This page contains a grid of 120 small diagrams, arranged in 12 rows and 10 columns. Each diagram appears to be a schematic or a small circuit diagram, possibly representing the internal structure of the ROM-BOOTSTRAP MD-11-DQMCA-A. The diagrams are very small and difficult to read, but they seem to show various components and their interconnections. The diagrams are arranged in a regular grid pattern, with each diagram occupying a small square area. The diagrams are arranged in 12 rows and 10 columns, totaling 120 diagrams. The diagrams are arranged in a regular grid pattern, with each diagram occupying a small square area. The diagrams are arranged in 12 rows and 10 columns, totaling 120 diagrams.

Small text in the bottom right corner, possibly a reference or part number.

INTRODUCTION

This file is produced by the Autodocumentation System ADSYS. The file constitutes the microprogram documentation for the 11/60 MICROCODE system.

The file consists of four parts, namely:

1. Introduction
2. Microprogram Table Of Contents
3. Microprogram Definitions
4. Microprogram Flows

A brief description of each of these parts follows.

1. THE INTRODUCTION

The first part of the file, this introduction, describes the file.

2. THE MICROPROGRAM TABLE OF CONTENTS

The second part of the file, the microprogram table of contents, contains an entry for each .TOC line in the microprogram. A typical entry in this part of the file has the form:

12 * LOGIC OPERATIONS ON FALU AND LOAD AR

The number, 23 in this example, indicates the page on which the .TOC entry with the text "LOGIC OPERATIONS ON FALU AND LOAD AR" can be found. The page number indicates the page in the third or fourth part of the file, depending on whether the entry appears in the first or second part of the microprogram table of contents.

3. THE MICROPROGRAM DEFINITIONS

The third part of the file, the microprogram definitions, contains the definitions exactly as they are given in the microprogram.

4. MICROPROGRAM FLOWS

The fourth part of the file contains the microprogram flows, constructed by ADSYS from the Assembler Output Listing. These flows resemble the one-to-one, hand-drawn flows that have previously accompanied a microprogram. They contain the cross-reference information that is necessary to interpret the microprogram.

4.1 Microinstruction Format

A microinstruction is represented in the following format in the microprogram flows:

```

box   tag, addr
      *****
      * comment ... *
      * ... *
      *-----*
      * time-state macro, macro *
      * ... *
      * ... *
      *****

```

where:

box	is an identifying number assigned to the box
tag	is the microinstruction tag
addr	is the microinstruction address
comment	is the text of comments associated with the micro instruction
time-state	is the name of a time state specified in the microinstruction
macro	is the name of a macro used in the microinstruction

The characters '...' indicate repetition. In the above box, the use of the repetition indicator shows that several comments can be given in a box, that a time-state can have many macros associated with it, and that a microinstruction can contain several time-states.

For example, consider the following excerpt from a microprogram flow:

```

104 LOADZ: 113
*****
*LOAD FIRB <5:3> = MO. TRANSFER FROM *
*AC[SF] TO AC[DF]. *
*-----*
*P2, AR←FSPAD[SF], ER←EB[SF] *
* SD←SCROUT, ENB←FPACK, ENB←PAUSE, *
* ENB←ABORT *
*NEXT, J/LOADZ, 02 *
*****

```

In this excerpt, box 104 is associated with the tag 'LOADZ' at address 113. A comment and two time-states, 'P2' and 'NEXT', are shown.

4.2 Cross-Reference Information

For each microinstruction box, all the points from which control can pass to the box are indicated by arrows pointing into the box and all the points to which control can pass from the box are shown by arrows pointing from the box. The microinstruction box with cross-reference information has the following form:

```

F/from-tag1      <-- from-info
F/from-tag2      <-- from-info
...
*****
*                *
* J/to-tag1      * --> to-info
* J/to-tag2      * --> to-info
* ...            *
*****

```

The 'from-info' gives the address, box-number, page-number, and microfiche coordinates for the associated tag. The 'to-info' gives that information and, in addition, contains offset information if the transfer is an n-way branch.

Consider the following excerpt from a microprogram flow:

```

107 STSTZ: 115          F/PREP          <--          21    3    3    D 1
          F/ADDNZ.02    <--          254   80   30   G 3
*****
*!SYSYZ: ! STST INSTRUCTION IS EXECUTED *
*IN BM BY WARM FLOATING POINT MICROCODE. *
*-----*
*          ENB-FPACK,ENB-PAUSE,ENB-ABORT, *
*NEXT,      J/STST.02          * -->          336  108  39   D 4
*****

```

The cross-reference information shows that the microinstruction 'PREP', address 21 at box 3 on page 3 with microfiche coordinates D 1, and the microinstruction 'ADDNZ.02', address 254 at box 80 on page 30 with microfiche coordinates G 3, transfer to the box for microinstruction 'STSTZ'. Further, it shows that the microinstruction 'STSTZ' transfers to microinstruction 'STST.02', address 336 at box 108 on page 39 with microfiche coordinates D 4.

4.3 Types of Flow

Three types of flow are distinguished by the Autodocumentation System, namely:

- Simple Transfer
- N-Way Branch Transfer
- Subroutine Call

The following sections give the method of representing each kind of flow.

4.3.1 Simple Transfer - A box that transfers directly to another box illustrates simple flow. If the box transfers to the next sequential box on the page, the 'to-info' is not given but instead the sequential flow is indicated by down pointers. Simple flow is shown in the following excerpt from a microprogram flow:

```

148 DIV.20: 46F          F/DIV.18          <-- VV
*****
*AR GETS DIVIDEND.
*-----*
*      AR+FSPAD[DF],ER+FPEMITE(352),
*NEXT,  J/DIV.22          * --> VV
*****
149 DIV.22: 470          F/DIV.20          <-- VV
*****
*FIRST DIVIDE STEP.
*-----*
*      AR+FSPAD[TMP1]-PLUS-AR,
*      INBUF+INBUF-LEFT-1
*NEXT,  J/DIV.24          * -->      471 150 51  D 5
*****

```

In this example, box 148 transfers to the next sequential box. Box 149 transfers to box 150, which is the next sequential box. However, since box 150 is on another page, the 'to-info' is given, showing a transfer to address 471, box 150 on page 51 with microfiche coordinates D 5.

4.3.2 N-Way Branch Transfer - A box that contains a branching-but illustrates n-way branch transfer. Consider the following excerpt from a microprogram flow:

```

111 CMPXNZ.02: 342
*****
*      AR+ZERO,
*      ER+EA[SF]-MINUS-EB[DF],
*      SD+SCROUT,
*NEXT,  BUT(EAEO'EBEQ), J/CMPXZ.02
*      J/CMPXZ.02          * -->      00 234 113 40  E 4
*      J/CMPXZ.22          * -->      01 235 123 43  H 4
*      J/CMPXZ.24          * -->      10 236 124 43  H 4
*      J/CMPXZ.26          * -->      11 237 125 44  I 4
*****

```

The microinstruction contains a branching-but 'BUT(EAEOO EBEOO)' to a branch base 'CMPXZ.02'. The four possible destinations of this box are shown. For the offset '00', tag 'CMPXZ.02', address 0234 at box 113 on page 40 with microfiche coordinates E 4, is the destination. For offset 'U1', tag 'CMPXZ.22', address 0235 at box 123 on page 43 with microfiche coordinates H 4, is the destination. And so on.

4.3.3 Subroutine Transfer - A box that calls a subroutine is illustrated in the following excerpt:

```

98  LOAD,30: 316          F/LOAD          <-- VV
*****
*          FSPAD-CD(6)+AR          *
*NEXT,          CALL(NZEROH,LOADNZERO)  *
***** -->
*****
442  339  107          L 9
*****
          VV
322  103  37          b 4

```

The 'to-info' for the subroutine called is given enclosed in a box. The 'to-info' for the return is shown below the subroutine. In the above excerpt, the subroutine 'NZEROH', address 442 at box 339 on page 107 with microfiche coordinates L 9, is called. Control is returned by the subroutine to 'LOADNZERO', address 322 at box 103 on page 37 with microfiche coordinates B 4.

4.4 The Microword

The bits of the microword are displayed to the right of the microinstruction box. Usually, the bits are given in several formatted lines. At the top of each page, the abbreviated field names for each line of bits are given. The first line of the heading gives the field names for the first line of bits; the second line of the heading, the field names for the second line of bits; and so on.

5. CONCLUSION

This file was produced by the Auto Documentation SYSTEM,
ADSYS. Further information on this system can be found in
the following documents:

1. Autodocumentation System (ADSYS), System Specification, No. 010777-01
2. Autodocumentation System (ADSYS), User's Guide, No. 010777-02

*****
*#OVERVIEW-IMPLEMENTATION FLAG ROUTINES *
*THE FOLLOWING ROUTINES ARE SHARED BY *
*FLOWS THAT HAVE NEED TO SET AND CLEAR *
*THE FLAGS. THEY ARE SUBROUTINES, I. E. *
*THE END IN A BUT(RETURN). THE SUBROUTINE *
*FLG GETS THE FLAGS AND PUTS THEM INTO *
*R(SRC). R(SRC) IS A TEMPORARY LOCATION *
*IN THE SCRATCH PADS USED BY THE BASE *
*MACHINE FOR OPREAND CALCULATION. THE *
*FLAG ROUTINES CAN NOT BE USED IF R(SRC) *
*IS TO BE USED FOR SOME THING ELSE. FLG *
*IS USED PRIOR TO USING FLGS OR FLGC. *
*FLGS IS USED TO SET A FLAG. THIS IS *
*DONE BY OR'ING THE MASK FOUND IN THE MD *
*WITH R(SRC) AND WRITTING THE RESULT INTO *
*THE FLAG REGISTER. THE RESULT IS ALSO *
*WRITTEN INTO R(SRC) SO THAT IT KEEPS AN *
*UP TO DATE COPY OF THE FLAGS IN CASE *
*THEY NEED TO BE MODIFIED AGAIN. THIS *
*MODIFICATION CAN THEN BE DONE WITHOUT *
*USING FLG *
*-----*
*SELECT, KPROC(FLAGS), *
*NEXT, *
* J/FLG02 *

.TOC "BEGINING OF 'SINGLE INSTRUCTION' (SIN) ROUTINE."
 ;; THIS ROUTINE CLEARS 'CONSOLE' IN R(CNTL) AND IN STATUS BOARD.
 ;; SETS 'SI' IN R(CNTL) AND SENDS CMND COMPLETE TO REMOTE CONSOLE.
 ;; IF BG IS ASSERTED IT GOES TO INTRO1 TO SERVICE THE PENDING REQUEST
 ;; AND RETURNS TO FETO1 TO EXECUTE AN INSTRUCTION. IF BG IS NOT ASSERTED
 ;; IT DIRECTLY GOES TO FETO1 TO EXECUTE AN INSTRUCTION. SINCE THE
 ;; CONSOLE SERVICE FLAG IS NOT CLEARED, CONSOLE IS REENTERED AFTER THE
 ;; EXECUTION OF ONE INSTRUCTION.

.TOC THIS ROUTINE INITIALIZES WCS ARRAY. THE PURPOSE IS TO WRITE EVERY " LOCATION IN THE WCS ARRAY SO THAT CORRECT PARITY IS GENERATED AND WRITTEN. LOCATION 0 GETS 0. LOCATION 1 GETS 172002. LOCATION 2 GETS 172003. LOCATION N GETS (172001+N). THE LAST LOCATION 5777 GETS 0. NO CONTAINS 172001 BEFORE ENTERING THIS ROUTINE.

↑.TOC " TEMPORARY REGISTERS ##FLPT##"
 .TOC " LABELLING CONVENTIONS IN ALL FLP MICROCODE:- ##FLPT##"

SECTIONS:
 THE LABEL ON THE FIRST WORD OF A SECTION IS ALSO THE NAME OF

BOX NO.	TAG:ADDRESS	SOURCE/DESTINATION OFST ADDR BOX PAGE	MICROFICHE COORD CARD	ADDR ALU BUS	BUSB SP	BUSA UBF	EXTENSION RIF COUT CLOCKS UPF
---------	-------------	--	--------------------------	-----------------	------------	-------------	-------------------------------------

THAT SECTION. BY CONVENTION IT HAS NO TRAILING NUMERICS.
 FOR EXAMPLE, ADDN2 IS THE LABEL OF THE FIRST WORD OF THE
 SECTION DOING ADD WITH A NON-ZERO DEST MODE, BUT CFC03 IS THE THIRD
 WORD OF THE SECTION CFCC. SUBROUTINES ARE ALSO SECTIONS.

WARM VS HOT:
 THE LAST CHARACTER OF A WARM SECTION NAME IS W.

 TOC "UCON - FLOATING POINT SPECIFIC ##FLPT##"

FPS<7:4>
 READ (TOGETHER WITH FLAGS AND FPS<3:0>) BY SELECTING
 KP HBMUX X PORT

EXAMPLE IN UMORDS:
 WRITTEN BY SELECT AND DATTB (MACRO IS FPS+D)
 EXAMPLE IN UMORD LDFPS2

FPS<3:0>
 READ WITH FPS<7:4> AS ABOVE

WRITTEN BY
 (A) MUX SELECT ROMEX.FPSSEL (MACRO FPSCC)
 (B) CLOCK ROMEX.USFCC (MACRO CLKFPSCC)
 EXAMPLE IN UMORDS LDFPS2 AND FET03F1

TOC - FLOATING POINT INSTRUCTION ABORTS ##FLPT##

THE LENGTH OF TIME REQUIRED TO COMPLETE EXECUTION OF THE ARITHMETIC INSTRUCTIONS AND THE REQUIREMENTS OF HONORING INTERRUPTS IN ORDER TO PREVENT INTERRUPT LATENCIES NECESSITATES THAT THE EXECUTION OF THESE INSTRUCTIONS BE INTERRUPTABLE. INSTRUCTIONS CAPABLE OF BEING INTERRUPTED AND RESTARTED ARE AS FOLLOWS:

ADDF/D, SUBF/D, MULF/D, DIVF/D, MODF/D, LDCT

TESTS ARE MADE AT APPROPRIATE POINTS IN THESE INSTRUCTIONS BY USING BUTR(BG) - CHECKING WHETHER A BUS GRANT IS PENDING. SHOULD INTERRUPT PENDING EXIST, THE PC OF THE INSTRUCTION IS BACKED UP TO REEXECUTE THE INSTRUCTION, THE ACCUMULATORS REFERENCED BY THE INSTRUCTION ARE RESTORED AND THE SPECIFIED SOURCE OPERAND REGISTER WOULD BE RESTORED IF IT WAS PUSHED OR POPPED. THE REFERENCED ACCUMULATOR IS SAVED BEFORE EXECUTION IN "A" SCRATCH PAD LOW, ALSO SAVED IS R(GRINC) INDICATING THE INCREMENT VALUE FOR THE GENERAL REGISTER. RESTORATION OCCURS IN THE RESTART FLOWS OF THE MICROCODE. ANOTHER POINT IN THE MICROCODE FLOWS WHERE AN INSTRUCTION ABORT CAN OCCUR IS IN THE OPERAND FETCH ROUTINE LABELLED AS FETCHSTOREFLT AS A CONSEQUENCE OF SHARING THE SAME I/O ROUTINE AS HFPP. IN THIS SITUATION, RESTORATION OF ACCUMULATORS AND GENERAL REGISTERS IS NOT NECESSARY AS NOTHING HAS BEEN ALTERED UP TO THIS POINT. ONLY THE PC IS BACKED UP AND THE T-BIT MASK IS SET UP BEFORE EXECUTING THE INTERRUPT ROUTINE.

.TOC - FLOATING POINT CLEAR, TEST ABSOLUTE AND NEGATE

CTAN - CLEAR TEST ABSOLUTE, AND NEGATE
DESCRIPTION OF INSTRUCTIONS:-
=====

CLR CLEAR THE WHOLE WORD.
NO INTERRUPTS WILL OCCUR.

TST SET THE CONDITION CODES.
FIUV INTERRUPT, IF ENABLED, FOR DM NON ZERO,
AFTER EXECUTION.
DOES NOT CLEAN UP A DIRTY ZERO.

ABS CLEAR SIGN BIT.
FIUV INTERRUPT, IF ENABLED, FOR DM NON ZERO,
AFTER EXECUTION.
CLEANS UP A DIRTY ZERO.

NEG INVERT THE SIGN BIT, UNLESS EXPONENT IS ZERO.
FIUV INTERRUPT, IF ENABLED, FOR DM NON ZERO,
AFTER EXECUTION.
CLEANS UP A DIRTY ZERO.

.TOC = MULTIPLICATION FRACTION SUBROUTINE ##FLPT##								
MFRAC SUBROUTINE								
MFRAC MULTIPLICATION FRACTION PROCESSING SUBROUTINE -								
GENERATES FRACTION RESULT FOR SINGLE AND DOUBLE PRECISION.								
PRODUCES 24 BITS PLUS GUARD FOR SINGLE								
PRODUCES 56 BITS PLUS GUARD FOR DOUBLE								
RESULTS ARE ALWAYS NORMALIZED AND CR.UFLO IS UPDATED IF REQUIRED								
NOTE: MFRAC CALLS UPON THE FOLLOWING SUBROUTINES:								
RTSHFSF - SHIFT RIGHT SOURCE REGISTERS								
RTSHFDST - SHIFT RIGHT DESTINATION REGISTERS								
PARAMETERS FOR ENTRY:								
RETURN ADDRESS MUST HAVE BEEN LOADED IN R(RETURN)								
MULTIPLIER IS IN FAC3(SF) - FAC0(SF)								
MULTIPLICAND IS IN FDST3 - FDST0								
R(ER) CONTAINS RESULTANT BIASED EXPONENT (RIGHT JUSTIFIED)								
TEMPORARIES USED ARE:								
R(MAND3) - R(MAND0) LOCATED IN R(T1A),R(T1B),R(T2A),R(T2B)								
UPON EXIT:								
FRACTION PRODUCT IS IN FAC3(SF) - FAC0(SF)								
FRACTION REQUIRES AT MOST ONE RIGHT SHIFT FOR NORMALIZATION								
GUARD BITS ARE IN GUARD REGISTER								
RETURN IS TO THE CALLER								

```

.TOC = MOD SPECIFIC INSTRUCTION PROPROCESSING ##FLPT##"							
:MOD SPECIFIC PROCESSING							
:INSTRUCTION SEPARATES INTEGER AND FRACTION INTO TWO FLOATING POINT FORMATTED NUMBERS							
:INSERTS INTEGER PORTION IN FAC(SF+1) AND FRACTION PORTION INTO FAC(SF) ACCUMULATORS							
:IF ODD ACCUMULATOR IS USED, ONLY THE FRACTION PORTION OF THE OPERATION IS KEPTED							
:INSTRUCTION FALLS INTO 5 CLASSES OF OPERATION AND ARE AS FOLLOWS							
CLASS 5 - PRODUCT PRODUCED AN UNDERFLOW							
FRACTION RESULTS IN FAC(SF) WITH THE EXPONENT OFF BY 400 OCTAL AND INTEGER PORTION IS EXACT ZERO IN FAC(SF+1)							
CLASS 4 - ABS(PROD) IS < 1 BUT NOT UNDERFLOWED							
FRACTION RESULTS IN FAC(SF) AND INTEGER IS = 0 IN FAC(SF+1)							
CLASS 3 - 1 < ABS(PROD) < 2**L WHERE L IS THE NUMBER OF BITS AVAILABLE FOR PRECISION AND ARE 24 FOR SINGLE PRECISION AND 56 BITS FOR DOUBLE PRECISION							
THIS IS THE ONLY CLASS WHERE THIS INSTRUCTION IS OF MOST VALUE. THE INTEGER RESULT IN FLOATING POINT FORMAT WILL BE IN FAC(SF+1) AND THE FRACTION NORMALIZED RESULT WILL BE IN FAC(SF)							
CLASS 2 - ABS(PROD) < 2**L BUT NOT OVERFLOW							
INTEGER RESULT WILL BE FAC(SF+1) AND FRACTION = 0 IN FAC(SF)							
CLASS 1 - ABS(PROD) PRODUCED AN OVERFLOW							
INTEGER RESULT OFF BY 400 OCTAL IN EXPONENT WILL BE IN FAC(SF+1) AND FRACTION = 0 IN FAC(SF)

---------	-------------	---------------------------------------	-----------------------	--------------	---------	----------	---------------------------

```

.TOC = FLOATING POINT DIVISION ##FLPT##
:WARM FLOATING POINT DIVISION ROUTINE
:ALGORITHM USED IN NON-RESTORING DIVIDE

```

TEMPORARY REGISTERS USED ARE AS FOLLOWS -

- DSORD - FAC0(DF)
- DSOR1 - R(T2B)
- DSOR2 - FAC2(DF)
- DSOR3 - R(T1B)
- RMDRD - FAC3(DF)
- RMDR1 - R(T2A)
- RMDR2 - FAC1(DF)
- RMDR3 - R(T1A)

FLOATING POINT ACCUMULATOR REFERRED TO AS FAC(DF) IN THIS ROUTINE ARE ACCUMULATORS FDST3-FDST0.

A FORCE TO ACCUMULATOR 7 IS PERFORMED SUCH THAT REFERENCE TO FDST ACCUMULATORS (RIF=7) AND R(T1B) AND R(T2B) (RIF=2) CAN BE MADE WITHOUT THE EXISTANCE OF CONFLICT IN MICRO FIELD CONTROL. THIS ALSO PERMITS THE DIVISION ROUTINE TO PROCEED QUICKER.

QUOTIENT IS DEVELOPED IN FAC(SF) THROUGH LEFT SHIFTS OF THE CARRY OUT FOLLOWING AN ARITHMETIC OPERATION.

26 BITS ARE ALWAYS DEVELOPED FOR SINGLE AND 58 BITS FOR DOUBLE

```

:TOC - ROUTINE FOR NORMALIZATION AND ROUNDING  ##FLPT##"
:ROUTINE USED FOR NORMALIZATION AND ROUNDING
:OF DATA IN FAC(SF).
:ROUTINE WILL PERFORM LEFT OR RIGHT SHIFTS REQUIRED
:TO NORMALIZE FRACTION.
:CHECKS ARE ALSO MADE IF FRACTION IS ZERO
:IF THIS CONDITION EXISTS, NUMBER IS DECLARED AN
:AN EXACT ZERO.
  
```

```

:EXPONENT IS MODIFIED APPROPRIATELY DEPENDENT ON
:SHIFT DIRECTION
:UFLO AND OFLO CONDITIONS ARE MONITORED AND WILL
:BE READJUSTED IF REQUIRED
  
```

```

:ROUTINE WILL FLOW INTO ROUNDING PROCEDURE WHERE
:CHECK ON FT BIT OF FPS IS PERFORMED AND ROUNDING
:WILL TAKE PLACE IF REQUIRED.
  
```

```

:REASSEMBLING OF FRACTION, EXPONENT, AND SIGN ALSO
:TAKES PLACE IN THIS ROUTINE
  
```

```

:EXIT FROM THIS ROUTINE WILL LEAD TO FINISH ROUTINE
:WHERE THE FOLLOWING WILL TAKE PLACE:
:SET CONDITION CODES FZ AND FN
:SAVE OFLO AND UFLO CONDITIONS
:RESTORE ALL GENERAL REGISTERS OF A SIDE
:EXIT WILL THEN BE TO OFLOTRAP CHECK,
:OR UFLOTRAP CHECK, OR TO FETO1 DEPENDING
:ON CONDITIONS OF NORMALIZATION
  
```

- PREQUISITES-
1. UPON ENTRY INTO THIS POINT, FAC(SF) CONTAINS THE FRACTION.
 2. R(ER) CONTAINS THE PRESENT EXPONENT
 3. CONDITION REGISTER CR1 CONTAINS SIGN
 4. CONDITION REGISTER CR2 CONTAINS UFLO OR OFLO CONDITIONS UP TO THIS POINT

TOC - TRAPS ##FLPT##
 I. FLOATING POINT EXCEPTIONS -
 =====

1. TRAP VECTOR 244

2. TYPES OF ERROR (BY ORDER OF FEC ASSIGNMENT)

2 OPCODE ERROR CLASS C

4 DIVIDE BY ZERO CLASS B

OVERFLOW CLASS A

U 12 UNDERFLOW CLASS A

UV 14 UNDEFINED VARIABLE CLASS A

16 MICROBREAK TRAP CLASS D

3. ACTIONS ON THE OCCURRENCE OF THE EXCEPTION CONDITION

CLASS A

=====

ON EXCEPTIONS DUE TO OVERFLOW AND UNDERFLOW, STORING OF AN EXACT ZERO WILL OCCUR IN THE SPECIFIED ACCUMULATOR (IR<7:6>). IF THE CORRESPONDING INTERRUPT IS DISABLED (FIV,FIU = 0) AS SET IN THE FLOATING POINT STATUS REGISTER (FPS). IN THE CASE OF AN UNDEFINED VARIABLE, IF THE FIUV BIT IS DISABLED, PASSAGE OF CONTROL IS RETURNED TO THE INSTRUCTION WHICH FETCHED THE UNDEFINED VARIABLE AND WILL BE USED AS AN OPERAND IN THAT INSTRUCTION.

ON THE OCCURANCE OF A CONVERSION ERROR IN THE STCT INSTRUCTION AN EXACT ZERO WILL BE STORED IN THE SPECIFIED DESTINATION (IR<5:0>) IF THE FIC BIT IS DISABLED (FIC=0).

IF THE CORRESPONDING INTERRUPTS ARE ENABLED (1) NO ACTION IS TAKEN IN THE ACCUMULATORS AS ABOVE AND THE CALCULATED ANSWERS WILL BE LEFT INTACT. THE ADDRESS OF THE OFFENDING INSTRUCTION IS STORED IN THE FLOATING EXCEPTION ADDRESS (FEA) AND THE CORRESPONDING EXCEPTION CODE IS STORED IN THE FLOATING EXCEPTION CODE REGISTER (FEC). A TEST IS THEN MADE ON THE FLOATING INTERRUPT DISABLE BIT OF THE FPS (FPS<14>).

IF FID IS DISABLED (1) PASSAGE OF CONTROL IS GIVEN TO THE NEXT INSTRUCTION. IF FID IS ENABLED (0), A TRAP TO VECTOR 244 OCCURS AND CONTROL PASSES TO THE TRAP FLOWS.

CLASS B,C,D

=====

FOR ALL EXCEPTIONS IN THESE CLASSES, UPDATE OF THE FEA AND FEC OCCURS. THE FEA IS LOADED WITH THE ADDRESS OF THE OFFENDING INSTRUCTION AND THE CORRESPONDING FEC CODE IS LOADED IN THE FLOATING EXCEPTION CODE REGISTER. A TEST IS MADE ON FID (INTERRUPT DISABLE). IF FID = 1 THEN THE INTERRUPT IS DISABLED AND CONTROL IS GIVEN TO THE NEXT INSTRUCTION. IF FID = 0 THEN A TRAP TO VECTOR 244 OCCURS.

ALL EXCEPTIONS WHICH CAUSE AN UPDATE OF THE FEA AND FEC TO OCCUR WILL ALSO SET THE FER BIT IN THE FPS (FPS<15>).

TOC " SUBROUTINE FETCH STORE FLOAT ##FLPT##"
 :; FETCHSTOREFLOAT SUBROUTINE

THIS SUBROUTINE FETCHES OR STORES A FLOATING POINT NUMBER:-
 32 BITS IF SINGLE 64 BITS IF DOUBLE.

ENTRY INTO THIS SUBROUTINE IS PREFIXED BY FETCHFLT, STOREFLT,
 :; FETCHINTLONG, OR STOREINTLONG TO SET APPROPRIATE CONDITIONS
 :; USED BY THIS SUBROUTINE THEREFORE THE USER SHOULD LOOK AT
 :; THESE ENTRY POINTS .

PARAMETERS-

ON ENTRY:

R(T2A)<01> = 0 FOR FETCH TO ENTER TRAPS IF NZERO
 IS OBTAINED FROM MEMORY
 1 WILL DEFER TRAP EXECUTION -
 RETURN TO CALLER IS PERFORMED
 USED BY TST, NEG, ABS, LDG/D, LDCPW
 D(C) = 0 TO INDICATE A DATI OPERATION FOLLOWING
 ADDRESS CALCULATION
 1 TO INDICATE A DATO OPERATION FOLLOWING
 ADDRESS CALCULATION

ON EXIT:

R(WDADR) = R(T1A) CONTAINS ADDRESS OF FIRST
 OPERAND FETCHED FROM MEMORY
 FDST3, FDST2, FDST1, FDST0 LEFT INTACT
 USING STORE SEQUENCE
 DATA LOADED INTO THESE REGISTER ON LOAD
 R(T2A)<15> = CONDITION REGISTER MODIFIED -
 0 FOR NOT IMMEDIATE ADDRESSING
 1 FOR IMMEDIATE (USED BY NEG AND ABS -DMO)
 R(T2A)<00> - 0 INDICATES THAT NO NEG ZERO WAS FETCHED
 WHEN RETURN FROM DEFER TRAP ENTRY
 1 INDICATES THAT A NEG ZERO WAS FETCHED
 BUT TRAP OPERATION HAS BEEN DEFERRED
 AND RETURN TO CALLER IS PERFORMED

THIS SUBROUTINE IS COMPLEX AND THUS REQUIRES CAREFUL READING OF THE
 FLOWS AND MICROCODE TO UNDERSTAND IT.

ITS MAIN FUNCTION IS TO FETCH OR STORE 32 OR 64 BITS AND TO
 UPDATE THE GENERAL REGISTERS ACCORDING TO THE ADDRESS MODE. IT ALSO
 DOES THE FOLLOWING:-

- TESTS FOR A MINUS-ZERO FETCH FROM MEMORY (SO THAT THE
 FIUV TRAP CAN OCCUR)
- TESTS FOR IMMEDIATE (REGISTER 7 AND MODES 1, 2, OR 4). IF
 IMMEDIATE THEN ONLY 16 BITS ARE FETCHED OR STORED.

THE CODE HAS BEEN WRITTEN SO THAT THE FETCHES AND STORES ARE
 INITIATED AS SOON AS POSSIBLE. THUS THE UPDATING OF THE
 GENERAL REGISTERS TAKES CYCLES AT THE END - THE CORRECT
 PLACE SINCE WE FAVOR HOT OVER WARM. HOT CAN BE PROCESSING

BOX NO.	TAG: ADDRESS	SOURCE/DESTINATION OFST ADDR BOX PAGE	MICROFICHE COORD CARD	ADDR ALU BUS	BUSB SP	BUSA UBF	EXTENSION RIF COUT CLOCKS UPF
...	THE FETCHED DATA WHILE THE BM IS UPDATING.						
...	GENERAL REGISTER UPDATING:- WE REQUIRE THE FOLLOWING:						
...	DM 0 1 2 3 4 5 6 7						
...	4 -4 -2 0 0						
...	8 2 -8 -2 0 0						
...	IMM 0 0 2 2 -2 -2 0 0						
...	TRANSFORMATION LEAVES R(GRINC) AT ZERO FOR THE MODES 0, 6 AND 7						
...	RETURN: - FETCH RETURNS BY A BUT(RETURN) IF NOT NZERO DATA OR R(T2A)<01> = 1 AND NZERO DATA ELSE WILL GO TO TRAPS AND EITHER RETURN OR TRAP STORE RETURNS BY BUT(RETURN)						
...	REGISTER MAP OF TEMPORARIES R(WADR2) = R(T1B) R(WADR) = R(T1A) R(GRINC) = R(T2B) R(T1A) USED FOR ADDR INCREMENTS R(T2A) = USED AS CONDITION REGISTER						
...	THIS SUBROUTINE IS USED BOTH BY HOT AND WARM FLOATING POINT TO PERFORM OPERAND FETCHES AND STORES TO MEMORY						
...	SPECIAL CONSIDERATION IS GIVEN TO DESTINATION MODES 1 OR 2 OR 4 AND DESTINATION REGISTER 7 (PC). IN THESE CASES, ONLY A ONE WORD FETCH OR STORE OPERATION IS PERFORMED AND THE INCREMENTING OR DECREMENTING OF REGISTER 7 REFLECTS THIS ONE WORD OPERATION REGARDLESS OF THE OPERAND MODE (FD OF FPS).						
...	WHEN USED BY HOT FLOATING POINT, A SYNCHRONIZATION OPERATION IS PERFORMED WITH THE HOT FPP VIA BUTR(SERVICE#D(C)#FPPACK). SYNCHRONIZATION IS ACCOMPLISHED BY BASE MACHINES ISSUANCE OF A MICROCODE GENERATED SIGNAL LABELLED AS "FLPGO". IN RESPONSE TO THIS SIGNAL, HOT FPP WILL ISSUE "FPPACK" PERMITTING BASE MACHINE TO BREAK OUT OF IT'S WAIT LOOP INDICATING THAT HOT FPP HAS ARRIVED HAS AT IT'S SYNC POINT. IF HOT FPP HAS ARRIVED AT IT'S SYNC POINT AHEAD OF BASE MACHINE, HOT FPP WILL SIT IN IT'S OWN WAIT LOOP MONITORING THE ISSUANCE OF "FLPGO" BY BASE MACHINE. FOLLOWING THE ISSUANCE OF "FLPGO" AND THE RESPONSE "FPPACK", BOTH HOT FPP AND BASE MACHINE WILL BE SYNCHRONIZED EITHER TO PASS DATA FROM HOT FPP TO BASE MACHINE OR TO FETCH OPERANDS FROM MEMORY TO THE HOT FPP UNIT UNDER BASE MACHINE'S CONTROL.						
...	IF A SERVICE CONDITION BECOMES PRESENT DURING THE MONITORING OF "FPPACK" BY THE BASE MACHINE OR IF BOTH CONDITIONS EXIST SIMULTANEOUSLY, THE SERVICE REQUEST WILL BE HONORED FIRST. AN ABORT OF THE PRESENT INSTRUCTION WILL BE PERFORMED ONLY ON OPERAND FETCHES. ON OPERAND STORES, THE INSTRUCTION WILL NOT BE ABORTED ON THE
