1.0 GENERAL INFORMATION

1.1 PROGRAM ABSTRACT

This is the only diagnostic program provided for testing the UDA 50 Unibus Disk Controller and the disk drives connected to it. There are four tests within this diagnostic:

- Test 4 1 Unibus Addressing Test, Runs the UDA 50 ROM resident diagnostics, then further tests the Unibus address interface.
- Test # 2 Disk Resident Diagnostic Test, Executes the diagnostics in each disk drive.
- Test # 3 Disk Function Test. Functionally tests each disk drive to ensure the disk can seek, read, write and format.
- Test # 4 Disk Exerciser. Exercises the disk drives in a manner similar to normal operating systems. This test should be used to gain confidence in the reliability of the disk drive.

This program is designed to handle all future disk drives that are attached to the UDA-50 without modifying or rereleasing. This is possible because the disk drives are programmed to tell this diagnostic about all their characteristics that make them different from other drives, such as number of cylinders, sectors per cylinder, etc.

Two other PDP-11 d'agnostic programs are provided for the UDA 50 disk subsystem:

- CZUDEDO UDA 50 Disk Drive Formatter.
- CXUDFRO UDA-50 Disk Drive Formatter Data File
- DEC/X11 Unibus Exerciser can be run on the UDA 50 using the UDA-50 module DUBCO.

This diagnostic has been written for use with the Diagnostic Runtime Services Software (Supervisor). These services provide the interface to the operator and to the software environment. For a complete description of the Runtime Services, refer to the XXDP+ User's Manual. There is a brief description of the Runtime Services in section 2 of this document.

This diagnostic will test UDA 50's with modules M7485 and M7486. Whenever a fault is detected in a UDA-50 and the fault can be isolated to one of the two modules in the UDA 50. Replace that module.

1.2 SYSTEM REQUIREMENTS

This program was designed using the PDP 11 Diagnostic Runtime Services revision C. Run time environments are determined by the Runtime Services and may change as new versions of the Services are developed. This program requires the following:

PDP 11 Unibus processor
28K words of memory (minimum)
Console terminal
XXDP+ load media containing this program and the ZUDDEO.PAK
data file
One or more UDA50 subsystems. The subsystem controller must be
type UDA50-A with microcode level 3 or greater.
Line clock - either Type L or P

The line clock is used for all timed loops in the program. The diagnostic will run on a system with no clock but will hang whenever an event for which the program is waiting does not happen (i.e., a time out error message will not result).

This diagnostic program requires that the data file ZUDDEO.PAK be on the XXDP+ system device. This data file is ordered under the name CZUDDEO. The XXDP+ system device must remain on line during the execution of this diagnostic.

2.0 OPERATING INSTRUCTIONS

This section contains a brief description of the Runtime Services. For detailed information, refer to the XXDP+ User's Manual (CHQUS).

2.1 COMMANDS

There are eleven legal commands for the Diagnostic Runtime Services (Supervisor). This section lists the commands and gives a very brief description of them. The XXDP+ User's Manual has more details.

COMMAND	EFFECT
START	Start the diagnostic from an initial state
RESTART	Start the diagnostic without initializing
CONTINUE	Continue at test that was interrupted (after (C)
PROCEED	Continue from an error halt
EXIT	Return to XXDP+ Monitor (XXDP+ OPERATION ONLY!)
√DD	Activate a unit for testing (all units are
	considered to be active at start time
DROP	Deactivate a unit
PRINT	Print statistical information (see section 4.0)
DISPLAY	Type a list of all device information
FLAGS	Type the state of all flags (see section 2.3)
ZFLAGS	Type the state of all flags (see section 2.3) Clear all flags (see section 2.3)

A command can be recognized by the first three characters. So you may, for example, type "STA" instead of "START".

2.2 SWITCHES

There are several switches which are used to modify supervisor operation. These switches are appended to the legal commands. All of the legal switches are tabulated below with a brief description of each. In the descriptions below, a decimal number is designated by 'DDDDD'.

SWITCH	EFFECT
/TESTS:LIST	Execute only those tests specified in the list. List is a string of test numbers, for example - /TESTS:1:5:7-10. This list will cause tests 1.5.7.8.9.10 to
/PASS:DDDDD /FLAGS:FLGS	be run. All other tests will not be run. Execute DDDDD passes (DDDDD = 1 to 64000) Set specified flags. Flags are described
/EOP:DDDDD	in section 2.3. Report end of pass message after every
/UNITS:LIST	DDDDD passes only. (DDDDD = 1 to 64000) TEST/ADD/DROP only those units specified in the list. List example - /UNITS:0:5:10 12 use units 0,5,10,11,12 (unit numbers = 0-63).

Example of switch usage:

START/TESTS:1-5/PASS:1000/E0P:100

The effect of this command will be: 1) tests 1 through 5 will be executed, 2) all units will tested 1000 times and 3) the end of pass messages will be printed after each 100 passes only. A switch can be recognized by the first three characters. You may, for example, type '/TES:1-5" instead of "/TESIS:1-5".

Below is a table that specifies which switches can be used by each command.

	TESTS	PASS	FLACS	EOP	UNITS
START	X		X	X	χ.
RESTART	X	X	X	X	X
CONTINUE PROCEED	•	×	×	X	
DROP					X
ADD PRINT					X
DISPLAY FLAGS ZFLAGS EXIT					×

2.3 FLAGS

.

Flags are used to set up certain operational parameters such as looping on error. All flags are cleared at startup and remain cleared until explicitly set using the flags switch. Flags are also cleared after a START or RESTART command unless set using the flag switch. The ZFLAGS command may also be used to clear all flags. With the exception of the START, the RESTART and ZFLAGS commands, no commands affect the state of the flags; they remain set or cleared as specified by the last flag switch.

FLAG	EFFECT
HOE	Halt on error - control is returned to runtime services command mode
LOE	Loop on error
IER*	Inhibit all error reports
IBE*	Inhibit all error reports except
	first level (first level contains
	error type, number, PC, test and unit)
IXE*	Inhibit extended error reports (those
	called by PRINTX macro's)
PRI	Direct messages to line printer
PNT	Print test number as test executes
BOE	"BE'_L" on error
UAM	Unattended mode (no manual intervention)
ISR	Inhibit statistical reports
IDU	Inhibit program dropping of units
LOT	Loop on test

*Error messages are Jescribed in section 3.1

See the XXDP+ User's Manual for more details on flags. You may specify more than one flag with the FLAG switch. For example, to cause the program to loop on error, inhibit error reports and type a "BELL' on error, you may use the following string:

/FLAGS:LOE: IER:BOE

2.4 HARDWARE QUESTIONS

When a diagnostic is STARTed, the Runtime Services will prompt the user for hardware information by typing 'CHANGE HW (L)?'. When you answer this question with a "Y", the Runtime Services will ask for the number of units (in decimal). You will then be asked the following questions for each unit. When you answer this question with an "N", the Runtime Services will use the answers built into the program by the SETUP utility (see chapter 6 of the XXDP+ User's Manual). If you have never run the SETUP utility on this program file, the default values listed below (just before the question mark) will be used.

UNIBUS ADDRESS OF UDA (0) 172150 ?

Answer with the address of the UDAIP register of one UDA as addressed by the processor with memory management turned off (i.e., an even 16 bit address in the range of 160000 to 177774).

VECTOR (0) 154 ?

Answer with the interrupt vector address of the UDA. A vector address in the range of 4 to 774 may be specified. The UDA does not have a vector "hard wired" to it, so any vector not being used by this program and XXDP+ may be used.

BR LEVEL (D) 5 ?

Answer with the interrupt priority used by the UDA. Levels 4 to 7 are accepted. This level must match the level "hard wired" in the UDA by the priority plug.

UNIBUS BURST RATE (D) 63 ?

The UDA allows the ability to control the maximum number of words transferred across the UNIBUS each time the UDA becomes master. The default answer of 63 will allow for the fastest execution of this diagnostic program. You may answer with the value your operating system uses or use zero which will tell the UDA to supply a value that should work on any system. A decimal number in the range of 0 to 63 may be specified and all values should work on any system. A larger value will allow for a faster running program. The value will be passed directly to the UDA during initialization.

DRIVE NUMBER (D) 0 ?

Answer with the drive number of the drive you wish to test. This is the number which appears on the "unit plug" on the front of the disk drive. On a multi un't drive, each sub unit number on the drive must be tested as a separate unit to completely test the drive. A maximum of eight logical drives may be tested on one UDA at a time (UDA configuration lim't).

EXERCISE ON CUSTOMER DATA AREA IN TEST 4 (L) N ?

Answer "N" to have test 4 (drive exerciser) run on the diagnostic area of the disk. Answer "Y" to run on the customer data area. A "Y' answer will destroy any customer data that may be on the disk. A warning message will be printed before testing begins if this question is answered "Y".

CUSTOMER DATA WILL BE DESTROYED ON:
UNIT UDA AT DRIVE
XX XXXXXX XXX

Unless the diagnostic is being run in unattended mode (i.e., START/FLAG: UAM command), a confirmation will also be required as follows:

ARE YOU SURE CUSTOMER DATA CAN BE DESTROYED (L) ?

If the above question is answered "N", the entire diagnostic will stop and the Runtime Services prompt will be displayed. No default answer is provided for this question.

2.5 SOFTWARE QUESTIONS

After you have answered the hardware questions or after a RESTART or CONTINUE command, the Runtime Services will ask for software parameters. You will be prompted by "CHANGE SW (L)?" If you wish to change any parameters, answer by typing "Y". The software questions and the default values are described in the next paragraphs.

ENTER MANUAL INTERVENTION MODE FOR SPECIAL DIAGNOSIS (L) N ?

Tests 2 and 4 have manual intervention modes which allow additional parameters to be input to alter the normal testing of a disk drive. This question should normally be answered "N" when this diagnostic is first run. Then, depending on the errors detected, it may be desirable to change this answer to "Y" and alter the testing to further isolate the problem. If this question is answered "Y", and the UAM (unattended mode operation) flag is set, tests 2 and 4 will print a warning message that the mode cannot be entered and will proceed as if answered "N". See the description of the individual tests in section 5 for more information.

REMAINING SOFTWARE QUESTIONS APPLY TO TEST 4 ONLY

This informational message is printed to describe the use of the remaining questions. If test 4 is not being run, a "CONTROL Z" can be typed to bypass them.

ERROR LIMIT (D) 32 ?

Enter the number of hard errors allowed before a drive is dropped from exercise by test #4. A number in the range of 1 to 65535 will be accepted.

READ TRANSFER LIMIT IN MEGABYTES O FOR NO LIMIT (D) 0 ?

When the specified number of bytes have been read from a drive by test #4, the drive will be dropped from testing. When all drives are dropped, an end of pass will be indicated and the selected tests will be run again. This is the method used to determine how long test #4 is to run. Answer with a zero to prevent test from ending. The only other way test #4 can end is to have all drives dropped because the error limit on each is exceeded. Of course, the operator can always stop test #4 by typing a control C.

SUPPRESS PRINTING SOFT ERRORS (L) Y?

When test 44 needs to perform retries, soft error reports will be printed to give as much information as possible. These actions are considered normal operation and are not error conditions until the retries fail. When the test is being run only to see how reliable the drive performs, this question should be answered "Y" so they are not confused with hard errors. The number of these soft errors is always reported in the statistical report. Answer "N" to see all the soft error reports.

DO INITIAL WRITE ON START (L) Y ?

If test #4 is to do data compares, the drive will need to be written with data patterns readable by the program.

If the diagnostic area is selected for testing, the initial write is always performed (regardless of how this question is answered).

If the customer data area is selected for testing, the initial write will be performed when all of the following are true:

- 1. This question is answered "Y".
- 2. This is the first time test #4 is being run after a START command.
- 3. The disk is write enabled.

Answering this question "N" when testing on the customer data area will normally result in data comparison errors if the disk was not previously written by this diagnostic or the formatter.

Note that write checks are not performed during the initial write.

ENABLE ERROR LOG (L) N ?

A "Y" answer will cause error messages in test #4 to be stored in a log buffer. Once the log buffer is full, additional error information is lost. The contents of the log buffer will be printed when test #4 is stopped and a statistical report requested. This log feature is intended to allow the Digital Diagnosis Center (DDC) to start test #4 then hang up from the system and let it run for some period of time. DDC can call the system back later, type control-C, then CONT and see the errors that have occurred (up to the limit of the log buffer). A message will be printed to indicate no errors have occurred if the log buffer is empty. Test #4 will not be allowed to end while the error log is enabled until the error log is printed. The log buffer will hold 30 error messages when one disk unit is being tested. The log buffer will decrease in size as more units are tested.

2.6 EXTENDED P ASLE DIALOGUE

When you answer the hardware questions, you are building entries in a table that describes the devices under test. The simplest way to build this table is to answer all questions for each unit to be tested. If you have a multiplexed device such as a mass storage controller with several drives or a communication device with several lines, this becomes tedious since most of the answers are repetitious.

To illustrate a more efficient method, suppose you are testing a fictional device, the XY11. Suppose this device consists of a control module with eight units (sub-devices) attached to it. These units are described by the octal numbers 0 through 7. There is one hardware parameter that can vary among units called the Q-factor. This Q factor may be 0 or 1. Below is a simple way to build a table for one XY11 with eight units.

UNITS (D) ? 8<CR>

UNIT 1 CSR ADDRESS (0) ? 160000<CR> SUB-DEVICE # (0) ? 0<CR> Q-FACTOR (0) 0 ? 1<CR>

UNIT 2 CSR ADDRESS (0) ? 160000<CR> SUB-DEVICE # (0) ? 1<CR> Q-FACTOR (0) 1 ? 0<CR>

UNIT 3
CSR ADDRESS (0) ? 160000 CR>
SUB-DEVICE # (0) ? 2 CR>
Q-FACTOR (0) 0 ? CR>

UNIT 4
CSR ADDRESS (0) ? 160000 CR>
SUB DEVICE # (0) ? 3 CR>
Q-FACTOR (0) 0 ? CR>

UNIT 5 CSR ADDRESS (0) ? 160000<CR> SUB DEVICE # (0) ? 4<CR> Q-FACTOR (0) 0 ? <CR>

UNIT 6
CSR ADDRESS (0) ? 160000<CR>
SUB-DEVICE # (0) ? 5<CR>
Q FACTOR (0) 0 ? <CR>

UNIT 7
CSR ADDRESS (0) ? 160000 CR>
SUB DEVICE # (0) ? 6 CR>
Q FACTOR (0) 0 ? 1 CR>

Notice that the default value for the Q-factor changes when a non default response is given. Be careful when specifying multiple units!

As you can see from the above example, the hardware parameters do not vary significantly from unit to unit. The procedure shown is not very efficient.

The Runtime Services can take multiple unit specifications however. Let's build the same table using the multiple specification feature.

UNITS (D) ? 8<CR>

UNIT 1
CSR ADDRESS (0) ? 160000 CR>
SUB-DEVICE 4 (0) ? 0,1 CR>
Q-FACTOR (0) 0 ? 1,0 CR>

UNIT 3 CSR ADDRESS (0) ? 160000<CR> SUB-DEVICE # (0) ? 2-5<CR> Q-FACTOR (0) 0 ? 0<CR>

UNIT 7 CSR ADDRESS (0) ? 160000<CR> SUB-DEVICE # (0) ? 6,7<CR> Q FACTOR (0) 0 ? 1<CR>

As you can see in the above dialogue, the runtime services will build as many entries as it can with the information given in any one pass through the questions. In the first pass, two entries are built since two sub-devices and q-factors were specified. The Services assume that the CSR address is 160000 for both since it was specified only once. In the second pass, four entries were built. This is because four sub-devices were specified. The "-" construct tells the Runtime Services to increment the data from the first number to the second. In this case, sub-devices 2, 3, 4 and 5 were specified. (If the sub device were specified by addresses, the increment would be by 2 since addresses must be on an even boundary.) The CSR addresses and Q-factors for the four entries are assumed to be 160000 and 0 respectively since they were only specified once. The last two units are specified in the third pass.

The whole process could have been accomplished in one pass as shown below.

UNITS (D) ? 8<CR>

UNIT 1 CSR ADDRESS (0) ? 160000<CR> SUB-DEVICE # (0) ? 0-7<CR> Q-FACTOR (0) 0 ? 0.1.0...1.1<CR>

As you can see from this example, null repl'es (commas enclosing a null field) tell the Runtime Services to repeat the last reply.

2.7 QUICK START-UP PROCEDURE

To start up this program:

- 1. Boot XXDP+
- 2. Give the date and answer the LSI and 50HZ (if there is a clock) questions
- 3. Type "R ZUDCEO"
- 4. Type "START"
- 5. Answer the "CHANGE HW" quest on with 'Y'
- 6. Answer all the hardware questions
- 7. Answer the "CHANGE SW" question with "N'

When you follow this procedure you will be using only the defaults for flags and software parameters. These defaults are described in sections 2.3 and 2.5.

3.0 ERROR INFORMATION

3.1 TYPES OF ERROR MESSAGES

There are three levels of error messages that may be issued by a diagnostic: general, basic and extended. General error messages are always printed unless the "IER" flag is set (section 2.3). The general error message is of the form:

NAME TYPE NUMBER ON UNIT NUMBER TST NUMBER PC:XXX.XX error message

where: NAME = diagnostic name

TYPE - error type (SYS FTL ERR, DEV FTL ERR, HRD ERR or SFT ERR)

NUMBER = error number

UNIT NUMBER = 0 - N (N is last un t in PTABLE)
TST NUMBER = test and subtest where error occurred

PC:XXXXXX = address of error message call

System fatal errors (SYS FTL ERR) are used to report errors that are fatal to the entire diagnostic program. The diagnostic stops and the Runtime Services prompt is printed.

Device fatal errors (DVC FTL ERR) are used to report errors that are fatal to the device (may be either a UDA 50 or disk drive). Testing stops on that device for the remainder of the current test.

Hard errors (HRD ERR) reports most of the errors detected. Testing w'll normally continue after the printing of the error.

Soft errors (SFT ERR) are used only in test 4. They present information about an error for which recovery will be attempted. These are printed only if the SUPPRESS PRINTING SOFT ERRORS software question is answered "N" and are used only to provide a greater detail of information. During the error recovery attempt, several soft errors may be printed. Unless the soft errors are followed by a hard error message, the error condition was corrected and testing proceeds.

Basic error messages are messages that contain some additional information about the error. These are always printed unless the "IER" or "IBE" flags are set (section 2.3). These messages are printed after the associated general message.

Extended error messages contain supplementary error information such as register contents or good/bad data. These are always printed unless the "IER", "IBE" or "IXE" flags are set (section 2.3). These messages are printed after the associated general error message and any associated basic error messages.

The general and basic error messages from this diagnost's are always one line each. The basic message defines what program detected the error, the drive being tested and the time of the error.

The PDP 11 program that is loaded into memory when you give the "R ZUDCEO" command to the XXDP+ monitor is only a small part of this diagnostic. A data file called ZUDDEO.PAK on the system load device (the same device from which the "R" command read the PDP-11 program) contains four programs which are read from the file and loaded into the UDA 50 for execution. These programs are called "diagnostic machine" or DM programs. The "diagnostic machine" is the facility in the UDA 50 which executes a PDP-11 like pogram. The large majority of the testing is done by these four "diagnostic machine" programs. Once the PDP-11 program has loaded and started the "diagnostic machine" program, all it does is respond to requests from that program. These requests include such things as telling the "diagnostic machine" which disks on that UDA-50 are to be tested, printing an error message and updating statistics which are printed in the statistical report (see section 4.0).

The basic message (the second line of every error message) will be one of the following:

HOST PROGRAM UDA AT XXXXXX RUNTIME hhh:mm:ss

The host program (PDP 11) detected the error. UDA AT xxxxx identifies the address of the UDA-50 being tested. It may be omitted if the error is not specific to one UDA 50.

UNIBUS ADDRESSING DM PC:xxxx UDA AT xxxxxx RUNTIME hhh:mm:ss

The "diagnostic machine" program loaded in test 1 detected the error. DM PC xxxx identifies the address in the "diagnostic machine" program where the error message is reported.

DISK RESIDENT DM PC:xxxx UDA AT xxxxxx DRIVE xxx RUNTIME hhh:mm:ss

general message basic message

extended message

Informational messages are also printed by this program. They are usually one or two lines in length. They are printed as extended messages and are always printed unless the "IER", 'IBE' or "IXE" flags are set.

Sample informational message:

UNIT 0 UDA AT 172150 DRIVE 0 RUNTIME 0:02:43 INITIAL WRITE COMPLETE

3.2 SPECIFIC ERROR MESSAGES

Following is a list of the error messages that may be printed by the d'agnostic program. In the list, some of the numbers that may vary with execution or program version are shown as "xxx". These include program counters and runtime. Other numbers, such as unit number, drive number, UDA-50 address and data in registers are filled with sample numbers. Additional information about the error may follow the error message.

3.2.1 HOST PROGRAM ERROR MESSAGES (00001 to 00999)

00001 CZUDC SYS FTL ERR 00001 ON UNIT 00 TST xxx SUB 000 PC: xxxxxx HOST PROGRAM UDA AT 172150 RUNTIME x:xx:xx I DON'T LIKE THE ANSWERS YOU GAVE TO THE HARDWARE QUESTIONS UDA HAS MORE THAN ONE VECTOR, BR LEVEL OR BURST RATE

When the hardware questions were answered, two units were selected with the same UNIBUS address but with a different vector, BR level or burst rate. A single UDA 50 car have only one vector, BR level or burst rate. The program is aborted and returns to the Runtime Services prompt so that you can change the hardware questions.

OOOO2 CZUDC SYS FTL ERR OOOO2 ON UNIT OO TST xxx SUB OOO PC: xxxxxx HOST PROGRAM UDA AT 172150 RUNTIME x:xx:xx I DON'T LIKE THE ANSWERS YOU GAVE TO THE HARDWARE QUESTIONS TWO UNITS SELECT THE SAME DRIVE

The hardware questions for two units were exactly the same. The program is aborted and returns to the Runtime Services prompt so that you can change the hardware questions.

OCCUPATION OCCUPATIONS

CZUDC SYS FTL ERR OCCUPATION OC

Up to four physical disk drives can be attached to a UDA 50 at one time. A physical disk drive may be from one to four logical disk drives. Each logical disk drive is considered one unit to the diagnostic program. Even though more than eight logical disk drives can be attached to one UDA-50, the UDA 50 only supports eight. The program is aborted and returns to the Runtime Services prompt so that you can change the hardware questions.

OOOO4 CZUDC SYS FTL ERR OOOO4 ON UNIT OO TST xxx SUB OOO PC: xxxxxx HOST PROGRAM RUNTIME x:xx:xx NOT ENOUGH ROOM IN MEMORY TO TEST THE UNITS SELECTED PLEASE START PROGRAM OVER AND TEST FEWER UNITS AT A TIME

This program does not limit the number of units that can be tested by specifying a maximum number. What limits the number is the amount of memory used to store data on each unit. You have exceeded the number of units that are testable at one time. Start program over and select fewer units.

00005 CZUDC SYS FTL ERR 00005 ON UNIT 00 TST xxx SUB 000 PC: xxxxxx HOST PROGRAM RUNTIME x:xx:xx CHECKSUM ERROR IN DM PROGRAM FILE

As a DM program is read from the load media, a checksum is calculated. If the checksum contained in the file does not match what is calculated, an error reading the data file is declared. Restore the data file ZUDDEO.PAK to your load media.

00006 CZUDC SYS FTL ERR 00006 ON UNIT 00 TST xxx SUB 000 PC: xxxxxx HOST PROGRAM RUNTIME x:xx:xx TABLE INCONSISTANCY ERROR. PLEASE RE-LOAD PROGRAM

When the host program is started, controller tables are set according to the P tables. Error 00006 w'll occur if the tables were corrupted after restarting the d'agnostic. Load and start your program again.

00007 CZUDC SYS FTL ERR 00007 ON UNIT 00 TST xxx SUB 000 PC: xxxxxx HOST PROGRAM RUNTIME x:xx:xx ERROR IN DM PROGRAM FILE. DM PROGRAM NOT FOUND

The host program was not able to read the DM program from the load med'a properly. Restore the data file ZUDDEO.PAK to your load med'a.

OOUOB CZUDC SYS FTL ERR OOOOB ON UNIT OO TST xxx SUB OOO PC: xxxxxx HOST PROGRAM UDA AT 172150 RUNTIME x:xx:xx I DON'T LIKE THE ANSWERS YOU GAVE TO THE HARDWARE QUESTIONS TWO UDA'S USE THE SAME VECTOR

The hardware questions for two units specified different UDA 50 Unibus addresses indentical vector addresses. The program is aborted and returns to the Runtime Services prompt so that you can change the hardware questions.

O0010 CZUDC DVC FTL ERR O0010 ON UNIT OO TST xxx SUB OOO PC: xxxxxx HOST PROGRAM UDA AT 172150 RUNTIME x:xx:xx WRONG APT DIAGNOSTIC IS BEING USED WITH THIS CONTROLLER USE CIUDx

The APT diagnostics are designed to run with one type of UDA 50 board set (either M7161-2 or M7485-6). For example, If the user is running CIUDA with a UDA-50 M7485-6 type, this error will occur. In that case the user will be told to use CIUDF. The following is a detailed description of which test is used with what configuration.

CIUDF - UDA-50 with M7485-6 modules runs tests 1-3 CIUDG - UDA-50 with M7485-6 modules runs test 4 CIUDH - UDA-50 with M7485 6 modules runs tests 1 3 CIUDI UDA-50 with M7485 6 modules runs test 4 O0014 CZUDC DVC FTL ERR O0014 ON UNIT OO TST xxx SUB xxx PC: xxxxxx HOST PROGRAM UDA AT 172150 RUNTIME x:xx:xx UDA50 CONTROLLER IS AT A REVISION LEVEL NO LONGER SUPPORTED BY THIS DIAGNOSTIC PROGRAM. THIS PROGRAM REQUIRES A UDA50-A CONTROLLER (MODEL 6) WITH MICROCODE REVISON AT 3 OR GREATER.

CONTROLLER REPORTED MODEL CODE xx AND MICROCODE VERSION xx

All UDA50-0's (modules M7161-2) are not supported by this diagnostic. The module set M7485-6 is the only one that can be tested by this diagnostic. If the controller is a UDA50-0 (M7161 2) it will not be tested. If the controller is a UDA50-A (M7485-6) and it has old microcode (the microcode version is less than 3) this message will be printed but testing will go on. If the controller consists of the M7161-2 modules, install one with M7485-6 modules. Do not intermix the two, it will not work!

OOO21 CZUDC DVC FTL ERR OOO21 ON UNIT OO TST OO1 SUB OO3 PC: xxxxxx HOST PROGRAM UDA AT 172150 RUNTIME x:xx:xx UDA RESIDENT DIAGNOSTICS DETECTED FAILURE UDASA CONTAINS 105154 REPLACE UDA MODULE M7486

The UDA Resident diagnostic detected a failure. The error is displayed in the UDASA. Here are the possible error values and their meaning:

104000 - Fatal seguncer error 104040 - D processor ALU error 104041 - D proc ROM parity error 105102 - D proc with no Board #2 or RAM parity error 105105 - D proc RAM buffer error 105152 - D proc SDI error 105153 - D proc write mode wrap SERDES error 105154 - D proc read mode SERDES, RSGEN, and ECC error 106040 U proc ALU error 106041 - U proc Control Register error 106042 - U proc DFAIL/ROM parity error/Board #1 test count is wrong 106047 - U proc Constant ROM error with D proc running SDI test 106055 - Unexpectant trap found, aborted diagnostic 106071 - U proc ROM error 106072 - U proc ROM parity error 106200 - Step 1 data error (MSB not set) 107103 - U proc RAM parity error 107107 - U proc RAM buffer error 107115 - Board #2 test count was wrong 112300 - Step 2 error 122240 - NPR error 122300 - Step 3 error 142300 - Step 4 error

Replace the board specified. M7485 is the Unibus interface board. M7486 is the SDI interface board.

OOO22 CZUDC DVC FTL ERR OOO22 ON UNIT OO TST OO1 SUB OO3 PC: xxxxxx HOST PROGRAM UDA AT 172150 RUNTIME x:xx:xx STEP BIT DID NOT SET IN UDASA REGISTER DURING INITIALIZATION STEP BIT EXPECTED OO4000 UDASA CONTAINS OO0000 REPLACE UDA MODULE M7485

The UDA did not respond as expected during the initialization sequence which communicates using data in the UDASA register. A normal response from the UDA contains either a STEP bit or an ERROR bit defined as follows:

Bit 15 (100000) Error bit Bit 14 (040000) Step 4 b't Bit 13 (020000) Step 3 bit Bit 12 (010000) Step 2 bit bit 11 (004000) Step 1 bit

The expected step bit nor the error bit set within the expected time.

CZUDC DVC FTL ERR 00023 ON UNIT 00 TST 001 SUB 005 PC: xxxxxx
HOST PROGRAM UDA AT 172150 RUNTIME x:xx:xx
UDA DID NOT CLEAR RING STRUCTURE IN HOST MEMORY DURING INITIALIZATION
6 WORDS WERE TO BE CLEARED STARTING AT ADDRESS 040644
FIRST SEVERAL WORDS NOT CLEARED (UP TO 6):
ADDRESS CONTENTS

ADDRESS CONTENTS 040644 000010 040650 000010 040652 000010

REPLACE UDA MODULE M7485

The UDA is to clear the ring structure (a communications area used by the UDA to talk to the host) in host memory before Step 4 of initialization. If the UDA d'agnostics did not clear memory and did not flag an error, then error message 00023 is displayed. The contents of each word in memory is set to 177777 before the test. Failure of the UDA to clear each word indicates a fault in the address interface to the Unibus.

O0024 CZUDC DVC FTL ERR O0024 ON UNIT OO TST OO1 SUB OO6 PC: xxxxxx HOST PROGRAM UDA AT 172150 RUNTIME x:xx:xx UDASA REGISTER DID NOT GO TO ZERO AFTER STEP 3 WRITE OF INITIALIZATION PURGE/POLE DIAGNOSTICS WERE REQUESTED UDASA CONTENTS 004400

For better testing, the host can test the PURGE and POLE mechanism of the UDA. To do so the host sets bit15 of the step 3 data and sends the data to the UDA. The UDA must go to zero and wait for the purge and pole. If the UDA never went to zero, then error message 00024 is displayed. The UDA may have a bad M7485 module or the UNIBUS maybe broken.

OOO25 CZUDC DVC FTL ERR OOO25 ON UNIT OO TST xxx SUB OOO PC: xxxxxx

OOO31 CZUDC DVC FTL ERR OOO31 ON UNIT OO TST xxx SUB OOO PC: xxxxxx HOST PROGRAM UDA AT 172150 RUNTIME x:xx:xx NO INTERRUPT RECEIVED FROM DM PROGRAM FOR 3 MINUTES ASSUME PROGRAM IS HUNG

All DM programs are required to communicate with the host program; so as to assure the host program that the DM program is not hung up or in an endless loop. If the DM program has not done so, the host program assumes the DM is hung and this message appears.

O0032 CZUDC DVC FTL ERR O0032 ON UNIT OO TST xxx SUB OOO PC: xxxxxx HOST PROGRAM UDA AT 172150 RUNTIME x:xx:xx MESSAGE BUFFER RECEIVED FROM DM PROGRAM WITH UNKNOWN REQUEST NUMBER MESSAGE BUFFER CONTAINS:

000001 000002 000003 000004 000005 000006 000007 000008 000009 000010 000011 000012 000013 000014 000015 000016 000017 000018 000019 000020 000021 000022 000023 000024 000025 000026 000027 000028 000029 000030 000031 000032 000033 000034 000035

The DM program and the host program communicate with each other using packets. Each packet must have a request number set up by the DM program and interpreted by the host program. This request number is not a known request number. The problem may be the UNIBUS or either one of the UDA modules or a corrupted DM program. Word 1 contains the DM request number, and word 2 typically contains the drive number. The rest of the buffer contains information specific to a DM request. The numbers in the example show the order in which words are displayed.

00033 CZUDC DVC FTL ERR 00033 ON UNIT 00 TST REX SUB 000 PC: REARER HOST PROGRAM UDA AT 172150 RUNTIME XIXXIXX RESPONSE PACKET FROM UDA DOES NOT CONTAIN EXPECTED DATA EITHER UDA RETURNED ERROR STATUS OR PACKET WAS NOT RECEIVED CORRECTLY COMMAND PACKET SENT RESPONSE PACKET RECEIVED 000000 000020 000000 000020 000000 000000 000000 000000 200000 000002 202000 000202 000000 014336 000000 014336 000000 034674 000000 034674 000000 000000 000000 00000C 000000 000000 000000 000000 000000 051232 000000 051232 000000 000000 000000 000000 000000 000000 000000 000000 000000 000000 000000 000000 000000 000000 000000 000000

The host program inspected the response packet which was given by to UDA. The response packet may have been in error with one of the following points:

- 1) The end code was not as expected.
- 2) The status code showed an error occurred with the last command.
- 3) The command reference numbers (the first word) did not match.

If 1 or 3 occurred, there may have been a transmission problem between the UDA and the host program. If 2 occurred, check the error code in the MSCP specification for further information. The packets are displayed two words per line, low order word and byte to the right (corresponding to the MSCP long word entity).

OCC CZUDC DVC FTL ERR OCC ON UNIT OCC TST ARR SUB OCC PC: REREAL HOST PROGRAM UDA AT 172150 RUNTIME A:RA:RA NO INTERRUPT RECEIVED FROM UDA FOR 30 SECONDS HMILE LOADING DM PROGRAM

After a DM program has been sent to the UDA, the host program expects an interrupt within 30 seconds. The interrupt is used to assure the host program that the DM program is sene. If no interrupt occurred, then error message 00036 is displayed and the DM program 's assumed to be hung.

CZUDC DVC FTL ERR 00037 ON UNIT 00 TST NRN SUB 00G PC: NRNRYN HOST PROGRAM UCA AT 172150 RUNTIME N:NR:NR UDA REPORTED FATAL ERROR IN UDASA REGISTER WHILE LOADING DM PROGRAM UDASA CONTAINS 100004 REPLACE UDA MODULF M7485

While oscing the DM program to the UDA, the UDASA became non zero. When this occurs, it signifies that the UD4 microcode has run across a fatal error. The displayed value is in octal. Check the error code with the list included with error number 00030.

O0038 CZUDC DVC FTL ERR 00038 ON UNIT 00 TST 001 SUB 002 PC: ***** HOST PROGRAM UDA AT 172150 RUNTIME *:**:** MEMORY ERROR TRYING TO READ UDA REGISTERS CHECK UNIBUS SELECTION SWITCHES ON UDA MODULE M7486 OR UNIBUS

```

After reading an entire buffer, the DM program checks each location. If any or all of the locations did not contain the expected data, this message appears. It contains the buffer size in octal, hex and decimal. The reason it appears in decimal is so the user can correlate this value with the number of errors which is printed in decimal. The starting addresses of the buffers are printed in ortal and hex. There will always be at least two buffers and up to four buffers printed. The current data pattern read is printed. DM program will be test ng the buffer with this data pattern. The last data pattern written by the DM program is printed. The address of the last buffer wr tten 's printed in cctal and hex. As many as three errors are presented in the message. This portion presents the location of the error, the expected data and the actual of a all in octal and hex.

01006 CZUDC HRD ERR 01006 ON UNIT 00 TST 001 SUB 007 PC: xxxxxx UNIBUS ADDRESSING DM PC:xxxx UDA AT xxxxxx RUNTIME hhh:mm:ss UNIBUS ADDRESSING ERROR. TWO ADDRESSES READ SAME LOCATION.

KNOWN GOOD ADDRESS 625252 32AAA ERROR ADDRESS 425252 22AAA ADDRESS BIT IN ERROR 200000 10000

The UDA can only write to a small portion of memory because there is a PDP-11 program running in the memory. To verify it can address all of memory, it uses one location that it is permitted to write which it calls a "known good address". By changing only one bit in the address of this location it selects a "test address". Different patterns are written to the "known good address", each followed by a read of the "test address". If the data read from the "test address" matches the data written to the "known good address" each time, the address line is determined to be stuck. The "test address" is printed as the error address.

3.2.3 TEST 2 INFORMATIONAL MESSAGES

UNIT x UDA AT xxxxxx DRIVE xxx RUNTIME ...mm·ss
INFORMATION SENT BACK FROM THE DRIVE IS BEING PRESENTED.
TEST NUMBER 0000
DRIVE TYPE 00
ERROR NUMBER 0000
data

There is not error, but it is a message. The d'sk drive wanted the let the host know what had happened when the drive's internal diagnostic was run. The format follows that of hard error 2021.

UNIT x UDA AT xxxxxx DRIVE xxx RUNTIME hhh:mm:ss FOLLOWING REPORT HAS BEEN TRUNCATED DUE TO SIZE

This is a message that may appear if the disk dr've gave too much data for the DM program to handle. This message may preced the previous message and hard error 2021.

3.2.4 TEST 2 ERROR MESSAGES (02000 TO 02999)

02000 CZUDC HRD ERR 02000 ON UNIT 00 TST 002 SUB 000 PC: xxxxxx DISK RESIDENT DM PC:xxxx UDA AT xxxxxx DRIVE xxx RUNTIME hhh:mm:ss HOST SPECIFIED UNIT #0 THAT CAN'T BE FOUND. TEST2 RESTARING

When test 2 starts executing out of the DM, it doesn't know if it had been started to execute drive diagnostics or restarted to down line load a diagnostic into the drive. If it had been restarted for the latter reason, the host must tell Test 2 which drive was to receive the diagnostic. If the drive specified by the host is not attached to the UDA or could not be located by Test 2, this error message will be printed.

O2007 CZUDC HRD ERR O2007 ON UNIT OO TST OO2 SUB OO0 PC: ***xxx DISK RESIDENT DM PC:xxxx UDA AT xxxxxx DRIVE xxx RUNTIME hhh:mm:ss ERROR BIT SET IN GET STATUS RESPONSE AFTER DRIVE CLEAR COMMAND GET STATUS RESPONSE REAL TIME STATE state

STATUS (FROM R TO L): word6 word5 word4 word3 word2 word1 word0:

This error message is presented when an error bit is set in the status of a drive after the drive was cleared of all errors. The data displayed is the responce from a GET STATUS command. The error bits in the responce are in bit position 3, 5 and 6 of word2. For further description of the GET STATUS responce, refer to the SDI Functional Spec v3.6 and the drive's functional spec.

REAL TIME STATE state: REAL TIME STATE 0003

The real time state is the real time drive state <<AFTER>> Test 2 detected the error. <<THIS VALUE IS DISPLAYED IN HEX>>. In this example, receiver ready and attention are both asserted.

The bit positions are defined as follows:

0001 Receiver ready (Test 2 able to transmit to drive)

0002 Attention (error occurred or online timeout expired)

0040 - Available (drive offline and usuable)

1000 Read/Write ready

The complete meaning of these bits is beyond the scope of this text, please refer to the operator documentation for the drive you are working on.

- STATUS (R TO L): word6 word5 word4 word3 word2 word1 word0:
 The status is the response to the SDI GET STATUS command. These
 words are printed in HEX. <<NOTE THAT THE STATUS IS PRINTED OUT
 FROM RIGHT TO LEFT!!>>. The status' meaning is beyond the scope
 of this text, please refer to the operator documentation for the
 drive you are working on.
- 02008 CZUDC HRD ERR 02008 ON UNIT 00 TST 002 SUB 000 PC: xxxxxx DISK RESIDENT DM PC:xxxx UDA AT xxxxxx DRIVE xxx RUNTIME hhh:mm:ss TIME-OUT ON SEND OF ONLINE COMMAND TO DRIVE

The ONLINE command timed out while it was sent to the drive. The drive did not assert the RECEIVER READY signal over the SDI.

02009 CZUDC HRD ERR 02009 ON UNIT OO TST 002 SUB 000 PC: xxxxxx DISK RESIDENT DM PC:xxxx UDA AT xxxxxx DRIVE xxx RUNTIME hhh:mm:ss ERROR DURING RECEIVE OF ONLINE RESPONSE FROM DRIVE explanation

This error message is presented if a receive of an ONLINE command was in error. An explanation of what the error was is also presented. These explanations are:

- TIMEOUT ERROR OCCURED DURING RECEIVE XFC
 This error is a failure of the drive to respond to an SDI level 2 command (see the SDI specification) before the drive-supplied command timeout expires.
- 1ST WORD NOT START FRAME DURING RECEIVE XFC
 The first word received by the UDA from the drive was not a valid message start frame.
- FRAMING ERROR OCCURED ON SDI LEVEL O READ DURING RECEIVE XFC
 This is caused by one of the following conditions:

 1) Illegal frame code -- the frame is not a message start, continue, or end frame. 2) Illegal sequence of frames—such as a message start frame without ever receiving a message end frame. This can be caused by the drive sending a response before the UDA asserts receiver ready, or a random hit on the SDI cable that garbles a frame or a bad drive transmitter or UDA receiver.
- CHECKSUM ERROR OCCURED ON 'DI LEVEL O READ DURING RECEIVE XFC
 The checksum attiched to a message end frame did not
 match the checksum computed over the level 2 command.
 This could be caused by a bad drive transmitter, bad
 UDA receiver, incorrectly computed checksum by the
 drive (unlikely) or a random hit on the SDI cabl.

- BUFFER SIZE SMALLER THEN RESPONSE DURING RECEIVE XFC

 A buffer size size set aside for the response was not large enough for the response received. This is caused by the drive sending a response that is incorrect for the request sent to the drive, or the drive sending some garbage with the response.
- CODE FROM RECEIVE YFC WAS UNINTELLIGIBLE FROM SUBSYSTEM 0000 The responce from the drive was not anything that was expected. Possible UDA microcode change without test 2 update.
- O2010 CZUDC HRD ERR O2010 ON UNIT OO TST OO2 SUB OO0 PC: xxxxxx DISK RESIDENT DM PC:xxxx UDA AT xxxxxx DRIVE xxx RUNTIME hhh:mm:ss ONLINE COMMAND WAS UNSUCCESSFUREAL TIME STATE 0003

DISK EXERCISER DM PC:xxxx UDA AT xxxxxx DRIVE xxx RUNTIME hh:mm:ss RCT AREA CORRUPTED, COULD NOT FIND REPLACEMENT FOR LBN WITH HEADER NOT FOUND ATTEMPTING TO READ RCT LBN bn SEARCHING FOR LBN bn

Error 4004 will occurr only when Test 4 is running in the customer data area. It occurs when 1) A sector 's either marked revectored or the header can't be found in two revolutions of the disk (both cases should be revectored) and 2) The replacement for that sector 'sn t found in the RCT and 3) a NULL entry isn t found at the end of the RCT (see DEC STANDARD 166, Replacement and Caching Table Format). In either case, the subunit should be reformatted, and the cause of the RCT corruption determined.

Error 4005 occurs only when Test 4 's writing a DBN or RBN. This is because bad blocks in the diagnostic area are not revectored, and RBN s are what LBN s are revectord to, so they should never be bad. Test 4 reports this error if the header being searched for couldn't be found in two revolutions of the disk.

Select track and read or write not executed occurs when the UDA attempts to send the select track and read/write level 1 cmd, but receiver ready is desserted or the state is invalid so it cannot send the command (the SERDES could also be broken so it sunable to send the command). The same error is generated if the UDA gets a header sync timeout, and when it looks at the drive's state, it is either invalid or reciever ready is desserted (header sync timeout is <<NOT>> a error it's quite normal on a high density disk).

See retry/recovery section for recovery details.

retries: The number of times the seek was re issued

If a seek required retries, error 4015 would print to notify the operator.

04016 CZUDC DEV FTL ERR 04016 ON UNIT 00 TST 04 SUB 000 PC: xxxxxx DISK EXERCISER DM PC:xxxx UDA AT xxxxxx DRIVE xxx RUNTIME hh:mm:99 ERRORS DURING DRIVE INITIALIZATION AND SETUP THIS UDA AND ALL DRIVES ATTACHED WILL BE REMOVED FROM TESTING

If any errors occur during drive and test initialization, DRIVES ATTACHED TO THE UDA THAT HAD THE DRIVE INITIALIZATION ERRORS WILL NOT BE TESTED. In this case, error 4016 will be printed to notify the operator. THIS ERROR DOES <<NOT>> REFER TO UDA INITIALIZATION. This error is unaffected by the operato inhibiting the dropping of units.

O4017 CZUDC DEV FTL ERR 04017 ON UNIT 00 TST 04 SUB 000 PC: xxxxxx DISK EXERCISER DM PC:xxxx UDA AT xxxxxx DRIVE xxx RUNTIME hh:mm:ss NO VALID STATE FROM DRIVE NO DRIVE CLOCKS

CZUDC DEV FTL ERR 04017 ON UNIT 00 TST 04 SUB 000 PC: XXXXXX DISK EXERCISER DM PC:XXXX UDA AT XXXXXX DRIVE XXX RUNTIME hh:mm:ss NO VALID STATE FROM DRIVE HARD PARITY OR PULSE ERROR FOR 1/2 A SECOND

If Test 4 is <<EVER>> unable to get valid drive state, the drive is immediately dropped, and error 4017 is printed. There are two types of invalid state: no clocks or 'hard' errors. If Test 4 <<EVER>> detects no clocks, the driver is dropped IMMEDIATELY. Parity and pulse errors are normal, so Test 4 tolerates them, <<UNLESS THEY HAPPEN CONTINUOUSLY FOR 1/2 A SECOND>>. If they do occur for 1/2 a second, either the transmitter or receiver is bad, and the drive is dropped. If the operator has inhibited the dropping of units, Test 4 will retry the module that the error occurred on.

O4018 CZUDC DEV FTL ERR 04018 ON UNIT 00 TST 04 SUB 000 PC: XXXXXX DISK EXERCISER DM PC:XXXX UDA AT XXXXX DRIVE XXX RUNTIME hh:mm:95 ATTEMPT TO WRITE ON WRITE PROTECTED DRIVE ERROR CODE RETURNED FROM UDA: code REAL TIME STATE 0003 STATUS (R TO L): 1312 1110 0908 0706 0504 0302 0100

code:

The error (in octal) returned to Test 4 from the UDA when Test 4 attempted to write on the write protected drive.

The UDA error codes (in octal) are as follows:

code error

2	SELECT TRACK AND WRITE LEVEL 1 CMD NOT SENT
3	LBN IS REVECTORED
4	HEADER NOT FOUND
153	SEEK OR HEAD SELECT ERROR
213	R/W RDY DROPPED
253	DATA OR STATE CLOCK TIMEOUT
313	RCVR RDY DROPPED
413	REAL TIME STATE RECEIVE ERROR

If Test 4 attempts to write on a write protected drive, error 4019 is printed. Test 4 requires the drive to detect the attempt to write when write protected and return an error for this error to be printed. If the operator has inhibited the dropping of units, a seek will be issued and the write attempted again.

O4019 CZUDC HRD ERR O4019 ON UNIT OO TST O4 SUB OOO PC: xxxxxx DISK EXERCISER DM PC:xxxx UDA AT xxxxxx DRIVE xxx RUNTIME hh:mm:ss HEADER NOT FOUND DURING READ type bn
SECTORS FROM INDEX sector TRK track GRP group CYL cylinder ORIGIN OF SEEK: GRP group CYL cylinder

Error 4019 occurs only when Test 4 is reading a DBN or RBN. This is because bad blocks in the diagnostic area are not revectored, and RBN s are what LBN's are revectord to, so they should never be bad. Test 4 reports this error if the header being searched for couldn't be found in two revolutions of the disk.

O4020 CZUDC SFT ERR O4020 ON UNIT 00 TST 04 SUB 000 PC: xxxxxx DISK EXERCISER DM PC:xxxx UDA AT xxxxxx DRIVE xxx RUNTIME hh:mm:ss SELECT TRACK AND READ LEVEL 1 CMD NOT SENT ATTEMPT attempt type bn SECTORS FROM INDEX sector TRK track GRP group CYL cylinder ORIGIN OF SEEK: GRP group CYL cylinder REAL TIME STATE 0003 STATUS (R TO L): 1312 1110 0908 0706 0504 0302 0100

Select track and read or write not executed occurs when the UDA attempts to send the select track and read/write level 1 cmd, but receiver ready is deasserted or the state is invalid so it cannot send the command (the SERDES could also be broken so it's unable to send the command). The same error is generated if the UDA gets a header sync timeout, and when it looks at the drive's state, it is either invalid or reciever ready is deasserted (header sync timeout is <<NOT>> a error - it's quite normal on a high-density disk).

See retry/recovery section for recovery details.

L6

The following commands_types occur only during initialization, and will cause a device fatal if they occur. Inhibiting the dropping of units has no effect on these errors.

ATTEMPTING TO SPIN UP DRIVE ATTEMPTING TO GET COMMON CHAR ATTEMPTING TO GET SUBUNIT CHAR

If <<ANY>> error occurs during initialization, <<NO>> testing is done on <<ANY>> drive attached to the UDA that the initialization erorr occured on. See error number 4016.

3.2.9 SPECIAL DEVICE FATAL (05000)

O5000 CZUDC DVC FTL O5000 ON UNIT OO TST 002 SUB 000 PC: xxxxxx DISK zzzzzzz DM PC:xxxx UDA AT xxxxxx DRIVE xxx RUNTIME hhh:mm:ss UNABLE TO FIND REQUESTED DRIVE FOR TESTING THE FOLLOWING IS VISIBLE ON THE PORTS UDA PORT 0 -- description UDA PORT 1 -- description UDA PORT 2 - description UDA PORT 3 -- description

Where zzzzzzz is either 'RESIDENT', 'FUNCION' or 'EXERCISER'. This message is presented when the specified drive was not found by test 2, test 3 or test 4 on any of the ports. A description of what was each port follows.

NO DRIVE ATTACHED

- There is nothing on the port. If there is suppose to be a drive on this port, make sure there is an odd number of cables between the UDA and the drive and make sure the cables are properly attached.

RCVR RDY NEVER ASSERTED

- The device on the port did not assert RCVR RDY while trying to get state.

TIMEOUT OF SEND

- Sending an SDI command timed out. RCVR RDY is not asserted.

TIMEOUT OF RECEIVE

- Receiving an SDI command timed out. The drive failed to respond to an SDI level 2 command before a timeout expired.

FIRST WORD RECEIVED WAS NOT START FRAME

- The first word received by the UDA from the drive was not a valid message start frame.

FRAMING ERROR ON LEVEL O RECEIVE

- The device and the UDA are out of sync or an illegal frame code (the frame is not a message start, continue, or end frame) or illegal sequence of frames. This can be caused by the drive sending a response before the UDA asserts receiver ready, or a random hit on the SDI cable that garbles a frame or a bad drive transmitter or UDA receiver.

CHECKSUM ERROR ON LEVEL O RECEIVE

The checksum attached to a message end frame did not match the checksum computed over the level 2 command. This could be caused by a bad drive transmitter, bad UDA receiver, incorrectly computed checksum by the drive (unl'kely) or a random hit on the SDI cable.

RESPONSE LONGER THAN EXPECTED FOR CMD

The buffer size set aside for the response was not large enough for the response received. This is caused by the drive sending a response that is incorrect for the request sent to the drive, or the drive sending some garbage with the response.

DRIVE n[, consecutive drive numbers if subunited drive] [further explanation] A drive was found at the end of the cable. It may be a subunited drive, so all the subunit numbers are printed. A further explanation may be presented. These further explanations are:

DRIVE NOT AVAILABLE TO THIS UDA
The drive was found but is not available to this
UDA. It may be dual ported and the drive is online
to another controller.

UNSPINABLE DRIVE

The drive is unspinable. The drive may be powered up but the RUN/STOP switch may be popped out.

;

3.3 TEST 4 RETRY/RECOVERY METHODS

ECC Error on Disk Read

ECC DETECTED ERROR, BUT CORRECTION FAILED ECC CORRECTIONS EXCEED THRESHOLD ECC DETECTED ERROR (If ECC correction disabled)

Retry/Recovery The UDA or Test 4 will first re-read the sector with the erroneous ECC N times, then N times for each level of error recovery the drive supports. The value of N is an SDI drive characteristic. This retry mechanism will persist until either the recovery level reaches zero or the operation succeeds. It should be noted that the menual intervention questions can disable retries (in this case the recovery fails the first time) and disable error correction (i.e., no ECC correction will be performed). ECC correction and retries are <ALWAYS>> enabled when the Test 4 is reading the RCT.

Recovery success. One soft error is counted for the entire operation including retries.

Recovery Failure Test 4 mill 'ssue a hard error for the sector. No soft errors mill be counted.

Error Detecting Code (EDC) Error

EDC DETECTED ERROR BUT ECC DID NO: ECC CORRECTION SUCCEEDED, BUT EDC DETECTS ERROR

This error is indicative of a UDA hardware error, either a SERDFS failure or an undetected RAM failure, or a sector that was written with an incorrectly computed EDC.

Retry/Recovery - The UDA or Test 4 will re read the sector with the erroneous EDC N times, then N times for each level of error recovery the drive supports. The value of N is an SDI drive characteristic. This retry mechanism will persist until either the recovery level reaches zero or the operation succeeds. It should be noted that the manual intervention questions can disable retries (in this case the recovery fails the first time). Retries are <<ALWATS>> enabled when the Test 4 is reading the RCT.

Recovery success. One soft error 's counted for the entire operation including retries.

Recovery Failure Test 4 μ 'll 'ssue a hard error for the sector. No soft errors μ ill be counted.

5D1 : evel 2 and Asynchronous Errors

he SDI level 2 errors are as follows:

- Packet acknowledge failure
- Level 2 command error response, "DE" bit set Level 2 command error response, "PE" or 'RE' bit set 0
- Receipt of erroneous drive response 0
- Seek complete timeout 0
- Asynchronous drive errors

Level 2 errors are always retried, even if retries are disabled in the menual intervention questions.

In the following retry/recovery algorithms, the Test 4 Generic error recovery is the following steps:

- Issue online command
- 2. Get status
 - If the port, run or spindle ready (PS, RU or SR) bit 's 20. deasserted, an Immediate device fatal error is reported and the unit and all its subunits are dropped from testing.
 - **2b**. If the recelibrate requested (RR) bit is set, Test 4 will issue a RECALIBRATE, then SEEK «AFTER» generic error recovery is complete.
 - If the drive error (DE) bit is set, Test 4 will issue a SEEK 2c. <<AFTER>> generic error recovery is complete.
- 3. If no drive errors, go to 5
- 4. Send DRIVE CLEAR command
- Change mode

If the drive s timeout expires once, so the drive asserts attent on NOTE: just to get Test 4 to issue a level 2. Test 4 m'll go through the above error recovery. However, since the timeout expiring s not an error, no error message is issued.

Packet Acknowledge Failure

TIMEOUT OF SEND TIMEOUT OF RECEIVE

The timeout of send occurs when the UDA attempts to send a level 2 command to the drive, but the drive s receiver ready is not asserted. Timeout of receive is a failure of the drive to respond to an SDI level 2 command (see the SDI specification) before the drive supplied command timeout expires. These errors are grouped together because their recoveries are the same.

Retry Recover, UDA The steps listed below are performed.

- 1. The dr ve 's 'n t al'zed.
- An SDI GET STATUS command is issued.
- 3. If the status obtained in the previous step indicated error conditions, these error conditions are resolved and then cleared by an SDI DRIVE CLEAR command.
- 4. An SDI SEEK command is issued.
- 5. The command is retried.

Retry/Recovery - Test 4 - The steps listed below are performed.

- 1. The drive is nitialized
- 2. Test 4 Generic error recovery is performed
- 3. An SDI SEEK command 's 'ssued.
- 4. The command is retried.

Recovery success. One soft error is counted for the entire operation including retries.

Recovery Failure The above sequence will be repeated two times and, if the failure persists, the Test 4 will issue a device fatal error and the drive and all its subunits will be dropped. It should be noted that the retry stra6dgy for SDI level 2 errors involves issuing additional level 2 commands. The retry count is the sum of all retries on all SDI level 2 commands, including those commands issued in recovery attempts.

Level 2 Command Error Response "DE" Bit Set

RESPONSE OF LEVF 2 CMD NOT AS EXPECTED SEEK RECEIVED UNSUCCESSFUL RESPONSE

Ar UNSUCCESSFUL response to a level 2 command, with the "DE' bit set in the status response, notifies the Test 4 that a drive error was detected (or occurred) in connection with the execution of the SDI command.

Retry/Recovery UDA The steps 1'sted below are performed.

- 1. An SDI GET STATUS command is 'squed,
- 2. The drive error is cleared by an SDI DRIVE CLEAR command and a SEEK command is issued for the cylinder where the drive was postioned when the error was reported.
- The command is retried.

Retry/Recovery Test 4 The steps listed below are performed.

- Test 4 Generic error recovery is performed Note that because the "DE" bit is set, Test 4 generic error recovery will issue a SEEK (see generic error recovery)
- 2. The command is retried

Recovery success - One soft error is counted for the entire operation including retries.

times and, if the failure persists, the Test 4 will issue a device fatal error and the drive and all its subunits will be dropped. Note that the retry strategy for SDI level 2 errors involves issuing additional level 2 commands. The retry count is the sum of all retries on all SDI level 2 commands, including those commands issued in recovery attempts.

Recovery Failure - The above sequence is repeated two

Level 2 Command Error Response "PE" or "RE' Bit Set

RESPONSE OF LEVEL 2 CMD NOT AS EXPECTED SEEK RECEIVED UNSUCCESSFUL RESPONSE

An UNSUCCESSFUL response to a level 2 command with the "PE" or "RE" bit set in the status response notifies the Test 4 that the command either was not appropriate for the state of the drive, or that the command contained invalid arguments.

Retry/Recovery - UDA The steps listed below are performed.

- 1. An SDI GET STATUS command is issued
- 2. The drive error is cleared by an SDI DRIVE CLEAR command.
- 3. The controller verifies the state of the drive and, if possible, retries the level 2 command. Otherwise, the UDA notifies the host and bypasses subsequent retries.

Retry/Recovery - Test 4 The steps listed below are performed.

- 1. Test 4 Generic error recovery is performed
- 2. The command is retried

Recovery success - One soft error is counted for the entire operation including retries.

Recovery Failure - The above sequence is repeated two times and, if the failure persists, the Test 4 will issue a device fatal error and the drive and all its subunits will be dropped. Note that the retry strategy for SDI level 2 errors involves issuing additional level 2 commands. The retry count is the sum of all retries on all SDI level 2 commands, including those commands issued in recovery attempts.

Receipt of an Erroneous Drive Response

FIRST WORD RECEIVED WAS NOT START FRAME
FRAMING ERROR ON LEVEL O RECEIVE
CHECKSUM ERROR ON LEVEL O RECEIVE
BUFFER SIZE SMALLER THAN RESPONSE
UNKNOWN ERROR CODE RETURNED FROM LEVEL 2 RECEIVE (hard error)

The first word not start frame error is caused when the UDA does not see a val d message start frame as the first frame received from the drive. The framing error is caused by the UDA receiving an illegal frame code - the frame is not a message start, continue, or end frame or Illegal sequence of frames - such as a message start frame without ever receiving a message end frame. The checksum error occurs when a message end frame checksum did not match the checksum computed over the level 2 command. The buffer size smaller than response error occurs when the buffer set aside for the response was not large enough for the response received. The urknown error code is returned when the UDA returns an error code that the Test 4 does not recognize. These errors are grouped together because their recoveries are the same.

Retry/Recovery - UDA - The steps listed below are performed.

- 1. An SDI GET STATUS command is 'ssued.
- 2. If the status obtained in the previous step indicated error conditions, these error conditions are resolved and then cleared by an SDI DRIVE CLEAR command.
- 3. The command is retried.

Retry/Recovery Test 4 - The steps listed below are performed.

- 1. Test 4 Generic error recovery is performed
- 2. The command is retried

Recovery success One soft error is counted for the entire operation including retries.

Recovery Failure - The above sequence is repeated two times and, if the failure persists, the Test 4 will issue a device fatal error and the drive and all its subunits will be dropped. Note that the retry strategy for SDI level 2 errors involves issuing additional level 2 commands. The retry count is the sum or all retries on all SDI level 2 commands, including those commands issued in recovery attempts.

SFQ 0085

Seek Complete Timeout

ATTN ASSERTED DURING SEEK SEEK DID NOT COMPLETE, NEITHER ATTN OR R/W RDY WAS ASSERTED

This error occurs when the drive fails to assert READ/WRITE READY, indicating the successful completion of a seek, or asserts the SDI ATTENTION signal without asserting the READ/WRITE READY signal, indicating the unsuccessful completion of a seek.

Retry/Recovery - UDA The steps listed below are performed.

- 1. An SDI GET STATUS rand is issued.
- 2. If the status obtained in the previous step indicated error conditions, these error conditions are resolved and then cleared by an SDI DRIVE CLEAR command.
- 3. The SEEK is retried.

Retry/Recovery - Test 4 - The steps listed below are performed.

- 1. Test 4 Generic error recovery is performed
- 2. The SEEK is retried

Recovery success - One soft error is counted for the entire operation including retries.

Recovery Failure - The above sequence is repeated two times and, if the failure persists, the Test 4 will issue a device fatal error and the drive and all its subun'ts will be dropped. Note that the retry strategy for SDI level 2 errors involves issuing additional level 2 commands. The retry count is the sum of all retries on all SDI level 2 commands, including those commands issued in recovery attempts.

Asynchronous Drive Errors

ATTN ASSERTED UNEXPECTEDLY, ASYN DRIVE ERROR OR LOGGABLE INFORMATION

Asynchronous drive errors are those errors reported by the drive which are not related to a level 2 or command. These errors are reported by the drive using the SDI ATTENTION signal. Examples are OFF CYLINDER and HDA OVERTEMPERATURE errors. Drive errors are reported to the controller by the "DE" or "WE" bit being set in the error byte in the status response.

Retry/Recovery UDA The steps listed below are performed.

- 1. An SDI GET STATUS command is issued.
- The drive error is cleared by an SDI DRIVE CLEAR command and, if the error is not "WE", a SEEK command is issued for the cylinder where the drive was last positioned.

Retry/Recovery - Test 4 - The steps listed below are performed.

- 1. Test 4 Generic error recovery is performed
- 2. A SEEK is issued

NOTE: A "WE' is a write on a write protected drive; Test 4 detects this in a different manner, so "WE' will never be set.

Recovery Failure -

NOTE: There is a difference between the UDA in controller mode and the Test 4 for this type of error.

The UDA in controller mode will repeat the above sequence two times and, if the drive error persists, the drive would be marked as offline.

Test 4 will <<NOT>> drop the drive after two retries. Instead, the drive will be dropped due to a side affect of such an error: A seek never completing, (causing a device fatal error) or Spindle ready dropping (causing a device fatal error).

Drive I/O Errors

The drive I/O errors occur either during the header compare process (i.e., before I/O actually begins) or during the I/O operation itself. They are as follows:

- o Header not found
- o Seek or head select error
- o Data sync timeout
- Data or state clock timeout during operation (read/write)
- o Receiver ready dropped during operation (read/write)
- o Read/write ready dropped during operation (read/write)
- o SERDES overrun error
- O Drive failed to execute select track and (read/write)
- o Real time state receive error

Header not found (header compare error)

HEADER NOT FOUND DURING (read/write)

This error occurs when the header compare routine fails to find the desired header (or a revectored version of the desired header) in two disk revolutions.

Retry/Recovery UDA and Test 4 - Failure to find the desired header in two rotations of the disk will cause the Test 4 to search the Replacement and Caching Table (RCT) to check if the logical block number has been replaced. If a match is found, the Test 4 will perform the desired operation on the revectored block. Enabling/disabling retries has no affect on this operation.

Recovery success No error is reported or counted.

Recovery Failure A hard error (header not found) is reported.

Seek or head select error (Positioner Error)

SEEK OR HEAD SELECT ERROR DETECTED DURING (read/write)

This error occurs when the header comparison routine determines that the drive is positioned at the wrong cylinder and that the drive has not detected a seek error.

NOTE: The header comparison routine is active <<ONLY>> in the customer data area. This error will never be detected in the diagnostic area.

Retry/Recovery UDA The steps listed below are performed.

- 1. An SDI GET STATUS command is issued.
- 2. If the status obtained in the previous step indicated error conditions, these error conditions are resolved and then cleared by an SDI DRIVE CLEAR command.
- 3. An SDI RECALIBRATE command is issued.
- 4. An SDI SEEK command is issued.
- 5. The I/O operation is retried.

Retry/Recovery Test 4 The steps listed below are performed.

- 1. Test 4 Generic error recovery is performed
- 2. An SDI RECALIBRATE command is issued.
- 3. An SDI SEEK command is issued.
- 4. If retries are disabled, Immediate recovery failure. Retries are <<ALWAYS>> enabled when the Test 4 is reading the RCT.
- 5. The I/O operation is retried.

Recovery success One soft error is counted for the entire operation including retries.

Recovery Failure The above sequence is repeated two times and, if a drive I/O error persists, a hard error is reported for the sector. No soft errors are counted.

Data Sync Timeout Error

DATA SYNC TIMEOUT DURING READ

This error occurs on a read operation after the correct header has been found and the UDA times out waiting for the data sync word.

Retry/Recovery - UDA The steps listed below are performed.

- 1. An SDI GET STATUS command is issued.
- If the status obtained in the previous step indicated error conditions, these error conditions are resolved and then cleared by an SDI DRIVE CLEAR COMMAND.
- 3. An SDI SEEK command is issued.
- 4. The read operation is retried.

Retry/Recovery - Test 4 The steps listed below are performed.

- 1. Test 4 Generic error recovery is performed
- 2. An SDI SEEK command is issued.
- 3. If retries are disabled, Immediate recovery failure. Retries are <<ALWAYS>> enabled when the Test 4 is reading the RCT.
- 4. The read operation is retried.

Recovery success One soft error is counted for the entire operation including retries.

Recovery Failure The above sequence is repeated two times and, if a drive I/O error persists, a hard error is reported for the sector. No soft errors are counted.

Data or state clock timeout (Loss of Drive Clock)
Receiver ready failure (Loss of Drive Receiver Ready)

DATA OR STATE CLOCK TIMEOUT DURING (read/write)
RCVR RDY DROPPED DURING (read/write)
COULD NOT SEND SELECT TRACK AND (read/write) CMD OR
HEADER SYNC TIMEOUT WITH INVALID STATE

The loss of drive clock occurs when the UDA is clocking data to or from the drive through the SERDES. Failure of a word to be clocked in during a 125 millisecond time period triggers a loss of drive clock error. The loss of drive receiver ready is detected when the UDA is trying to send out a real-time read or write command. Unable to select track and read or write occurs when the UDA attempts to send the select track and read/write level 1 cmd, but receiver ready is deasserted or the state is invalid so it cannot send the command (the SERDES could also be broken so it's unable to send the command). The same error is generated if the UDA gets a header sync timeout, and when it looks at the drive's state, it is either invalid or reciever ready is deasserted (header sync timeout is <<NOT>> a error it's quite normal on a high-density disk). These errors are grouped together because their recoveries are the same.

Retry/Recovery - UDA The steps listed below are performed.

- 1. The drive is initialized.
- 2. An SDI GET STATUS command is issued.
- 3. If the status obtained in the previous step indicated error conditions, these error conditions are resolved and then cleared by an SDI DRIVE CLEAR command.
- 4. An SDI SEEK command is issued.
- 5. The I/O operation is retried.

Retry/Recovery - Test 4 - The steps listed below are performed.

- 1. The drive is initialized
- 2. Test 4 Generic error recovery is purformed
- 3. An SDI SEEK command is issued.
- 4. If retries are disabled, Immediate recovery failure. Retries are <<ALWAYS>> enabled when the Test 4 is reading the RCT.
- 5. The I/O operation is retried.

Recovery success One soft error is counted for the entire operation including retries.

Recovery failure The above sequence is repeated two times and, if a drive I/O error persists, a hard error is reported for the sector. No soft errors are counted.

CZ

Read/Write ready dropped (Loss of Drive Read/Write Ready)
SERDES Overrun Error
Real Time State Receive Error (Real Time Drive State Receive Error)

R/W RDY DROPPED DURING (read/write)
SERDES OVERRUN ERROR DURING READ
REAL TIME STATE RECEIVE ERROR DURING (read/write)
UNKNOWN ERROR CODE DURING (read/write)

The loss of read/write ready error is detected either before an I/0 has begun when trying to send out the real time command or at the end of an I/0 operation when checking for errors. The SERDES overrun error is detected on a read operation and is indicative of a drive whose transfer rate is greater than 23 MHZ or a broken SERDES. The real time drive state receive error is detected at the end of an I/0 operation and indicates that there was a pulse or parity error in the receipt of the drive's state during the I/0 operation. The unknown error code is returned when the UDA returns an error code that the Test 4 does not recognize. They are grouped together because their recoveries are the same.

Retry/Recovery UDA - The steps listed below are performed.

- 1. An SDI GET STATUS command is 'ssued.
- 2. If the status obtained in the previous step indicated error conditions, these error conditions are resolved and then cleared by an SDI DRIVE CLEAR command.
- 3. An SDI SEEK command is 'ssued.
- 4. The I/O operation is retried.

Retry/Recovery - Test 4 The steps listed below are performed.

- 1. Test 4 Generic error recovery is performed
- 2. An SDI SEEK command is issued.
- 3. If retries are disabled, Immediate recovery failure. Retries are <<ALWAYS>> enabled when the test 4 is reading the RCT.
- 4. The read operation is retried.

Recovery success - One soft error is counted for the entire operation including retries.

Recovery Failure - The above sequence is repeated two times and, if a drive I/O error persists, a hard error is reported for the sector. No soft errors are counted.

3.4 DEC STANDARD 166 EXCERPTS

3.4.1 THE REPLACEMENT AND CECHING TABLES

The Replacement and Caching Tables record the locat one of all revectored LBN sectors and the status of each RBN on the unit. Each copy of the table 's organized in secending RBN order, with an entry for each RBN sector on the unit. There are "n" copies of the table on the unit, where 'n' is a device characteristic. The tables are stored at the high address end of the LBN area of the unit. Table entries (and RBNs) are allocated via a hash algorithm described later.

Replacement And Cach ng Table Format

Each entry in the Replacement and Caching Table represents an RBN on the unit. The table is ordered in ascending RBN order. Thus the first entry corresponds to the first RBN on the unit, etc. The size of each copy of the table may exceed that required to contain an entry for each RBN on the unit since additional entries may be required to align the table so that adjacent copies can begin on a track boundary. Entries that do not correspond to RBNs on the unit are called "null entries": there is always at least one null entry at the end of the RCT. All other entries past this last null entry are undefined.

NOTE

The RCT pad area is controller specific and should never be accessed by the host.

The format of a replacement block descriptor in the Replacement and Caching Tables is:

« · · · · · · · · · · · · · · · · · · 	· · · · · · 16 b'ts	>!
}	LBN (low)	
CODE !	LBN (h'gh)	•
4 bitale		

Where:

LBN is the Logical Block Number of a revectored LBN sector.

CODE is one of the following octal values:

- 00 Unallocated (empty) replacement block.
- 02 Allocated replacement block primary RBN.
- 03 Allocated replacement block non primary RBN.
- 04 Unusable replacement block.
- 05 Alternate unusable replacement block
 - 10 Mill entry no corresponding RBN sector.

For codes OC, O4, and 10 the LBN field is always zero.

NOTE

* This code is reserved. Programs should treat this code as if it were code 04.

Embedded controllers with no distinction between primary and secondary RBN's must use:

- 1. Code 02 if the replacement block can be retrieved with little degradation of performance for all blocks.
- 2. Code 03 if accessing the replacement block has a large 'mpact on performance for all blocks.

3.4.2 FCT Structure

Each copy of the FCT is composed of one volume information block, one 512 byte format table, one 576 byte format table, and one subsystem temporary storage area (distributed amongst the alignment pads). An FCT copy has the following format:

! volume ! ! information ! ! block	SECTOR O
128 bed block descriptors 512 rode	SECTOR 1
128 bed block descriptors 512 mode	SECTOR 2
128 bed block descriptors 576 mode	SECTOR m
128 bed block descriptors 576 mode	SECTOR m+1
· · · · · · · · · · · · · · · · · · ·	!
128 bad block descriptors 576 mode	SECTOR p
subsystem scratch storage	SECTOR p+1
· · · · · · · · · · · · · · · · · · ·	•
eubsystem scratch storage	SECTOR Fet 1

The XBN area itself is always formatted to contain 512 byte sectors. The calculations for m and p are:

m := ((((Lc*g*t*r)+1)/2)+127)/128

p := 24m

Sector 0 contains various volume 'dentification informat'on. The format is:

	•	-
media mode	WORD	0
formatting instance : number	WORD	1
! volume serial number ! least sign ficant word!	WORD	2
! volume serial number !	WORD	3
! olume serial number !	WORD	4
! volume serial number ! most significant word !	WORD	5
! date that volume was ! first formatted 'low')!	WORD	6
! date that volume was ! first formatted !	WORD	7
! date that volume was ! first formatted !	WORD	8
! date that volume was ! first formatted (high)!	WORD	9
! date of most recent ! !volume formatting (low)!	WORD	10
<pre>! date of most recent ! ! volume formatting !</pre>	WORD	11
! date of most recent ! volume formatting !	WORD	12
! date of most recent !volum formatting (high)!	WORD	13
! number of used entries! ! 'n 512 table (low)	WORD	14

• • • • • • • • • • • • • • • • • • • •	,	
number of used entries in 512 table (h'gh)	WORD	15
number of used entries in 576 table (low)	WORD	16
number of used entries in 576 table (high)		17
XBN of scratch area in this copy (low)	WORD	18
XBN of scratch area in this copy (high)	WORD	19
size of scratch area in this copy	WORD	20
zeros	•	
Zeros .	WORD	255

Where:

WORD 0: "Media Mode" is "126736" for a 512 byte format and '074161" for a 576 byte format. During formatting the media mode word is set to zero.

4.0 PERFORMANCE AND PROGRESS REPORTS

At the end of each pass, the pass count is given along with the total number of errors reported since the diagnostic was started. The "EOP" suitch can be used to control how often the end of pass message is printed. Section 2.2 describes switches.

A statistical report will automatically be printed periodically (approximately every fifteen minutes) and at the end of test #4. It can be suppressed by setting the Inhib't Statistical Report flag (e.g. START/FLAGS:ISR). This is the same report that can be printed on demand with the PRINT command.

During tests 1, 2, and 3, the report will look like the following example:

TEST 1 IN PROGRESS RU TIME 2:24:10

During test #4, the report will contain statistics on each drive for the current pass of the test; for example:

TEST 4 IN PROGRESS RUN TIME 2:24:10

UNIT DRI	IVE	SERIAL-NUMBER			MBYTES WRITTEN		SOFT	ECC
0	0	1002 7 34 2102112	12	36	55	0	0	1

Explanation of each column:

UNIT	The unit number (number of HW P-table).
DRIVE	The drive number (the number which appears on the "unit plug" on the front of the disk drive).
SERIAL - NUMBER	The decimal serial number of the disk drive.
SEEKS X1000	The decimal number of seeks performed by this drive during this pass of test 4. Multiply value by 1000.
MBYTES READ	The number of mega-bytes (million bytes) read by this drive during this pass of test 4. It is this value that is used to optionally drop a drive by the READ TRANSFER LIMIT software question.
MBYTES WRITTEN	The number of mega-bytes written by this drive during this pass of test 4.
HARD ERRORS	The number of hard error reports printed for this drive during this pass of test 4. It is this value that is used to optionally drop a drive by the ERROR LIMIT software question.

SOFT ERRORS

The number of soft errors reported for the drive during this pass of test 4. A soft error is any error condition that resulted in a retry operation that eventually succeeded in recovering from the error condition. One soft error is counted even though several retry attempts may be made and does not correspond to the number of soft error reports printed. To see the soft error reports, you must change the default answer to the SUPPRESS PRINTING SOFT ERRORS software question.

The number of times data read from the drive was modified using the error correction code (ECC) and resulted in a matching error detection code (EDC).

ECC

5.0 TEST SUMMARIES

The UDA Host Resident Diagnostic consists of one PDP-11 diagnostic supervisor program that runs in the PDP 11 processor and four programs that run in the UDA's buffer memory through an interpreter called the "diagnostic machine" which resides in the UDA. The PDP 11 program mainly is responsible for downline loading the "diagnostic machine" programs into the UDA and starting their execution. The diagnostic machine" program controls the testing from that point by requesting the PDP 11 processor to supply information, print error messages and update statistics. The 'diagnostic machine" program informs the PDP 11 processor when a test is complete.

Four "diagnostic machine" programs are in the ZUDDEO.PAK data file which is read from the XXDP+ system device by the PDP 11 program. The data file comes with listings of each program.

5.1 TEST # 1 UNIBUS ADDRESSING TEST

The purpose of test #1 is to complete the testing of the Unibus interface in the UDA. The UDA resident diagnostic is not able to completely test the Unibus interface because communication with the PDP 11 processor is necessary. Specifically, this test will:

- 1. Check that every address line on the Unibus can be driven to both one and zero states.
- 2. Check that the UDA can interrupt the PDP-11 processor at the proper priority level and vector.
- 3. Exercise the Unibus interface by transferring blocks of data to and from Unibus memory.

This test assumes that the following are being tested by the UDA Resident Diagnostic:

- 1. All data bits can be written and read correctly.
- 2. NPR cycles can be executed correctly.

Test 1 's divided into six subtests. One at a time, each UDA selected for testing will run each subtest.

Subtest 1 makes sure that the UDAIP and UDASA registers are existent and runs the first part of the UDA's resident diagnostics.

Subtest 2 initializies the UDA into diagnostic loop mode. In this mode any value written into the UDASA is echoed in the UDASA.

In subtest 3, the UDA is 'nitialized with interrupts enabled. The vector address and priority level will be determined solely from the answers to the hardware quest'ons. If the hardware vectors to the wrong address, it is impossible to determine the result. A descriptive error message of the problem will not occur (the program or processor may hang or an unrelated message may occur). Therefore, the message "TESTING INTERRUPT ABILITY OF UDA AT ADR xxxxxx VEC xxx..." isprinted just before the UDA is requested to cause an interrupt and the word "COMPLETED" is printed (on the same l'ne) when the interrupt test is completed. If the word "COMPLETED" does not follow the first message, it should be apparent that the interrupt caused the diagnostic or processor to go astray. The pr'or'ty level of the interrupt request is also verified.

Subtest 4 and 5 initializes the UDA using different sizes of the host communications area. The different sizes of the host communications area are supplied to allow the UDA Resident Diagnostic to do the most Unibus address testing possible. Interrupts are disabled. Any UDA Resident Diagnostic errors will be reported. Subtest 4 initializes the UDA with the smallest ring buffer size possible. Subtest 5 initializes the UDA with a large ring buffer area.

Subtest 6 downline loads a "diagnostic machine" program into the UDA. The "diagnostic machine" program is downline loaded from the memory space included in the host communications area when the UDA was first initialized. The UDA Resident Diagnostic has already verified that it can access these memory addresses, so the downline load command should perform properly. The "diagnostic machine" program is then started.

The "diagnostic machine" program asks the PDP-11 program to fill free memory (that memory available to the PDP-11 program that is not being used by the program or the Runtime Services) with an addressing pattern and report the location and size of the free memory. Every location of free memory is read and the data checked. Then, one by one, each address line is tested as follows:

- Determine a test address by taking the first address of free memory and complimenting the address bit to be tested.
- 2. Read from the test address.
- 3. If a non-existant memory error occurs, the test is complete.
- 4. Write all ones to the first address of free memory then read from the test address. If data read is not all ones, then test is complete.
- 5. Write zeros to the first address of free memory then read from the test address. If data read is not zeros, then test is complete.
- 6. Report Unit is addressing error.

When all address bits have been tested, then block transfers to and from memory are tested with different data patterns. This data is transferred at the rate disk data is transferred to and from memory during normal UDA operation.

The next UDA selected for testing is then be tested in the same manner. When all UDAs have been tested, test #1 ends.

5.2 TEST # 2 DISK RESIDENT DIAGNOSTIC TEST

The purpose of test #2 is to execute the diagnostics that run in each disk drive. These diagnostic programs may be resident in the disk drive or require downline loading from the ZUDDEO.PAK data file. (There currently are no disk drives that require countline loading and no such files exist in the ZUDDEO.PAK file. This program is designed such that they can be easily added in a future release.) This UDA diagnostic program only knows the procedure to execute the disk resident diagnostics and how to determine whether a test passed or failed.

One at a time, each UDA selected for testing is initialized and a "diagnostic machine" program downline loaded. The "diagnostic machine" program asks what drives are to be tested, then issues several commands to the disk drive and check for the correct response from the drive. This should serve as a good indicator that the UDA and disk drive can communicate.

A DIAGNOSE command is then issued to the drive to request the drive run all of its diagnostics. If the disk drive requests a downline load of a drive diagnostic, the diagnostic program is read from the XXDP+ load device, downline loaded into the disk drive and started. There is no limit to the number of downline loads that can be requested by a drive.

If the "Manual Intervention Mode" software question was answered 'N (default) testing proceeds to the next drive. When all drives on the UDA have been tested, the next UDA selected for testing is tested in the same manner. When all UDA's have been tested, test 42 ends.

If the "Manual Intervent on Mode" software question was answered 'Y", an interactive mode is entered to allow the operator to perform diagnostic activities on the disk drive as desired. The Service Manual for the disk drive must be used to determine what diagnostic capabilities are available.

First, a brief description of available commands is printed as follows:

TEST #2 MANUAL INTERVENTION ON UNIT xx UDA AT xxxxxx DRIVE xxx TO WRITE AND READ MEMORY:
W DATA REGION OFFSET
R REGION OFFSET
TO RUN A DIAGNOSTIC:
D REGION
TO EXIT QUESTIONING:
E
DATA, REGION AND OFFSET ARE HEX VALUES.
?

Commands may be typed after the question mark prompt. Each command is processed as entered and results displayed immediately. The exit command will allow the diagnostic to proceed.

Read and write commands remember the region and offset values. Successive read and successive write commands automatically increment to the next offset if the region and offset values are not typed. If a region is typed but not an offset, offset zero is used.

Examples:

1. W FF FFFC 4
2. W 02
3. R FFFC 4
FFFC 0004/ FF
4. R
FFFC 0005/ 02
5. W 21 FFFC
6. R
FFFC 0000/ 21

Command 1 writes one byte (FF) into region FFFC, offset 4. Command 2 writes one byte (02) into the next byte - region FFFC, offset 0005. Commands 3 and 4 read the bytes back. Command 5 writes one byte (21) into the first byte of region FFFC. Command 6 reads back that byte.

The diagnose command remembers the region from previous diagnose commands only, because the region containing the diagnostic is generally not the same region used to write parameters or read results. If the diagnostic returns any data, the data is printed immediately.

5.3 TEST # 3 - DISK FUNCTION TEST

The purpose of test #3 is to functionally test the disk drive. On a drive that is well diagnosed by its disk resident diagnostics (executed by test #2) these functional tests will have little value. On a drive that has no or minimal resident diagnostics, these functional tests will have more value.

Test 43 starts by initializing each UDA selected for testing and then downline loading a "diagnostic machine" program into each UDA. Once all UDAs have been started, the PDP-11 program responds to requests from all UDAs. When all the UDAs have indicated the end of testing, test 43 ends.

The "diagnostic machine" program performs the following functions on each drive:

- 1. Issue a DRIVE CLEAR command.
- 2. Issue RECALIBRATE command.
- 3. Issue a CHANGE MODE command to enable diagnostic cylinder access, set the drive to 512 byte sector size, and write protect.
- 4. Issue INITIATE SEEK command to last diagnostic cylinder.
- 5. Read all factory formatted sector headers. If no headers on a track can be read, report the error, otherwise continue.
- 6. Starting with cylinder 0, group 0 and incrementing through every cylinder on the disk, seek to a group, read a header on track 0 and then seek to the factory formatted diagnostic cylinder. Read from the diagnostic cylinder to verify disk positioned correctly.
- 7. Attempt to write on the first diagnostic cylinder while write protected.
- 8. Issue a CHANGE MODE command to enable formatting operations and disable write protect.
- 9. Format all writable DBNs in 512 byte format.
- 10. Write and read several data patterns to each writable DBN. Report an error if all DBNs on one track have an error.
- 11. Send 'nvalid SDI level 2 and level 1 commands and check the results.
- 12. Go to the XBN area and read a copy of the FCT. Check to see if the drive has been properly formatted in 512 byte mode.
- 13. Issue a DISCONNECT command.

5.4 TEST # 4 DISK EXERCISER

The purpose of test 44 is to exercise the disk drives in a manner similar to normal usage under standard operating systems. Execution of this test should give an indication of the performance of the disk drive. This test may be run for long or short periods of time, depending on how the software questions are answered.

These are two modes of operation for test #4:

- 1. Default operation on the entire area selected (customer or diagnostic) with all parameters selected for random operation as shown by default answers below.
- 2. Manual intervention mode where a number of questions are asked and operation is controlled by their answers.

Which mode is entirely determined by the answer to the first software question asking, "Enter manual intervention mode for special diag nosis?" This question would normally have been answered "N" (default) and testing will begin immediately. If answered "Y", the following series of questions will be asked for each unit selected for testing:

THE FOLLOWING QUESTIONS REFER TO UNIT XX UDA AT XXXXXX DRIVE XXX

This message will identify to which drive the questions are being asked. The entire series of questions will be asked for each drive, there is no short way to answer like in the hardware questions.

NUMBER OF BAD BLOCKS (D) 0 ?

An answer in the range of 1 to 16 will allow that many bad block numbers to be entered. The program will allow writes and reads to these blocks but no error messages will be printed for these blocks. Errors encountered on these blocks will not appear in the statistics. Answer zero to bypass entering bad blocks.

BAD BLOCK (A) ?

This question will be asked the number of times requested by the previous answer. Any decimal number that can be converted into a 28-bit binary value will be accepted. No other error checking will be made at this time to determine if the block number actually exists on the disk.

DO YOU WANT TO CHANGE TESTING PARAMETERS FOR THIS DRIVE (L) N ?

Answer "N" to bypass all further questioning on this drive. Answer "Y" to be asked the following questions.

READ ONLY (L) N ?

Answer "Y" to dictate read only and prevent test #4 from performing any writes to the disk.

WRITE ONLY (L) N ?

This question will only be asked if the previous quest'on was ensured "N". Answer "Y" to dictate write only.

CHECK ALL WRITES BY READING (L) N ?

Answer "Y" to cause all writes to be checked by reading the data immediately after the write operation.

RANDOMLY CHECK WRITES BY READING (L) Y ?

This question will only be seked if the previous question was ensured "N". Answer "Y" for the write check to be performed randomly. Answer "N" if write checks are not desired. This question is seked no matter how previous questions were seked.

DATA PATTERN O FOR RANDOM SELECTION (D) G :

There are 16 data patterns available, selected as 1 to 16. Pattern number 0 will cause patterns 1 to 15 to be randomly selected for each write. If pattern number 16 is selected, the following set of questions will be asked for a pattern to be input.

ENABLE ECC DATA CORRECTION (L) Y ?

A "Y" enswer will enable the use of ECC to correct data errors. If the number of corrections is within the drive's threshold, an informational message will be printed dentifying the block number. These ECC corrections will also appear in the statistical report for the drive.

An "N' answer will prevent the use of ECC. All ECC errors will cause an error message to be printed and retries to be attempted.

COMPARE ALL DATA READ (L) N ?

Answer "Y" to cause a data compare after every read.

RANDOMLY COMPARE DATA READ (L) Y ?

This question will only be asked if the previous question was answered "N . Answer T for the data compare to be performed on random records. Answer "N" if data compares are not desired

ENABLE RETRIES (L) Y

A 'Y' answer will enable retries to be performed on disk

RANDOM ACCESS MODE (L) 1 ?

Answer ':" to cause block numbers to be chosen randomly. Answer "N" to cause block numbers to be selected sequentially up and down the disk surface.

DO YOU WISH TO:

- O TEST ENTIRE AREA SELECTED
- SPECIFY BEGIN/END SETS TO TEST
- 2 SPECIFY TRACKS AND CYLINDERS TO TEST
- SPECIFY GROUPS AND CYLINDERS TO TEST

SPECIFY CYLINDERS TO TEST

(D) 0 ?

This question specifies the options evailable to limit testing to a portion of the selected area (customer or diagnost c) of the disk. A zero ensuer is the default which specifies to use the entire area for the test. Other answers will cause additional questions to be asked.

NUMBER OF BEGIN/END SETS (D) 1 ? BEGIN BLOCK (A) 0 ? END BLOCK (A) 0 ?

> These questions are asked if begin/end sets were selected to limit the testing area (Answer 1). One to four sets may be specified. The SEGIN BLOCK and END BLOCK questions are asked es meny times es needed.

NUMBER OF TRACKS TO TEST (D) 1 ? TRACK (D) 0 2

NUMBER OF GROUPS TO TEST (D) 1 ? GROUP (D) 0 2

> One of these sets of questions is asked if either tracks and cylinders or groups and cylinders was specified to limit the testing area (Answers 2 or 5). Up to seven tracks or groups may be specified on which testing will be limited.

DO YOU WISH TO LIMIT THE CYLINDERS TESTED (L) N ?

This question is asked only after the tracks or groups have been specified above. If testing is to be further limited to a set of cylinders, ensuer "" and the following two ques tions will be saked:

STARTING CYLINDER (A) 0 ? ENDING CYLINDER (A) 0 ?

requests from all UDAs.

These questions are asked 'f the quest'on immediately above was answered "I or if cyl nders were selected to limit the testing area (Answer 4). One set of cylinder numbers may be specified to limit the testing area.

After the above questions have been asked for all drives selected for testing, the following questions will be asked if data pattern 16 was selected for any drive:

NUMBER OF WORDS IN DATA PATTERN 16 (D) 1 ? DATA WORD (O) 0 ?

Data pattern 16 can be input by these questions. A data pattern consists of a buffer of one to 16 words which is repeated throughout the data portion of the disk block. Enter the contents of the data pattern buffer. The DATA WORD question will be repeated as needed.

Test 04 will then initialize each UDA relected for testing and downline load a "diagnostic machine" program into each UDA. Becaus the "diagnostic machine" programs are too large to fit both copies in memory at the same time (as done in Tests 1 through 3), the program checks which type of UDA-50s are being tested. It all are of the same type, that program is read. If both types are selected for testing, the program for the UDA-50 with the M7485 and M7486 boards is read. The "diagnostic machine" program asks what drives are to be tested and then for the parameters for each drive (the answers to the manual intervention questions or their defaults). Once all UDAs have been started, the PDP 11 program responds to

The disks are then be exercised according to the parameters. The exercise consists of selecting a disk sector, seeking to the proper cylinder, then reading or writing the sector. The parameters control how the disk sector is selected, whether the sector is written or read and whether a write is followed by a read (write check).

The "diagnostic machine" program periodically sends statistics to the PDP 11 program. These statistics include counts of reads, writes, seeks and errors on a per drive basis. The PDP 11 program accumulates the statistics from all the UDAs and watches for the transfer limit to be exceeded. As long as the error log 's not enabled, the exceeding of the transfer limit will cause he end of test 04.

Each time an error occurs, the "diagnostic machine" tells the PDP 11 program. A message is printed (or stored in the log buffer) and then the error limit for the drive is checked. If the error limit has been reached, the drive is dropped from testing. If no more drives remain to be tested, test #4 will end (unless the error log is enabled).

When the end of test #4 occurs, the accumulated statistics for each drive is printed. This statistical report can be printed at any time during test #4 by typing control-C then the PRINT command.

The data patterns used by test #4 are indicated below. Each pattern 's generated by writing the pattern number in each 4 bit nibble of the first word, then repeating the data pattern (sequence of one to 16 words) throughout the rest of the data buffer. Pattern number 16 writes nibbles of zeros. When pattern number zero is used, the actual pattern number written (1 to 15) is placed in the nibbles.

PATTERN 0 This pattern number is used to indicate any pattern number 1 to 15 chosen at random.

PATTERN 1 Words in pattern sequence - 1

Sequence (Octal) 105613 Sequence (Mex) 8888

PATTERN 2 Words in pattern sequence 1

Sequence (Octal) 031463 Sequence (Hex) 3333

PATTERN 3 Words in pattern sequence - 1

Sequence (Octal) 030221 Sequence (Hex) 3091

PATTERN 4 Hords in pattern sequence - 16 (Shifting ones)

Sequence (Octal) 000001, 000003, 000007, 000017, 000037, 000077, 000177, 000377, 000777, 017777, 037777, 077777, 177777

                                              DM REQUEST 1
                                     PROVIDE DIAGNOSTIC TO DOWNLINE LOAD INTO DISK DRIVE.
                                     THE UDA MAY BE USED TO GET THE DIAGNOSTIC IF THE SYSTEM LOAD DEVICE
                                     IS ON THE UDA. THIS ACTION WILL CAUSE A REINITIALIZATION OF THE JOA
                                     AND THE RING STRUCTURE MOVED. SINCE THIS PROGRAM HAS NO WAY TO
                                     DETERMINE IF THE UDA IS USED. IT WILL ALWAYS ASSUME IT IS USED AND
                                     WILL INITIALIZE AND RELOAD THE DM PROGRAM AFTER READING THE
10
11
                                     DIAGNOSTIC. THE OUTPUTS OF THIS ROUTINE ARE STORED AND SENT TO THE
12
                                     IDM PROGRAM IN THE UTOTST REQUEST.
