-048

- (25) Open this circuit breaker on the overhead panel, P11, and attach a DO-NOT-CLOSE tag:
- (a) 11H14, SLATS SHUTOFF VALVE

S 864-049

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (26) Pressurize the center hydraulic system (AMM 29-11-00/201) and permit the slat PDU to become stable in the fully retracted position.

**NOTE:** It is usual for the output shaft to turn in the slat PDU when you pressurize the center hydraulic system.

S 494-050

- (27) Try to install rig pin LE3 (for the outboard slat PDU) or rig pin LE6 (for the inboard slat PDU) as applicable, into the rig pin hole for the follow-up cam.

EFFECTIVITY

ALL

27-81-10

01

Page 420  
Dec 22/99

S 824-051

(28) If you cannot install rig pin LE3 or LE6 easily, set the slat PDU for mechanical null and hydraulic null with these steps:

(a) Set the slat PDU to mechanical null with these steps:

- 1) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).
- 2) Disconnect the control valve control rod (between the control unit and the control valve module) from the control unit output arm.

NOTE: You will release the fluid pressure lock in the control valve when you disconnect the control valve control rod from the output arm. This will permit you to turn the PDU output shafts to align the rig pin hole for rig pin LE3 (outboard slat PDU) or LE6 (inboard slat PDU).

- 3) Turn the output shaft on the slat PDU by small increments, until you can install rig pin LE3 or LE6 freely.
- 4) After you install the rig pin, connect the control valve control rod back to the control unit output arm.
- 5) Try to install rig pin LE4 (for the outboard slat PDU) or LE7 (for the inboard slat PDU), as applicable, in the control valve input arm.
- 6) If you cannot install rig pin LE4 or LE7 fully and easily, adjust the length of the control valve control rod with these steps:
  - a) Remove the lockwire and loosen the jamnut at each end of the control rod.
  - b) Turn the control rod body to adjust the rod length, until you can easily install rig pin LE4 or LE7.

NOTE: The usual length of the rod before the final adjustment is 6.56 inches (166.6 mm).

- c) Tighten the jamnuts on the control rod, but do not install the lockwires.

NOTE: It is possible that you will adjust the control valve control rod again during the hydraulic null adjustment.

- 7) Remove rig pins LE3 and LE4 from the outboard slat PDU, or, rig pins LE6 and LE7 from the inboard slat PDU as applicable.

(b) Set the slat PDU for hydraulic null with these steps after you set the PDU for mechanical null:

EFFECTIVITY

ALL

27-81-10

01

Page 421  
Dec 22/01

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- 1) Pressurize the center hydraulic system (AMM 29-11-00/201) and permit the slat PDU to become stable in the fully retracted position.

**NOTE:** It is usual for the output shaft to turn at the slat PDU when you pressurize the center hydraulic system.

**CAUTION:** DO NOT DISCONNECT THE CONTROL VALVE CONTROL ROD TO DO THE ROD ADJUSTMENT WHILE THE CENTER HYDRAULIC SYSTEM IS PRESSURIZED. DO NOT ADJUST THE CONTROL ROD WITH THE RIG PIN LE3 OR LE6 INSTALLED. ADJUST THE CONTROL ROD ONLY BY SMALL INCREMENTS TO PREVENT DAMAGE TO THE SLAT PDU.

- 2) Try to install rig pin LE3 (for the outboard slat PDU) or LE6 (for the inboard slat PDU), as applicable, into the rig pin hole for the follow-up cam.
- 3) If you cannot install rig pin LE3 or LE6 easily, adjust the control valve control rod with these steps:

**NOTE:** Do not adjust the control rod while rig pin LE3 or LE6 is installed. Install rig pin LE3 or LE6 only to make sure that the control rod is adjusted correctly.

- a) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).
- b) Loosen the jamnut at each end of the control valve control rod.

Apr 22/06

 **BOEING**  
767  
MAINTENANCE MANUAL

- c) Turn the control rod to adjust the rod length until you can easily install rig pin LE3 or LE6.

NOTE: It is not necessary to install rig pin LE4 or LE7 for this adjustment.

- d) Tighten the jamnut at each end of the control rod.
  - e) Install lockwires to the jamnuts on the control rod with the double twist procedure (AMM 20-10-23/401).
- 4) Remove rig pin LE3 or LE6.

S 864-052

- (29) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).

S 094-053

- (30) Remove the PDU lock from the TE flap PDU (Fig. 403).

S 094-054

- (31) Remove the groundlock from the slat PDU that you did not install (Fig. 403).

S 864-055

- (32) Remove the DO-NOT-OPERATE tag from the manual override lever on the TE flap PDU bypass valve, and move the lever to the No. 2 (normal) position.

S 864-056

- (33) On the slat PDU that was not installed, remove the DO-NOT-OPERATE tag from the manual override lever on the PDU bypass valve, and move the override lever to the No. 2 (normal) position.

S 094-057

- (34) Remove rig pin LE3 or LE6, as applicable, and install the plug in the rig pin hole.

S 214-058

- (35) Make sure the marks that you made before the PDU removal will align between the torque tube and the PDU coupling.

S 824-059

- (36) If the marks do not align, do these steps:
  - (a) Manually turn the torque tube on each side of the slat PDU to retract the slats (AMM 27-81-00/201), and make sure the retract overtravel stop clearances are correct as shown (Fig. 404).
  - (b) If the retract overtravel stops are not correct, adjust the slat drive with the steps given in the "Inboard Slat Drive Adjustment" or the "Outboard Slat Drive Adjustment" procedure (AMM 27-81-00/501).

EFFECTIVITY

ALL

27-81-10

02

Page 423  
Apr 22/06

S 434-060

- (37) Connect the torque tubes back to the two sides of the slat PDU with these steps:
- Apply a thin layer of BMS 3-33 grease, to the full length of the torque tube splines and the splines in the PDU coupling.
  - Engage the torque tube to the splines in the PDU coupling and install the screws to the coupling.

NOTE: If it is necessary, turn the torque tube to the nearest distance possible to engage the spline teeth on the coupling ( $\pm 1/2$  tooth).

S 224-061

- (38) Do a check on the axial movement of the torque tube with these steps:
- Push the torque tube tightly against one end and make a mark on its position.
  - Move the torque tube fully to the opposite end.
  - Make sure the torque tube can move easily, and that the axial movement is between 0.100 to 0.460 inch (2.54-11.68 mm).

NOTE: If there is resistance when you move the torque tube, loosen the coupling screws by a small increment to permit the torque tube to move freely.

S 434-062

- (39) Install a lockwire to the coupling screws with the double twist procedure (AMM 20-10-23/401).

S 644-063

- (40) Fill the PDU coupling with grease, MIL-PRF-23827, through the lubrication hole.

S 094-064

- (41) Remove the supports from the slats.

S 864-065

- (42) Remove the DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
- 11H14, SLATS SHUTOFF VALVE

Page 424  
Aug 22/08

S 824-066

(43) Do the "Slat PDU Adjustment" procedure below.

G. Slat PDU Adjustment

S 214-067

(1) Make sure the flaps and slats are in the fully retracted position.

S 214-068

(2) Make sure the flap control lever is in the zero (FLAPS UP) detent.

S 094-069

(3) Remove the DO-NOT-OPERATE tag from the flap control lever.

S 864-070

(4) Supply electrical power (AMM 24-22-00/201).

S 864-071

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

(5) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 864-072

(6) Move the flap control lever to the 30-unit detent, and make sure the flaps and slats move to the fully extended position.

S 864-073

(7) Move the flap control lever back to the zero (FLAPS UP) detent, and make sure the flaps and slats move to the fully retracted position.

S 864-074

(8) Remove the power from the center hydraulic system (AMM 29-11-00/201).

S 494-075

(9) Install the PDU lock in the TE flap PDU (Fig. 403).

S 494-076

(10) Install the groundlocks in the inboard and outboard slat PDUs (Fig. 403).

EFFECTIVITY

ALL

27-81-10

01

Page 425  
Dec 22/99

S 214-077

- (11) For the inboard slat PDU,  
do a check on the control rod (at the pilot input arm) for the  
correct adjustment with these steps (Detail C, Fig. 401):
- (a) Make sure you can install rig pin LE5 fully and freely into the  
input cam rig pin hole.
  - (b) Make sure that you can see the threads in the inspection hole.  
Adjust the rod length if it is necessary.

S 214-078

- (12) For the outboard slat PDU,  
do a check on the control rod (at the pilot input arm) for the  
correct adjustment with these steps (Detail B, Fig. 402):
- (a) Use a force gage and apply a 15 to 20 pound (66.8-88.9 newtons)  
load to the control rod along the centerline of the rod, to the  
inboard direction (Fig. 406).
  - (b) Make sure that you can install rig pin LE2 fully and freely  
through the input cam rig pin hole (Detail B, Fig. 402) while  
you apply the load to the control rod.
  - (c) If you cannot install rig pin LE2 easily,  
adjust the control rod.

NOTE: Make sure you can see the threads through the inspection  
hole at the rod end.

S 094-079

- (13) If installed, remove rig pins LE2 and LE5 and install the plugs in  
the rig pin holes.

S 864-080

- (14) On the TE flap PDU in the right MLG wheel well,  
move the manual override lever on the PDU bypass valve to the No. 1  
(bypass) position, and install a DO-NOT-OPERATE tag.

EFFECTIVITY

ALL

LEADING EDGE SLAT POWER DRIVE UNIT COMPONENTS – REMOVAL/INSTALLATION

1. General

- A. This procedure contains the removal and the installation tasks for the components on the leading edge (LE) slat power drive units (PDU).
- B. The LE slats are operated by two slat PDUs. The inboard slat PDU (in the right wing) is to operate the inboard slat drive. The outboard slat PDU (in the left wing) is to operate the outboard slat drive. You can remove and install the components on each slat PDU independently.

TASK 27-81-11-024-001

2. Leading Edge Slat Power Drive Unit (PDU) Components – Removal

A. General

- (1) This task contains the removal procedure for these components on the slat PDUs:

- the Control Unit
- the Hydraulic Motor
- the Electric Motor
- the Rotary Variable Differential Transformer (RVDT).

Because this task contains four procedures, only do the applicable procedure to remove the component.

To start one of these procedures, do the steps in the "Prepare for the Removal" topic, then do the applicable group of steps to remove the component.

B. Equipment

- (1) Circuit Breaker Lockout Clip  
(4 necessary) Commercially Available

C. References

(2) Access Panels

511BB	LE Slat Power Drive Unit - Outboard (Left)
611BB	LE Slat Power Drive Unit - Inboard (Right)

E. Prepare for the Removal

S 214-002

- (1) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

S 494-003

**WARNING:** USE THE PROCEDURE IN AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Open the doors for the landing gear and install the door locks (AMM 32-00-15/201).

S 214-004

- (3) Make sure the flaps and slats are in the fully retracted position.

S 214-005

- (4) Make sure the flap control lever is in the zero detent.

S 494-006

- (5) Attach a DO-NOT-OPERATE tag to the flap control lever.

S 864-007

- (6) Remove the pressure from the center hydraulic system and reservoir (Ref 29-11-00).

S 864-008

- (7) Open these circuit breakers on the overhead panel, P11, and install circuit breaker locks and DO-NOT-CLOSE tags:
  - (a) 11C15, FLAP SLAT ELEC UNIT 1 SENSOR
  - (b) 11C16, FLAP SLAT ELEC UNIT 1 CONT

S 864-009

- (8) Open these circuit breakers on the main power distribution panel, P6, and install circuit breaker locks and DO-NOT-CLOSE tags:
  - (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6D24, ALTN FLAP PWR
  - (c) 6F24, ALTN SLAT OUTBD PWR

S 014-010

- (9) Remove the access panels, 511BB and 611BB, to get access to the outboard and inboard slat power drive units (PDU) (AMM 06-44-00/201).

F. Remove the Control Unit

**NOTE:** Refer to Fig. 401 to remove the control unit on the inboard slat PDU.  
Refer to Fig. 402 to remove the control unit on the outboard slat PDU.

S 024-011

- (1) Remove the control valve module on the slat PDU (AMM 27-81-12/401).

S 034-012

- (2) Disconnect the control valve control rod from the control unit output arm (View A-A).

S 034-013

- (3) Disconnect the electrical connectors from the RVDT cover.

**NOTE:** Attach an identification tag (which reflects the RVDT equipment number; e.g. M548, etc.) to each airplane wiring connector and RVDT connector for the subsequent installation.

S 034-014

- (4) Disconnect the bonding jumper at the support on the control unit (Fig. 403).

S 034-015

- (5) Disconnect the input control rod from the pilot input arm (View A-A).

(G)

- 1 APPLY BMS 3-24 GREASE TO ALL THE SURFACES BEFORE INSTALLATION
- 2 CLEAN THE BONDING SURFACES WITH A ROTARY STAINLESS STEEL BRUSH. MAKE SURE THE TOTAL RESISTANCE BETWEEN THE BOND IS NOT MORE THAN 0.001 OHM
- 3 ADD OR DELETE WASHERS AS NECESSARY TO GET THE WASHER FLUSH WITH OR EXTEND LESS THAN ONE WASHER THICKNESS ABOVE THE ADJACENT SURFACE.
- 4 LUBRICATE SPLINE TEETH WITH BMS 3-33 (MIL-PRF-23827 ALTERNATE)
- 5 REMOVE ADAPTER PLATE FROM THE ALTERNATE MOTOR AND ATTACH IT TO THE PDU HOUSING.
- 6 AIPC 27-81-10-01A AND AIPC 27-81-10-01B

**PROCEDURE A  
(POWER SUPPLY USING DIGITAL VOLTMETER)**

**PROCEDURE A  
(POWER SUPPLY USING PHASE ANGLE VOLTMETER)**

- 1 USE A 4-1/2 DIGIT VOLTMETER ON 200V AC SCALE
- 2 USE A 4-1/2 DIGIT VOLTMETER ON 20V AC SCALE
- 3 IF YOU USE A DIGITAL VOLTMETER TO CALCULATE THE RVDT SIGNAL VOLTAGE, TAKE THE VOLTAGE READINGS AS FOLLOWS:

**NOTE:** THE STEPS BELOW APPLY ALSO TO BOTH THE RETRACT AND EXTEND SIGNAL VOLTAGES;  
RETRACT SIGNAL VOLTAGE  $V1 > V2$ , EXTEND SIGNAL VOLTAGE  $V2 > V1$   
THIS IS TRUE FOR BOTH NO. 1 AND 2 RVDTs ON THE LE SLAT PDUs.

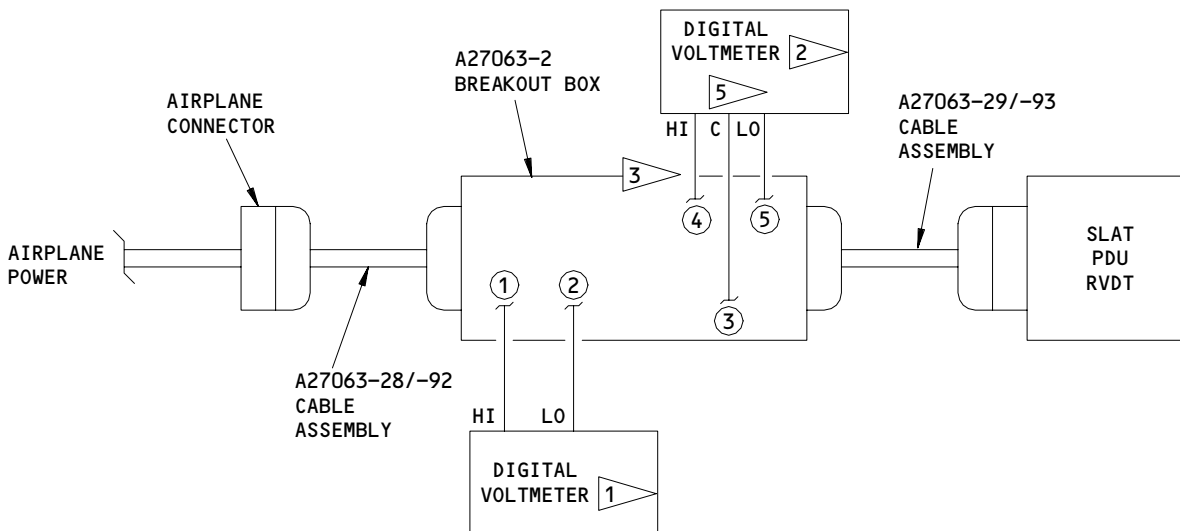

- 1.  $V1$ , BETWEEN PINS 3 AND 5;  $V2$ , BETWEEN PINS 3 AND 4
- 2. IF  $V1 < V2$ , DO THE REMOVAL/INSTALLATION PROCEDURE AGAIN.
- 3. RVDT SIGNAL VOLTAGE =  $V2 - V1$   
EXAMPLE:  $V1 = 10.93$ ,  $V2 = 2.18$      $V2 - V1 = 2.18 - 10.93 = -8.75$

- 4 TO READ THE ACTUAL RVDT SIGNAL VOLTAGE, CONNECT THE LEADS BETWEEN PINS 4 AND 5.  
IN-PHASE (+), OUT-PHASE (-)
- 5 "C" IS FOR COMMON

S 034-016

- (6) Remove the four bolts that connect the control unit to the PDU gearbox (Detail A) and remove the control unit.

NOTE: The bonding jumper between the control unit and the electric motor will be disconnected after you remove the four bolts. Keep the quill shaft (Detail D) for the subsequent installation.

S 494-017

- (7) Put a cover on the control unit and the gearbox to keep dirt away from the mating surfaces.
- G. Remove the Hydraulic Motor (Fig. 404)

S 034-018

- (1) Disconnect the hydraulic lines at the pressure inlet and case drain ports.

S 494-019

- (2) Install plugs in the hydraulic lines, and caps on the hydraulic ports.

S 024-020

- (3) Disconnect the four bolts and remove the hydraulic motor from the PDU gearbox (Detail C or D).

NOTE: For the inboard slat PDU, the quill shaft is a component of the PDU gearbox, which stays with the gearbox after you remove the hydraulic motor.

S 494-021

- (4) Put a cover on the hydraulic motor and the gearbox to keep dirt away from the mating surfaces.
- H. Remove the Electric Motor (Fig. 404)

S 034-022

- (1) Disconnect the electrical connector from the electric motor.

S 024-023

- (2) Remove the electric motor from the PDU gearbox.
  - (a) Disconnect the four bolts and remove the electric motor from the PDU gearbox.

NOTE: The two bonding jumpers attached to the electric motor will be disconnected when you remove the four bolts.

Apr 22/03

- (b) Remove the adapter plate (at the inboard slat PDU only), if the electric motor assembly you want to install does not include an adapter plate.

NOTE: If you are replacing motor assemblies with adapter plates then it is not necessary to remove the same adapter plate already installed.

- (c) Put a cover on the electric motor and the gearbox to keep dirt away from the mating surfaces.

I. Remove the Rotary Variable Differential Transformers (RVDT) (Fig. 405)

S 034-025

- (1) Disconnect the electrical connectors from the RVDT cover.

NOTE: Attach an identification tag (which reflects the RVDT equipment number; e.g. M548, etc) to each airplane wiring connector and receptacle for the subsequent installation.

S 034-026

- (2) Remove the six screws and washers that attach the RVDT cover to the control unit.

NOTE: Carefully remove the RVDT cover only for a small distance, sufficient to get access to the screws that attach the RVDT connectors to the inside of the cover.

S 034-027

- (3) Remove the screws attached to the RVDT electrical connectors at the inside of the RVDT cover, and remove the cover.

NOTE: Attach an identification tag (which reflects the RVDT equipment number, e.g., M548, etc.) to each airplane wiring connector and receptacle for the subsequent installation.

S 024-028

- (4) Remove the bolts and clamps that hold the RVDTs to the support plate, and remove the RVDTs.

TASK 27-81-11-424-029

3. Leading Edge Slat Power Drive Unit (PDU) Components - Installation

A. General

(1) This task contains the installation procedure for these components:

- the Control Unit
- the Hydraulic Motor
- the Electric Motor
- the Rotary Variable Differential Transformer (RVDT).

Because this task contains four procedures, only do the applicable procedure to install the component.

To start one of these procedures, do the steps in the "Prepare for the Installation" topic before you do the applicable group of steps to install the component. Then do the "Put the Airplane Back to Its Usual Condition" group of steps.

B. Equipment

(1) Rig Pins from Set A20004-XX (AMM 20-10-24/201):

- (a) LE2 - P/N A20004-9
- (b) LE3 - P/N A20004-9
- (c) LE4 - P/N A20004-73
- (d) LE5 - P/N A20004-9
- (e) LE6 - P/N A20004-9
- (f) LE7 - P/N A20004-73

(2) Slat PDU Control Unit RVDT Adjustment Equipment (for Procedure A):

**NOTE:** Procedure A uses an external power supply, without airplane power.

- (a) Power Supply - Powertron Model 5900  
Industrial Test Equipment Corp.  
Port Washington, NY
- (b) Digital Voltmeter (DVM), 4-1/2 Digit  
Meter, 200 VAC Scale
- (c) Digital Voltmeter (DVM), 4-1/2 Digit  
Meter, 20 VAC Scale
- (d) Phase Angle Voltmeter - North Atlantic  
Model 2250
- (e) Resistor - 41.5k ohm (2 Necessary)
- (f) Breakout Box and Cables, Rigging, Flight  
Controls Position Sensors from the  
Breakout Box Equipment - A27063-71:
  - 1) Breakout Box - A27063-2
  - 2) Cable Assembly - A27063-29  
(for Inbd. Slat PDU RVDTs and Outbd. Slat PDU No. 1 RVDT)  
or  
Cable Assembly - A27063-93  
(for Outboard Slat PDU No. 2 RVDT)

MAINTENANCE MANUAL

(3) Slat PDU Control Unit RVDT Adjustment Equipment (for Procedure B):

NOTE: Procedure B uses the airplane power as a power source.

- (a) Digital Voltmeter (DVM), 4-1/2 Digit Meter, 200 VAC Scale
- (b) Digital Voltmeter (DVM), 4-1/2 Digit Meter, 20 VAC Scale
- (c) Phase Angle Voltmeter - North Atlantic Model 2250-F1
- (d) Breakout Box and Cables, Rigging, Flight Controls Position Sensors from the Breakout Box Equipment - A27063-71:
  - 1) Breakout Box - A27063-2
  - 2) Cable Assembly - A27063-28 and -29 (for Inbd. Slat PDU RVDTs and Outbd. Slat PDU No. 1 RVDT) or Cable Assembly - A27063-92 and -93 (for Outboard Slat PDU No. 2 RVDT)
- (4) Rotary Stainless Steel Brush
- (5) Bonding Meter (Microhm Bridge, Type 2 Bonding Meter) - 477W Avtron Model Avtron Manufacturing Inc. Cleveland, Ohio
- (6) LE Slats Groundlock - A27007-1 (2 Necessary)
- (7) TE Flap PDU Lock - A27009-7
- (8) Force Gage, 0-25 Pounds (0-111 newtons)

NOTE: Used only for control unit Installation.

C. Consumable Materials

- (1) A00251 Sealant - BMS 5-26, Type II, Class B-2
- (2) A00276 Adhesive - BMS 5-126, Type II, Class 1 or Type III, Class 1
- (3) B00316 Solvent - Aliphatic Naphtha, TT-N-95, Type I
- (4) C00308 Corrosion Preventive Compound - MIL-C-11796, Class 3
- (5) D00633 Grease - BMS 3-33 (Preferred)

EFFECTIVITY

ALL

- 511BB LE Slat Power Drive Unit - Outboard (Left)
- 611BB LE Slat Power Drive Unit - Inboard (Right)

G. Prepare for the Installation

S 214-030

- (1) Make sure the flaps and slats are in the fully retracted position.

S 214-031

- (2) Make sure the flap control lever is in the zero (FLAPS UP) detent.

S 214-032

- (3) Make sure the power is removed from the center hydraulic system (AMM 29-11-00/201).

S 214-033

- (4) Make sure these circuit breakers are opened in the overhead panel, P11:
- (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD
  - (c) 11J24, FLAPS ALTN CONT

S 214-034

- (5) Make sure these circuit breakers are opened on the main power distribution panel, P6:
- (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6D24, ALTN FLAP PWR
  - (c) 6F24, ALTN SLAT OUTBD PWR

H. Install the Control Unit

**NOTE:** Refer to Fig. 401 to install the control unit on the inboard slat PDU. Refer to Fig. 402 to install the control unit on the outboard slat PDU.

S 094-035

- (1) Remove the covers on the mating surfaces of the control unit and the gearbox.

EFFECTIVITY

ALL

27-81-11

01

Page 424  
Aug 22/05

S 494-036

- (2) Install rig pin LE2 (for outboard slat PDU) or LE5 (for inboard slat PDU) to the input cam rig pin hole on the control unit with these steps:
- (a) Turn the pilot input arm to the position shown (View A-A).
  - (b) Install rig pin LE2 or LE5, as applicable.

NOTE: If it is necessary, turn the pilot input arm by a small increment until you can fully and freely install the rig pin.

S 494-037

- (3) Install rig pin LE3 (for outboard slat PDU) or LE6 (for inboard slat PDU) in the follow-up cam rig pin hole on the control unit with these steps:
- (a) Turn the spline at the quill shaft interface, until the control unit output arm is in the position shown (View A-A).
  - (b) Install rig pin LE3 or LE6, as applicable.

NOTE: If it is necessary, adjust the output arm position by a small increment until you can fully and freely install the rig pin.

S 434-038

- (4) With the rig pins installed, engage the quill shaft (Detail D) to the splines in the control unit and the gearbox.

NOTE: Be careful not to cause damage to the quill shaft when you engage the splines.

S 214-039

- (5) With the quill shaft connected, do a check to see if the bolt holes align between the control unit and the gearbox.

EFFECTIVITY

ALL

27-81-11

01

Page 425  
Aug 22/05

S 424-040

- (6) If the bolt holes align, install the control unit with these steps:
- (a) Apply BMS 3-24 grease to the bolts and washers for the control unit.
  - (b) Install the bolts and washers at four locations, and tighten the bolts.

NOTE: Install the bonding jumper for the electric motor at the bolt location shown (Fig. 403). Clean the bonding surfaces with a stainless steel brush. Make sure the total resistance across the wire connection is not more than 0.001 ohm.

- (c) Install lockwires at the location shown (Fig. 403) with the double twist procedure (AMM 20-10-23/401).

S 824-041

- (7) If the bolt holes on the control unit and the gearbox do not align, do these steps:
- (a) Make a mark between the PDU coupling and the torque tube on each side of the slat PDU.
  - (b) Disconnect the torque tubes on each side of the slat PDU to disengage the slat drive (AMM 27-81-24/401).

NOTE: Do not turn the torque tube. It will be necessary to adjust the slat drive if you turn the torque tubes while disconnected. Hold the torque tube in position with a clamp if it is necessary.

- (c) Turn the PDU coupling on the gearbox until you can align the bolt holes between the control unit and the gearbox.

NOTE: The control unit will turn with the quill shaft when you turn the output coupling on the PDU gearbox.

EFFECTIVITY

ALL

27-81-11

01

Page 426  
Aug 22/05

- (d) Apply BMS 3-24 grease to the bolts and washers for the control unit.
- (e) Install the four bolts and washers on the control unit, and tighten the bolts.

**NOTE:** Install the bonding jumper for the electric motor at the bolt location shown (Fig. 403). Clean the bonding surfaces with a stainless steel brush. Make sure the total resistance across the wire connection is not more than 0.001 ohm.

- (f) Install lockwires to the four bolts at the location shown (Fig. 403) with the double twist procedure (AMM 20-10-23/401).
- (g) Make sure the slats are in the fully retracted position, and that the torque tubes did not turn while disconnected.
- (h) Align the marks that you made between the torque tube and the PDU coupling, and connect the torque tubes to each side of the slat PDU (AMM 27-81-24/401).
- (i) Make sure you install a lockwire to the PDU coupling screws with the double twist procedure (AMM 20-10-23/401).

S 434-042

- (8) Connect the control valve control rod to the control unit output arm (View A-A, Fig. 401 or 402) with the bolt, washers, and nut.

**NOTE:** Put a washer below the nut, and a washer below the bolt head. Install the bolt with the head pointed away from the control unit.

S 424-043

- (9) Install the control valve module on the control unit (AMM 27-81-12/401).

S 434-044

- (10) Connect the bonding jumper between the support on control unit and the structure (Fig. 403).

**NOTE:** Clean the bonding surfaces with a stainless steel brush. Make sure the total resistance across the wire connection is not more than 0.001 ohms. Add a washer to each side of the wire connection at the support.

EFFECTIVITY

ALL

01

Page 427  
Aug 22/05

- S 434-045
- (11) Remove the identification tags and install the electrical connectors on the RVDT cover (Fig. 401 or 402).
- S 094-046
- (12) Remove rig pins LE2 and LE3 (outboard slat PDU) or rig pins LE5 and LE6 (inboard slat PDU), as applicable, and install the plugs in the rig pin holes.
- S 824-047
- (13) Adjust the inboard or outboard slat PDU, as applicable (AMM 27-81-00/501, "Inboard Slat PDU Adjustment" or "Outboard Slat PDU Adjustment").
- S 824-048
- (14) Adjust the RVDTs on the control unit with the instruction given in the "Install the RVDT" topic in this procedure.
- S 724-049
- (15) Do a test on the slat primary power and drive (AMM 27-51-00/501, "Test for the Flap and Slat Primary Drives and Position Indicating Systems").
- S 724-050
- (16) Do a test on the slat alternate power and drive (AMM 27-81-00/501, "Test for the Slat Alternate Power and Drive System, and the Slat Position Indicating System").
- I. Install the Hydraulic Motor (Fig. 404)
- S 094-051
- (1) Remove the cover from the hydraulic motor, and the caps from the hydraulic ports.
- S 644-052
- (2) Lightly lubricate the hydraulic fittings and the packing O-rings with Skydrol assembly lube or hydraulic fluid.
- S 644-053
- (3) Apply a thin layer of BMS 3-33 grease to the mating splines on the hydraulic motor.
- S 644-054
- (4) Install the lubricated packing O-ring, screw-thread plug, and bleeder in the seal drain port.
- S 094-055
- (5) Remove the cover on the gearbox mating surface.

EFFECTIVITY

ALL

27-81-11

01

Page 428  
Aug 22/05

S 644-056

- (6) Apply a light layer of BMS 3-33 grease to the splines on the mating surface of the gearbox.

S 434-057

- (7) Carefully engage the splines of the hydraulic motor to the gearbox, with the lubricated packing O-ring between the motor and the gearbox.

S 424-058

- (8) Install the bolt, washer (below bolthead), washer (below the nut), and nut at four locations (Detail C or D) to connect the hydraulic motor.

NOTE: Apply BMS 3-24 grease to the washers before the installation.

S 094-059

- (9) Remove the plugs from the hydraulic lines.

S 614-060

- (10) Fill the hydraulic motor with hydraulic fluid.

S 824-061

- (11) Align the hydraulic lines for the installation.

NOTE: Make sure the hydraulic lines are clear from the adjacent components by a minimum of 0.25 inches (6.4 mm).

S 434-062

- (12) Install the hydraulic lines with the lubricated packing O-rings, and tighten the nuts.

S 724-063

- (13) Do a test on the slat primary power and drive (AMM 27-51-00/501, "Test for the Flap and Slat Primary Drives and Position Indicating Systems").

S 214-064

- (14) Do a check at all the hydraulic line connections to the hydraulic motor, and make sure there is no leakage of hydraulic fluid.

J. Install the Electric Motor

S 864-184

- (1) Make sure you remove pressure from the center hydraulic system (AMM 29-11-00/201).

S 864-185

- (2) Make sure that the flap and slat alternate drives are off.

EFFECTIVITY

ALL

27-81-11

01

Page 429  
Aug 22/05

- S 094-065
- (3) Remove the covers from the electric motor and the gearbox mating surface.
- S 104-066
- (4) Clean the mating surfaces with solvent.
- S 424-183
- (5) Do these steps to install the electric motor (Fig. 404).
- (a) If your replacement electric motor assembly includes an adapter plate, install adapter plate to the slat PDU housing.
- NOTE: Electric motors with adapter plate are installed at inboard slat PDUs only.
- (b) Apply a layer of BMS 3-33 grease to the splines of the electric motor and the gearbox.
- (c) Apply BMS 3-24 grease to the washers before the installation.
- (d) Install the electric motor to the gearbox and connect the two bonding jumpers (View E or F, Fig. 404).
- NOTE: Clean the bonding surfaces with a stainless steel brush. Make sure the total resistance across the wire connection is not more than 0.001 ohm.
- (e) Connect the electrical connector to the electric motor.
- S 724-071
- (6) Do a test on the slat alternate power and drive (AMM 27-81-00/501, "Test for the Slat Alternate Power and Drive System, and the Slat Position Indicating System").

K. Install the RVDTs

- S 424-176
- (1) Install the two RVDTs on the inboard slat PDU and the #1 RVDT on the outboard slat PDU.
- (a) Align the black electrical null mark on the RVDT body with the null slot on the RVDT shaft (Detail C, Fig. 405).
- (b) Put the RVDT in the control unit, and attach the clamp with two bolts on each RVDT (View A-A or B-B).
- NOTE: Keep the bolts loose for the subsequent adjustment.

EFFECTIVITY

ALL

27-81-11

04

Page 430  
Aug 22/05

- (c) Adjust the RVDTs (with -53 or older FSEU installed) with the steps that follow:

NOTE: If you have a -63 FSEU installed then follow the RVDT adjustment using a -63 FSEU shown later in the procedure.

- 1) Connect the electrical equipment (-28 and/or -29 cable assemblies) and digital voltmeters (or phase angle voltmeter) with Procedure A (with external power) or Procedure B (with airplane power), as shown (Fig. 406).
- 2) Procedure A:  
Supply the excitation voltage:
  - a) Start the external power supply.
- 3) Procedure B:  
Remove the DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel, P11, and supply electrical power (AMM 24-22-00/201):
  - a) 11C15, FLAP SLAT ELEC UNIT 1 SENSOR
  - b) 11C16, FLAP SLAT ELEC UNIT 1 CONT
  - c) 11G15, FLAP SLAT ELEC UNIT 2 SENSOR
  - d) 11G16, FLAP SLAT ELEC UNIT 2 CONT
  - e) 11G22, FLAP SLAT ELEC UNIT 3 SENSOR
  - f) 11G23, FLAP SLAT ELEC UNIT 3 CONT
- 4) Turn the RVDT counterclockwise until you get a retract signal voltage of -8.75v ac (+/-60 mv), with an excitation voltage of 28.00v ac (Fig. 406).

NOTE: If you can not supply an excitation voltage of 28.00v ac, refer to Table 401 to get the relation between the excitation voltage and retract signal voltage.

- 5) Tighten the RVDT clamp bolts to 10-30 pound-inches (1.2-3.4 newton-meters), and make sure the voltage shown on the voltmeter does not change.
- 6) Install a lockwire between the two clamp bolts with the double twist procedure (AMM 20-10-23/401).

S 424-177

- (2) Install the #2 RVDT on the outboard slat PDU.
- (a) Make sure the lock pin for the RVDT spline shaft is held in the leaf spring notch on the RVDT.
  - (b) Align the RVDT attach bolts to the bolt holes on the control unit, and engage the RVDT spline shaft.

NOTE: The RVDT spline shaft is held in the locked (rigged) position during installation. The shaft will be free to turn after you tighten the second RVDT clamp bolt.

Page 431  
Aug 22/05

- (c) Tighten the RVDT clamp bolt that is identified by an arrow with a label "TIGHTEN FIRST" on the RVDT. Tighten to 10-30 pound-inches.
- (d) Tighten the second RVDT clamp bolt to 10-30 pound-inches (1.2-3.4 newton-meters).
- (e) Do a check of the No. 2 RVDT adjustment (with -53 or older FSEU installed) on the outboard slat PDU with the steps that follow:

NOTE: If you have a -63 FSEU installed then follow the RVDT adjustment using a -63 FSEU shown later in the procedure.

- 1) Connect the electrical equipment (-92 and -93 cable assemblies) and digital voltmeters (or phase angle voltmeter) with either Procedure A (with external power) or Procedure B (with airplane power) as shown (Fig. 406).
- 2) Procedure A:  
Supply the excitation voltage:
  - a) Start the external power supply.
- 3) Procedure B:  
Remove the DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel, P11, and supply electrical power (AMM 24-22-00/201):
  - a) 11C15, FLAP SLAT ELEC UNIT 1 SENSOR
  - b) 11C16, FLAP SLAT ELEC UNIT 1 CONT
  - c) 11G15, FLAP SLAT ELEC UNIT 2 SENSOR
  - d) 11G16, FLAP SLAT ELEC UNIT 2 CONT
  - e) 11G22, FLAP SLAT ELEC UNIT 3 SENSOR
  - f) 11G23, FLAP SLAT ELEC UNIT 3 CONT
- 4) Make sure you get a retract signal voltage of -10.0 volts (+/- 60 mv), with an excitation voltage of 28.00v ac (Fig. 406). If the retract signal voltage is not correct do the steps that follow:

NOTE: If you cannot supply an excitation voltage of 28.00v ac, refer to Table 402 to get the relation between the excitation voltage and retract signal voltage.

- a) Loosen the clamp bolts.
- b) Turn the RVDT clockwise, and check the retract signal voltage.
  - If the voltage increases, continue to turn the RVDT until you get the correct voltage.
  - If the voltage decreases, turn the RVDT counterclockwise until you get the correct voltage.
- c) Tighten the clamp bolts to 10-30 pound-inches (1.2-3.4 newton-meters) and install a lockwire between the two clamp bolts with the double twist procedure (AMM 20-10-23/401).

S 824-181

- (3) Do a check of the RVDT extend signal voltage (with -53 or older FSEU installed) with the steps that follow:

**NOTE:** If you have a -63 FSEU installed then follow the RVDT adjustment using a -63 FSEU shown later in the procedure.

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

**CAUTION:** MAKE SURE YOU REMOVE ALL THE RIG PINS FROM THE SLAT PDU BEFORE YOU OPERATE THE SLATS WITH HYDRAULIC POWER. OPERATION OF THE PDU WITH RIG PINS INSTALLED WILL CAUSE DAMAGE TO THE SLAT PDU.

- (a) Pressurize the center hydraulic system and reservoir (AMM 29-11-00/201).
- (b) Remove the DO-NOT-OPERATE tag from the flap control lever, and move the lever to the 30-unit detent.
- (c) Make sure the flaps and slats move to the fully extended position.
- (d) Remove the power from the center hydraulic system (AMM 29-11-00/201).
- (e) Install the PDU lock in the TE flap PDU (Fig. 407).
- (f) Install the groundlocks in the inboard and outboard slat PDUs (Fig. 408).
- (g) Make sure that the extend signal voltage is +11.25v ac  $\pm$ 225 mv for the RVDTs of the inboard slat PDU, or +10.32v ac  $\pm$ 220 mv for the #1 RVDT and +9.07v ac 220 mv for the #2 RVDT of the outboard slat PDU, with an ac excitation voltage of 28v ac.

**NOTE:** If you can not supply an excitation voltage of 28.00v ac, refer to Tables 401, 402 to get the relation between the excitation voltage and retract or extend signal voltage.

- (h) Remove the PDU lock from the TE flap PDU (Fig. 407).
- (i) Remove the groundlocks from the inboard and outboard slat PDU (Fig. 408).

- 2) Down arrow to the RVDT you want to check and push YES key to display the RVDT reading.

NOTE: There is no need to correct the value displayed for excitation voltage as is necessary when using a PAV. This correction has already being done by the FSEU. To display another RVDT reading, push the down or up arrow key. This will take you to the next RVDT in the list. Push YES to display its value. There is a 5-minute automatic time limit after which the display will turn off if no keys are pushed in. To keep the display active while reading an RVDT value, push the YES key every few minutes. This has no effect on the display, but resets the 5-minute time limit.

LEADING EDGE SLAT DRIVE CONTROL VALVE MODULE AND BYPASS VALVE -  
REMOVAL/INSTALLATION

1. General

- A. This procedure contains the removal and the installation tasks for the Flow Regulator Valve (On-Wing) of the Control Valve Module, the Control Valve Module, the Bypass Valve of the Control Valve Module, and the Bypass Valve Rotary Actuator (the electric motor with the gears).

TASK 27-81-12-024-001

2. Leading Edge Slat Power Drive Unit (PDU) Control Valve Module and Bypass Valve - Removal

A. General

- (1) This task contains the removal procedure for these components on the slat PDU:

- the Control Valve Module - the Flow Regulator Valve
- the Control Valve Module
- the Control Valve Module - the Bypass Valve
- the Bypass Valve Rotary Actuator.

Because this task contains four procedures, only do the applicable procedure to remove the component.

To start one of these procedures, do the steps in the "Prepare for the Removal" topic, then do the applicable group of steps to remove the component.

B. Equipment

- (1) LE Slat Groundlock - A27007-1 (2 Necessary)
- (2) TE Flap PDU Lock - A27009-7
- (3) Circuit Breaker Lockout Clip  
(4 Necessary) Commercially Available

C. References

D. Access

(1) Location Zones

144	Right MLG Wheel Well
211/212	Control Cabin
510/610	Wing Leading Edge - Inboard
520/620	Wing Leading Edge - Outboard
710	Nose Landing Gear and Doors
730/740	Main Landing Gear and Doors

(2) Access Panels

511BB	LE Slat Power Drive Unit - Outboard (Left)
611BB	LE Slat Power Drive Unit - Inboard (Right)

E. Prepare for the Removal

S 214-002

- (1) Make sure the downlocks are installed on the nose and main landing gear (Ref 32-00-20).

S 494-003

**WARNING:** USE AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Open the doors from the landing gear and install the door locks (Ref 32-00-15).

S 214-004

- (3) Make sure the flaps and slats are in the fully retracted position.

S 214-005

- (4) Make sure the flap control lever is in the zero (FLAPS UP) detent.

S 494-006

- (5) Attach a DO-NOT-OPERATE tag to the flap control lever.

S 864-007

- (6) Remove the pressure from the center hydraulic system and reservoir (Ref 29-11-00).

S 864-008

- (7) Open these circuit breakers on the overhead panel, P11, and install circuit breaker locks and DO-NOT-CLOSE tags:

- (a) 11H23, SLAT ALTN CONT INBD
- (b) 11H24, SLAT ALTN CONT OUTBD
- (c) 11J24, FLAPS ALTN CONT

EFFECTIVITY

ALL

27-81-12

Page 410  
Aug 22/01

S 864-009

- (8) Open these circuit breakers on the main power distribution panel, P6, and install circuit breaker locks and DO-NOT-CLOSE tags:
- (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6D24, ALTN FLAP PWR
  - (c) 6F24, ALTN SLAT OUTBD PWR

S 494-010

- (9) Install the PDU lock in the TE flap PDU (Fig. 404).

S 014-011

- (10) Remove the access panel, 511BB and 611BB, to get access to the outboard and inboard slat PDUs (Ref 06-44-00).

S 494-012

- (11) Install the groundlocks in the inboard and outboard slat PDUs (Fig. 405).

- F. Remove the Flow Regulator Valve from the Control Valve Module (inboard or outboard slat PDU)

**NOTE:** Refer to Fig. 401 to remove the flow regulator valve on the inboard slat PDU.  
Refer to Fig. 402 to remove the flow regulator valve on the outboard slat PDU.

S 034-125

- (1) Disconnect the electrical connectors from the bypass valve.

S 024-126

- (2) Remove the lockwire and loosen the flow regulator.

S 494-128

- (3) Remove the flow regulator, packings, and rings.

EFFECTIVITY

ALL

27-81-12

01

Page 411  
Apr 22/99

S 034-127

- (4) Put a cover on the control valve module to prevent any contamination.

S 214-129

- (5) Examine flow regulator valve parts for damage, wear, cracks, stripped screw threads, and replace them as necessary.

G. Remove the Control Valve Module

**NOTE:** Refer to Fig. 401 to remove the control valve module on the inboard slat PDU.  
Refer to Fig. 402 to remove the control valve module on the outboard slat PDU.

S 494-013

- (1) Remove the plugs from the rig pin holes, and install rig pins LE2 and LE3 (for the outboard slat PDU), and rig pins LE5 and LE6 (for the inboard slat PDU), as applicable.

S 034-014

- (2) Disconnect the electrical connectors from the bypass valve.

S 034-015

- (3) Disconnect the control valve control rod from the control valve input arm (View D, Fig. 401 or View B, Fig. 402).

**NOTE:** Do not change the length of control rod during or after you disconnect the rod.

S 034-016

- (4) Disconnect the hydraulic pressure, return, and case drain lines from the module at five locations on the control valve (View A, Fig. 401 or View A, Fig. 402).

EFFECTIVITY

ALL

27-81-12

02

Page 412  
Apr 22/06

S 494-017

- (5) Install plugs in the hydraulic lines and caps on the hydraulic ports.

S 034-018

- (6) Disconnect the bolts as shown to remove the control valve module (View E, Fig. 401 or View C, Fig. 402).

H. Remove the Bypass Valve

**NOTE:** Refer to Fig. 401 to remove the bypass valve for the inboard slat PDU.  
Refer to Fig. 402 to remove the bypass valve for the outboard slat PDU.

S 494-019

- (1) Remove the plugs from the rig pin holes, and install rig pins LE2 and LE3 (outboard slat PDU), or rig pins LE5 and LE6 (inboard slat PDU), as applicable.

S 034-020

- (2) Disconnect the electrical connectors from the bypass valve.

S 034-021

- (3) Remove the bolts that attach the bypass valve to the control valve module.

S 024-022

- (4) Remove the bypass valve.

S 494-023

- (5) Put a cover on the control valve module and the bypass valve to keep dirt away from the mating surfaces.

I. Remove the Bypass Valve Rotary Actuator (Fig. 403)

S 034-024

- (1) Disconnect the electrical connector from the rotary actuator.

EFFECTIVITY

ALL

27-81-12

01

Page 413  
Apr 22/06

- S 034-025
- (2) Remove the four bolts that connect the rotary actuator to the bypass valve housing.
- S 024-026
- (3) Remove the rotary actuator with the pin lock.
- S 494-027
- (4) Put a cover on the bypass valve housing and the rotary actuator to keep dirt away from the mating surfaces.

TASK 27-81-12-424-028

3. Leading Edge Slat Power Drive Unit (PDU) Control Valve Module and Bypass Valve - Installation

A. General

- (1) This task contains the installation procedure for these components:
- the Control Valve - the Flow Regulator Valve
  - the Control Valve Module
  - the Control Valve Module - the Bypass Valve Module
  - the Bypass Valve Rotary Actuator.

Because this task contains four different installation procedures, only do the applicable procedure to install the component.

To start one of these procedures, do the steps in the "Prepare for the Installation" topic before you do the applicable group of steps to install the component. Then do the "Put the Airplane Back to Its Usual Condition" group of steps.

- (2) If you will install the bypass valve, or the bypass valve rotary actuator, do the bypass valve operational tests for the slat primary and alternate drives after the installation, with the instructions given in this task.

EFFECTIVITY

S 214-033

- (5) Make sure these circuit breakers are opened on the main power distribution panel, P6:
  - (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6D24, ALTN FLAP PWR
  - (c) 6F24, ALTN SLAT OUTBD PWR
- G. Install the Flow Regulator Valve in the Control Valve Module (inboard or outboard slat PDU):

**NOTE:** Refer to Fig. 401 to install the flow regulator valve for the inboard slat PDU.  
Refer to Fig. 402 to install the flow regulator valve for the outboard slat PDU.

S 434-130

- (1) Lubricate the threads on the flow regulator, packings and rings with hydraulic fluid or skydrol assembly lube.

S 094-131

- (2) Install packings and rings on the flow regulator valve.

S 424-133

- (3) Remove the cover from the control valve module.

S 434-132

- (4) Thread flow regulator valve in the body assembly of the control valve module, and tighten flow regulator valve to 400 to 500 pound-inches (45.194 to 56.492 newton meter).

S 434-134

- (5) Install lockwire to the flow regulator valve using the double twist procedure (AMM 20-10-23/401).

EFFECTIVITY

ALL

27-81-12

01

Page 417  
Dec 22/01

- S 714-135
- (6) Connect the electrical connector to the bypass valve of the control valve module.

- S 714-137
- (7) Do a test on the operation of the flow regulator valve for the slat primary drive with the instructions in the "Bypass Valve Operational Test - Slat Primary Drive" paragraph.

H. Install the Control Valve Module

NOTE: Refer to Fig. 401 to install the control valve module for the inboard slat PDU.  
Refer to Fig. 402 to install the control valve module for the outboard slat PDU.

- S 214-034
- (1) Make sure that (outboard slat PDU) rig pins LE2 and LE3 (View B and View D, Fig. 402) or (inboard slat PDU) rig pins LE5 and LE6 (View B and View D, Fig. 401) are installed in the applicable slat PDU.

- S 644-035
- (2) Apply BMS 3-33 grease to the bushings and bolts before the installation.

- S 104-148
- (3) Clean the bond surfaces between the control valve module and the control unit (SWPM 20-20-00).

- S 434-037
- (4) Put the control valve module on the control unit and install the bolt, aluminum washer (below the bolt head), bushing, steel washer (below the nut), and nut at two locations (View E, Fig. 401 or View C, Fig. 402). Tighten the nut.

EFFECTIVITY

ALL

27-81-12

02

Page 418  
Apr 22/08

S 104-149

- (5) Make sure the bonding resistance between the control valve module and the control unit is not more than 0.001 ohm.

S 094-038

**CAUTION:** IF YOU INSTALLED A NEW CONTROL VALVE MODULE, MAKE SURE YOU REMOVE THE O-RINGS WITH THE SHIPPING CAP FROM THE HYDRAULIC PORTS ON THE CONTROL VALVE MODULE. THE O-RINGS ON THE SHIPPING CAPS CAN CAUSE INCORRECT CONNECTIONS WITH THE HYDRAULIC LINES AND CAUSE LEAKAGE OF HYDRAULIC FLUID.

- (6) Remove the plugs from the hydraulic lines, and the caps from the hydraulic ports.

**NOTE:** If you installed a new control valve module, remove the O-rings supplied with the shipping caps from the hydraulic ports.

S 644-039

- (7) Apply Skydrol assembly lube or hydraulic fluid to the packing O-rings and the fittings before you connect the hydraulic lines.

S 434-040

- (8) Connect the hydraulic pressure, return, and case drain lines to the control valve module at five locations (View A, Fig. 401 or View A, Fig. 402).

S 434-041

- (9) Install the electrical connector at the bypass valve.

S 434-042

- (10) Connect the control valve control rod to the control valve input arm.

**NOTE:** Do not change the length of the control rod during the installation.

S 824-043

- (11) Adjust the inboard or outboard slat PDU if it is necessary (Ref 27-81-00/501, "Inboard Slat PDU Adjustment" or "Outboard Slat PDU Adjustment").

S 824-044

- (12) Do a check of the PDU RVDT signal voltages and adjust the RVDT if it is necessary (AMM 27-81-11/401).

EFFECTIVITY

ALL

27-81-12

03

Page 419  
Apr 22/06

S 094-045

- (13) Make sure you remove the rig pins LE2 and LE3, or LE5 and LE6, as applicable, and install the plugs in the rig pin holes.

S 714-046

- (14) Do a test on the slat primary power and drive (Ref 27-51-00/501, "Test for the Flap and Slat Primary Drives and Position Indicating Systems").

S 714-047

- (15) Do a test on the slat alternate power and drive (Ref 27-81-00/501, "Test for the Slat Alternate Power and Drive System, and the Slat Position Indicating System").

S 214-048

- (16) Make sure there is no leakage of hydraulic fluid at the hydraulic line connections on the control valve module.

I. Install the Bypass Valve

NOTE: Refer to Fig. 401 to install the bypass valve for the inboard slat PDU.  
Refer to Fig. 402 to install the bypass valve for the outboard slat PDU.

S 214-049

- (1) Make sure that (outboard slat PDU) rig pins LE2 and LE3 (View B and View D, Fig. 402) or (inboard slat PDU) rig pins LE5 and LE6 (View B and View D, Fig. 401) are installed in the applicable slat PDU.

S 644-050

- (2) Lightly lubricate the hydraulic fittings, packing O-rings, and the backup rings with Skydrol assembly lube or hydraulic fluid.

S 094-051

- (3) Remove the cover on the mating surface of the control valve module.

EFFECTIVITY

ALL

27-81-12

03

Page 420  
Apr 22/06

- S 104-052
- (4) Clean the mating surfaces between the control valve module and the bypass valve, and make sure there is no grease on the surfaces.
- S 434-053
- (5) Install the packing O-ring and backup rings on the valve sleeve.
- S 424-054
- (6) Install the bypass valve in the control valve module, and tighten the bolts to 67-83 pound-inches (7.6-9.3 newton-meters).
- S 434-055
- (7) Install lockwires to the bolts together with the double twist procedure (Ref 20-10-23).
- S 394-056
- (8) Apply sealant around the mating edges of the flange and the bolts.
- S 434-057
- (9) Install the electrical connector.
- S 214-058
- (10) Make sure the manual override lever on the bypass valve is in the No. 2 (normal) position.
- S 094-059
- (11) Remove the rig pins LE2 and LE3, or, LE5 and LE6 as applicable, and install the plugs in the rig pin holes.
- S 714-060
- (12) Do a test on the operation of the bypass valve for the slat primary drive with the instructions in the "Bypass Valve Operational Test - Slat Primary Drive" paragraph.
- S 714-061
- (13) Do a test on the operation of the bypass valve for the slat alternate drive with the instructions in the "Bypass Valve Operational Test - Slat Alternate Drive" paragraph.
- J. Install the Bypass Valve Rotary Actuator (Fig. 403)
- S 094-062
- (1) Remove the covers from the bypass valve housing and the rotary actuator.
- S 104-063
- (2) Clean the mating surfaces between the bypass valve housing and the rotary actuator, and make sure there is no grease on the surfaces.
- S 434-064
- (3) Install the pin lock on the rotary actuator.

EFFECTIVITY

S 214-083

- (9) Move the flap control lever to the 1-unit detent and do these checks:
- (a) While the slats extend, make sure the L and R needles on the flap position indicator (P3) move to a position between the UP and the 1-unit marks.
  - (b) Make sure the flaps do not move.
  - (c) After the slats stop in the intermediate position, make sure the L and R needles on the flap position indicator point to the 1-unit mark.

S 214-084

- (10) Move the flap control lever to the zero (FLAPS UP) detent and do these checks:
- (a) While the slats retract, make sure the L and R needles on the flap position indicator move to a position between the 1-unit and the UP marks.
  - (b) After the slats stop at the fully retracted position, make sure the L and R needles on the flap position indicator point to the UP mark.

S 864-085

- (11) Remove the power from the center hydraulic system (Ref 29-11-00).  
L. Bypass Valve Operational Test - Slat Alternate Drive

**NOTE:** During this test, make sure the EICAS messages on the EICAS display, and the amber LEADING EDGE light, on the P3 panel, do not come on unless it is shown in the instruction.

S 094-086

- (1) Remove the PDU lock from the TE flap PDU (Fig. 404).

S 094-087

- (2) Remove the groundlocks from the inboard and outboard slat PDUs (Fig. 405).

S 044-088

**WARNING:** DO THE THRUST REVERSER DEACTIVATION PROCEDURE TO PREVENT THE OPERATION OF THE THRUST REVERSER. THE ACCIDENTAL OPERATION OF THE THRUST REVERSER CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (3) Do this procedure: Thrust Reverser Deactivation for Ground Maintenance (AMM 78-31-00/201).

S 864-089

- (4) Remove the circuit breaker locks and DO-NOT-CLOSE tags and close these circuit breakers on the P11 panel:
- (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD
  - (c) 11J24, FLAPS ALTN CONT

S 864-090

- (5) Remove the circuit breaker locks and DO-NOT-CLOSE tags, and close these circuit breakers on the P6 panel:
- (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6D24, ALTN FLAP PWR
  - (c) 6F24, ALTN SLAT OUTBD PWR

S 214-091

- (6) Make sure the six EICAS circuit breakers are closed on the P11 panel.

S 214-094

- (7) Make sure the flaps and slats are in the fully retracted position.

S 214-095

- (8) Make sure the flap control lever is in the zero (FLAPS UP) detent.

S 214-096

- (9) Make sure the position selector switch for the flap/slat alternate drive, on the P3 panel, is in the NORM detent.

S 864-097

- (10) Supply electrical power (Ref 24-22-00).

S 214-098

- (11) Make sure the arming switches for the flap and slat alternate drives, on the P3 panel, are off (ALTN switch lights are off).

EFFECTIVITY

ALL

01

Page 425  
Aug 22/01

S 864-099

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

(12) Pressurize the center hydraulic system (Ref 29-11-00).

S 864-100

(13) Push the arming switch for the slat alternate drive , on the P3 panel, to arm the slat alternate drive (ALTN switch light comes on), and look for these conditions to occur seven seconds after you push the arming switch:

(a) The amber LEADING EDGE light, on the P3 panel, comes on and this message, LE SLAT DISAGREE shows in the EICAS display.

S 864-101

(14) Move the flap control lever to the 1-unit detent and make sure the inboard and outboard slats do not move.

**NOTE:** It is normal that the slats move lightly. This is due to the transition of the bypass valve in the power drive unit.

S 864-102

(15) Move the flap control lever to the zero (FLAPS UP) detent.

S 864-103

(16) Remove the power from the center hydraulic system (Ref 29-11-00).

S 864-104

(17) Push the arming switch for the slat alternate drive, on the P3 panel, to disarm the slat alternate drives (ALTN switch lights go off).

S 214-105

(18) Make sure the amber LEADING EDGE light, on the P3 panel, goes off and the message, LE SLAT DISAGREE, does not show in the EICAS display.

EFFECTIVITY

ALL

Aug 22/01

S 214-106

- (19) Make sure the EICAS message, LE SLAT DISAGREE, does not show on the display unit in the flight compartment.

M. Put the Airplane Back to Its Usual Condition

S 094-107

- (1) If installed, remove the DO-NOT-OPERATE tag from the flap control lever.

S 094-108

- (2) If installed, remove the PDU lock from the TE flap PDU (Fig. 404).

S 094-109

- (3) If installed, remove the groundlocks from the inboard and outboard slat PDUs (Fig. 405).

S 864-110

- (4) Remove the circuit breaker locks and DO-NOT-CLOSE tags, and close these circuit breakers on the P11 panel:
- (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD
  - (c) 11J24, FLAPS ALTN CONT

S 864-111

- (5) Remove the circuit breaker locks and DO-NOT-CLOSE tags and close these circuit breakers on the P6 panel:
- (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6D24, ALTN FLAP PWR
  - (c) 6F24, ALTN SLAT OUTBD PWR

S 214-112

- (6) Make sure there is not leakage of hydraulic fluid at the hydraulic line connections on the control valve module.

S 744-113

- (7) Operate the test switch on the panel of the flap/slat electronics unit (FSEU) at the E2 equipment rack, and look for a no-fault indication.

S 864-114

- (8) Remove the power from the center hydraulic system (Ref 29-11-00).

S 864-115

- (9) Remove electrical power (Ref 24-22-00).

S 444-116

- (10) Do the activation procedure for the thrust reverser (AMM 78-31-00/201).

LEADING EDGE SLAT DRIVE BODY ANGLE GEARBOX – REMOVAL/INSTALLATION

1. General

- A. This procedure contains the removal and the installation tasks for the body angle gearbox for the leading edge (LE) slat drive.
- B. The body angle gearbox is a component of the inboard slat drive system.

TASK 27-81-15-024-001

2. Inboard Slat Drive Body Angle Gearbox – Removal

A. Equipment

- (1) Leading Edge Slats Groundlock – A27007-1  
(2 Necessary)
- (2) TE Flap PDU Lock – A27009-7
- (3) Circuit Breaker Lockout Clip  
(4 necessary) Commercially Available

B. References

- (1) 06-44-00/201, Wing Access Doors and Panels
- (2) 06-46-00/201, Entry, Service and Cargo Doors
- (3) 24-22-00/201, Electrical Power – Control
- (4) 25-52-01/401, Sidewall Panels
- (5) 27-81-00/501, Leading Edge Slat System
- (6) 27-81-24/401, Leading Edge Slat Torque Tubes
- (7) 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems
- (8) 32-00-15/201, Landing Gear Door Locks
- (9) 32-00-20/201, Landing Gear Downlocks

C. Access

(1) Location Zones

125/126	Area Aft of the Forward Cargo Compartment
144	Right MLG Wheel Well
211/212	Control Cabin
710	Nose Landing Gear and Doors
730/740	Left/Right Main Landing Gear and Doors
821	Forward Cargo Door

(2) Access Panel

511BB	LE Slat Power Drive Unit – Outboard (Left)
611BB	LE Slat Power Drive Unit – Inboard (Right)

D. Prepare for the Removal

S 214-002

- (1) Make sure the downlocks are installed on the nose and main landing gear (Ref 32-00-20).

S 494-003

**WARNING:** USE AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Open the doors for the landing gear and install the door locks (Ref 32-00-15).

S 214-004

- (3) Make sure the flaps and slats are in the fully retracted position.

S 214-005

- (4) Make sure the flap control lever is in the zero (FLAPS UP) detent.

S 494-006

- (5) Attach a DO-NOT-OPERATE tag to the flap control lever.

S 864-007

- (6) Remove the power from the center hydraulic system (Ref 29-11-00).

S 494-008

- (7) Install the PDU lock on the TE flap power drive unit (PDU) (Fig. 402).

S 014-009

- (8) Remove the access panels, 511BB and 611BB, to get access to the outboard and inboard slat PDUs (Ref 06-44-00).

S 494-010

- (9) Install the groundlocks on the inboard and outboard slat PDUs (Fig. 403).

S 864-011

- (10) Open these circuit breakers on the overhead panel, P11, and install circuit breaker locks and DO-NOT-CLOSE tags:
- (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD
  - (c) 11J24, FLAPS ALTN CONT

S 864-012

- (11) Open these circuit breakers on the main power distribution panel, P6, and install circuit breaker locks and DO-NOT-CLOSE tags:
- (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6D24, ALTN FLAP PWR
  - (c) 6F24, ALTN SLAT OUTBD PWR

S 014-013

- (12) Open the forward cargo door (Ref 06-46-00).

S 014-014

- (13) Remove the cargo lining panels at the aft end of the forward cargo compartment (Ref 25-52-01).

S 014-015

- (14) Get access to the body angle gearbox behind the main distribution manifold (Fig. 401).

E. Remove the Body Angle Gearbox (Fig. 401)

S 934-016

- (1) Make a mark between the torque tube and the adjacent structure on each side of the body angle gearbox.

NOTE: These marks will help keep a record of the torque tube position before you disconnect the torque tube.

S 494-017

- (2) Hold the weight of the left inboard slat with a support.

NOTE: The weight of the left inboard slat can cause the torque tube to turn away from the adjusted position. The PDU groundlock will prevent the movement of the right inboard slat.

S 034-018

- (3) Disconnect the torque tube on each side of the body angle gearbox (Ref 27-81-24).

NOTE: Do not turn the torque tube. It will be necessary to adjust the inboard slat drive if you turn the torque tube while it is disconnected (Ref 27-81-00).

S 494-003

**WARNING:** USE AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Open the doors for the landing gear and install the door locks (Ref 32-00-15).

S 214-004

- (3) Make sure the flaps and slats are in the fully retracted position.

S 214-005

- (4) Make sure the flap control lever is in the zero (FLAPS UP) detent.

S 494-006

- (5) Attach a DO-NOT-OPERATE tag to the flap control lever.

S 864-007

- (6) Remove the power from the center hydraulic system (Ref 29-11-00).

S 494-008

- (7) Install the PDU lock in the TE flap power drive unit (PDU) (Fig. 402).

S 014-010

- (8) Remove the access panels, 511BB and 611BB, to get access to the outboard and inboard slat PDUs (Ref 06-44-00).

S 494-011

- (9) Install the groundlocks in the inboard and outboard slat PDUs (Fig. 403).

S 864-013

- (10) Open these circuit breakers on the overhead panel, P11, and install circuit breaker locks and DO-NOT-CLOSE tags:
- (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD
  - (c) 11J24, FLAPS ALTN CONT

S 864-014

- (11) Open these circuit breakers on the main power distribution panel, P6, and install circuit breaker locks and DO-NOT-CLOSE tags:
- (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6D24, ALTN FLAP PWR
  - (c) 6F24, ALTN SLAT OUTBD PWR

S 014-015

- (12) Remove the fixed lower access panels when it is necessary to get access to the gearbox (Ref 06-44-00).

LEADING EDGE SLAT DRIVE OUTBOARD ANGLE GEARBOX – REMOVAL/INSTALLATION

1. General

- A. This procedure contains the removal and the installation tasks for the outboard angle gearbox for the leading edge (LE) slat drive. The installation task also contains the steps for the test of the gearbox installation.
- B. The outboard angle gearbox is a component of the outboard slat drive system.

TASK 27-81-17-024-001

2. Outboard Slat Drive Outboard Angle Gearbox – Removal

A. Equipment

- (1) Leading Edge Slats Groundlock – A27007-1  
(2 Necessary)
- (2) TE Flap PDU Lock – A27009-7
- (3) Circuit Breaker Lockout Clip  
(4 necessary) Commercially Available

- 611ST Upper LE Structure (Right)

D. Prepare for the Removal

S 214-002

- (1) Make sure the downlocks are installed on the nose and main landing gear (Ref 32-00-20).

S 494-003

**WARNING:** USE AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Open the doors for the landing gear and install the door locks (Ref 32-00-15).

S 044-004

**WARNING:** DO THE THRUST REVERSER DEACTIVATION PROCEDURE TO PREVENT THE OPERATION OF THE THRUST REVERSER. THE ACCIDENTAL OPERATION OF THE THRUST REVERSER CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (3) Do this procedure: Thrust Reverser Deactivation for Ground Maintenance (AMM 78-31-00/201).

S 214-005

- (4) Make sure the flaps and slats are in the fully retracted position.

S 214-006

- (5) Make sure the flap control lever is in the zero (FLAPS UP) detent.

S 494-007

- (6) Attach a DO-NOT-OPERATE tag to the flap control lever.

D. Outboard Angle Gearbox (Fig. 401)

S 214-019

- (1) Make sure the flaps and slats are in the fully retracted position.

S 214-020

- (2) Make sure the flap control lever is in the zero (FLAPS UP) detent.

S 214-021

- (3) Make sure the power is removed from the center hydraulic system (Ref 29-11-00).

S 214-022

- (4) Make sure the electrical power is removed (Ref 24-22-00).

S 434-023

- (5) Put the gearbox in its position and install the three bolts with a washer below each nut. Tighten the nut.

S 644-024

- (6) Apply a light layer of grease to the splines of the coupling and the torque tube.

S 434-025

- (7) Connect the torque tubes to each side of the gearbox (Ref 27-81-24).

**NOTE:** Do not turn the torque tube during the installation. It will be necessary to adjust the outboard slat drive if you turn the torque tube (Ref 27-81-00).

S 224-026

- (8) Use these steps to do a check on the end clearances for the torque tubes that you connected:
- (a) Push the torque tube tightly against one end and make a mark on its position.
  - (b) Move the torque tube fully to the opposite end.
  - (c) Make sure the torque tube can move easily, and that the axial movement is between 0.100 and 0.460 inch (2.6-11.7 mm).

**NOTE:** If there is resistance when you move the torque tube, loosen the coupling screws by a small increment to permit the torque tube to move freely.

OUTBOARD ANGLE GEARBOX – INSPECTION/CHECK

1. General

- A. This procedure only has an illustration and a wear limit table, which show the data for wear limits. There are no procedures for access, removal or installation of the parts. Refer to the Outboard Angle Gearbox – Removal/Installation for procedures to do these tasks.

TASK 27-81-17-226-001

2. Wear Limits for the Outboard Angle Gearbox (Fig. 601)

A. General

- (1) This procedure only has an illustration and a wear limit table, which show the data for wear limits. There are no procedures for access, removal or installation of the parts. Refer to the Outboard Angle Gearbox – Removal/Installation for procedures to do these tasks.

KRUEGER SEAL FLAP ROTARY ACTUATOR – REMOVAL/INSTALLATION

1. General

- A. This procedure contains the removal and the installation tasks for the krueger seal flap rotary actuator. The installation task also contains the test steps for the rotary actuator installation.
- B. It is possible to see signs of grease at the external surface of the rotary actuator, migrated from the actuator drain hole. If the grease shown on the external surface is less than approximately 0.5 ounce (14 grams), and most of which did not leak from the area between the arm gear and the ring gear (Fig. 401), the actuator is normal. Repair or replace the actuator if grease leaked from the area between the arm gear and the ring gear.

TASK 27-81-19-024-001

2. Krueger Seal Flap Rotary Actuator – Removal

A. Equipment

- (1) Leading Edge Slats Groundlock – A27007-1  
(2 Necessary)
- (2) TE Flap PDU Lock – A27009-7
- (3) Circuit Breaker Lockout Clip  
(4 Necessary) Commercially Available

D. Prepare for the Removal

S 214-002

- (1) Make sure the downlocks are installed on the nose and main landing gear (Ref 32-00-20).

S 494-003

**WARNING:** USE AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Open the doors for the landing gear and install the door locks (Ref 32-00-15).

S 044-004

**WARNING:** DO THE THRUST REVERSER DEACTIVATION PROCEDURE TO PREVENT THE OPERATION OF THE THRUST REVERSER. THE ACCIDENTAL OPERATION OF THE THRUST REVERSER CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (3) Do this procedure: Thrust Reverser Deactivation for Ground Maintenance (AMM 78-31-00/201).

S 214-005

- (4) Make sure the flaps and slats are in the fully retracted position.

S 214-006

- (5) Make sure the flap control lever is in the zero (FLAPS UP) detent.

S 864-007

- (6) Supply electrical power (Ref 24-22-00).

EFFECTIVITY

Page 407  
Aug 22/01

S 864-008

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS . IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

(7) Pressurize the center hydraulic system (Ref 29-11-00).

S 864-009

(8) Move the flap control lever to the 30-unit detent, and make sure the flaps and slats move to the fully extended position.

S 494-010

(9) Attach a DO-NOT-OPERATE tag to the flap control lever.

S 864-011

(10) Remove the power from the center hydraulic system (Ref 29-11-00).

S 494-012

(11) Install the PDU lock in the TE flap power drive unit (PDU) (Fig. 402).

S 014-013

(12) Remove the access panels, 511BB and 611BB, to get access to the outboard and inboard slat PDUs (Ref 06-44-00).

S 494-014

(13) Install the groundlocks in the inboard and outboard slat PDUs (Fig. 403).

S 864-015

(14) Open these circuit breakers on the overhead panel, P11, and install circuit breaker locks and DO-NOT-CLOSE tags:

- (a) 11H23, SLAT ALTN CONT INBD
- (b) 11H24, SLAT ALTN CONT OUTBD
- (c) 11J24, FLAPS ALTN CONT

S 864-016

(15) Open these circuit breakers on the main power distribution panel, P6, and install circuit breaker locks and DO-NOT-CLOSE tags:

- (a) 6D21, ALTN SLAT INBD PWR
- (b) 6D24, ALTN FLAP PWR

S 014-017

- (16) Remove these access panels, 511QB and 511RB (on the left wing), or, 611QB and 611RB (on the right wing), to get access to the rotary actuator for the krueger seal flap (Ref 06-44-00).

E. Remove the Rotary Actuator (Fig. 401)

S 034-018

- (1) Disconnect the drive shaft at the universal joint (View A-A).

NOTE: Do not turn the drive shaft. It will be necessary to adjust the krueger seal flap drive if you turn the drive shaft while it is disconnected (Ref 27-81-00).

S 034-019

- (2) Disconnect the flap drive link from the rotary actuator arm (View B-B).

NOTE: You can manually turn the disconnected universal joint on the rotary actuator to move the actuator arm to get access to the flap drive link.

S 034-020

- (3) Disconnect the three bolts on the inboard side of the rotary actuator and remove the housing (Detail A).

S 034-021

- (4) Disconnect the three bolts on the outboard side of the rotary actuator.

S 034-087

- (5) Remove the plate assembly to allow removal of the rotary actuator. (View C, Fig. 401)

611QB	Lower LE Structure (Right)
611RB	Lower LE Structure (Right)

D. Install the Rotary Actuator (Fig. 401)

S 214-024

- (1) Make sure the flaps and slats are in the fully extended position.

S 214-025

- (2) Make sure the flap control lever is in the 30-unit detent.

S 214-026

- (3) Make sure the power is removed from the center hydraulic system (Ref 29-11-00).

EFFECTIVITY

ALL

27-81-19

02.1

Page 410  
Aug 22/09

- S 214-027
- (4) Make sure the electrical power is removed (Ref 24-22-00).
- S 434-028
- (5) Put the rotary actuator in its position and install three bolts with a washer below each nut, at the outboard side of the actuator.
- S 434-089
- (6) Install the plate assembly after the rotary actuator is back into position. Install the three bolts, washers, shims and nuts, and the four bolts, washers, shims, and nuts, to re-install plate assembly. Re-install pin on joint 'A'. (View C, Fig. 401).
- S 434-029
- (7) Attach the housing and the inboard side of the rotary actuator to the structure with three bolts, washers, and nuts.
- S 864-058
- (8) Make sure the bullnose control rod is correctly adjusted.
- S 434-030
- (9) Connect the flap drive link to the actuator arm (View B-B). Tighten the nut to 100-140 pound-inches (11.3-15.8 newton-meters).

**NOTE:** You can manually turn the disconnected universal joint on the rotary actuator to move the actuator arm as necessary to connect the flap drive link.

S 984-031

**CAUTION:** BEFORE YOU CONNECT THE DRIVE SHAFT, MAKE SURE THE KRUEGER SEAL FLAP IS FULLY EXTENDED, AND THAT THE JOINTS A, B, AND C IS STRAIGHT WHILE THE FLAP DRIVE LINK IS IN POSITION 1, AS SHOWN IN FIG. 401. YOU CAN CAUSE DAMAGE TO THE KRUEGER SEAL FLAP DRIVE IF YOU CONNECT THE DRIVE SHAFT WHILE THE FLAP DRIVE LINK IS NOT IN POSITION 1.

BEFORE YOU CONNECT THE DRIVE SHAFT, MAKE SURE THE KRUEGER SEAL FLAP IS CORRECTLY RIGGED (AMM 27-81-00/501 "KRUEGER FLAP SEAL DRIVE ADJUSTMENT AT SLAT 6 OR 7"). YOU CAN CAUSE DAMAGE TO THE KRUEGER FLAP SEAL DRIVE IF THE KRUEGER FLAP SEAL IS NOT CORRECTLY ADJUSTED.

- (10) Manually extend the krueger seal flap until the joints A, B, and C are in a straight line, and that the flap drive link is in position 1. Keep this position while you connect the drive shaft in the subsequent step.

EFFECTIVITY

ALL

27-81-19

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS . IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

(7) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 864-068

(8) Move the flap control lever to the 25-unit detent and make sure the slats move to the fully extended position.

S 494-069

(9) Attach a DO-NOT-OPERATE tag to the flap control lever.

S 864-070

(10) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).

S 864-071

(11) Open these circuit breakers on the overhead panel, P11, and install circuit breaker locks and DO-NOT-CLOSE tags:

- (a) 11H23, SLAT ALTN CONT INBD
- (b) 11H24, SLAT ALTN CONT OUTBD
- (c) 11J24, FLAPS ALTN CONT

S 864-072

(12) Open these circuit breakers on the main power distribution panel, P6, and install circuit breaker locks and DO-NOT-CLOSE tags:

- (a) 6D21, ALTN SLAT INBD PWR
- (b) 6D24, ALTN FLAP PWR
- (c) 6F24, ALTN SLAT OUTBD PWR

S 494-073

(13) Install the PDU lock in the TE flap power drive unit (PDU) (Fig. 402).

S 014-074

(14) Open the lower access panels, on the wings LE to get access to the outboard and inboard slat PDUs, and rotary actuators (AMM 06-44-00/201).

EFFECTIVITY

ALL

27-81-19

02.101

Page 415  
Aug 22/09

S 494-075

- (15) Install the groundlocks in the inboard and outboard slat PDUs (Fig. 403).

S 494-076

- (16) Remove these access panels, 511QB and 511RB (on the left wing), or, 611QB and 611RB (on the right wing), to get access to the rotary actuator for the krueger seal flap (AMM 06-44-00/201).

S 034-077

- (17) Disconnect the control rod from the rotary actuator arm gear.

**NOTE:** Examine how the bolt and associated hardware are installed. It is important to install them, back in place, in the same order.

E. Backlash Check for the Krueger Seal Flap Rotary Actuator (s)

S 834-078

- (1) Apply 60 to 120 pound (266-533 newtons) force to the actuator at the clevis holes.

S 974-079

- (2) Install a dial indicator at the actuator arm clevis in line with the applied load.

S 974-080

- (3) Zero the dial indicator and reverse the direction of the load.

S 974-081

- (4) Measure the arm displacement.

S 974-082

- (5) Make sure the backlash is 0.048 inch (1.2 mm) maximum measured at 3.45 inches (87.6 mm) radius on the krueger actuator arm.

F. Axial Freeplay Check

S 974-083

- (1) Use an inside caliper or a feeler gage set to take linear axial travel measurements between arm gear and ring gears.

**NOTE:** If you use a dial indicator install it in such a way that you can measure the axial travel of the arm gear to a fixed point.

EFFECTIVITY

ALL

27-81-19

02.101

Page 416  
Aug 22/09

S 974-084

- (2) Manually push arm gear inboard, as far as possible, and record the reading measurement shown on the caliper, dial indicator, or record the thickness of the feeler blade used.

S 974-085

- (3) Manually push arm gear outboard, as far as possible, and record measurement shown on caliper, dial indicator, or record the thickness of the feeler blade used.

S 974-086

- (4) Make sure that the subtraction of the two recorded measurements is no more than the maximum permitted axial freeplay of 0.070 inch (1.78 mm).

G. Put the Airplane Back to Its Usual Condition

S 414-045

- (1) Install the access panels, 511QB and 511RB (left wing), 611QB and 611RB (right wing), to close the access for the rotary actuators (Ref 06-44-00).

S 414-046

- (2) Install the access panels, 511BB and 611BB, to close the access to the outboard and inboard slat PDUs (Ref 06-44-00).

S 864-047

- (3) Remove the circuit breaker locks and DO-NOT-CLOSE tags, and close these circuit breakers on the overhead panel, P11:
  - (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD
  - (c) 11J24, FLAPS ALTN CONT

S 864-048

- (4) Remove the circuit breaker locks and DO-NOT-CLOSE tags, and close these circuit breakers on the main power distribution panel, P6:
  - (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6D24, ALTN FLAP PWR
  - (c) 6F24, ALTN SLAT OUTBD PWR

S 094-049

**WARNING:** USE AMM 32-00-15/201 TO REMOVE THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (5) Remove the door locks from the landing gear doors and close the doors (Ref 32-00-15).

KRUEGER SEAL FLAP ROTARY ACTUATOR – INSPECTION/CHECK

1. General

A. This procedure only has an illustration and a wear limit table, which show the data for wear limits. There are no procedures for access, removal, or installation of the parts. Refer to the Krueger Seal Flap Rotary Actuator – Removal/Installation for procedures to do these tasks.

TASK 27-81-19-226-001

2. Wear Limits for the Krueger Seal Flap Rotary Actuator (Fig. 601)

NOTE: The wear limits for the Krueger Seal Flap Drive Linkage that connects to the rotary actuator are given in AMM 27-81-04/201.

A. General

(1) This procedure only has an illustration and a wear limit table, which show the data for wear limits. There are no procedures for access, removal, or installation of the parts. Refer to the Krueger Seal Flap Rotary Actuator – Removal/Installation for procedures to do these tasks.

LEADING EDGE SLAT DRIVE ROTARY ACTUATOR AND  
OFFSET GEARBOX – MAINTENANCE PRACTICES

1. General

- A. This procedure has these tasks:
- (1) Offset Gearbox Replacement
  - (2) Rotary Actuator Removal for the Inboard and Outboard Slats
  - (3) Rotary Actuator Installation for the Inboard and Outboard Slats
  - (4) Rotary Actuator and Offset Gearbox Test
  - (5) In-Service Backlash and Axial Freeplay Checks (On Wing) for the Leading Edge (LE) Slat Rotary Actuator(s)
  - (6) Slat Retract and Extend Overtravel Stop Clearance Check Leading Edge (LE) Slat Rotary Actuator(s)
- B. The rotary actuator installation task (3) contains the steps to check and adjust the slat retract and extend overtravel stop clearances. Thus, if you do all the steps in the rotary actuator installation task (3), it is not necessary to do the "slat retract and extend overtravel stop clearance check" task at the end of this procedure.

NOTE: Replace the rotary actuator and the offset gearbox where overtravel stop contact is found and no clearance exist.

- C. It is possible to see signs of grease at the external surface of the rotary actuator, migrated from the actuator drain hole. If the grease shown on the external surface is less than approximately 0.5 ounce (14 grams), most of which did not leak from the area between the arm gear and the ring gear (Fig. 201 and 202), the actuator is normal. Repair the seal or replace the actuator if large amounts of grease leaked from the area between the arm gear and the ring gear.

TASK 27-81-20-902-001

2. Offset Gearbox – Replacement

- A. Equipment
- (1) Leading Edge Slats Groundlock – A27007-1  
(2 Necessary)
  - (2) Socket – Thin Wall Inboard LE Slat Drive Gearbox – A27073-1
  - (3) TE Flap PDU Lock – A27009-7
  - (4) Circuit Breaker Lockout Clip (4 Necessary)

E. Prepare for the Removal

S 212-002

- (1) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

S 492-003

**WARNING:** USE THE PROCEDURE IN AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Open the doors for the landing gear and install the door locks (AMM 32-00-15/201).

S 042-004

**WARNING:** DO THE THRUST REVERSER DEACTIVATION PROCEDURE TO PREVENT THE OPERATION OF THE THRUST REVERSER. THE ACCIDENTAL OPERATION OF THE THRUST REVERSER CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (3) Do this procedure: Thrust Reverser Deactivation for Ground Maintenance (AMM 78-31-00/201).

S 212-006

- (4) Make sure the trailing edge (TE) flaps and the leading edge (LE) slats are in the fully retracted position.

S 212-007

- (5) Make sure the flap control lever is in the zero (FLAPS UP) detent.

S 492-008

- (6) Attach a DO-NOT-OPERATE tag to the flap control lever.

S 862-009

- (7) Remove the power from the center hydraulic system (AMM 29-11-00/201).

EFFECTIVITY	
ALL	

# 27-81-20

L96773

- S 492-010  
(8) Install the PDU lock in the TE flap power drive unit (PDU) (Fig. 205).

- S 012-011  
(9) Open the lower access panels, on the wings LE to get access to the outboard and inboard slat PDUs, and offset gear boxes (AMM 06-44-00/201).

- S 492-012  
(10) Install the groundlocks in the inboard and outboard slat PDUs (Fig. 206).

- S 862-013  
(11) Open these circuit breakers on the overhead panel, P11, and install circuit breaker locks and DO-NOT-CLOSE tags:  
(a) 11H23, SLAT ALTN CONT INBD  
(b) 11H24, SLAT ALTN CONT OUTBD  
(c) 11J24, FLAPS ALTN CONT

- S 862-014  
(12) Open these circuit breakers on the main power distribution panel, P6, and install circuit breaker locks and DO-NOT-CLOSE tags:  
(a) 6D21, ALTN SLAT INBD PWR  
(b) 6D24, ALTN FLAP PWR  
(c) 6F24, ALTN SLAD OUTBD PWR

F. Remove the Offset Gearbox

S 292-630

**WARNING:** DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

- (1) Keep clean and free of all unwanted objects (FOD), the housing (can) assemblies of the slat main tracks, at all time.

- S 032-015  
(2) To remove the offset gearbox at the slat No. 5 (left wing) or No. 8 (right wing), remove the clamp (not installed on all seals), the seal, and the seal housing at the inboard side of the offset gearbox (Detail B, Fig. 202).

**NOTE:** This will get you the access to the torque tube coupling on the slat No. 5 or No. 8.

EFFECTIVITY

ALL

27-81-20

02

Page 211  
Apr 22/08

S 932-016

- (3) Make a mark on the offset gearbox, the adjacent coupling, and the torque tube before you disconnect the torque tube from the gearbox.

**NOTE:** This will keep a record of the correct position for the subsequent installation.

S 032-017

- (4) Remove the screws on the torque tube coupling and disconnect the torque tube on each side of the offset gearbox at the applicable location:

**NOTE:** Do not turn a disconnected torque tube. It will be necessary to adjust the slat drive if you turn the torque tube (AMM 27-81-00/501).

- (a) Inboard slat (No. 6 and 7) (Fig. 201)  
(b) Outboard slat (No. 1-5 and 8-12) (Fig. 202).

**NOTE:** There is only one torque tube coupling attached to the outboard gearbox for the slats No.1 and 12.

S 032-018

**WARNING:** BE CAREFUL WHEN YOU REMOVE THE OFFSET GEARBOX. THE ROTATIONAL ENERGY CAN CAUSE THE GEARBOX TO TURN QUICKLY AND CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (5) Remove the three gearbox bolts that attach the offset gearbox to the rotary actuator.

**NOTE:** Use the socket set for the slats No. 6 and 7.

S 022-019

- (6) Remove the offset gearbox from the airplane.  
G. Install the Offset Gearbox

S 642-020

- (1) Apply a thick layer of BMS 3-33 grease to the rotary actuator, and the offset gearbox mating surfaces at these locations as applicable:  
(a) The rotary actuator and the offset gearbox for the inboard slats (Detail D, Fig. 201).

EFFECTIVITY

ALL

27-81-20

11

Page 212  
Apr 22/08

(b) The rotary actuator and the offset gearbox for the outboard slats (Detail F, Fig. 202).

S 642-021

- (2) Apply a light layer of BMS 3-33 grease to the shank of the gearbox bolts.

S 982-022

- (3) Put the offset gearbox into its position and engage the output spline to the rotary actuator input shaft.

S 212-023

- (4) If you install the rotary actuator at the same time, make sure the rotary actuator is tightly attached to the structure with the offset gearbox when you attach the gearbox bolts.

S 432-024

- (5) Attach the the offset gearbox and the rotary actuator to the rib structure together with the three gearbox bolts, nuts and washers.

**NOTE:** Install a washer at each nut. Use the socket set for the slats No. 6 and 7.

S 862-363

**CAUTION:** FAILURE TO COMPLETE THE STEP THAT FOLLOWS CAN CAUSE FASTER WEAR OR DAMAGE TO TORQUE TUBES, OFFSET GEARBOXES, AND ROTARY ACTUATORS.

- (6) Apply approximately 10 to 15 pound-inch (1.0 to 1.5 Nm) torque to the input shaft of the offset gearbox to remove the freeplay.

**NOTE:** See Table 201 for the correct direction to turn the input shaft. Rotate input shaft in the same direction as the rest of the offset gearboxes to align all the gearboxes and torque tubes.

EFFECTIVITY

ALL

27-81-20

25

Page 213  
Apr 22/08

**NOTE:** THE SLATS ARE GIVEN THE NUMBER FROM 1 THROUGH 12, FROM THE LEFT WING TO THE RIGHT WING.

### LEFT WING (RIGHT WING IS OPPOSITE)

### OVERTRAVEL STOP CLEARANCES, INBOARD SLAT (EXAMPLE, SLATS NO. 6 AND 7)

(A)

- 1 0.03 INCH (0.8 mm) MINIMUM CLEARANCE (INBOARD SLATS EXTENDED WITH HYDRAULIC POWER) AT THE EXTEND OVERTRAVEL STOP.
- 2 0.03 INCH (0.8 mm) MINIMUM CLEARANCE (OUTBOARD SLATS EXTENDED WITH HYDRAULIC POWER) AT THE EXTEND OVERTRAVEL STOP.
- 3 0.05 TO 0.10 INCH (1.3 TO 2.5 mm) CLEARANCE (INBOARD OR OUTBOARD SLATS RETRACTED WITH HYDRAULIC POWER) AT THE RETRACT OVERTRAVEL STOP.
- 4 NOT LESS THAN 0.03 INCH (0.8 mm) (SLATS RETRACTED OR EXTENDED WITH ELECTRIC POWER) AT THE RETRACT OR EXTEND OVERTRAVEL STOPS.

### OVERTRAVEL STOP CLEARANCES, OUTBOARD SLAT (EXAMPLE, SLATS NO. 1-5 AND 8-12)

8-12	COUNTERCLOCKWISE
*[1] LOOK TO THE INBOARD DIRECTION	

S 642-026

- (7) Apply a layer of BMS 3-33 grease to the full length of the internal spline in the torque tube coupling and the offset gearbox.

S 822-027

- (8) Align the mark on the coupling and connect the torque tube to each end of the offset gearbox.

**NOTE:** Do not turn the torque tube when you connect it. It will be necessary to adjust the slat drive if you turn the torque tube.

S 032-028

- (9) Move the torque tube coupling on the offset gearbox connection and install the screws that attach the coupling to the offset gearbox. Do not tighten the coupling screws too tight.

S 222-029

- (10) Do these checks for the axial movement of a torque tube with a coupling at each end:
- (a) Push the torque tube tightly against one end and make a mark on its position.
  - (b) Move the torque tube fully to the opposite end.
  - (c) Make sure the torque tube can move easily, and that the axial movement is between 0.100 to 0.460 inch (2.54 to 11.7 mm).

**NOTE:** If there is resistance when you move the torque tube, loosen the coupling screws by a small increment to permit the torque tube to move freely.

EFFECTIVITY

ALL

27-81-20

06

Page 218  
Aug 22/99

S 222-030

- (11) Do these checks on the axial movement of a torque tube with a coupling at one end and a bearing housing at the opposite end:
- (a) Push the coupling away from the end of the torque tube, and make sure that the clearance between the torque tube and the mating part is between 0.050 to 0.370 inch (1.27 to 9.40 mm).

S 642-031

- (12) Fill the torque tube coupling with BMS 3-33 grease through the lubrication hole.

S 432-032

- (13) Install a lockwire to the coupling screws with the double twist procedure (AMM 20-10-23/401).

S 432-033

- (14) Install the seal housing, the seal, and the clamp at the slat No. 5 or No. 8 if applicable (Detail B, Fig. 202). Tighten the clamp screw to 15 - 20 pound-inches (1.7 - 2.3 Nm).

S 292-631

**WARNING:** DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

- (15) Keep clean and free of all unwanted objects (FOD), the housing (can) assemblies of the slat main tracks, at all time.

S 712-034

- (16) Do a test on the gearbox installation with the steps given in the "Rotary Actuator and Offset Gearbox Test" paragraph.

TASK 27-81-20-022-035

- (9) AMM 78-31-00/201, Thrust Reverser System

C. Access

(1) Location Zone

144	Right MLG Wheel Well
211/212	Control Cabin
510/610	Wing Leading Edge - Inboard
520/620	Wing Leading Edge - Outboard
710	Nose Landing Gear and Doors
730/740	Left/Right Main Landing Gear and Doors

(2) Access Panels

511BB	LE Slat Power Drive Unit - Outboard (Left)
611BB	LE Slat Power Drive Unit - Inboard (Right)

D. Prepare for the Removal

S 212-036

- (1) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

S 492-037

**WARNING:** USE THE PROCEDURE IN AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Open the doors for the landing gear and install the door locks (AMM 32-00-15/201).

S 042-038

**WARNING:** DO THE THRUST REVERSER DEACTIVATION PROCEDURE TO PREVENT THE OPERATION OF THE THRUST REVERSER. THE ACCIDENTAL OPERATION OF THE THRUST REVERSER CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (3) Do this procedure: Thrust Reverser Deactivation for Ground Maintenance (AMM 78-31-00/201).

EFFECTIVITY

ALL

27-81-20

02

Page 220  
Apr 22/08

- S 012-039
- (4) Remove the lower access panels for the leading edge when it is necessary to get access to the rotary actuators (AMM 06-44-00/201).

NOTE: Use the procedure in AMM 27-81-00/201 to extend and retract the slats to remove the access panels.

- S 212-040
- (5) Make sure the trailing edge (TE) flaps and the leading edge (LE) slats are in the fully retracted position.

- S 212-041
- (6) Make sure the flap control lever is in the zero (FLAPS UP) detent.

- S 492-042
- (7) Attach a DO-NOT-OPERATE tag to the flap control lever.

- S 862-043
- (8) Remove the power from the center hydraulic system (AMM 29-11-00/201).

- S 492-044
- (9) Install the PDU lock in the TE flap power drive unit (PDU) (Fig. 205).

- S 012-045
- (10) Open the access panels, 511BB and 611BB, to get access to the outboard and inboard slat PDUs (AMM 06-44-00/201).

- S 492-046
- (11) Install the groundlocks in the inboard and outboard slat PDUs (Fig. 206).

- S 862-047
- (12) Open these circuit breakers on the overhead panel, P11, and install circuit breaker locks and DO-NOT-CLOSE tags:
- (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD
  - (c) 11J24, FLAPS ALTN CONT

- S 862-048
- (13) Open these circuit breakers on the main power distribution panel, P6, and install circuit breaker locks and DO-NOT-CLOSE tags:
- (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6D24, ALTN FLAP PWR
  - (c) 6F24, ALTN SLAT OUTBD PWR

EFFECTIVITY

ALL

27-81-20

E. Remove the Rotary Actuator(s) for the Inboard Slats (No. 6 and 7)

S 292-645

**WARNING:** DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

- (1) Keep clean and free of all unwanted objects (FOD), the housing (can) assemblies of the slat main tracks, at all time.

S 862-439

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (2) At the inboard and outboard slat PDUs, move the manual override lever on the bypass valve to the No. 1 (bypass) position, and attach a DO-NOT-OPERATE tag.

S 862-050

- (3) At the TE flap PDU, move the manual override lever on the bypass valve to the No. 1 (bypass) position, and attach a DO-NOT-OPERATE tag.

S 972-051

- (4) Measure the retract overtravel stop clearance at the rotary actuator adjacent to the rotary actuator (on the same slat) that you will remove. Make a written record of the retract stop clearance (Detail A, Fig. 204).

**NOTE:** This dimension is used to adjust the rotary actuator at the subsequent installation. You can use a feeler gauge or a long shim to measure the stop clearance.

S 092-052

- (5) Remove the groundlock from the inboard slat PDU (Fig. 206).

S 982-053

- (6) Use one of the two procedures that follow to extend the inboard slats manually to get access to the bolt that connects the actuator arm to the slat control rod:
  - (a) Turn the torque tube with an air motor and adapter A27077 (AMM 27-81-00/501).

EFFECTIVITY

ALL

27-81-20

08

Page 222  
Apr 22/08

(b) Turn the torque tube with your hand.

S 492-054

(7) Install the groundlock on the inboard slat PDU (Fig. 206).

S 032-055

(8) Disconnect the slat control rod from the actuator arm at each end of the slat (View A-A, Fig. 201).

**NOTE:** Do not change the length of the slat control rod in order to disconnect or after you disconnected it.

**NOTE:** Examine how the slat control rod and the actuator arm are connected together. It is important to install them in the same order.

S 492-056

(9) Attach a rope to hold the disconnected end of the slat into position.

S 022-057

(10) Remove the offset gearbox with the instructions given in the "Offset Gearbox Replacement" paragraph.

S 032-058

(11) For the inboard rotary actuator, remove the five actuator bolts on the side of the rotary actuator opposite to the offset gearbox (Detail A, Fig. 201).

S 032-059

(12) For the outboard rotary actuator, remove the five actuator bolt that connects the actuator and the universal joint housing (for the krueger seal flap) to the structure (Detail B, Fig. 201).

**NOTE:** Do not turn the universal joint for the krueger seal flap when you disconnect the housing from the rotary actuator. You must adjust the krueger seal flap drive if you turn the universal joint (AMM 27-81-04/201).

EFFECTIVITY

ALL

27-81-20

08

Page 223  
Apr 22/08

S 022-060

- (13) Remove the rotary actuator from the airplane.  
F. Remove the Rotary Actuator(s) for the Outboard Slat (No. 1-5 and 8-12)

S 292-632

**WARNING:** DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

- (1) Keep clean and free of all unwanted objects (FOD), the housing (can) assemblies of the slat main tracks, at all time.

S 862-061

- (2) At the inboard and outboard slat PDUs, move the manual override lever on the bypass valve to the No. 1 (bypass) position, and attach a DO-NOT-OPERATE tag.

S 862-062

- (3) At the TE flap PDU, move the manual override lever on the bypass valve to the No. 1 (bypass) position, and attach a DO-NOT-OPERATE tag.

S 972-063

- (4) Measure the retract overtravel stop clearance at the rotary actuator adjacent to the rotary actuator (on the same slat) that you will remove. Make a written record of the retract stop clearance (Detail B, Fig. 204)

**NOTE:** This dimension is used to adjust the rotary actuator at the subsequent installation. You can use a feeler gauge or a long shim to measure the stop clearance.

S 092-064

- (5) Remove the groundlock from the outboard slat PDU (Fig. 206).

S 982-065

- (6) Use one of the two procedures that follow to extend the outboard slats manually, to get access to the bolt that connects the actuator arm to the slat control rod:  
(a) Turn the torque tube with an air motor and adapter A27077 (AMM 27-81-00/201).

EFFECTIVITY

ALL

27-81-20

12

Page 224  
Apr 22/08

(b) Turn the torque tube with your hand.

S 492-066

(7) Install the groundlock on the outboard slat PDU (Fig. 206).

S 032-067

(8) Disconnect the slat control rod from the actuator arm at each end of the slat (Fig. 202).

**NOTE:** Do not change the length of the slat control rod in order to disconnect or after you disconnected it.

**NOTE:** Examine how the slat control rod and the actuator arm are connected together. It is important to install them in the same order.

S 022-068

(9) Remove the offset gearbox with the instructions given in the "Offset Gearbox Replacement" paragraph.

S 022-344

(10) Remove the telescoping duct for the thermal anti-ice system if you will remove the rotary actuators at slats No. 5 and/or 8 (AMM 30-11-05/401).

S 022-345

(11) Remove each of the interstitial duct from the thermal anti-ice duct(s) of the adjacent slat(s) (AMM 30-11-06/401).

**NOTE:** This step permits you to lift the slat up to pull the main track forward and to get access to the bolts that hold the rotary actuator to the rib in the wing leading edge.

S 032-464

**CAUTION:** DO NOT LET THE SLAT TO FALL FREE FORWARD WHEN YOU DISCONNECT THE SLAT FROM THE FORWARD END OF THE MAIN TRACK. DAMAGE TO THE BRACKET OF THE SLAT SKEW SENSOR SWITCH INSTALLED ON MAIN TRACK AND TO THE WING FRONT SPAR CAN OCCUR.

(12) Disconnect the two main tracks from the slat (Fig. 203).

EFFECTIVITY

ALL

27-81-20

10

Page 225  
Apr 22/08

S 032-070

- (13) Remove the downstop bushings from the two main tracks that you disconnected.

S 982-071

**WARNING:** HOLD THE WEIGHT OF THE MAIN TRACK TO MOVE IT IN THE STEP THAT FOLLOWS. THE MAIN TRACK IS LOOSE WHEN IT IS DISCONNECTED FROM THE SLAT AND THE DOWNSTOP IS REMOVED. THE WEIGHT OF THE MAIN TRACK CAN CAUSE THE MAIN TRACK TO FALL AND CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (14) Pull the main tracks forward to clear the rotary actuators.

**NOTE:** You can lift the slat up to clear the path for the main track. It is not necessary to remove the main track.

S 492-072

- (15) Attach a rope to hold the main track to the slat.

S 032-073

- (16) Remove the three actuator bolts on the side of the rotary actuator opposite to the offset gearbox (Fig. 202).

S 022-074

- (17) Remove the rotary actuator from the airplane.

S 022-076

- (18) Remove the nylon end cover from the rotary actuator (Detail F, Fig. 202).

**NOTE:** This nylon end cover is installed only on the rotary actuators for the outboard slats.

TASK 27-81-20-422-077

4. Rotary Actuator Installation for the Inboard and Outboard Slats

A. Equipment

- (1) Leading Edge Slats Groundlock - A27007-1 (two necessary)
- (2) TE Flap PDU Lock - A27009-7
- (3) Circuit Breaker Lockout Clip (4 Necessary)  
Commercially Available
- (4) Circuit Breaker Lock Set (4 Necessary)  
Commercially Available
- (5) Rigging Gage (Outboard Leading Edge Slat) - A27089-1
- (6) Adapter - Leading Edge Slat Drive - A27077-1
- (7) Air Motor with 1/2-inch Drive - Commercially Available
- (8) Shim - 0.075 ±0.003 inch (1.905 ±0.76 mm) thick
- (9) 50-Pound Weight (22.67 Kg)

B. Consumable Materials

- (1) D00633 Grease, Corrosion Preventive - BMS 3-33 (Preferred)
- (2) D00015 Grease, Corrosion Preventive - BMS 3-24 (Alternate)
- (3) G02020 Modeling Clay

C. References

D. Access

- (1) Location Zone
  - 144 Right MLG Wheel Well
  - 211/212 Control Cabin
  - 510/610 Wing Leading Edge - Inboard
  - 520/620 Wing Leading Edge - Outboard

EFFECTIVITY

ALL

**27-81-20**

12.1

Page 227  
Aug 22/09

- (2) Access Panels
  - 511EB Inboard Slat Mechanism, Slat Actuator (Left)
  - 511FB Lower LE Structure, Slat Mechanism (Left)
  - 511KB Lower LE Structure, Slat Mechanism (Left)
  - 611EB Inboard Slat Mechanism, Slat Actuator (Right)
  - 611FB Lower LE Structure, Slat Mechanism (Right)
  - 611KB Lower LE Structure, Slat Mechanism (Right)

E. Install the Rotary Actuator(s) for the Inboard Slat (Fig. 201)

**NOTE:** You can install the actuator bolts with the head pointed to the center of the actuator. Make sure you have at least 0.125 inch (3.175 mm) clearance between the actuator bolts and the slat track.

S 292-633

**WARNING:** DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

- (1) Keep clean and free of all unwanted objects (FOD), the housing (can) assemblies of the slat main tracks, at all time.

S 212-078

- (2) Make sure the flap control lever is in the zero (FLAPS UP) detent.

S 212-079

- (3) Make sure the power for the center hydraulic system is removed (AMM 29-11-00/201).

S 982-080

- (4) Put the rotary actuator into position and loosely attach the actuator to the structure with the actuator bolts. Do not tighten the actuator bolts.

S 422-081

- (5) Use the instructions given in the "Offset Gearbox Replacement" paragraph and attach the offset gearbox and the rotary actuator to the structure, with the gearbox bolts.

S 032-082

- (6) Remove the loose actuator bolts on the side of the actuator opposite to the offset gearbox.

EFFECTIVITY

ALL

27-81-20

S 642-083

- (7) Apply a light layer of BMS 3-33 grease to the shank of the actuator bolts.

S 432-084

- (8) Do this step for the inboard rotary actuator:  
(a) Install the five actuator bolts with one washer at each nut. Tighten the nuts.

S 432-085

- (9) Do these steps for the outboard rotary actuator:  
(a) Connect the universal joint housing and the rotary actuator to the structure with the five actuator bolts.

**NOTE:** Do not turn the universal joint for the krueger seal flap when you connect the housing to the actuator. It will be necessary to adjust the krueger seal flap drive if you turn the universal joint (AMM 27-81-04/201).

- (b) Install a washer and a nut to each actuator bolt and tighten the nut.

S 092-086

- (10) Remove the rope that holds the disconnected end of the slat.

S 432-087

- (11) Connect the slat control rod to the actuator arm at each end of the slat (Section A-A, Fig. 201). Tighten the nut to 270-300 pound-inches (31 - 34 Nm).

**NOTE:** Do not change the length of the slat control rod while you connect the slat control rod.

S 212-367

- (12) Make sure the slat control rods and actuator control arms are connected (tighten and lockwired) correctly.

EFFECTIVITY

ALL

27-81-20

S 092-088

- (13) Remove the groundlock from the inboard slat PDU (Fig. 206).

S 982-089

- (14) Retract the slats manually until the retract overtravel stop clearance on the adjacent actuator (on the same slat) is the same as the clearance that you measured before the actuator removal (Detail A, Fig. 204). You can use one of these procedures to retract the slats:
- (a) Turn the torque tube with an air motor and adapter A27077 (AMM 27-81-00/201).
  - (b) Turn the torque tube by hand.

S 222-090

- (15) Measure the clearance of the retract overtravel stop for the rotary actuator that you installed.

S 822-091

- (16) If the clearance of the retract overtravel stop is not in the RIG position limit, adjust the retract overtravel stop.

S 092-092

- (17) Remove the groundlock from the outboard slat PDU (Fig. 206).

S 092-093

- (18) Remove the PDU lock from the TE flap PDU (Fig. 205).

S 862-094

**WARNING:** MAKE SURE THE POWER FOR THE CENTER HYDRAULIC SYSTEM IS REMOVED BEFORE YOU TURN THE MANUAL OVERRIDE LEVER TO THE NO.2 (NORMAL) POSITION. THE FLAPS AND SLATS CAN MOVE IF THE HYDRAULIC POWER IS ON, AND CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (19) Remove the DO-NOT-OPERATE tag from manual override lever on the inboard and outboard slat PDUs, and move the lever to the No. 2 (normal) position.

S 862-095

- (20) Remove the DO-NOT-OPERATE tag from the manual override lever on the TE flap PDU, and move the lever to the No. 2 (normal) position.

EFFECTIVITY

ALL

27-81-20

S 862-096

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM THE FLAPS AND SLATS IN THE STEP THAT FOLLOWS. THE INBOARD AND OUTBOARD SLATS WILL MOVE TO THE POSITION SHOWN ON THE FLAP CONTROL LEVER WHEN THE CENTER HYDRAULIC SYSTEM IS PRESSURIZED. THE ACCIDENTAL MOVEMENT OF THE SLATS CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

(21) Pressurize the center hydraulic system (AMM 29-11-00/201), and permit the slats to move to the position shown on the flap control lever.

S 862-097

(22) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).

S 492-098

(23) Install the PDU lock on the TE flap PDU (Fig. 205).

S 492-099

(24) Install the groundlocks on the inboard and outboard slat PDUs (Fig. 206).

S 222-100

(25) Make sure that the end of the slat that you connected aligns with the adjacent fixed structure within  $\pm 0.04$  inch ( $\pm 1.0$  mm) in the horizontal plane.

S 822-101

(26) Adjust the slat control rod if you cannot get this condition to agree.

S 712-102

(27) Do a test on the rotary actuator and the offset gearbox installation with the instructions given in the "Offset Gearbox and Rotary Actuator Test" paragraph.

EFFECTIVITY

ALL

27-81-20

F. Install the Rotary Actuator(s) for the Outboard Slat (Fig. 202)

**NOTE:** You can install the actuator bolts with the head pointed to the center of the actuator. Make sure you have at least 0.125 inch (3.175 mm) clearance between the actuator bolts and the slat track.

S 292-634

**WARNING:** DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

- (1) Keep clean and free of all unwanted objects (FOD), the housing (can) assemblies of the slat main tracks, at all time.

S 212-103

- (2) Make sure the flap control lever is in the zero (FLAPS UP) detent.

S 212-104

- (3) Make sure the power for the center hydraulic system is removed (AMM 29-11-00/201).

S 422-105

- (4) If removed, install the nylon end cover on the side of the rotary actuator opposite to the offset gearbox (Detail F, Fig. 202).

S 432-106

- (5) Put the rotary actuator into position and loosely attach the actuator to the structure with the actuator bolts. Do not tighten the actuator bolts.

S 422-107

- (6) Use the instruction given in the "Offset Gearbox Replacement" paragraph and attach the offset gearbox and the rotary actuator to the structure, with the gearbox bolts.

S 032-108

- (7) Remove the loose actuator bolts on the side of the actuator opposite to the offset gearbox.

S 642-109

- (8) Apply a light layer of BMS 3-33 grease to the shank of the actuator bolts.

S 432-110

- (9) Install the three actuator bolts with one washer at each nut.

EFFECTIVITY

ALL

27-81-20

S 092-111

- (10) Hold the weight of the main track and release the rope between the main track and the slat.

S 432-112

- (11) Connect the main track to the slat and tighten the nut to these torque values as applicable (Fig. 203):
- (a) At slats No. 1 and 12, tighten the nut to 270-350 pound-inches (31 - 40 Nm).
  - (b) At slats No. 2 and 11, tighten the nut to 290-510 pound-inches (33 - 58 Nm).
  - (c) At slats No. 3-5 and 8-10, tighten the nut to 480-850 pound-inches (54 - 96 Nm).

S 422-635

**CAUTION:** MAKE SURE THAT THE DOWNSTOP BUSHINGS ARE INSTALLED CORRECTLY AND THE NUT HAS THE CORRECT TORQUE. IF THEY ARE NOT, THE MAIN TRACK/STRUCTURE JOINT CAN BECOME LOOSE. THE DOWNSTOP PARTS CAN DISCONNECT AND CAN CAUSE DAMAGE TO THE SLAT TRACK HOUSING.

- (12) Make sure the parts of the downstop assembly are installed correctly and the nut has the correct torque.

S 432-113

- (13) Install the downstop bushing to the main track (Section A-A, Fig. 203).

S 432-114

- (14) Do these steps to connect the slat control rod to the actuator arm at each end of the slat (View A-A, Fig. 202):

**NOTE:** Do not change the length of the control rod.

- (a) Install bolt (with bolthead in the outboard direction), washers, flange bushing, and nut.
- (b) Tighten the nut to 130-200 pound-inches (15 - 23 Nm).

S 212-371

- (15) Make sure the slat control rods and actuator control arms are connected (tighten and lockwired) correctly.

S 432-360

- (16) Install the telescoping duct(s) for the thermal anti-ice system if you installed the rotary actuator(s) for slats No.5 and/or 8 (AMM 32-11-05/401).

S 432-361

- (17) Install the interstitial duct(s) to the end(s) of the thermal anti-ice duct(s) of the adjacent slat(s) (AMM 30-11-06/401).

EFFECTIVITY

ALL

27-81-20

15

Page 233  
Apr 22/08

S 092-115

- (18) Remove the groundlock from the outboard slat PDU (Fig. 206).

S 982-116

- (19) Retract the slats manually until the retract overtravel stop clearance on the adjacent actuator (on the same slat) has the same clearance that you measured before the actuator removal (Detail B, Fig. 204). You can use one of these procedure to retract the slats:
- (a) Turn the torque tube with an air motor and adapter A27077 (AMM 27-81-00/201).
  - (b) Turn the torque tube by hand.

S 222-117

- (20) Measure the clearance of the retract overtravel stop for the rotary actuator that you installed.

S 822-118

- (21) If the clearance of the retract overtravel stop is not in the RIG position limit, adjust the retract overtravel stop.

S 862-119

**WARNING:** MAKE SURE THE POWER FOR THE CENTER HYDRAULIC SYSTEM IS REMOVED BEFORE YOU TURN THE MANUAL OVERRIDE LEVER TO THE NO.2 (NORMAL) POSITION. THE FLAPS AND SLATS CAN MOVE IF THE HYDRAULIC POWER IS ON, AND CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (22) Remove the DO-NOT-OPERATE tag from manual override lever on the inboard and outboard slat PDUs, and move the lever to the No. 2 (normal) position.

S 862-120

- (23) Remove the DO-NOT-OPERATE tag from the manual override lever on the TE flap PDU, and move the lever to the No.2 (normal) position.

EFFECTIVITY

ALL

27-81-20

16

Page 234  
Apr 22/08

S 862-121

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM THE FLAPS AND SLATS IN THE STEP THAT FOLLOWS. THE INBOARD AND OUTBOARD SLATS WILL MOVE TO THE POSITION SHOWN ON THE FLAP CONTROL LEVER WHEN THE CENTER HYDRAULIC SYSTEM IS PRESSURIZED. THE ACCIDENTAL MOVEMENT OF THE SLATS CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

(24) Pressurize the center hydraulic system (AMM 29-11-00/201), and permit the slats to move to the position shown on the flap control lever.

S 862-122

(25) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).

S 492-123

(26) Install the PDU lock in the TE flap PDU (Fig. 205).

S 492-124

(27) Install the groundlocks on the inboard and outboard slat PDUs (Fig. 206).

S 222-125

(28) Do a check on the position of the outboard slat with the rigging gage A27089 (Detail D, Fig. 202).

S 822-126

(29) Adjust the slat control rod if you cannot get this condition to agree.

S 712-127

(30) Do a test on the rotary actuator and offset gearbox installation with the steps given in the "Offset Gearbox and Rotary Actuator Test" paragraph.

G. Prepare for the Check and the Adjustment for the Retract and Extend Overtravel Stop Clearances

EFFECTIVITY

ALL

Apr 22/08

S 042-128

**WARNING:** DO THE THRUST REVERSER DEACTIVATION PROCEDURE TO PREVENT THE OPERATION OF THE THRUST REVERSER. THE ACCIDENTAL OPERATION OF THE THRUST REVERSER CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (1) Do this procedure: Thrust Reverser Deactivation for Ground Maintenance (AMM 78-31-00/201).

S 862-129

- (2) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).

S 862-130

- (3) Open these circuit breakers on the overhead panel, P11, and install circuit breaker locks and DO-NOT-CLOSE tags:
  - (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD
  - (c) 11J24, FLAPS ALTN CONT

S 862-131

- (4) Open these circuit breakers on the main power distribution panel, P6, and install circuit breaker locks and DO-NOT-CLOSE tags:
  - (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6D24, ALTN FLAP PWR
  - (c) 6F24, ALTN SLAT OUTBD PWR

S 862-132

- (5) Supply electrical power (AMM 24-22-00/201).
- H. Retract and Extend Overtravel Stop Clearance Check - Inboard Slat (Detail A, Fig. 204)

S 862-133

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (1) Pressurize the center hydraulic system (AMM 29-11-00/201).

EFFECTIVITY

ALL

27-81-20

S 862-134

- (2) Move the flap control lever to the 25-unit detent, and make sure the slats move to the fully extended position.

S 492-135

- (3) Attach a DO-NOT-OPERATE tag to the flap control lever.

S 862-136

- (4) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).

S 012-137

- (5) Remove lower leading edge access panels, 511EB, 511FB, 511KB, 611EB, 611FB, and 611KB (AMM 06-44-00/201).

S 222-138

- (6) Do a check of the clearance between the actuator arm and the EXTEND overtravel stop (for the inboard slat) at each rotary actuator on the same slat (Fig. 204).

S 492-139

- (7) Attach the modeling clay to the RETRACT overtravel stop at the outboard rotary actuator only.

**NOTE:** Attach a piece of tape to the structure so that you can remove the clay easily.

S 862-268

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (8) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 092-141

- (9) Remove the DO-NOT-OPERATE tag from the flap control lever.

EFFECTIVITY

ALL

27-81-20

S 862-142

- (10) Move the flap control lever to the zero (FLAPS UP) detent and make sure the slats move to the fully retracted position.

**NOTE:** After the slats moved to the fully retracted position, stop for one minute before you do the next step.

S 492-143

- (11) Attach a DO-NOT-OPERATE tag to the flap control lever.

S 862-144

- (12) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).

S 222-145

- (13) At the inboard rotary actuator, do a check of the clearance between the actuator arm and the retract overtravel stop (Fig. 204).

S 862-269

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (14) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 092-147

- (15) Remove the DO-NOT-OPERATE tag from the flap control lever.

S 862-148

- (16) Move the flap control lever to the 25-unit detent and make sure the slats move to the fully extended position.

S 492-149

- (17) Attach a DO-NOT-OPERATE tag to the flap control lever.

S 862-150

- (18) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).

EFFECTIVITY

ALL

27-81-20

S 092-151

- (19) Carefully remove the modeling clay from the outboard rotary actuator.

S 222-152

- (20) Measure the thickness of the clay and make sure the thickness is between 0.05 and 0.10 inch (1.3 and 2.5 mm).

**NOTE:** The thickness of the modeling clay is the retract overtravel stop clearance for the outboard actuator (Fig. 204).

S 862-270

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (21) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 092-154

- (22) Remove the DO-NOT-OPERATE tag from the flap control lever.

S 862-155

- (23) Move the flap control lever to the zero (FLAPS UP) detent and make sure the slats move to the fully retracted position.

S 492-156

- (24) Attach a DO-NOT-OPERATE tag to the flap control lever.

S 862-157

- (25) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).

S 822-158

- (26) If the retract or extend overtravel stop clearances are incorrect as specified in Fig. 204, adjust the stop clearance for the inboard slat (refer to the tasks for Retract and Extend Overtravel Stop Clearance Adjustment - Inboard and Outboard Rotary Actuators, Inboard Slat).

EFFECTIVITY

ALL

27-81-20

16

Page 239  
Apr 22/08

S 412-159

- (27) Install the access panels, 511EB, 511FB, 511KB, 611EB, 611FB, and 611KB (AMM 06-44-00/201).

S 712-160

- (28) Do a test on the offset gearbox and the rotary actuator with the instructions given in the "Rotary Actuator and Offset Gearbox Test" paragraph.

I. Retract and Extend Overtravel Stop Clearance Check - Outboard Slats (Detail B, Fig. 204)

S 292-636

**WARNING:** DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

- (1) Keep clean and free of all unwanted objects (FOD), the housing (can) assemblies of the slat main tracks, at all time.

S 862-161

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (2) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 092-164

- (3) Remove the DO-NOT-OPERATE tag from the flap control lever.

S 862-162

- (4) Move the flap control lever to the 25-unit detent, and make sure the slats move to the fully extended position.

S 492-163

- (5) Attach a DO-NOT-OPERATE tag to the flap control lever.

S 862-165

- (6) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).

EFFECTIVITY

ALL

27-81-20

S 222-166

- (7) Do a check of the clearance between the actuator arm and the EXTEND overtravel stop at each rotary actuator on the same slat (Fig. 204).

S 492-167

- (8) Attach the modeling clay to the RETRACT overtravel stops at the two rotary actuators.

**NOTE:** Attach tape to the structure so that you can remove the clay easily.

S 862-271

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (9) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 092-169

- (10) Remove the DO-NOT-OPERATE tag from the flap control lever.

S 862-170

- (11) Move the flap control lever to the zero (FLAPS UP) detent and make sure the slats move to the fully retracted position.

**NOTE:** After the slats moved to the fully retracted position, stop for one minute before you do the next step.

S 862-171

- (12) Move the flap control lever to the 25-unit detent and make sure the slats move to the fully extended position.

S 492-172

- (13) Attach a DO-NOT-OPERATE tag to the flap control lever.

S 862-173

- (14) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).

EFFECTIVITY

ALL

27-81-20

S 092-174

- (15) Carefully remove the modeling clay from the two rotary actuators.

S 222-175

- (16) Measure the thicknesses of the two modeling clay and make sure the two thicknesses are between 0.05 to 0.10 inch (1.3 to 2.5 mm) (Fig. 204).

**NOTE:** The thickness of the modeling clay is the retract overtravel stop clearance.

S 862-272

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (17) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 092-177

- (18) Remove the DO-NOT-OPERATE tag from the flap control lever.

S 862-178

- (19) Move the flap control lever to the zero (FLAPS UP) detent and make sure the slats move to the fully retracted position.

S 492-179

- (20) Attach a DO-NOT-OPERATE tag to the flap control lever.

EFFECTIVITY

ALL

27-81-20

S 862-180

- (21) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).

S 822-181

- (22) If the retract or extend overtravel stop clearances are incorrect as specified in Fig. 204, adjust the stop clearance for the outboard slat (refer to the tasks for Retract and Extend Overtravel Stop Clearance Adjustment - Inboard and Outboard Rotary Actuators, Outboard Slat).

S 712-182

- (23) Do a test on the offset gearbox and the rotary actuator with the instruction given in the "Rotary Actuator and Offset Gearbox Test" paragraph.

J. Retract and Extend Overtravel Stop Clearance Adjustment - Inboard Rotary Actuator, Inboard Slat (Fig. 201)

S 292-637

**WARNING:** DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

- (1) Keep clean and free of all unwanted objects (FOD), the housing (can) assemblies of the slat main tracks, at all time.

S 212-183

- (2) Make sure the flaps and slats are in the fully retracted position, and the flap control lever is in the zero (FLAPS UP) detent.

S 212-184

- (3) Make sure the pressure is removed from the center hydraulic system (AMM 29-11-00/201).

S 032-187

- (4) At the inboard rotary actuator of the inboard slat, remove the lockwire and screws on the coupling and disconnect the torque tube on each side of the offset gearbox (Fig. 201).

S 982-435

- (5) Manually turn the input shaft on the inboard offset gearbox in the extend direction until a shim can be installed on the retract stop of the actuator arm.

EFFECTIVITY

ALL

27-81-20

S 432-434

- (6) Install shim on the actuator arm retract stop with a thickness of 0.075 +/- 0.003 inch (1.91 +/- 0.08 mm) to set the clearance (Fig. 201).

S 982-188

- (7) Manually turn the input shaft on the inboard offset gearbox in the retract direction until the shim on the actuator arm makes contact with the retract overtravel stop (Fig. 201).

S 432-189

- (8) Install the torque tube on each side of the inboard offset gearbox. (AMM 27-81-24/401).

**NOTE:** To remove freeplay on the gearbox, apply 10 to 15 pound-inches (1 to 1.5 Nm) of torque to the gearbox input shaft at one side of the gearbox, while you connect the torque tube to the other side. Keep the shim between the actuator arm and the retract stop during this step.

Turn the torque tube to the nearest distance possible to align the spline teeth on the coupling when you connect the torque tube ( $\pm 1/2$  tooth).

S 862-191

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (9) Pressurize the center hydraulic system (AMM 29-11-00/201).

EFFECTIVITY

ALL

27-81-20

S 092-192

- (10) Remove the DO-NOT-OPERATE tag from the flap control lever.

S 862-193

- (11) Move the flap control lever to the 25-unit detent and make sure the slats move to the fully extended position.

S 492-194

- (12) Attach a DO-NOT-OPERATE tag to the flap control lever.

S 862-195

- (13) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).

S 092-196

- (14) Remove the shim between the actuator arm and the retract overtravel stop at the inboard rotary actuator.

S 862-273

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (15) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 092-198

- (16) Remove the DO-NOT-OPERATE tag from the flap control lever.

EFFECTIVITY

ALL

27-81-20

S 862-199

- (17) Move the flap control lever to the zero (FLAPS UP) detent and make sure the slats and the krueger seal flaps move to the fully retracted position.

S 492-200

- (18) Attach a DO-NOT-OPERATE tag to the flap control lever.

S 862-201

- (19) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).

S 222-202

- (20) Do a check on the overtravel stop clearances for the inboard slats with the instructions given by the "Retract and Extend Overtravel Stop Clearance Check - Inboard Slat" paragraph.

S 432-203

- (21) Make sure you install lockwires to the coupling screws with the double twist procedure for the torque tubes that you connected (AMM 20-10-23/401).

K. Retract and Extend Overtravel Stop Clearance Adjustment -  
Outboard Rotary Actuator, Inboard Slat (Fig. 201)

S 292-638

**WARNING:** DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

- (1) Keep clean and free of all unwanted objects (FOD), the housing (can) assemblies of the slat main tracks, at all time.

S 212-204

- (2) Make sure the flaps and slats are in the fully retracted position, and the flap control lever is in the zero (FLAPS UP) detent.

S 212-205

- (3) Make sure the pressure is removed from the center hydraulic system (AMM 29-11-00/201).

S 032-206

- (4) Disconnect the drive shaft for the krueger seal flap at the universal joint, at the outboard rotary actuator of the inboard slat (AMM 27-81-04/201).

EFFECTIVITY

ALL

27-81-20

S 032-207

- (5) Remove the sleeve from the drive shaft.

S 032-208

- (6) At the inboard rotary actuator of the inboard slat, remove the lockwire and screws on the coupling and disconnect the torque tube on each side of the inboard offset gearbox (Fig. 201).

S 982-209

- (7) Manually turn the disconnected torque tube between the two rotary actuators (for the inboard slat) in the retract direction, until the actuator arm on the outboard rotary actuator touches the retract stop.

**NOTE:** Apply 10 to 15 pound-inch (1 to 1.5 Nm) torque to the torque tube to remove the gearbox freeplay, and to keep the actuator arm against the retract stop at the outboard actuator.

S 982-210

- (8) Manually turn the input shaft on the inboard offset gearbox to the retract direction until the actuator arm on the inboard rotary actuator touches the retract stop.

**NOTE:** Apply 10 to 15 pound-inch (1 to 1.5 Nm) torque to the input shaft to remove the gearbox freeplay, and to keep the actuator arm against the retract stop at the inboard actuator.

S 432-211

- (9) Install the torque tube to the outboard side of the inboard offset gearbox (AMM 27-81-24/401).

**NOTE:** Turn the torque tube to the nearest distance possible to align the spline teeth on the coupling when you connect the torque tube ( $\pm 1/2$  tooth). Apply 10 to 15 pound-inch (1 to 1.5 Nm) torque to the input shaft at the inboard side of the inboard gearbox to remove the freeplay while you connect the torque tube.

EFFECTIVITY

ALL

27-81-20

S 982-436

- (10) Manually turn the input shaft on the outboard offset gearbox in the extend direction until a shim can be installed on the retract stop of the inboard actuator arm.

S 432-437

- (11) Install shim on the inboard actuator arm retract stop with a thickness of 0.075 +/- 0.003 inch (1.9 +/- 0.08 mm) to set the clearance (Fig. 201).

S 982-438

- (12) Manually turn the input shaft on the outboard offset gearbox in the retract direction until the shim on the inboard actuator arm makes contact with the retract overtravel stop (Fig. 201).

S 432-213

- (13) Install the torque tube to the inboard side of the inboard offset gearbox (AMM 27-81-24/401).

**NOTE:** Turn the torque tube to the nearest distance possible to align the spline teeth on the coupling when you connect the torque tube ( $\pm 1/2$  tooth). Apply 10 to 15 pound-inch (1 to 1.5 Nm) torque on the input shaft at the inboard side of the inboard gearbox to remove the freeplay while you connect the torque tube.

S 822-214

- (14) Adjust the stop screw for the Krueger seal flap drive with these steps (AMM 27-81-04/201):

**NOTE:** Use the Figures in AMM 27-81-04/201 to do this adjustment.

- (a) Remove the fastener at the lower inboard corner of the Krueger seal flap and attach a 50-pound (20 kg) weight to the Krueger seal flap.
- (b) Manually turn the drive shaft to retract the Krueger seal flap until the flap touches the stop screw.

**NOTE:** Make sure the flap does not touch the stop screw when you turn the drive shaft by a small increment in the opposite direction.

EFFECTIVITY

ALL

27-81-20

17

Page 248  
Apr 22/08

- (c) Install the sleeve on the drive shaft.
- (d) Connect the drive shaft to the outboard rotary actuator at the universal joint.

**NOTE:** Increase the flap contact load on the stop screw by a maximum of one spline when you engage the splines between the sleeve and the drive shaft.

- (e) Remove the 50-pound (20 kg) weight from the flap and install the fastener.

S 862-215

- (15) Remove the circuit breaker lock and DO-NOT-CLOSE tag and close this circuit breaker on the P11 panel:
  - (a) 11H23, SLAT ALTN CONT INBD

S 862-216

- (16) Push the arming switch for the slat alternate drive to arm the slat alternate drive.

**NOTE:** The slat alternate drive will move the manual override lever to the No. 1 (bypass) position on the inboard slat PDU.

S 862-217

- (17) Open this circuit breaker on the P11 panel:
  - (a) 11H23, SLAT ALTN CONT INBD

S 982-218

- (18) Manually turn the torque tube on the inboard side of the inboard offset gearbox to the extend direction and remove the shim between the inboard actuator arm and the retract stop at the inboard rotary actuator.

S 862-219

- (19) Close this circuit breaker on the P11 panel:
  - (a) 11H23, SLAT ALTN CONT INBD

EFFECTIVITY

ALL

27-81-20

S 862-220

- (20) Push the arming switch for the slat alternate drive to disarm the slat alternate drive.

**NOTE:** This will move the manual override lever to the No. 2 (normal) position on the inboard slat PDU.

S 862-221

- (21) Open this circuit breaker on the P11 panel and install a circuit breaker lock and a DO-NOT-CLOSE tag:  
(a) 11H23, SLAT ALTN CONT INBD

S 862-222

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (22) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 092-223

- (23) Remove the DO-NOT-OPERATE tag from the flap control lever.

S 862-224

- (24) Move the flap control lever to the zero (FLAPS UP) detent and make sure the slats and the krueger seal flaps move to the fully retracted position.

EFFECTIVITY

ALL

27-81-20

15

Page 250  
Apr 22/08

S 492-225

- (25) Attach a DO-NOT-OPERATE tag to the flap control lever.

S 862-226

- (26) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).

S 222-227

- (27) Do a check on the overtravel stop clearances for the inboard slats with the instructions given in the "Retract and Extend Overtravel Stop Clearance Check - Inboard Slat" paragraph.

S 432-228

- (28) Make sure you install lockwires to the coupling screws with the double twist procedure for the torque tubes that you connected (AMM 20-10-23/401).

- L. Retract and Extend Overtravel Stop Clearance Adjustment - Inboard and Outboard Rotary Actuators, Outboard Slat (Fig. 202)

S 292-639

**WARNING:** DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

- (1) Keep clean and free of all unwanted objects (FOD), the housing (can) assemblies of the slat main tracks, at all time.

S 212-229

- (2) Make sure the flaps and slats are in the fully retracted position, and the flap control lever is in the zero (FLAPS UP) detent.

S 212-230

- (3) Make sure the power is removed from the center hydraulic system (AMM 29-11-00/201).

S 032-231

- (4) At the rotary actuator that you will adjust, remove the lockwire and screws on the coupling and disconnect the torque tube on each side of the offset gearbox (Fig. 202).

S 982-432

- (5) Manually turn the input shaft of the offset gearbox in the extend direction until the shim can be installed on the actuator arm retract stop.

EFFECTIVITY

ALL

27-81-20

S 432-433

- (6) Install 0.075 +/- 0.003 inch (1.9 +/- 0.08 mm) shim on the actuator arm retract stop (Fig. 202).

S 982-232

- (7) Manually turn the input shaft to the offset gearbox until the shim on the actuator arm makes contact with the retract overtravel stop.

S 432-233

- (8) Install the torque tube on each side of the offset gearbox. (AMM 27-81-24/401).

**NOTE:** To remove freeplay on the gearbox, apply 10 to 15 pound-inches (1 to 1.5 Nm) of torque to the gearbox input shaft at one side of the gearbox, while you connect the torque tube to the other side. Keep the shim between the actuator arm and the retract stop during this step.

Turn the torque tube to the nearest distance possible to align the spline teeth on the coupling when you connect the torque tube ( $\pm 1/2$  tooth).

S 862-234

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (9) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 092-235

- (10) Remove the DO-NOT-OPERATE tag from the flap control lever.

S 862-236

- (11) Move the flap control lever to the 25-unit detent and make sure the slats move to the fully extended position.

EFFECTIVITY

ALL

27-81-20

S 492-237

- (12) Attach a DO-NOT-OPERATE tag to the flap control lever.

S 862-238

- (13) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).

S 092-239

- (14) Remove the shim between the actuator arm and the retract overtravel stop at the rotary actuator.

S 862-274

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (15) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 092-241

- (16) Remove the DO-NOT-OPERATE tag from the flap control lever.

S 862-242

- (17) Move the flap control lever to the zero (FLAPS UP) detent and make sure the slats move to the fully retracted position.

S 492-243

- (18) Attach a DO-NOT-OPERATE tag to the flap control lever.

S 862-244

- (19) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).

S 222-245

- (20) Do a check on the overtravel stop clearances for the inboard slats with the instructions given by the "Retract and Extend Overtravel Stop Clearance Check - Outboard Slat" paragraph.

S 432-246

- (21) Make sure you install lockwires to the coupling screws with the double twist procedure for the torque tubes that you connected (AMM 20-10-23/401).

EFFECTIVITY

TASK 27-81-20-712-247

5. Rotary Actuator and Offset Gearbox Test

A. References

- (1) AMM 06-44-00/201, Wing Access Doors and Panels
- (2) AMM 24-22-00/201, Electrical Power - Control
- (3) AMM 27-81-00/201, Leading Edge Slat System
- (4) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems
- (5) AMM 32-00-15/201, Landing Gear Door Locks
- (6) AMM 78-31-00/201, Thrust Reverser System

B. Access

(1) Location Zones

144	Right MLG Wheel Well
211/212	Control Cabin
510/610	Wing Leading Edge - Inboard
520/620	Wing Leading Edge - Outboard
550/650	Wing Trailing Edge - Inboard
560/660	Wing Trailing Edge - Outboard
710	Nose Landing Gear and Doors
730/740	Left/Right Main Landing Gear and Doors

(2) Access Panels

511BB	LE Slat Power Drive Unit - Outboard (Left)
611BB	LE Slat Power Drive Unit - Inboard (Right)

C. Prepare for Test

S 212-248

- (1) Make sure the trailing edge (TE) flaps and the leading edge (LE) slats are in the fully retracted position.

S 212-249

- (2) Make sure the flap control lever is in the zero (FLAPS UP) detent.

S 092-250

- (3) Remove the DO-NOT-OPERATE tag from the flap control lever.

S 862-251

- (4) Supply electrical power (AMM 24-22-00/201).

S 092-252

- (5) Remove the groundlocks from the inboard and outboard slat power drive units (PDU) (Fig. 206).

S 092-253

- (6) Remove the PDU lock from the TE flap PDU (Fig. 205).

EFFECTIVITY

ALL

Page 254  
Aug 22/09

S 862-254

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (7) Pressurize the center hydraulic system (AMM 29-11-00/201).  
D. Test for the Rotary Actuator and Offset Gearbox Installation

S 862-255

- (1) Move the flap control lever to the 30-unit detent, and make sure the flaps and slats move to the fully extended position.

S 862-256

- (2) Move the flap control lever to the zero (FLAPS UP) detent, and make sure the flaps and slats move to the fully retracted position.  
E. Put the Airplane Back to the Usual Condition

S 412-257

- (1) Install the lower access panels for the leading edge (AMM 06-44-00/201).

**NOTE:** Use the procedure in AMM 27-81-00/201 to operate the slats as necessary to install the access panels.

S 862-258

- (2) Remove the circuit breaker locks and the DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel, P11:  
(a) 11H23, SLAT ALTN CONT INBD  
(b) 11H24, SLAT ALTN CONT OUTBD  
(c) 11J24, FLAPS ALTN CONT

S 862-259

- (3) Remove the circuit breaker locks and the DO-NOT-CLOSE tags and close these circuit breakers on the main power distribution panel, P6:  
(a) 6D21, ALTN SLAT INBD PWR  
(b) 6D24, ALTN FLAP PWR  
(c) 6F24, ALTN SLAT OUTBD PWR

S 092-260

**WARNING:** USE THE PROCEDURE IN AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

(4) Remove the door locks from the landing gear doors and close the doors (AMM 32-00-15/201).

S 862-261

(5) Remove the power from the center hydraulic system (AMM 29-11-00/201).

S 862-262

(6) Remove electrical power (AMM 24-22-00/201).

S 412-263

(7) Install the access panels, 511BB and 611BB, for the inboard and outboard slat PDUs (AMM 06-44-00/201).

S 442-264

(8) Do the activation procedure for the thrust reverser (AMM 78-31-00/201).

TASK 27-81-20-422-401

6. In-Service Backlash and Axial Freeplay Checks (On-Wing) for the Leading Edge (LE) Slat Rotary Actuator(s)

A. Equipment

- (1) Leading Edge Slats Groundlock - A27007-1  
(2 Necessary)
- (2) TE Flap PDU Lock - A27009-7
- (3) Circuit Breaker Lockout Clip (4 Necessary)  
Commercially Available
- (4) Force Gage (0 to 50 pounds)(0-222 newtons)

B. References

611FB	Lower LE Structure, Slat Mechanism (Right)
611KB	Lower LE Structure, Slat Mechanism (Right)

D. Prepare for the Checks

S 292-640

**WARNING:** DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

- (1) Keep clean and free of all unwanted objects (FOD), the housing (can) assemblies of the slat main tracks, at all time.

S 492-402

- (2) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

S 422-429

**WARNING:** USE THE PROCEDURE IN AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (3) Open the doors for the landing gear and install the door locks (AMM 32-00-15/201).

EFFECTIVITY

ALL

**27-81-20**

S 012-005

- (4) Remove the lower access panels for the leading edge when it is necessary to get to the rotary actuators (AMM 06-44-00/201).

**NOTE:** Use the procedure in AMM 27-81-00/201 to extend and retract the slats to remove the access panels.

S 012-428

**WARNING:** DO THE THRUST REVERSER DEACTIVATION PROCEDURE TO PREVENT THE OPERATION OF THE THRUST REVERSER. THE ACCIDENTAL OPERATION OF THE THRUST REVERSER CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (5) Do this procedure: Thrust Reverser Deactivation for Ground Maintenance (AMM 78-31-00/201).

S 862-425

- (6) Open these circuit breakers on the overhead panel, P11, and install circuit breaker locks and DO-NOT-CLOSE tags:
- (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD
  - (c) 11J24, FLAPS ALTN CONT

S 862-426

- (7) Open these circuit breakers on the main power distribution panel, P6, and install circuit breaker locks and DO-NOT-CLOSE tags:
- (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6D24, ALTN FLAP PWR
  - (c) 6F24, ALTN SLAT OUTBD PWR

S 412-407

- (8) Supply electrical power (AMM 24-22-00/201).

S 862-343

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

- (9) Pressurize the center hydraulic system (AMM 29-11-00/201).

EFFECTIVITY

ALL

27-81-20

S 212-348

- (10) Move the flap control lever to the 25-unit detent and make sure the slats move to the fully extended position.

S 492-349

- (11) Attach a DO-NOT-OPERATE tag to the flap control lever.

S 862-355

- (12) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).

S 012-409

- (13) Install the PDU lock in the TE flap power drive unit (PDU) (Fig. 205).

S 492-410

- (14) Open the lower access panels, on the wings LE to get access to the outboard and inboard slat PDUs, and rotary actuators (AMM 06-44-00/201).

S 862-411

- (15) Install the groundlocks in the inboard and outboard slat PDUs (Fig. 206).

S 032-356

- (16) Disconnect the control rod from the rotary actuator arm gear.

**NOTE:** Notice how the bolt and associated hardware are installed. It is important to install them, back in place, in the same order.

E. Backlash Check for the Inboard and Outboard Slat Rotary Actuator (s)

S 832-358

- (1) Pull aft on the actuator arm, 25 to 50 pounds (100 to 200 Newtons) maximum.

**NOTE:** If the force applied to the actuator arm gear is more than 50 pounds (200 Newtons), it can cause the sun gear of the rotary actuator to rotate, which will make the measurements that follow incorrect.

S 972-346

- (2) Measure the clearance at the extend overtravel stop.

EFFECTIVITY

ALL

27-81-20

S 832-359

- (3) Push forward on the actuator arm gear, 25 to 50 pounds (100 to 200 Newtons) maximum.

**NOTE:** If the force applied to the actuator arm gear is more than 50 pounds (200 Newtons), it can cause the sun gear of the rotary actuator to rotate, which will make the measurements that follow incorrect.

S 972-347

- (4) Measure the clearance at the extend overtravel stop.

S 222-357

- (5) Make sure the difference of the two measurements taken before is not greater than 0.052 inch (1.3 mm).

F. Axial Freeplay Check

S 832-412

- (1) Use an inside caliper or a feeler gage set to take linear axial travel measurements between arm gear and ring gears.

**NOTE:** If you use a dial indicator install it in such a way that you can measure the axial travel of the arm gear to a fixed point.

S 832-413

- (2) Manually push arm gear inboard, as far as possible, and record the reading measurement shown on the caliper, dial indicator, or record the thickness of the feeler blade used.

S 832-414

- (3) Manually push arm gear outboard, as far as possible, and record measurement shown on caliper, dial indicator, or record the thickness of the feeler blade used.

S 832-415

- (4) Make sure that the subtraction of the two recorded measurements is no more than the maximum permitted axial freeplay of 0.070 inch (1.8 mm).

G. Put the Airplane Back to the Usual Condition

EFFECTIVITY

ALL

27-81-20

Page 260  
Apr 22/08

S 292-641

**WARNING:** DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

- (1) Keep clean and free of all unwanted objects (FOD), the housing (can) assemblies of the slat main tracks, at all time.

S 832-416

- (2) Connect the control rod to the actuator arm gear.

**NOTE:** It is important you install the bolt and associated hardware in the same order they were installed.

S 492-350

- (3) Remove the DO-NOT-OPERATE tag from the flap control lever.

S 862-353

- (4) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 212-351

- (5) Move the flap control lever to the zero (FLAPS UP) detent and make sure the slats move to the fully retracted position.

S 862-354

- (6) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).

S 412-417

- (7) Remove electrical power (AMM 24-22-00/201).

S 862-430

**WARNING:** USE THE PROCEDURE IN AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (8) Remove the door locks from the landing gear doors and close the doors (AMM 32-00-15/201).

S 442-419

- (9) Install the access panels, 511BB and 611BB, for the inboard and outboard slat PDUs (AMM 06-44-00/201).

S 442-420

- (10) Install the lower access panels for the leading edge that you removed to get to the rotary actuators (AMM 06-44-00/201).

EFFECTIVITY

ALL

27-81-20

S 862-421

- (11) Remove the circuit breaker locks and the DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel, P11:
- (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD
  - (c) 11J24, FLAPS ALTN CONT

S 862-422

- (12) Remove the circuit breaker locks and the DO-NOT-CLOSE tags and close these circuit breakers on the main power distribution panel, P6:
- (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6D24, ALTN FLAP PWR
  - (c) 6F24, ALTN SLAT OUTBD PWR

S 862-423

- (13) Do the activation procedure for the thrust reverser (AMM 78-31-00/201).

TASK 27-81-20-202-277

7. Slat Retract and Extend Overtravel Stop Clearance Check

NOTE: This is a scheduled maintenance task.

A. Equipment

- (1) Circuit Breaker Lockout Clip (4 Necessary)  
Commercially Available
- (2) Circuit Breaker Lock Set (4 Necessary)  
Commercially Available

B. Consumable Materials

- (1) G02020 Modeling Clay

C. References

- (4) AMM 78-31-00/201, Thrust Reverser System

D. Prepare for Check

S 042-278

WARNING: DO THE THRUST REVERSER DEACTIVATION PROCEDURE TO PREVENT THE OPERATION OF THE THRUST REVERSER. THE ACCIDENTAL OPERATION OF THE THRUST REVERSER CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (1) Do this procedure: Thrust Reverser Deactivation for Ground Maintenance (AMM 78-31-00/201).

S 862-279

- (2) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).

EFFECTIVITY

ALL

27-81-20

S 862-281

- (3) Open these circuit breakers on the overhead panel, P11, and install circuit breaker locks and DO-NOT-CLOSE tags:
- (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD
  - (c) 11J24, FLAPS ALTN CONT

S 862-282

- (4) Open these circuit breakers on the main power distribution panel, P6, and install circuit breaker locks and DO-NOT-CLOSE tags:
- (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6D24, ALTN FLAP PWR
  - (c) 6F24, ALTN SLAT OUTBD PWR

S 862-283

- (5) Supply electrical power (AMM 24-22-00/201).
- E. Retract and Extend Overtravel Stop Clearance Check - Inboard Slat (Detail A, Fig. 204)

S 292-644

**WARNING:** DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

- (1) Keep clean and free of all unwanted objects (FOD), the housing (can) assemblies of the slat main tracks, at all time.

S 862-284

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (2) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 862-285

- (3) Move the flap control lever to the 25-unit detent, and make sure the slats move to the fully extended position.

EFFECTIVITY

ALL

27-81-20

- S 492-286
- (4) Attach a DO-NOT-OPERATE tag to the flap control lever.
- S 862-287
- (5) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).
- S 012-288
- (6) Remove lower leading edge access panels 511EB, 511FB, 511KB on left wing and/or 611EB, 611FB, 611KB on right wing (AMM 06-44-00/201).
- S 222-289
- (7) Do a check of the clearance between the actuator arm and the EXTEND overtravel stop (for the inboard slat), a clearance of more than 0.03 inch (0.8 mm) is needed at each rotary actuator.
- S 492-290
- (8) Attach modeling clay to the RETRACT overtravel stop at the outboard rotary actuator only.

**NOTE:** Attach a piece of tape to the structure so that you can remove the clay easily.

S 862-291

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (9) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 092-292

- (10) Remove the DO-NOT-OPERATE tag from the flap control lever.

S 862-293

- (11) Move the flap control lever to the zero (FLAPS UP) detent and make sure the slats move to the fully retracted position.

**NOTE:** After the slats moved to the fully retracted position, stop for one minute before you do the next step.

EFFECTIVITY

ALL

27-81-20

12

Page 264  
Apr 22/08

S 492-294

- (12) Attach a DO-NOT-OPERATE tag to the flap control lever.

S 862-295

- (13) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).

S 222-296

- (14) At the inboard rotary actuator, make sure the clearance between the actuator arm and the retract overtravel stop is 0.05 to 0.10 inch (1.3 to 2.5 mm).

S 862-297

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (15) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 092-298

- (16) Remove the DO-NOT-OPERATE tag from the flap control lever.

S 862-299

- (17) Move the flap control lever to the 25-unit detent and make sure the slats move to the fully extended position.

S 492-300

- (18) Attach a DO-NOT-OPERATE tag to the flap control lever.

S 862-301

- (19) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).

S 092-302

- (20) Carefully remove the modeling clay from the outboard rotary actuator.

EFFECTIVITY

ALL

27-81-20

S 222-303

- (21) Measure the thickness of the clay and make sure the thickness is between 0.05 and 0.10 inch (1.3 to 2.5 mm).

**NOTE:** The thickness of the modeling clay is the retract overtravel stop clearance for the outboard actuator.

S 862-304

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (22) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 092-305

- (23) Remove the DO-NOT-OPERATE tag from the flap control lever.

S 862-306

- (24) Move the flap control lever to the zero (FLAPS UP) detent and make sure the slats move to the fully retracted position.

S 492-307

- (25) Attach a DO-NOT-OPERATE tag to the flap control lever.

S 862-308

- (26) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).

S 822-309

- (27) If the retract or extend overtravel stop clearances are incorrect as specified in Fig. 204, adjust the stop clearance for the inboard slat (refer to the tasks for Retract and Extend Overtravel Stop Clearance Adjustment - Inboard and Outboard Rotary Actuators, Inboard Slat).

S 412-310

- (28) Install the access panels, 511EB, 511FB, 511KB on left wing and/or 611EB, 611FB, 611KB on right wing (AMM 06-44-00/201).

- F. Retract and Extend Overtravel Stop Clearance Check - Outboard Slats (Detail B, Fig. 204)

LEADING EDGE SLAT TORQUE TUBE - REMOVAL/INSTALLATION

1. General

- A. This procedure contains the tasks for the removal and the installation of the leading edge (LE) slat torque tubes. The LE slats are identified by the numbers 1 through 12, from the left wing to the right wing. There are six slats on each wing.
- B. There are three types of torque tubes:
  - (1) Torque tubes with a splined coupling at each end
  - (2) Torque tubes with a splined coupling at one end and a bearing housing at the other end
  - (3) Torque tubes with a bearing housing at each end.
- C. You must remove the torque tubes with the coupling on each end first, before you can remove any other types of torque tubes.
- D. The safety straps are installed in the slat drive system to prevent damage on the adjacent structure if a torque tube becomes disconnected during the operation of the slats (Fig. 404).

TASK 27-81-24-024-001

2. Leading Edge Slat Torque Tube - Removal

A. Equipment

- (1) Leading Edge Slats Groundlock - A27007-1 (2 necessary)
- (2) TE Flap PDU Lock - A27009-7
- (3) Circuit Breaker Lockout Clip  
(4 necessary) Commercially Available
- (4) Rig Pins from Set A20004-XX (Ref 20-10-24):
  - (a) LE2 - P/N A20004-9
  - (b) LE5 - P/N A20004-9

C. Access

(1) Location Zones

122	Right MLG Wheel Well
125/126	Area Aft of the Forward Cargo Compartment
211/212	Control Cabin
510/610	Wing Leading Edge - Inboard
520/620	Wing Leading Edge - Outboard
710	Nose landing Gear and Doors
730/740	Left/Right Main landing Gear and Doors

(2) Access Panels

511BB	LE Slat Power Drive Unit, Outboard (Left)
611BB	LE Slat Power Drive Unit, Inboard (Right)

D. Prepare for the Removal

S 214-002

- (1) Make sure the downlocks are installed on the nose and main landing gear (Ref 32-00-20).

S 494-003

**WARNING:** USE AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Open the doors for the landing gear and install the door locks (Ref 32-00-15).

S 044-004

**WARNING:** DO THE THRUST REVERSER DEACTIVATION PROCEDURE TO PREVENT THE OPERATION OF THE THRUST REVERSER. THE ACCIDENTAL OPERATION OF THE THRUST REVERSER CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (3) Do this procedure: Thrust Reverser Deactivation for Ground Maintenance (AMM 78-31-00/201).

S 014-005

- (4) Remove the lower access panels for the leading edge as necessary to get to the torque tubes (Ref 06-44-00).

**NOTE:** Use the procedure in 27-81-00/201 to extend and retract the slats as necessary to remove the access panels.

E. LE Slat Torque Tube Removal

S 294-046

**WARNING:** DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

- (1) Keep clean and free of all unwanted objects (FOD), the housing (can) assemblies of the slat main tracks, at all time.

S 974-044

- (2) Measure the retract stop clearance at the rotary actuator arms that are adjacent to the torque tube that you will remove. Make a written record of your measurement.

**NOTE:** This record of the retract stop clearance will be used to do the subsequent installation.

S 034-014

- (3) Remove the splined coupling, retainer, bearing housing, or body seal at these locations as applicable to remove the torque tube:

**NOTE:** Do not turn the torque tube while it is disconnected. It will be necessary to adjust the slat drive if you turn the torque tube (Ref 27-81-00/501).

- (a) At the aft end of the forward cargo compartment, remove the body seal (Fig. 401)
- (b) At slats No. 6 and 7, and the area inboard of slats No. 5 and 8, (Fig. 402)
- (c) At slats No. 1 through 5, and slats No. 8 through 12 (Fig. 403).

S 034-018

- (4) Disconnect the safety straps as necessary (Fig. 404).

S 034-034

- (5) If you do not have sufficient clearance to remove the torque tube, do these steps:
  - (a) Disconnect the adjacent torque tubes and offset gearbox as necessary to get sufficient clearance (Ref 27-81-20/201).

**NOTE:** Be careful not to turn the crank arm for the rotary actuator out of the rig position if you move or turn the disconnected gearbox.

EFFECTIVITY

**WARNING:** DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

- (1) Keep clean and free of all unwanted objects (FOD), the housing (can) assemblies of the slat main tracks, at all time.

S 214-023

- (2) Make sure the trailing edge (TE) flaps and the leading edge (LE) slats are in the fully retracted position.

S 214-024

- (3) Make sure the flap control lever is in the zero (FLAPS UP) detent.

S 214-021

- (4) Make sure the deactivation procedure for the TE flaps is done (Ref 27-51-00).

S 214-022

- (5) Make sure the deactivation procedure for the LE slats is done (Ref 27-81-00/201).

S 844-025

- (6) Put the torque tube through the safety straps and hold the torque tube into position for installation (Fig. 404).

S 434-028

- (7) Install the mating components with the instructions given in the figures that follow, and connect the torque tube at these locations as applicable:

**NOTE:** Do not turn the adjacent torque tubes during the component installation. It will be necessary to adjust the slat drive if you turn the adjacent torque tubes (Ref 27-81-00/501).

- (a) At the aft end of the forward cargo compartment (Fig. 401)
- (b) At the slats No. 6 and 7, and the area inboard of the slats No. 5 and 8 (Fig. 402)
- (c) At the slats No. 1 through 5, and slats No. 8 through 12 (Fig. 403).

S 434-035

- (8) If removed, install the adjacent torque tubes and offset gearbox (Ref 27-81-20/201).

EFFECTIVITY

ALL

27-81-24

01

Page 417  
Apr 22/08

S 434-027

- (9) Attach the safety straps to the structure (Fig. 404).

S 224-026

- (10) Make sure the radial clearance for the safety straps is correct (Fig. 404).

S 224-028

- (11) Do the checks that follow on the axial movement for a torque tube with a splined coupling at each end:
- (a) Push the torque tube tightly against one end and make a mark on its position.
  - (b) Move the torque tube fully to the opposite end.
  - (c) Make sure the torque tube can move easily, and that the axial movement is between 0.100 and 0.460 inch (2.6-11.7 mm).

**NOTE:** If there is resistance when you move the torque tube, loosen the coupling screws by a small increment to permit the torque tube to move freely.

S 224-029

- (12) Do the check that follows on the axial movement for a torque tube with a splined coupling at one end and a bearing housing at the opposite end:
- (a) Push the splined coupling away from the end of the torque tube and make sure that the clearance between the torque tube and the mating part is between 0.050 and 0.370 inch (1.3-9.4 mm).

S 224-030

- (13) Do a check on the retract stop clearance between the rotary actuator arm and the retract stop at these locations as necessary (Fig. 405):

**NOTE:** Set the retract stop clearance to the distance that you measured before the torque tube removal. This will put the slat drive to the correctly adjusted position.

- (a) Measure the clearance at the inboard rotary actuator of slats No. 6 and 7 if you replaced the torque tubes for the inboard slat drive
- (b) Measure the clearance at the outboard rotary actuator of slats No. 5 and 8 if you replaced the torque tubes for the outboard slat drive.

EFFECTIVITY

ALL

27-81-24

03

Page 418  
Apr 22/08

S 224-031

- (14) If you disconnected a torque tube between any two rotary actuators on the same wing, do a check on the stop clearance at each rotary actuator arm (Fig. 405).

**NOTE:** Set the retract stop clearance to the distance that you measured before the torque tube removal. This will put the slat drive to the correctly adjusted position.

S 824-032

- (15) Adjust the slat drive if you cannot get the correct stop clearance (Ref 27-81-00/501).

S 434-036

**CAUTION:** MAKE SURE YOU INSTALL LOCKWIRE ON THE COUPLING SCREWS. IF THE COUPLING SCREWS COME OFF, THE TORQUE TUBE COUPLING WILL DISCONNECT AND CAUSE DAMAGE TO THE AIRPLANE.

- (16) Install a lockwire to the coupling screws with the double twist procedure given in 20-10-23, at the locations where a splined coupling was installed (Fig. 401).

E. Test for the Torque Tube Adjustment

S 094-033

- (1) Remove the DO-NOT OPERATE tag from the flap control lever.

S 094-034

- (2) Remove the rig pin LE2 or LE5 as applicable and install the plug into the rig pin hole.

S 864-035

- (3) Supply electrical power (Ref 24-22-00).

S 094-037

- (4) Remove the PDU lock from the TE flap PDU (Fig. 406).

S 094-038

- (5) Remove the ground locks from the inboard and outboard slat PDUs (Fig. 407).

EFFECTIVITY

ALL

27-81-24

03

Page 419  
Apr 22/08

S 864-036

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

(6) Pressurize the center hydraulic system (Ref 29-11-00).

S 864-040

(7) Move the flap control lever to the 20-unit detent and do this check:  
(a) Make sure the TE flaps and the LE slats extend to the intermediate position.

S 864-041

(8) Move the flap control lever to the 30-unit detent and do this check:  
(a) Make sure the TE flaps and the LE slats move to the fully extended position.

S 864-043

(9) Move the flap control lever to the zero (FLAPS UP) detent and do this check:  
(a) Make sure the TE flaps and the LE slats move to the fully retracted position.

F. Put the Airplane Back to Its Usual Condition

S 294-048

**WARNING:** DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

(1) Keep clean and free of all unwanted objects (FOD), the housing (can) assemblies of the slat main tracks, at all time.

S 864-017

(2) Remove the circuit breaker locks and the DO-NOT-CLOSE tags and close these circuit breakers on the overhead panel, P11:  
(a) 11H23, SLAT ALTN CONT INBD  
(b) 11H24, SLAT ALTN CONT OUTBD  
(c) 11J24, FLAPS ALTN CONT

LEADING EDGE SLAT TORQUE TUBE - INSPECTION/CHECK

TASK 27-81-24-206-020

1. Wear Limit Inspection for the Leading Edge Slat Torque Tubes

A. General

- (1) This procedure only has illustrations and a wear limit table, which show the data for wear limits. There are no procedures for the removal or installation of the parts. Refer to the Leading Edge Slat Torque Tube Removal/Installation for procedures to do these tasks.

B. References

- (1) 06-44-00/201, Wing Access Doors and Panels  
(2) 27-81-24/401, Leading Edge Slat Torque Tubes  
(3) 29-11-00/201, Main (Left, Right and Center) Hydraulic Systems  
(4) 32-00-15/201, Landing Gear Door Locks  
(5) 32-00-20/201, Landing Gear Downlocks  
(6) 78-31-00/201, Thrust Reverser System

C. Access

(1) Location Zones

144	Right MLG Wheel Well
211/212	Control Cabin
510/610	Wing Leading Edge - Inboard
520/620	Wing Leading Edge - Outboard
730/740	Left/Right Main Landing Gear and Doors

D. Prepare for the Inspection

S 216-001

- (1) Make sure the downlocks are installed on the nose and main landing gear (Ref 32-00-20).

S 496-002

**WARNING:** USE AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Open the doors for the landing gear and install the door locks (Ref 32-00-15).

S 046-022

**WARNING:** DO THE THRUST REVERSER DEACTIVATION PROCEDURE TO PREVENT THE OPERATION OF THE THRUST REVERSER. THE ACCIDENTAL OPERATION OF THE THRUST REVERSER CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (3) Do this procedure: Thrust Reverser Deactivation for Ground Maintenance (AMM 78-31-00/201).

S 866-021

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (4) Supply the power to the center hydraulic system (Ref 29-11-00).

S 866-003

- (5) Move the flap control level to the 30-unit detent and permit the TE flaps and the LE slats to move to the fully extended position.

S 496-004

- (6) Attach a DO-NOT-OPERATE tag on the flap control lever.

S 866-005

- (7) Remove the power from the center hydraulic system (Ref 29-11-00).

S 866-006

- (8) Open these circuit breakers on the main power distribution panel, P6, and attach DO-NOT-CLOSE tags:  
(a) 6D21, ALTN SLAT INBD PWR  
(b) 6F24, ALTN SLAT OUTBD PWR

S 866-007

- (9) Open these circuit breakers on the overhead panel, P11, and attach DO-NOT-CLOSE tags:  
(a) 11H23, SLAT ALTN CONT INBD  
(b) 11H24, SLAT ALTN CONT OUTBD

EFFECTIVITY

ALL

27-81-24

01

Page 607  
Apr 22/01

S 026-008

- (10) Remove the Leading Edge Access Panels as necessary to get access to the torque tubes (Ref 06-44-00).

S 296-035

**WARNING:** DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

- (11) Keep clean and free of all unwanted objects (FOD), the housing (can) assemblies of the slat main tracks, at all time.

E. Wear Limits for the LE Slat Torque Tubes (Fig. 601)

S 226-032

- (1) Disconnect one end of the torque tube opposite to the end that you will examine.

**NOTE:** Do not turn the torque tube. The slat drive will be out of adjustment if you turn the torque tube while it is disconnected.

S 226-033

- (2) Measure the angular backlash (Fig. 601) and the spline wear. If the backlash or spline wear is more than the permitted wear limit, replace the coupling sleeve and the coupling half at this connection (AMM 27-81-24/401).

**NOTE:** Move the torque tube axially through the length of the splined sleeve to find the maximum backlash.

S 226-009

- (3) Use the data in figure 601 to examine the LE slat torque tubes for wear.

S 436-034

- (4) Connect the torque tube at the opposite end (AMM 27-81-24/401).

F. Axial Clearance Inspection for the LE Slat Torque Tubes (Fig. 602)

S 226-010

- (1) Do these steps to examine the axial clearance of a type A torque tube:

**NOTE:** A type A torque tube has a splined coupling at one end, and a fixed support bearing at the other end.

- (a) Move the coupling sleeve off the splined coupling.

EFFECTIVITY

ALL

**27-81-24**

03

Page 608  
Apr 22/08

- (b) Measure the clearance between the end of the torque tube and its mating part. Do the step that follow:
  - 1) Move the torque tube in the direction of the fixed support bearing (to make the clearance as large as possible).
- (c) Make sure the clearance is between 0.050 and 0.370 inch (1.3-9.4 mm).

S 226-011

- (2) Do a check on the axial movement of a type B torque tube with the steps that follow:

NOTE: A type B torque tube has a splined coupling at each end of the torque tube.

- (a) Push the torque tube fully one direction, and make a written record of its position.
- (b) Move the torque tube axially until it touches the opposite end. Make sure the torque tube can move easily and that the axial movement is between 0.100 and 0.460 inch (2.6-11.7 mm).
- (c) If there is resistance when you move the torque tube axially, loosen the coupling screws by a small increment to permit the torque tube to move freely.

S 216-012

- (3) No axial clearance check is necessary for a type C torque tube.

NOTE: A type C torque tube has a fixed support bearing at each end of the torque tube.

#### G. Put the Airplane Back to Its Usual Condition

S 296-036

WARNING: DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

- (1) Keep clean and free of all unwanted objects (FOD), the housing (can) assemblies of the slat main tracks, at all time.

S 416-013

- (2) Install the leading edge access panels as necessary (Ref 06-44-00).

S 866-014

- (3) Remove the DO-NOT-CLOSE tags and close these circuit breakers on the P6 panel:
  - (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6F24, ALTN SLAT OUTBD PWR

EFFECTIVITY

LEADING EDGE SLAT TORQUE TUBE - APPROVED REPAIRS

TASK 27-81-24-308-013

1. Approved Repairs for the Leading Edge Slat Torque Tube

A. General

- (1) This procedure gives instructions for the repair of damaged torque tubes caused by wear on the outer diameter. This procedure does not give instructions to remove or install the torque tube.

B. Consumable Materials

- (1) C00064 Alodine 1200S  
(2) C00699 Primer - BMS 10-11, Type 1  
(3) C00032 Enamel BMS 10-60, Type I, Boeing color 707

C. References

- (1) 27-81-24/401, Leading Edge Slat Torque Tubes  
(2) 51-21-04/701, Alodine Coating  
(3) 51-21-10/701, Decorative Exterior Finishes  
(4) 78-31-00/201, Thrust Reverser System

D. Access

- (1) Location Zones  
510/610 Wing Leading Edge - Inboard  
520/620 Wing Leading Edge - Outboard

E. Examine the Torque Tube for Repair or Replacement

S 228-001

- (1) You must replace the torque tube if you have one or more of these conditions (Ref 27-81-24):
- (a) The full diameter surface at the worn area of the torque tube was repaired before.
  - (b) The worn area is adjacent to the end fitting fasteners.
  - (c) The depth of the repair done before is larger than the repair limits given by Table 801.

S 228-002

- (2) You can repair the torque tube if the repair is less than the limits given by Table 801:

EFFECTIVITY

ALL

**27-81-24**

01

Page 801  
Aug 10/90

Table 801		
OUTER DIAMETER OF THE TORQUE TUBE	PERMITTED AREA OF THE REPAIR *[1]	PERMITTED DEPTH OF THE REPAIR *[1]
1.00 INCH BY 0.083 INCH WALL THICKNESS	less than 30% of the torque tube circumference and less than 3 inches long	0.018 inch
	more than 30% of the torque tube circumference or more than 3 inches long	0.009 inch
*[1] THE REPAIR LIMITS ARE THE TOTAL OF THE REPAIR THAT YOU WILL DO, AND THE REPAIR DONE BEFORE.		

S 228-003

- (3) If there are two or more defects on the torque tube, you can repair the torque tube only if the defects are at least 1.50 inches (38.1 mm) apart.

F. Repair the Torque Tube

S 048-004

**WARNING:** DO THE THRUST REVERSER DEACTIVATION PROCEDURE TO PREVENT THE OPERATION OF THE THRUST REVERSER. ACCIDENTAL OPERATION OF THE THRUST REVERSER CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (1) Do this procedure: Thrust Reverser Deactivation for Ground Maintenance (AMM 78-31-00/201).

S 328-005

- (2) Machine the worn area. Use a minimum machine radius 1.00 inch (2.54 centimeters) . The surface finish of the repaired area must be 63 microinches or less (1.6 micrometers). The torque tube is structurally satisfactory if the depth of the repair (include the repair done before) is not more than the repair limits given by Table 801.

S 238-006

- (3) Do a penetrant inspection of the repaired area.

S 378-007

- (4) Apply Alodine to the repaired surface (Ref 51-21-04).

27-81-31

S 494-003

**WARNING:** USE AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Open the doors for the landing gear and install the door locks (Ref 32-00-15).

S 044-004

**WARNING:** DO THE THRUST REVERSER DEACTIVATION PROCEDURE TO PREVENT THE OPERATION OF THE THRUST REVERSER. THE ACCIDENTAL OPERATION OF THE THRUST REVERSER CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (3) Do this procedure: Thrust Reverser Deactivation for Ground Maintenance (AMM 78-31-00/201).

S 214-005

- (4) Make sure the flaps and slats are in the fully retracted position.

S 214-006

- (5) Make sure the flap control lever is in the zero (FLAPS UP) detent.

S 864-007

- (6) Supply electrical power (Ref 24-22-00).

S 864-008

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (7) Pressurize the center hydraulic system (Ref 29-11-00).

S 864-009

- (8) Move the flap control lever to the 30-unit detent, and make sure the flaps and slats move to the fully extended position.

S 494-010

- (9) Attach a DO-NOT-OPERATE tag to the flap control lever.

27-81-31

S 864-011

- (10) Remove the power from the center hydraulic system (Ref 29-11-00).

S 494-012

- (11) Install the PDU lock in the TE flap power drive unit (PDU) (Fig. 403).

S 014-013

- (12) Remove the access panels, 511BB and 611BB, to get access to the outboard and inboard slat PDU (Ref 06-44-00).

S 494-014

- (13) Install the groundlocks on the inboard and outboard slat PDUs (Fig. 404).

S 864-015

- (14) Open these circuit breakers on the overhead panel, P11, and install circuit breaker locks and DO-NOT-CLOSE tags:
- (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD
  - (c) 11J24, FLAPS ALTN CONT

S 864-016

- (15) Open these circuit breakers on the main power distribution panel, P6, and install circuit breaker locks and DO-NOT-CLOSE tags:
- (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6D24, ALTN FLAP PWR
  - (c) 6F24, ALTN SLAT OUTBD PWR

S 014-017

- (16) Remove the fixed lower access panels at the leading edge when it is necessary to get access to the aerodynamic seals (Ref 06-44-00).

S 294-049

**WARNING:** DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

- (17) Keep clean and free of all unwanted objects (FOD), the housing (can) assemblies of the slat main tracks, at all time.

E. Remove the Aerodynamic Seal

LEADING EDGE SLAT AUXILIARY TRACK – REMOVAL/INSTALLATION

1. General

- A. This procedure contains the replacement task (removal and installation) for the leading edge (LE) slat auxiliary track.
- B. The leading edge (LE) slats are given the numbers from No. 1 through No. 12, from the left wing to the right wing.

TASK 27-81-32-904-001

2. Auxiliary Track – Replacement

A. Consumable Materials

- (1) C00259 Primer – BMS 10-11, Type 1

B. References

- (1) 27-81-01/401, Inboard Leading Edge Slat
- (2) 27-81-02/401, Outboard Leading Edge Slat
- (3) 27-81-32/601, Leading Edge Slat Auxiliary Track

C. Access

(1) Location Zones

- 510/610 Wing Leading Edge – Inboard
- 520/620 Wing Leading Edge – Outboard

- D. Remove the Auxiliary Track for the Inboard Slat (Fig. 401)

S 294-021

**WARNING:** DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

- (1) Keep clean and free of all unwanted objects (FOD), the housing (can) assemblies of the slat main tracks, at all time.

S 024-002

- (2) Remove the inboard slat (Ref 27-81-01).

**NOTE:** Prepare for the removal with the instructions given in 27-81-01.

S 034-003

- (3) Remove the bolt that connects the aft end of the auxiliary track to the link.

**NOTE:** Do not change the length of the link during the removal.

LEADING EDGE SLAT MAIN TRACK - REMOVAL/INSTALLATION

1. General

- A. This procedure contains two tasks. The first task removes the main track for the leading edge slat. The second task installs the main track for the leading edge slat.
- B. The slats are given the numbers from No. 1 through No. 12, from the left wing to the right wing.

TASK 27-81-34-004-001

2. Remove the Main Track for the Leading Edge Slat

A. References

- (1) 27-81-01/401, Inboard Leading Edge Slat
- (2) 27-81-02/401, Outboard Leading Edge Slat

B. Access

- (1) Location Zones
  - 510/610 Wing Leading Edge - Inboard
  - 520/620 Wing Leading Edge - Outboard

C. Remove the Main Track for the Inboard Slat (Fig. 401)

S 294-035

**WARNING:** DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

- (1) Keep clean and free of all unwanted objects (FOD), the housing (can) assemblies of the slat main tracks, at all time.

S 014-002

- (2) Remove the inboard slat (AMM 27-81-01/401).

S 034-003

- (3) Remove the downstop on the main track.

**NOTE:** Hold the weight of the main track while you remove the downstop.

S 024-004

- (4) Remove the main track from the airplane.

D. Remove the Main Track for the Outboard Slat (Fig. 402)

### 27-81-34

S 294-037

**WARNING:** DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

- (1) Keep clean and free of all unwanted objects (FOD), the housing (can) assemblies of the slat main tracks, at all time.

S 014-005

- (2) Remove the outboard slat (AMM 27-81-02/401).

S 034-034

**CAUTION:** DO NOT LET THE SLAT TO FALL FREE FORWARD WHEN YOU DISCONNECT THE SLAT FROM THE FORWARD END OF THE MAIN TRACK. DAMAGE TO THE BRACKET OF THE SLAT SKEW SENSOR SWITCH INSTALLED ON MAIN TRACK AND TO THE WING FRONT SPAR CAN OCCUR.

- (3) Remove the downstop on the main track (and the electrical wiring support-bracket, if airplane has Outboard LE Slat Skew Detection System).

**NOTE:** Hold the weight of the main track while you remove the downstop.

S 024-007

- (4) Remove the main track from the airplane.

TASK 27-81-34-404-014

3. Install the Main Track for the Leading Edge Slat

A. References

- (1) 27-81-01/401, Inboard Leading Edge Slat
- (2) 27-81-02/401, Outboard Leading Edge Slat
- (3) 27-81-02/501, Outboard Leading Edge Slat
- (4) 27-81-34/601, Leading Edge Slat Main Track

B. Access

(1) Location Zones

- |         |                              |
|---------|------------------------------|
| 510/610 | Wing Leading Edge - Inboard  |
| 520/620 | Wing Leading Edge - Outboard |

C. Install the Main Track for the Inboard Slat (Fig. 401)

**NOTE:** The wear limit inspection for main track of the inboard slat is in 27-81-34/601.

EFFECTIVITY

ALL

27-81-34

Page 404  
Aug 22/08

S 294-039

**WARNING:** DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

- (1) Keep clean and free of all unwanted objects (FOD), the housing (can) assemblies of the slat main tracks, at all time.

S 424-043

**CAUTION:** MAKE SURE THAT THE DOWNSTOP BUSHINGS ARE INSTALLED CORRECTLY AND THE NUT HAS THE CORRECT TORQUE. IF THEY ARE NOT, THE MAIN TRACK/STRUCTURE JOINT CAN BECOME LOOSE. THE DOWNSTOP PARTS CAN DISCONNECT AND CAN CAUSE DAMAGE TO THE SLAT TRACK HOUSING.

- (2) Make sure the parts of the downstop assembly are installed correctly and the nut has the correct torque.

S 424-008

- (3) Put the main track through the track rollers and install the downstop.

S 414-009

- (4) Install the inboard slat (AMM 27-81-01/401).

**NOTE:** The instructions for the adjustment, test, and put the airplane back to its usual condition for the inboard slat are in the installation procedure in AMM 27-81-01/401.

D. Install the Main Track for the Outboard Slat (Fig. 402)

**NOTE:** The wear limit inspection for main track of the outboard slat is in 27-81-34/601.

S 294-040

**WARNING:** DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

- (1) Keep clean and free of all unwanted objects (FOD), the housing (can) assemblies of the slat main tracks, at all time.

EFFECTIVITY

ALL

27-81-34

02

Page 405  
Apr 22/08

S 214-010

- (2) Do a check of the bearing plates for wear.

**NOTE:** The maximum acceptable wear on the bearing plate is 0.030 inch (0.762 mm). If the bearing plate thickness is less than 0.070 inch (1.78 mm), replace the bearing plate (AMM 57-41-65/401).

S 424-012

- (3) Do these steps to install the main track for the outboard slat:
- (a) Put the slat main track through the track rollers.
  - (b) Move track up and down by hand.
  - (c) Do a check for the clearance between forward bearing plate, nutplate and track.

**NOTE:** If track is found to contact nut plate, re-position nutplate (AMM 57-41-65/401).

**CAUTION:** MAKE SURE THAT THE DOWNSTOP BUSHINGS ARE INSTALLED CORRECTLY AND THE NUT HAS THE CORRECT TORQUE. IF THEY ARE NOT, THE MAIN TRACK/STRUCTURE JOINT CAN BECOME LOOSE. THE DOWNSTOP PARTS CAN DISCONNECT AND CAN CAUSE DAMAGE TO THE SLAT TRACK HOUSING.

- (d) Make sure the parts of the downstop assembly are installed correctly and the nut has the correct torque.
  - 1) Apply a minimum self locking (run-on) torque of 10 pound-inches to the nut. Replace the nut if it does meet the minimum self locking torque.
  - 2) Tighten the nut within the range of 120-130 pound-inches.
- (e) Install the down stop (and the electrical wiring support-bracket, if airplane has Outboard LE Slat Skew Detection System).

S 414-013

- (4) Install the outboard slat (AMM 27-81-02/401).

S 824-014

- (5) Adjust and test the outboard slat (AMM 27-81-02/501).

**NOTE:** Put the airplane back to its usual condition with the instructions given in 27-81-02.

EFFECTIVITY

ALL

LE SLAT MAIN TRACKS – INSPECTION/CHECK

1. General

- A. This procedure only has illustrations and wear limit tables, which show the data for wear limits. There are no procedures for access, removal, or installation of the parts. Refer to the Leading Edge Slat Main Track – Removal/Installation for procedures to do these tasks.

TASK 27-81-34-226-001

2. Wear Limits for the Inboard Slat Main Track (Fig. 601)

A. General

- (1) This procedure only has illustrations and wear limit tables, which show the data for wear limits. There are no procedures for access, removal, or installation of the parts. Refer to the Leading Edge Slat Main Track – Removal/Installation for procedures to do these tasks.

TASK 27-81-34-226-002

3. Wear Limits for the Outboard Slat Main Track (Fig. 602 and 603)

A. General

- (1) This procedure only has illustrations and wear limit tables, which show the data for wear limits. There are no procedures for access, removal, or installation of the parts. Refer to the Leading Edge Slat Main Track – Removal/Installation for procedures to do these tasks.

INBOARD LEADING EDGE SLAT SIDE BRACE LINK -  
REMOVAL/INSTALLATION

1. General

- A. This procedure contains the removal and installation tasks for the inboard slat side brace link.

TASK 27-81-36-024-009

2. Remove the Side Brace Link for the Inboard Slat

A. Equipment

- (1) Leading Edge Slat Sling Equipment - A27017-41
- (2) Circuit Breaker Lockout Clip  
(6 necessary) Commercially Available
- (3) Groundlock, Leading Edge Slat - A27007-1  
(2 Necessary)

B. References

- (1) AMM 06-44-00/201, Wings Access Doors and Panels
- (2) AMM 24-22-00/201, Electrical Power - Control
- (3) AMM 29-11-00/201, Main (Left, Right, and Center) Hydraulic Systems
- (4) AMM 32-00-20/201, Landing Gear Downlocks
- (5) AMM 78-31-00/201, Thrust Reverser System

C. Access

(1) Location Zones

143/144	Left/Right MLG Wheel Well
211/212	Control Cabin
520/620	Wing Leading Edge - Inboard

(2) Access Panel

511BB	LE Slat Power Drive Unit - Outboard (Left)
511EB	Inboard Slat Mechanism, Slat Actuator (Left)
511FB	Lower LE Structure, Slat Mechanism (Left)
611BB	LE Slat Power Drive Unit - Inboard (Right)
611EB	Inboard Slat Mechanism, Slat Actuator (Right)
611FB	Lower LE Structure, Slat Mechanism (Right)

D. Prepare for the Removal

S 214-001

- (1) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

EFFECTIVITY

ALL

27-81-36

01

Page 401  
Aug 22/01

S 044-002

**WARNING:** DO THE THRUST REVERSER DEACTIVATION PROCEDURE TO PREVENT THE OPERATION OF THE THRUST REVERSER. THE ACCIDENTAL OPERATION OF THE THRUST REVERSER CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Do this procedure: Thrust Reverser Deactivation for Ground Maintenance (AMM 78-31-00/201).

S 864-003

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (3) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 864-004

- (4) Supply electrical power (AMM 24-22-00/201).

S 864-005

- (5) Move the flap control lever to the 30-unit detent, and permit the slats to move to the fully extended position.

S 864-006

- (6) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).

S 864-007

- (7) Open these circuit breakers on the main power distribution panel, P6, and install circuit breaker locks and DO-NOT-CLOSE tags:
- (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6D24, ALTN FLAP PWR
  - (c) 6F24, ALTN SLAT OUTBD PWR

S 864-008

- (8) Open these circuit breakers on the overhead panel, P11, and install circuit breaker locks and DO-NOT-CLOSE tags:
- (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD
  - (c) 11J24, FLAPS ALTN CONT

EFFECTIVITY

ALL

27-81-36

01

Page 402  
Aug 22/01

S 014-010

- (9) Remove these access panels at the left and right inboard leading edge (LE): 511BB, 511EB, 511FB (left), and 611BB, 611EB, 611FB (right) (AMM 06-44-00/201).

S 494-011

- (10) Install the PDU groundlocks on the inboard and outboard slat power drive units (PDUs) (Fig. 405).

S 294-049

**WARNING:** DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

- (11) Keep clean and free of all unwanted objects (FOD), the housing (can) assemblies of the slat main tracks, at all time.

E. Remove the Side Brace Link

S 034-012

- (1) Remove the screws on the support door for the side brace link (Fig. 403).

S 024-013

- (2) Remove the support door.

S 034-014

- (3) Remove the shims.

**NOTE:** Measure and make a written record of the thickness of the shims. Keep the shims for the subsequent installation.

S 494-015

**CAUTION:** BE CAREFUL WHEN YOU INSTALL THE SLING EQUIPMENT TO THE SLAT. THE POLISHED EXTERNAL SKIN OF THE SLAT CAN BE EASILY DAMAGED.

- (4) Install the sling equipment on the slat (Fig. 404).

S 034-016

- (5) Disconnect the forward supports from the side brace link (Fig. 402).

**NOTE:** Keep the forward supports for the subsequent installation.

S 294-050

**WARNING:** DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

- (1) Keep clean and free of all unwanted objects (FOD), the housing (can) assemblies of the slat main tracks, at all time.

S 434-022

- (2) Connect the side brace link to the support fitting (Detail D) with a bolt, washers (two), bushing, and nut.

S 434-023

- (3) Tighten the nut for the support fitting to 90-125 pound-inches (10.2-14.1 newton-meters), and install the cotter pin.

S 434-025

- (4) Connect the side brace link to the tripod fitting (Detail C) with a bolt, washer, and nut.

S 434-024

- (5) Tighten the nut for the tripod fitting to 440-650 pound-inches (49.8-73.4 newton-meters), and install the cotter pin.

S 434-026

- (6) Connect the side brace link to the slat (Detail B) with a bolt, washers (two), bushing, and nut.

S 434-027

- (7) Tighten the nut for the slat connection to 145-200 pound-inches (16.4-22.5 newton-meters), and install the cotter pin.

S 434-028

- (8) Connect the forward supports to the side brace link with eight bolts and eight collars (Fig. 402).

S 434-029

- (9) Connect the aft supports to the side brace link with eight bolts and eight collars.

S 094-030

- (10) Remove the sling equipment on the slat (Fig. 404).

S 094-031

- (11) Remove the groundlocks from the inboard and outboard slat PDUs (Fig. 405).

EFFECTIVITY

ALL

27-81-36

03

Page 412  
Apr 22/08

S 864-032

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

(12) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 864-033

(13) Move the flap control lever to the zero (FLAPS UP) detent and permit the flaps and slats to move to the fully retracted position.

S 864-034

(14) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).

S 494-035

(15) Install the groundlocks to the inboard and outboard slat PDUs (Fig. 405).

S 434-036

(16) Do this step only if old shims are available:  
(a) Install the old shims at the connections for the side brace link door. Install the shims by the same sequence as you removed them before, and add a 0.10 inch (2.54 mm) thick shim at each door support (Fig. 403).

**NOTE:** The 0.10 inch (2.54 mm) thick shim is removed in the subsequent steps to get the correct preload.

S 824-038

(17) Do this step only if old shims are lost are damaged and new shims will be installed:  
(a) Add or remove the new shims between the door and the supports until you can get the door to align by 0.02 inch (0.50 mm) along the contour of the slat.

S 434-037

(18) Put the door into its position and install the screws.

EFFECTIVITY

ALL

27-81-36

02

Page 413  
Apr 22/08

S 034-039

- (19) Do these steps to get the correct preload for the door:
- (a) At the forward door support, remove the 0.10 inch (2.54 mm) shim.
  - (b) At the aft door support, remove the 0.10 inch (2.54 mm) shim.

F. Put the Airplane Back to Its Usual Condition

S 294-051

**WARNING:** DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

- (1) Keep clean and free of all unwanted objects (FOD), the housing (can) assemblies of the slat main tracks, at all time.

S 864-040

- (2) Remove the pressure from the center hydraulic system (AMM 29-11-00/201).

S 094-041

- (3) Remove the groundlocks from the inboard and outboard slat PDUs (Fig. 405).

S 414-042

- (4) Install these access panels aft of the left and right inboard slats: 511BB, 511EB, 511FB (left), and 611BB, 611EB, 611FB (right) (AMM 06-44-00/201).

S 864-043

- (5) Remove electrical power (AMM 24-22-00/201).

S 864-044

- (6) Remove the circuit breaker locks and DO-NOT-CLOSE tags, and close these circuit breakers at the overhead panel, P11:
- (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD
  - (c) 11J24, FLAPS ALTN CONT

S 864-045

- (7) Remove the circuit breaker locks and DO-NOT-CLOSE tags, and close these circuit breakers on the main power distribution panel, P6:
- (a) 6D21, ALTN SLAT INBD PWR
  - (b) 6D24, ALTN FLAP PWR
  - (c) 6F24, ALTN SLAT OUTBD PWR

LEADING EDGE SLAT POSITION INDICATING SYSTEM –  
DESCRIPTION AND OPERATION

1. General

- A. The slat position indicating system checks slat position. The system uses sensor switches on the slats and two rotary variable differential transformers (RVDTs) on each of the inboard and outboard slat power drive units.
- B. The signals from the switches and the RVDTs are matched with flap lever position signals by the proximity switch electronic unit (PSEU) and flap/slat electronic unit (FSEU). PSEU and FSEU logic control the slat hydraulic shutoff valve and failure protection and annunciation (AMM 27-51-01/001, Flap/Slat Electronics Unit – Description and Operation).
- C. The flap/slat position indicator provides slat position indication when between zero and one.

2. General Description

- A. Indicating System Purpose (Fig. 1)
  - (1) The slat position indicating system checks the slats for: Asymmetry, un-commanded motion (slat motion without command or slat motion opposite to command), and slat condition when slats do not move with command.
  - (2) The system has two sensor (proximity) switches with targets on each slat. A two-unit rotary variable differential transformer (RVDT) installation is on each slat power drive unit. A two-unit RVDT installation is in the control stand for flap lever position signals.
  - (3) Each RVDT on the slat power drive units is driven by a shaft. The shaft connects to the power drive unit gearbox.
  - (4) A flap/slat position indicator with an amber LEADING EDGE slat failure light is on P3.
  - (5) Inboard and outboard slat alternate drive armed condition is shown by arming switch light indication (AMM 27-81-00/001, Leading Edge Slat System – Description and Operation).
  - (6) The EICAS system accepts inputs from various systems. The inputs are prioritized and coded in alphanumeric data. The EICAS data is sent to a display in the flight compartment where the warning or caution messages are displayed. The messages are divided into three levels and two colors. The red messages are level A warnings. Amber messages are considered cautions and are divided into levels B and C with B the highest priority message.
  - (7) The FSEU and PSEU receive signals related to the flap lever and the slats. The FSEU and PSEU process and analyze the signals. Some conditions require the FSEU and PSEU to make an EICAS input to the display (LE SLAT DISAGREE or LE SLAT ASYM) and to the LEADING EDGE slat failure light (AMM 27-51-01/001, Flap/Slat Electronics Unit – Description and Operation).

B. LE Slat Proximity Sensor Switches (Fig. 2 and Fig. 3)

- (1) Each slat has four moving targets and two structure-mounted sensor switches. The targets for full retraction are mounted on the forward section of each slat inboard and outboard auxiliary track arm. The targets for intermediate and fully extended positions are part of the bolt installations connecting auxiliary tracks with auxiliary track arms. The two sensor switches for each slat are mounted to wing leading edge fixed structure and the targets are in proximity to the sensor switches for an extend or retract signal. The sensor switches are located in the wing leading edge so that one switch picks up an intermediate position signal and the other switch picks up a fully-extended position signal. In the fully retracted position, both of the retract targets are in proximity to sensor switches.
- (2) The sensor switches operate from 28vdc power. Replacement of the sensor switches and targets is on a failure basis rather than a scheduled time basis.
- (3) The slat position signals are sent to the proximity switch electronics unit (PSEU). The PSEU compares slat position signal with an incoming flap lever position signal or alternate flaps/slats position selector system switch from the flap/slat electronic unit (FSEU) The PSEU also compares slat position signals for asymmetry detection.
- (4) When the FSEU and PSEU combine to detect a failure condition in the leading edge slat system, such as asymmetry, uncommanded motion (slat motion without command or slat motion opposite to command), and no slat motion with command, EICAS failure messages will appear on the display (LE SLAT DISAGREE or LE SLAT ASYM) and the LEADING EDGE slat failure light will come on (AMM 27-51-01/001, Flap/Slat Electronics Unit - Description and Operation).
- (5) The PSEU and the FSEU combine to interpret slat and flap lever position signals for control of the leading edge slat hydraulic shutoff valve and the bypass valves on each power drive unit (AMM 27-51-01/001, Flap/Slat Electronics Unit - Description and Operation). Bypass valve control provides failure protection.

C. PSEU (Fig. 1)

- (1) The proximity switch electronic unit (PSEU) is on electronic shelf E1. The PSEU contains the logic and circuits to process position signals from the slat sensor switches and, by way of the flap/slat electronic unit (FSEU), from the flap lever rotary differential transformers (RVDTs) on the control stand and the alternate flaps/slats position selector switch.
- (2) All electrical components are mounted on printed circuit cards. Cards are mounted in plug-in connectors. Circuit card replacement may be done from the front of the unit without removing the unit from the shelf and with the hold-down in place.
- (3) The PSEU has extensive built-in-test equipment (BITE).
- (4) The PSEU receives position signals from the sensor switches mounted on the slats. The PSEU also receives a flap lever position signal from the flap/slat electronic unit (FSEU).

Page 4  
Dec 22/01

- (5) Built-In-Test Equipment (BITE)
- (a) The PSEU BITE fault isolation is to the level of: Sensor switches, associated sensor switch wiring, sensor switch targets, and printed circuit cards. Fault indication on the control and display panel is by: Sensor switch number and indicator lights labeled TARGET NEAR, TARGET FAR, SENSOR, CARD, and TARGET.
  - (b) Three levels of PSEU BITE function are provided. These are: An automatic in-flight test, an on-ground test, and a target test. The memory function of the PSEU BITE is the storing of LRU failures. The failures are stored by LRU number and LRU type. Memory contents may be called up by depressing the BITE button on the control and display panel. Memory contents are shown by LRU number display and LRU type lights. Further button depressions recall memory contents on last in-first out basis. The LRU number displays code 000 when the recall button is depressed and the memory contains no LRU entries or all entries have been recalled. Memory recall does not erase the memory contents. The memory contents are erased when the memory reset button is depressed.
  - (c) The PSEU automatic in-flight BITE function initiates a test to isolate a fault in the sensor switch system. The test records a failure by LRU number and LRU type identification in the memory.
  - (d) AIRPLANES WITH S283T006-14 AND EARLIER;  
all automatic in-flight test functions only occur after the landing gear is indicated tilted (in-flight).
  - (e) AIRPLANES WITH PSEU S283T006-15 AND LATER;  
the automatic in-flight test functions occur after the landing gear is indicated tilted (in-flight), or the -15 PSEU automatically monitors and isolates faults in the leading edge slat position indication system (on-ground), when all the doors and hatches of the airplane are closed.
  - (f) The PSEU BITE on-ground test function covers fault detection, fault isolation, operational verification, and BITE self-test. On-ground test is initiated by actuating the VERIFY switch. Test completion is indicated by code 999 in the LRU number display.

D. LE Slat PDU RVDTs (Fig. 1)

- (1) Two rotary variable differential transformers (RVDTs) are components of both the inboard and outboard power drive units.
- (2) The RVDTs are located in the control unit of each power drive unit. Each RVDT is driven by a shaft connected to the power drive unit gearbox.
- (3) The RVDTs detect slat position and motion.
- (4) Slat position signals are sent from the inboard and outboard PDU No. 2 RVDTs to the flap/slat electronic unit (FSEU) for control of the inboard and outboard leading edge slat alternate drives (AMM 27-81-00/001, Leading Edge Slat System - Description and Operation).

EFFECTIVITY

ALL

27-88-00

03

Page 5  
Dec 22/00

- (5) Slat position signals are sent from the inboard and outboard PDU No. 1 RVDTs to the FSEU for control of the leading edge slat hydraulic shutoff valve (AMM 27-81-00/001, Leading Edge Slat System - Description and Operation).
  - (6) Slat-in-motion signals are sent from the RVDTs to the FSEU. The FSEU logic interprets slat-in-motion signals together with flap lever and slat position signals for failure protection. Slat-in-motion signals are also sent from the FSEU to the warning electronic module (WEU) for interpretation in the stall warning system.
- E. Flap/Slat Position Indicator (Fig. 1)
- (1) The flap/slat position indicator is on P3. The indicator has a split needle. The needles show position of the left and right side trailing edge flaps and leading edge slats. Table 1 shows flap/slat movement related to needle position.
  - (2) If the slats do not extend with flap lever in the 1-unit detent (slats to intermediate position), the flaps will not extend. When the flap lever is moved from the 5-unit detent to the zero (FLAPS UP) detent in the retract mode, the slats will not move from intermediate position to fully retracted position until the flaps are fully retracted.

F. LE Slat Failure Annunciator Light (Fig. 1)

- (1) The amber LEADING EDGE slat failure annunciator light is on P3. The light is controlled by logic circuits in the proximity switch electronic unit (PSEU) and flap/slat electronic unit (FSEU) where signals for slat position, flap lever position, alternate flaps/slats position selector switch position, and slat motion are analyzed (AMM 27-51-01/001, Flap/Slat Electronic Unit - Description and Operation).
- (2) When the logic circuits in the PSEU and the FSEU interpret a slat failure condition, a ground is completed in the FSEU, and the LEADING EDGE slat failure annunciator light will come on.
- (3) Illumination of the LEADING EDGE slat failure annunciator light is accompanied by slat failure messages (LE SLAT DISAGREE or LE SLAT ASYM) on the EICAS display.

- G. L.E. Slat Caution and Warning Annunciations (Fig. 1)
- (1) The flap/slat electronic unit (FSEU), the proximity switch electronic unit (PSEU), and the warning electronic module (WEU) process signals for positions of the flap lever and the slats. Lights come on, aural indication comes on, and display messages are shown for caution or warning annunciation.
  - (2) Takeoff Warning
    - (a) If the slats are not in takeoff position (intermediate position) as commanded by flap lever and the thrust levers are advanced into takeoff range with the engines running, takeoff warning is announced as follows:
      - 1) A red level A FLAPS EICAS message will appear on the display.
      - 2) The master warning lights on P2 will come on.
      - 3) The aural warning will sound.
      - 4) The red CONFIGURATION light on P2 will come on.

LEADING EDGE SLAT POSITION INDICATING SYSTEM -  
ADJUSTMENT/TEST

1. General

- A. This procedure contains these tasks:
  - (1) Leading Edge Slat Sensor Switch - Operational Test
  - (2) Leading Edge Slat Sensor Switch - System Test
- B. For a complete OPERATIONAL TEST of the leading edge slat position indicating system, it is necessary to do these tests:
  - Leading Edge Slat Sensor Switch - Operational Test
  - Flap and Slat Primary Drives and Position Indicating System - Test (Ref 27-51-00/501)
- C. Refer to 31-51-00/501, Warning System, for a test of the LE slat takeoff warning.
- D. Refer to 27-88-01/201, Leading Edge Slat Sensor Switches, for the adjustment of the slat sensor switch clearance.
- E. For the adjustment of the two RVDTs in the control unit of the inboard and outboard slat PDUs, it is necessary to remove the RVDTs. Refer to 27-81-11/401, Leading Edge Power Drive Unit Components, to remove, adjust, or install the RVDTs.

TASK 27-88-00-715-098

C. Prepare for the Test

S 215-121

- (1) Make sure you close these circuit breakers on the P11 Overhead Panel:
  - (a) 11J02, EICAS CMPTR L
  - (b) 11J03, EICAS UPPER DISPL
  - (c) 11J29, EICAS CMPTR R
  - (d) 11J30, EICAS LOWER DSPL
  - (e) 11J31, EICAS DSPL SW
  - (f) 11J32, EICAS PILOT DISPLAY, or  
DISPLAY SELECT

S 215-101

- (2) Make sure the flaps and slats are in the fully retracted position.

S 215-102

- (3) Make sure the flap control lever is in the zero (FLAPS UP) detent.

S 865-103

- (4) Supply electrical power (Ref 24-22-00/201).

D. Leading Edge Slat Proximity Switch Operational Test (Fig. 501)

S 015-104

- (1) Open the access door, 119AL, and get access to the main equipment center, E1-2 shelf (Ref 06-41-00/201).

S 985-105

- (2) At the BITE panel of the Proximity Switch Electronics Unit (PSEU), set the SENSOR CHANNEL SELECT dials to "507".

S 725-106

- (3) Push the VERIFY button on the PSEU to start the test, and make sure these conditions occur:
  - (a) The PSEU display will show "CCC" for approximately two minutes.
  - (b) The PSEU display will show the code "999" when the test is completed.

- (10) Make sure the message, LE SLAT DISAGREE or LE SLAT ASYM, does not show on the top EICAS display.

S 865-020

- (11) Remove the circuit breaker locks and close these circuit breakers on the P11 panel:
- (a) 11H23, SLAT ALTN CONT INBD
  - (b) 11H24, SLAT ALTN CONT OUTBD

S 865-021

- (12) Push the arming switch for the slat alternate drive to disarm the slat alternate drive (ALTN switch light goes off).

S 215-022

- (13) Make sure the amber LEADING EDGE light goes off.

S 215-148

- (14) Make sure the LE SLAT DISAGREE message does not show on the EICAS display after 7 seconds.

S 865-023

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (15) Pressurize the center hydraulic system (Ref 29-11-00).

S 865-024

- (16) Move the flap control lever to the 25-unit detent, and make sure the flaps move to the 25-degree position, and the slats move to the fully extended position.

S 865-025

- (17) Remove the pressure from the center hydraulic system (Ref 29-11-00).

LEADING EDGE SLAT SENSOR SWITCHES – MAINTENANCE PRACTICES

1. General

- A. This procedure contains the replacement and test tasks for the leading edge slat sensor switches. The test procedure contains the test steps for the sensor installation, and the adjustment steps for the switch-to-target clearance.

It will be necessary to adjust the switch-to-target clearance if you replaced a inboard or a outboard slat.

- B. The bolts that attach the slat track rollers to the inboard and outboard auxiliary track arms on each slat make a target. While the auxiliary track arms move with the slats in the auxiliary tracks, the sensor switches will come on when the targets are adjacent to the sensor switches. This condition occurs when the slats are in the intermediate and fully extended positions. In the slat fully retracted position, the sensor switches are set to on by the targets attached to the slat auxiliary track arms.

TASK 27-88-01-902-001

2. Leading Edge Slat Sensor Switch – Replacement

A. Equipment

- (1) Leading Edge Slats Groundlock – A27007-1  
(2 Necessary)
- (2) TE Flap PDU Lock – A27009-7
- (3) Circuit Breaker Lockout Clip  
(4-necessary) Commercially Available

D. Prepare for the Removal

S 212-002

- (1) Make sure the downlocks are installed on the nose and main landing gear (AMM 32-00-20/201).

S 492-003

**WARNING:** USE THE PROCEDURE IN AMM 32-00-15/201 TO INSTALL THE DOOR LOCKS. THE DOORS OPEN AND CLOSE QUICKLY AND CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (2) Open the doors for the landing gear and install the door locks (AMM 32-00-15/201).

S 042-004

**WARNING:** DO THE THRUST REVERSER DEACTIVATION PROCEDURE TO PREVENT THE OPERATION OF THE THRUST REVERSER. THE ACCIDENTAL OPERATION OF THE THRUST REVERSER CAN CAUSE INJURY TO PERSONS OR DAMAGE TO EQUIPMENT.

- (3) Do this procedure: Thrust Reverser Deactivation for Ground Maintenance (AMM 78-31-00/201).

S 212-005

- (4) Make sure the trailing edge (TE) flaps and the leading edge (LE) slats are in the fully retracted position, and the flap control lever is in the zero (FLAPS UP) detent.

S 862-006

- (5) Supply electrical power (AMM 24-22-00/201).

EFFECTIVITY

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

(6) Pressurize the center hydraulic system (AMM 29-11-00/201).

S 862-008

(7) Move the flap control lever to the 30-unit detent, and make sure the flaps and slats move to the fully extended position.

S 492-009

(8) Attach a DO-NOT-OPERATE tag to the flap control lever.

S 862-010

(9) Remove the power from the center hydraulic system (AMM 29-11-00/201).

S 492-011

(10) Install the PDU lock in the TE flap power drive unit (PDU) (Fig. 202).

S 012-012

(11) Remove the access panels, 511BB and 611BB, to get access to the outboard and inboard slat PDUs (AMM 06-44-00/201).

S 492-013

(12) Install the groundlocks in the inboard and outboard slat PDUs (Fig. 203).

S 862-014

(13) Open these circuit breakers on the overhead panel, P11, and install circuit breaker locks and DO-NOT-CLOSE tags:

- (a) 11C10, SLAT POS IND
- (b) 11H23, SLAT ALTN CONT INBD
- (c) 11H24, SLAT ALTN CONT OUTBD
- (d) 11J24, FLAPS ALTN CONT

S 862-015

(14) Open these circuit breakers on the main power distribution panel, P6, and install circuit breaker locks and DO-NOT-CLOSE tags:

- (a) 6D21, ALTN SLAT INBD PWR

EFFECTIVITY

Dec 22/00

- (b) 6D24, ALTN FLAP PWR
- (c) 6F24, ALTN SLAT OUTBD PWR

S 012-016

- (15) Remove the fixed lower access panels when it is necessary (AMM 06-44-00/201).

S 292-155

**WARNING:** DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

- (16) Keep clean and free of all unwanted objects (FOD), the housing (can) assemblies of the slat main tracks, at all time.

E. Remove the Slat Sensor Switch (Fig. 201)

S 032-017

- (1) Disconnect the wiring at the splice and identify the wires with tags.

S 032-018

- (2) Remove the bolts that attach the switch to the structure.

S 022-019

- (3) Remove the switch.

F. Install the Slat Sensor Switch (Fig. 201)

S 212-020

- (1) Make sure the power is removed from the center hydraulic system (AMM 29-11-00/201).

S 212-021

- (2) Make sure the flaps and slats are in the fully extended position.

S 212-022

- (3) Make sure the flap control lever is in the 30-unit detent.

S 422-023

- (4) Put the switch into its position and install the bolts.

S 432-024

- (5) Remove the tags from the wires and connect the switch wires at the splice.

S 822-077

**CAUTION:** SL 27-83 RECOMMENDS REDUCTION OF SENSOR TARGET CLEARANCES TO PREVENT NUISANCE INDICATIONS (LE SLAT ASYM EICAS MESSAGE, LE LIGHT ILLUMINATION, TAKE OFF CONFIGURATION WARNING FLAPS OR STICK SHAKER ACTIVATION). THE TARGET WASHERS HAVE DIFFERENT PROFILES. TARGET WASHERS ARE NOT INTERMIXABLE. INSTALLATION OF TARGET WASHERS DEPEND ON LOCATION AND INCORRECT PART NUMBER INSTALLATION CAN CAUSE NUISANCE INDICATIONS AND DAMAGE TO EQUIPMENT CAN OCCUR.

- (6) Adjust the switch-to-target clearance, if you moved the mounting bracket when you replaced the switch.

**NOTE:** If you do the clearance adjustment, make sure you install the target closest to the proximity sensor. The target can be identified by the countersunk holes on one side. Metal attraction by the target is stronger than by the shims. Airplanes that have not completed the intent of service letter 767-SL-27-83 can keep superseded wider clearance. SB 57-0052 adds step washers and reworks target washers and bolts.

S 742-026

- (7) Do the BITE procedure for the PSEU sensor target to examine the sensor switch operation (FIM 32-09-03/101).

S 292-156

**WARNING:** DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

- (8) Keep clean and free of all unwanted objects (FOD), the housing (can) assemblies of the slat main tracks, at all time.

S 722-027

- (9) Do a test on the switch installation.

**NOTE:** Put the airplane back to its usual condition after you do the test on the switch installation. Use the procedure in the "Leading Edge Slat Sensor Switch - Test" task.

**WARNING:** DO NOT LET OBJECTS GET IN THE HOUSING ASSEMBLY OF THE SLAT TRACK. THIS WILL HELP PREVENT A PUNCTURE OF THE HOUSING ASSEMBLY THAT COULD CAUSE A FUEL LEAK. THE FUEL LEAK COULD CAUSE A FIRE AND POSSIBLE DEATH OR INJURY TO PERSONNEL.

(10) Keep clean and free of all unwanted objects (FOD), the housing (can) assemblies of the slat main tracks, at all time.

F. Sensor Switch Test

S 222-082

**CAUTION:** SL 27-83 RECOMMENDS REDUCTION OF SENSOR TARGET CLEARANCES TO PREVENT NUISANCE INDICATIONS (LE SLAT ASYM EICAS MESSAGE, LE LIGHT ILLUMINATION, TAKE OFF CONFIGURATION WARNING FLAPS OR STICK SHAKER ACTIVATION). THE TARGET WASHERS HAVE DIFFERENT PROFILES. TARGET WASHERS ARE NOT INTERMIXABLE. INSTALLATION OF TARGET WASHERS DEPEND ON LOCATION AND INCORRECT PART NUMBER INSTALLATION CAN CAUSE NUISANCE INDICATIONS AND DAMAGE TO EQUIPMENT CAN OCCUR.

(1) If it is necessary, do a check on the switch-to-target clearance at the slat fully extended (landing) position with these steps:

**NOTE:** Airplanes that have not completed the intend of service letter 767-SL-27-83 can keep superseded wider clearance. SB 57-0052 adds step washers and reworks target washers and bolts.

**WARNING:** KEEP PERSONS AND EQUIPMENT AWAY FROM ALL CONTROL SURFACES WHEN HYDRAULIC POWER IS SUPPLIED. AILERONS, ELEVATORS, RUDDER, FLAPS, SLATS, SPOILERS, AND STABILIZER ARE FULLY POWERED SURFACES. INJURY TO PERSONS OR DAMAGE TO EQUIPMENT CAN OCCUR WHEN HYDRAULIC POWER IS SUPPLIED.

**CAUTION:** MAKE SURE THE ACCESS DOOR FOR THE ENGINE STRUT, THE INBOARD FAN COWLING, AND THE THRUST REVERSER COWLING ARE CLEAR FROM THE MOVEMENT OF THE SLATS. IF THE MOVEMENT OF THE SLATS IS BLOCKED, IT CAN CAUSE DAMAGE TO THE AIRPLANE.

- (a) Pressurize the center hydraulic system (AMM 29-11-00/201).
- (b) Move the flap control lever to the 30-unit detent, and make sure the slats move to the fully extended (landing) position.
- (c) Remove the power from the center hydraulic system (AMM 29-11-00/201).
- (d) Install the groundlocks in the inboard and outboard slat PDUs (Fig. 203).

EFFECTIVITY
