GENERAL DESCRIPTION

The VR14 is a self-contained CRT display unit requiring only analog position and digital unblanking information. It is designed for use with a digital display controller. The amount of information displayed depends on the specific system; however, 1250 random points can be displayed flicker free at a 40 Hz. refresh rate. Viewable area is 62 inches square with an aspect ratio of 3:4. The unit is 10 1/2 inches high, 19 inches wide, 17 inches deep, and weighs about 75 pounds. It is available in either a rack mounted or table top model.

OPERATOR CONTROLS (All controls labeled as to function)

Front Panel:

Brightness / ON-OFF Manual brightness control and AC power switch.

Channel Select Operator selection of either channel 1 or channel 2 if a time multiplexed signal is available.

Internal Controls: These controls accessible from the top of the unit through the safety screen.

Deflection Controls: The following controls are 10 turn pots located on the deflection amplifiers (A225). All inputs have protection against momentary excessive voltage.

X Gain Controls horizontal input sensitivity.

Y Gain Controls vertical input sensitivity.

X Position Manual Position Control.

Y Position Manual Position Control.

NOTE: With deflection inputs grounded, the position controls allow the beam to be positioned anywhere within the usable screen area.

ENGINEERING SPECIFICATION

CONTINUATION SHEET

TITLE VR14 SPECIFICATION

CRT Controls: These controls are 10 turn pots located on the G836 power supply module. Their purpose is to adjust focus and grid bias voltages. They are adjusted at the factory.

Focus: Adjusted for best overall focus.

Brightness Preset: To adjust the range of the front panel brightness control.

GENERAL ELECTRICAL SPECIFICATION

Spot Size: ≤ 20 mils inside the usable screen area at a brightness of 30 footlamberts. Spot size is measured using shrinking raster technique at a brightness of greater than 30 foot-lamberts.

Jitter: $\leq \pm 1/2$ spot diameter.

Repeatability: $\leq \pm 1$ spot diameter
(Repeatability is the deviation from the nominal location of any given spot)

Gain Change: From a fixed point on the screen, less than ± 0.3 percent gain change for each ± 1 percent line voltage variation.

Temperature Range: 0 to 50°C operating

Relative Humidity: 10 to 90 percent noncondensing.

Brightness: ≥ 30 footlamberts; measured using a shrinking raster technique.

Linearity: Maximum deviation of any straight line will be ≤ 1 percent of the line length measured perpendicular to a best fit straight line.

Deflection Method: Magnetic (70° diagonal deflection angle)

Focus Method: Electrostatic

High Voltage: 11.7 KV DC nominal (voltage proportional to input line voltage). Supply is self-contained and equipped with a bleeder resistor.

Shielding: CRT is fully enclosed in a magnetic shield.

Overload Protection: Unit is protected against fan failure or air blockage by thermal cutouts.

DEFLECTION AMPLIFIER SPECIFICATION

1. Deflection Amplifiers are DC coupled and are capable of sustaining a worst case AC or DC deflection at environmental extremes.
2. Input Specification
 - A. Inputs are differential.
 - B. Differential input impedance . . . 5K ohms minimum.
 - C. Input sensitivity . . . 200 mv/inch maximum.
 - D. Common Mode Rejection Ratio . . . 40 db.
 - E. Maximum Operating Input . . . $\pm 6V$. (Maximum operating input is the sum of the common mode input and the differential input.)
 - F. Input offset not to exceed $\pm 1/2$ peak to peak input signal.
 - G. Maximum non-operating input . . . $\pm 50V$.

Z AXIS SPECIFICATION

1. Z Input

A negative transition from $\geq +2.4V$, but not exceeding $+8V$, to $\leq +0.8V$, but not less than $-4V$, in ≤ 20 ns will cause an unblanking pulse at the CRT cathode from approximately $+60V$ to ground with a duration of ≥ 200 ns at the 50 percent points. Delay between the 50 percent point of the negative input transition to the 50 percent point of the output pulse is less than 100 ns.
2. Z Direct

A positive going pulse not exceeding 35V, but at least 20V in height and not exceeding 10 μs , but at least 1 μs in duration will unblank the CRT to a viewable intensity. This signal is AC coupled to the CRT grid.
3. Channel Select

With the Channel Select Switch in the Channel 1 position, a positive level of greater than $+2.4V$, but not exceeding $+8V$ will enable the Z input circuit. A level of less than $+0.8V$ but not less than $-4V$ will disable the circuit. With the switch in the Channel 2 position, a positive level will enable the Z circuit; a negative level will disable it. Placing the switch in the Channel 1 and 2 position disables this input.

DC VOLTAGE CHECKS

The next series of tests are voltage tests.

The meter should be set up and connected to the test points first then power turned on for a minimum amount of time (1 to 3 seconds).

It is very important that power be on only briefly because if a fault does exist damage to the unit can be avoided. Never leave power on even if correct voltage is observed because a fault may exist that will not be detected

until a later test.

6. Perform the following voltage checks using the procedure outlined above.

- a. Perform voltage check number 1 of table 1.
- b. Perform voltage check number 2 of table 1.

18. Strike rub out and repeat on the TTY until the cursor returns to its original starting position.
19. Strike line feed on the TTY. This will cause the cursor to move to the lower left corner of the display.
20. Type "DX, comma, carriage return," this will cause the directory of tape unit 0 to be displayed. Check the general quality of the display for acceptable limits.
21. Power down the VR14 and disconnect the line cord. Wire the unit for 230VAC input.
22. Power up the VR14 with 230VAC and check display quality with DISPTST.
23. If O.K. remove line cord and rewire for 115VAC.
24. Hit stop and I/O PRESET on the PDP-12 console.
25. With a Variac set the line to each unit to 90VAC and with no signal connected and A02-A, A03-A at approximately +2.2V (standard settings for PDP-12), turn on off switch on and off rapidly (within 1/2 sec) about 5 times while monitoring the voltage at A02-A. Leave power on after the fifth time. If A02-A does not return to its original value (about 2.2V), but instead goes away negative shut down and do not ship this unit. It has power-on latch up.
26. All VR14/20's must be vibrated horizontally, vertically, and on its back facing up thru the range 0-60 on the vibration table while displaying DISPTST. Any breaking up or disappearing of the picture is a reject and cannot be retested unless the intermittent cause is found and fixed.
27. All units must be tested in a heat tent which has an ambient temperature between 45 and 55° C. For 3 hours with A02-A, A03-A at +2.0V (not 2.5) and then 3 hours with A02-A, A03-A adjusted to -2.0V (not 2.5). Now run DISPTST for 3 hours under heat tent. After both heat tent tests the following measurements must be made to see if any power transistors have become "leaky".

TITLE

- A. Turn the position pots on X and Y deflection (A225) so that +2.5 volts is measured at A02-A and A03-A. This causes +5 amps to flow from both amplifiers and represents the worst case dissipation for the 2N4399 transistors in the power supply and deflection.
- B. Measure the case temperature of the 2N4399 in the X and Y and power supply. The case temperature a room ambient should never exceed 72°C (161°F).
- C. While the 2N4399's are still at full load, the 2N5302's are all unloaded and should be measured for leakage. Measure A02L to A02K, this voltage should read less than .75 volts. Measure A03L to A03K and should read less than .75 volts. This same measurement can be made at the power supply regulator board by measuring less than .75 volts between pin 11 (blue gray) and pin 12 (green) P3.
- D. Now that the 2N4399's have been run full load, the 2N5302's should be done. Turn the X and Y position pots so that -2.5 volts is measured at A02-A and A03-A. This loads fully all the 2N5302's.
- E. Measure the case temperatures of all 2N5302's. They should also be less than 72°C (161°F).
- F. Now measure the 2N4399's (which should all be off). Measure less than .75 volts between A02-R and A02-T and also between A03-R and A03-T. On the power supply measure less than .75 volts between pin 2 (yellow gray) and pin 1 (orange) on P3.
- G. After the test return the position setting to 0, 0 in X and Y.
- H. If any of the measurements are above limits, the unit should never be shipped to anyone as it is a potential failure.

TITLE ACCEPTANCE PROCEDURE FOR BASIC PDP1105

1.0 SCOPE

- 1.1 This procedure establishes the minimum mechanical and electrical standards that a PDP11/05 must meet to be considered acceptable for shipment.
- 1.2 Any basic PDP11/05 that fails any portion of this procedure may be returned to production for correction of the discrepancy at the discretion of the acceptance supervisor. Upon resubmission of product acceptance, the PDP11/05 may be subjected to this entire procedure or portion thereof; provided no one step of this procedure is omitted.

2.0 INITIAL VERIFICATION

- 2.1 All PDP11/05's should have the T-17 (D0QE or latest revision) diagnostic in core when the machine is submitted to acceptance.
 - 2.1.1 Plug the power cord of the PDP11/05 into the appropriate AC outlet.
 - 2.1.2 Depress halt switch.
 - 2.1.3 Turn the key switch to power on.
 - 2.1.4 Set the switch register of the PDP11/05 to 200 (8).
 - 2.1.5 Ensure that both fans turn.
 - 2.1.6 Depress the "load address" switch.
 - 2.1.7 Put switches 11 and 15 in the up position and switch 8 in the down position.
 - 2.1.8 Depress the "Start" switch.
 - 2.1.9 After the PDP11/05 has been running for the time specified in Table 1 without halting, depress the "halt" switch. The machine should halt.
 - 2.1.10 Turn off the key switch and remove the AC cord from the power outlet.
- 2.2 Should the basic PDP11/05 fail to meet the requirements of 2.0, one reloading of the diagnostic will be allowed. (See 9.1 and 9.4.1.1 to 9.4.1.8). Should the PDP11/05 then fail to run properly as described in 2.1.1 to 2.1.10, it shall be rejected and returned to production for repair.

3.0 MECHANICAL INSPECTION

- 3.1 Description of sides.
 - 3.1.1 Front side shall be the console side.
 - 3.1.2 The right side shall be the side on the right when looking at the PDP11/05 from the front.

TITLE ACCEPTANCE PROCEDURE FOR BASIC PDP11/05

- 3.2 Inspect the unit for conformance to "Hardware Assembly Standard" A-SP-7665099-0-0.
- 3.3 With the PDP11/05 chassis on its right side, check the bottom of the chassis for:
 - 3.3.1 Four (4) Phillips head screws with internal lock washers securing the power supply chassis to the PDP11/05 chassis.
 - 3.3.2 Three (3) Phillips head screws with internal lock-washers securing the logic to the chassis.
 - 3.3.3 Four (4) Phillips head screws with internal lock-washers holding the module guides in place.
- 3.4 With the PDP11/05 chassis on its bottom, check the left side for:
 - 3.4.1 Six (6) Phillips head screws with internal lock-washers securing the card guide supports.
 - 3.4.2 Side cover should have foam against the module handle. This cover is secured to the chassis with four (4) Phillips head screws with internal lockwashers.
 - 3.4.3 Console cable should be routed to avoid damage from module handles.
- 3.5 Check the 54-9728 regulator module for six (6) Phillips head screws securing the module to the power supply chassis, these screws are located on the top of the module, one on each corner of the heat sink and one at each corner of the module at the end closest to the transformer.
 - 3.5.1 Make sure the regulator module is not bowed.
- 3.6 All wires must be tied neatly using cable ties.
- 3.7 Make sure that two (2) plastic cable clamps have been used to dress the AC harness wires coming from the AC input box and going to the power supply fan and the key switch.
- 3.8 The remaining wires should be supported by two (2) more cable clamps along the left side of the power supply chassis.
- 3.9 Check all crimp connections by pulling gently on the wires entering the crimp. There should be no signs of looseness. The stranded wire should be exposed beyond the crimp approximately 1/16".
- 3.10 Check the male tabs to which the crimp connector attaches for cold solder joints and flux.

- 3.11 Insure that an acceptance stamp appears on the top of the logic indicating that the logic has been tested by the AWT.
 - 3.12 All units must be free of all loose hardware.
 - 3.13 Inspect the AC power cord. The cord must be free from cuts, burns and abrasions.
 - 3.14 There should be two (2) Phillips head screws with internal lockwashers securing the AC input box to the chassis.
 - 3.15 The rear fan screw should not be missing, bent, or damaged in anyway.
 - 3.16 The rear fan must be secured to the rear screen assembly by four (4) Phillips head screws with internal lockwashers.
 - 3.17 A second cable clamp should be attached to the left rear of the chassis, across the cable access hole.
 - 3.18 Failure Determination
 - 3.18.1 Any PDP11/05 that fails to meet the criteria in 3.0 with the exceptions of 3.9 and 3.10 will be documented as a recycle, but the failure may be corrected in the acceptance area by a person (s) from production.
 - 3.18.2 Any PDP11/05 that fails to meet the criteria outlined in 3.9 and/or 3.10 must be documented as a recycle and returned to the production area for correction of the discrepancy. Before the unit is returned to acceptance, a quick verify must be run in production.

 B. GTP with power fail option (if only 4K, run T-17 and power fail).

9.6 Failure Classification

9.6.1 Any PDP11/05 that fails 9.4.0 or 9.5.2 will be documented as a recycle and will be returned to production for repair.

9.6.2 Upon resubmission to acceptance, the PDP11/05 may, at the discretion of the acceptance supervisor, be required to pass 24 hours of burn-in.

9.6.3 See next page.

10.0 DOCUMENTATION AND FAILURE CLASSIFICATION (con't)

10.1 Each system accepted against section 9.0 (Electrical Acceptance) of this procedure must have a completed log sheet and a PDP11/05 basic acceptance checklist added to its test and inspection envelope. See attachments.

10.2 Any unit which fails to properly run diagnostics according to MAINDEC documents other than continuously and as specified will be classified defective and returned to production for rework. Printouts, if generated will be returned to production with the PDP11/05.

10.3 Any system which has had any major modification as listed below; must be recycled through the entire production checkout procedure (including the heat cycle) prior to resubmission to the acceptance area. These machines will be required to undergo another 24 hours burn-in.
 A. Power Supply replacement.
 B. Memory System replacement.
 C. Any module replacement in the processor or the front panel.
