

SM 3540-D

SMX 7220-D

SM 3540

SWITCHED MODE POWER SUPPLY 0 - 35 V 0 - 40 A

- * Input 220 V AC or DC
- * 1400 Watts DC output
- * New 100 kHz MOSFET power conversion technique
- * Efficiency 91%
- * Weight only 14,5 kgs
- * Natural convection cooling, no blower, no noise
- * No inrush current
- * Ready for programming by computer (via PSC 625 programmer). Programming plug with all input and output levels 0-5 V
- * Protected against all overload and short circuit conditions
- * Equal current sharing when connected in parallel and equal voltage sharing when connected in series (master and slave connection, voltage and current control by the master).
- * Modular built up, service friendly.

Constant voltage / constant current

Efficiency versus load current at 35V

Efficiency

91% at 235 V DC input and 1400 Watts output.

89% at 220 V AC input and 1400 Watts output.

The efficiency is extremely high and constant over a large range of output current.

Input voltage

185-265 V AC 50-60Hz or 210-350 V DC up to 30 V 40 A (1200 Watts)

198-265 V AC 50-60Hz or 240-350 V DC up to 35 V 40 A (1400 Watts)

Maximum output current as function of output voltage with AC and DC line input as parameter.

Inrush current

During switch on the inrush current is limited by a special circuit and practically does not exceed the normal input current during operation at full load.

Photo: The upper diagram shows the 50Hz AC input current (50 A/div.) during switch on at full load. The lower diagram shows the output voltage (10V/div.), which comes up after a delay of about 120 mS.

Input current

At 1400 Watts output and 220 V AC input the input current is 9.3A rms

A 50Hz choke in the input circuit limits sharp current peaks in order to cause no (low frequency) line voltage distortion.

Photo: 50Hz input current at full load (10A/div.).

Insulation

2.5 kV AC rms (1 min.) input to case and input to output. 500VDC output to case.

Creepage distances and clearances input to output and input to case are 8 mm. Insulation resistance is better than 50 MOhm (measured at 500 VDC). Safety is in accordance with IEC 348.

RFI suppression

Practically no radio frequency interference on input and output because of carefully designed filters.

RFI suppression is in accordance with VDE 0871 level B, both on input and output.

Master and slave connection

The rear panel plug has special connections to make a master and slave connection of two or more units SM 3540 possible. Parallel as well as in series, with automatic equal current sharing and equal voltage sharing. Series connection is allowed up to 500 V total output.

Remote programming

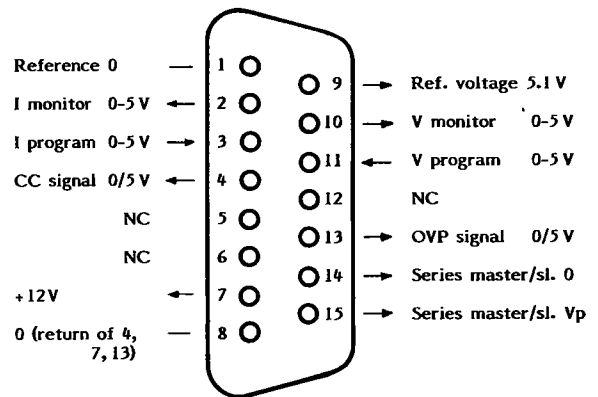

Output voltage and current can be programmed by voltage. A programming voltage of 0-5 V corresponds with 0 to full range of output voltage or current. The maximum programming speed is 600 V/sec. However the output electrolytic capacitors might be overheated when a high programming amplitude is combined with a high repetition frequency. Output voltage and current can also be set by external potentiometers of 5 kOhm.

Voltage and current monitoring

At the rear plug two monitor voltages 0-5 V are available, corresponding with 0 to full range of output voltage and current. These can be used to talk back to a computer or to connect external meters. CC and OVP signal are logic signals indicating the CV/CC and OVP status.

CV/CC regulation

The SM 3540 can either be used as a constant voltage source with current limiting or as a constant current source with voltage limiting. The change of mode occurs sharply at the crossing of the voltage and current settings.

Line regulation

Input 185-265 V AC

Load regulation

Load 0-100%

Ripple p-p

Temperature coefficient per °C

Stability

During 8 hours after 1 hour warm up, under constant load and ambient conditions

Output impedance

Up to 100 kHz, less than

	CV	CC
Line regulation	5 mV	25 mA
Load regulation	5 mV	25 mA
Ripple p-p	10 mV	25 mA
Temperature coefficient per °C	$5 \cdot 10^{-5}$	$1 \cdot 10^{-4}$
Stability	$3 \cdot 10^{-4}$	$1 \cdot 10^{-3}$
Output impedance	0.05 Ohm	-

Recovery time

For recovery to within 0.1 V

0.5 ms for a 10% to 100% load step

0.1 ms for a 50% to 100% load step

measured at 35 V 40 A

Ambient temperature

-20 to +50°C up to 1400 Watts output.

Recovery time at 50-100% load step. Vert.: 0.2V/div. Hor.: 0.5ms/div.

Remote sensing

Normally the sensing wires are linked to the output terminals. When remote sensing is required the sense connections have to be wired to the remote load terminals in order to stabilize the voltage across the load, so compensating the voltage drop over the load leads. A maximum of 2 V per lead can be compensated. This voltage subtracts from the maximum voltage rating of the power supply.

Thermal protection

In case of insufficient cooling a thermoswitch shuts down the output voltage.

Overvoltage protection

Built in over voltage protection is adjustable 7-40 V with a screwdriver through a hole in the front panel. When the output reaches the set trip level of the OVP the power supply shuts down. To reset the output it is necessary to switch off the power supply and switch it on again.

The OVP is not of the crowbar type and therefore cannot absorb power from external sources. An external voltage exceeding 50 V can damage the OVP circuit and the output capacitors.

Voltage and current controls

Voltage and current controls are by 10-turn potentiometers for reliable high resolution.

SMX 7220

1440 W SWITCHED MODE DC POWER SUPPLY

0 - 72 V 0 - 20 A

- Available with analog or digital meters. For digital meters add -D to model no.
- 100 kHz power conversion technique.
- Efficiency 91 %.
- Weight only 14.5 kgs.
- Natural convection cooling, no blower, no noise.
- Remote programming of voltage and current by analog voltages 0 - 5 V.
- Very low output ripple.
- IEEE 488 programming with external interface PSC 44M (pin compatible).
- Master / Slave parallel and series operation with equal current and voltage sharing.
- Wide input voltage range, AC and DC.
- No inrush current during switch on.
- 50 Hz choke on input to avoid low frequency distortion on the line voltage.
- Input / output insulation 3750 V rms.
- RFI suppression according to VDE 0871 B both on input and output.
- Designed for long life at full power.
- Protection against all overload and short circuit conditions.
- Modular built-up, service friendly.
- Built-in overvoltage protection
- Voltage and current control with 10 turn potentiometers, resolution 0.03 %.
- Can also be used as a DC - DC converter.

Specifications:

	CV	CC
Output	: 0 - 72 V	0 - 20 A
Regulation		
Load 0 - 100%	: 5 mV	15 mA
Line 198 - 265 V AC	: 5 mV	15 mA
Ripple + noise, rms/p-p	: 4 / 20 mV	4 / 12 mA
Temp. coeff., per °C	: $5 \cdot 10^{-5}$	$1 \cdot 10^{-4}$
Stability during 8 hrs after 1 hr warm up	: $3 \cdot 10^{-4}$	$1 \cdot 10^{-3}$
Output imp. up to 100 kHz	: 0.05 Ohm	—
Recovery time		
50 - 100% load step recovery within 50mV	: 150 μ s	—
Programming input impedance	: 0 - 5 V 1 MOhm	0 - 5 V 1 MOhm
Monitoring output impedance	: 0 - 5 V 20 Ohm	0 - 5 V 20 Ohm
Max. programming speed	: 0 - 72 V in 60 ms	
OVP trip range	: 7 - 80 V	
Status output CV/CC	: 5 V / 10 mA logic 1 is CC	
Status output OVP	: 5 V / 10 mA logic 1 is trip	
Input	: 198 - 265 V 50 - 60 Hz 237 - 350 V DC	
Input current	: 9.3 A at 220 V AC	
Insulation		
Input/Output	: 3750 Vrms (1 min.) 8mm creepage/clearance	
Input/case	: 2500 Vrms (1 min.)	
Output/case	: 600 V DC	
Safety	: IEC 348 / IEC 380	
RFI suppression	: VDE 0871 B, input and output	
Operating temp.	: -20 to +50 °C	
Remote sensing	: Max. 2 V per lead	
Series operation	: Max. 600 V total voltage	
Standby input power	: Only 10W	
Thermal protection	: Output shuts down in case of insufficient cooling.	

Maximum output current vs output voltage with AC or DC input voltage as a parameter

Efficiency versus load current at 72 V output, DC input

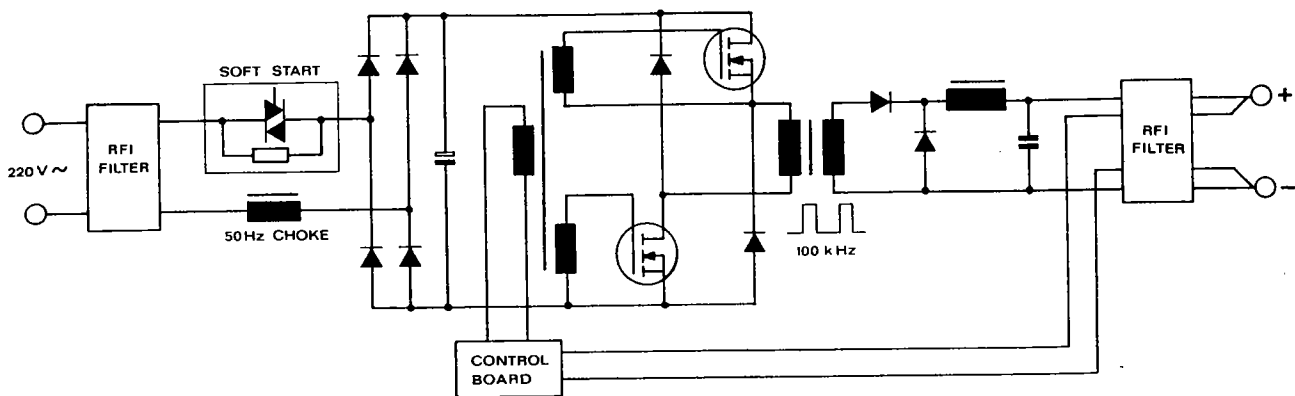

Operating temperature range

Rear panel. 15-p D connector for remote programming and master / slave operation.

Circuit description

Simplified functional diagram of SM 3540

The 220V AC line voltage is rectified by a bridge rectifier and smoothed by a large electrolytic capacitor. The 50Hz choke in the input circuit improves the waveform of the input current so that no low frequency distortion is produced on the line voltage.

The high frequency interference produced inside the power supply is prevented to go to the line or the load by carefully designed RFI filters.

When the unit is switched on the large electrolytic capacitor is charged via the resistor of the SOFT START circuit so that no large inrush current will flow. As soon as the voltage is sufficiently high the power supply starts working and the series resistor is bypassed by a triac.

The use of powerfet's makes it possible to operate at 100kHz switching frequency with many advantages like small size, light weight, low ripple and fast regulation. The rectified 220V (300VDC) is chopped by the power mosfet and transformed to a lower voltage. This 100kHz power converter is of the feed forward type. The regulation is achieved by pulse width modulation.

Carefull design, overdimensioning of vital components, several built-in protections and cool operation (because of the very high efficiency) make the SM3540 a very reliable power supply which can continuously be used at maximum rating.

Cooling and thermal protection

The SM3540 has natural convection cooling (no fans no noise). This means that it has to be used in horizontal position so that the air can pass freely vertically along and through the unit.

To protect the unit for overheating in case of wrong use (like covering it with something or building it in with insufficient cooling) two thermo-switches are built in which can shut down the output.

One is thermally coupled to the power fets. If it is activated all led lamps go out. The second is thermally coupled to the high frequency power diodes of the output circuit. If it is activated the led lamp of the OVP starts burning.

Load ripple and peak currents

Ripple currents caused by the load at frequencies below 1 kHz are compensated by the voltage regulation.

However high load ripple currents which exceed the current limit or which have strong

components above 1 kHz can overheat the output electrolytic capacitors. Also repetitive high peak currents, like taken by 50Hz DC-AC inverters can have this effect. If the current limit is exceeded periodically by such high ripple current the CC led lamp will start blinking. The rms value of the current should be kept below 15A.

In above cases an electrolytic capacitor of 10.000 uF as buffer parallel to the load is recommended.

Local or remote sensing

Local sensing

Remote sensing

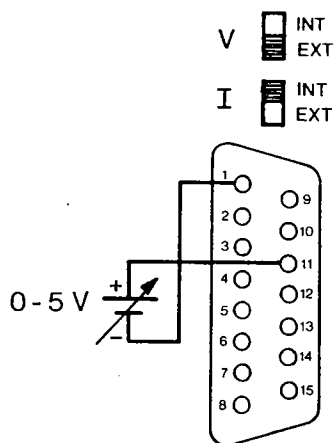

For most applications the SM3540 can be used with local sensing, which means that the output voltage is kept constant at the output terminals. Local sensing is recommended because it cannot cause problems like interference or oscillating.

However if it is desirable to compensate the voltage drop over the leads to the load the point of stabilisation can be displaced from the output terminals to the load terminals by using sense leads (thin measuring wires) from S+ and S- to the + and - of the load.

To prevent for interference and oscillations it is advisable to twist the sense leads and to connect an extra electrolytic capacitor of 2200 uF to the load terminals.

Maximum 2V can be compensated in each load lead. Of course in that case the 4V subtracts from the maximum voltage rating.

Voltage and current programming

Voltage programming
by 0 - 5V

Current programming
by 0 - 5V

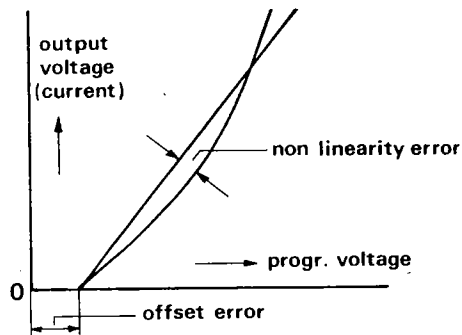

Both output voltage and current can be programmed by 0-5V.

To program connect as drawn above and put the switches V and I (through the holes above the connector) in the right position (at external for programming).

The programming inputs have a very high input impedance (opamp inputs). The zero of the programming inputs (pin 1 at the 15-pole D-connector at the rear of the power supply) is internally connected (through a picofuse of 250mA) to the negative power output terminal. So when connecting one has to take care that the load current will not flow through the programming zero connection and blow the picofuse.

Our IEC625/IEEE488 controllers PSC 625 and PSC 44M have isolated (1000V) analog outputs, so in that case there is no problem.

Programming accuracy

For the full output voltage range (or current range) the required programming input voltage is 0-5V +/- 2%.

The linearity error (not including the offset error) is maximum 0.15%.

The zero offset error is always positive and maximum 30mV for voltage- and max. 40mV for current programming.

Our IEC625/IEEE488 power supply controllers PSC625 and PSC44M have trim pots at the rear to compensate for the range tolerance and zero shift of the power supply programming inputs.

Programming speed

The maximum programming speed at full load (0,875 Ohm) is about 600V/sec.

With other loads higher speed is possible but to avoid overheating of the output capacitors do not exceed 1000V/sec.

Reference 0

I-monitor, 0-5V out corresponds with zero to full output current.

I-program, 0-5V in corresponds with zero to full output current.

CC-signal, 5V out when in constant current mode, 0V when in constant voltage mode.

+12 V

0, return of connections 4, 7, 13

Reference voltage 5.1V

V-monitor, 0-5V out corresponds with zero to full output voltage.

V-program, 0-5V in corresponds with zero to full output voltage.

OVP-signal, 5V out when in overvoltage protection, 0V when not.

Series m/s 0, to be connected to pin1 of slave when used as master/slave in series.

Series m/s Vp, to be connected to pin11 of slave when used as master/slave in series.

Connections to 15-pole D-connector

Remote control SM3540

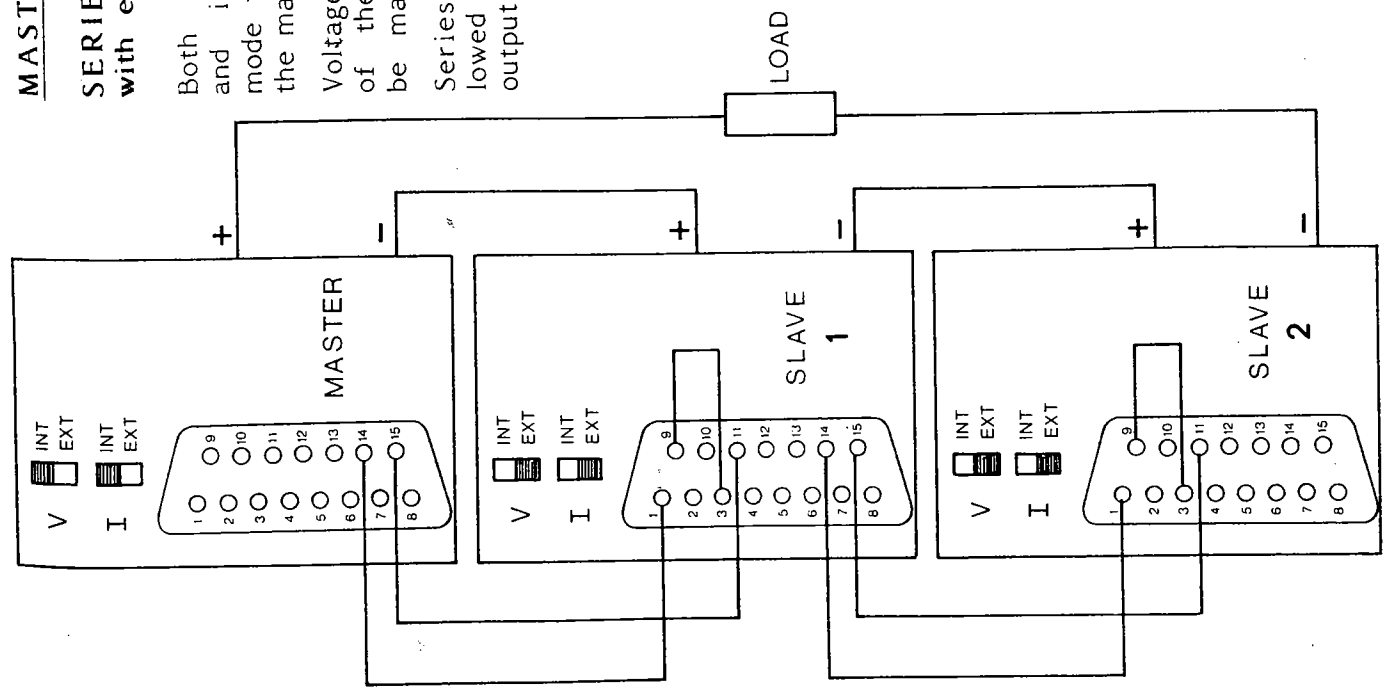

MASTER AND SLAVE

SERIES CONNECTION with equal voltage sharing

Both in constant voltage and in constant current mode the slaves will follow the master.

Voltage and current control of the master can either be manual or programmed.

Series connection is allowed up to 500V total output.

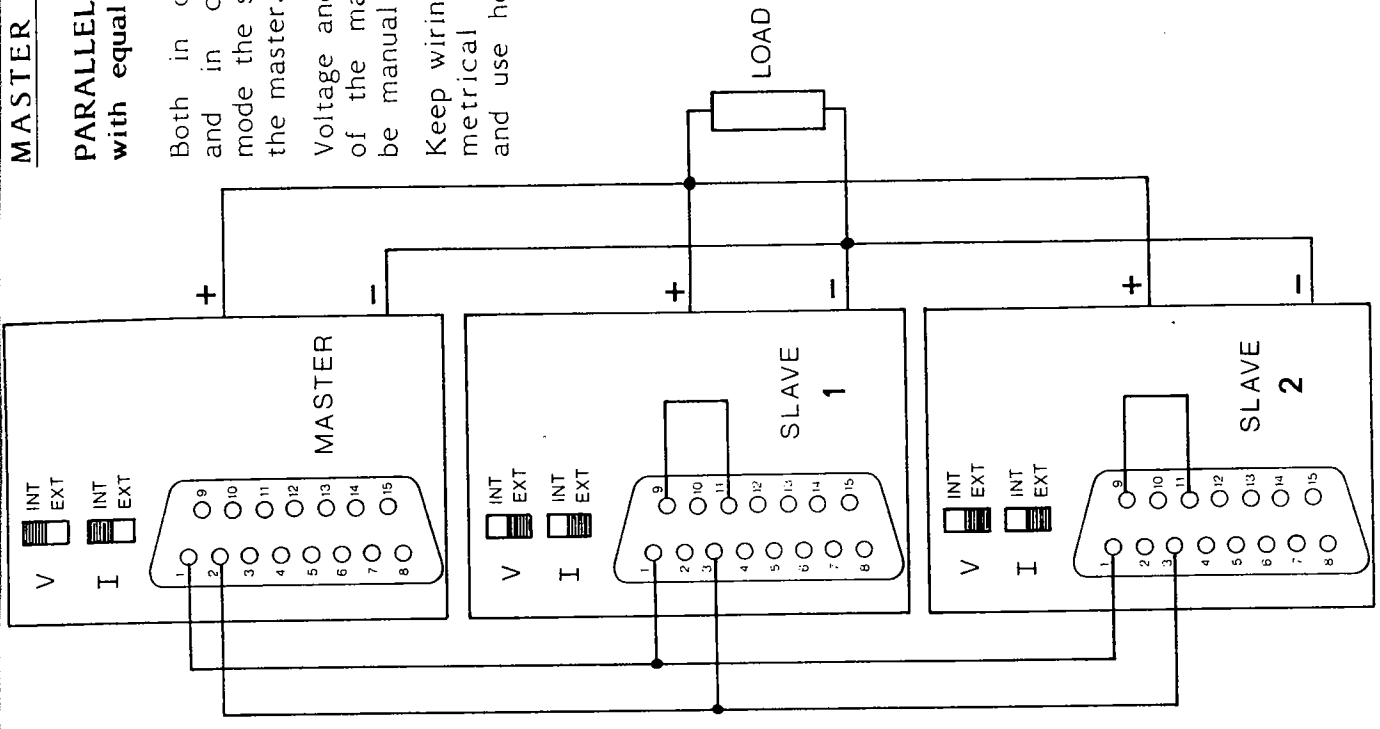

MASTER AND SLAVE

PARALLEL CONNECTION with equal current sharing

Both in constant voltage and in constant current mode the slaves will follow the master.

Voltage and current control of the master can either be manual or programmed.

Keep wiring short and symmetrical (equal lengths) and use heavy gauge wire.

MASTER AND SLAVE

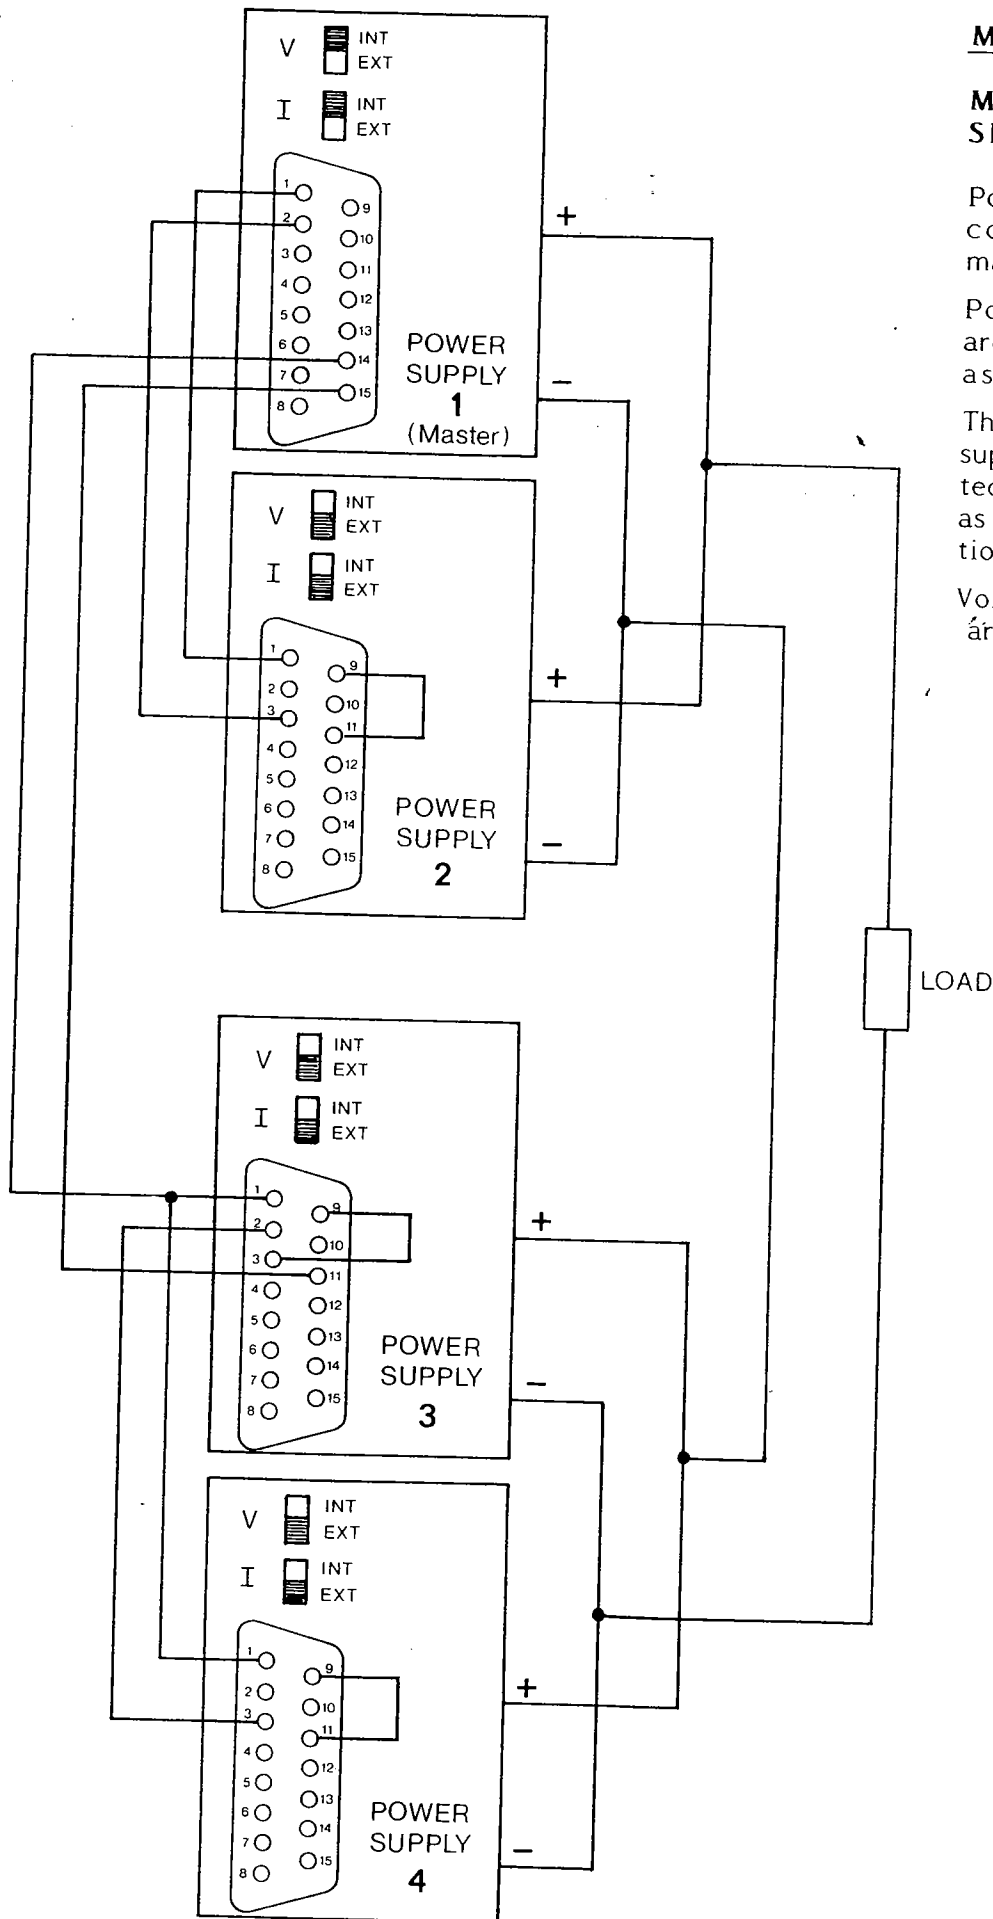

MIXED PARALLEL AND SERIES CONNECTION

Power supply 1 and 2 are connected parallel as master and slave.

Power supply 3 and 4 are also connected parallel as master and slave.

The combination of power supply 3 and 4 is connected in series with and as slave of the combination 1 and 2.

Voltage and current control are now by power supply 1.

TROUBLESHOOTING SM3540

Fuse F3 is blown

1. Check diodes D 83, 84, 85, 86. (BYW 93-200, on heatsink).
2. Check all diodes on P 284, defective diodes will give a short. You don't have to desolder to measure them.
3. When one of the transistors Q 5 - Q 12 (BUZ 67) is blown, also one or more resistors R 16 - R 19, R 22 - R 25 (6,8 Ohm) will be blown (open circuit).
4. Replace defective components.
5. Switch on power supply.

If fuse F3 on P 313 is blown again, replace the whole switching unit containing P 273, P 284 and Q 5 - Q 12, also replace P 323. Send defective units for repair.

The SM3540 is a very reliable design and we expect a very low failure rate. To check this we want to keep record of every repair and therefore ask your cooperation.

In case you repair an SM3540 please report to us:

- Serial no
- Description of defect
- Presumable cause of defect
- Replaced parts
