- High Temperature, +500°F (+260°C)

### DESCRIPTION

The ENDEVCO® Model 8520A is a rugged, miniature, high sensitivity piezoresistive pressure transducer. The transducer has a 0.15 inch (3.8 mm) face diameter and is available in ranges from 10 to 500 psi. The Model 8520A features high temperature performance to +500°F (+260°C) and can operate with diminished lifetime to +600°F (+316°C). Its excellent linearity (even to 2X range) combined with very high resonance makes it ideal for measuring dynamic pressure.

The transducer employs silicon strain gages bonded to a micro-machined silicon diaphragm for maximum sensitivity and wide frequency response. Internal sensitivity compensation and zero trim provides accuracy to +500°F (+260°C). This transducer exhibits low photoflash sensitivity and high stability during temperature transients.

The Model 8520A is designed to measure a wide range of static or dynamic pressures. Its small diameter suits it to flush mounting for measuring skin pressures on aircraft, inlet distortion pressures in turbine engines or small scale models in wind tunnels. The vent tube provides for venting to the atmosphere or to a standard reference manifold, or for differential pressure measurements.

ENDEVCO Model 136 Three-Channel System, Model 4428A or 4430A Signal Conditioner, or OASIS 2000 Computer-Controlled System are recommended as signal conditioner and power supply.

### NOTES

- 1 psi = 6.895 kPa = 0.069 bar.
2. Calibration provided is for positive pressure. Negative sensitivity is typically within 2% of positive sensitivity.
3. FSO (Full Scale Output) is defined as transducer output from 0 to +full scale pressure.
4. Zero Measurand Output (ZMO) is the transducer with 0 psig applied.
5. The metal screen partially shields the silicon diaphragm from incident radiation. Accordingly, light incident at acute angles to the screen generally increases the error by a factor of 2 to 3.
6. Per ISA-S37.10, Para. 6.7, Procedure II.
7. Warm-up time is defined as elapsed time from excitation voltage "turn on" until the transducer output is within ±1% of reading accuracy.
8. Use of excitation voltages other than 10.0 Vdc requires manufacture and calibration at that voltage since thermal errors increase with high excitation voltages.
9. The 8520A can be operated at 500°F (260°C) continuously, at 550°F (288°C) for up to 24 hours and at 600°F (316°C) for up to 4 hours.
10. Maintain high levels of precision and accuracy using Endevco's factory calibration services. Call Endevco's inside sales force at 800-982-6732 for recommended intervals, pricing and turn-around time for these services as well as for quotations on our standard products.
