

This image displays a grid of 100 small diagnostic tables, arranged in 10 rows and 10 columns. Each table contains technical data, likely related to the MD-11 aircraft diagnostic system. The tables are organized into a structured grid, with each cell containing a small table of data. The data appears to be organized into columns and rows, possibly representing different diagnostic parameters or test results. The overall layout is a dense grid of technical information.

3.0 LOADING PROCEDURE

- 1. USE STANDARD PROCEDURE FOR LOADING BINARY TAPES.

4.0 STARTING PROCEDURE

- 1. THE PROGRAM IS SELF STARTING WITH A RESTART ADDRESS OF "200".

5.0 TELEPRINTER CONTROL SWITCHES

- 1. RETURN TO MONITOR (↑C)*

TYPING A '↑C' AT ANY TIME WILL ENABLE THE PROGRAM TO RETURN TO THE KEYBOARD MONITOR AND WAIT FOR A NEW TEST TO BE ENTERED.

- 2. CONTINUE (C)

IF A '↑C' HAS BEEN TYPED, RETURNING CONTROL TO THE KEYBOARD MONITOR, AND THE USER WISHES TO RESTART THE LAST TEST HE WAS RUNNING, HE CAN SIMPLY TYPE 'C' CARRIAGE RETURN AND CONTINUE WITHOUT HAVING TO RE-TYPE THE TEST NAME.

- 3. RESTART (↑R)*

TYPING A '↑R' WILL ENABLE THE CURRENT TEST TO BE RESTARTED. IF A '↑R' IS TYPED WHILE IN MONITOR MODE, THE ENTIRE TEST PROTOCOL IS RETYPED.

- 4. MODULE ADDRESS UPDATING (↑A)*

TYPING A '↑A' WHILE RUNNING ANY OF THE MODULE PROGRAMS WILL ENABLE A NEW MODULE ADDRESS TO BE ENTERED.

- 5. EXIT WAIT MODE (CR)

TYPING 'CR' WILL ENABLE THE PROGRAM TO CONTINUE FROM THE WAIT MODE.

* ALL CONTROL CHARACTERS ARE OBTAINED BY TYPING THE 'CTRL AND THE

GENERAL THOUGH, DATA SWITCHES '0-3' ARE USED IN THE EXERCISER TESTS TO ENABLE THE USER TO SELECT ANY PARTICULAR MODULE MODE. IN THESE CASES, THE PROGRAM ADDS A CODE OF '60' TO THE NUMBER READ FROM THE SWITCHES TO REPRESENT AN ASCII NUMBER.

7.0 SERIAL I/O INPUT OPTION

AS MENTIONED IN THE ABSTRACT, THE PDM70 MODULES CAN BE TESTED IN TWO MODES: PER MODULE BASES OR SYSTEM TEST. IF THE MODULE IS TESTED INDIVIDUALLY A DF11 IS PLUGGED DIRECTLY INTO THE CONTROL SLOT OF THE PDM70 MOTHER BOARD. THIS ENABLES THE PDP-11 TO ACT AS A COMBINATION CONTROL, SOURCE AND DESTINATION MODULE. IN THIS CASE, THE SYSTEM CLOCK MUST BE SET TO CORRESPOND TO THE CLOCK FREQUENCY OF THE DL11.

WHEN THE MODULE IS TESTED IN A SYSTEM ENVIRONMENT, THE BASIC SYSTEM CONFIGURATION CONSISTS OF A : CONTROL, CLOCK, 'KGM' (KNOWN GOOD SERIAL INPUT/OUTPUT MODULE) AND A 'MUT' (MODULE UNDER TEST). THE 'KGM' SHOULD BE VERIFIED AS SUCH BY TESTING IT WITH THE M7385I TEST (REFER TO SECTION 12.13). THE 'KGM' CAN BE INSERTED IN ANY MODULE SLOT AND THEN CABLED TO THE DL11 OUTPUT OF THE PDP-11. THIS MODULE IS TO BE SET UP WITH THE "D" JUMPER OUT AND THE "L" JUMPER IN SO THAT IT IS INITIALIZED ON POWER UP. THE SYSTEM CLOCK MUST BE SET EITHER EQUAL TO OR GREATER THAN THE INPUT DEVICES (E.G. DL11) BAUD RATE. PROGRAMS ARE THEN SENT FROM THE PDP-11 STORED IN THE CONTROL MODULE.

NOT OBVIOUS TO THE USER IS THE EXTRA ADDRESSING WHICH IS 'PADDED' IN WHEN THE SERIAL I/O MODULE IS USED. THIS PADDING SERVES TWO FUNCTIONS. FIRST, IT FACILITATES LOADING A LEGAL PROGRAM INTO THE CONTROL MODULE 'FIFO' (FIRST-IN, FIRST-OUT BUFFER). THIS MEANS STARTING EACH PROGRAM WITH AN 'STX' AND ENDING IT WITH AN 'ETX'. PADDING ISN'T NECESSARY WHEN THE MODULE IS TESTED ON A MODULE BASIS. ALSO, EXTRA ADDRESSING MUST BE ADDED TO ADDRESS THE 'KGM'. THE PROGRAM HAS TO BE CERTAIN THAT THE 'KGM' NEVER LOSES CONTROL OF A PROGRAM SINCE THIS IS THE ONLY INTERFACE TO THE PDP-11. BY SETTING DATA SWITCH 12, THE USER CAN SINGLE STEP ANY MODULE TEST PROGRAM AND EXAMINE WHAT THIS PADDED PROGRAM LOOKS LIKE.

WHEN THE PROGRAM IS STARTED, IT ASKS IF A SERIAL I/O IS BEING USED. IF IT IS, TYPE 'YES' OR 'Y' CARRIAGE RETURN. IF IT'S NOT, TYPE 'NO', 'N' OR SIMPLY 'CR'. THIS PARAMETER CAN BE CHANGED AT ANY TIME BY TYPING A 'R' WHILE IN THE MONITOR MODE.

IF THE 'KGM' I/O IS BEING USED, THE PROGRAM WILL THEN ASK FOR THE ADDRESS OF THIS MODULE. THIS CAN BE ANY ADDRESS EXCEPT '17' WHICH FIT THE GUIDE LINES DESCRIBED IN SECTION 9.0 (MODULE ADDRESSING).

8.0 DL11 ADDRESS SETUP PROCEDURE

AFTER SETTING UP THE SERIAL I/O OPTION, THE PROGRAM PRINTS "DL11
ADRS. VEC.?" THIS ENABLES THE USER TO SELECT HIS OWN DL11
DEVICE AND VECTOR ADDRESSES. BY SIMPLY TYPING 'CR', THE DEFAULT
RCSR ADDRESS OF '175610' AND VECTOR ADDRESS OF '300' ARE USED.
IF THESE ADDRESSES ARE TO BE MODIFIED, TYPE THE RCSR ADDRESS AND
THE VECTOR ADDRESS SEPERATED BY A COMMA.

THE USER SHOULD NOTE THAT BOTH THE DL11 AND THE SERIAL I/O MODULE
ARE NORMALLY SETUP FOR 7 BIT EVEN PARITY.

9.0 MODULE ADDRESSING

WHEN A MODULE PROGRAM IS SELECTED, THE PROGRAM REQUESTS THE
MODULE ADDRESS BEFORE THE TEST IS RUN. THIS ADDRESS CAN BE ANY
NUMBER FROM '0-17'*. THE ONLY RESTRICTION IS THAT IF THE SERIAL
INPUT OPTION IS BEING USED, THESE TWO MODULE ADDRESSES MUST NOT
CONFLICT. IF THEY DO, A NEW MODULE ADDRESS WILL BE REQUESTED.
TYPING A '1A' AT ANY POINT WHILE A MODULE PROGRAM IS RUNNING WILL
CAUSE THE PROGRAM TO REQUEST A NEW MODULE ADDRESS.

10.0 MODULE ERRORS

WHEN A MODULE ERROR IS DETECTED, THE FAILING SUBTEST NUMBER, M.A.
(MEMORY ADDRESS) WHERE ERROR OCCURRED AND A DESCRIPTIVE MESSAGE
OF THE FAILURE ARE TYPED OUT. THE PROGRAM THEN ENTERS THE 'WAIT
MODE' UNTIL A 'CR' IS TYPED ENABLING THE PROGRAM TO CONTINUE.

WHEN AN ERROR IS DETECTED, THE 'M.A.' SHOULD BE USED TO LOCATE
THE FAILING SUBTEST IN THE LISTING. HERE THE USER WILL FIND A
WRITTEN DISCRPTION OF WHAT THE SUBTEST WAS ATTEMPTING TO DO.
THE TEST CAN THEN BE ANALYZED AND THEN LOOPED IF NECESSARY UNTIL
THE FAILURE IS FIXED.

WHEN A MODULE IS FAILING THE FIRST SUBTEST, IT IS A GOOD IDEA TO
RE-CHECK THE MODULE TO MAKE SURE THAT IT WAS SET UP CORRECTLY
WITH THE CORRECT SWITCH & JUMPER SETTINGS. THE IDEAL SITUATION,
IF POSSIBLE, WOULD BE TO FIRST TEST A KNOWN GOOD MODULE.

11.0 SCOPE LOOPING

* THE MODULE ADDRESS IS INTERPRETTED AS AN OCTAL VALUE.

430

EACH MODULE ADDRESS TEST PROGRAM IS COMPRISED OF ANY NUMBER OF INDIVIDUAL SUBTESTS. WHEN A MODULE PROGRAM IS RUN THESE SUBTESTS ARE RUN AS A WHOLE, OTHERWISE, WHEN ONE SUBTEST FINISHES THE NEXT SUBTEST IS EXECUTED.

THERE ARE TWO WAYS OF RUNNING ANY SELECTED SUBTEST; THE USER MAY RUN THE 'SUBX' ROUTINE (REFER TO SECTION 13.1) OR RUN THROUGH THE ENTIRE MODULE PROGRAM UNTIL THE SELECTED SUBTEST IS REACHED. IF THE LATTER METHOD IS USED, LOAD THE NUMBER OF THE SUBTEST TO BE LOOPED IN THE CONSOLE SWITCH REGISTER AND START THE MODULE PROGRAM. THE PROGRAM WILL TYPE 'SCOPE BREAK AT XXX' WHEN THE SUBTEST IS REACHED. NOW SET CONSOLE SWITCH '14' TO LOOP ON THE CURRENT SUBTEST AND THEN TYPE 'CR'. THE PROGRAM WILL THEN RUN THE SELECTED SUBTEST UNTIL SWITCH '14' IS RESET TO '0' ENABLING THE PROGRAM TO CONTINUE.

12.0 MODULE TEST PROGRAMS

THE FOLLOWING IS A LIST AND DESCRIPTION OF ALL THE MODULE PROGRAMS. IT SHOULD BE NOTED THAT IN THE PROGRAM TEST PROTOCOL EACH MODULE PROGRAM ENDS WITH A LETTER. THIS LETTER INDICATES THE TYPE OF TEST; A = ADDRESSING, C = CALIBRATION*, E = EXERCISER, G = GAIN*, I = INTERFACE, R = REPEATIBILITY*.

THE MODULE ADDRESS TEST SHOULD BE RUN AND PROVED FULLY OPERATIONAL BEFORE RUNNING ANY OF THE OTHER TESTS. THIS TEST VERIFIES THAT THE MODULE CAN BE ADDRESSED AND THAT IT WORKS 'FUNCTIONALLY' IN ALL ITS INTENDED DATA MODES.

THE USER SHOULD REFER TO THE ENGINEERING SPECIFICATIONS TO VERIFY THAT THE SWITCHES AND JUMPERS ARE SET UP CORRECTLY BEFORE RUNNING ANY TESTS.

12.1. M7380A, CONTROL MODULE TEST

THIS PROGRAM TAKES THE CONTROL MODULE THRU THE INITIALIZATION, ADDRESS AND DATA MODES RESPECTIVELY. INITIALLY, TWO PROGRAMS ARE STORED IN THE CONTROL MODULE 'FIFO'. THE SECOND PROGRAM IS HEADED WITH A 'DC4' SO IT WILL NOT BE RECIRCULATED. WITH THE FIRST PROGRAM IN THE DATA MODE, A '500' WORD RANDOM DATA BUFFER IS CIRCULATED THRU THE CONTROL MODULE. AFTER VERIFYING THE DATA, AN 'EOT' IS ISSUED. THIS ENABLES THE SECOND PROGRAM TO BE CALLED OUT. THE DATA MODE IS AGAIN CHECKED AND ANOTHER 'EOT' IS ISSUED ENABLING THE FIRST PROGRAM IS BE RE-CALLED. ONCE VERIFIED, ANOTHER 'EOT' IS ISSUED. A CHECK IS THEN MADE THAT THE SECOND PROGRAM, HEADED WITH A 'DC4', NO LONGER EXISTS. THE 'FIFO' IS THEN REPROGRAMMED.

487

THIS PROGRAM CONSISTS OF '64' CHARACTERS ENABLING THE CONTROL 'FIFO' TO BE COMPLETELY FILLED. THE PROGRAM CONSISTS OF ONE SOURCE AND ONE DESTINATION ADDRESS. THE REMAINING 55 LOCATIONS ARE FILLED WITH RANDOM LITERAL CHARACTERS. THE PROGRAM IS THEN CALLED OUT AND VERIFIED.

THE LAST TEST CHECKS THE DELAY TIMES OF THE 'SYN' CHARACTER. THIS TEST REQUIRES A '110 BAUD' CONSOLE DEVICE SUCH AS A 'TTY' IN ORDER TO RUN. THE CRYSTAL CLOCK IN THE TTY IS USED TO TIME THE 'SYN' DELAYS. IF THE CONSOLE DEVICE IS NOT AVAILABLE, THIS TEST WILL NOT PASS. ALL THE DELAYS, 1-9, ARE TESTED IN ORDER. THE TESTS MAKES TWO CHECKS AT EACH DELAY. FIRST, THAT THE DELAY ISN'T TOO SHORT AND SECOND, THAT THE DELAY ISN'T TOO LONG.

THIS COMPLETES THE CONTROL MODULE TESTS. HOWEVER, IF DATA SW10 IS SET THE PROGRAM WILL ALSO TEST THE M7387 HARDWARE READIN MODULE (1). OTHERWISE, THE MESSAGE 'TEST COMPLETE' IS PRINTED AND THE PROGRAM WILL CONTINUE TO CYCLE THRU THE CONTROL TEST UNTIL STOPPED.

1. M7387, HARDWARE READ-IN MODULE

AS MENTIONED ABOVE, THIS TEST IS RUN IN CONJUNCTION WITH THE M7380A TEST. THE TEST REQUIRES THE USER TO INSERT THE M7387 MODULE WITH A DIAGNOSTIC 'PROM' PROGRAM INTO SLOT 'P5' OF THE MOTHER BOARD.

AFTER THE MODULE HAS BEEN INSERTED, THE PDM70 SHOULD BE POWERED UP. THIS WILL ENABLE THE PROM PROGRAM TO BE READ OUT, STORED IN THE CONTROL MODULES FIFO, AND THEN EXECUTED.

THE PROM PROGRAM IS SETUP TO ADDRESS THE SERIAL I/O DESTINATION MODULE AND THEN SEND LITERAL DATA. AFTER VERIFYING THE DATA, THE MESSAGE "PROM OK" IS TYPED. IF THIS MESSAGE IS NOT TYPED IMMEDIATELY AFTER POWER UP, NO DATA WAS EVER RECEIVED, THUS INDICATING AN ERROR CONDITION.

12.2. M7381A, BCD INPUT MODULE ADDRESS TEST

THIS TEST ADDRESSES THE 'BCD' MODULE IN ALL FOUR(4) DATA MODES VERIFYING INTERNAL AND EXTERNAL DEVICE FLAG OPERATION. IT IS SUGGESTED THAT THE M7381E TEST SHOULD BE RUN IF ANY DATA ERRORS ARE REPORTED. HERE THE USER CAN READILY IDENTIFY THE DATA ERROR BY THE TYPEOUT. THE CUSTOMER SWITCHES (WHICH SELECT HOW MANY DIGITS ARE READ) ARE TESTED BY THE PROGRAM REQUESTING UNIQUE SWITCH SETTINGS. SETTING DATA 'SW10' WILL INHIBIT THE MANUAL INTERVENTION TESTS. THIS MODULE HAS TO BE TESTED WITH THE 'L' JUMPER OUT.

542

12.3. M7381E, BCD INPUT MODULE EXERCISER TEST

THIS PROGRAM CONTINUOUSLY LOOPS ADDRESSING THE BCD MODULE AND PRINTING THE RECEIVED DATA. DATA SWITCHES '0 & 1' ARE USED TO SELECT ANY ONE OF THE FOUR (4) 'BCD' DATA MODES. THE SWITCH SETTINGS MAY BE SET AND RESET ANY TIME. DATA SW13 CAN ALSO BE SET TO INHIBIT THE DATA PRINTOUT.

12.4. M7382A, BCD OUTPUT MODULE ADDRESSING TEST

THIS TEST IS COMPRISED OF A SERIES OF SUBTESTS WHICH OUTPUT KNOWN DATA TO THE 'BCD' OUTPUT MODULE. ONCE THE DATA IS TRANSMITTED, THE USER IS NOTIFIED OF THE TRANSMITTED PATTERN. THE PROGRAM THEN ENTERS THE 'WAIT' MODE ENABLING THE USER TO VERIFY THE DATA.

THE LAST SUBTEST REQUESTS FOR THE USER TO SCOPE FOR THE SIGNAL 'OUTPUT DONE H & L'. THE PROGRAM WILL INDEFINITELY HANG IN THIS SUBTEST UNTIL EITHER 'R' IS TYPED TO RESTART THE M7382A TEST OR 'C' IS TYPED TO RETURN TO THE MONITOR.

12.5. BCD I/O TEST

THIS IS AN EXERCISE TEST UTILIZING BOTH THE BCD 'INPUT & OUTPUT' MODULES. AN INCREMENTING BCD COUNT IS SENT TO THE OUTPUT MODULE AND WRAPPED AROUND VIA A SPECIAL CABLE TO THE INPUT MODULE. THE INPUT MODULE IS THEN ADDRESSED, ENABLING THE DATA TO BE READ. THE RECEIVED DATA IS VERIFIED AGAINST THE TRANSMITTED DATA. THIS TEST VERIFIES THAT ALL DATA LINES ARE GOOD AND THAT NO TWO LINES ARE SHORTED TOGETHER.

THE INPUT MODULE CAN BE SET UP TO USE EITHER INTERNAL OR EXTERNAL SYNC. IF EXTERNAL SYNC IS SELECTED, THE SYNC SIGNAL IS SUPPLIED FROM THE BCD OUTPUT MODULE VIA THE CABLE.

12.6. M7383A, A/D MODULE ADDRESS TEST

THIS TEST ADDRESSES THE A/D MODULE AND VERIFIES THE CORRECT DATA FORMAT IS RECEIVED FROM THE MODULE. THE EXTERNAL SYNC FUNCTION IS ALSO TESTED. IT SHOULD BE NOTED THAT THIS TEST MAKES NO ATTEMPT TO VERIFY WHEATHER OR NOT THE A/D IS CONVERTING THE CORRECT VALUES.

12.7. M7383C, A/D CALIBRATION ROUTINE

THIS TEST RUNS IN A CONTINUOUS LOOP ADDRESSING THE A/D MODULE AND

0000
0000
0000

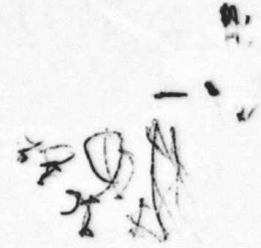

PRINTING THE CONVERSION VALUE. AFTER ACCEPTING THE MODULE
ADDRESS, THE PROGRAM TYPES "REMOTE DST.". THIS IS AN OPTION

'0 & 1' AND CAN BE SET AND RESET AT ANYTIME. SETTING DATA SWITCH '0' WILL SELECT CHANNEL '0'. SETTING DATA SWITCH '1' WILL SELECT CHANNEL 1 AND SETTING BOTH '0 & 1' WILL SELECT BOTH CHANNELS.

TYPING A '1R' WILL ENABLE FOR A NEW SET OF DAC VALUES TO BE ACCEPTED.

12.12. M7385A, SERIAL I/O ADDRESS TEST

THIS TEST CHECKS BOTH THE SOURCE AND DESTINATION PARTS OF THE SERIAL I/O. BY USING A SPECIAL WRAPPING CABLE, THE DESTINATION OUTPUTS TO THE SOURCE INPUT.

BEFORE TESTING, ALL 'ACTIVE' RECEIVER JUMPERS MUST BE INSERTED AND THE 'D' & 'L' 'MR' JUMPERS MUST BE OUT.

THIS TEST CHECKS ONLY THE 'EIA' OUTPUT OF THE MODULE. REFER TO THE M7385T TEST (12.14) FOR TESTING THE "TTY" OUTPUT LOGIC.

IT SHOULD BE NOTED THAT WHEN THIS TEST IS RUN USING THE SERIAL I/O INPUT OPTION, THAT ONLY SUBTESTS "1, 5 & 10" ARE EXECUTED. THIS MEANS THE TESTING ISN'T TESTED AS IT IS WHEN USING THE DF11 INTERFACE.

IT SHOULD ALSO BE NOTED THAT WHEN THE SERIAL INPUT OPTION IS USED, SUBTEST 5 RETURNS ONE HUNDRED AND TWENTY EIGHT CHARACTERS (128) TO THE DL11 RECEIVER INSTEAD OF "64". THE FIRST "64" CHARACTERS OF THE BUFFER ARE RETURNED DIRECTLY FROM THE DESTINATION OF THE SERIAL INPUT MODULE. THE SECOND "64" CHARACTERS ARE THE CHARACTERS THAT WERE ACTUALLY BUFFERED IN THE "FIFO" OF THE MODULE UNDER TEST.

12.13. M7385I, SERIAL I/O INTERFACE MODULE TEST

THIS TEST IS INTENDED TO VERIFY THAT THE SERIAL I/O MODULE USED AS THE PDP-11 INTERFACE IS FUNCTIONING CORRECTLY. THIS IS DONE BY REMOVING THE M7380 CONTROL MODULE (THUS ELIMINATING ONE UNKNOWN) AND JUMPERING THE 'T & R' BUSES (F1D1 TO F1V2) TOGETHER. THE MODULE MUST HAVE THE 'D' JUMPER OUT AND THE 'L' JUMPER IN SO THAT IT IS INITIALIZED ON POWER UP. A PROGRAM IS THEN SENT TO ADDRESS THE DESTINATION PORTION OF THE MODULE. WHEN THIS TEST HAS BEEN RUN SUCCESSFULLY, THE CONTROL MODULE CAN BE RE-INSERTED AND VERIFIED BY RUNNING THE M7380A TEST (12.1).D

12.14. M7385T, SERIAL I/O TTL TEST

THIS TEST VERIFIES THAT THE TTL I/O SECTION OF THE SERIAL I/O

G02

CONSOLE PRINTER ONCE THE TEST IS SELECTED. IF THE CONSOLE PRINTER IS USED, THE PROGRAM SHOULD BE HALTED BEFORE DISCONNECTING THE PRINTER AND THEN RE-STARTED AT THE 'TTLTST'* ADDRESS. ALL CHARACTERS THEN TRANSMITTED WILL BE RECEIVED BY THE SERIAL SOURCE AND WRAPPED AROUND (BY THE CONTROL MODULE OR COMPUTER IF THE DF11 IS USED) TO THE DESTINATION. HERE THE CHARACTER WILL BE TRANSMITTED BACK TO THE TELEPRINTER AND PRINTED. EFFECTIVELY AS FOR AS THE USER IS CONCERNED, THIS TEST ACTS LIKE A KEYBOARD ECHO TEST.

12.15. M7386A, KEYBOARD/DISPLAY MODULE ADDRESS TEST

IN ORDER TO RUN THIS TEST, THE "W1" JUMPER MUST BE OUT. THE FIRST SUBTEST ADDRESSES THE KEYBOARD AND CHECKS FOR THE FORCED RETURN OF THE "EOT".

THE SECOND SUBTEST RUNS IN A CONTINUOUS LOOP ADDRESSING BOTH THE KEYBOARD & DISPLAY. WHEN THE USER STRIKES "KEY REQUEST", THE KEYBOARD BECOMES BUS MASTER. ALL DATA THEN TRANSMITTED FROM THE KEYBOARD IS SENT TO THE DISPLAY (IF AVAILABLE). THIS DATA IS ALSO RECEIVED BY THE PDP-11 AND PRINTED.

IF "EOT" IS STRUCK, THE KEYBOARD RELEASES THE BUS AND THE PROGRAM IS AGAIN LOOPED UNTIL THE NEXT "KEY REQUEST".

IF "STX" IS STRUCK AND THE SERIAL INPUT OPTION IS BEING USED, THE MESSAGE "RE-INITIALIZE THE PDM70" IS PRINTED. THE PROGRAM THEN ENTERS THE "WAIT MODE" AND UPON RECEIVING A "CR", WILL BEGIN RE-CYCLING THE SUBTEST.

IF "ETX" IS STRUCK, THIS SUBTEST IS EXITED, AND THE NEXT SUBTEST IS ENTERED. UPON ENTERING THE NEXT SUBTEST, THE MESSAGE "ENTERING THE DISPLAY TEST, RE-INITIALIZE THE PDM70" IS PRINTED. THE PROGRAM THEN ENTERS THE "WAIT MODE" AND WAITS FOR "CR". UPON RECEIPT OF THE "CR" THE SUBTEST STARTS DISPLAYING THE ENTIRE CHARACTER SET, ON CHARACTER AT A TIME ACROSS THE ENTIRE SCREEN. AFTER EACH CHARACTER IS DISPLAYED, A SOFTWARE DELAY IS EXECUTED. THIS DELAY ENABLES THE USER TO VIEW THE LINE BEFORE THE NEXT CHARACTER LINE IS DISPLAYED. AFTER THE ENTIRE CHARACTER SET HAS BEEN DISPLAYED, THE TEST ENTIRE TEST PROGRAM IS RESTARTED.

12.16. M7387A, PROM HARDWARE READ-IN MODULE

THIS PROGRAM MAY BE SELECTED AS A SEPERATE MODULE TEST, ALTHOUGH IT IS RUN AS PART OF THE M7380 CONTROL MODULE TEST. REFER TO PART 1 OF SECTION 12.1 FOR A COMPLETE TEST DESCRIPTION.

12.17. M7388A, CHARACTER I/O MODULE ADDRESS (IN-HOUSE) TEST

THIS TEST REQUIRES A SPECIAL WRAP-AROUND MODULE (AVAILABLE ONLY IN HOUSE) TO RUN THIS TEST. FOR FIELD TESTING THIS MODULE REFER TO THE M7388F (SECTION 12.18).

THE TEST USES THE SAME TEST PROGRAM AS THE SERIAL I/O MODULE (REFER TO SECTION 12.12). TO RUN THIS TEST, JUMPERS 'SO & SI' MUST BE IN AND THE 'D' & 'L' JUMPERS MUST BE OUT.

12.18 M7388F, CHARACTER I/O MODULE ADDRESS (FIELD) TEST.

THIS PROGRAM IS DESIGNED TO COMMUNICATE WITH THE FIELD SERVICE TESTER. THE FIRST SUBTEST ADDRESS THE MODULE IN MODE '0' AND CHECKS FOR THE FORCED 'EOT'. THE NEXT SUBTEST ADDRESS THE MODULE IN MODE '1' AND CHECKS THAT NO 'EOT' IS RETURNED. A REQUEST IS THEN MADE FOR THE USER TO INPUT DATA (VIA THE TESTER) TO THE MODULE. AS EACH CHARACTER IS RECEIVED, IT IS ECHOED TO PRINTER. THE PROGRAM WILL HANG IN THIS SUBTEST UNTIL 'EOT' IS RECEIVED, ENABLING IT TO ENTER THE NEXT SUBTEST. THE NEXT SUBTEST IS A 'FIFO' STORAGE TEST. IT REQUESTS FOR THE USER TO INPUT DATA (UP TO 63 CHARACTERS) AND AN 'EOT'. AFTER ALL THE DATA HAS BEEN TRANSMITTED, TYPE 'CR'; THE MODULE (SOURCE) IS THEN ADDRESSED IN MODE '0' ENABLING THE 'FIFO' DATA TO BE READ AND PRINTED.

THE NEXT SUBTEST LOADS "16", "4" CHARACTER DATA PATTERNS (A TOTAL OF 64 CHAR.'S) INTO THE DESTINATION 'FIFO'. THE USER IS THEN REQUESTED TO STROKE OUT THESE "64" CHARACTERS AND VERIFY THEM. THE "4" CHARACTERS PATTERN IS: ALL 1'S, ALLO'S, ALTERNATE "1'S & 0'S" AND REVERSED ALTERNATE "1'S & 0'S".

THE LAST SUBTEST ADDRESSES THE MODULE USING ALL THE WRONG MODULE ADDRESSES AND CHECKS THAT THE SOURCE ISN'T ENABLED. THIS SUBTEST IS NOT EXECUTED WHEN USING THE SERIAL INPUT OPTION.

12.19 M7377A, REMOTE SERIAL I/O TEST

THIS PROGRAM TESTS THE M7377 MODULE USING THE PDP-11 VIA THE DL-11 AS THE DESTINATION INPUT AND SOURCE OUTPUT.

THE FIRST SUBTEST ADDRESSES THE SOURCE PORTION OF THE MODULE AND CHECKS FOR FORCED RETURN OF EOT.

THE SECOND SUBTEST TRANSMITS A RANDOM BUFFER AND CHECKS THAT IT IS RETURNED CORRECTLY.

IN THE NEXT SUBTEST A 2ND RANDOM BUFFER IS TRANSMITTED AND THE VARIABLE TERMINATOR OPTION IS CHECKED.

K02

PDM70 DIAGNOSTIC TEST MACY11 27(732) 10-SEP-76 11:50 PAGE 23
DZPMAB.P11

832
833

NEXT, THE SOURCE IS THEN ADDRESSED USING THE WRONG MODULE
ADDRESSES AND CHECKED TO MAKE SURE IT DOESN'T BECOME ENABLED.

ETX AND STX ARE THEN USED TO VERIFY THAT ETX WILL CLEAR THE SOURCE AND STX WILL CLEAR THE DESTINATION.

A MANUAL INTERVENTION SUBTEST THEN REQUESTS THAT THE OPERATOR RESET THE MODULE ADDRESS TO '17'. DATA IS TRANSMITTED AND THE RECEIVED DATA IS VERIFIED.

THE LAST SUBTEST CHECKS THE TIMEOUT AND REMOTE TIMEOUT ABILITY OF THE MODULE. A NON-EXISTENT SOURCE IS ADDRESSED AND THE MODULE IS CHECKED TO SEE IF IT TIME-OUT CORRECTLY.

12.20 M7378A, FOUNDATION MODULE TEST

THIS TEST SETS THE SERIAL I/O UP AS A SOURCE AND THE FOUNDATION MODULE AS A DESTINATION. A RANDOM BUFFER IS TRANSMITTED TO THE FOUNDATION MODULE VIA THE SERIAL I/O. THEN THE FOUNDATION MODULE IS ADDRESSED AS THE SOURCE AND THE SERIAL I/O IS ADDRESSED AS THE DESTINATION. THE DATA SHOULD BE RETURNED VIA THE "WRAP-AROUND" CABLE FROM THE FOUNDATION MODULE TO THE SERIAL I/O.

IT SHOULD BE NOTED THAT THE PDM-70 MUST BE LOADED WITH THE FOLLOWING PROGRAM TO RUN THIS TEST:

STX, DC1, 8, SOH, 1, DC3, ETX

THE NEXT SUBTESTS VERIFY THAT ADDRESS '17' WILL RETURN DATA CORRECTLY, THAT THE WRONG ADDRESSES WILL NOT RETURN DATA, AND THAT THE CUSTOMER DEFINED MODE FLIP FLOP WORKS CORRECTLY.

13.0 USER AID ROUTINES

13.1. SUBX

THIS ROUTINE ENABLES THE USER TO RUN ANY SELECTED MODULE ADDRESS SUBTEST WITHOUT RUNNING THE ENTIRE PROGRAM. WHEN 'SUBX' IS SELECTED IT ASKS FOR THE 'MEMORY ADDRESS' OF THE SUBTEST TO BE EXECUTED. THIS IS TO BE THE ADDRESS OF THE 'SCOPE' ARGUMENT BEGINNING THAT SUBTEST. IF A 'SUBX' ADDRESS HAD PREVIOUSLY BEEN SET UP, THE USER CAN SIMPLY TYPE 'CR' AND THE PREVIOUSLY SELECTED TEST WILL BE RE-ENTERED.

13.2. RECBUF

THIS ROUTINE ENABLES THE USER TO EXAMINE THE CONTENTS OF THE DL11'S RECEIVER BUFFER. WHEN SELECTED, THIS ROUTINE PRINTS THE

IT SHOULD BE NOTED THAT ALL DATA RECEIVED FROM THE PDM70 IS STORED IN THIS BUFFER.

13.3. TRNBUF

THIS ROUTINE ENABLES THE USER TO EXAMINE THE DATA TRANSMITTED VIA THE DL11 TO THE PDM70. THE 'RECBUF' & 'TRNBUF' ROUTINES ARE ESPECIALLY USEFUL IN TRACKING DOWN A DATA FAILURE. BY COMPARING THE TWO BUFFERS, THE USER CAN SEE EXACTLY WHERE THE FAILURE OCCURRED AND PICK OUT ANY DESIRED DATA PATTERNS.

13.4. SEND

THIS ROUTINE ENABLES THE USER TO SEND HIS OWN PROGRAM TO THE PDM70. WHEN 'SEND' IS SELECTED AN ASTERISK IS PRINTED TO INDICATE THAT THE ROUTINE IS READY TO ACCEPT INPUT. AS EACH CHARACTER IS RECEIVED IT IS ECHOED BACK TO THE TELEPRINTER AND TRANSMITTED TO THE PDM70.

THIS ROUTINE IS RUN WITH THE DL11 RECEIVER ENABLED. THIS MEANS THAT THE USER CAN USE THE 'RECBUF' ROUTINE TO EXAMINE FOR ANY DATA RETURNED BY HIS PROGRAM.

13.5. RUN

THIS ROUTINE IS USED IN CONJUNCTION WITH THE SEND ROUTINE. WHEN 'RUN' IS SELECTED, IT WILL RE-TRANSMIT THE USER'S 'SEND' PROGRAM. IF THE SERIAL INPUT OPTION IS BEING USED, THE 'SEND' PROGRAM IS TRANSMITTED AND THEN THE PROGRAM ENTERS THE 'WAIT' MODE. IF THE SERIAL INPUT OPTION IS NOT BEING USED, THE SEND PROGRAM IS CONTINUOUSLY TRANSMITTED. IN THIS CASE, THE CONSOLE SWITCHES CAN BE USED TO INCORPORATE A DELAY TIME BEFORE THE PROGRAM IS RE-TRANSMITTED. NO PROGRAM DELAY IS ISSUED WITH ALL DATA SWITCHES DOWN. ALL DATA SWITCHES UP (EXCEPT 11 & 12)* REPRESENT A MAXIMUM PROGRAM DELAY. THE USERS SEND PROGRAM CAN BE EXAMINED AT ANYTIME BY USING THE 'TRNBUF' ROUTINE.

'CONTROL C' WHICH IS NORMALLY USED TO RETURN TO THE MONITOR IS ECHOED AND TRANSMITTED AS AN 'ETX'. SO IN THE SEND ROUTINE, 'CONTROL E' IS USED TO ESCAPE AND RETURN TO THE MONITOR.

* REFER TO CONSOLE SWITCH SETTINGS (SECTION 6.) FOR SPECIFIC SWITCH

:SBTTL M7384 D/A EXERCISER TEST  
:THIS TEST ENABLES ANY VALUE THE USER TYPES IN ON THE TELEPRINTER TO BE  
:OUTPUTTED FROM THE D/A. WHEN SELECTED, THE TEST REQUESTS FOR TWO THREE DIGIT VALUES  
:(SEPARATED VIA COMMA'S) TO BE TYPED IN. THE FIRST VALUE IS THE ONLY ONE  
:OUTPUTTED WHEN RUNNING ONLY ONE CHANNEL. IF BOTH CHANNELS ARE SELECTED  
:THE FIRST VALUE WILL BE OUTPUTTED ON CHANNEL '0' (X DAC) AND THE  
:SECOND VALUE WILL BE OUTPUTTED ON CHANNEL '1' (Y DAC). THE CHANNELS  
:ARE SELECTED BY DATA SWITCHES '0 & 1' AND MAY BE SET AND RESET  
:AT ANYTIME. SETTING DATA SWITCH '0' WILL SELECT CHANNEL '0', SETTING  
:DATA SWITCH '1' WILL SELECT CHANNEL 1 AND SETTING BOTH '0 & 1' WILL  
:ENABLE BOTH CHANNELS.

.SBTTL DL11 TRANSMITTER ROUTINE
;THIS ROUTINE IS ENTERED WITH THE ADDRESS OF THE CHARACTER OR CHARACTERS
;TO BE TRANSMITTED IN ADDRESS 'TRANPT'. CHARACTERS ARE TRANSMITTED UNTIL
;EITHER AND 'EOT', 'EXT' OR A NULL CHARACTER IS TRANSMITTED. IF 'SW11'
;IS SET, THE SAME CHARACTER IS TRANSMITTED EVERY TIME. IF 'SW12' IS SET,
;THE PROGRAM WAITS FOR A 'CR' TO BE TYPED BEFORE THE CHARACTER IS TRANS-
;MITTED. AS IT IS TRANSMITTED, IT IS ALSO PRINTED.
*****
