MADE IN USA

The table contains a grid of approximately 10 columns and 15 rows of data. The text is extremely faint and illegible, appearing as a series of vertical lines and small clusters of characters. It likely represents a technical test log or a data table related to the LPA/AD11-K system.

1.0 ABSTRACT

This diagnostic has two starting addresses: 200 for standard tolerances and 210 for tighter option test area tolerances.

This diagnostic tests the AD11K with or without a wraparound module (G5036).

When starting the diagnostic, a set of tests is listed and this statement is printed out: "Type the letter and carriage return of the desired test:". The following chart indicates which letter corresponds to which test:

- W: The entire Wraparound test (requires G5036 module)
 - a. Analog subtests
 - b. Noise test
 - c. Interchannel Settling test
 - d. Differential Linearity and Relative Accuracy test
- C: Calibration test only
- N: Noise test only
- S: Interchannel Settling only
- L: Logic Subtests only
- A: Auto test (requires G5036 module)
 - A. Logic subtests
 - B. Analog subtests
 - C. Noise Test
 - D. Interchannel Settling Test
 - E. Differential Linearity and Relative Accuracy Test

THIS PROGRAM IS A MODIFIED VERSION OF 'MD-11-DZADL-B' IT WAS MODIFIED TO ENABLE THE OPERATOR TO CHECK OUT THE AD 11K OPTION WHEN IT IS ON THE LPA11-KX I/O BUS. NO RECABLING IS NEEDED. SOME TEST DONE IN THE ORIGINAL DIAGNOSTIC SUCH AS ARBITRATION TEST, WERE DELETED AS THEY COULD NOT BE CHECKED. IF THIS DIAGNOSTIC DOESN'T FIND A SUSPECTED PROBLEM, YOU MAY HAVE TO RUN 'MD-11-DZADL-B' YOU SHOULD RUN 'MD-11-CRLPA' BEFORE RUNNING THIS DIAGNOSTIC. PLEASE READ SECTION 10.

2.0 REQUIREMENTS

2.1 Equipment

PDP-11 family computer with 8K of memory
 Console terminal
 AD11K Module installed in an LPA-11
 Bit-map terminal <OPTIONAL>
 G5036 Wraparound Module

2.2 Storage

This program uses all 8K of memory and is not "chainable" on an 8K CPU. The program is "chainable" on 12K or greater. The program will destroy "absolute loader" on an 8K CPU, if "W" or "A" is selected.

3.0 LOADING PROCEDURE

Procedure for loading normal binary tapes should be followed.

4.0 STARTING PROCEDURE

4.1 Control Switch Settings

Standard PDP-11 Format

SW15=1	Halt on error
SW14=1	Loop on test
SW13=1	Inhibit error typeouts
SW12=1	Halt for Bit map display
SW11=1	Inhibit iterations
SW10=1	Bell on error
SW9 =1	Loop on error
SW8 =1	Loop on test in SWR <7:0>

200 is the starting address of the diagnostic for standard tolerances. 204 is the restart address. 210 is the starting address of the diagnostic for the option test area's tighter tolerances. Starting address of the USER LINK loop is at 214.

5.0 OPERATING PROCEDURE

Start the diagnostic at 200 or 210. The program heading and the list of tests available, will be printed out followed by a message "Type the letter and carriage return for the desired test:". Then type the letter you want, according to the table listed and hit carriage return.

Two control characters, ^A and ^C, are set aside for interrupting a test and transferring control to either the beginning of the diagnostic (^C) or to the beginning of the specific test which was in progress (^A). During the logic tests while a reset is being performed, ^C or ^A will not be executed until after the reset has been completed, therefore hit ^C or ^A until it is successful.

For machines without a hardware switch register, location SWREG (176) is used as a software switch register. To modify the contents of SWREG, type ^G. The program responds with the current contents of SWREG and a slash. Type the desired new contents of SWREG followed by a carriage return.

If 'W' is typed, the program will type 'xx AD11K's FOUND'. Where xx is the number of AD11K's in octal. If the number is greater than 1, the test will be run successively on each AD11K. The program will run through the logic subtests, the Noise test on 8 edges, the Interchannel Settling test on 8 edges, and the Differential Linearity and Relative Accuracy test. A G5036 wraparound module is required. The program supports AD11K expansion beyond 16 channels. To run this test on a group of channels other than 0-17, load 20, 40, or 60 into location BASECH (1336) for channels 20-37, 40-57, 60-77.

If 'C' is typed, the program will run the calibration test and will loop on that test until the operator halts it. If a certain AD11K is to be tested, its status register address must be loaded into \$BASE (1250), and its vector address must be loaded into the low byte of \$VECT1 (1244) (the high byte containing the priority).

If 'N' is typed, the program will run the Noise test tagged 'BEGINN' and will loop on this test until the operator halts it. If a certain AD11K is to be tested its status register address must be loaded into \$BASE (1250), and its vector address must be loaded into the low byte of \$VECT1 (1244) (the high byte containing the priority).

If "S" is typed, the program will run the Interchannel Settling test tagged "BEGINS" and will loop on this test until the operator halts it. At the beginning of this test, the operator must respond to the statements asking for the "FROM" channel and the "TO" channel by typing in the channel value in octal and hitting carriage return. If a certain AD11K is to be tested its status register address must be loaded into \$BASE (1250), and its vector address must be loaded into \$VECT1 (1244) (the high byte containing the priority).

If "A" is typed, the program will execute the logic tests, analog tests, noise, settle and differential linearity. At the beginning of the test the program will type "XX AD11K's Found". Where XX IS THE NUMBER OF AD11K's in octal If the number is greater than 1, the test will be run successively on each AD11K. The program supports AD11K expansion beyond 16. channels. To run this test on a group of channels other than 0-17, load 20,40, or 60 into location BASECH (1336) for channels 20-37, 40-57, 60-77.

If "L" is typed, the program will execute the logic tests, printing "END PASS" when it has completed an entire pass. At the beginning of the test the program will type "XX AD11K's Found". Where XX is the number of AD11K's in octal If the number is greater than 1, the test will be run successively on each AD11K.

6.0 ERRORS

This program uses the Diagnostic "SYSMAC" package for error reporting and typeout. The error information consists of the following:

ERRPC: Location at which an error was detected.
STREG: Address of the status register.
ADBUFF: Address of the buffer
CHANL: Channel value
NOMINAL: Expected correct data
TOLERANCE: The acceptable deviation from the nominal
ACTUAL: Actual data
EXPECTED: Expected correct data

7.0 MISCELLANEOUS

7.1 Execution Time

Execution time for each of the tests is:

Calibration: 8 conversions/5 seconds @ 110 baud
Wraparound Test: 17 minutes first pass; 35 minutes
for successive passes
Settling Test: 1 minute
Noise Test: 1 minute
Logic Test: 1 minute
Auto Test: 18 minutes first pass, 36 minutes
for successive passes

7.2 Status Register and Vector Addresses and Priority

When testing more than one AD11K, the difference in addresses is presently 40 for bus address and vector address. These values are in VADR (bus address) (1326) and VVCT (vector address) (1330). The first AD11K's status register address must be in \$BASE (1250), its vector address must be in the low byte of \$VECT1 (1244), and the priority must be in the high byte of \$VECT1.

7.3 AD11K Priority

If AD11K is set for a priority other than 6, the high byte of \$VECT1 (1244) must be adjusted accordingly (the low byte containing the vector address). If more than one AD11K is being tested, all must be set at the same priority.

7.4 Switch Register

If a hardware switch register is present and the operator desires to use a software switch register and the ^G feature; it is necessary to load the starting address, set the hardware switch register to all ones (-1), and hit start. The program will then run with the software switch register.

7.5 BIT-MAP Graphic Output

The screen display may be halted for examination by setting bit 12. And then just hit continue to complete the program's execution.

7.6 USER LINK TO I/O DEVICE

A SPECIAL USER LINK HAS BEEN PROVIDED IN ORDER FOR THE OPERATOR TO EXAMINE OR MODIFY LOCATIONS ON THE LPA11-KX I/O BUS. (NOTE: THIS CANNOT BE DONE DIRECTLY.)

PROCEDURE:

- 1) START THE PROCESSOR AT LOCATION 214
- 2) THE DIALOG TO EXAMINE A LOCATION IS AS FOLLOWS:

```
E OR D      "E"  
DEVICE ADDRS= "OCTAL ADDRS"  
XXXXXX
```

WHERE XXXXXX IS THE CONTENTS OF THE SPECIFIED LOC.

- 3) THE DIALOG TO MODIFY A LOCATION IS AS FOLLOWS:

```
E OR D      "D"  
DATA=      "DATA TO BE DEPOSITED"
```

- 4) THE PROGRAM WILL STAY IN THIS LOOP UNTIL THE OPERATOR IS FINISHED. AT THIS TIME THE PROCESSOR SHOULD BE HALTED.

NOTE: THE OPERATORS RESPONSE IS ENCLOSED IN QUOTES.

8.0 RESTRICTIONS

- 8.1 A G5036 wraparound module must be present when running the auto test and the wraparound test.

Switch on G5036 must be in '0' position.

```
*****
The wraparound (G5036) module must be connected as follows:
  AD11K TO BC08R CONNECTION A-A, VV-VV
  BC08R TO G5036 CONNECTION 'UPSIDE-DOWN' A-VV, VV-A
*****
```

- 8.2 The program is chainable under XXDP. However, you may only execute it one pass (R RLPKC0/1). The reason is because of the 'BUS RESET' in the end of pass handler.

9.0 PROGRAM DESCRIPTION

9.1 Logic Tests

These 8 logic subtests run sequentially without further operator intervention after he/she has typed in the number of AD11K's to be tested. Its purpose is to check that each of the mux bits can be loaded and properly read back; that initialize clears the external start enable bit, the done bit, the interrupt enable bit, the overflow bit, the error flag, and the A/D start bit. It also checks that the A/D done flag sets at end of conversion and clears when the converted value is read. It checks the interrupt logic and the correct setting of the error flag.

9.2 Calibration Test

This test begins when the operator types "C", it then loads the channel from the switch register bits 0-7 and does a conversion on that channel. If SWR bit 13 is down, it prints out the converted value on the teletype; otherwise, if SWR bit 13 is up, it puts the converted value in the display register. The operator may change the channel at any time during the test, however the new values from the new channel will not be printed until the next line of 8 values is printed. The 8 values on each line correspond to only one channel.

9.3 Differential Linearity

This test is to determine if a change in the input voltage represents a similar change in the resulting converted binary value.

9.4 Settling Test

The purpose of this test is to check that the time needed to settle and correctly report a new input value after switching channels does not exceed the expected amount of time for such a change.

9.5 Noise Test

This test measures the internal short-term repeatability noise within the A/D. RMS noise equals 1 standard deviation of the Gaussian curve, PEAK noise equals 2.3 standard deviation of the Gaussian curve.

9.6 Analog Tests

These 11 subtests check the channels and their output.

10. LPA11 (SYSTEM) DIAGNOSTIC SUMMARY

DIAGNOSTICS FOR THE LPA11 ARE WRITTEN AT THREE LEVELS: (1) TOTAL PDP-11 SYSTEM, (2) LPA11 SYSTEM; AND, (3) LPA11 OPTIONS.

LEVEL 1, IS DESIGNED TO ISOLATE A FAILURE TO THE LPA11 SYSTEM. ALL OPTIONS ON THE PDP-11 ARE EXERCISED.

LEVEL 2 DIAGNOSTICS ISOLATE A FAILURE TO THE INDIVIDUAL OPTION WITHIN THE LPA11. THE LEVEL 2 DIAGNOSTIC IS MD-11-CRLPA. WHEN THE USER RUNS "CRLPA" HE CAN GENERALLY TELL WHICH OPTION DIAGNOSTIC (LEVEL 3) TO RUN NEXT. M8254 AND M8200-YC ERRORS MAY "LOOK" ALIKE AND "CRLPA" MAY NOT BE ABLE TO DISTINGUISH BETWEEN THEM. ARBITRATION ERRORS WILL NOT BE DETECTED BY THIS DIAGNOSTIC.

LEVEL THREE DIAGNOSTICS AID IN DETERMINING IF THE ERROR WAS IN FACT ON THE OPTION THE "CRLPA" SPECIFIED. THE USER MAY "LOOP" ON THE ERROR. WITHIN LEVEL THREE, THERE ARE TWO GROUPS OF DIAGNOSTICS. THE FIRST GROUP REQUIRES NO "EXTRA" WORK BY THE USER IN ORDER TO RUN. GROUP "A" DIAGNOSTICS DO NOT CHECK ARBITRATION, AND REQUIRE EXTRA TIME FOR EXECUTION. THE SECOND GROUP (GROUP "B") REQUIRES THAT THE USER RECONFIGURE THE PDP-11 SYSTEM. THIS RECONFIGURATION INVOLVES CABLING THE UNIBUS TO THE LPA'S I/O BUS.

THE DIAGNOSTIC FOR THE M8254 FALLS INTO THE GROUP "B" CATEGORY.

THE LPA11-KX DIAGNOSTIC KIT WILL INCLUDE:

K 1

SEQ 0010

<u>OPTION</u>	<u>GROUP</u>	<u>DIAG. #</u>	<u>DIAG. TITLE</u>

PRODUCT CODE: MAINDEC-11-DZADL-B
 PRODUCT NAME: AD11-K PERFORMANCE TEST
 DATE: DECEMBER 1976
 MAINTAINER: DIANOSTIC GROUP

PRODUCT CODE: MAINDEC-11-DRLPK-A
 PRODUCT NAME: LPA/AD11-K PERFORMANCE TEST
 DATE: JANUARY 1978
 MAINTAINER: DIAGNOSTIC GROUP

REASON FOR DEVELOPMENT:

- 1) TO ENABLE THE OPERATOR TO CHECK OUT THE AD11-K OPTION WHEN IT IS ON THE LPA11-KX I/O BUS.

CHANGES MADE:

- 1) TOOK OUT CERTAIN TESTS FROM ORIGINAL DIAGNOSTIC (I.E. INTERRUPTS, TIME DEPENDENT CODE).
- 2) REPLACED DIRECT LINKS TO DEVICE WITH MACRO CALLS TO THE KMC-11 MICRO CODE. KMC-11 MICRO CODE (FILE:DRLPX2) HANDLES DIRECT COMMUNICATIONS WITH THE DEVICE.

FILE: DRLPA.MAC
 CONTAINS MACRO LINKS BETWEEN PDP-11 CODE AND KMC-11 MICRO CODE. FILE: DRLPX2 NEEDS TO BE ASSEMBLED WITH DRLPK (SEE .CTL FILE).

FILE: DRLPX2
 MICRO CODE FILE THAT GETS LOADED INTO THE KMC-11 VIA ROUTINES IN DRLPA.MAC.

DRLPX2.P11 IS ASSEMBLED WITH MACY11 (ONLY) AS ANY OTHER .P11 FILE. THE RESULTS OF ITS ASSEMBLY IS A .OBJ MODULE AS WAS THE RESULT OF THE ASSEMBLY OF THE DIAGNOSTIC .P11 FILE. BOTH .OBJ FILES GET LINKED WITH LNKX11 (ONLY).

FILE: DRLPK.CTL
 THIS FILE EXPLAINS SEQUENCE OF ASSEMBLES AND LINKS. IT IS IN TOPS-20 FORMAT.

PRODUCT CODE: AC-B049B-MC

MAINTAINER: DIAGNOSTIC GROUP

M 1

SEQ 0012

THE 'B' VERSION WAS GENERATED TO REPAIR THE FOLLOWING PROBLEMS:

1. PROGRAM LISTING DID NOT AGREE WITH THE BINARY FILE AFTER LOC. 12064. THIS WAS DUE TO THE RELEASE ENGINEERING GROUP REASSEMBLING TO GET THE LISTING AND USING THE BINARY FILE SUPPLIED BY AUTHOR. (DEVELOPED WITH C2 SYSMAC - RELEASED WITH C3 SYSMAC)
2. WHEN SUBTEST 'A' OR 'W' WAS SELECTED, A 'MICRO-CODE LOAD ERROR' OCCURRED AT LOCATION 17612 ON THE 'THIRD PASS'. (DUE TO THE AUTHOR FORGETTING ABOUT WHERE THE MICRO-CODE 'HIDES' AT.)
3. 'TST11' COULD NOT BE LOOPED ON CORRECTLY. (ORIGINAL PROGRAM USED A ABSOLUTE TAG FOR AT THAT TEST <<TST17>>)
4. AFTER A POWER FAILURE, THE PROGRAM APPEARED TO RECOVERY PROPERLY. BUT AFTER THE OPERATOR ENTERED THE TEST NUMBER THE PROGRAM REPORTED 'LPA FAULT' AND THEN HALTS. (PROGRAM DID A RESTART - IT MUST BE STARTED)

-
1. REASSEMBLED THE FILE - <EASY AND FREE FIX WHEN WORKING ON PROBLEM 2-4
 2. PROTECT THE 'HIDDEN' SPACE THAT THE MICRO-CODE RESIDES AT.
 3. REMOVE INCORRECT TAG FROM 'TST11'
 4. BECAUSE THE KMC-11 IS A VOLIATLE DEVICE A COMPLETE PROGRAM START WAS NEEDED. JUST A ONE LOCATION PATCH IN THE POWER FAIL ROUTINE FIXES THE PROBLEM.

VERSION 'C' WAS MADE BECAUSE OF A MICRO-CODE CHANGE IN THE LPA-11. EFFECTIVELY ONLY THE TITLE AND TITLE TYPEOUT WERE CHANGED IN THE SOURCE. THE MAJOR CHANGE OCCURRED IN THE MACRO FILE THAT THE PROGRAM IS ASSEMBLED WITH.
