The command descriptions in this reference show upper and lowercase characters. For example, :AUToscale indicates that the entire command name is :AUTOSCALE. The short form, :AUT, is also accepted by the oscilloscope.

- **Chapter 46**, "More About Oscilloscope Commands," starting on page 1445, contains additional information about oscilloscope programming commands.

Finally, there is a chapter that contains programming examples:

- **Chapter 47**, "Programming Examples," starting on page 1455.

Mixed-Signal Oscilloscope Channel Differences

Because both the "analog channels only" oscilloscopes (DSO models) and the mixed-signal oscilloscopes (MSO models) have analog channels, topics that describe analog channels refer to all oscilloscope models. Whenever a topic describes digital channels, that information applies only to the mixed-signal oscilloscope models.

Command Differences From 4000 X-Series Oscilloscopes / 43

What's New in Version 6.10

New features in version 6.10 of the InfiniiVision 6000 X-Series oscilloscope software are:

- The Control Loop Response (Bode) power analysis now lets you select a phase plot as well as a gain plot.
- Updates to support CAN FD serial decode and triggering, including the ISO standard.
- Up to 10 annotations are supported.
- Being able to load LIN symbolic data from an LDF (*.ldf) file into the oscilloscope, display it in the decode, and use it to set up triggers and protocol decode searches.
- SENT serial decode and triggering option.
- New built-in demo signals (with EDK license that comes with the N6455A Education Kit).

More detailed descriptions of the new and changed commands appear below.

Version 6.00 at Introduction

The Keysight InfiniiVision 6000 X-Series oscilloscopes were introduced with version 6.00 of oscilloscope operating software.

The command set is most closely related to the InfiniiVision 3000 X-Series oscilloscopes (and the 7000A/B Series, 6000 Series, and 54620/54640 Series oscilloscopes before them). For more information, see **"Command Differences From 4000 X-Series Oscilloscopes"** on page 43.

Command Differences From 4000 X-Series Oscilloscopes

The Keysight InfiniiVision 6000 X-Series oscilloscopes command set is most closely related to the InfiniiVision 4000 X-Series oscilloscopes (and the 3000 X-Series, 7000A/B Series, 6000 Series, and 54620/54640 Series oscilloscopes before them).

The main differences between the version 6.00 programming command set for the InfiniiVision 6000 X-Series oscilloscopes and the 3.20 programming command set for the InfiniiVision 4000 X-Series oscilloscopes are related to:

2 Setting Up

Step 1. Install Keysight IO Libraries Suite software / 48

Step 2. Connect and set up the oscilloscope / 49

Step 3. Verify the oscilloscope connection / 51

This chapter explains how to install the Keysight IO Libraries Suite software, connect the oscilloscope to the controller PC, set up the oscilloscope, and verify the oscilloscope connection.

Step 1. Install Keysight IO Libraries Suite software

- 1 Download the Keysight IO Libraries Suite software from the Keysight web site at:
 - <http://www.keysight.com/find/iolib>
- 2 Run the setup file, and follow its installation instructions.

Step 2. Connect and set up the oscilloscope

The 6000 X-Series oscilloscope has two different interfaces you can use for programming:

- USB (device port).
- LAN. To configure the LAN interface, press the **[Utility]** key on the front panel, then press the **I/O** softkey, then press the **Configure** softkey.

These interfaces are always active.

Figure 1 Control Connectors on Rear Panel

Using the USB (Device) Interface

- 1 Connect a USB cable from the controller PC's USB port to the "USB DEVICE" port on the back of the oscilloscope.

This is a USB 2.0 high-speed port.

Using the LAN Interface

- 1 If the controller PC is not already connected to the local area network (LAN), do that first.
- 2 Contact your network administrator about adding the oscilloscope to the network.

Find out if automatic configuration via DHCP or AutoIP can be used. Also, find out whether your network supports Dynamic DNS or Multicast DNS.

If automatic configuration is not supported, get the oscilloscope's network parameters (hostname, domain, IP address, subnet mask, gateway IP, DNS IP, etc.).

- 3 Connect the oscilloscope to the local area network (LAN) by inserting LAN cable into the "LAN" port on the back of the oscilloscope.
- 4 Configure the oscilloscope's LAN interface:
 - a Press the **Configure** softkey until "LAN" is selected.
 - b Press the **LAN Settings** softkey.
 - c Press the **Config** softkey, and enable all the configuration options supported by your network.
 - d If automatic configuration is not supported, press the **Addresses** softkey.

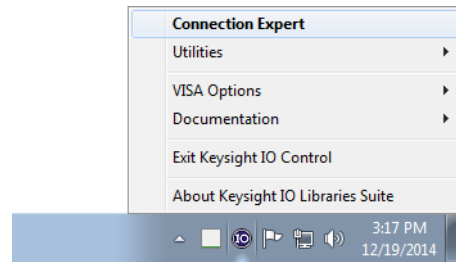

Use the **Modify** softkey (and the other softkeys and the Entry knob) to enter the IP Address, Subnet Mask, Gateway IP, and DNS IP values.

When you are done, press the **[Back up]** key.
 - e Press the **Host name** softkey. Use the softkeys and the Entry knob to enter the Host name.

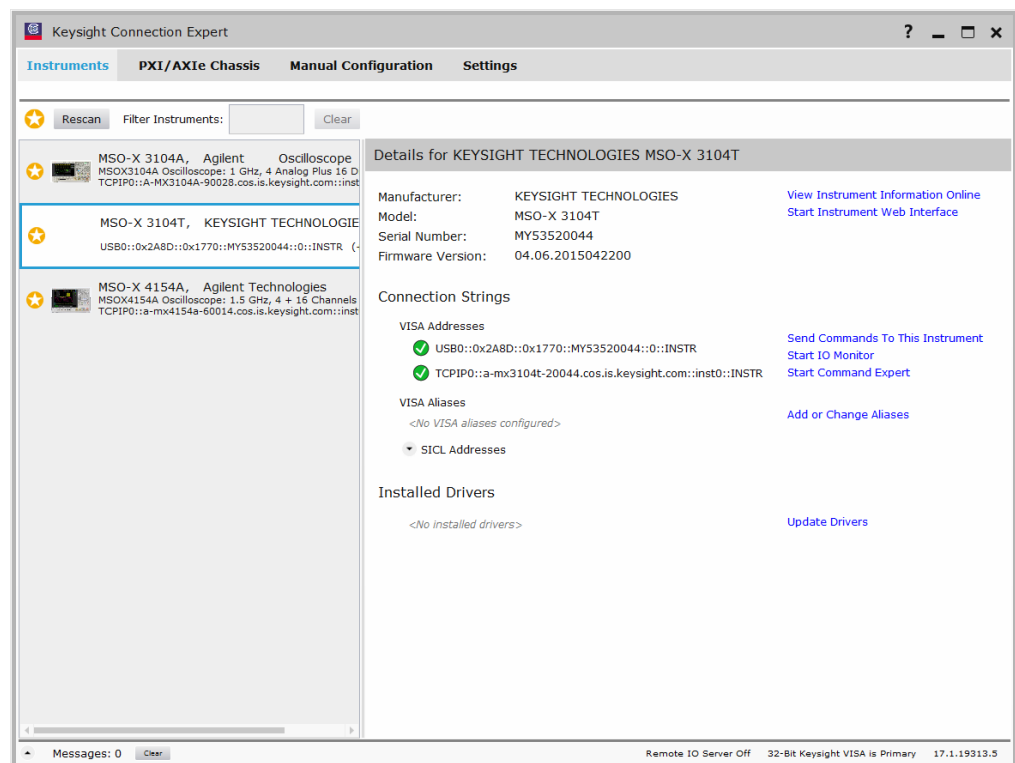

When you are done, press the **[Back up]** key.

Step 3. Verify the oscilloscope connection

- 1 On the controller PC, click on the Keysight IO Control icon in the taskbar and choose **Connection Expert** from the popup menu.

- 2 In the Keysight Connection Expert application, instruments connected to the controller's USB and GPIB interfaces as well as instruments on the same LAN subnet should automatically appear in the Instruments tab.

- 3 If your instrument does not appear, you can add it using the Manual Configuration tab.

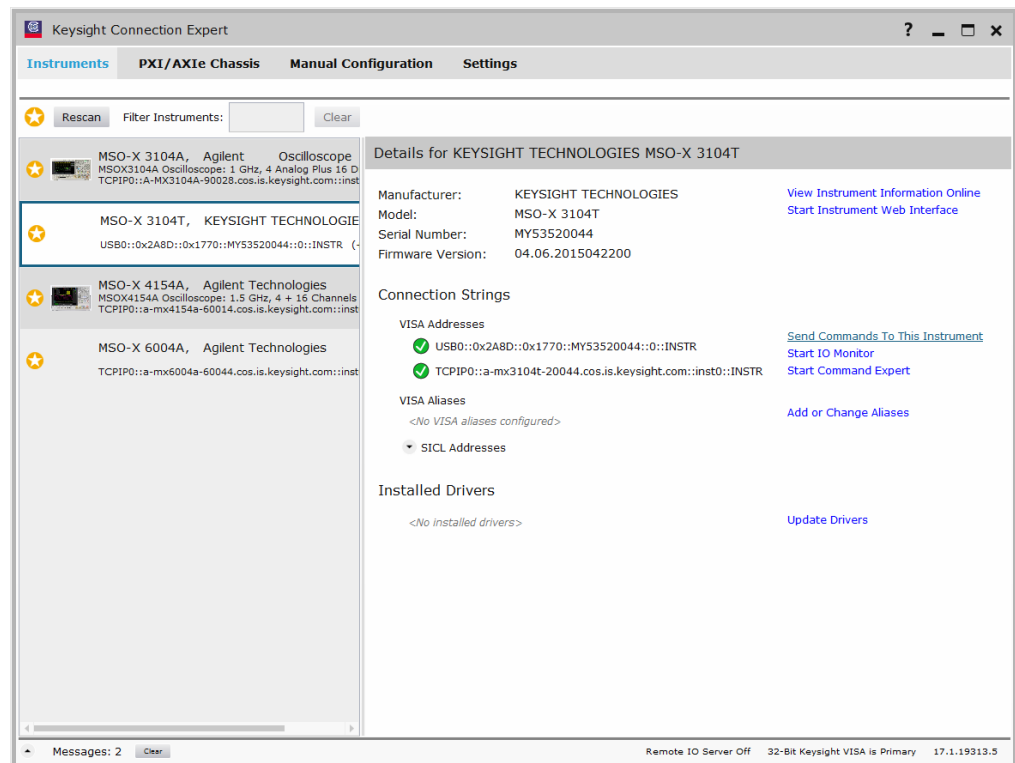

For example, to add a device:

- a Select **LAN instrument** in the list on the left.
- b Enter the oscilloscope's **Hostname** or **IP address**.
- c Select the protocol.
- d Select **Instrument** under Set Protocol.
- e Click **Test This VISA Address** to verify the connection.
- f If the connection test is successful, click **Accept** to add the instrument.

If the connection test is not successful, go back and verify the LAN connections and the oscilloscope setup.

- 4 Test some commands on the instrument:
- a In the Details for the selected instrument, click **Send Commands To This Instrument**.

- b In the Keysight Interactive IO application, enter commands in the **Command** field and press **Send Command**, **Read Response**, or **Send & Read**.

- c Choose **Connect > Exit** from the menu to exit the Keysight Interactive IO application.
- 5 In the Keysight Connection Expert application, choose **File > Exit** from the menu to exit the application.

3 Getting Started

Basic Oscilloscope Program Structure / 56

Programming the Oscilloscope / 58

Other Ways of Sending Commands / 67

This chapter gives you an overview of programming the 6000 X-Series oscilloscopes. It describes basic oscilloscope program structure and shows how to program the oscilloscope using a few simple examples.

The getting started examples show how to send oscilloscope setup, data capture, and query commands, and they show how to read query results.

NOTE

Language for Program Examples

The programming examples in this guide are written in Visual Basic using the Keysight VISA COM library.

Basic Oscilloscope Program Structure

The following figure shows the basic structure of every program you will write for the oscilloscope.

Initializing

To ensure consistent, repeatable performance, you need to start the program, controller, and oscilloscope in a known state. Without correct initialization, your program may run correctly in one instance and not in another. This might be due to changes made in configuration by previous program runs or from the front panel of the oscilloscope.

- Program initialization defines and initializes variables, allocates memory, or tests system configuration.
- Controller initialization ensures that the interface to the oscilloscope is properly set up and ready for data transfer.
- Oscilloscope initialization sets the channel configuration, channel labels, threshold voltages, trigger specification, trigger mode, timebase, and acquisition type.

Capturing Data

Once you initialize the oscilloscope, you can begin capturing data for analysis. Remember that while the oscilloscope is responding to commands from the controller, it is not performing acquisitions. Also, when you change the oscilloscope configuration, any data already captured will most likely be rendered.

To collect data, you use the `:DIGitize` command. This command clears the waveform buffers and starts the acquisition process. Acquisition continues until acquisition memory is full, then stops. The acquired data is displayed by the oscilloscope, and the captured data can be measured, stored in acquisition

memory in the oscilloscope, or transferred to the controller for further analysis. Any additional commands sent while :DIGitize is working are buffered until :DIGitize is complete.

You could also put the oscilloscope into run mode, then use a wait loop in your program to ensure that the oscilloscope has completed at least one acquisition before you make a measurement. Keysight does not recommend this because the needed length of the wait loop may vary, causing your program to fail. :DIGitize, on the other hand, ensures that data capture is complete. Also, :DIGitize, when complete, stops the acquisition process so that all measurements are on displayed data, not on a constantly changing data set.

Analyzing Captured Data

After the oscilloscope has completed an acquisition, you can find out more about the data, either by using the oscilloscope measurements or by transferring the data to the controller for manipulation by your program. Built-in measurements include: frequency, duty cycle, period, positive pulse width, and negative pulse width.

Using the :WAVEform commands, you can transfer the data to your controller. You may want to display the data, compare it to a known good measurement, or simply check logic patterns at various time intervals in the acquisition.

Referencing the IO Library

No matter which instrument programming library you use (SICL, VISA, or VISA COM), you must reference the library from your program.

In C/C++, you must tell the compiler where to find the include and library files (see the Keysight IO Libraries Suite documentation for more information).

To reference the Keysight VISA COM library in Visual Basic for Applications (VBA, which comes with Microsoft Office products like Excel):

- 1 Choose **Tools > References...** from the main menu.
- 2 In the References dialog, check the "VISA COM 5.2 Type Library".

- 3 Click **OK**.

To reference the Keysight VISA COM library in Microsoft Visual Basic 6.0:

- 1 Choose **Project > References...** from the main menu.
- 2 In the References dialog, check the "VISA COM 5.2 Type Library".
- 3 Click **OK**.

Opening the Oscilloscope Connection via the IO Library

PC controllers communicate with the oscilloscope by sending and receiving messages over a remote interface. Once you have opened a connection to the oscilloscope over the remote interface, programming instructions normally appear as ASCII character strings embedded inside write statements of the programming language. Read statements are used to read query responses from the oscilloscope.

For example, when using the Keysight VISA COM library in Visual Basic (after opening the connection to the instrument using the ResourceManager object's Open method), the FormattedIO488 object's WriteString, WriteNumber, WriteList, or WriteIIEEBlock methods are used for sending commands and queries. After a query is sent, the response is read using the ReadString, ReadNumber, ReadList, or ReadIIEEBlock methods.

The following Visual Basic statements open the connection and send a command that turns on the oscilloscope's label display.

```
Dim myMgr As VisaComLib.ResourceManager
Dim myScope As VisaComLib.FormattedIO488

Set myMgr = New VisaComLib.ResourceManager
Set myScope = New VisaComLib.FormattedIO488

' Open the connection to the oscilloscope. Get the VISA Address from the
' Keysight Connection Expert (installed with Keysight IO Libraries Suite
').
Set myScope.IO = myMgr.Open("<VISA Address>")

' Send a command.
myScope.WriteString ":DISPlay:LABel ON"
```

The ":DISPLAY:LABEL ON" in the above example is called a *program message*. Program messages are explained in more detail in "[Program Message Syntax](#)" on page 1447.

Initializing the Interface and the Oscilloscope

To make sure the bus and all appropriate interfaces are in a known state, begin every program with an initialization statement. When using the Keysight VISA COM library, you can use the resource session object's Clear method to clear the interface buffer:

```

Dim myMgr As VisaComLib.ResourceManager
Dim myScope As VisaComLib.FormattedIO488

Set myMgr = New VisaComLib.ResourceManager
Set myScope = New VisaComLib.FormattedIO488

' Open the connection to the oscilloscope. Get the VISA Address from the
' Keysight Connection Expert (installed with Keysight IO Libraries Suite
').
Set myScope.IO = myMgr.Open("<VISA Address>")

' Clear the interface buffer and set the interface timeout to 10 seconds
.
myScope.IO.Clear
myScope.IO.Timeout = 10000

```

When you are using GPIB, CLEAR also resets the oscilloscope's parser. The parser is the program which reads in the instructions which you send it.

After clearing the interface, initialize the instrument to a preset state:

```
myScope.WriteString "*RST"
```

NOTE**Information for Initializing the Instrument**

The actual commands and syntax for initializing the instrument are discussed in [Chapter 5, "Common \(*\) Commands,"](#) starting on page 181.

Refer to the Keysight IO Libraries Suite documentation for information on initializing the interface.

Using :AUToscale to Automate Oscilloscope Setup

The :AUToscale command performs a very useful function for unknown waveforms by setting up the vertical channel, time base, and trigger level of the instrument.

The syntax for the autoscale command is:

```
myScope.WriteString ":AUToscale"
```

Using Other Oscilloscope Setup Commands

A typical oscilloscope setup would set the vertical range and offset voltage, the horizontal range, delay time, delay reference, trigger mode, trigger level, and slope. An example of the commands that might be sent to the oscilloscope are:

```

myScope.WriteString ":CHANnel1:PROBe 10"
myScope.WriteString ":CHANnel1:RANGe 16"
myScope.WriteString ":CHANnel1:OFFSet 1.00"
myScope.WriteString ":TIMEbase:MODE MAIN"
myScope.WriteString ":TIMEbase:RANGe 1E-3"
myScope.WriteString ":TIMEbase:DELay 100E-6"

```

Vertical is set to 16 V full-scale (2 V/div) with center of screen at 1 V and probe attenuation set to 10. This example sets the time base at 1 ms full-scale (100 ms/div) with a delay of 100 μ s.

Example Oscilloscope Setup Code

This program demonstrates the basic command structure used to program the oscilloscope.

```
' Initialize the instrument interface to a known state.
myScope.IO.Clear
myScope.IO.Timeout = 10000 ' Set interface timeout to 10 seconds.

' Initialize the instrument to a preset state.
myScope.WriteString "*RST"

' Set the time base mode to normal with the horizontal time at
' 50 ms/div with 0 s of delay referenced at the center of the
' graticule.
myScope.WriteString ":TIMEbase:RANGE 5E-4" ' Time base to 50 us/div.
myScope.WriteString ":TIMEbase:DElay 0" ' Delay to zero.
myScope.WriteString ":TIMEbase:REfERENCE CENTER" ' Display ref. at
' center.

' Set the vertical range to 1.6 volts full scale with center screen
' at -0.4 volts with 10:1 probe attenuation and DC coupling.
myScope.WriteString ":CHANnel:PROBe 10" ' Probe attenuation
' to 10:1.
myScope.WriteString ":CHANnel:RANGE 1.6" ' Vertical range
' 1.6 V full scale.
myScope.WriteString ":CHANnel:OFFSet -0.4" ' Offset to -0.4.
myScope.WriteString ":CHANnel:COUPling DC" ' Coupling to DC.

' Configure the instrument to trigger at -0.4 volts with normal
' triggering.
myScope.WriteString ":TRIGger:SWEep NORMal" ' Normal triggering.
myScope.WriteString ":TRIGger:LEVel -0.4" ' Trigger level to -0.4.
myScope.WriteString ":TRIGger:SLOPe POSitive" ' Trigger on pos. slope.

' Configure the instrument for normal acquisition.
myScope.WriteString ":ACQuire:TYPE NORMal" ' Normal acquisition.
```

Capturing Data with the :DIGitize Command

The :DIGitize command captures data that meets the specifications set up by the :ACQuire subsystem. When the digitize process is complete, the acquisition is stopped. The captured data can then be measured by the instrument or transferred to the controller for further analysis. The captured data consists of two parts: the waveform data record, and the preamble.

NOTE**Ensure New Data is Collected**

When you change the oscilloscope configuration, the waveform buffers are cleared. Before doing a measurement, send the :DIGitize command to the oscilloscope to ensure new data has been collected.

When you send the :DIGitize command to the oscilloscope, the specified channel signal is digitized with the current :ACQUIRE parameters. To obtain waveform data, you must specify the :WAVEform parameters for the SOURce channel, the FORMat type, and the number of POINTs prior to sending the :WAVEform:DATA? query.

NOTE**Set :TIMEbase:MODE to MAIN when using :DIGitize**

:TIMEbase:MODE must be set to MAIN to perform a :DIGitize command or to perform any :WAVEform subsystem query. A "Settings conflict" error message will be returned if these commands are executed when MODE is set to ROLL, XY, or WINDow (zoomed). Sending the *RST (reset) command will also set the time base mode to normal.

The number of data points comprising a waveform varies according to the number requested in the :ACQUIRE subsystem. The :ACQUIRE subsystem determines the number of data points, type of acquisition, and number of averages used by the :DIGitize command. This allows you to specify exactly what the digitized information contains.

The following program example shows a typical setup:

```
myScope.WriteString ":ACQUIRE:TYPE AVERage"
myScope.WriteString ":ACQUIRE:COMPLete 100"
myScope.WriteString ":ACQUIRE:COUNt 8"
myScope.WriteString ":DIGitize CHANnel1"
myScope.WriteString ":WAVEform:SOURce CHANnel1"
myScope.WriteString ":WAVEform:FORMat BYTE"
myScope.WriteString ":WAVEform:POINTs 500"
myScope.WriteString ":WAVEform:DATA?"
```

This setup places the instrument into the averaged mode with eight averages. This means that when the :DIGitize command is received, the command will execute until the signal has been averaged at least eight times.

After receiving the :WAVEform:DATA? query, the instrument will start passing the waveform information.

Digitized waveforms are passed from the instrument to the controller by sending a numerical representation of each digitized point. The format of the numerical representation is controlled with the :WAVEform:FORMat command and may be selected as BYTE, WORD, or ASCii.

The easiest method of transferring a digitized waveform depends on data structures, formatting available and I/O capabilities. You must scale the integers to determine the voltage value of each point. These integers are passed starting with the left most point on the instrument's display.

For more information, see the waveform subsystem commands and corresponding program code examples in **Chapter 39**, “:WAVeform Commands,” starting on page 1251.

NOTE**Aborting a Digitize Operation Over the Programming Interface**

When using the programming interface, you can abort a digitize operation by sending a Device Clear over the bus (for example, `myScope.IO.Clear`).

Reading Query Responses from the Oscilloscope

After receiving a query (command header followed by a question mark), the instrument interrogates the requested function and places the answer in its output queue. The answer remains in the output queue until it is read or another command is issued. When read, the answer is transmitted across the interface to the designated listener (typically a controller).

The statement for reading a query response message from an instrument's output queue typically has a format specification for handling the response message.

When using the VISA COM library in Visual Basic, you use different read methods (`ReadString`, `ReadNumber`, `ReadList`, or `ReadIEEEBlock`) for the various query response formats. For example, to read the result of the query command `:CHANnel1:COUPling?` you would execute the statements:

```
myScope.WriteString ":CHANnel1:COUPling?"
Dim strQueryResult As String
strQueryResult = myScope.ReadString
```

This reads the current setting for the channel one coupling into the string variable `strQueryResult`.

All results for queries (sent in one program message) must be read before another program message is sent.

Sending another command before reading the result of the query clears the output buffer and the current response. This also causes an error to be placed in the error queue.

Executing a read statement before sending a query causes the controller to wait indefinitely.

The format specification for handling response messages depends on the programming language.

Reading Query Results into String Variables

The output of the instrument may be numeric or character data depending on what is queried. Refer to the specific command descriptions for the formats and types of data returned from queries.

NOTE

Express String Variables Using Exact Syntax

In Visual Basic, string variables are case sensitive and must be expressed exactly the same each time they are used.

The following example shows numeric data being returned to a string variable:

```
myScope.WriteString ":CHANnel1:RANGe?"
Dim strQueryResult As String
strQueryResult = myScope.ReadString
MsgBox "Range (string):" + strQueryResult
```

After running this program, the controller displays:

Range (string): +40.0E+00

Reading Query Results into Numeric Variables

The following example shows numeric data being returned to a numeric variable:

```
myScope.WriteString ":CHANnel1:RANGe?"
Dim varQueryResult As Variant
varQueryResult = myScope.ReadNumber
MsgBox "Range (variant):" + CStr(varQueryResult)
```

After running this program, the controller displays:

Range (variant): 40

Reading Definite-Length Block Query Response Data

Definite-length block query response data allows any type of device-dependent data to be transmitted over the system interface as a series of 8-bit binary data bytes. This is particularly useful for sending large quantities of data or 8-bit extended ASCII codes. The syntax is a pound sign (#) followed by a non-zero digit representing the number of digits in the decimal integer. After the non-zero digit is the decimal integer that states the number of 8-bit data bytes being sent. This is followed by the actual data.

For example, for transmitting 1000 bytes of data, the syntax would be:

Figure 2 Definite-length block response data

The "8" states the number of digits that follow, and "00001000" states the number of bytes to be transmitted.

The VISA COM library's `ReadIEEEBlock` and `WriteIEEEBlock` methods understand the definite-length block syntax, so you can simply use variables that contain the data:

```
' Read oscilloscope setup using ":SYSTEM:SETup?" query.
myScope.WriteString ":SYSTEM:SETup?"
Dim varQueryResult As Variant
varQueryResult = myScope.ReadIEEEBlock(BinaryType_UI1)

' Write learn string back to oscilloscope using ":SYSTEM:SETup" command:
myScope.WriteIEEEBlock ":SYSTEM:SETup ", varQueryResult
```

Sending Multiple Queries and Reading Results

You can send multiple queries to the instrument within a single command string, but you must also read them back as a single query result. This can be accomplished by reading them back into a single string variable, multiple string variables, or multiple numeric variables.

For example, to read the `:TIMEbase:RANGE?;DElay?` query result into a single string variable, you could use the commands:

```
myScope.WriteString ":TIMEbase:RANGE?;DElay?"
Dim strQueryResult As String
strQueryResult = myScope.ReadString
MsgBox "Timebase range; delay:" + strQueryResult
```

When you read the result of multiple queries into a single string variable, each response is separated by a semicolon. For example, the output of the previous example would be:

```
Timebase range; delay: <range_value>;<delay_value>
```

To read the `:TIMEbase:RANGE?;DElay?` query result into multiple string variables, you could use the `ReadList` method to read the query results into a string array variable using the commands:

```
myScope.WriteString ":TIMEbase:RANGE?;DElay?"
Dim strResults() As String
```

```
strResults() = myScope.ReadList(ASCIIType_BSTR)
MsgBox "Timebase range: " + strResults(0) + ", delay: " + strResults(1)
```

To read the :TIMEbase:RANGE?;DElay? query result into multiple numeric variables, you could use the ReadList method to read the query results into a variant array variable using the commands:

```
myScope.WriteString ":TIMEbase:RANGE?;DElay?"
Dim varResults() As Variant
varResults() = myScope.ReadList
MsgBox "Timebase range: " + FormatNumber(varResults(0) * 1000, 4) + _
      " ms, delay: " + FormatNumber(varResults(1) * 1000000, 4) + " us"
```

Checking Instrument Status

Status registers track the current status of the instrument. By checking the instrument status, you can find out whether an operation has been completed, whether the instrument is receiving triggers, and more.

For more information, see [Chapter 44](#), “Status Reporting,” starting on page 1411 which explains how to check the status of the instrument.

Other Ways of Sending Commands

Standard Commands for Programmable Instrumentation (SCPI) can also be sent via a Telnet socket or through the Browser Web Control:

- **"Telnet Sockets"** on page 67
- **"Sending SCPI Commands Using Browser Web Control"** on page 67

Telnet Sockets

The following information is provided for programmers who wish to control the oscilloscope with SCPI commands in a Telnet session.

To connect to the oscilloscope via a telnet socket, issue the following command:

```
telnet <hostname> 5024
```

where <hostname> is the hostname of the oscilloscope. This will give you a command line with prompt.

For a command line without a prompt, use port 5025. For example:

```
telnet <hostname> 5025
```

Sending SCPI Commands Using Browser Web Control

To send SCPI commands using the Browser Web Control feature, establish a connection to the oscilloscope via LAN as described in the *InfiniiVision 6000 X-Series Oscilloscopes User's Guide*. When you make the connection to the oscilloscope via LAN and the instrument's welcome page is displayed, select the **Browser Web Control** tab, then select the **Remote Programming** link.

Number Format

NR1 specifies integer data.

NR3 specifies exponential data in floating point format (for example, -1.0E-3).

<NL> (Line Terminator)

<NL> = new line or linefeed (ASCII decimal 10).

The line terminator, or a leading colon, will send the parser to the "root" of the command tree.

[] (Optional Syntax Terms)

Items enclosed in square brackets, [], are optional.

{ } (Braces)

When several items are enclosed by braces, { }, only one of these elements may be selected. Vertical line (|) indicates "or". For example, {ON | OFF} indicates that only ON or OFF may be selected, not both.

::= (Defined As)

::= means "defined as".

For example, <A> ::= indicates that <A> can be replaced by in any statement containing <A>.

< > (Angle Brackets)

< > Angle brackets enclose words or characters that symbolize a program code parameter or an interface command.

... (Ellipsis)

... An ellipsis (trailing dots) indicates that the preceding element may be repeated one or more times.

n,...,p (Value Ranges)

n,...,p ::= all integers between n and p inclusive.

d (Digits)

d ::= A single ASCII numeric character 0 - 9.

Quoted ASCII String

A quoted ASCII string is a string delimited by either double quotes (") or single quotes ('). Some command parameters require a quoted ASCII string. For example, when using the Keysight VISA COM library in Visual Basic, the command:

```
myScope.WriteString ":CHANNEL1:LABEL 'One' "
```

has a quoted ASCII string of:

```
'One'
```

In order to read quoted ASCII strings from query return values, some programming languages require special handling or syntax.

Definite-Length Block Response Data

Definite-length block response data allows any type of device-dependent data to be transmitted over the system interface as a series of 8-bit binary data bytes. This is particularly useful for sending large quantities of data or 8-bit extended ASCII codes. This syntax is a pound sign (#) followed by a non-zero digit representing the number of digits in the decimal integer. After the non-zero digit is the decimal integer that states the number of 8-bit data bytes being sent. This is followed by the actual data.

For example, for transmitting 1000 bytes of data, the syntax would be

```
#800001000<1000 bytes of data> <NL>
```

8 is the number of digits that follow

00001000 is the number of bytes to be transmitted

<1000 bytes of data> is the actual data

**Introduction to
Common (*)
Commands**

The common commands are defined by the IEEE 488.2 standard. They are implemented by all instruments that comply with the IEEE 488.2 standard. They provide some of the basic instrument functions, such as instrument identification and reset, reading the instrument setup, and determining how status is read and cleared.

Common commands can be received and processed by the instrument whether they are sent over the interface as separate program messages or within other program messages. If an instrument subsystem has been selected and a common command is received by the instrument, the instrument remains in the selected subsystem. For example, if the program message ":ACQUIRE:TYPE AVERAGE; *CLS; COUNT 256" is received by the instrument, the instrument sets the acquire type, then clears the status information and sets the average count.

In contrast, if a root level command or some other subsystem command is within the program message, you must re-enter the original subsystem after the command. For example, the program message ":ACQUIRE:TYPE AVERAGE; :AUTOSCALE; :ACQUIRE:COUNT 256" sets the acquire type, completes the autoscale, then sets the acquire count. In this example, :ACQUIRE must be sent again after the :AUTOSCALE command in order to re-enter the ACQUIRE subsystem and set the count.

NOTE

Each of the status registers has an enable (mask) register. By setting the bits in the enable register, you can select the status information you want to use.

*CLS (Clear Status)

C (see [page 1446](#))

Command Syntax

*CLS

The *CLS common command clears the status data structures, the device-defined error queue, and the Request-for-OPC flag.

NOTE

If the *CLS command immediately follows a program message terminator, the output queue and the MAV (message available) bit are cleared.

*ESE (Standard Event Status Enable)

C (see [page 1446](#))

Command Syntax *ESE <mask_argument>

<mask_argument> ::= integer from 0 to 255

The *ESE common command sets the bits in the Standard Event Status Enable Register. The Standard Event Status Enable Register contains a mask value for the bits to be enabled in the Standard Event Status Register. A "1" in the Standard Event Status Enable Register enables the corresponding bit in the Standard Event Status Register. A zero disables the bit.

Table 77 Standard Event Status Enable (ESE)

Bit	Name	Description	When Set (1 = High = True), Enables:
7	PON	Power On	Event when an OFF to ON transition occurs.
6	URQ	User Request	Event when a front-panel key is pressed.
5	CME	Command Error	Event when a command error is detected.
4	EXE	Execution Error	Event when an execution error is detected.
3	DDE	Device Dependent Error	Event when a device-dependent error is detected.
2	QYE	Query Error	Event when a query error is detected.
1	RQL	Request Control	Event when the device is requesting control. (Not used.)
0	OPC	Operation Complete	Event when an operation is complete.

Query Syntax *ESE?

The *ESE? query returns the current contents of the Standard Event Status Enable Register.

Return Format <mask_argument><NL>

<mask_argument> ::= 0,...,255; an integer in NR1 format.

*ESR (Standard Event Status Register)

C (see [page 1446](#))

Query Syntax *ESR?

The *ESR? query returns the contents of the Standard Event Status Register. When you read the Event Status Register, the value returned is the total bit weights of all of the bits that are high at the time you read the byte. Reading the register clears the Event Status Register.

The following table shows bit weight, name, and condition for each bit.

Table 78 Standard Event Status Register (ESR)

Bit	Name	Description	When Set (1 = High = True), Indicates:
7	PON	Power On	An OFF to ON transition has occurred.
6	URQ	User Request	A front-panel key has been pressed.
5	CME	Command Error	A command error has been detected.
4	EXE	Execution Error	An execution error has been detected.
3	DDE	Device Dependent Error	A device-dependent error has been detected.
2	QYE	Query Error	A query error has been detected.
1	RQL	Request Control	The device is requesting control. (Not used.)
0	OPC	Operation Complete	Operation is complete.

Return Format <status><NL>
<status> ::= 0,..,255; an integer in NR1 format.

NOTE

Reading the Standard Event Status Register clears it. High or 1 indicates the bit is true.

*LRN (Learn Device Setup)

C (see [page 1446](#))

Query Syntax

*LRN?

The *LRN? query result contains the current state of the instrument. This query is similar to the :SYSTem:SETup? (see [page 1149](#)) query, except that it contains ":SYST:SET " before the binary block data. The query result is a valid command that can be used to restore instrument settings at a later time.

Return Format

<learn_string><NL>

<learn_string> ::= :SYST:SET <setup_data>

<setup_data> ::= binary block data in IEEE 488.2 # format

<learn string> specifies the current instrument setup. The block size is subject to change with different firmware revisions.

NOTE

The *LRN? query return format has changed from previous Keysight oscilloscopes to match the IEEE 488.2 specification which says that the query result must contain ":SYST:SET " before the binary block data.

C (see [page 1446](#))

Command Syntax *SAV <value>

<value> ::= {0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9}

<mask> ::= integer with values defined in the following table.

The *SRE command sets the bits in the Service Request Enable Register. The Service Request Enable Register contains a mask value for the bits to be enabled in the Status Byte Register. A one in the Service Request Enable Register enables the corresponding bit in the Status Byte Register. A zero disables the bit.

Table 79 Service Request Enable Register (SRE)

Bit	Name	Description	When Set (1 = High = True), Enables:
7	OPER	Operation Status Register	Interrupts when enabled conditions in the Operation Status Register (OPER) occur.
6	---	---	(Not used.)
5	ESB	Event Status Bit	Interrupts when enabled conditions in the Standard Event Status Register (ESR) occur.
4	MAV	Message Available	Interrupts when messages are in the Output Queue.
3	---	---	(Not used.)
2	MSG	Message	Interrupts when an advisory has been displayed on the oscilloscope.
1	USR	User Event	Interrupts when enabled user event conditions occur.
0	TRG	Trigger	Interrupts when a trigger occurs.

Query Syntax *SRE?

The *SRE? query returns the current value of the Service Request Enable Register.

Return Format <mask><NL>

<mask> ::= sum of all bits that are set, 0,...,255;

*STB (Read Status Byte)

C (see [page 1446](#))

Query Syntax *STB?

The *STB? query returns the current value of the instrument's status byte. The MSS (Master Summary Status) bit is reported on bit 6 instead of the RQS (request service) bit. The MSS indicates whether or not the device has at least one reason for requesting service.

Return Format <value><NL>

Table 80 Status Byte Register (STB)

Bit	Name	Description	When Set (1 = High = True), Indicates:

6	RQS	Request Service	When polled, that the device is requesting service.
	MSS	Master Summary Status	When read (by *STB?), whether the device has a reason for requesting service.
5	ESB	Event Status Bit	An enabled condition in the Standard Event Status Register (ESR) has occurred.
4	MAV	Message Available	There are messages in the Output Queue.
3	---	---	(Not used, always 0.)
2	MSG	Message	An advisory has been displayed on the oscilloscope.

**Introduction to
Root (:)
Commands**

Root level commands control many of the basic operations of the instrument. These commands are always recognized by the parser if they are prefixed with a colon, regardless of current command tree position. After executing a root-level command, the parser is positioned at the root of the command tree.

:ACTivity

N (see [page 1446](#))

Command Syntax :ACTivity

The :ACTivity command clears the cumulative edge variables for the next activity query.

Query Syntax :ACTivity?

The :ACTivity? query returns whether there has been activity (edges) on the digital channels since the last query, and returns the current logic levels.

NOTE

Because the :ACTivity? query returns edge activity since the last :ACTivity? query, you must send this query twice before the edge activity result is valid.

Return Format

<edges>, <levels><NL>

<edges> ::= presence of edges (16-bit integer in NR1 format).

<levels> ::= logical highs or lows (16-bit integer in NR1 format).

bit 0 ::= DIGital 0

bit 15 ::= DIGital 15

NOTE

A bit = 0 (zero) in the <edges> result indicates that no edges were detected on that channel (across the specified threshold voltage) since the last query.

A bit = 1 (one) in the <edges> result indicates that edges have been detected on that channel (across the specified threshold voltage) since the last query.

(The threshold voltage must be set appropriately for the logic levels of the signals being probed.)

:AER (Arm Event Register)

C (see [page 1446](#))

Query Syntax

:AER?

The AER query reads the Arm Event Register. After the Arm Event Register is read, it is cleared. A "1" indicates the trigger system is in the armed state, ready to accept a trigger.

The Armed Event Register is summarized in the Wait Trig bit of the Operation Status Event Register. A Service Request can be generated when the Wait Trig bit transitions and the appropriate enable bits have been set in the Operation Status Enable Register (OPEE) and the Service Request Enable Register (SRE).

Return Format

<value><NL>

<value> ::= {0 | 1}; an integer in NR1 format.

:AUToscale

C (see [page 1446](#))

Command Syntax :AUToscale
 :AUToscale [<source>[,...,<source>]]
 <source> ::= CHANnel<n> for the DSO models
 <source> ::= {DIGital<d> | POD1 | POD2 | CHANnel<n>} for the MSO models
 <n> ::= 1 to (# analog channels) in NR1 format
 <d> ::= 0 to (# digital channels - 1) in NR1 format

The <source> parameter may be repeated up to 5 times.

The :AUToscale command evaluates all input signals and sets the correct conditions to display the signals. This is the same as pressing the **[Auto Scale]** key on the front panel.

If one or more sources are specified, those specified sources will be enabled and all others blanked. The autoscale channels mode (see **" :AUToscale:CHANnels "** on page 216) is set to DISPlayed channels. Then, the autoscale is performed.

When the :AUToscale command is sent, the following conditions are affected and actions are taken:

- Thresholds.
- Channels with activity around the trigger point are turned on, others are turned off.
- Channels are reordered on screen; analog channel 1 first, followed by the remaining analog channels, then the digital channels 0-15.
- Delay is set to 0 seconds.
- Time/Div.

The :AUToscale command does not affect the following conditions:

- Label names.
- Trigger conditioning.

The :AUToscale command turns off the following items:

- Cursors.
- Measurements.
- Math waveforms.
- Reference waveforms.
- Zoomed (delayed) time base mode.

For further information on :AUToscale, see the *User's Guide*.

- ["Introduction to Root \(:\) Commands"](#) on page 210
 - [":AUToscale:CHANnels"](#) on page 216

Example Code

```
' AUTOSCALE - This command evaluates all the input signals and sets  
' the correct conditions to display all of the active signals.  
myScope.WriteString ":AUToscale" ' Same as pressing Auto Scale key.
```

See complete example programs at: [Chapter 47](#), "Programming Examples," starting on page 1455

:AUToscale:AMODE

N (see [page 1446](#))

Command Syntax :AUToscale:AMODE <value>

<value> ::= {NORMal | CURRent}

The :AUToscale:AMODE command specifies the acquisition mode that is set by subsequent :AUToscales.

- When NORMal is selected, an :AUToscale command sets the NORMal acquisition type and the RTIME (real-time) acquisition mode.
- When CURRent is selected, the current acquisition type and mode are kept on subsequent :AUToscales.

Use the :ACquire:TYPE and :ACquire:MODE commands to set the acquisition type and mode.

Query Syntax :AUToscale:AMODE?

The :AUToscale:AMODE? query returns the autoscale acquire mode setting.

Return Format <value><NL>

<value> ::= {NORM | CURR}

:AUToscale:CHANnels

N (see [page 1446](#))

Command Syntax :AUToscale:CHANnels <value>
<value> ::= {ALL | DISplayed}

The :AUToscale:CHANnels command specifies which channels will be displayed on subsequent :AUToscales.

- When ALL is selected, all channels that meet the requirements of :AUToscale will be displayed.
- When DISplayed is selected, only the channels that are turned on are autoscaled.

Use the :VIEW or :BLANK root commands to turn channels on or off.

Query Syntax :AUToscale:CHANnels?

The :AUToscale:CHANnels? query returns the autoscale channels setting.

Return Format <value><NL>
<value> ::= {ALL | DISP}

:AUToscale:FDEBug

N (see [page 1446](#))

Command Syntax :AUToscale:FDEBug <on_off>
 <on_off> ::= {{1 | ON} | {0 | OFF}}

The :AUToscale:FDEBug command turns fast debug auto scaling on or off.

The Fast Debug option changes the behavior of :AUToscale to let you make quick visual comparisons to determine whether the signal being probed is a DC voltage, ground, or an active AC signal.

Channel coupling is maintained for easy viewing of oscillating signals.

Query Syntax :AUToscale:FDEBug?

for the DSO models

<source> ::= {CHANnel<n> | DIGital<d> | POD{1 | 2}

NOTE

The :DIGitize command is only executed when the :TIMEbase:MODE is MAIN or WINDOW.

NOTE

To halt a :DIGitize in progress, use the device clear command.

Table 92 :ACquire Commands Summary (continued)

Command	Query	Options and Query Returns
n/a	:ACquire:SRATE? [MAXimum] (see page 263)	<sample_rate> ::= sample rate (samples/s) in NR3 format
:ACquire:TYPE <type> (see page 264)	:ACquire:TYPE? (see page 264)	<type> ::= {NORMAL AVERage HRESolution PEAK}

Introduction to :ACquire Commands The ACquire subsystem controls the way in which waveforms are acquired. These acquisition types are available: normal, averaging, peak detect, and high resolution.

Normal

The :ACquire:TYPE NORMAL command sets the oscilloscope in the normal acquisition mode. For the majority of user models and signals, NORMAL mode yields the best oscilloscope picture of the waveform.

Averaging

The :ACquire:TYPE AVERage command sets the oscilloscope in the averaging mode. You can set the count by sending the :ACquire:COUNT command followed by the number of averages. In this mode, the value for averages is an integer from 2 to 65536. The COUNT value determines the number of averages that must be acquired.

High-Resolution

The :ACquire:TYPE HRESolution command sets the oscilloscope in the high-resolution mode (also known as *smoothing*). This mode is used to reduce noise at slower sweep speeds where the digitizer samples faster than needed to fill memory for the displayed time range. Instead of decimating samples, they are averaged together to provide the value for one display point. The slower the sweep speed, the greater the number of samples that are averaged together for each display point.

Peak Detect

The :ACquire:TYPE PEAK command sets the oscilloscope in the peak detect mode. In this mode, :ACquire:COUNT has no meaning.

Reporting the Setup

Use :ACquire? to query setup information for the ACquire subsystem.

Return Format

The following is a sample response from the :ACquire? query. In this case, the query was issued following a *RST command.

```
:ACQ:MODE RTIM;TYPE NORM;COMP 100;COUNT 8;SEGM:COUN 2
```

:ACquire:AALias

N (see [page 1446](#))

Query Syntax :ACquire:AALias?

The :ACquire:AALias? query returns the current state of the oscilloscope acquisition anti-alias control. This control can be directly disabled or disabled automatically.

Return Format <value><NL>

<value> ::= {1 | 0}

- See Also**
- ["Introduction to :ACquire Commands"](#) on page 248
 - [":ACquire:DAALias"](#) on page 253

:ACquire:COMplete

C (see [page 1446](#))

Command Syntax :ACquire:COMplete <complete>
<complete> ::= 100; an integer in NR1 format

The :ACquire:COMplete command affects the operation of the :DIGitize command. It specifies the minimum completion criteria for an acquisition. The parameter determines the percentage of the time buckets that must be "full" before an acquisition is considered complete. If :ACquire:TYPE is NORMal, it needs only one sample per time bucket for that time bucket to be considered full.

The only legal value for the :COMplete command is 100. All time buckets must contain data for the acquisition to be considered complete.

Query Syntax :ACquire:COMplete?

The :ACquire:COMplete? query returns the completion criteria (100) for the currently selected mode.

Return Format <completion_criteria><NL>
<completion_criteria> ::= 100; an integer in NR1 format

 - [":ACquire:TYPE"](#) on page 264
 - [":DIGitize"](#) on page 219
 - [":WAVEform:POINTS"](#) on page 1264

Example Code

```
' ACQUIRE_COMPLETE - Specifies the minimum completion criteria for
' an acquisition. The parameter determines the percentage of time
' buckets needed to be "full" before an acquisition is considered
' to be complete.
myScope.WriteString ":ACquire:COMplete 100"
```

See complete example programs at: [Chapter 47](#), "Programming Examples," starting on page 1455

:ACquire:COUNT

C (see [page 1446](#))

Command Syntax :ACquire:COUNT <count>
<count> ::= integer in NR1 format

In averaging mode, the :ACquire:COUNT command specifies the number of values to be averaged for each time bucket before the acquisition is considered to be complete for that time bucket. When :ACquire:TYPE is set to AVERage, the count can be set to any value from 2 to 65536.

NOTE

The :ACquire:COUNT 1 command has been deprecated. The AVERage acquisition type with a count of 1 is functionally equivalent to the HRESolution acquisition type; however, you should select the high-resolution acquisition mode with the :ACquire:TYPE HRESolution command instead.

Query Syntax :ACquire:COUNT?

The :ACquire:COUNT? query returns the currently selected count value for averaging mode.

Return Format <count_argument><NL>
<count_argument> ::= an integer from 2 to 65536 in NR1 format

- See Also**
- ["Introduction to :ACquire Commands"](#) on page 248
 - [":ACquire:TYPE"](#) on page 264
 - [":DIGitize"](#) on page 219
 - [":WAVEform:COUNT"](#) on page 1260

:ACquire:DAALias

N (see [page 1446](#))

Command Syntax :ACquire:DAALias <mode>

<mode> ::= {DISable | AUTO}

The :ACquire:DAALias command sets the disable anti-alias mode of the oscilloscope.

When set to DISable, anti-alias is always disabled. This is good for cases where dithered data is not desired.

When set to AUTO, the oscilloscope turns off anti-alias control as needed. Such cases are when the FFT or differentiate math functions are silent. The :DIGitize command always turns off the anti-alias control as well.

Query Syntax :ACquire:DAALias?

The :ACquire:DAALias? query returns the oscilloscope's current disable anti-alias mode setting.

Return Format <mode><NL>

<mode> ::= {DIS | AUTO}

- See Also**
- ["Introduction to :ACquire Commands"](#) on page 248
 - [":ACquire:AALias"](#) on page 250

:ACquire:MODE

C (see [page 1446](#))

Command Syntax :ACquire:MODE <mode>

<mode> ::= {RTIME | MRTime | ETIME | SEGmented}

The :ACquire:MODE command sets the acquisition mode of the oscilloscope.

- **RTIME** – Specifies that the oscilloscope produce the waveform display from samples collected during one trigger event (that is, one acquisition). At fast sweep speeds, when not enough samples can be collected for a waveform, a sophisticated reconstruction filter is used to fill-in sample points and enhance the waveform display.

In RTIME mode, to accurately reproduce a sampled waveform, the sample rate should be at least 2.5 times the highest frequency component of the waveform. If not, it is possible for the reconstructed waveform to be distorted or aliased. Aliasing is most commonly seen as jitter on fast digital edges.

Use RTIME sampling to capture infrequent triggers, unstable triggers, or complex changing waveforms, such as eye diagrams.

NOTE

The obsolete command **ACquire:TYPE:REALtime** is functionally equivalent to sending **ACquire:MODE RTIME; TYPE NORMAl**.

- **MRTime** – This is the same as Realtime except that in order to provide maximum update rate (trigger rates), the sample rate drops from 20 GSa/s to 2 GSa/s at a faster time/div setting than normal.

This mode is ideal for finding glitches and infrequent events in waveforms that do not require the full 20 GSa/s sample rate (and associated bandwidth).

This mode is not allowed in single, roll, segmented, mask test, or zone trigger.

- **ETIME** – Available in 6 GHz bandwidth models, this option gives you another way to fill-in sample points at fast sweep speeds – it is used only when sweep speeds are 20 ns/div or faster. In this case, instead of a reconstruction filter, a technique known as random repetitive sampling is used to build-up and draw one waveform using multiple triggers (acquisitions).

At slower sweep speeds, there are enough sample points in a trigger (acquisition, in other words) to render a waveform on the display.

Equivalent time sampling mode requires a repetitive waveform with a stable trigger.

- **SEGmented** – Sets the oscilloscope in segmented memory mode.

Query Syntax :ACquire:MODE?

The :ACquire:MODE? query returns the acquisition mode of the oscilloscope.

Return Format <mode><NL>

<mode> ::= {RTIM | MRT | ETIM | SEGM}

- See Also**
- ["Introduction to :ACquire Commands"](#) on page 248
 - [":ACquire:TYPE"](#) on page 264

:ACquire:POINts

C (see [page 1446](#))

Query Syntax :ACquire:POINts?

The :ACquire:POINts? query returns the number of data points that the hardware will acquire from the input signal. The number of points acquired is not directly controllable. To set the number of points to be transferred from the oscilloscope, use the command :WAVEform:POINts. The :WAVEform:POINts? query will return the number of points available to be transferred from the oscilloscope.

Return Format <points_argument><NL>

<points_argument> ::= an integer in NR1 format

- See Also**
- ["Introduction to :ACquire Commands"](#) on page 248
 - [":DIGitize"](#) on page 219
 - [":WAVEform:POINts"](#) on page 1264

:ACQUIRE:RSIGNAL

N (see [page 1446](#))

Command Syntax :ACQUIRE:RSIGNAL <ref_signal_mode>
 <ref_signal_mode> ::= {OFF | OUT | IN}

The :ACQUIRE:RSIGNAL command selects the 10 MHz reference signal mode.

- The OFF mode disables the oscilloscope's 10 MHz REF BNC connector.
- The OUT mode is used to synchronize the timebase of two or more instruments.
- The IN mode is used to supply a sample clock to the oscilloscope. A 10 MHz square or sine wave signal is input to the BNC connector labeled 10 MHz REF. The amplitude must be from - 5 dBm to 17 dBm (356 mVpp to 4.48 Vpp).

CAUTION

Do not apply more than 20 dBm Max (6.32 Vpp Max) at the 10 MHz REF BNC connector on the rear panel or damage to the instrument may occur.

Query Syntax :ACQUIRE:RSIGNAL?

The :ACQUIRE:RSIGNAL? query returns the current 10 MHz reference signal mode.

Return Format <ref_signal_mode><NL>
 <ref_signal_mode> ::= {OFF | OUT | IN}

:ACQUIRE:SEGMENTED:ANALYZE

N (see [page 1446](#))

Command Syntax :ACQUIRE:SEGMENTED:ANALYZE

NOTE

This command is available when the segmented memory option (Option SGM) is enabled.

This command calculates measurement statistics and/or infinite persistence over all segments that have been acquired. It corresponds to the front panel **Analyze Segments** softkey which appears in both the Measurement Statistics and Segmented Memory Menus.

In order to use this command, the oscilloscope must be stopped and in segmented acquisition mode, with either quick measurements or infinite persistence on.

:ACquire:SEGmented:COUNT

N (see [page 1446](#))

Command Syntax :ACquire:SEGmented:COUNT <count>
 <count> ::= an integer from 2 to 1000 (w/4M memory) in NR1 format

NOTE

This command is available when the segmented memory option (SGM license) is installed.

The :ACquire:SEGmented:COUNT command sets the number of memory segments to acquire.

The segmented memory acquisition mode is enabled with the :ACquire:MODE command, and data is acquired using the :DIGitize, :SINGle, or :RUN commands. The number of memory segments in the current acquisition is returned by the :WAVEform:SEGmented:COUNT? query.

The maximum number of segments may be limited by the memory depth of your oscilloscope. For example, an oscilloscope with 1M memory allows a maximum of 250 segments.

Query Syntax :ACquire:SEGmented:COUNT?

The :ACquire:SEGmented:COUNT? query returns the current count setting.

Return Format <count><NL>
 <count> ::= an integer from 2 to 1000 (w/4M memory) in NR1 format

:ACquire:SEGmented:INDEX

N (see [page 1446](#))

Command Syntax :ACquire:SEGmented:INDEX <index>
 <index> ::= an integer from 1 to 1000 (w/4M memory) in NR1 format

NOTE

This command is available when the segmented memory option (SGM license) is installed.

The :ACquire:SEGmented:INDEX command sets the index into the memory segments that have been acquired.

The segmented memory acquisition mode is enabled with the :ACquire:MODE command. The number of segments to acquire is set using the :ACquire:SEGmented:COUNT command, and data is acquired using the :DIGitize, :SINGLE, or :RUN commands. The number of memory segments that have been acquired is returned by the :WAVEform:SEGmented:COUNT? query. The time tag of the currently indexed memory segment is returned by the :WAVEform:SEGmented:TTAG? query.

The maximum number of segments may be limited by the memory depth of your oscilloscope. For example, an oscilloscope with 1M memory allows a maximum of 250 segments.

Query Syntax :ACquire:SEGmented:INDEX?

The :ACquire:SEGmented:INDEX? query returns the current segmented memory index setting.

Return Format <index><NL>
 <index> ::= an integer from 1 to 1000 (w/4M memory) in NR1 format

:ACQUIRE:SRATE

N (see [page 1446](#))

Query Syntax :ACQUIRE:SRATE? [MAXimum]

The :ACQUIRE:SRATE? query returns the current oscilloscope acquisition sample rate. The sample rate is not directly controllable.

When the MAXimum parameter is used, the oscilloscope's maximum possible sample rate is returned.

Return Format <sample_rate><NL>

<sample_rate> ::= sample rate in NR3 format

- ["Introduction to :ACQUIRE Commands"](#) on page 248
 - [":ACQUIRE:POINTS"](#) on page 256

:ACquire:TYPE

C (see [page 1446](#))

Command Syntax :ACquire:TYPE <type>

<type> ::= {NORMAL | AVERage | HRESolution | PEAK}

The :ACquire:TYPE command selects the type of data acquisition that is to take place. The acquisition types are:

- NORMAL – sets the oscilloscope in the normal mode.
- AVERage – sets the oscilloscope in the averaging mode. You can set the count by sending the :ACquire:COUNT command followed by the number of averages. In this mode, the value for averages is an integer from 1 to 65536. The COUNT value determines the number of averages that must be acquired.

The AVERage type is not available when in segmented memory mode (:ACquire:MODE SEGmented).

- HRESolution – sets the oscilloscope in the high-resolution mode (also known as *smoothing*). This mode is used to reduce noise at slower sweep speeds where the digitizer samples faster than needed to fill memory for the displayed time range.

For example, if the digitizer samples at 200 MSa/s, but the effective sample rate is 1 MSa/s (because of a slower sweep speed), only 1 out of every 200 samples needs to be stored. Instead of storing one sample (and throwing others away), the 200 samples are averaged together to provide the value for one display point. The slower the sweep speed, the greater the number of samples that are averaged together for each display point.

- PEAK – sets the oscilloscope in the peak detect mode. In this mode, :ACquire:COUNT has no meaning.

The AVERage and HRESolution types can give you extra bits of vertical resolution. See the *User's Guide* for an explanation. When getting waveform data acquired using the AVERage and HRESolution types, be sure to use the WORD or ASCii waveform data formats to get the extra bits of vertical resolution.

NOTE

The obsolete command ACquire:TYPE:REALtime is functionally equivalent to sending ACquire:MODE RTIME; TYPE NORMAl.

Query Syntax :ACquire:TYPE?

The :ACquire:TYPE? query returns the current acquisition type.

Return Format <acq_type><NL>

<acq_type> ::= {NORM | AVER | HRES | PEAK}

10 :CGRade Commands

The :CGRade commands control the color grade waveform analysis feature.

When color grade analysis is enabled, a database is created that has the same number of memory locations as there are pixel locations in the waveform viewing area. Each database memory location is a counter. These counters are incremented when sampled waveform data crosses (or "hits") the associated pixel.

When the oscilloscope is stopped, the counter database remains intact until the acquired data display is modified, usually horizontally or vertically. At that time, the database is reset and the last displayed acquisition is used to start a new database.

Table 95 :CGRade Commands Summary

:CGRade:LEVels

N (see [page 1446](#))

Query Syntax :CGRade:LEVels?

The :CGRade:LEVels? query returns a comma-delimited list of the hit ranges for each color bin. For example:

```
"1,20,21,40,41,81,82,163,164,326,327,653,654,1307"
```

The first two values show the hit range for the color bin with fewest number of hits, the next two values show the hit range for the next color bin, and so on.

The color used for the greatest number of hits (white in both themes) represents pixels with the greatest number to about half that number. The next color represents half as many hits, and so on, until the last range (green in the INTensity theme or dark blue in the TEMPerature theme) represents the remaining range of the fewest number of hits.

The following table shows the approximate counter ranges of each color in the INTensity and TEMPerature color grade themes.

:CGRade:SCHEME		Range (MH = most hits)		
INTensity	TEMPerature	Upper Limit	to	Lower Limit (0 if Upper Limit is 0, Else)
		MH	to	MH/2
		MH/2	to	MH/4

Introduction to :CHANnel<n> Commands

<n> ::= 1 to (# analog channels) in NR1 format

The CHANnel<n> subsystem commands control an analog channel (vertical or Y-axis of the oscilloscope). Channels are independently programmable for all offset, probe, coupling, bandwidth limit, inversion, vernier, and range (scale) functions. The channel number (1, 2, 3, or 4) specified in the command selects the analog channel that is affected by the command.

A label command provides identifying annotations of up to 10 characters.

You can toggle the channel displays on and off with the :CHANnel<n>:DISPlay command as well as with the root level commands :VIEW and :BLANK.

NOTE

The obsolete CHANnel subsystem is supported.

Reporting the Setup

Use :CHANnel1?, :CHANnel2?, :CHANnel3? or :CHANnel4? to query setup information for the CHANnel<n> subsystem.

Return Format

The following are sample responses from the :CHANnel<n>? query. In this case, the query was issued following a *RST command.

```
:CHAN1:RANG +40.0E+00;OFFS +0.00000E+00;COUP DC;IMP ONEM;DISP 1;BWL 0;
INV 0;LAB "1";UNIT VOLT;PROB +10E+00;PROB:SKEW +0.00E+00;STYP SING
```

:CHANnel<n>:BANDwidth**N** (see [page 1446](#))**Command Syntax** :CHANnel<n>:BANDwidth <limit>

<limit> ::= 20E6, 200E6, 1.5E9, or 3E9 in NR3 format (depending on oscilloscope bandwidth and settings)

<n> ::= 1 to (# analog channels) in NR1 format

The :CHANnel<n>:BANDwidth command sets the bandwidth limit value and turns on bandwidth limiting (see the :CHANnel<n>:BWLimit command).

For waveforms with frequencies below the bandwidth limit, turning the bandwidth limit on removes unwanted high frequency noise from the waveform.

Bandwidth limit also limits the trigger signal path of the channel.

You can request any limit; the oscilloscope will choose the one that is greater than or equal to the limit requested. The limits available depend on the bandwidth of oscilloscope, the channel's input impedance setting (:CHANnel<n>:IMPedance), and the channel's V/div setting:

Input Impedance	V/div	Oscilloscope Bandwidth	Limits Available
1M Ohm	>2 mV/div	(all)	20 MHz
	<=2 mV/div	(all)	20 MHz or 200 MHz
50 Ohm	(all)	1 GHz	20 MHz or 200 MHz
		2.5 GHz	20 MHz, 200 MHz, or 1.5 GHz
		4 GHz	20 MHz, 200 MHz, 1.5 GHz, or 3 GHz
		6 GHz	20 MHz, 200 MHz, 1.5 GHz, or 3 GHz

Query Syntax :CHANnel<n>:BANDwidth? [MAXimum]

The :CHANnel<n>:BANDwidth? query returns the current setting of the low-pass filter.

If the bandwidth limit is off, the query returns the full bandwidth of the oscilloscope.

When the MAXimum parameter is used, the oscilloscope's maximum possible bandwidth is returned.

Return Format <limit><NL>

<limit> ::= 20E6, 200E6, 1.5E9, or 3E9 in NR3 format
(depending on oscilloscope bandwidth, input impedance, and
whether the limiting is off)

<on_off> ::= {{1 | ON} | {0 | OFF}}

<n> ::= 1 to (# analog channels) in NR1 format

The :CHANnel<n>:BWLimit command enables or disables the bandwidth limit.

To specify the bandwidth limit value, see the :CHANnel<n>:BANDwidth command.

:CHANnel<n>:LABel

N (see [page 1446](#))

Command Syntax :CHANnel<n>:LABel <string>
 <string> ::= quoted ASCII string
 <n> ::= 1 to (# analog channels) in NR1 format

NOTE

Label strings are 32 characters or less, and may contain any commonly used ASCII characters. Labels with more than 32 characters are truncated to 32 characters. Lower case characters are converted to upper case.

The :CHANnel<n>:LABel command sets the analog channel label to the string that follows. Setting a label for a channel also adds the name to the label list in non-volatile memory (replacing the oldest label in the list).

Query Syntax :CHANnel<n>:LABel?

The :CHANnel<n>:LABel? query returns the label associated with a particular analog channel.

Return Format <string><NL>

:CHANnel<n>:OFFSet**C** (see [page 1446](#))

Command Syntax :CHANnel<n>:OFFSet <offset> [<suffix>]
 <offset> ::= Vertical offset value in NR3 format
 <suffix> ::= {V | mV}
 <n> ::= 1 to (# analog channels) in NR1 format

The :CHANnel<n>:OFFSet command sets the value that is represented at center screen for the selected channel. The range of legal values varies with the value set by the :CHANnel<n>:RANGe and :CHANnel<n>:SCALe commands. If you set the offset to a value outside of the legal range, the offset value is automatically set to the nearest legal value. Legal values are affected by the probe attenuation setting.

Query Syntax :CHANnel<n>:OFFSet?

The :CHANnel<n>:OFFSet? query returns the current offset value for the selected channel.

Return Format <offset><NL>
 <offset> ::= Vertical offset value in NR3 format

:CHANnel<n>:PROBe

C (see [page 1446](#))

Command Syntax :CHANnel<n>:PROBe <attenuation>

<attenuation> ::= probe attenuation ratio in NR3 format

<n> ::= 1 to (# analog channels) in NR1 format

The obsolete attenuation values X1, X10, X20, X100 are also supported.

The :CHANnel<n>:PROBe command specifies the probe attenuation factor for the selected channel.

The probe attenuation factor may be from 0.1 to 10000.

This command does not change the actual input sensitivity of the oscilloscope. It changes the reference constants for scaling the display factors, for making automatic measurements, and for setting trigger levels.

If an AutoProbe probe is connected to the oscilloscope, the attenuation value cannot be changed from the sensed value. Attempting to set the oscilloscope to an attenuation value other than the sensed value produces an error.

Query Syntax :CHANnel<n>:PROBe?

The :CHANnel<n>:PROBe? query returns the current probe attenuation factor for the selected channel.

Return Format <attenuation><NL>

<attenuation> ::= probe attenuation ratio in NR3 format

 <n> ::= 1 to (# analog channels) in NR1 format

The :CHANnel<n>:PROBe:SKEW command sets the channel-to-channel skew factor for the specified channel. Each analog channel can be adjusted + or -100 ns for a total of 200 ns difference between channels. You can use the oscilloscope's probe skew control to remove cable-delay errors between channels.

The :CHANnel<n>:PROBe:STYPe command sets the channel probe signal type (STYPe) to differential or single-ended when using the 113xA Series probes and determines how offset is applied.

When single-ended is selected, the :CHANnel<n>:OFFSet command changes the offset value of the probe amplifier. When differential is selected, the :CHANnel<n>:OFFSet command changes the offset value of the channel amplifier.

Query Syntax :CHANnel<n>:PROBe:STYPe?

The :CHANnel<n>:PROBe:STYPe? query returns the current probe signal type setting for the selected channel.

:CHANnel<n>:PROTection

N (see [page 1446](#))

Command Syntax :CHANnel<n>:PROTection[:CLEar]

<n> ::= 1 to (# analog channels) in NR1 format | 4}

When the analog channel input impedance is set to 50Ω, the input channels are protected against overvoltage. When an overvoltage condition is sensed, the input impedance for the channel is automatically changed to 1 MΩ.

The :CHANnel<n>:PROTection[:CLEar] command is used to clear (reset) the overload protection. It allows the channel to be used again in 50Ω mode after the signal that caused the overload has been removed from the channel input.

Reset the analog channel input impedance to 50Ω (see "[:CHANnel<n>:IMPedance](#)" on page 303) after clearing the overvoltage protection.

Query Syntax :CHANnel<n>:PROTection?

The :CHANnel<n>:PROTection query returns the state of the input protection for CHANnel<n>. If a channel input has experienced an overload, TRIP (tripped) will be returned; otherwise NORM (normal) is returned.

<range> ::= vertical full-scale range value in NR3 format

<suffix> ::= {V | mV}

<n> ::= 1 to (# analog channels) in NR1 format

The :CHANnel<n>:RANGe command defines the full-scale vertical axis of the selected channel. When using 1:1 probe attenuation, legal values for the range are from 8 mV to 40 V.

Return Format <off_on><NL>

:CLOCK:METHOD

Command Syntax :CLOCK:METHOD <method>

```

<method> ::= {<fixed> | <fopll> | <sopll> | <explicit>}
<fixed> ::= FIXed, {AUTO | SEMI[, <data_rate>] | <data_rate>}
<fopll> ::= FOPLl, <data_rate>, <loop_bandwidth>

    in NR3 format
<source> ::= explicit clock source, CHANNEL<n>
<n> ::= 1 to (# analog channels) in NR1 format
<multiplier> ::= explicit clock multiplier from 1 to 1000 in NR1 format

```

The :CLOCK:METHOD command sets the clock recovery method:

- **FIXed** – The clock is assumed to be a constant frequency, and the data rate recovery options are:
 - **AUTO** – The clock is recovered using the signal edge database only. The narrowest pulse is presumed to be an isolated one or zero.
 - **SEMI** – The clock is recovered using the expected nominal data rate as a "seed" and the signal edge database.
 - **<data_rate>** – The expected nominal data rate you enter is used. It should be the reciprocal of the signal's unit interval.
- **FOPLl** – With First Order PLL, the clock is recovered using the DSP-modeled response of an ideal first-order hardware PLL.
- **SOPLl** – With Second Order PLL, the clock is recovered using the DSP-modeled response of an ideal Type II, second-order hardware PLL.

Typical damping factor values are 1.0, which is critically damped, and 0.707, which is considered ideal or optimal because of its fast settling time (optimally flat) and Butterworth type response. Values less than 1 are underdamped, and values greater than 1 are overdamped.

- **EXPLicit** – The clock is recovered from a second signal in your device under test, with a multiplier from 1 to 1000 applied.

Query Syntax :CLOCK:METHOD?

The :CLOCK:METHOD? query returns the currently specified clock recovery method.

Return Format <method><NL>

:COMPLIance:USB:AUTOsetup

N (see [page 1446](#))

Command Syntax :COMPLIance:USB:AUTOsetup

The :COMPLIance:USB:AUTOsetup command automatically sets up the oscilloscope for the selected signal quality test and USB compliance test packets. Automatically set are:

- Horizontal scale and delay.
- Analog input channel(s) scale and vertical offset.
- Trigger mode and trigger level.

The :COMPLIance:USB:AUTOsetup command causes the oscilloscope to run (that is, capture acquisitions that meet the trigger condition).

If you are testing the signal quality of real-world packets (instead of USB compliance test packets), you may need to adjust the auto setup.

Note that gating of measurements can only be done via the oscilloscope's horizontal controls. This can be done after the :COMPLIance:USB:AUTOsetup command and before the :COMPLIance:USB:RUN command. The horizontal controls should be adjusted so that only the data to be tested is on screen when the :COMPLIance:USB:RUN command is executed. This is normally one packet of data.

:COMPLIance:USB:RUN

N (see [page 1446](#))

Command Syntax

`:COMPLIance:USB:RUN`

The `:COMPLIance:USB:RUN` command runs the selected signal quality test.

Please be patient as tests can take several minutes to complete.

When tests are run, the oscilloscope stops acquisitions if they are running, analyzes the data on screen, and then displays the results. The analyzed acquisition remains on screen and can be viewed by moving or dismissing the results dialog.

You can run tests when the oscilloscope is already stopped. This is useful in the case of embedded hosts (and other cases) where the device under test (DUT) may not easily be placed in a test mode, and you want to analyze already acquired data.

Command Syntax :COUNTER:NDIGits <value>
 <value> ::= 3 to 10 in NR1 format

Higher resolutions require longer gate times, which cause the measurement times to be longer as well.

Query Syntax :COUNTER:NDIGits

The :COUNTER:NDIGits? query returns the currently set number of digits of resolution.

Return Format <value><NL>

:COUNTER:SOURce

N (see [page 1446](#))

Command Syntax :COUNTER:SOURce <source>

<source> ::= {CHANnel<n> | TQEvent}

<n> ::= 1 to (# analog channels) in NR1 format

The :COUNTER:SOURce command selects the waveform source that the counter measures. You can select one of the analog input channels or the trigger qualified event signal.

With the TQEvent (trigger qualified event) source (available when the trigger mode is not EDGE), you can see how often trigger events are detected. This can be more often than when triggers actually occur, due to the oscilloscope's acquisition time or update rate capabilities. The TRIG OUT signal shows when triggers actually occur. Remember that the oscilloscope's trigger circuitry does not re-arm until the holdoff time occurs (:TRIGger:HOLDoff) and that the minimum holdoff time is 40 ns; therefore, the maximum trigger qualified event frequency that can be counted is 25 MHz.

Query Syntax :COUNTER:SOURce?

The :COUNTER:SOURce? query returns the currently set counter source channel.

Return Format <source><NL>

N (see [page 1446](#))

Command Syntax :COUNTER:TOTALize:GATE:ENABLE {{0 | OFF} | {1 | ON}}

The :COUNTER:TOTALize:GATE:ENABLE command enables or disables totalizer gating.

When totalizer gating is enabled, the totalizer only counts edges when a second gating signal polarity is true. The second gating signal can be one of the remaining analog channel inputs.

Query Syntax :COUNTER:TOTALize:GATE:ENABLE?

The :COUNTER:TOTALize:GATE:ENABLE? query returns whether totalizer gating is enabled or disabled.

**Introduction to
:DIGital<d>
Commands**

<d> ::= 0 to (# digital channels - 1) in NR1 format

The DIGital subsystem commands control the viewing, labeling, and positioning of digital channels. They also control threshold settings for groups of digital channels, or *Pods*.

NOTE

These commands are only valid for the MSO models.

Reporting the Setup

Use :DIGital<d>? to query setup information for the DIGital subsystem.

Return Format

The following is a sample response from the :DIGital0? query. In this case, the query was issued following a *RST command.

```
:DIG0:DISP 0;THR +1.40E+00;LAB 'D0';POS +0
```

Command Syntax :DIGital<d>:DISPlay <display>

<d> ::= 0 to (# digital channels - 1) in NR1 format

<display> ::= {{1 | ON} | {0 | OFF}}

The :DIGital<d>:DISPlay command turns digital display on or off for the specified channel.

NOTE

This command is only valid for the MSO models.

Query Syntax :DIGital<d>:DISPlay?

The :DIGital<d>:DISPlay? query returns the current digital display setting for the specified channel.

Return Format <display><NL>

<display> ::= {0 | 1}

Command Syntax :DIGital<d>:LABel <string>
 <d> ::= 0 to (# digital channels - 1) in NR1 format
 <string> ::= any series of 10 or less characters as quoted ASCII string.

The :DIGital<d>:LABel command sets the channel label to the string that follows. Setting a label for a channel also adds the name to the label list in non-volatile memory (replacing the oldest label in the list).

NOTE

This command is only valid for the MSO models.

NOTE

Label strings are 10 characters or less, and may contain any commonly used ASCII characters. Labels with more than 10 characters are truncated to 10 characters.

Query Syntax :DIGital<d>:LABel?

The :DIGital<d>:LABel? query returns the name of the specified channel.

Return Format <label string><NL>

<label string> ::= any series of 10 or less characters as a quoted ASCII string.

Large	0-7	7	0
Medium	0-15	15	0
Small	0-31	31	0

The :DIGital<d>:POSition command sets the position of the specified channel. Note that bottom positions might not be valid depending on whether digital buses, serial decode waveforms, or the zoomed time base are displayed.

NOTE

This command is only valid for the MSO models.

Query Syntax :DIGital<d>:POSition?

The :DIGital<d>:POSition? query returns the position of the specified channel.

If the returned value is "-1", this indicates there is no space to display the digital waveform (for example, when all serial lanes, digital buses, and the zoomed time base are displayed).

Return Format <position><NL>
 <position> ::= integer in NR1 format.

See Also • ["Introduction to :DIGital<d> Commands"](#) on page 356

:DIGital<d>:SIZE

N (see [page 1446](#))

Command Syntax :DIGital<d>:SIZE <value>

<d> ::= 0 to (# digital channels - 1) in NR1 format

<value> ::= {SMALl | MEDium | LARGe}

The :DIGital<d>:SIZE command specifies the size of digital channels on the display. Sizes are set for all digital channels. Therefore, if you set the size on digital channel 0 (for example), the same size is set on all other as well.

<suffix> ::= {V | mV | uV}

- TTL = 1.4V
- CMOS = 2.5V
- ECL = -1.3V

The :DIGital<d>:THReshold command sets the logic threshold value for all channels in the same *pod* as the specified channel. The threshold is used for triggering purposes and for displaying the digital data as high (above the threshold) or low (below the threshold).

NOTE

This command is only valid for the MSO models.

- Turn vectors on or off.
- Set waveform persistence.
- Specify labels.
- Save and Recall display data.

Reporting the Setup

Use :DISPlay? to query the setup information for the DISPlay subsystem.

Introduction to :EXternal Trigger Commands

The EXternal trigger subsystem commands control the input characteristics of the external trigger input. The probe factor, impedance, input range, input protection state, units, and bandwidth limit settings may all be queried. Depending on the instrument type, some settings may be changeable.

Reporting the Setup

Use :EXternal? to query setup information for the EXternal subsystem.

Return Format

The following is a sample response from the :EXternal query. In this case, the query was issued following a *RST command.

```
:EXT:BWL 0;RANG +8.0E+00;UNIT VOLT;PROB +1.000E+00
```

:EXtErnal:BWLimit

C (see [page 1446](#))

Command Syntax :EXtErnal:BWLimit <bwlimit>

<bwlimit> ::= {0 | OFF}

The :EXtErnal:BWLimit command is provided for product compatibility. The only legal value is 0 or OFF. Use the :TRIGger:HFReject command to limit bandwidth on the external trigger input.

Query Syntax :EXtErnal:BWLimit?

The :EXtErnal:BWLimit? query returns the current setting of the low-pass filter (always 0).

Return Format <bwlimit><NL>

<bwlimit> ::= 0

- See Also**

:EXternal:PROBe

C (see [page 1446](#))

Command Syntax :EXternal:PROBe <attenuation>

<attenuation> ::= probe attenuation ratio in NR3 format

The :EXternal:PROBe command specifies the probe attenuation factor for the external trigger. The probe attenuation factor may be 0.1 to 1000. This command does not change the actual input sensitivity of the oscilloscope. It changes the reference constants for scaling the display factors and for setting trigger levels.

If an AutoProbe probe is connected to the oscilloscope, the attenuation value cannot be changed from the sensed value. Attempting to set the oscilloscope to an attenuation value other than the sensed value produces an error.

Query Syntax :EXternal:PROBe?

The :EXternal:PROBe? query returns the current probe attenuation factor for the external trigger.

Return Format <attenuation><NL>

<attenuation> ::= probe attenuation ratio in NR3 format

- See Also**

Command Syntax `:EXtErnal:RANGe <range>[<suffix>]`

`<range> ::= vertical full-scale range value in NR3 format`

`<suffix> ::= {V | mV}`

Command Syntax :FUNCTION<m>[:FFT]:WINDow <window>

<m> ::= 1 to (# math functions) in NR1 format

<window> ::= {RECTangular | HANNing | FLATtop | BHARris}

The :FUNCTION<m>[:FFT]:WINDow command allows the selection of four different windowing transforms or operations for the FFT (Fast Fourier Transform) function.

The FFT operation assumes that the time record repeats. Unless an integral number of sampled waveform cycles exist in the record, a discontinuity is created between the end of one record and the beginning of the next. This discontinuity introduces additional frequency components about the peaks into the spectrum. This is referred to as leakage. To minimize leakage, windows that approach zero smoothly at the start and end of the record are employed as filters to the FFTs. Each window is useful for certain classes of input signals.

- RECTangular – useful for transient signals, and signals where there are an integral number of cycles in the time record.
- HANNing – useful for frequency resolution and general purpose use. It is good for resolving two frequencies that are close together, or for making frequency measurements. This is the default window.
- FLATtop – best for making accurate amplitude measurements of frequency peaks.
- BHARris (Blackman-Harris) – reduces time resolution compared to the rectangular window, but it improves the capacity to detect smaller impulses due to lower secondary lobes (provides minimal spectral leakage).

The :FUNCTION<m>[:FFT]:WINDow? query returns the value of the window selected for the FFT function.

Return Format <window><NL>

<window> ::= {RECT | HANN | FLAT | BHAR}

:FUNCTION<m>:OPERation

N (see [page 1446](#))

Command Syntax :FUNCTION<m>:OPERation <operation>

<m> ::= 1 to (# math functions) in NR1 format

```
<operation> ::= {ADD | SUBTract | MULTiPLY | DIVide | DIFF | INTegrate
| FFT | SQRT | MAGNify | ABSolute | SQUare | LN | LOG | EXP | TEN
| LOWPass | HIGHpass | AVERage | SMOoth | ENVELOpe | LINear
| MAXHold | MINHold | TRENd | BTIMing | BSTate | CLOCK}
```

The :FUNCTION<m>:OPERation command sets the desired waveform math operator, transform, filter or visualization:

- Operators:

- ADD – Source1 + source2.
- SUBTract – Source1 - source2.
- MULTiPLY – Source1 * source2.
- DIVide – Source1 / source2.

Operators perform their function on two analog channel sources.

- Transforms:

- DIFF – Differentiate
- INTegrate – The INTegrate:IOFFset command lets you specify a DC offset correction factor.
- FFT – The SPAN, CENTER, VTYPE, and WINDOW commands are used for FFT functions. When FFT is selected, the horizontal cursors change from time to frequency (Hz), and the vertical cursors change from volts to decibel (dB).
- LINear – Ax + B – The LINear commands set the gain (A) and offset (B) values for this function.
- SQUare
- SQRT – Square root
- ABSolute – Absolute Value
- LOG – Common Logarithm
- LN – Natural Logarithm
- EXP – Exponential (e^x)
- TEN – Base 10 exponential (10^x)

Transforms operate on a single analog channel source or on lower math functions.

- Filters:

- LOWPass – Low pass filter – The FREQUENCY:LOWPass command sets the -3 dB cutoff frequency.

- **HIGHpass** – High pass filter – The **FREQUency:HIGHpass** command sets the -3 dB cutoff frequency.
- **AVERAge** – Averaged value – The **AVERAge:COUNT** command specifies the number of averages.

Unlike acquisition averaging, the math averaging operator can be used to average the data on a single analog input channel or math function.

If acquisition averaging is also used, the analog input channel data is averaged and the math function averages it again. You can use both types of averaging to get a certain number of averages on all waveforms and an increased number of averages on a particular waveform.

Averages are calculated using a "decaying average" approximation, where:

$$\text{next_average} = \text{current_average} + (\text{new_data} - \text{current_average})/N$$

Where N starts at 1 for the first acquisition and increments for each following acquisition until it reaches the selected number of averages, where it holds.

- **SMOoth** – Smoothing – The resulting math waveform is the selected source with a normalized rectangular (boxcar) FIR filter applied.

The boxcar filter is a moving average of adjacent waveform points, where the number of adjacent points is specified by the **SMOoth:POINts** command. You can choose an odd number of points, from 3 to 999.

The smoothing operator limits the bandwidth of the source waveform. The smoothing operator can be used, for example, to smooth measurement trend waveforms.

- **ENVELOpe** – Envelope – The resulting math waveform is the amplitude envelope for an amplitude modulated (AM) input signal.

This function uses a Hilbert transform to get the real (in-phase, I) and imaginary (quadrature, Q) parts of the input signal and then performs a square root of the sum of the real and imaginary parts to get the demodulated amplitude envelope waveform.

Filters operate on a single analog channel source or on a lower math function.

- **Visualizations:**
 - **MAGNify** – Operates on a single analog channel source or on a lower math function.
 - **MAXHold** – Operates on a single analog channel source or on a lower math function. The Max Hold (or Max Envelope) operator records the maximum vertical values found at each horizontal bucket across multiple analysis cycles and uses those values to build a waveform.

- MINHold – Operates on a single analog channel source or on a lower math function. The Min Hold (or Min Envelope) operator records the minimum vertical values found at each horizontal bucket across multiple analysis cycles and uses those values to build a waveform.
- TREND – Measurement trend – Operates on a single analog channel source. The TREND:NMEasurement command selects the measurement whose trend you want to measure.
- BTIMing – Chart logic bus timing – Operates on a bus made up of digital channels. The BUS:YINcrement, BUS:YORigin, and BUS:YUNits commands specify function values.
- BState – Chart logic bus state – Operates on a bus made up of digital channels. The BUS:YINcrement, BUS:YORigin, and BUS:YUNit commands specify function values. The BUS:CLOCK and BUS:SLOPe commands specify the clock source and edge.
- CLOCK – Clock recovery – You can display recovered clocks from different sources using multiple math function waveforms; however, the same clock recovery method applies to all recovered clocks. See **":CLOCK:METHod"** on page 321.

Query Syntax :FUNction<m>:OPERation?

The :FUNction<m>:OPERation? query returns the current operation for the selected function.

Return Format <operation><NL>

```
<operation> ::= {ADD | SUBT | MULT | DIV | INT | DIFF | FFT | SQRT
| MAGN | ABS | SQU | LN | LOG | EXP | TEN | LOWP | HIGH | AVER
| SMO | ENV | LIN | MAXH | MINH | TREN | BTIM | BST | CLOC}

:FUNCTION<m>:SOURCE1

N (see [page 1446](#))

Command Syntax :FUNCTION<m>:SOURCE1 <value>

<m> ::= 1 to (# math functions) in NR1 format

<value> ::= {CHANnel<n> | FUNCTION<c> | MATH<c> | BUS}

<n> ::= 1 to (# analog channels) in NR1 format

<c> ::= {1 | 2 | 3}, must be lower than <m>

 ::= {1 | 2}

The :FUNCTION<m>:SOURCE1 command is used for any :FUNCTION<m>:OPERation selection. This command selects the first source for the operator math functions or the single source for the transform functions, filter functions, or visualization functions.

The FUNCTION<c> or MATH<c> parameters are available for the transform functions, filter functions, and the magnify visualization function (see "[Introduction to :FUNCTION<m> Commands](#)" on page 396) when <c> is lower than <m>.

In other words, higher math functions can operate on lower math functions when using operators other than the simple arithmetic operations (+, -, *, /). For example, if :FUNCTION1:OPERation is a SUBtract of CHANnel1 and CHANnel2, the :FUNCTION2:OPERation could be set up as a FFT operation on the FUNCTION1 source. These are called cascaded math functions.

To cascade math functions, select the lower math function using the :FUNCTION<m>:SOURCE1 command.

When cascading math functions, to get the most accurate results, be sure to vertically scale lower math functions so that their waveforms take up the full screen without being clipped.

The BUS<m> parameter is available for the bus charting visualization functions.

NOTE

Another shorthand notation for SOURCE1 in this command/query (besides SOUR1) is SOUR.

When :FUNCTION<m>:OPERation is TRENd, the :FUNCTION<m>:SOURCE1 command reports error -221, "Settings conflict" because the TRENd function operates on a measurement and not a source waveform.

Query Syntax :FUNCTION<m>:SOURCE1?

The :FUNCTION<m>:SOURCE1? query returns the current source1 for function operations.

The :FUNCTION<m>:SOURCE2 command specifies the second source for math operator functions that have two sources. (The :FUNCTION<m>:SOURCE1 command specifies the first source.)

The :FUNCTION<m>:SOURCE2 setting is not used for the transform functions, filter functions, or visualization functions (except when the measurement trend visualization's measurement requires two sources).

When :FUNCTION<m>:OPERation is TREND, the :FUNCTION<m>:SOURCE2 command reports error -221, "Settings conflict" because the TREND function operates on a measurement and not a source waveform.

Query Syntax :FUNCTION<m>:SOURCE2?

The :FUNCTION<m>:SOURCE2? query returns the currently specified second source for math operations.

22 :HISTogram Commands

These commands control the histogram analysis feature.

The histogram analysis feature provides a statistical view of a waveform or a measurement's results.

Waveform histograms show the number of times a waveform crosses into (or hits) a row or column of a user-defined window. For vertical histograms, the window is divided into rows. For horizontal histograms, the window is divided into columns.

Measurement histograms show the distribution of a measurement's results similar to ordinary measurement statistics.

As waveforms are acquired and displayed, or as measurements are made, a counter database accumulates the total number of hits (or measurements), and the histogram data is displayed as a bar graph on the graticule.

When the oscilloscope is stopped, that counter database remains intact until the acquired data display is modified, usually horizontally or vertically. At that time, the database is reset and the last displayed acquisition is used to start a new database.

Histogram Interaction With Other Oscilloscope Features

When you enable a histogram, horizontal zoom, XY time mode, or roll time mode are automatically disabled.

When using segmented memory acquisitions, histograms perform similarly to math waveforms and measurements. The histogram is reset at the start of a segmented acquisition and all segments are histogrammed at the end of the acquisition.

Because it is not possible to histogram every waveform, be aware that persistence can show a peak or glitch that does not show up in the histogram data.

Histograms do not wait for the specified number of averaged acquisitions to be acquired before starting analysis, so intermediate results could be erratic.

- **VERTical** – the limits window is divided into rows, and the number of hits in each row is displayed in a histogram bar graph at the left of the graticule.

23 :JITTer Commands

When the optional DSOX6JITTER jitter analysis feature is licensed, these commands control jitter analysis.

Jitter analysis measures the variance of a measurement over time. The principal measurement used with jitter analysis is time interval error (TIE), but several other measurements can be analyzed as well.

The TIE measurement recovers an ideal clock frequency from the source waveform and compares it against measured transitions to generate error statistics. Several different clock recovery methods are available.

Jitter statistics can be visualized in four ways: measurement statistics, histogram, trend, and spectrum.

NOTE

It is important to set up absolute thresholds for the integrity of jitter measurements from acquisition to acquisition. See **":MEASure:DEFine"** on page 537.

:JITter:SPECTrum:WINDow

N (see [page 1446](#))

Command Syntax :JITter:SPECTrum:WINDow <window>

<window> ::= {RECTangular | HANNing | FLATtop | BHARris}

The :JITter:SPECTrum:WINDow command allows the selection of four different windowing transforms or operations for the jitter spectrum FFT (Fast Fourier Transform).

The jitter spectrum operation assumes that the time record repeats. Unless an integral number of sampled waveform cycles exist in the record, a discontinuity is created between the end of one record and the beginning of the next. This discontinuity introduces additional frequency components about the peaks into the spectrum. This is referred to as leakage. To minimize leakage, windows that approach zero smoothly at the start and end of the record are employed as filters to the FFTs. Each window is useful for certain classes of input signals.

- RECTangular – useful for transient signals, and signals where there are an integral number of cycles in the time record.
- HANNing – useful for frequency resolution and general purpose use. It is good for resolving two frequencies that are close together, or for making frequency measurements. This is the default window.
- FLATtop – best for making accurate amplitude measurements of frequency peaks.
- BHARris (Blackman-Harris) – reduces time resolution compared to the rectangular window, but it improves the capacity to detect smaller impulses due to lower secondary lobes (provides minimal spectral leakage).

After the :JITter:SPECTrum:APPLY command, this command is an alias for :FUNCTION4[:FFT]:WINDow.

:JITTer:STATe

N (see [page 1446](#))

Command Syntax :JITTer:STATe {{0 | OFF} | {1 | ON}}

The :JITTer:STATe command enables or disables the jitter analysis feature.

When jitter analysis is enabled, the **[Jitter]** front panel key is lit, and these oscilloscope settings are forced on:

- Precision measurements with a 1M precision analysis record length (see [":SYSTem:PRECIsion"](#) on page 1143), which gives better accuracy.
- All edges in each acquisition are measured (instead of a single edge per acquisition, as is normally the case). For each acquisition, the measurement count increases by the number of edges in the acquisition. This applies to all measurements that look at edges, not just jitter analysis measurements.

When jitter analysis is disabled:

- The light behind the **[Jitter]** key is turned off.
- The "precision measurements" and 1M precision analysis record length settings are returned to the settings present when jitter analysis was enabled.
- The oscilloscope returns to measuring a specific edge in each acquisition (generally around the horizontal time reference) and ignoring all other edges in the acquisition, as is normally the case. For each acquisition, the measurement count increases by one.

Query Syntax :JITTer:STATe?

The :JITTer:STATe? query returns whether the jitter analysis feature is enabled.

Return Format <off_on><NL>

{0 | 1}

Introduction to :MARKer Commands

The MARKer subsystem commands set and query the settings of X-axis markers (X1 and X2 cursors) and the Y-axis markers (Y1 and Y2 cursors). You can set and query the marker mode and source, the position of the X and Y cursors, and query delta X and delta Y cursor values.

Reporting the Setup

Use :MARKer? to query setup information for the MARKer subsystem.

Return Format

The following is a sample response from the :MARKer? query. In this case, the query was issued following a *RST and ":MARKer:MODE MANual" command.

```
:MARK:X1Y1 CHAN1;X2Y2 CHAN1;MODE MAN
```

:MARKer:DYDX

N (see [page 1446](#))

Query Syntax :MARKer:DYDX?

The MARKer:DYDX? query returns the cursor $\Delta Y/\Delta X$ value.

X cursor units are set by the :MARKer:XUNits command.

NOTE

If the front-panel cursors are off, the marker position values are not defined. Make sure to set :MARKer:MODE to MANual or WAVEform to put the cursors in the front-panel Normal mode.

Return Format <value><NL>

<value> ::= •Y/•X value in NR3 format.

:MARKer:MODE

N (see [page 1446](#))

Command Syntax :MARKer:MODE <mode>

<mode> ::= {OFF | MEASurement | MANual | WAVeform | BINary | HEX}

The :MARKer:MODE command sets the cursors mode:

- OFF – removes the cursor information from the display.
- MANual – enables manual placement of the X and Y cursors.

If the front-panel cursors are off, or are set to the front-panel Hex or Binary mode, setting :MARKer:MODE MANual will put the cursors in the front-panel Normal mode.

- MEASurement – cursors track the most recent measurement.

Setting the mode to MEASurement sets the marker sources (:MARKer:X1Y1source and :MARKer:X2Y2source) to the measurement source (:MEASure:SOURce). Setting the measurement source remotely always sets the marker sources.

- WAVeform – the Y1 cursor tracks the voltage value at the X1 cursor of the waveform specified by the X1Y1source, and the Y2 cursor does the same for the X2 cursor and its X2Y2source.
- BINary – logic levels of displayed waveforms at the current X1 and X2 cursor positions are displayed in the Cursor sidebar dialog in binary.
- HEX – logic levels of displayed waveforms at the current X1 and X2 cursor positions are displayed in the Cursor sidebar dialog in hexadecimal.

Query Syntax :MARKer:MODE?

The :MARKer:MODE? query returns the current cursors mode.

Return Format <mode><NL>

<mode> ::= {OFF | MEAS | MAN | WAV | BIN | HEX}

 <suffix> ::= {s | ms | us | ns | ps | Hz | kHz | MHz}

The :MARKer:X1Position command:

- Sets :MARKer:MODE to MANual if it is not currently set to WAVEform (see [":MARKer:MODE"](#) on page 493).
- Sets the X1 cursor position to the specified value.

X cursor units are set by the :MARKer:XUNits command.

Query Syntax :MARKer:X1Position?

The :MARKer:X1Position? query returns the current X1 cursor position. This is functionally equivalent to the obsolete :MEASure:TSTArt command/query.

```

<n> ::= 1 to (# analog channels) in NR1 format

<m> ::= 1 to (# math functions) in NR1 format

<r> ::= 1 to (# ref waveforms) in NR1 format

The :MARKer:X1Y1source command sets the source for the cursors. The channel you specify must be enabled for cursors to be displayed. If the channel or function is not on, an error message is issued.

If the marker mode is currently WAVEform, the X1Y1 source can be set separate from the X2Y2 source.

If :MARKer:MODE is set to OFF or MANual, setting :MEASure:SOURce to CHANnel<n>, FUNction, MATH, or WMEMory<r> will also set :MARKer:X1Y1source and :MARKer:X2Y2source to this value.

NOTE

MATH is an alias for FUNction. The query will return FUNC if the source is FUNction or MATH.

```

<n> ::= 1 to (# analog channels) in NR1 format

<m> ::= 1 to (# math functions) in NR1 format

<r> ::= 1 to (# ref waveforms) in NR1 format

The :MARKer:X2Y2source command sets the source for the cursors. The channel you specify must be enabled for cursors to be displayed. If the channel or function is not on, an error message is issued.

If the marker mode is not currently WAVEform (see [":MARKer:MODE"](#) on page 493):

- Sending a :MARKer:X2Y2source command will put the cursors in the MANual mode.

X cursor units are set by the :MARKer:XUNits command.

NOTE

If the front-panel cursors are off, the marker position values are not defined. Make sure to set :MARKer:MODE to MANual or WAVEform to put the cursors in the front-panel Normal mode.

:MARKer:YDELta

N (see [page 1446](#))

Query Syntax :MARKer:YDELta?

The :MARKer:YDELta? query returns the value difference between the current Y1 and Y2 cursor positions.

Ydelta = (Value at Y2 cursor) - (Value at Y1 cursor)

NOTE

If the front-panel cursors are off or are set to Binary or Hex Mode, the marker position values are not defined. Make sure to set :MARKer:MODE to MANual or WAVEform to put the cursors in the front-panel Normal mode.

Y cursor units are set by the :MARKer:YUNits command.

Return Format <value><NL>

<value> ::= difference value in NR3 format

:MARKer:YUNits

N (see [page 1446](#))

Command Syntax :MARKer:YUNits <units>
<units> ::= {BASE | PERCent}

The :MARKer:YUNits command sets the Y cursors units:

- BASE – for making measurements in the units associated with the cursors source.
- PERCent – for making ratio measurements. Use the :MARKer:YUNits:USE command to set the current Y1 location as 0 percent and the current Y2 location as 100 percent.

Changing Y units affects the input and output values of the :MARKer:Y1Position, :MARKer:Y2Position, and :MARKer:YDELta commands/queries.

Query Syntax :MARKer:YUNits?

The :MARKer:YUNits? query returns the current Y cursors units.

Return Format <units><NL>
<units> ::= {BASE | PERC}

:MARKer:YUNits:USE

N (see [page 1446](#))

Command Syntax :MARKer:YUNits:USE

When PERCent is selected for :MARKer:YUNits, the :MARKer:YUNits:USE command sets the current Y1 location as 0 percent and the current Y2 location as 100 percent.

Once the 0 and 100 percent locations are set, inputs to and outputs from the :MARKer:Y1Position, :MARKer:Y2Position, and :MARKer:YDELta commands/queries are relative to the set locations.

Introduction to :MEASure Commands

The commands in the MEASure subsystem are used to make parametric measurements on displayed waveforms.

Measurement Setup

To make a measurement, the portion of the waveform required for that measurement must be displayed on the oscilloscope screen.

Measurement Type	Portion of waveform that must be displayed
period, duty cycle, or frequency	at least one complete cycle
pulse width	the entire pulse
rise time	rising edge, top and bottom of pulse
fall time	falling edge, top and bottom of pulse

Measurement Error

If a measurement cannot be made (typically because the proper portion of the waveform is not displayed), the value +9.9E+37 is returned for that measurement.

Making Measurements

If more than one waveform, edge, or pulse is displayed, time measurements are made on the portion of the displayed waveform closest to the trigger reference (left, center, or right).

When making measurements in the zoomed (delayed) time base mode (:TIMebase:MODE WINDow), the oscilloscope will attempt to make the measurement inside the zoomed sweep window. If the measurement is an average and there are not three edges, the oscilloscope will revert to the mode of making the measurement at the start of the main sweep.

When the command form is used, the measurement result is displayed on the instrument. When the query form of these measurements is used, the measurement is made one time, and the measurement result is returned over the bus.

Measurements are made on the displayed waveforms specified by the :MEASure:SOURce command. The MATH source is an alias for the FUNCtion source.

Not all measurements are available on the digital channels or FFT (Fast Fourier Transform).

Reporting the Setup

Use the :MEASure? query to obtain setup information for the MEASure subsystem. (Currently, this is only :MEASure:SOURce.)

Return Format

The following is a sample response from the :MEASure? query. In this case, the query was issued following a *RST command.

```
:MEAS:SOUR CHAN1,CHAN2;STAT ON
```

:MEASure:ALL

N (see [page 1446](#))

Command Syntax :MEASure:ALL

This command installs a Snapshot All measurement on the screen.

See Also · ["Introduction to :MEASure Commands"](#) on page 524

:MEASure:AREa

N (see [page 1446](#))

Command Syntax :MEASure:AREa [<interval>][,<source>]
 <interval> ::= {CYCLe | DISPlay}

 <n> ::= 1 to (# analog channels) in NR1 format
 <m> ::= 1 to (# math functions) in NR1 format
 <r> ::= 1 to (# ref waveforms) in NR1 format

The :MEASure:AREa command installs an area measurement on screen. Area measurements show the area between the waveform and the ground level.

The <interval> option lets you specify the measurement interval: either an integral number of cycles, or the full screen. If <interval> is not specified, DISPlay is implied.

NOTE

This command is not available if the source is FFT (Fast Fourier Transform).

Query Syntax :MEASure:AREa? [<interval>][,<source>]

The :MEASure:AREa? query measures and returns the area value.

Return Format <value><NL>
 <value> ::= the area value in volt-seconds in NR3 format

:MEASure:BRATe

N (see [page 1446](#))

Command Syntax :MEASure:BRATe [<source>]

```
<source> ::= {<digital channels> | CHANnel<n> | FUNction<m> | MATH<m>
| WMEMory<r>}
```

```
<digital channels> ::= DIGital<d> for the MSO models
```

```
<d> ::= 0 to (# digital channels - 1) in NR1 format
```

```
<n> ::= 1 to (# of analog channels) in NR1 format

<r> ::= 1 to (# ref waveforms) in NR1 format
```

The :MEASure:BRATe command installs a screen measurement and starts the bit rate measurement. If the optional source parameter is specified, the currently specified source is modified.

NOTE

This command is not available if the source is FFT (Fast Fourier Transform).

Query Syntax :MEASure:BRATe? [<source>]

The :MEASure:BRATe? query measures all positive and negative pulse widths on the waveform, takes the minimum value found of either width type and inverts that minimum width to give a value in Hertz.

Return Format <value><NL>

```
<value> ::= the bit rate value in Hertz
```

:MEASure:BWIDth

N (see [page 1446](#))

Command Syntax :MEASure:BWIDth [<source>]

<source> ::= {CHANnel<n> | FUNction<m> | MATH<m> | WMEMory<r>}

<n> ::= 1 to (# analog channels) in NR1 format

<m> ::= 1 to (# math functions) in NR1 format

<r> ::= 1 to (# ref waveforms) in NR1 format

The :MEASure:BWIDth command installs a burst width measurement on screen. If the optional source parameter is not specified, the current measurement source is used.

NOTE

This command is not available if the source is FFT (Fast Fourier Transform).

Query Syntax :MEASure:BWIDth? [<source>]

The :MEASure:BWIDth? query measures and returns the width of the burst on the screen.

The burst width is calculated as follows:

$$\text{burst width} = (\text{last edge on screen} - \text{first edge on screen})$$

Return Format <value><NL>

<value> ::= burst width in seconds in NR3 format

- ["Introduction to :MEASure Commands"](#) on page 524
 - [":MEASure:SOURce"](#) on page 587

:MEASure:CLEAr

N (see [page 1446](#))

Command Syntax :MEASure:CLEAr

This command clears all selected measurements and markers from the screen.

See Also • ["Introduction to :MEASure Commands"](#) on page 524

:MEASure:COUNter

N (see [page 1446](#))

Command Syntax :MEASure:COUNter [<source>]
 <source> ::= {<digital channels> | CHANnel<n> | EXTernal}
 <digital channels> ::= DIGital<d> for the MSO models
 <n> ::= 1 to (# analog channels) in NR1 format
 <d> ::= 0 to (# digital channels - 1) in NR1 format

The :MEASure:COUNter command installs a screen measurement and starts a counter measurement. If the optional source parameter is specified, the current source is modified. Any channel except Math or Reference Waveforms may be selected for the source.

The counter measurement counts trigger level crossings within a certain amount of time (gate time) and displays the results in Hz.

The gate time is the horizontal range of the oscilloscope but is limited to ≥ 0.1 s and ≤ 10 s. Unlike other measurements, the Zoom horizontal timebase window does not gate the Counter measurement.

The Counter measurement can measure frequencies up to the bandwidth of the oscilloscope. The minimum frequency supported is $2.0 / \text{gateTime}$.

Only one counter measurement may be displayed at a time.

NOTE

This command is not available if the source is MATH.

Query Syntax :MEASure:COUNter? [<source>]

The :MEASure:COUNter? query measures and outputs the counter frequency of the specified source.

NOTE

The :MEASure:COUNter? query times out if the counter measurement is installed on the front panel. Use :MEASure:CLEar to remove the front-panel measurement before executing the :MEASure:COUNter? query.

Return Format <source><NL>
 <source> ::= count in Hertz in NR3 format

:MEASure:CTCNwidth

N (see [page 1446](#))

Command Syntax

NOTE

This measurement is available when the optional DSOX6JITTER jitter analysis feature is licensed

```
:MEASure:CTCNwidth [<source>]
```

```
<source> ::= CHANnel<n>
```

```
<n> ::= 1 to (# analog channels) in NR1 format
```

The :MEASure:CTCNwidth command installs a -Width to -Width (cycle-to-cycle negative width) jitter measurement on screen.

The -Width to -Width jitter measurement subtracts the first cycle's negative pulse width from the second cycle's negative pulse width for the first measurement result. Then, the second cycle's negative pulse width is subtracted from the third cycle's negative pulse width for the second measurement result, and so on, until all of the cycles of the waveform have been measured. The following figure shows the first two -Width to -Width measurements.

-Width1 -Width2

1st Measurement = -Width2 - -Width1

-Width2 -Width3

2nd Measurement = -Width3 - -Width2

All of the measurement results are used to compute the statistics. The statistics are the values accumulated over all of the trigger cycles that have occurred.

The measurement is made on all the cycles of the waveform. Even in Zoom mode, all the cycles of the waveform in the Main window will be measured.

Query Syntax

```
:MEASure:CTCNwidth? [<source>]
```

The :MEASure:CTCNwidth? query measures and returns the -Width to -Width jitter value.

Return Format <value><NL>

<value> ::= -Width to -Width jitter in NR3 format

- [":MEASure:CTCPwidth"](#) on page 535
 - [Chapter 23](#), “:JITTer Commands,” starting on page 465

:MEASure:CTCPwidth

N (see [page 1446](#))

Command Syntax

NOTE

This measurement is available when the optional DSOX6JITTER jitter analysis feature is licensed

```
:MEASure:CTCPwidth [<source>]
```

```
<source> ::= CHANnel<n>
```

```
<n> ::= 1 to (# analog channels) in NR1 format
```

The :MEASure:CTCPwidth command installs a +Width to +Width (cycle-to-cycle positive width) jitter measurement on screen.

The +Width to +Width jitter measurement subtracts the first cycle's positive pulse width from the second cycle's positive pulse width for the first measurement result. Then, the second cycle's positive pulse width is subtracted from the third cycle's positive pulse width for the second measurement result, and so on, until all of the cycles of the waveform have been measured. The following figure shows the first two +Width to +Width measurements.

+Width1 +Width2

1st Measurement = +Width2 - +Width1

+Width2 +Width3

2nd Measurement = +Width3 - +Width2

All of the measurement results are used to compute the statistics. The statistics are the values accumulated over all of the trigger cycles that have occurred.

The measurement is made on all the cycles of the waveform. Even in Zoom mode, all the cycles of the waveform in the Main window will be measured.

Query Syntax

```
:MEASure:CTCPwidth? [<source>]
```

The :MEASure:CTCPwidth? query measures and returns the +Width to +Width jitter value.

Return Format <value><NL>

<value> ::= +Width to +Width jitter in NR3 format

- See Also**
- [":MEASure:CTCNwidth"](#) on page 533
 - [Chapter 23](#), "JITTer Commands," starting on page 465

:MEASure:DEFine

N (see [page 1446](#))

Command Syntax :MEASure:DEFine <meas_spec>[,<source>]
 <meas_spec> ::= {DELay | THResholds}
 <source> ::= {CHANnel<n> | FUNCTION<m> | MATH<m> | WMEMory<r>}
 <n> ::= 1 to (# analog channels) in NR1 format
 <m> ::= 1 to (# math functions) in NR1 format
 <r> ::= 1 to (# ref waveforms) in NR1 format

The :MEASure:DEFine command sets up the definition for measurements by specifying the delta time or threshold values. Changing these values may affect the results of other measure commands. The table below identifies which measurement results that can be affected by redefining the DELay specification or the THResholds values. For example, changing the THResholds definition from the default 10%, 50%, and 90% values may change the returned measurement result.

MEASure Command	DELay	THResholds
DUTYcycle		X
DELay	X	X
FALLtime		X
FREQuency		X
NWIDth		X
OVERshoot		X
PERiod		X
PHASe		X
PREShoot		X
PWIDth		X
RISetime		X
VAVerage		X
VRMS		X

:MEASure:DEFine DELay Command Syntax
 :MEASure:DEFine DELay,<delay_spec>[,<source>]
 <delay_spec> ::= <edge_spec1>,<edge_spec2>
 <edge_spec1> ::= [<slope>]<occurrence>
 <edge_spec2> ::= [<slope>]<occurrence>

```
<slope> ::= {+ | -}
```

```
<occurrence> ::= integer
```

This command defines the behavior of the :MEASure:DElay? query by specifying the start and stop edge to be used. <edge_spec1> specifies the slope and edge number on source1. <edge_spec2> specifies the slope and edge number on source2. The measurement is taken as:

```
delay = t(<edge_spec2>) - t(<edge_spec1>)
```

NOTE

The :MEASure:DElay command and the front-panel delay measurement use an auto-edge selection method to determine the actual edge used for the measurement. The :MEASure:DEfine command has no effect on these delay measurements. The edges specified by the :MEASure:DEfine command only define the edges used by the :MEASure:DElay? query.

**:MEASure:DEfine
THResholds
Command Syntax**

```
:MEASure:DEfine THResholds, <threshold spec> [, <source>]
```

```
<threshold spec> ::= {STANdard  
| {<threshold mode>, <upper>, <middle>, <lower>}}
```

```
<threshold mode> ::= {PERCent | ABSolute}
```

for <threshold mode> = PERCent:

```
<upper>, <middle>, <lower> ::= A number specifying the upper, middle,  
and lower threshold percentage values  
between Vbase and Vtop in NR3 format.
```

for <threshold mode> = ABSolute:

```
<upper>, <middle>, <lower> ::= A number specifying the upper, middle,  
and lower threshold absolute values in  
NR3 format.
```

- STANdard threshold specification sets the lower, middle, and upper measurement thresholds to 10%, 50%, and 90% values between Vbase and Vtop.
- Threshold mode PERCent sets the measurement thresholds to any user-defined percentages between 5% and 95% of values between Vbase and Vtop.
- Threshold mode ABSolute sets the measurement thresholds to absolute values. ABSolute thresholds are dependent on channel scaling (:CHANnel<n>:RANGe or **":CHANnel<n>:SCALE"** on page 315:CHANnel<n>:SCALE), probe attenuation (:CHANnel<n>:PROBe), and probe units (:CHANnel<n>:UNITs). Always set these values first before setting ABSolute thresholds.

Query Syntax

```
:MEASure:DEfine? <meas_spec> [, <source>]
```

```
<meas_spec> ::= {DElay | THResholds}
```

The :MEASure:DEfine? query returns the current edge specification for the delay measurements setup or the current specification for the thresholds setup.

Return Format for <meas_spec> = DELay:

```
{ <edge_spec1> | <edge_spec2> | <edge_spec1>,<edge_spec2>} <NL>
```

for <meas_spec> = THResholds and <threshold mode> = PERCent:

```
THR,PERC,<upper>,<middle>,<lower><NL>
```

<upper>, <middle>, <lower> ::= A number specifying the upper, middle, and lower threshold percentage values between Vbase and Vtop in NR3 format.

for <meas_spec> = THResholds and <threshold mode> = ABSolute:

```
THR,ABS,<upper>,<middle>,<lower><NL>
```

<upper>, <middle>, <lower> ::= A number specifying the upper, middle, and lower threshold voltages in NR3 format.

for <threshold spec> = STANdard:

```
THR,PERC,+90.0,+50.0,+10.0
```

:MEASure:DElAy

N (see [page 1446](#))

Command Syntax :MEASure:DElAy [<source1>] [,<source2>]

<source1>, <source2> ::= {CHANnel<n> | FUNction<m> | MATH<m> | WMEMory<r>}

<n> ::= 1 to (# analog channels) in NR1 format

<m> ::= 1 to (# math functions) in NR1 format

<r> ::= 1 to (# ref waveforms) in NR1 format

The :MEASure:DElAy command places the instrument in the continuous measurement mode and starts a delay measurement.

The measurement is taken as:

$$\text{delay} = t(\text{<edge spec 2>}) - t(\text{<edge spec 1>})$$

where the <edge spec> definitions are set by the :MEASure:DEFine command

NOTE

The :MEASure:DElAy command and the front-panel delay measurement differ from the :MEASure:DElAy? query.

The delay command or front-panel measurement run the delay measurement in auto-edge select mode. In this mode, you can select the edge polarity, but the instrument will select the edges that will make the best possible delay measurement. The source1 edge chosen will be the edge that meets the polarity specified and is closest to the trigger reference point. The source2 edge selected will be that edge of the specified polarity that gives the first of the following criteria:

- The smallest positive delay value that is less than source1 period.
- The smallest negative delay that is less than source1 period.
- The smallest absolute value of delay.

The :MEASure:DElAy? query will make the measurement using the edges specified by the :MEASure:DEFine command.

Query Syntax :MEASure:DElAy? [<source1>] [,<source2>]

The :MEASure:DElAy? query measures and returns the delay between source1 and source2. The delay measurement is made from the user-defined slope and edge count of the signal connected to source1, to the defined slope and edge count of the signal connected to source2. Delay measurement slope and edge parameters are selected using the :MEASure:DEFine command.

Also in the :MEASure:DEFine command, you can set upper, middle, and lower threshold values. *It is the middle threshold value that is used when performing the delay query.* The standard upper, middle, and lower measurement thresholds are

90%, 50%, and 10% values between Vbase and Vtop. If you want to move the delay measurement point nearer to Vtop or Vbase, you must change the threshold values with the :MEASure:DEFine THResholds command.

Return Format <value><NL>

<value> ::= floating-point number delay time in seconds in NR3 format

:MEASure:DUAL:CHARge

N (see [page 1446](#))

Overview This measurement is available with the N2820A high sensitivity current probe when both the Primary and Secondary probe cables are used. This measurement joins the Zoom In waveform data below the probe's clamp level with Zoom Out waveform data above the probe's clamp level to create the waveform on which the measurement is made.

Command Syntax `:MEASure:DUAL:CHARge [<interval>] [,<source1>] [,<source2>]`
`<interval> ::= {CYCLe | DISPlay}`
`<source1>,<source2> ::= CHANnel<n> with N2820A probe connected`
`<n> ::= 1 to (# analog channels) in NR1 format`

The `:MEASure:DUAL:CHARge` command installs a charge measurement on screen. Charge measurements show the area between the waveform and the ground level.

The `<interval>` option lets you specify the measurement interval: either an integral number of cycles, or the full screen. If `<interval>` is not specified, `DISPlay` is implied.

If the optional source parameter(s) are specified, the currently specified source(s) are modified.

Query Syntax `:MEASure:DUAL:CHARge? [<interval>] [,<source1>] [,<source2>]`

The `:MEASure:DUAL:CHARge?` query measures and returns the charge measurement value.

Overview This measurement is available with the N2820A high sensitivity current probe when both the Primary and Secondary probe cables are used. This measurement joins the Zoom In waveform data below the probe's clamp level with Zoom Out waveform data above the probe's clamp level to create the waveform on which the measurement is made.

Command Syntax :MEASure:DUAL:VAMplitude [<source1>] [,<source2>]
 <source1>,<source2> ::= CHANnel<n> with N2820A probe connected

Overview This measurement is available with the N2820A high sensitivity current probe when both the Primary and Secondary probe cables are used. This measurement joins the Zoom In waveform data below the probe's clamp level with Zoom Out waveform data above the probe's clamp level to create the waveform on which the measurement is made.

Command Syntax `:MEASure:DUAL:VAverage [<interval>] [,<source1>] [,<source2>]`
`<interval> ::= {CYCLe | DISPlay}`
`<source1>,<source2> ::= CHANnel<n> with N2820A probe connected`
`<n> ::= 1 to (# analog channels) in NR1 format`

The `:MEASure:DUAL:VAverage` command installs a screen measurement and starts an average value measurement.

The `<interval>` option lets you specify the measurement interval: either an integral number of cycles, or the full screen. If `<interval>` is not specified, `DISPlay` is implied.

If the optional source parameter(s) are specified, the currently specified source(s) are modified.

Query Syntax `:MEASure:DUAL:VAverage? [<interval>] [,<source1>] [,<source2>]`

The `:MEASure:DUAL:VAverage?` query returns the average value measurement.

Return Format `<value><NL>`
`<value> ::= calculated average value in NR3 format`

Command Syntax :MEASure:DUTYcycle [<source>]

<source> ::= {<digital channels> | CHANnel<n> | FUNction<m> | MATH<m>
| WMEMory<r>}

<digital channels> ::= DIGital<d> for the MSO models

<d> ::= 0 to (# digital channels - 1) in NR1 format

<n> ::= 1 to (# of analog channels) in NR1 format

<m> ::= 1 to (# math functions) in NR1 format

<r> ::= 1 to (# ref waveforms) in NR1 format

The :MEASure:DUTYcycle command installs a screen measurement and starts a positive duty cycle measurement on the current :MEASure:SOURce. If the optional source parameter is specified, the current source is modified.

NOTE

The signal must be displayed to make the measurement. This command is not available if the source is FFT (Fast Fourier Transform).

Query Syntax :MEASure:DUTYcycle? [<source>]

The :MEASure:DUTYcycle? query measures and outputs the positive duty cycle of the signal specified by the :MEASure:SOURce command. The value returned for the duty cycle is the ratio of the positive pulse width to the period. The positive pulse width and the period of the specified signal are measured, then the duty cycle is calculated with the following formula:

$$+duty\ cycle = (+pulse\ width/period)*100$$

Return Format <value><NL>

 <n> ::= 1 to (# analog channels) in NR1 format
 <m> ::= 1 to (# math functions) in NR1 format
 <r> ::= 1 to (# ref waveforms) in NR1 format

The :MEASure:FALLtime command installs a screen measurement and starts a fall-time measurement. For highest measurement accuracy, set the sweep speed as fast as possible, while leaving the falling edge of the waveform on the display. If the optional source parameter is specified, the current source is modified.

NOTE

This command is not available if the source is FFT (Fast Fourier Transform).

Query Syntax :MEASure:FALLtime? [<source>]

The :MEASure:FALLtime? query measures and outputs the fall time of the displayed falling (negative-going) edge closest to the trigger reference. The fall time is determined by measuring the time at the upper threshold of the falling edge, then measuring the time at the lower threshold of the falling edge, and calculating the fall time with the following formula:

$$\text{fall time} = \text{time at lower threshold} - \text{time at upper threshold}$$

Return Format <value><NL>
 <value> ::= time in seconds between the lower threshold and upper threshold in NR3 format

:MEASure:NCJitter

N (see [page 1446](#))

Command Syntax

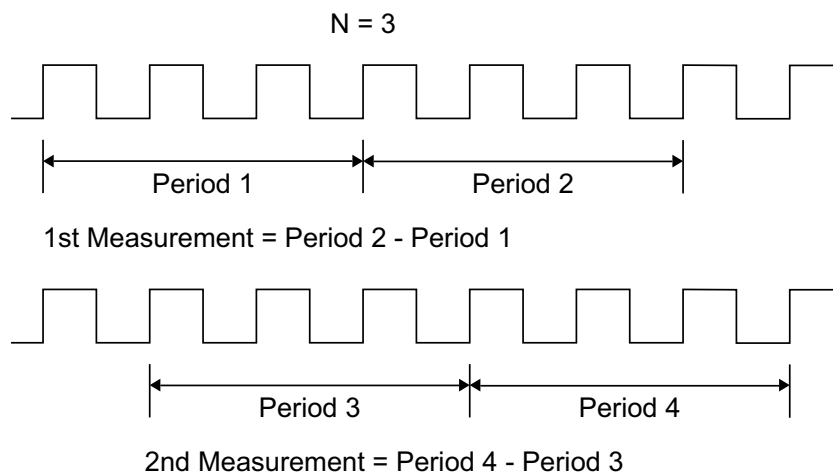

NOTE

This measurement is available when the optional DSOX6JITTER jitter analysis feature is licensed

```
:MEASure:NCJitter <config>
<config> ::= <source>, <direction>, <num_periods>
<source> ::= {CHANnel<n> | FUNction<m> | MATH<m> | WMEMory<r>}
<n> ::= 1 to (# analog channels) in NR1 format
<m> ::= 1 to (# math functions) in NR1 format
<r> ::= 1 to (# ref waveforms) in NR1 format
<direction> ::= {RISing | FALLing}
<num_periods> ::= 1 to 10000 in NR1 format
```

The :MEASure:NCJitter command install a period-period (N-cycle) jitter measurement on screen.

The Period-Period jitter measurement takes a group of cycles and measures the period from the first edge of the first cycle of the group to the final edge of the last cycle of the group. The N-period of the first group is measured and subtracted from the N-period of the second group. After shifting ahead one cycle the next measurement is made. The following figure shows how an N-cycle jitter measurement is made for N=3.

Once all of the groups of cycles of the waveform are measured, the statistics are calculated. The statistics are the values accumulated over all of the trigger cycles that have occurred.

To perform a cycle-cycle jitter measurement, use Period-Period and set N=1.

The measurement is made on all the cycles of the waveform. Even in Zoom mode, all the cycles of the waveform in the Main window will be measured.

Query Syntax :MEASure:NCJitter? <config>

The :MEASure:NCJitter? query measures and returns the N-Period to N-Period jitter value.

Return Format

<value><NL>

<value> ::= N-Period to N-Period jitter in NR3 format

<n> ::= 1 to (# of analog channels) in NR1 format

<m> ::= 1 to (# math functions) in NR1 format

<r> ::= 1 to (# ref waveforms) in NR1 format

The :MEASure:NDUTy command installs a screen measurement and starts a negative duty cycle measurement on the current :MEASure:SOURce. If the optional source parameter is specified, the current source is modified.

NOTE

The signal must be displayed to make the measurement. This command is not available if the source is FFT (Fast Fourier Transform).

Query Syntax :MEASure:NDUTy? [<source>]

The :MEASure:NDUTy? query measures and outputs the negative duty cycle of the signal specified by the :MEASure:SOURce command. The value returned for the duty cycle is the ratio of the negative pulse width to the period. $$-\text{duty cycle} = (-\text{pulse width}/\text{period}) * 100$$

Command Syntax :MEASure:OVERshoot [<source>]
 <source> ::= {CHANnel<n> | FUNCTION<m> | MATH<m> | WMEMory<r>}
 <n> ::= 1 to (# analog channels) in NR1 format
 <m> ::= 1 to (# math functions) in NR1 format
 <r> ::= 1 to (# ref waveforms) in NR1 format

The :MEASure:OVERshoot command installs a screen measurement and starts an overshoot measurement. If the optional source parameter is specified, the current source is modified.

NOTE

This command is not available if the source is FFT (Fast Fourier Transform).

Query Syntax :MEASure:OVERshoot? [<source>]

The :MEASure:OVERshoot? query measures and returns the overshoot of the edge closest to the trigger reference, displayed on the screen. The method used to determine overshoot is to make three different vertical value measurements: Vtop, Vbase, and either Vmax or Vmin, depending on whether the edge is rising or falling.

For a rising edge:

$$\text{overshoot} = ((V_{\text{max}} - V_{\text{top}}) / (V_{\text{top}} - V_{\text{base}})) \times 100$$

For a falling edge:

$$\text{overshoot} = ((V_{\text{base}} - V_{\text{min}}) / (V_{\text{top}} - V_{\text{base}})) \times 100$$

Vtop and Vbase are taken from the normal histogram of all waveform vertical values. The extremum of Vmax or Vmin is taken from the waveform interval right after the chosen edge, halfway to the next edge. This more restricted definition is used instead of the normal one, because it is conceivable that a signal may have more preshoot than overshoot, and the normal extremum would then be dominated by the preshoot of the following edge.

Return Format <overshoot><NL>
 <overshoot> ::= the percent of the overshoot of the selected waveform in NR3 format

<n> ::= 1 to (# analog channels) in NR1 format

<m> ::= 1 to (# math functions) in NR1 format

<r> ::= 1 to (# ref waveforms) in NR1 format

The :MEASure:PHASe command places the instrument in the continuous measurement mode and starts a phase measurement.

Query Syntax :MEASure:PHASe? [<source1>] [,<source2>]

The :MEASure:PHASe? query measures and returns the phase between the specified sources.

A phase measurement is a combination of the period and delay measurements. First, the period is measured on source1. Then the delay is measured between source1 and source2. The edges used for delay are the source1 rising edge used for the period measurement closest to the horizontal reference and the rising edge on source 2. See :MEASure:DELAy for more detail on selecting the 2nd edge.

The phase is calculated as follows:

$$\text{phase} = (\text{delay} / \text{period of input 1}) \times 360$$

<source> ::= {CHANnel<n> | FUNction<m> | MATH<m> | WMEMory<r>}

The :MEASure:PREShoot command installs a screen measurement and starts a preshoot measurement. If the optional source parameter is specified, the current source is modified.

Query Syntax :MEASure:PREShoot? [<source>]

The :MEASure:PREShoot? query measures and returns the preshoot of the edge closest to the trigger, displayed on the screen. The method used to determine preshoot is to make three different vertical value measurements: Vtop, Vbase, and either Vmin or Vmax, depending on whether the edge is rising or falling.

For a rising edge:

$$\text{preshoot} = ((V_{\text{min}} - V_{\text{base}}) / (V_{\text{top}} - V_{\text{base}})) \times 100$$

Vtop and Vbase are taken from the normal histogram of all waveform vertical values. The extremum of Vmax or Vmin is taken from the waveform interval right before the chosen edge, halfway back to the previous edge. This more restricted definition is used instead of the normal one, because it is likely that a signal may have more overshoot than preshoot, and the normal extremum would then be dominated by the overshoot of the preceding edge.

:MEASure:RESults

N (see [page 1446](#))

Query Syntax :MEASure:RESults?

The :MEASure:RESults? query returns the results of the continuously displayed measurements. The response to the MEASure:RESults? query is a list of comma-separated values.

If more than one measurement is running continuously, the :MEASure:RESults return values are duplicated for each continuous measurement from the first to last (top to bottom) result displayed. Each result returned is separated from the previous result by a comma. There is a maximum of 10 continuous measurements that can be continuously displayed at a time.

When no quick measurements are installed, the :MEASure:RESults? query returns nothing (empty string). When the count for any of the measurements is 0, the value of infinity (9.9E+37) is returned for the min, max, mean, and standard deviation.

Return Format <result_list><NL>

<result_list> ::= comma-separated list of measurement results

The following shows the order of values received for a single measurement if :MEASure:STATistics is set to ON.

Measureme nt label	current	min	max	mean	std dev	count
-----------------------	---------	-----	-----	------	---------	-------

Measurement label, current, min, max, mean, std dev, and count are only returned if :MEASure:STATistics is ON.

If :MEASure:STATistics is set to CURRent, MIN, MAX, MEAN, STDDev, or COUNT only that particular statistic value is returned for each measurement that is on.

<n> ::= 1 to (# analog channels) in NR1 format

<m> ::= 1 to (# math functions) in NR1 format

<r> ::= 1 to (# ref waveforms) in NR1 format

The :MEASure:RISetime command installs a screen measurement and starts a rise-time measurement. If the optional source parameter is specified, the current source is modified.

NOTE

This command is not available if the source is FFT (Fast Fourier Transform).

Query Syntax :MEASure: RISetime? [<source>]

The :MEASure:RISetime? query measures and outputs the rise time of the displayed rising (positive-going) edge closest to the trigger reference. For maximum measurement accuracy, set the sweep speed as fast as possible while leaving the leading edge of the waveform on the display. The rise time is determined by measuring the time at the lower threshold of the rising edge and the time at the upper threshold of the rising edge, then calculating the rise time with the following formula:

$$\text{rise time} = \text{time at upper threshold} - \text{time at lower threshold}$$

 <n> ::= 1-2 or 1-4 (# of analog channels) in NR1 format
 <m> ::= 1 to (# math functions) in NR1 format
 <r> ::= 1 to (# ref waveforms) in NR1 format

NOTE

This ":MEASure:VRMS DISPlay, AC" command is the preferred syntax for making standard deviation measurements.

The :MEASure:SDEVIation command installs a screen measurement and starts std deviation measurement. If the optional source parameter is specified, the current source is modified.

NOTE

This command is not available if the source is FFT (Fast Fourier Transform).

Query Syntax :MEASure:SDEVIation? [<source>]

:MEASure:SOURce

C (see [page 1446](#))

Command Syntax :MEASure:SOURce <source1>[,<source2>]

```
<source1>,<source2> ::= {<digital channels> | CHANnel<n> | FUNction
                        | MATH | WMEMory<r> | EXTErnal}
```

```
<digital channels> ::= DIGital<d> for the MSO models
```

```
<n> ::= 1 to (# of analog channels) in NR1 format
```

```
<r> ::= 1-2 in NR1 format
```

```
<d> ::= 0 to (# digital channels - 1) in NR1 format
```

The :MEASure:SOURce command sets the default sources for measurements. The specified sources are used as the sources for the MEASure subsystem commands if the sources are not explicitly set with the command.

If a source is specified for any measurement, the current source is changed to this new value.

If :MARKer:MODE is set to OFF or MANual, setting :MEASure:SOURce to CHANnel<n>, FUNction, or MATH will also set :MARKer:X1Y1source to source1 and :MARKer:X2Y2source to source2.

EXTErnal is only a valid source for the counter measurement (and <source1>).

Query Syntax :MEASure:SOURce?

The :MEASure:SOURce? query returns the current source selections. If source2 is not specified, the query returns "NONE" for source2. If all channels are off, the query returns "NONE,NONE". Source2 only applies to :MEASure:DELAy and :MEASure:PHASe measurements.

NOTE

MATH is an alias for FUNction. The query will return FUNC if the source is FUNction or MATH.

Return Format <source1>,<source2><NL>

```

To do this, change the horizontal position and enter the command for each new pulse that is measured.

This command is only allowed when the oscilloscope is stopped and quick measurements are on.

The command is allowed in segmented acquisition mode even though the corresponding front panel softkey is not available.

:MEASure:TEDGe

N (see [page 1446](#))

Query Syntax :MEASure:TEDGe? <slope><occurrence>[,<source>]

<slope> ::= direction of the waveform. A rising slope is indicated by a space or plus sign (+). A falling edge is indicated by a minus sign (-).

<occurrence> ::= the transition to be reported. If the occurrence number is one, the first crossing from the left screen edge is reported. If the number is two, the second crossing is reported, etc.

<source> ::= {<digital channels> | CHANnel<n> | FUNction<m> | MATH<m> | WMEMory<r>}

<digital channels> ::= DIGital<d> for the MSO models

<n> ::= 1 to (# of analog channels) in NR1 format

<m> ::= 1 to (# math functions) in NR1 format

<r> ::= 1 to (# ref waveforms) in NR1 format

<d> ::= 0 to (# digital channels - 1) in NR1 format

When the :MEASure:TEDGe query is sent, the displayed signal is searched for the specified transition. The time interval between the trigger event and this occurrence is returned as the response to the query. The sign of the slope selects a rising (+) or falling (-) edge. If no sign is specified for the slope, it is assumed to be the rising edge.

The threshold voltage used for this measurement is at the 50% point with a bit of hysteresis added. You cannot change the threshold voltage used for this measurement with the :MEASure:DEFine command.

The magnitude of occurrence defines the occurrence to be reported. For example, +3 returns the time for the third time the waveform crosses the midpoint threshold in the positive direction. Once this crossing is found, the oscilloscope reports the time at that crossing in seconds, with the trigger point (time zero) as the reference.

If the specified crossing cannot be found, the oscilloscope reports +9.9E+37. This value is returned if the waveform does not cross the specified vertical value, or if the waveform does not cross the specified vertical value for the specific number of times in the direction specified.

You can make delay and phase measurements using the MEASure:TEDGe command:

Delay = time at the nth rising or falling edge of the channel - time at the same edge of another channel

Phase = (delay between channels / period of channel) x 360

For an example of making a delay and phase measurement, see "[:MEASure:TEDGe Code](#)" on page 596.

If the optional source parameter is specified, the current source is modified.

NOTE

This query is not available if the source is FFT (Fast Fourier Transform).

Return Format

<value><NL>

<value> ::= time in seconds of the specified transition in NR3 format

:MEASure:TEDGe Code

<n> ::= 1 to (# analog channels) in NR1 format
<m> ::= 1 to (# math functions) in NR1 format
<r> ::= 1 to (# ref waveforms) in NR1 format
```

The :MEASure:TIEData command installs a data TIE jitter measurement on screen.

The Data TIE (Time Interval Error) jitter measurement compares edges in a data signal with the edges in an ideal data signal determined by the clock recovery feature. To change the clock recovery method, see **" :CLOCK:METhod "** on page 321.

Once the ideal data rate is determined, all of the data intervals are measured with respect to the ideal data rate and the error statistics are computed. The following figure shows how the Data TIE is measured on rising edges of the data.

The measurement is made on all the cycles of the waveform. Even in Zoom mode, all the cycles of the waveform in the Main window will be measured.

Query Syntax :MEASure:TIEData? <config>

The :MEASure:TIEData? query measures and returns the Data TIE jitter value.

Return Format

<r> ::= 1 to (# ref waveforms) in NR1 format
<direction> ::= {RISing | FALLing | BOTH}
```

The :MEASure:TIEClock command installs a clock TIE jitter measurement on screen.

The Clock TIE (Time Interval Error) jitter measurement compares edges in a clock signal with the edges in an ideal clock signal determined by the clock recovery feature. To change the clock recovery method, see **":CLOCK:METHod"** on page 321.

Once the ideal clock frequency is determined, all of the cycles of your waveform are compared to the ideal clock frequency and the error statistics are computed. The following figure shows how the Clock TIE is measured on rising edges of the clock.

The measurement is made on all the cycles of the waveform. Even in Zoom mode, all the cycles of the waveform in the Main window will be measured.

Query Syntax

Query Syntax :MEASure:TVALue? <value>, [<slope>]<occurrence>[,<source>]

<value> ::= the vertical value that the waveform must cross. The value can be volts or a math function value such as dB, Vs, or V/s.

<slope> ::= direction of the waveform. A rising slope is indicated by a plus sign (+). A falling edge is indicated by a minus sign (-).

<occurrence> ::= the transition to be reported. If the occurrence number is one, the first crossing is reported. If the number is two, the second crossing is reported, etc.

<source> ::= {CHANnel<n> | FUNCTION<m> | MATH<m> | WMEMory<r>}

<n> ::= 1 to (# analog channels) in NR1 format

<m> ::= 1 to (# math functions) in NR1 format

<r> ::= 1 to (# ref waveforms) in NR1 format

When the :MEASure:TVALue? query is sent, the displayed signal is searched for the specified value level and transition. The time interval between the trigger event and this defined occurrence is returned as the response to the query.

The specified value can be negative or positive. To specify a negative value, use a minus sign (-). The sign of the slope selects a rising (+) or falling (-) edge. If no sign is specified for the slope, it is assumed to be the rising edge.

The magnitude of the occurrence defines the occurrence to be reported. For example, +3 returns the time for the third time the waveform crosses the specified value level in the positive direction. Once this value crossing is found, the oscilloscope reports the time at that crossing in seconds, with the trigger point (time zero) as the reference.

If the specified crossing cannot be found, the oscilloscope reports +9.9E+37. This value is returned if the waveform does not cross the specified value, or if the waveform does not cross the specified value for the specified number of times in the direction specified.

<n> ::= 1 to (# analog channels) in NR1 format

<m> ::= 1 to (# math functions) in NR1 format

<r> ::= 1 to (# ref waveforms) in NR1 format

The :MEASure:VPP command installs a screen measurement and starts a vertical peak-to-peak measurement. If the optional source parameter is specified, the current source is modified.

Query Syntax :MEASure:VPP? [<source>]

The :MEASure:VPP? query measures the maximum and minimum vertical value for the selected source, then calculates the vertical peak-to-peak value and returns that value. The peak-to-peak value (Vpp) is calculated with the following formula:

$$V_{pp} = V_{max} - V_{min}$$

Vmax and Vmin are the vertical maximum and minimum values present on the selected source.

Return Format <value><NL>

Introduction to :MTESt Commands

Mask testing automatically compares the current displayed waveform with the boundaries of a set of polygons that you define. Any waveform or sample that falls within the boundaries of one or more polygons is recorded as a failure.

Reporting the Setup

Use :MTESt? to query setup information for the MTESt subsystem.

Return Format

The following is a sample response from the :MTESt? query. In this case, the query was issued following a *RST command.

:MTESt:ALL

N (see [page 1446](#))

Command Syntax :MTESt:ALL <on_off>

<on_off> ::= {{1 | ON} | {0 | OFF}}

The :MTESt:ALL command specifies the channel(s) that are included in the mask test:

- ON – All displayed analog channels are included in the mask test.
- OFF – Just the selected source channel is included in the test.

Query Syntax :MTESt:ENABle?

The :MTESt:ENABle? query returns the current setting.

Return Format <on_off><NL>

<on_off> ::= {1 | 0}

See Also • ["Introduction to :MTESt Commands"](#) on page 643

:MTESt:AMASk:CREate

N (see [page 1446](#))

Command Syntax :MTESt:AMASk:CREate

The :MTESt:AMASk:CREate command automatically constructs a mask around the current selected channel, using the tolerance parameters defined by the :MTESt:AMASk:XDELta, :MTESt:AMASk:YDELta, and :MTESt:AMASk:UNITs commands. The mask only encompasses the portion of the waveform visible on the display, so you must ensure that the waveform is acquired and displayed consistently to obtain repeatable results.

The :MTESt:SOURce command selects the channel and should be set before using this command.

:MTESt:AMASk:SOURce

N (see [page 1446](#))

Command Syntax :MTESt:AMASk:SOURce <source>

<source> ::= CHANnel<n>

<n> ::= 1 to (# analog channels) in NR1 format

The :MTESt:AMASk:SOURce command selects the source for the interpretation of the :MTESt:AMASk:XDELta and :MTESt:AMASk:YDELta parameters when :MTESt:AMASk:UNITs is set to CURRent.

When UNITs are CURRent, the XDELta and YDELta parameters are defined in terms of the channel units, as set by the :CHANnel<n>:UNITs command, of the selected source.

Suppose that UNITs are CURRent and that you set SOURce to CHANNEL1, which is using units of volts. Then you can define AMASk:XDELta in terms of volts and AMASk:YDELta in terms of seconds.

This command is the same as the :MTESt:SOURce command.

Query Syntax :MTESt:AMASk:SOURce?

The :MTESt:AMASk:SOURce? query returns the currently set source.

Return Format <source> ::= CHAN<n>

<n> ::= 1 to (# analog channels) in NR1 format

:MTESt:AMASk:UNITs

N (see [page 1446](#))

Command Syntax :MTESt:AMASk:UNITs <units>

<units> ::= {CURRENT | DIVisions}

The :MTESt:AMASk:UNITs command alters the way the mask test subsystem interprets the tolerance parameters for automasking as defined by :MTESt:AMASk:XDELta and :MTESt:AMASk:YDELta commands.

- CURRENT – the mask test subsystem uses the units as set by the :CHANnel<n>:UNITs command, usually time for ΔX and voltage for ΔY .
- DIVisions – the mask test subsystem uses the graticule as the measurement system, so tolerance settings are specified as parts of a screen division. The mask test subsystem maintains separate XDELta and YDELta settings for CURRENT and DIVisions. Thus, XDELta and YDELta are not converted to new values when the UNITs setting is changed.

Query Syntax :MTESt:AMASk:UNITs?

The :MTESt:AMASk:UNITs query returns the current measurement units setting for the mask test automask feature.

Return Format <units><NL>

<units> ::= {CURR | DIV}

:MTESt:AMASk:XDELta

N (see [page 1446](#))

Command Syntax `:MTESt:AMASk:XDELta <value>`
 `<value> ::= X delta value in NR3 format`

The :MTESt:AMASk:XDELta command sets the tolerance in the X direction around the waveform for the automasking feature. The absolute value of the tolerance will be added and subtracted to horizontal values of the waveform to determine the boundaries of the mask.

The horizontal tolerance value is interpreted based on the setting specified by the :MTESt:AMASk:UNITs command; thus, if you specify 250-E3, the setting for :MTESt:AMASk:UNITs is CURRent, and the current setting specifies time in the horizontal direction, the tolerance will be ± 250 ms. If the setting for :MTESt:AMASk:UNITs is DIVisions, the same X delta value will set the tolerance to ± 250 millidivisions, or 1/4 of a division.

Query Syntax `:MTESt:AMASk:XDELta?`

The :MTESt:AMASk:XDELta? query returns the current setting of the ΔX tolerance for automasking. If your computer program will interpret this value, it should also request the current measurement system using the :MTESt:AMASk:UNITs query.

Return Format `<value><NL>`
 `<value> ::= X delta value in NR3 format`

:MTESt:AMASk:YDELta

N (see [page 1446](#))

Command Syntax :MTESt:AMASk:YDELta <value>

<value> ::= Y delta value in NR3 format

The :MTESt:AMASk:YDELta command sets the vertical tolerance around the waveform for the automasking feature. The absolute value of the tolerance will be added and subtracted to vertical values of the waveform to determine the boundaries of the mask.

The vertical tolerance value is interpreted based on the setting specified by the :MTESt:AMASk:UNITs command; thus, if you specify 250-E3, the setting for :MTESt:AMASk:UNITs is CURRent, and the current setting specifies voltage in the vertical direction, the tolerance will be ± 250 mV. If the setting for :MTESt:AMASk:UNITs is DIVisions, the same Y delta value will set the tolerance to ± 250 millidivisions, or 1/4 of a division.

Query Syntax :MTESt:AMASk:YDELta?

The :MTESt:AMASk:YDELta? query returns the current setting of the ΔY tolerance for automasking. If your computer program will interpret this value, it should also request the current measurement system using the :MTESt:AMASk:UNITs query.

:MTESt:SCALe:X1

N (see [page 1446](#))

Command Syntax :MTESt:SCALe:X1 <x1_value>
 <x1_value> ::= X1 value in NR3 format

The :MTESt:SCALe:X1 command defines where X=0 in the base coordinate system used for mask testing. The other X-coordinate is defined by the :MTESt:SCALe:XDELta command. Once the X1 and XDELta coordinates are set, all X values of vertices in the mask regions are defined with respect to this value, according to the equation:

$$x = (X * \Delta X) + X1$$

Thus, if you set X1 to 100 ms, and XDELta to 100 ms, an X value of 0.100 is a vertex at 110 ms.

The oscilloscope uses this equation to normalize vertices. This simplifies reprogramming to handle different data rates. For example, if you halve the period of the waveform of interest, you need only to adjust the XDELta value to set up the mask for the new waveform.

The X1 value is a time value specifying the location of the X1 coordinate, which will then be treated as X=0 for mask regions coordinates.

Query Syntax :MTESt:SCALe:X1?

The :MTESt:SCALe:X1? query returns the current X1 coordinate setting.

Return Format <x1_value><NL>
 <x1_value> ::= X1 value in NR3 format

:MTESt:SCALe:XDELta

N (see [page 1446](#))

Command Syntax `:MTESt:SCALe:XDELta <xdelta_value>`

`<xdelta_value> ::= X delta value in NR3 format`

The :MTESt:SCALe:XDELta command defines the position of the X2 marker with respect to the X1 marker. In the mask test coordinate system, the X1 marker defines where X=0; thus, the X2 marker defines where X=1.

Because all X vertices of the regions defined for mask testing are normalized with respect to X1 and ΔX , redefining ΔX also moves those vertices to stay in the same locations with respect to X1 and ΔX . Thus, in many applications, it is best if you define XDELta as a pulse width or bit period. Then, a change in data rate without corresponding changes in the waveform can easily be handled by changing ΔX .

The X-coordinate of polygon vertices is normalized using this equation:

$$x = (X * \Delta X) + X1$$

The X delta value is a time value specifying the distance of the X2 marker with respect to the X1 marker.

For example, if the period of the waveform you wish to test is 1 ms, setting ΔX to 1 ms ensures that the waveform's period is between the X1 and X2 markers.

Query Syntax `:MTESt:SCALe:XDELta?`

The :MTESt:SCALe:XDELta? query returns the current value of ΔX .

:MTESt:SCALe:Y1

N (see [page 1446](#))

Command Syntax :MTESt:SCALe:Y1 <y1_value>

<y1_value> ::= Y1 value in NR3 format

The :MTESt:SCALe:Y1 command defines where Y=0 in the coordinate system for mask testing. All Y values of vertices in the coordinate system are defined with respect to the boundaries set by SCALe:Y1 and SCALe:Y2 according to the equation:

$$Y = (Y * (Y2 - Y1)) + Y1$$

Thus, if you set Y1 to 100 mV, and Y2 to 1 V, a Y value of 0.100 in a vertex is at 190 mV.

The Y1 value is a voltage value specifying the point at which Y=0.

Query Syntax :MTESt:SCALe:Y1?

The :MTESt:SCALe:Y1? query returns the current setting of the Y1 marker.

Command Syntax :MTESt:SCALe:Y2 <y2_value>

<y2_value> ::= Y2 value in NR3 format

The :MTESt:SCALe:Y2 command defines the Y2 marker in the coordinate system for mask testing. All Y values of vertices in the coordinate system are defined with respect to the boundaries defined by SCALe:Y1 and SCALe:Y2 according to the following equation:

$$Y = (Y * (Y2 - Y1)) + Y1$$

Thus, if you set Y1 to 100 mV, and Y2 to 1 V, a Y value of 0.100 in a vertex is at 190 mV.

The Y2 value is a voltage value specifying the location of the Y2 marker.

:POD<n>:THReshold

N (see [page 1446](#))

Command Syntax :POD<n>:THReshold <type>[<suffix>]

<n> ::= An integer, 1 or 2, is attached as a suffix to the command and defines the group of channels that are affected by the command.

<type> ::= {CMOS | ECL | TTL | <user defined value>}

<user defined value> ::= -8.00 to +8.00 in NR3 format

<suffix> ::= {V | mV | uV}

POD1 ::= D0-D7

POD2 ::= D8-D15

TTL ::= 1.4V

CMOS ::= 2.5V

ECL ::= -1.3V

The :POD<n>:THReshold command sets the threshold for the specified group of channels. The threshold is used for triggering purposes and for displaying the digital data as high (above the threshold) or low (below the threshold).

NOTE

This command is only valid for the MSO models.

Query Syntax :POD<n>:THReshold?

The :POD<n>:THReshold? query returns the threshold value for the specified group of channels.

Return Format <threshold><NL>

<threshold> ::= Floating point number in NR3 format

Example Code

```
' THRESHOLD - This command is used to set the voltage threshold for
' the waveforms. There are three preset values (TTL, CMOS, and ECL)
' and you can also set a user-defined threshold value between
' -8.0 volts and +8.0 volts.
'
' In this example, we set channels 0-7 to CMOS, then set channels
' 8-15 to a user-defined 2.0 volts, and then set the external trigger
' to TTL. Of course, you only need to set the thresholds for the
' channels you will be using in your program.
```

```
' Set channels 0-7 to CMOS threshold.  
myScope.WriteString ":POD1:THRESHOLD CMOS"  
  
' Set channels 8-15 to 2.0 volts.  
myScope.WriteString ":POD2:THRESHOLD 2.0"  
  
' Set external channel to TTL threshold (short form).  
myScope.WriteString ":TRIG:LEV TTL,EXT"
```

:POWer:CLResponse:APPLy

N (see [page 1446](#))

Command Syntax :POWer:CLResponse:APPLy

The :POWer:CLResponse:APPLy command performs the control loop response (Bode) analysis to help you determine the margin of a control loop.

A Bode plot measurement plots gain or phase (selected by the :POWer:CLResponse:VIEW command) as a function of frequency.

This control loop response analysis requires an input sine wave (from the oscilloscope's waveform generator, V_i) be swept from a low to a high frequency while measuring V_i and V_o RMS voltages at each step frequency, using two channels of the oscilloscope.

For a gain plot, gain (A , in dB units) at each step frequency is computed as $20\text{Log}(V_o/V_i)$ and plotted using a math function waveform.

For a phase plot, the phase difference between the channels is measured at each step frequency. Phase measurements and plots are only possible if the input and output waveforms exceed 1 division peak-to-peak (>1 mVpp).

It takes some time for the frequency sweep analysis to complete. You can query bit 0 of the Standard Event Status Register (*ESR?) to find out when the analysis is complete.

:POWer:DESKew

N (see [page 1446](#))

Command Syntax :POWer:DESKew

The :POWer:DESKew command launches the auto deskew process on the oscilloscope.

Before sending this command:

- 1 Demagnetize and zero-adjust the current probe.
Refer to the current probe's documentation for instructions on how to do this.
- 2 Make connections to the U1880A deskew fixture as described in the oscilloscope's connection dialog or in the *DSOX4PWR Power Measurement Application User's Guide*.
- 3 Make sure the voltage probe and current probe channels are specified appropriately using the :POWer:SIGNals:SOURce:VOLTage1 and :POWer:SIGNals:SOURce:CURRent1 commands.

NOTE

Use the lowest attenuation setting on the high voltage differential probes whenever possible because the voltage levels on the deskew fixture are very small. Using a higher attenuation setting may yield inaccurate skew values (and affect the measurements made) because the noise level is magnified as well.

The deskew values are saved in the oscilloscope until a factory default or secure erase is performed. The next time you run the Power Application, you can use the saved deskew values or perform the deskew again.

Generally, you need to perform the deskew again when part of the test setup changes (for example, a different probe, different oscilloscope channel, etc.) or when the ambient temperature has changed.

The :POWer:HARMonics:APPLy command applies the current harmonics analysis.

Switching power supplies draw a range of harmonics from the AC mains.

Standard limits are set for these harmonics because these harmonics can travel back to the supply grid and cause problems with other devices on the grid.

Use the Current Harmonics analysis to test a switching power supply's current harmonics to pre-compliance standard of IEC61000-3-2 (Class A, B, C, or D). The analysis presents up to 40 harmonics.

N (see [page 1446](#))

Command Syntax :POWer:PSRR:APPLy

The :POWer:PSRR:APPLy command applies the power supply rejection ratio (PSRR) analysis.

The Power Supply Rejection Ratio (PSRR) test is used to determine how well a voltage regulator rejects ripple noise over different frequency range.

This analysis provides a signal from the oscilloscope's waveform generator that sweeps its frequency. This signal is used to inject ripple to the DC voltage that feeds the voltage regulator.

The AC RMS ratio of the input over the output is measured and is plotted over the range of frequencies.

It takes some time for the frequency sweep analysis to complete. You can query bit 0 of the Standard Event Status Register (*ESR?) to find out when the analysis is complete.

Command Syntax :POWer:QUALity:APPLy

The :POWer:QUALity:APPLy command applies the selected power quality analysis type (:POWer:QUALity:TYPE).

Power quality is gauged by these measurements: power factor, apparent power, true power, reactive power, crest factor, and phase angle of the current and voltage of the AC line.

Introduction to :RECall Commands The :RECall subsystem provides commands to recall previously saved oscilloscope setups, reference waveforms, and masks.

Reporting the Setup

Use :RECall? to query setup information for the RECall subsystem.

Return Format

The following is a sample response from the :RECall? query. In this case, the query was issued following the *RST command.

```
:REC:FIL "scope_0"
```

:RECall:ARbitrary[:START]

N (see [page 1446](#))

Command Syntax :RECall:ARbitrary:[START] [<file_spec>][, <column>][, <wavegen_id>]
 <file_spec> ::= {<internal_loc> | <file_name>}
 <column> ::= Column in CSV file to load. Column number starts from 1.
 <wavegen_id> ::= {WGEN1 | WGEN2} - specifies which wavegen
 <internal_loc> ::= 0-3; an integer in NR1 format
 <file_name> ::= quoted ASCII string

The :RECall:ARbitrary:[START] command recalls an arbitrary waveform.

NOTE

If a file extension is provided as part of a specified <file_name>, it must be ".csv".

For internal locations, the <column> parameter is ignored.

For external (USB storage device) files, the column parameter is optional. If no <column> parameter is entered, and it is a 2-column file, the 2nd column (assumed to be voltage) is automatically be selected. If the <column> parameter is entered, and that column does not exist in the file, the operation fails.

When recalling arbitrary waveforms (from an external USB storage device) that were not saved from the oscilloscope, be aware that the oscilloscope uses a maximum of 8192 points for an arbitrary waveform. For more efficient recalls, make sure your arbitrary waveforms are 8192 points or less.

The <wavegen_id> parameter specifies which waveform generator to recall the arbitrary waveform into.

32 :RTEYe Commands

When the jitter analysis feature is licensed, the :RTEYe commands control the real-time eye analysis feature.

An eye diagram is a view of a signal in which the waveform is triggered using its data rate. A real-time eye accomplishes this by acquiring data, performing clock recovery, then superimposing (folding) successive unit intervals within a single plot. This is a statistical view in the form of a color grade.

When real-time eye analysis is enabled, the color grade analysis feature is no longer available.

To build the real-time eye, acquisitions are performed separately, by sending the :RTEYe:ACQuire command. Successive single acquisitions are used to get the largest acquisition record possible, resulting in the most accurate clock recovery and eye measurements possible.

Mask testing and unfolding the real-time eye (features available on other Keysight oscilloscopes) are not available on this oscilloscope.

Introduction to :SBUS<n> Commands

The :SBUS subsystem commands control the serial decode bus viewing, mode, and other options.

NOTE

These commands are only valid on oscilloscope models when a serial decode option has been licensed.

The following serial bus decode/trigger types are available (see "[:TRIGger:MODE](#)" on page 1176).

- **CAN (Controller Area Network) triggering**— will trigger on CAN version 2.0A and 2.0B signals. Setup consists of connecting the oscilloscope to a CAN signal. Baud rate, signal source, and signal polarity, and type of data to trigger on can be specified. You can trigger on CAN data and identifier patterns and you can set the bit sample point.

- **I2S (Inter-IC Sound or Integrated Interchip Sound bus) triggering**— consists of connecting the oscilloscope to the serial clock, word select, and serial data lines, then triggering on a data value.
- **IIC (Inter-IC bus) triggering**— consists of connecting the oscilloscope to the serial data (SDA) line and the serial clock (SCL) line, then triggering on a stop/start condition, a restart, a missing acknowledge, or on a read/write frame with a specific device address and data value.
- **LIN (Local Interconnect Network) triggering**— will trigger on LIN sync break at the beginning of a message frame. You can trigger on Sync Break, Frame IDs, or Frame IDs and Data.
- **SPI (Serial Peripheral Interface) triggering**— consists of connecting the oscilloscope to a clock, data (MOSI or MISO), and framing signal. You can then trigger on a data pattern during a specific framing period. The serial data string can be specified to be from 4 to 64 bits long.
- **UART/RS-232 triggering** (with COMP license) — lets you trigger on RS-232 serial data.
- **SENT triggering** (with SENSOR license) — lets you trigger on SENT serial data.
- **USB 2.0 triggering** (with USBFL license or USBH license) — lets you trigger on USB 2.0 serial data.

NOTE

Two I2S buses or two SPI buses cannot be decoded on both SBUS1 and SBUS2 at the same time.

Reporting the Setup

Use :SBUS<n>? to query setup information for the :SBUS<n> subsystem.

Dominant low signals:

- CANL – the actual CAN_L differential bus signal.
- RX – the Receive signal from the CAN bus transceiver.
- TX – the Transmit signal to the CAN bus transceiver.
- DIFL – the CAN differential (L-H) bus signal connected to an analog source channel using a differential probe.
- DIFFerential – the CAN differential bus signal connected to an analog source channel using a differential probe. This is the same as DIFL.

<string ::= "0xnn...n" where n ::= {0,...,9 | A,...,F | X | \$}

The :SBUS<n>:CAN:TRIGger:PATtern:DATA command defines the CAN data pattern resource according to the string parameter. This pattern, along with the data length (set by the :SBUS<n>:CAN:TRIGger:PATtern:DATA:LENGth command), control the data pattern searched for in each CAN message.

If the string parameter starts with "0x", it is a hexadecimal string made up of hexadecimal and X (don't care) characters; otherwise, it is a binary string made up of 0, 1, and X (don't care) characters.

NOTE

If more bits are sent for <string> than specified by the :SBUS<n>:CAN:TRIGger:PATtern:DATA:LENGth command, the most significant bits will be truncated. If the data length is changed after the <string> is programmed, the added or deleted bits will be added to or deleted from the least significant bits.

Query Syntax :SBUS<n>:CAN:TRIGger:PATtern:DATA?

The :SBUS<n>:CAN:TRIGger:PATtern:DATA? query returns the current settings of the specified CAN data pattern resource in the binary string format.

<string ::= "0xnn...n" where n ::= {0,...,9 | A,...,F | X | \$}

The :SBUS<n>:CAN:TRIGger:PATtern:ID command defines the CAN identifier pattern resource according to the string parameter. This pattern, along with the identifier mode (set by the :SBUS<n>:CAN:TRIGger:PATtern:ID:MODE command), control the identifier pattern searched for in each CAN message.

If the string parameter starts with "0x", it is a hexadecimal string made up of hexadecimal and X (don't care) characters; otherwise, it is a binary string made up of 0, 1, and X (don't care) characters.

NOTE

The ID pattern resource string is always 29 bits. Only 11 of these bits are used when the :SBUS<n>:CAN:TRIGger:PATtern:ID:MODE is STANDard.

Command Syntax :SBUS<n>:I2S:TRIGger <operator>

<operator> ::= {EQUal | NOTequal | LESSthan | GREaterthan | INRange
| OUTRange | INCReasing | DECReasing}

The :SBUS<n>:I2S:TRIGger command sets the I2S trigger operator:

- EQUal – triggers on the specified audio channel's data word when it equals the specified word.
- NOTequal – triggers on any word other than the specified word.
- LESSthan – triggers when the channel's data word is less than the specified value.
- GREaterthan – triggers when the channel's data word is greater than the specified value.
- INRange – enter upper and lower values to specify the range in which to trigger.
- OUTRange – enter upper and lower values to specify range in which trigger will not occur.
- INCReasing – triggers when the data value makes a certain increase over time and the specified value is met or exceeded. Use the :SBUS<n>:I2S:TRIGger:RANGe command to set "Trigger" and "Armed" values. The "Trigger" value is the value that must be met or exceeded to cause the trigger. The "Armed" value is the value the data must go below in order to re-arm the oscilloscope (ready it to trigger again).

Return Format <operator><NL>

<operator> ::= {EQU | NOT | LESS | GRE | INR | OUTR | INCR | DECR}

Return Format <audio_ch><NL>

<audio_ch> ::= {RIGH | LEFT | EITH}

- See Also**
- ["Introduction to :TRIGger Commands"](#) on page 1165
 - [":SBUS<n>:I2S:TRIGger"](#) on page 887

:SBUS<n>:I2S:TRIGger:PATtern:DATA

N (see [page 1446](#))

Command Syntax :SBUS<n>:I2S:TRIGger:PATtern:DATA <string>

<string> ::= "n" where n ::= 32-bit integer in signed decimal when
<base> = DECimal

<string> ::= "nn...n" where n ::= {0 | 1 | X | \$} when
<base> = BINary

<string> ::= "0xnn...n" where n ::= {0,...,9 | A,...,F | X | \$} when
<base> = HEX

NOTE

<base> is specified with the :SBUS<n>:I2S:TRIGger:PATtern:FORMat command. The default <base> is DECimal.

The :SBUS<n>:I2S:TRIGger:PATtern:DATA command specifies the I2S trigger data pattern searched for in each I2S message.

Set a <string> bit to "0" or "1" to set the corresponding bit in the data pattern to low or high, respectively.

Set a <string> bit to "X" to ignore (mask off) that bit in the data pattern.

Use the "\$" character to indicate that the value of the corresponding bit will not be changed (the existing bit value is used).

When <base> = DECimal, the "X" and "\$" characters cannot be entered. When queried, the "\$" character is returned when any bits in the pattern have the value of "X" and <base> = DECimal. When any bits in a given nibble have the value of "X" and <base> = HEX, the "\$" character is returned for the corresponding nibble.

NOTE

The :SBUS<n>:I2S:TRIGger:PATtern:DATA command specifies the I2S trigger data pattern used by the EQUal, NOTequal, GREaterthan, and LESSthan trigger conditions. If the GREaterthan or LESSthan trigger condition is selected, the bits specified to be masked off ("X") will be interpreted as 0's.

NOTE

The length of the trigger data value is determined by the :SBUS<n>:I2S:RWIDth and :SBUS<n>:I2S:TWIDth commands. When the receiver word size is less than the transmitter word size, the data length is equal to the receiver word size. When the receiver word size is greater than the transmitter word size, the data length is equal to the transmitter word size.

NOTE

If more bits are sent for <string> than the specified trigger data length, the most significant bits will be truncated. If the word size is changed after the <string> is programmed, the added or deleted bits will be added to or deleted from the least significant bits.

Query Syntax :SBUS<n>:I2S:TRIGger:PATtern:DATA?

The :SBUS<n>:I2S:TRIGger:PATtern:DATA? query returns the currently specified I2S trigger data pattern.

Return Format <string><NL>

Note that for INCReasing and DECReasing, the <lower> and <upper> values correspond to the "Armed" and "Trigger" softkeys.

NOTE

The length of the <lower> and <upper> values is determined by the :SBUS<n>:I2S:RWIDth and :SBUS<n>:I2S:TWIDth commands. When the receiver word size is less than the transmitter word size, the length is equal to the receiver word size. When the receiver word size is greater than the transmitter word size, the length is equal to the transmitter word size.

:SBUS<n>:LIN:TRIGger:ID

N (see [page 1446](#))

Command Syntax :SBUS<n>:LIN:TRIGger:ID <value>

<value> ::= 7-bit integer in decimal, <nondecimal>, or <string>
from 0-63 or 0x00-0x3f

<nondecimal> ::= #Hnn where n ::= {0,...,9 | A,...,F} for hexadecimal

<nondecimal> ::= #Bnn...n where n ::= {0 | 1} for binary

<string> ::= "0xnn" where n ::= {0,...,9 | A,...,F} for hexadecimal

The :SBUS<n>:LIN:TRIGger:ID command defines the LIN identifier searched for in each CAN message when the LIN trigger mode is set to frame ID.

Setting the ID to a value of "-1" results in "0xXX" which is equivalent to all IDs.

Query Syntax :SBUS<n>:LIN:TRIGger:ID?

Return Format <value><NL>

<value> ::= integer in decimal

:SBUS<n>:LIN:TRIGger:PATtern:DATA

N (see [page 1446](#))

Command Syntax :SBUS<n>:LIN:TRIGger:PATtern:DATA <string>

<string> ::= "n" where n ::= 32-bit integer in unsigned decimal when
<base> = DECimal

<string> ::= "nn...n" where n ::= {0 | 1 | X | \$} when
<base> = BINary

<string> ::= "0xnn...n" where n ::= {0,...,9 | A,...,F | X | \$} when
<base> = HEX

NOTE

<base> is specified with the :SBUS<n>:LIN:TRIGger:PATtern:FORMat command. The default <base> is BINary.

The :SBUS<n>:LIN:TRIGger:PATtern:DATA command specifies the LIN trigger data pattern searched for in each LIN data field.

Set a <string> bit to "0" or "1" to set the corresponding bit in the data pattern to low or high, respectively.

Set a <string> bit to "X" to ignore (mask off) that bit in the data pattern.

Use the "\$" character to indicate that the value of the corresponding bit will not be changed (the existing bit value is used).

When <base> = DECimal, the "X" and "\$" characters cannot be entered. When queried, the "\$" character is returned when any bits in the pattern have the value of "X" and <base> = DECimal. When any bits in a given nibble have the value of "X" and <base> = HEX, the "\$" character is returned for the corresponding nibble.

NOTE

The length of the trigger data value is determined by the :SBUS<n>:LIN:TRIGger:PATtern:DATA:LENGth command.

NOTE

If more bits are sent for <string> than the specified trigger pattern data length, the most significant bits will be truncated. If the data length size is changed after the <string> is programmed, the added or deleted bits will be added to or deleted from the least significant bits.

Query Syntax :SBUS<n>:LIN:TRIGger:PATtern:DATA?

The :SBUS<n>:LIN:TRIGger:PATtern:DATA? query returns the currently specified LIN trigger data pattern.

Return Format <string><NL>

:SBUS<n>:SENT:DISPlay

N (see [page 1446](#))

Command Syntax :SBUS<n>:SENT:DISPlay <base>

<base> ::= {HEX | DECimal | SYMBolic}

The :SBUS<n>:SENT:DISPlay command specifies the number base used by the decoder. The chosen base is used for the data nibbles in Raw decode format, the defined Signals in the other formats, and for the data field of the Serial Messages.

This selection is used for both the Lister and the decode line displays.

When SYMBolic is selected, Fast Channel Signals display a calculated physical value based on the specified multiplier and offset:

- $PhysicalValue = (Multiplier * SignalValueAsUnsignedInteger) + Offset$

When SYMBolic is selected, the CRC and Slow Channel information is displayed in hex.

Query Syntax :SBUS<n>:SENT:DISPlay?

The :SBUS<n>:SENT:DISPlay? query returns the SENT decode number base setting.

Return Format <base><NL>

<base> ::= {HEX | DEC | SYMB}

:SBUS<n>:SENT:FORMat

N (see [page 1446](#))

Command Syntax :SBUS<n>:SENT:FORMat <decode>

<decode> ::= {NIBBles | FSIGNal | FSSerial | FESerial | SSERial | ESERial}

The :SBUS<n>:SENT:FORMat command specifies the message decode/triggering format:

- NIBBles – displays the raw transmitted nibble values.
- FSIGNal – displays Fast Channel Message Signals.
- FSSerial – displays both Fast and Slow Messages (Short format) simultaneously.
- FESerial – displays both Fast and Slow Messages (Enhanced format) simultaneously.
- SSERial – displays Slow Channel Messages in Short format.
- ESERial – displays Slow Channel Messages in Enhanced format.

This selection affects both decoding and triggering. The decode is affected both in how the system interprets the data, and what will be displayed. The trigger is affected in that the trigger hardware needs to be configured to trigger on serial messages correctly.

You can specify the nibble display order for Fast Channel Message Signals (see :SBUS<n>:SENT:SIGNal<s>:ORDER). Raw transmitted nibble values are displayed in the order received.

Note that for the Slow Channel, the proper format, Short or Enhanced, must be chosen for proper decoding and triggering to occur.

Slow Channel Serial Messages are always displayed as defined by the SENT specification.

Query Syntax :SBUS<n>:SENT:FORMat?

The :SBUS<n>:SENT:FORMat? query returns the message decode/triggering format setting.

Return Format <decode><NL>

<decode> ::= {NIBB | FSIG | FSS | FES | SSER | ESER}

Introduction to :SYSTem Commands SYSTem subsystem commands enable writing messages to the display, setting and reading both the time and the date, querying for errors, and saving and recalling setups.

:SYSTem:DATE

N (see [page 1446](#))

Command Syntax :SYSTem:DATE <date>

<date> ::= <year>, <month>, <day>

<year> ::= 4-digit year in NR1 format

<month> ::= {1, ..., 12 | JANuary | FEBruary | MARCH | APRil | MAY | JUNE
| JULy | AUGust | SEPTember | OCTober | NOVember | DECember}

<day> ::= {1, ..., 31}

The :SYSTem:DATE command sets the date. Validity checking is performed to ensure that the date is valid.

Query Syntax :SYSTem:DATE?

The SYSTem:DATE? query returns the date.

Return Format <year>, <month>, <day><NL>

- See Also**
- ["Introduction to :SYSTem Commands"](#) on page 1138
 - [":SYSTem:TIME"](#) on page 1151

:SYSTem:DSP

N (see [page 1446](#))

Command Syntax :SYSTem:DSP <string>

<string> ::= quoted ASCII string (up to 75 characters)

The :SYSTem:DSP command writes the quoted string (excluding quotation marks) to a text box on-screen.

Use :SYSTem:DSP "" to remotely remove the message from the display. (Two sets of quote marks without a space between them creates a NULL string.)

Press any menu key to manually remove the message from the display.

See Also • ["Introduction to :SYSTem Commands"](#) on page 1138

:SYSTem:ERRor

C (see [page 1446](#))

Query Syntax :SYSTem:ERRor?

The :SYSTem:ERRor? query outputs the next error number and text from the error queue. The instrument has an error queue that is 30 errors deep and operates on a first-in, first-out basis. Repeatedly sending the :SYSTem:ERRor? query returns the errors in the order that they occurred until the queue is empty. Any further queries then return zero until another error occurs.

When remote logging is enabled (using the oscilloscope's front panel), additional debug information can be included in the returned error string. If the error is detected by the SCPI command parser, such as a header error or other syntax error, the extra debug information is generated and included. But if the error is detected by the oscilloscope system, such as when an out-of-range value is sent, then no extra debug information is included.

Return Format <error number>,<error string><NL>

<error number> ::= an integer error code in NR1 format

<error string> ::= quoted ASCII string containing the error message

Error messages are listed in [Chapter 43](#), "Error Messages," starting on page 1403.

:SYSTem:LOCK

N (see [page 1446](#))

Command Syntax :SYSTem:LOCK <on_off>
 <on_off> ::= {{1 | ON} | {0 | OFF}}

The :SYSTem:LOCK command disables the front panel. LOCK ON is the equivalent of sending a local lockout message over the programming interface.

Query Syntax :SYSTem:LOCK?

The :SYSTem:LOCK? query returns the lock status of the front panel.

Return Format <on_off><NL>
 <on_off> ::= {1 | 0}

See Also • ["Introduction to :SYSTem Commands"](#) on page 1138

:SYSTem:PRECision

N (see [page 1446](#))

Command Syntax :SYSTem:PRECision <on_off>
 <on_off> ::= {{1 | ON} | {0 | OFF}}

The :SYSTem:PRECision command turns the oscilloscope's precision analysis setting on or off.

- OFF (0) – provides the maximum oscilloscope waveform update rate by performing measurements and math functions on the default 65535-point (maximum) *measurement record*.
- ON (1) – at the expense of oscilloscope waveform update rate, this setting allows measurements and math functions to be performed on a longer, *precision analysis record* (see [":WAVEform:POINTS:MODE"](#) on page 1266).

The length of the precision analysis record is specified by the :SYSTem:PRECision:LENGth command.

The precision analysis setting is OFF after a *RST command.

Precision analysis is not available when:

- Realtime sampling mode is off.
- Averaging acquisition modes is selected.
- XY or Roll time modes are selected.

Query Syntax :SYSTem:PRECision?

The :SYSTem:PRECision? query returns the current precision analysis setting.

Return Format <on_off><NL>
 <on_off> ::= {1 | 0}

- See Also**
- ["Introduction to :SYSTem Commands"](#) on page 1138
 - [":SYSTem:PRECision:LENGth"](#) on page 1144

 - ["*RST \(Reset\)"](#) on page 196

:SYSTem:PRECision:LENGth

N (see [page 1446](#))

Command Syntax :SYSTem:PRECision:LENGth <length>

<length> ::= between 100k and 1M points in NR1 format

The :SYSTem:PRECision:LENGth command specifies the length of the precision analysis record (when precision measurements and math functions mode is enabled). You can specify between 100k and 1M points.

Query Syntax :SYSTem:PRECision:LENGth?

The :SYSTem:PRECision:LENGth? query returns the current precision analysis record length setting.

Return Format <length><NL>

<length> ::= between 100k and 1M points in NR1 format

- See Also**
- ["Introduction to :SYSTem Commands"](#) on page 1138

 - ["*RST \(Reset\)"](#) on page 196

:SYSTem:PRESet

C (see [page 1446](#))

Command Syntax :SYSTem:PRESet

The :SYSTem:PRESet command places the instrument in a known state. This is the same as pressing the **[Default Setup]** key or **[Save/Recall] > Default/Erase > Default Setup** on the front panel.

When you perform a default setup, some user settings (like preferences) remain unchanged. To reset all user settings to their factory defaults, use the *RST command.

:SYSTem:SETup

C (see [page 1446](#))

Command Syntax :SYSTem:SETup <setup_data>

<setup_data> ::= binary block data in IEEE 488.2 # format.

The :SYSTem:SETup command sets the oscilloscope as defined by the data in the setup (learn) string sent from the controller. The setup string does not change the interface mode or interface address.

Query Syntax :SYSTem:SETup?

The :SYSTem:SETup? query operates the same as the *LRN? query. It outputs the current oscilloscope setup in the form of a learn string to the controller. The setup (learn) string is sent and received as a binary block of data. The format for the data transmission is the # format defined in the IEEE 488.2 specification.

Return Format <setup_data><NL>

<setup_data> ::= binary block data in IEEE 488.2 # format

- See Also**
- ["Introduction to :SYSTem Commands"](#) on page 1138
 - ["*LRN \(Learn Device Setup\)"](#) on page 191

Introduction to :TIMEbase Commands The TIMEbase subsystem commands control the horizontal (X-axis) functions and set the oscilloscope to X-Y mode (where channel 1 becomes the X input and channel 2 becomes the Y input). The time per division, delay, vernier control, and reference can be controlled for the main and window (zoomed) time bases.

Reporting the Setup

Use :TIMEbase? to query setup information for the TIMEbase subsystem.

Return Format

The following is a sample response from the :TIMEbase? query. In this case, the query was issued following a *RST command.

```
:TIM:MODE MAIN;REF CENT;MAIN:RANG +1.00E-03;POS +0.0E+00
```

:TIMEbase:MODE

C (see [page 1446](#))

Command Syntax :TIMEbase:MODE <value>

<value> ::= {MAIN | WINDow | XY | ROLL}

The :TIMEbase:MODE command sets the current time base. There are four time base modes:

- MAIN – The normal time base mode is the main time base. It is the default time base mode after the *RST (Reset) command.
- WINDow – In the WINDow (zoomed or delayed) time base mode, measurements are made in the zoomed time base if possible; otherwise, the measurements are made in the main time base.
- XY – In the XY mode, the :TIMEbase:RANGe, :TIMEbase:POSition, and :TIMEbase:REFerence commands are not available. No measurements are available in this mode.
- ROLL – In the ROLL mode, data moves continuously across the display from left to right. The oscilloscope runs continuously and is untriggered. The :TIMEbase:REFerence selection changes to RIGHT.

Query Syntax :TIMEbase:MODE?

The :TIMEbase:MODE query returns the current time base mode.

Return Format <value><NL>

<value> ::= {MAIN | WIND | XY | ROLL}

Introduction to :TRIGger Commands

The commands in the TRIGger subsystem define the conditions for an internal trigger. Many of these commands are valid in multiple trigger modes.

The default trigger mode is :EDGE.

The trigger subsystem controls the trigger sweep mode and the trigger specification. The trigger sweep (see "[:TRIGger:SWEep](#)" on page 1178) can be AUTO or NORMAl.

- **NORMAl** mode – displays a waveform only if a trigger signal is present and the trigger conditions are met. Otherwise the oscilloscope does not trigger and the display is not updated. This mode is useful for low-repetitive-rate signals.
- **AUTO** trigger mode – generates an artificial trigger event if the trigger specification is not satisfied within a preset time, acquires unsynchronized data and displays it.

AUTO mode is useful for signals other than low-repetitive-rate signals. You must use this mode to display a DC signal because there are no edges on which to trigger.

The following trigger types are available (see **":TRIGger:MODE"** on page 1176).

- **Edge triggering**— identifies a trigger by looking for a specified slope and voltage level on a waveform.
- **Nth Edge Burst triggering**— lets you trigger on the Nth edge of a burst that occurs after an idle time.
- **Pulse width triggering**— (:TRIGger:GLITCh commands) sets the oscilloscope to trigger on a positive pulse or on a negative pulse of a specified width.
- **Pattern triggering**— identifies a trigger condition by looking for a specified pattern. This pattern is a logical AND combination of the channels. You can also trigger on a specified time duration of a pattern.
- **TV triggering**— is used to capture the complicated waveforms of television equipment. The trigger circuitry detects the vertical and horizontal interval of the waveform and produces triggers based on the TV trigger settings you selected. TV triggering requires greater than ¼ division of sync amplitude with any analog channel as the trigger source.
- **USB (Universal Serial Bus) triggering**— will trigger on a Start of Packet (SOP), End of Packet (EOP), Reset Complete, Enter Suspend, or Exit Suspend signal on the differential USB data lines. USB Low Speed and Full Speed are supported by this trigger.

Reporting the Setup

Use :TRIGger? to query setup information for the TRIGger subsystem.

Return Format

:TRIG:EDGE:SOUR CHAN1;LEV +0.00000E+00;SLOP POS;REJ OFF;COUP DC;

:TRIGger:FORCe

N (see [page 1446](#))

Command Syntax :TRIGger:FORCe

The :TRIGger:FORCe command causes an acquisition to be captured even though the trigger condition has not been met. This command is equivalent to the front panel **[Force Trigger]** key.

See Also • ["Introduction to :TRIGger Commands"](#) on page 1165

:TRIGger:HFReject

C (see [page 1446](#))

Command Syntax :TRIGger:HFReject <value>
<value> ::= {{0 | OFF} | {1 | ON}}

The :TRIGger:HFReject command turns the high frequency reject filter off and on. The high frequency reject filter adds a 50 kHz low-pass filter in the trigger path to remove high frequency components from the trigger waveform. Use this filter to remove high-frequency noise, such as AM or FM broadcast stations, from the trigger path.

Query Syntax :TRIGger:HFReject?

The :TRIGger:HFReject? query returns the current high frequency reject filter mode.

Return Format <value><NL>
<value> ::= {0 | 1}

 - [":TRIGger\[:EDGE\]:REJect"](#) on page 1195

:TRIGger:HOLDoff

C (see [page 1446](#))

Command Syntax :TRIGger:HOLDoff <holdoff_time>
 <holdoff_time> ::= 40 ns to 10 s in NR3 format

The :TRIGger:HOLDoff command defines the holdoff time value in seconds. Holdoff keeps a trigger from occurring until after a certain amount of time has passed since the last trigger. This feature is valuable when a waveform crosses the trigger level multiple times during one period of the waveform. Without holdoff, the oscilloscope could trigger on each of the crossings, producing a confusing waveform. With holdoff set correctly, the oscilloscope always triggers on the same crossing. The correct holdoff setting is typically slightly less than one period.

Query Syntax :TRIGger:HOLDoff?

The :TRIGger:HOLDoff? query returns the holdoff time value for the current trigger mode.

Return Format <holdoff_time><NL>
 <holdoff_time> ::= the holdoff time value in seconds in NR3 format.

See Also • ["Introduction to :TRIGger Commands"](#) on page 1165

:TRIGger:JFRee

N (see [page 1446](#))

Command Syntax :TRIGger:JFRee {{0 | OFF} | {1 | ON}}

The :TRIGger:JFRee command disables or enables the Jitter-Free Trigger option.

Oscilloscope trigger circuitry introduces a certain amount of noise and jitter that result in horizontal error. To correct for this error, in certain trigger modes and at certain timebase ranges, hardware Jitter-Free Trigger correction is used to minimize trigger jitter at the trigger point.

The effect seen on the oscilloscope display is that all plotted acquisitions cross through the same pixel location at the intersection of the trigger level and time=0.

Jitter-Free Trigger correction works well for fast digital edges, but you may want to turn it off for some slow slew rate analog signals.

Query Syntax :TRIGger:JFRee?

The :TRIGger:JFRee? query returns the Jitter-Free Trigger option setting.

Return Format {0 | 1}

:TRIGger:LEVel:ASETup

N (see [page 1446](#))

Command Syntax :TRIGger:LEVel:ASETup

The :TRIGger:LEVel:ASETup command automatically sets the trigger levels of all displayed analog channels to their waveforms' 50% values.

If AC coupling is used, the trigger levels are set to 0 V.

When High and Low (dual) trigger levels are used (as with Rise/Fall Time and Runt triggers, for example), this command has no effect.

:TRIGger[:EDGE]:COUpling

C (see [page 1446](#))

Command Syntax :TRIGger[:EDGE]:COUpling <coupling>
 <coupling> ::= {AC | DC | LFReject}

The :TRIGger[:EDGE]:COUpling command sets the input coupling for the selected trigger sources. The coupling can be set to AC, DC, or LFReject.

- AC coupling places a high-pass filter (10 Hz for analog channels, and 3.5 Hz for all External trigger inputs) in the trigger path, removing dc offset voltage from the trigger waveform. Use AC coupling to get a stable edge trigger when your waveform has a large dc offset.
- LFReject coupling places a 50 KHz high-pass filter in the trigger path.
- DC coupling allows dc and ac signals into the trigger path.

NOTE

The :TRIGger[:EDGE]:COUpling and the :TRIGger[:EDGE]:REJect selections are coupled. Changing the setting of the :TRIGger[:EDGE]:REJect can change the COUpling setting.

Query Syntax :TRIGger[:EDGE]:COUpling?

The :TRIGger[:EDGE]:REJect command turns the low-frequency or high-frequency reject filter on or off. You can turn on one of these filters at a time.

- The high frequency reject filter adds a 50 kHz low-pass filter in the trigger path to remove high frequency components from the trigger waveform. Use the high frequency reject filter to remove high-frequency noise, such as AM or FM broadcast stations, from the trigger path.
- The low frequency reject filter adds a 50 kHz high-pass filter in series with the trigger waveform to remove any unwanted low frequency components from a trigger waveform, such as power line frequencies, that can interfere with proper triggering.

NOTE

The :TRIGger[:EDGE]:REJect and the :TRIGger[:EDGE]:COUPling selections are coupled. Changing the setting of the :TRIGger[:EDGE]:COUPling can change the COUPling setting.

:TRIGger:OR Commands

Table 155:TRIGger:OR Commands Summary

Command	Query	Options and Query Returns
:TRIGger:OR <string> (see page 1208)	:TRIGger:OR? (see page 1208)	<string> ::= "nn...n" where n ::= {R F E X} R = rising edge, F = falling edge, E = either edge, X = don't care. Each character in the string is for an analog or digital channel as shown on the front panel display.

:TRIGger:OR

N (see [page 1446](#))

Command Syntax :TRIGger:OR <string>

<string> ::= "nn...n" where n ::= {R | F | E | X}

R = rising edge, F = falling edge, E = either edge, X = don't care.

The :TRIGger:OR command specifies the edges to include in the OR'ed edge trigger.

In the <string> parameter, each bit corresponds to a channel as described in the following table:

Oscilloscope Models	Value and Mask Bit Assignments
4 analog + 16 digital channels (mixed-signal)	Bits 0 through 15 - digital channels 0 through 15. Bits 16 through 19 - analog channels 4 through 1.
2 analog + 16 digital channels (mixed-signal)	Bits 0 through 15 - digital channels 0 through 15. Bits 16 and 17 - analog channels 2 and 1.

:TRIGger:PATtern

C (see [page 1446](#))

Command Syntax :TRIGger:PATtern <pattern>

<pattern> ::= <string>[, <edge_source>,<edge>]

<string> ::= "nn...n" where n ::= {0 | 1 | X | R | F} when
<base> = ASCii

<string> ::= "0xnn...n" where n ::= {0,...,9 | A,...,F | X | \$} when
<base> = HEX

<edge_source> ::= {CHANnel<n> | NONE} for DSO models

<edge_source> ::= {CHANnel<n> | DIGital<d>
| NONE} for MSO models

<n> ::= 1 to (# of analog channels) in NR1 format

<d> ::= 0 to (# digital channels - 1) in NR1 format

<edge> ::= {POSitive | NEGative}

The :TRIGger:PATtern command specifies the channel values to be used in the pattern trigger.

In the <string> parameter, each bit corresponds to a channel as described in the following table:

Oscilloscope Models	Value and Mask Bit Assignments
4 analog + 16 digital channels (mixed-signal)	Bits 0 through 15 - digital channels 0 through 15. Bits 16 through 19 - analog channels 4 through 1.
2 analog + 16 digital channels (mixed-signal)	Bits 0 through 15 - digital channels 0 through 15. Bits 16 and 17 - analog channels 2 and 1.
4 analog channels only	Bits 0 through 3 - analog channels 4 through 1.
2 analog channels only	Bits 0 and 1 - analog channels 2 and 1.

The format of the <string> parameter depends on the :TRIGger:PATtern:FORMat command setting:

- When the format is ASCii, the string looks just like the string you see on the oscilloscope's front panel, made up of 0, 1, X (don't care), R (rising edge), and F (falling edge) characters.
- When the format is HEX, the string begins with "0x" and contains hex digit characters or X (don't care for all four bits in the nibble).

With the hex format string, you can use the <edge_source> and <edge> parameters to specify an edge on one of the channels.

NOTE

The optional <edge_source> and <edge> parameters should be sent together or not at all. The edge can be specified in the ASCII <string> parameter. If the edge source and edge parameters are used, they take precedence.

You can only specify an edge on one channel. When an edge is specified, the :TRIGger:PATtern:QUALifier does not apply.

Query Syntax :TRIGger:PATtern?

The :TRIGger:PATtern? query returns the pattern string, edge source, and edge.

Return Format <string>, <edge_source>, <edge><NL>

:TRIGger:PATTern:QUALifier

N (see [page 1446](#))

Command Syntax :TRIGger:PATTern:QUALifier <qualifier>

```
<qualifier> ::= {ENTERed | GREaterthan | LESSthan | INRange | OTRange
                | TIMEout}
```

The :TRIGger:PATTern:QUALifier command qualifies when the trigger occurs:

- ENTERed – when the pattern is entered.
- LESSthan – when the pattern is present for less than a time value.
- GREaterthan – when the pattern is present for greater than a time value. The trigger occurs when the pattern exits (not when the GREaterthan time value is exceeded).
- TIMEout – when the pattern is present for greater than a time value. In this case, the trigger occurs when the GREaterthan time value is exceeded (not when the pattern exits).
- INRange – when the pattern is present for a time within a range of values.
- OTRange – when the pattern is present for a time outside of range of values.

Pattern durations are evaluated using a timer. The timer starts on the last edge that makes the pattern (logical AND) true. Except when the TIMEout qualifier is selected, the trigger occurs on the first edge that makes the pattern false, provided the time qualifier criteria has been met.

Set the GREaterthan qualifier value with the :TRIGger:PATTern:GREaterthan command.

Set the LESSthan qualifier value with the :TRIGger:PATTern:LESSthan command.

Set the INRange and OTRange qualifier values with the :TRIGger:PATTern:RANGe command.

:TRIGger:TV:UDTV:HSYNc

N (see [page 1446](#))

Command Syntax :TRIGger:TV:UDTV:HSYNc {{0 | OFF} | {1 | ON}}

The :TRIGger:TV:UDTV:HSYNc command enables or disables the horizontal sync control in the Generic video trigger.

For interleaved video, enabling the HSYNc control and setting the HTIME adjustment to the sync time of the probed video signal allows the ENUMber function to count only lines and not double count during equalization. Additionally, the Field Holdoff can be adjusted so that the oscilloscope triggers once per frame.

Similarly, for progressive video with a tri-level sync, enabling the HSYNc control and setting the HTIME adjustment to the sync time of the probed video signal allows the ENUMber function to count only lines and not double count during vertical sync.

Query Syntax :TRIGger:TV:UDTV:HSYNc?

The :TRIGger:TV:UDTV:HSYNc query returns the horizontal sync control setting.

Return Format {0 | 1}

Query Syntax :TRIGger:TV:UDTV:PGTHan?

The :TRIGger:TV:UDTV:PGTHan query returns the "greater than the sync pulse width" time setting.

Return Format <min_time><NL>

:TRIGger:ZONE:STATe

N (see [page 1446](#))

Command Syntax :TRIGger:ZONE:STATe <on_off>

<on_off> ::= {{0 | OFF} | {1 | ON}}

The :TRIGger:ZONE:STATe command enables or disables the zone qualified trigger feature.

When the zone qualified trigger is on, the zone(s) are actively being used to qualify the trigger.

Note that the :TRIGger:ZONE<n>:STATe setting must also be ON for a zone to be active.

Note that :TRIGger:ZONE:STATe mimics the behavior of the **[Zone]** key on the front panel, and :TRIGger:ZONE<n>:STATe mimics the behavior of the **Zone 1 On** and **Zone 2 On** softkeys. At least one zone's state must be on for the Zone Trigger feature (:TRIGger:ZONE:STATe) to be on. When the states of both individual zones are turned off, Zone Trigger is automatically turned off. In this case, when Zone Trigger is turned back on Zone 1 is forced to on. Otherwise, if at least one zone was on when Zone Trigger was turned off, the same configuration of individual zone on/off states will be restored when Zone Trigger is turned back on.

Query Syntax :TRIGger:ZONE:STATe?

The :TRIGger:ZONE:STATe? query returns whether the zone qualified trigger feature is enabled or disabled.

Return Format <on_off><NL>

<on_off> ::= {0 | 1}

N (see [page 1446](#))

Command Syntax :TRIGger:ZONE<n>:MODE <mode>

<mode> ::= {INTersect | NOTintersect}

<n> ::= 1-2 in NR1 format

The :TRIGger:ZONE<n>:MODE command sets the zone qualifying condition for Zone 1 or Zone 2 as either "Must Intersect" or "Must Not Intersect".

Query Syntax :TRIGger:ZONE<n>:MODE?

The :TRIGger:ZONE<n>:MODE? query returns the zone qualifying condition for Zone 1 or Zone 2.

Return Format <mode><NL>

<mode> ::= {INT | NOT}

- See Also**

:TRIGger:ZONE<n>:PLACement

N (see [page 1446](#))

Command Syntax :TRIGger:ZONE<n>:PLACement <width>, <height>, <x_center>, <y_center>
 <width> ::= width of zone in seconds
 <height> ::= height of zone in volts
 <x_center> ::= center of zone in seconds
 <y_center> ::= center of zone in volts
 <n> ::= 1-2 in NR1 format

The :TRIGger:ZONE<n>:PLACement command sets the size and location of Zone 1 or Zone 2.

No error is returned if the zone is placed off-screen, or if the zones overlap such that Zone 2 becomes invalid. The :TRIGger:ZONE<n>:VALidity? query is used to retrieve this information.

Query Syntax :TRIGger:ZONE<n>:PLACement?

The :TRIGger:ZONE<n>:PLACement? query returns the size and location of Zone 1 or Zone 2.

Return Format <opt><NL>
 <opt> ::= <width>, <height>, <x_center>, <y_center>

:TRIGger:ZONE<n>:VALidity

N (see [page 1446](#))

Query Syntax :TRIGger:ZONE<n>:VALidity?

<n> ::= 1-2 in NR1 format

The :TRIGger:ZONE<n>:VALidity? query returns the validity of Zone 1 or Zone 2.

- INValid is returned (for Zone 2 only) when Zone 1 and Zone 2 overlap and have opposing qualifying conditions (modes). Zone 1 can never be invalid.
- OSCReen (off-screen) is returned when the associated zone is off-screen, and thus not being used to qualify the trigger.
- A zone is valid when it is neither invalid nor off-screen.

The validity of a zone is not affected by the zone's state. For example, a zone can be valid and off. You cannot directly set the validity of a zone.

Return Format <validity><NL>

<validity> ::= {VALid | INValid | OSCReen}

Command Syntax :TRIGger:ZONE<n>:STATe <on_off>

<n> ::= {1 | 2}

<on_off> ::= {{0 | OFF} | {1 | ON}}

<n> ::= 1-2 in NR1 format

The :TRIGger:ZONE<n>:STATe command sets the state for Zone 1 or Zone 2.

- When a zone's state is on, and the Zone Trigger feature is on (see "[:TRIGger:ZONE:STATe](#)" on page 1245), that zone is actively being used to qualify the trigger if it is not invalid or off-screen (see "[:TRIGger:ZONE<n>:VALidity](#)" on page 1248).
- When the Zone Trigger feature is off, no zones are being used to qualify the trigger, regardless of their individual states.

Note that :TRIGger:ZONE:STATe mimics the behavior of the **[Zone]** key on the front panel, and :TRIGger:ZONE<n>:STATe mimics the behavior of the **Zone 1 On** and **Zone 2 On** softkeys. At least one zone's state must be on for the Zone Trigger feature (:TRIGger:ZONE:STATe) to be on. When the states of both individual zones are turned off, Zone Trigger is automatically turned off. In this case, when Zone Trigger is turned back on Zone 1 is forced to on. Otherwise, if at least one zone was on when Zone Trigger was turned off, the same configuration of individual zone on/off states will be restored when Zone Trigger is turned back on.

Query Syntax :TRIGger:ZONE<n>:STATe?

The :TRIGger:ZONE<n>:STATe? query returns the state of Zone 1 or Zone 2.

Introduction to :WAVEform Commands The WAVEform subsystem is used to transfer data to a controller from the oscilloscope waveform memories. The queries in this subsystem will only operate when the channel selected by :WAVEform:SOURce is on.

Waveform Data and Preamble

The waveform record is actually contained in two portions: the preamble and waveform data. The waveform record must be read from the oscilloscope by the controller using two separate commands, :WAVEform:DATA (see [page 1261](#)) and :WAVEform:PREAmble (see [page 1268](#)). The waveform data is the actual data acquired for each point in the specified source. The preamble contains the information for interpreting the waveform data, which includes the number of points acquired, the format of acquired data, and the type of acquired data. The preamble also contains the X and Y increments, origins, and references for the acquired data, so that word and byte data can be translated to time and voltage values.

Data Acquisition Types

There are four types of waveform acquisitions that can be selected for analog channels with the :ACQUIRE:TYPE command (see [page 264](#)): NORMal, AVERage, PEAK, and HRESolution. Digital channels are always acquired using NORMal. When the data is acquired using the :DIGitize command (see [page 219](#)) or :RUN command (see [page 240](#)), the data is placed in the channel buffer of the specified source.

Once you have acquired data with the :DIGitize command, the instrument is stopped. If the instrument is restarted (via the programming interface or the front panel), or if any instrument setting is changed, the data acquired with the :DIGitize command may be overwritten. You should first acquire the data with the :DIGitize command, then immediately read the data with the :WAVeform:DATA? query (see [page 1261](#)) before changing any instrument setup.

A waveform record consists of either all of the acquired points or a subset of the acquired points. The number of points acquired may be queried using :ACQUIRE:POINTS? (see [page 256](#)).

Helpful Hints:

The number of points transferred to the computer is controlled using the :WAVeform:POINTS command (see [page 1264](#)). If :WAVeform:POINTS MAXimum is specified and the instrument is not running (stopped), all of the points that are displayed are transferred. This can be as many as 4,000,000 in some operating modes or as many as 8,000,000 for a digital channel on the mixed signal oscilloscope. Fewer points may be specified to speed data transfers and minimize controller analysis time. The :WAVeform:POINTS may be varied even after data on a channel is acquired. However, this decimation may result in lost pulses and transitions. The number of points selected for transfer using :WAVeform:POINTS must be an even divisor of 1,000 or be set to MAXimum. :WAVeform:POINTS determines the increment between time buckets that will be transferred. If POINTs = MAXimum, the data cannot be decimated. For example:

- :WAVeform:POINTS 1000 – returns time buckets 0, 1, 2, 3, 4 ,..., 999.
- :WAVeform:POINTS 500 – returns time buckets 0, 2, 4, 6, 8 ,..., 998.
- :WAVeform:POINTS 250 – returns time buckets 0, 4, 8, 12, 16 ,..., 996.
- :WAVeform:POINTS 100 – returns time buckets 0, 10, 20, 30, 40 ,..., 990.

Analog Channel Data

NORMal Data

Normal data consists of the last data point (hit) in each time bucket. This data is transmitted over the programming interface in a linear fashion starting with time bucket 0 and going through time bucket $n - 1$, where n is the number returned by the :WAVeform:POINTS? query (see [page 1264](#)). Only the magnitude values of each data point are transmitted. The first voltage value corresponds to the first time bucket on the left side of the screen and the last value corresponds to the

next-to-last time bucket on the right side of the screen. Time buckets without data return 0. The time values for each data point correspond to the position of the data point in the data array. These time values are not transmitted.

AVERage Data

AVERage data consists of the average of the first n hits in a time bucket, where n is the value returned by the :ACQUIRE:COUNT query (see [page 252](#)). Time buckets that have fewer than n hits return the average of the data they do have. If a time bucket does not have any data in it, it returns 0.

This data is transmitted over the interface linearly, starting with time bucket 0 and proceeding through time bucket n-1, where n is the number returned by the :WAVEform:POINTS? query (see [page 1264](#)). The first value corresponds to a point at the left side of the screen and the last value corresponds to one point away from the right side of the screen. The maximum number of points that can be returned in average mode is 1000 unless ACQUIRE:COUNT has been set to 1.

PEAK Data

Peak detect display mode is used to detect glitches for time base settings of 500 us/div and slower. In this mode, the oscilloscope can sample more data than it can store and display. So, when peak detect is turned on, the oscilloscope scans through the extra data, picks up the minimum and maximum for each time bucket, then stores the data in an array. Each time bucket contains two data sample.

The array is transmitted over the interface bus linearly, starting with time bucket 0 proceeding through time bucket n-1, where n is the number returned by the :WAVEform:POINTS? query (see [page 1264](#)). In each time bucket, two values are transmitted, first the minimum, followed by the maximum. The first pair of values corresponds to the time bucket at the leftmost side of the screen. The last pair of values corresponds to the time bucket at the far right side of the screen. In :ACQUIRE:TYPE PEAK mode (see [page 264](#)), the value returned by the :WAVEform:XINcrement query (see [page 1281](#)) should be doubled to find the time difference between the min-max pairs.

HRESolution Data

The high resolution (*smoothing*) mode is used to reduce noise at slower sweep speeds where the digitizer samples faster than needed to fill memory for the displayed time range.

Data Conversion

Word or byte data sent from the oscilloscope must be scaled for useful interpretation. The values used to interpret the data are the X and Y references, X and Y origins, and X and Y increments. These values are read from the waveform preamble. Each channel has its own waveform preamble.

In converting a data value to a voltage value, the following formula is used:

$$\text{voltage} = [(\text{data value} - \text{yreference}) * \text{yincrement}] + \text{yorigin}$$

If the :WAVeform:FORMat data format is ASCII (see [page 1263](#)), the data values are converted internally and sent as floating point values separated by commas.

In converting a data value to time, the time value of a data point can be determined by the position of the data point. For example, the fourth data point sent with :WAVeform:XORigin = 16 ns, :WAVeform:XREFerence = 0, and :WAVeform:XINCrement = 2 ns, can be calculated using the following formula:

$$\text{time} = [(\text{data point number} - \text{xreference}) * \text{xincrement}] + \text{xorigin}$$

This would result in the following calculation for time bucket 3:

$$\text{time} = [(3 - 0) * 2 \text{ ns}] + 16 \text{ ns} = 22 \text{ ns}$$

In :ACQuire:TYPE PEAK mode (see [page 264](#)), because data is acquired in max-min pairs, modify the previous time formula to the following:

$$\text{time} = [(\text{data pair number} - \text{xreference}) * \text{xincrement} * 2] + \text{xorigin}$$

Data Format for Transfer

There are three formats for transferring waveform data over the interface: BYTE, WORD and ASCII (see [":WAVeform:FORMat"](#) on page 1263). BYTE, WORD and ASCII formatted waveform records are transmitted using the arbitrary block program data format specified in IEEE 488.2.

When you use the block data format, the ASCII character string "#8<DD...D>" is sent prior to sending the actual data. The 8 indicates how many Ds follow. The Ds are ASCII numbers that indicate how many data bytes follow.

For example, if 1000 points will be transferred, and the WORD format was specified, the block header "#800001000" would be sent. The 8 indicates that eight length bytes follow, and 00001000 indicates that 1000 binary data bytes follow.

Use the :WAVeform:UNSigned command (see [page 1279](#)) to control whether data values are sent as unsigned or signed integers. This command can be used to match the instrument's internal data type to the data type used by the programming language. This command has no effect if the data format is ASCII.

Data Format for Transfer - ASCII format

The ASCII format (see [":WAVeform:FORMat"](#) on page 1263) provides access to the waveform data as real Y-axis values without using Y origin, Y reference, and Y increment to convert the binary data. Values are transferred as ASCII digits in floating point format separated by commas. In ASCII format, holes are represented by the value 9.9e+37. The setting of :WAVeform:BYTeorder (see [page 1259](#)) and :WAVeform:UNSigned (see [page 1279](#)) have no effect when the format is ASCII.

Data Format for Transfer - WORD format

WORD format (see **":WAVEform:FORMat"** on page 1263) provides 16-bit access to the waveform data. In the WORD format, the number of data bytes is twice the number of data points. The number of data points is the value returned by the :WAVEform:POINts? query (see **page 1264**). If the data intrinsically has less than 16 bits of resolution, the data is left-shifted to provide 16 bits of resolution and the least significant bits are set to 0. Currently, the greatest intrinsic resolution of any data is 12 bits, so at least the lowest 4 bits of data will be 0. If there is a hole in the data, the hole is represented by a 16 bit value equal to 0.

Use :WAVEform:BYTeorder (see **page 1259**) to determine if the least significant byte or most significant byte is to be transferred first. The :BYTeorder command can be used to alter the transmit sequence to match the storage sequence of an integer in the programming language being used.

Data Format for Transfer - BYTE format

The BYTE format (see **":WAVEform:FORMat"** on page 1263) allows 8-bit access to the waveform data. If the data intrinsically has more than 8 bits of resolution (averaged data), the data is right-shifted (truncated) to fit into 8 bits. If there is a hole in the data, the hole is represented by a value of 0. The BYTE-formatted data transfers over the programming interface faster than ASCII or WORD-formatted data, because in ASCII format, as many as 13 bytes per point are transferred, in BYTE format one byte per point is transferred, and in WORD format two bytes per point are transferred.

The :WAVEform:BYTeorder command (see **page 1259**) has no effect when the data format is BYTE.

Digital Channel Data (MSO models only)

The waveform record for digital channels is similar to that of analog channels. The main difference is that the data points represent either DIGital0,...,7 (POD1), DIGital8,...,15 (POD2), or any grouping of digital channels (BUS1 or BUS2).

For digital channels, :WAVEform:UNSigned (see **page 1279**) must be set to ON.

Digital Channel POD Data Format

Data for digital channels is only available in groups of 8 bits (Pod1 = D0 - D7, Pod2 = D8 - D15). The bytes are organized as:

:WAVEform:SOURce	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
POD1	D7	D6	D5	D4	D3	D2	D1	D0
POD2	D15	D14	D13	D12	D11	D10	D9	D8

If the :WAVEform:FORMat is WORD (see [page 1263](#)) is WORD, every other data byte will be 0. The setting of :WAVEform:BYTeorder (see [page 1259](#)) controls which byte is 0.

If a digital channel is not displayed, its bit value in the pod data byte is not defined.

Digital Channel BUS Data Format

Digital channel BUS definitions can include any or all of the digital channels. Therefore, data is always returned as 16-bit values. :BUS commands (see [page 267](#)) are used to select the digital channels for a bus.

Reporting the Setup

The following is a sample response from the :WAVEform? query. In this case, the query was issued following a *RST command.

```
:WAV:UNS 1;VIEW MAIN;BYT MSBF;FORM BYTE;POIN +1000;SOUR CHAN1;SOUR:SUBS  
NONE
```

:WAVeform:BYTeorder

C (see [page 1446](#))

Command Syntax :WAVeform:BYTeorder <value>
 <value> ::= {LSBFirst | MSBFirst}

The :WAVeform:BYTeorder command sets the output sequence of the WORD data. The parameter MSBFirst sets the most significant byte to be transmitted first. The parameter LSBFirst sets the least significant byte to be transmitted first. This command affects the transmitting sequence only when :WAVeform:FORMat WORD is selected. The default setting is LSBFirst.

Query Syntax :WAVeform:BYTeorder?

The :WAVeform:BYTeorder query returns the current output sequence.

Return Format <value><NL>
 <value> ::= {LSBF | MSBF}

:WAVEform:COUNT

C (see [page 1446](#))

Query Syntax :WAVEform:COUNT?

The :WAVEform:COUNT? query returns the count used to acquire the current waveform. This may differ from current values if the unit has been stopped and its configuration modified. For all acquisition types except average, this value is 1.

Return Format <count_argument><NL>

<count_argument> ::= an integer from 1 to 65536 in NR1 format

:WAVEform:DATA

C (see [page 1446](#))

Query Syntax :WAVEform:DATA?

The :WAVEform:DATA query returns the binary block of sampled data points transmitted using the IEEE 488.2 arbitrary block data format. The binary data is formatted according to the settings of the :WAVEform:UNSIGNED, :WAVEform:BYTEORDER, :WAVEform:FORMAT, and :WAVEform:SOURCE commands. The number of points returned is controlled by the :WAVEform:POINTS command.

In BYTE or WORD waveform formats, these data values have special meaning:

- 0x00 or 0x0000 – Hole. Holes are locations where data has not yet been acquired.

Another situation where there can be zeros in the data, incorrectly, is when programming over telnet port 5024. Port 5024 provides a command prompt and is intended for ASCII transfers. Use telnet port 5025 instead.

- 0x01 or 0x0001 – Clipped low. These are locations where the waveform is clipped at the bottom of the oscilloscope display.
- 0xFF or 0xFFFF – Clipped high. These are locations where the waveform is clipped at the top of the oscilloscope display.

Return Format <binary block data><NL>

Example Code

```
' QUERY_WAVE_DATA - Outputs waveform data that is stored in a buffer.

' Query the oscilloscope for the waveform data.
myScope.WriteString ":WAV:DATA?"

' READ_WAVE_DATA - The wave data consists of two parts: the header,

' The query data has the following format:
'
'     <header><waveform_data><NL>

' Where:

:WAVEform:FORMat

C (see [page 1446](#))

Command Syntax :WAVEform:FORMat <value>

<value> ::= {WORD | BYTE | ASCii}

The :WAVEform:FORMat command sets the data transmission mode for waveform data points. This command controls how the data is formatted when sent from the oscilloscope.

- ASCII formatted data converts the internal integer data values to real Y-axis values. Values are transferred as ASCII digits in floating point notation, separated by commas.

ASCII formatted data is transferred ASCII text.

- WORD formatted data transfers 16-bit data as two bytes. The :WAVEform:BYTeorder command can be used to specify whether the upper or lower byte is transmitted first. The default (no command sent) is that the upper byte transmitted first.
- BYTE formatted data is transferred as 8-bit bytes.

When the :WAVEform:SOURce is the serial decode bus (SBUS1 or SBUS2), ASCII is the only waveform format allowed.

When the :WAVEform:SOURce is one of the digital channel buses (BUS1 or BUS2), ASCII and WORD are the only waveform formats allowed.

Query Syntax :WAVEform:FORMat?

The :WAVEform:FORMat query returns the current output format for the transfer of waveform data.

Return Format <value><NL>

<value> ::= {WORD | BYTE | ASC}

:WAVEform:POINts

C (see [page 1446](#))

Command Syntax :WAVEform:POINts <# points>

```
<# points> ::= {100 | 250 | 500 | 1000 | <points mode>}
              if waveform points mode is NORMAl

<# points> ::= {100 | 250 | 500 | 1000 | 2000 | 5000 | 10000 | 20000
              | 50000 | 100000 | 200000 | 500000 | 1000000 | 2000000
              | 4000000 | 8000000 | <points mode>}
              if waveform points mode is MAXimum or RAW

<points mode> ::= {NORMAl | MAXimum | RAW}
```

NOTE

The <points_mode> option is deprecated. Use the :WAVEform:POINts:MODE command instead.

The :WAVEform:POINts command sets the number of analog channel waveform points to be transferred with the :WAVEform:DATA? query. (The number of digital channel waveform points cannot be specified.) This value represents the points contained in the waveform selected with the :WAVEform:SOURce command.

For the analog or digital sources, the records that can be transferred depend on the waveform points mode. The maximum number of points returned for math (function) waveforms is determined by the NORMAl waveform points mode. See the :WAVEform:POINts:MODE command (see [page 1266](#)) for more information.

Only data visible on the display will be returned.

When the :WAVEform:SOURce is the serial decode bus (SBUS1 or SBUS2), this command is ignored, and all available serial decode bus data is returned.

Query Syntax :WAVEform:POINts?

The :WAVEform:POINts query returns the number of waveform points to be transferred when using the :WAVEform:DATA? query. Setting the points mode will affect what data is transferred (see the :WAVEform:POINts:MODE command (see [page 1266](#)) for more information).

When the :WAVEform:SOURce is the serial decode bus (SBUS1 or SBUS2), this query returns the number of messages that were decoded.

Return Format <# points><NL>

```
<# points> ::= {100 | 250 | 500 | 1000 | <maximum # points>}
              if waveform points mode is NORMAl

<# points> ::= {100 | 250 | 500 | 1000 | 2000 | 5000 | 10000 | 20000
              | 50000 | 100000 | 200000 | 500000 | 1000000 | 2000000
              | 4000000 | 8000000 | <maximum # points>}
              if waveform points mode is MAXimum or RAW
```

NOTE

If a full screen of data is not displayed, the number of points returned will not be 1000 or an even divisor of it.

:WAVEform:POINts:MODE

N (see [page 1446](#))

Command Syntax :WAVEform:POINts:MODE <points_mode>

<points_mode> ::= {NORMal | MAXimum | RAW}

The :WAVEform:POINts:MODE command sets the data record to be transferred with the :WAVEform:DATA? query.

For the analog or digital sources, there are three different records that can be transferred:

- The first is the raw acquisition record. The maximum number of points available in this record is returned by the :ACQUIRE:POINts? query. The raw acquisition record can only be retrieved from the analog or digital sources.
- The second is referred to as the *measurement record* and is a 65,535-point (maximum) representation of the raw acquisition record. The measurement record can be retrieved, when :SYSTEM:PRECision is OFF, from any source.
- The third is referred to as the *precision analysis record* and is a user-selectable 100k-point to 1M-point (maximum) representation of the raw acquisition record. The precision analysis record can be retrieved when :SYSTEM:PRECision is ON, from analog sources.

If the <points_mode> is NORMal and :SYSTEM:PRECision is OFF, the measurement record is retrieved.

If the <points_mode> is NORMal and :SYSTEM:PRECision is ON, the precision analysis record is retrieved.

If the <points_mode> is RAW, the raw acquisition record is used. Under some conditions, this data record is unavailable.

If the <points_mode> is MAXimum, whichever record contains the maximum amount of points is used. Usually, this is the raw acquisition record. But, the measurement record may have more data. If data is being retrieved as the oscilloscope is stopped and as the data displayed is changing, the data being retrieved can switch between the measurement and raw acquisition records.

**Considerations for
MAXimum or RAW
data retrieval**

- The instrument must be stopped (see the :STOP command (see [page 244](#)) or the :DIGitize command (see [page 219](#)) in the root subsystem) in order to return more than the *measurement record* or *precision analysis record*.
- :TIMEbase:MODE must be set to MAIN.
- :ACQUIRE:TYPE must be set to NORMal, AVERage, or HRESolution.
- MAXimum or RAW will allow up to 4,000,000 points to be returned. The number of points returned will vary as the instrument's configuration is changed. Use the :WAVEform:POINts? MAXimum query to determine the maximum number of points that can be retrieved at the current settings.

Query Syntax :WAVEform:POINts:MODE?

The :WAVeform:POINts:MODE? query returns the current points mode. Setting the points mode will affect what data is transferred. See the discussion above.

:WAVEform:PREamble

Query Syntax :WAVEform:PREamble?

The :WAVEform:PREamble query requests the preamble information for the selected waveform source. The preamble data contains information concerning the vertical and horizontal scaling of the data of the corresponding channel.

Return Format <preamble_block><NL>

```
<preamble_block> ::= <format 16-bit NR1>,
                    <type 16-bit NR1>,
                    <points 32-bit NR1>,

                    <xreference 32-bit NR1>,
                    <yincrement 32-bit floating point NR3>,
                    <yorigin 32-bit floating point NR3>,

<format> ::= 0 for BYTE format, 1 for WORD format, 4 for ASCII format;
an integer in NR1 format (format set by :WAVEform:FORMat).

<type> ::= 3 for HRESolution type, 2 for AVERage type, 0 for NORMal
type, 1 for PEAK detect type; an integer in NR1 format
(type set by :ACQuire:TYPE).

<count> ::= Average count or 1 if PEAK or NORMal; an integer in NR1
format (count set by :ACQuire:COUNT).

:WAVEform:SEGMented:COUNT

N (see [page 1446](#))

Query Syntax :WAVEform:SEGMented:COUNT?

NOTE

This command is available when the segmented memory option (Option SGM) is enabled.

The :WAVEform:SEGMented:COUNT query returns the number of memory segments in the acquired data. You can use the :WAVEform:SEGMented:COUNT? query while segments are being acquired (although :DIGitize blocks subsequent queries until the full segmented acquisition is complete).

The segmented memory acquisition mode is enabled with the :ACQUIRE:MODE command. The number of segments to acquire is set using the :ACQUIRE:SEGMented:COUNT command, and data is acquired using the :DIGitize, :SINGLE, or :RUN commands.

Return Format <count> ::= an integer from 2 to 1000 in NR1 format (count set by :ACQUIRE:SEGMented:COUNT) .

:WAVeform:SEGMented:TTAG**N** (see [page 1446](#))**Query Syntax** :WAVeform:SEGMented:TTAG?**NOTE**

This command is available when the segmented memory option (Option SGM) is enabled.

The :WAVeform:SEGMented:TTAG? query returns the time tag of the currently selected segmented memory index. The index is selected using the :ACQuire:SEGMented:INDex command.

Return Format <time_tag> ::= in NR3 format

:WAVEform:SOURce

C (see [page 1446](#))

Command Syntax :WAVEform:SOURce <source>

```
<source> ::= {CHANnel<n> | FUNCTION<m> | MATH<m> | WMEMory<r>
             | SBUS{1 | 2}} for DSO models

<source> ::= {CHANnel<n> | POD{1 | 2} | BUS{1 | 2} | FUNCTION<m>
             | MATH<m> | WMEMory<r> | SBUS{1 | 2}}
             for MSO models

<n> ::= 1 to (# analog channels) in NR1 format

<m> ::= 1 to (# math functions) in NR1 format

<r> ::= 1 to (# ref waveforms) in NR1 format
```

The :WAVEform:SOURce command selects the analog channel, function, digital pod, digital bus, reference waveform, or serial decode bus to be used as the source for the :WAVEform commands.

Function capabilities include add, subtract, multiply, integrate, differentiate, and FFT (Fast Fourier Transform) operations.

When the :WAVEform:SOURce is the serial decode bus (SBUS1 or SBUS2), ASCII is the only waveform format allowed, and the :WAVEform:DATA? query returns a string with timestamps and associated bus decode information.

With MSO oscilloscope models, you can choose a POD or BUS as the waveform source. There are some differences between POD and BUS when formatting and getting data from the oscilloscope:

- When POD1 or POD2 is selected as the waveform source, you can choose the BYTE, WORD, or ASCII formats (see [":WAVEform:FORMat"](#) on page 1263).

When the WORD format is chosen, every other data byte will be 0. The setting of :WAVEform:BYTeorder controls which byte is 0.

When the ASCII format is chosen, the :WAVEform:DATA? query returns a string with unsigned decimal values separated by commas.

- When BUS1 or BUS2 is selected as the waveform source, you can choose the WORD or ASCII formats (but not BYTE because bus values are always returned as 16-bit values).

When the ASCII format is chosen, the :WAVEform:DATA? query returns a string with hexadecimal bus values, for example: 0x1938,0xff38,...

Query Syntax :WAVEform:SOURce?

The :WAVEform:SOURce? query returns the currently selected source for the WAVEform commands.

NOTE

MATH<m> is an alias for FUNCtion<m>. The :WAVEform:SOURce? query returns FUNC<m> if the source is FUNCtion<m> or MATH<m>.

Return Format

<source><NL>

<source> ::= {CHAN<n> | FUNC<m> | WMEM<r> | SBUS{1 | 2}} for DSO models

<source> ::= {CHAN<n> | POD{1 | 2} | BUS{1 | 2} | FUNC<m>

```
<subsource> ::= {SUB0 | RX | MOSI | FAST}
                | {SUB1 | TX | MISO | SLOW}
```

If the :WAVEform:SOURce is SBUS<n> (serial decode), more than one data set may be available, and this command lets you choose from the available data sets.

When using UART serial decode, this option lets you get "TX" data. (TX is an alias for SUB1.) The default, SUB0, specifies "RX" data. (RX is an alias for SUB0.)

When using SPI serial decode, this option lets you get "MISO" data. (MISO is an alias for SUB1.) The default, SUB0, specifies "MOSI" data. (MOSI is an alias for SUB0.)

When using SENT serial decode, this option lets you get "SLOW" data. (SLOW is an alias for SUB1.) The default, SUB0, specifies "FAST" data. (FAST is an alias for SUB0.)

If the :WAVEform:SOURce is not SBUS, or the :SBUS<n>:MODE is not UART, SPI, or SENT, the only valid subsource is SUB0.

Query Syntax :WAVEform:SOURce:SUBSource?

The :WAVEform:SOURce:SUBSource? query returns the current waveform subsource setting.

Return Format <subsource><NL>

```
<subsource> ::= {SUB0 | SUB1}
```

Command Syntax :WAVEform:UNSigned <unsigned>

<unsigned> ::= {{0 | OFF} | {1 | ON}}

The :WAVEform:UNSigned command turns unsigned mode on or off for the currently selected waveform. Use the WAVEform:UNSigned command to control whether data values are sent as unsigned or signed integers. This command can be used to match the instrument's internal data type to the data type used by the programming language. This command has no effect if the data format is ASCII.

If :WAVEform:SOURce is set to POD1, POD2, BUS1, or BUS2, WAVEform:UNSigned must be set to ON.

Query Syntax :WAVEform:UNSigned?

The :WAVEform:UNSigned? query returns the status of unsigned mode for the currently selected waveform.

:WGEN<w>:MODulation:FM:DEVIation

N (see [page 1446](#))

Command Syntax :WGEN<w>:MODulation:FM:DEVIation <frequency>

<w> ::= 1 in NR1 format

<frequency> ::= frequency deviation in Hz in NR3 format

The :WGEN<w>:MODulation:FM:DEVIation command specifies the frequency deviation from the original carrier signal frequency.

When the modulating signal is at its maximum amplitude, the output frequency is the carrier signal frequency plus the deviation amount, and when the modulating signal is at its minimum amplitude, the output frequency is the carrier signal frequency minus the deviation amount.

The frequency deviation cannot be greater than the original carrier signal frequency.

Also, the sum of the original carrier signal frequency and the frequency deviation must be less than or equal to the maximum frequency for the selected waveform generator function plus 100 kHz.

Command Syntax :WGEN<w>:MODulation:NOISe <percent>

<w> ::= 1 or 2 in NR1 format

<percent> ::= 0 to 100

The :WGEN<w>:MODulation:NOISe command adds noise to the currently selected signal. The sum of the amplitude between the original signal and injected noise is limited to the regular amplitude limit (for example, 5 Vpp in 1 MOhm), so the range for <percent> varies according to current amplitude.

Note that adding noise affects edge triggering on the waveform generator source as well as the waveform generator sync pulse output signal (which can be sent to TRIG OUT). This is because the trigger comparator is located after the noise source.

The :WGEN<w>:MODulation:NOISe query returns the percent of added noise.

Return Format <percent><NL>

<percent> ::= 0 to 100

The :WGEN<w>:VOLTage:HIGH? query returns the currently specified waveform high-level voltage.

Return Format <high><NL>

<high> ::= high-level voltage in volts, in NR3 format

<w> ::= 1 or 2 in NR1 format

<low> ::= low-level voltage in volts, in NR3 format

For all waveforms except DC, the :WGEN<w>:VOLTage:LOW command specifies the waveform's low-level voltage. Use the :WGEN<w>:VOLTage:HIGh command to specify the high-level voltage.

You can also specify the high-level and low-level voltages indirectly using the :WGEN<w>:VOLTage and :WGEN<w>:VOLTage:OFFSet commands. For example, a high-level voltage of 4 V and a low-level voltage of -1 V is the same as an amplitude of 5 V and an offset of 1 V.

NOTE

When the amplitude is below 40 mV, the offset is limited to ± 500 mV.

<w> ::= 1 or 2 in NR1 format

<offset> ::= offset in volts in NR3 format

The :WGEN<w>:VOLTage:OFFSet command specifies the waveform's offset voltage or the DC level. Use the :WGEN<w>:VOLTage command to specify the amplitude.

You can also specify the amplitude and offset indirectly using the :WGEN<w>:VOLTage:HIGH and :WGEN<w>:VOLTage:LOW commands. For example, an amplitude of 5 V and an offset of 1 V is the same as a high-level voltage of 4 V and a low-level voltage of -1 V.

NOTE

When the amplitude is below 40 mV, the offset is limited to ± 500 mV.

Query Syntax :WGEN<w>:VOLTage:OFFSet?

The :WGEN<w>:VOLTage:OFFSet? query returns the currently specified waveform offset voltage.

Return Format <offset><NL>

 <r> ::= 1 to (# ref waveforms) in NR1 format
 <string> ::= quoted ASCII string

NOTE

Label strings are 10 characters or less, and may contain any commonly used ASCII characters. Labels with more than 10 characters are truncated to 10 characters. Lower case characters are converted to upper case.

The :WMEemory<r>:LABel command sets the reference waveform label to the string that follows.

Setting a label for a reference waveform also adds the name to the label list in non-volatile memory (replacing the oldest label in the list).

Query Syntax :WMEemory<r>:LABel?

The :WMEemory<r>:LABel? query returns the label associated with a particular reference waveform.

Return Format <string><NL>
 <string> ::= quoted ASCII string

The :WMEemory<r>:YOFFset command sets the value that is represented at center screen for the selected reference waveform.

The range of legal values varies with the value set by the :WMEemory<r>:YRANge or :WMEemory<r>:YSCale commands. If you set the offset to a value outside of the legal range, the offset value is automatically set to the nearest legal value. Legal values are affected by the probe attenuation setting.

Query Syntax :WMEemory<r>:YOFFset?

The :WMEemory<r>:YOFFset? query returns the current offset value for the selected reference waveform.

Return Format <offset><NL>

<offset> ::= vertical offset value in NR3 format

- See Also**

Discontinued Parameters

Some previous oscilloscope queries returned control setting values of OFF and ON. The InfiniiVision 6000 X-Series oscilloscopes only return the enumerated values 0 (for off) and 1 (for on).

:CHANnel:ACTivity

O (see [page 1446](#))

Command Syntax :CHANnel:ACTivity

The :CHANnel:ACTivity command clears the cumulative edge variables for the next activity query.

NOTE

The :CHANnel:ACTivity command is an obsolete command provided for compatibility to previous oscilloscopes. Use the :ACTivity command (see [page 211](#)) instead.

Query Syntax :CHANnel:ACTivity?

The :CHANnel:ACTivity? query returns the active edges since the last clear, and returns the current logic levels.

Return Format <edges>, <levels><NL>

<edges> ::= presence of edges (32-bit integer in NR1 format).

<levels> ::= logical highs or lows (32-bit integer in NR1 format).

NOTE

A bit equal to zero indicates that no edges were detected at the specified threshold since the last clear on that channel. Edges may have occurred that were not detected because of the threshold setting.

A bit equal to one indicates that edges have been detected at the specified threshold since the last clear on that channel.

:CHANnel:LABel

O (see [page 1446](#))

Command Syntax :CHANnel:LABel <source_text><string>
 <source_text> ::= {CHANnel1 | CHANnel2 | DIGital<d>}
 <d> ::= 0 to (# digital channels - 1) in NR1 format
 <string> ::= quoted ASCII string

The :CHANnel:LABel command sets the source text to the string that follows. Setting a channel will also result in the name being added to the label list.

NOTE

The :CHANnel:LABel command is an obsolete command provided for compatibility to previous oscilloscopes. Use the :CHANnel<n>:LABel command (see [page 305](#)) or :DIGital<n>:LABel command (see [page 358](#)).

Query Syntax :CHANnel:LABel?

The :CHANnel:LABel? query returns the label associated with a particular analog channel.

Return Format <string><NL>

NOTE

The short form of this command, TSTO, does not follow the defined Long Form to Short Form Truncation Rules (see [page 1448](#)). The normal short form "TST" would be the same for both TSTArt and TSTOp, so sending TST for the TSTOp command produces an error.

O (see [page 1446](#))

Query Syntax :MEASure:TVOLt? <value>, [<slope>]<occurrence>[,<source>]

<value> ::= the voltage level that the waveform must cross.

<slope> ::= direction of the waveform. A rising slope is indicated by a plus sign (+). A falling edge is indicated by a minus sign (-).

<occurrence> ::= the transition to be reported. If the occurrence number is one, the first crossing is reported. If the number is two, the second crossing is reported, etc.

<source> ::= {<digital channels> | CHANnel<n> | FUNction | MATH}

<digital channels> ::= {DIGital<d>} for the MSO models

<n> ::= 1 to (# analog channels) in NR1 format

<d> ::= 0 to (# digital channels - 1) in NR1 format

When the :MEASure:TVOLt? query is sent, the displayed signal is searched for the specified voltage level and transition. The time interval between the trigger event and this defined occurrence is returned as the response to the query.

The specified voltage can be negative or positive. To specify a negative voltage, use a minus sign (-). The sign of the slope selects a rising (+) or falling (-) edge. If no sign is specified for the slope, it is assumed to be the rising edge.

The magnitude of the occurrence defines the occurrence to be reported. For example, +3 returns the time for the third time the waveform crosses the specified voltage level in the positive direction. Once this voltage crossing is found, the oscilloscope reports the time at that crossing in seconds, with the trigger point (time zero) as the reference.

If the specified crossing cannot be found, the oscilloscope reports +9.9E+37. This value is returned if the waveform does not cross the specified voltage, or if the waveform does not cross the specified voltage for the specified number of times in the direction specified.

If the optional source parameter is specified, the current source is modified.

The :MEASure:VSTArt command moves the vertical marker (Y1 cursor) to the specified value corresponding to the selected source. The source can be selected by the MARKer:X1Y1source command.

NOTE

The short form of this command, VSTA, does not follow the defined Long Form to Short Form Truncation Rules (see [page 1448](#)). The normal short form, VST, would be the same for both VSTArt and VSTOp, so sending VST for the VSTArt command produces an error.

NOTE

The short form of this command, VSTO, does not follow the defined Long Form to Short Form Truncation Rules (see [page 1448](#)). The normal short form, VST, would be the same for both VSTArt and VSTOp, so sending VST for the VSTOp command produces an error.

IEEE 488.2 defines data structures, commands, and common bit definitions for status reporting (for example, the Status Byte Register and the Standard Event Status Register). There are also instrument-defined structures and bits (for example, the Operation Status Event Register and the Overload Event Register).

An overview of the oscilloscope's status reporting structure is shown in the following block diagram. The status reporting structure allows monitoring specified events in the oscilloscope. The ability to monitor and report these events allows determination of such things as the status of an operation, the availability and reliability of the measured data, and more.

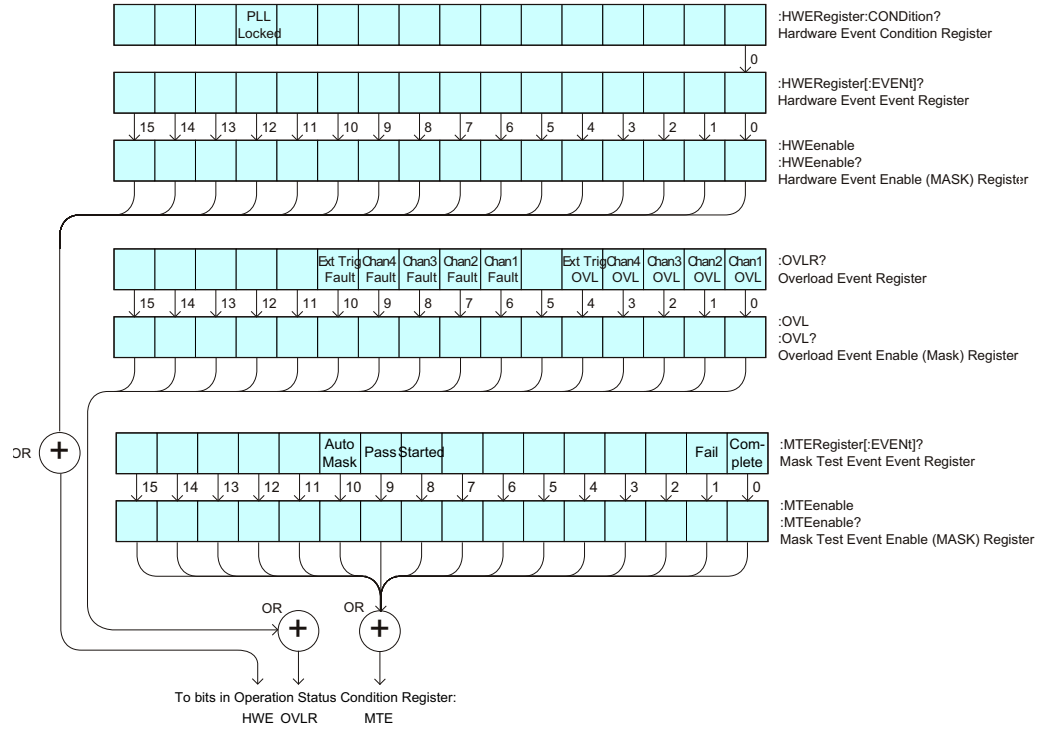

- To monitor an event, first clear the event; then, enable the event. All of the events are cleared when you initialize the instrument.
- To allow a service request (SRQ) interrupt to an external controller, enable at least one bit in the Status Byte Register (by setting, or unmasking, the bit in the Service Request Enable register).

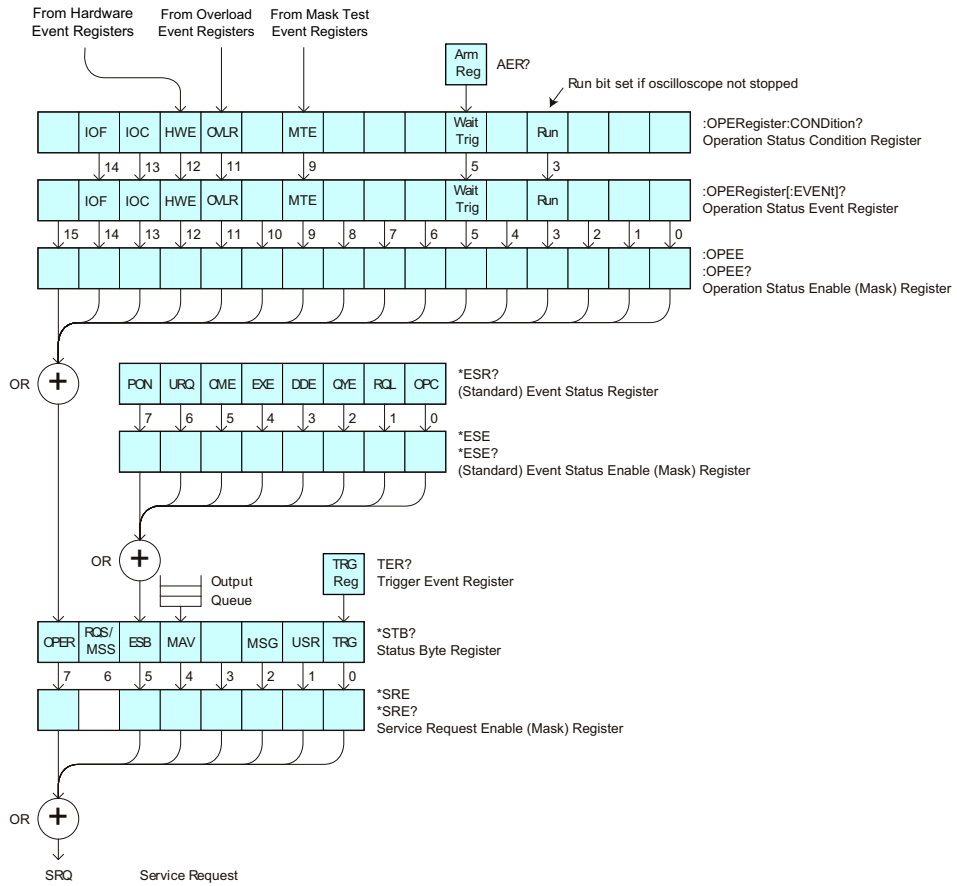

The Status Byte Register, the Standard Event Status Register group, and the Output Queue are defined as the Standard Status Data Structure Model in IEEE 488.2-1987.

The bits in the status byte act as summary bits for the data structures residing behind them. In the case of queues, the summary bit is set if the queue is not empty. For registers, the summary bit is set if any enabled bit in the event register is set. The events are enabled with the corresponding event enable register. Events captured by an event register remain set until the register is read or cleared. Registers are read with their associated commands. The *CLS command clears all event registers and all queues except the output queue. If you send *CLS immediately after a program message terminator, the output queue is also cleared.

Status Reporting Data Structures

The following figure shows how the status register bits are masked and logically OR'ed to generate service requests (SRQ) on particular events.

The status register bits are described in more detail in the following tables:

- [Table 80](#)
- [Table 78](#)
- [Table 88](#)
- [Table 89](#)
- [Table 91](#)
- [Table 83](#)
- [Table 84](#)
- [Table 86](#)

The status registers picture above shows how the different status reporting data structures work together. To make it possible for any of the Standard Event Status Register bits to generate a summary bit, the bits must be enabled. These bits are enabled by using the *ESE common command to set the corresponding bit in the Standard Event Status Enable Register.

To generate a service request (SRQ) interrupt to an external controller, at least one bit in the Status Byte Register must be enabled. These bits are enabled by using the *SRE common command to set the corresponding bit in the Service Request Enable Register. These enabled bits can then set RQS and MSS (bit 6) in the Status Byte Register.

Status Byte Register (STB)

The Status Byte Register is the summary-level register in the status reporting structure. It contains summary bits that monitor activity in the other status registers and queues. The Status Byte Register is a live register. That is, its summary bits are set and cleared by the presence and absence of a summary bit from other event registers or queues.

If the Status Byte Register is to be used with the Service Request Enable Register to set bit 6 (RQS/MSS) and to generate an SRQ, at least one of the summary bits must be enabled, then set. Also, event bits in all other status registers must be specifically enabled to generate the summary bit that sets the associated summary bit in the Status Byte Register.

The Status Byte Register can be read using either the *STB? Common Command or the programming interface serial poll command. Both commands return the decimal-weighted sum of all set bits in the register. The difference between the two methods is that the serial poll command reads bit 6 as the Request Service (RQS) bit and clears the bit which clears the SRQ interrupt. The *STB? command reads bit 6 as the Master Summary Status (MSS) and does not clear the bit or have any affect on the SRQ interrupt. The value returned is the total bit weights of all of the bits that are set at the present time.

The use of bit 6 can be confusing. This bit was defined to cover all possible computer interfaces, including a computer that could not do a serial poll. The important point to remember is that, if you are using an SRQ interrupt to an external computer, the serial poll command clears bit 6. Clearing bit 6 allows the oscilloscope to generate another SRQ interrupt when another enabled event occurs.

No other bits in the Status Byte Register are cleared by either the *STB? query or the serial poll, except the Message Available bit (bit 4). If there are no other messages in the Output Queue, bit 4 (MAV) can be cleared as a result of reading the response to the *STB? command.

If bit 4 (weight = 16) and bit 5 (weight = 32) are set, the program prints the sum of the two weights. Since these bits were not enabled to generate an SRQ, bit 6 (weight = 64) is not set.

The following example uses the *STB? query to read the contents of the oscilloscope's Status Byte Register.

```
myScope.WriteString "*STB?"
varQueryResult = myScope.ReadNumber
MsgBox "Status Byte Register, Read: 0x" + Hex(varQueryResult)
```

The next program prints 0xD1 and clears bit 6 (RQS) and bit 4 (MAV) of the Status Byte Register. The difference in the output value between this example and the previous one is the value of bit 6 (weight = 64). Bit 6 is set when the first enabled summary bit is set and is cleared when the Status Byte Register is read by the serial poll command.

Example The following example uses the resource session object's ReadSTB method to read the contents of the oscilloscope's Status Byte Register.

```
varQueryResult = myScope.IO.ReadSTB  
MsgBox "Status Byte Register, Serial Poll: 0x" + Hex(varQueryResult)
```

NOTE

Use Serial Polling to Read Status Byte Register. Serial polling is the preferred method to read the contents of the Status Byte Register because it resets bit 6 and allows the next enabled event that occurs to generate a new SRQ interrupt.

Service Request Enable Register (SRE)

Setting the Service Request Enable Register bits enable corresponding bits in the Status Byte Register. These enabled bits can then set RQS and MSS (bit 6) in the Status Byte Register.

Bits are set in the Service Request Enable Register using the *SRE command and the bits that are set are read with the *SRE? query.

Example The following example sets bit 4 (MAV) and bit 5 (ESB) in the Service Request Enable Register.

```
myScope.WriteString "*SRE " + CStr(CInt("&H30"))
```

This example uses the decimal parameter value of 48, the string returned by CStr(CInt("&H30")), to enable the oscilloscope to generate an SRQ interrupt under the following conditions:

- When one or more bytes in the Output Queue set bit 4 (MAV).
- When an enabled event in the Standard Event Status Register generates a summary bit that sets bit 5 (ESB).

Trigger Event Register (TER)

This register sets the TRG bit in the status byte when a trigger event occurs.

The TER event register stays set until it is cleared by reading the register or using the *CLS command. If your application needs to detect multiple triggers, the TER event register must be cleared after each one.

If you are using the Service Request to interrupt a program or controller operation, you must clear the event register each time the trigger bit is set.

Output Queue

The output queue stores the oscilloscope-to-controller responses that are generated by certain instrument commands and queries. The output queue generates the Message Available summary bit when the output queue contains one or more bytes. This summary bit sets the MAV bit (bit 4) in the Status Byte Register.

When using the Keysight VISA COM library, the output queue may be read with the FormattedIO488 object's ReadString, ReadNumber, ReadList, or ReadIEEEBlock methods.

Message Queue

The message queue contains the text of the last message written to the advisory line on the screen of the oscilloscope. The length of the oscilloscope's message queue is 1. Note that messages sent with the :SYSTem:DSP command do not set the MSG status bit in the Status Byte Register.

(Standard) Event Status Register (ESR)

The (Standard) Event Status Register (ESR) monitors the following oscilloscope status events:

- PON - Power On
- URQ - User Request
- CME - Command Error
- EXE - Execution Error
- DDE - Device Dependent Error
- QYE - Query Error
- RQC - Request Control
- OPC - Operation Complete

When one of these events occur, the event sets the corresponding bit in the register. If the bits are enabled in the Standard Event Status Enable Register, the bits set in this register generate a summary bit to set bit 5 (ESB) in the Status Byte Register.

You can read the contents of the Standard Event Status Register and clear the register by sending the *ESR? query. The value returned is the total bit weights of all of the bits that are set at the present time.

Example The following example uses the *ESR query to read the contents of the Standard Event Status Register.

```
myScope.WriteString "*ESR?"
varQueryResult = myScope.ReadNumber
MsgBox "Standard Event Status Register: 0x" + Hex(varQueryResult)
```

If bit 4 (weight = 16) and bit 5 (weight = 32) are set, the program prints the sum of the two weights.

(Standard) Event Status Enable Register (ESE)

To allow any of the (Standard) Event Status Register (ESR) bits to generate a summary bit, you must first enable that bit. Enable the bit by using the *ESE (Event Status Enable) common command to set the corresponding bit in the (Standard) Event Status Enable Register (ESE).

Set bits are read with the *ESE? query.

Example Suppose your application requires an interrupt whenever any type of error occurs. The error related bits in the (Standard) Event Status Register are bits 2 through 5 (hexadecimal value 0x3C). Therefore, you can enable any of these bits to generate the summary bit by sending:

```
myScope.WriteString "*ESE " + CStr(CInt("&H3C"))
```

Whenever an error occurs, it sets one of these bits in the (Standard) Event Status Register. Because all the error related bits are enabled, a summary bit is generated to set bit 5 (ESB) in the Status Byte Register.

If bit 5 (ESB) in the Status Byte Register is enabled (via the *SRE command), an SRQ service request interrupt is sent to the controller PC.

NOTE

Disabled (Standard) Event Status Register bits respond but do not generate a summary bit. (Standard) Event Status Register bits that are not enabled still respond to their corresponding conditions (that is, they are set if the corresponding event occurs). However, because they are not enabled, they do not generate a summary bit to the Status Byte Register.

Error Queue

As errors are detected, they are placed in an error queue. This queue is first in, first out. If the error queue overflows, the last error in the queue is replaced with error 350, Queue overflow. Any time the queue overflows, the least recent errors remain in the queue, and the most recent error is discarded. The length of the oscilloscope's error queue is 30 (29 positions for the error messages, and 1 position for the Queue overflow message).

The error queue is read with the :SYSTEM:ERRor? query. Executing this query reads and removes the oldest error from the head of the queue, which opens a position at the tail of the queue for a new error. When all the errors have been read from the queue, subsequent error queries return "0, No error".

The error queue is cleared when:

- the instrument is powered up,
- the instrument receives the *CLS common command, or
- the last item is read from the error queue.

Operation Status Event Register (:OPERRegister[:EVENT])

The Operation Status Event Register register hosts these bits:

Name	Location	Description
RUN bit	bit 3	Is set whenever the instrument goes from a stop state to a single or running state.
WAIT TRIG bit	bit 5	Is set by the Trigger Armed Event Register and indicates that the trigger is armed.
MTE bit	bit 9	Comes from the Mask Test Event Registers.
OVL bit	bit 11	Is set whenever a 50Ω input overload occurs.
HWE bit	bit 12	Comes from the Hardware Event Registers.
IOC bit	bit 13	Is set when any IO operation completes. IO operations are any remote data request using any interface (USB, LAN, or GPIB). For example, if you connect to an oscilloscope using the USB interface and then request waveform data, the IOC bit will be set when the IO operation completes.
IOF bit	bit 14	Is set only when something causes the IO operation to fail, like disconnecting a USB device or interrupting the operation from the oscilloscope's front panel.

If any of these bits are set, the OPER bit (bit 7) of the Status Byte Register is set. The Operation Status Event Register is read and cleared with the :OPERRegister[:EVENT]? query. The register output is enabled or disabled using the mask value supplied with the OPEE command.

Operation Status Condition Register (:OPERRegister:CONDition)

The Operation Status Condition Register register hosts these bits:

Name	Location	Description
RUN bit	bit 3	Is set whenever the instrument is not stopped.
WAIT TRIG bit	bit 5	Is set by the Trigger Armed Event Register and indicates that the trigger is armed.
MTE bit	bit 9	Comes from the Mask Test Event Registers.
OVL R bit	bit 11	Is set whenever a 50Ω input overload occurs.
HWE bit	bit 12	Comes from the Hard ware Event Registers.
IOC bit	bit 13	Is set when any IO operation completes. IO operations are any remote data request using any interface (USB, LAN, or GPIB). For example, if you connect to an oscilloscope using the USB interface and then request waveform data, the IOC bit will be set when the IO operation completes.
IOF bit	bit 14	Is set only when something causes the IO operation to fail, like disconnecting a USB device or interrupting the operation from the oscilloscope's front panel.

The :OPERRegister:CONDition? query returns the value of the Operation Status Condition Register.

Arm Event Register (AER)

This register sets bit 5 (Wait Trig bit) in the Operation Status Register and the OPER bit (bit 7) in the Status Byte Register when the instrument becomes armed.

The ARM event register stays set until it is cleared by reading the register with the AER? query or using the *CLS command. If your application needs to detect multiple triggers, the ARM event register must be cleared after each one.

If you are using the Service Request to interrupt a program or controller operation when the trigger bit is set, then you must clear the event register after each time it has been set.

Overload Event Register (:OVLRegister)

The Overload Event Register register hosts these bits:

Name	Location	Description
Channel 1 OVL	bit 0	Overload has occurred on Channel 1 input.
Channel 2 OVL	bit 1	Overload has occurred on Channel 2 input.
Channel 3 OVL	bit 2	Overload has occurred on Channel 3 input.
Channel 4 OVL	bit 3	Overload has occurred on Channel 4 input.
External Trigger OVL	bit 4	Overload has occurred on External Trigger input.
Channel 1 Fault	bit 6	Fault has occurred on Channel 1 input.
Channel 2 Fault	bit 7	Fault has occurred on Channel 2 input.
Channel 3 Fault	bit 8	Fault has occurred on Channel 3 input.
Channel 4 Fault	bit 9	Fault has occurred on Channel 4 input.
External Trigger Fault	bit 10	Fault has occurred on External Trigger input.

Hardware Event Event Register (:HWERegister[:EVENT])

This register hosts the PLL LOCKED bit (bit 12).

- The PLL LOCKED bit (bit 12) is for internal use and is not intended for general use.

Hardware Event Condition Register (:HWERegister:CONDition)

This register hosts the PLL LOCKED bit (bit 12).

- The :HWERegister:CONDition? query returns the value of the Hardware Event Condition Register.
- The PLL LOCKED bit (bit 12) is for internal use and is not intended for general use.

Mask Test Event Event Register (:MTERegister[:EVENT])

The Mask Test Event Event Register register hosts these bits:

Name	Location	Description
Complete	bit 0	Is set when the mask test is complete.
Fail	bit 1	Is set when there is a mask test failure.
Started	bit 8	Is set when mask testing is started.
Pass	bit 9	Is set when the mask test passes.
Auto Mask	bit 10	Is set when auto mask creation is completed.

The :MTERegister[:EVENT]? query returns the value of, and clears, the Mask Test Event Event Register.

Clearing Registers and Queues

The *CLS common command clears all event registers and all queues except the output queue. If *CLS is sent immediately after a program message terminator, the output queue is also cleared.

Synchronizing with a Single-Shot Device Under Test (DUT) / 1440

Synchronization with an Averaging Acquisition / 1442

When remotely controlling an oscilloscope with programming commands, it is often necessary to know when the oscilloscope has finished the previous operation and is ready for the next command. The most common example is when an acquisition is started using the :DIGitize, :RUN, or :SINGle commands. Before a measurement result can be queried, the acquisition must complete. Too often fixed delays are used to accomplish this wait, but fixed delays often use excessive time or the time may not be long enough. A better solution is to use synchronous commands and status to know when the oscilloscope is ready for the next request.

Synchronization in the Programming Flow

Most remote programming follows these three general steps:

- 1 Set up the oscilloscope and device under test (see [page 1436](#)).
- 2 Acquire a waveform (see [page 1436](#)).
- 3 Retrieve results (see [page 1436](#)).

Set Up the Oscilloscope

Before making changes to the oscilloscope setup, it is best to make sure it is stopped using the :STOP command followed by the *OPC? query.

NOTE

It is not necessary to use *OPC?, hard coded waits, or status checking when setting up the oscilloscope. After the oscilloscope is configured, it is ready for an acquisition.

Acquire a Waveform

When acquiring a waveform there are two possible methods used to wait for the acquisition to complete. These methods are blocking and polling. The table below details when each method should be chosen and why.

	Blocking Wait	Polling Wait
Use When	You know the oscilloscope <i>will</i> trigger based on the oscilloscope setup and device under test.	You know the oscilloscope <i>may or may not</i> trigger on the oscilloscope setup and device under test.
Advantages	No need for polling. Fastest method.	Remote interface will not timeout No need for device clear if no trigger.
Disadvantages	Remote interface may timeout. Device clear only way to get control of oscilloscope if there is no trigger.	Slower method. Requires polling loop. Requires known maximum wait time.
Implementation Details	See " Blocking Synchronization " on page 1437.	See " Polling Synchronization With Timeout " on page 1438.

Retrieve Results

Once the acquisition is complete, it is safe to retrieve measurements and statistics.

Blocking Synchronization

Use the :DIGitize command to start the acquisition. This blocks subsequent queries until the acquisition and processing is complete. For example:

Synchronizing with a Single-Shot Device Under Test (DUT)

The examples in **"Blocking Synchronization"** on page 1437 and **"Polling Synchronization With Timeout"** on page 1438 assume the DUT is continually running and therefore the oscilloscope will have more than one opportunity to trigger. With a single shot DUT, there is only one opportunity for the oscilloscope to trigger, so it is necessary for the oscilloscope to be armed and ready before the DUT is enabled.

NOTE

The blocking :DIGitize command cannot be used for a single shot DUT because once the :DIGitize command is issued, the oscilloscope is blocked from any further commands until the acquisition is complete.

This example is the same **"Polling Synchronization With Timeout"** on page 1438 with the addition of checking for the armed event status.

Synchronization with an Averaging Acquisition

When averaging, it is necessary to know when the average count has been reached. The :SINGle command does not average.

If it is known that a trigger will occur, a :DIGitize will acquire the complete number of averages, but if the number of averages is large, a timeout on the connection can occur.

The example below polls during the :DIGitize to prevent a timeout on the connection.

Command Classifications

To help you use existing programs with your oscilloscope, or use current programs with the next generation of Keysight InfiniiVision oscilloscopes, commands are classified by the following categories:

- **"Core Commands"** on page 1446
- **"Non-Core Commands"** on page 1446
- **"Obsolete Commands"** on page 1446

C Core Commands

Core commands are a common set of commands that provide basic oscilloscope functionality on this oscilloscope and future Keysight InfiniiVision oscilloscopes. Core commands are unlikely to be modified in the future. If you restrict your programs to core commands, the programs should work across product offerings in the future, assuming appropriate programming methods are employed.

N Non-Core Commands

Non-core commands are commands that provide specific features, but are not universal across all Keysight InfiniiVision oscilloscope models. Non-core commands may be modified or deleted in the future. With a command structure as complex as the one for your oscilloscope, some evolution over time is inevitable. Keysight's intent is to continue to expand command subsystems, such as the rich and evolving trigger feature set.

O Obsolete Commands

Obsolete commands are older forms of commands that are provided to reduce customer rework for existing systems and programs. Generally, these commands are mapped onto some of the Core and Non-core commands, but may not strictly have the same behavior as the new command. None of the obsolete commands are guaranteed to remain functional in future products. New systems and programs should use the Core (and Non-core) commands. Obsolete commands are listed in:

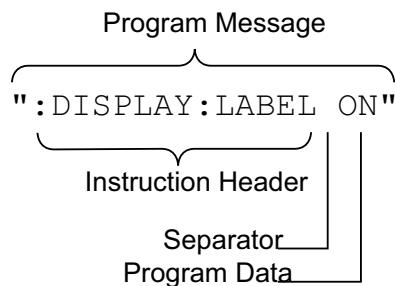

- **Chapter 42**, "Obsolete and Discontinued Commands," starting on page 1345

Valid Command/Query Strings

- **"Program Message Syntax"** on page 1447
- **"Duplicate Mnemonics"** on page 1451
- **"Tree Traversal Rules and Multiple Commands"** on page 1451

Program Message Syntax

To program the instrument remotely, you must understand the command format and structure expected by the instrument. The IEEE 488.2 syntax rules govern how individual elements such as headers, separators, program data, and terminators may be grouped together to form complete instructions. Syntax definitions are also given to show how query responses are formatted. The following figure shows the main syntactical parts of a typical program statement.

Instructions (both commands and queries) normally appear as a string embedded in a statement of your host language, such as Visual Basic or C/C++. The only time a parameter is not meant to be expressed as a string is when the instruction's syntax definition specifies <block data>, such as <learn string>. There are only a few instructions that use block data.

Program messages can have long or short form commands (and data in some cases – see **"Long Form to Short Form Truncation Rules"** on page 1448), and upper and/or lower case ASCII characters may be used. (Query responses, however, are always returned in upper case.)

Instructions are composed of two main parts:

- The header, which specifies the command or query to be sent.
- The program data, which provide additional information needed to clarify the meaning of the instruction.

Instruction Header The instruction header is one or more mnemonics separated by colons (:) that represent the operation to be performed by the instrument.

":DISPlay:LABel ON" is a command. Queries are indicated by adding a question mark (?) to the end of the header, for example, ":DISPlay:LABel?". Many instructions can be used as either commands or queries, depending on whether or

not you have included the question mark. The command and query forms of an instruction usually have different program data. Many queries do not use any program data.

There are three types of headers:

- **"Simple Command Headers"** on page 1449
- **"Compound Command Headers"** on page 1449
- **"Common Command Headers"** on page 1449

White Space (Separator) White space is used to separate the instruction header from the program data. If the instruction does not require any program data parameters, you do not need to include any white space. White space is defined as one or more space characters. ASCII defines a space to be character 32 (in decimal).

Program Data Program data are used to clarify the meaning of the command or query. They provide necessary information, such as whether a function should be on or off, or which waveform is to be displayed. Each instruction's syntax definition shows the program data, as well as the values they accept. **"Program Data Syntax Rules"** on page 1450 describes all of the general rules about acceptable values.

When there is more than one data parameter, they are separated by commas(,). Spaces can be added around the commas to improve readability.

Program Message Terminator The program instructions within a data message are executed after the program message terminator is received. The terminator may be either an NL (New Line) character, an EOI (End-Of-Identify) asserted in the programming interface, or a combination of the two. Asserting the EOI sets the EOI control line low on the last byte of the data message. The NL character is an ASCII linefeed (decimal 10).

NOTE

New Line Terminator Functions. The NL (New Line) terminator has the same function as an EOS (End Of String) and EOT (End Of Text) terminator.

Long Form to Short Form Truncation Rules

To get the short form of a command/keyword:

- When the command/keyword is longer than four characters, use the first four characters of the command/keyword unless the fourth character is a vowel; when the fourth character is a vowel, use the first three characters of the command/keyword.
- When the command/keyword is four or fewer characters, use all of the characters.

Long Form	Short form
RANGe	RANG
PATTern	PATT

Long Form	Short form
TIMebase	TIM
DELay	DEL
TYPE	TYPE

In the oscilloscope programmer's documentation, the short form of a command is indicated by uppercase characters.

Programs written in long form are easily read and are almost self-documenting. The short form syntax conserves the amount of controller memory needed for program storage and reduces I/O activity.

Simple Command Headers

Simple command headers contain a single mnemonic. :AUToscale and :DIGitize are examples of simple command headers typically used in the oscilloscope. The syntax is:

```
<program mnemonic><terminator>
```

Simple command headers must occur at the beginning of a program message; if not, they must be preceded by a colon.

When program data must be included with the simple command header (for example, :DIGitize CHANnel1), white space is added to separate the data from the header. The syntax is:

```
<program mnemonic><separator><program data><terminator>
```

Compound Command Headers

Compound command headers are a combination of two or more program mnemonics. The first mnemonic selects the subsystem, and the second mnemonic selects the function within that subsystem. The mnemonics within the compound message are separated by colons. For example, to execute a single function within a subsystem:

```
:<subsystem>:<function><separator><program data><terminator>
```

For example, :CHANnel1:BWLlimit ON

Common Command Headers

Common command headers control IEEE 488.2 functions within the instrument (such as clear status). Their syntax is:

```
*<command header><terminator>
```

No space or separator is allowed between the asterisk (*) and the command header. *CLS is an example of a common command header.

Program Data Syntax Rules

Program data is used to convey a parameter information related to the command header. At least one space must separate the command header or query header from the program data.

```
<program mnemonic><separator><data><terminator>
```

When a program mnemonic or query has multiple program data, a comma separates sequential program data.

```
<program mnemonic><separator><data>,<data><terminator>
```

For example, `:MEASure:DELay CHANnel1,CHANnel2` has two program data: CHANnel1 and CHANnel2.

Two main types of program data are used in commands: character and numeric.

Character Program Data

Character program data is used to convey parameter information as alpha or alphanumeric strings. For example, the `:TIMEbase:MODE` command can be set to normal, zoomed (delayed), XY, or ROLL. The character program data in this case may be MAIN, WINDow, XY, or ROLL. The command `:TIMEbase:MODE WINDow` sets the time base mode to zoomed.

The available mnemonics for character program data are always included with the command's syntax definition.

When sending commands, you may either the long form or short form (if one exists). Uppercase and lowercase letters may be mixed freely.

When receiving query responses, uppercase letters are used exclusively.

Numeric Program Data

Some command headers require program data to be expressed numerically. For example, `:TIMEbase:RANGe` requires the desired full scale range to be expressed numerically.

For numeric program data, you have the option of using exponential notation or using suffix multipliers to indicate the numeric value. The following numbers are all equal:

$$28 = 0.28E2 = 280e-1 = 28000m = 0.028K = 28e-3K.$$

When a syntax definition specifies that a number is an integer, that means that the number should be whole. Any fractional part will be ignored, truncating the number. Numeric data parameters accept fractional values are called real numbers.

All numbers must be strings of ASCII characters. Thus, when sending the number 9, you would send a byte representing the ASCII code for the character 9 (which is 57). A three-digit number like 102 would take up three bytes (ASCII codes 49, 48, and 50). This is handled automatically when you include the entire instruction in a string.

Duplicate Mnemonics

Identical function mnemonics can be used in more than one subsystem. For example, the function mnemonic RANGe may be used to change the vertical range or to change the horizontal range:

```
:CHANnel1:RANGe .4
```

Sets the vertical range of channel 1 to 0.4 volts full scale.

```
:TIMebase:RANGe 1
```

Sets the horizontal time base to 1 second full scale.

:CHANnel1 and :TIMebase are subsystem selectors and determine which range is being modified.

Tree Traversal Rules and Multiple Commands

Command headers are created by traversing down the command tree. A legal command header would be :TIMebase:RANGe. This is referred to as a *compound header*. A compound header is a header made of two or more mnemonics separated by colons. The mnemonic created contains no spaces.

The following rules apply to traversing the tree:

- A leading colon (<NL> or EOI true on the last byte) places the parser at the root of the command tree. A leading colon is a colon that is the first character of a program header. Executing a subsystem command lets you access that subsystem until a leading colon or a program message terminator (<NL>) or EOI true is found.
- In the command tree, use the last mnemonic in the compound header as the reference point (for example, RANGe). Then find the last colon above that mnemonic (TIMebase:). That is the point where the parser resides. Any command below that point can be sent within the current program message without sending the mnemonics which appear above them (for example, POSition).

The output statements in the examples are written using the Keysight VISA COM library in Visual Basic. The quoted string is placed on the bus, followed by a carriage return and linefeed (CRLF).

To execute more than one function within the same subsystem, separate the functions with a semicolon (;):

```
:<subsystem>:<function><separator><data>;<function><separator><data><terminator>
```

For example:

```
myScope.WriteString ":TIMebase:RANGe 0.5;POSition 0"
```

NOTE

The colon between TIMEbase and RANGE is necessary because TIMEbase:RANGE is a compound command. The semicolon between the RANGE command and the POSition command is the required program message unit separator. The POSition command does not need TIMEbase preceding it because the TIMEbase:RANGE command sets the parser to the TIMEbase node in the tree.

Example 2:
Program Message
Terminator Sets
Parser Back to
Root

```
myScope.WriteString ":TIMEbase:REfERENCE CENTER;POSition 0.00001"
or
myScope.WriteString ":TIMEbase:REfERENCE CENTER"
myScope.WriteString ":TIMEbase:POSition 0.00001"
```

NOTE

In the first line of example 2, the subsystem selector is implied for the POSition command in the compound command. The POSition command must be in the same program message as the REfERENCE command because the program message terminator places the parser back at the root of the command tree.

A second way to send these commands is by placing TIMEbase: before the POSition command as shown in the second part of example 2. The space after POSition is required.

Example 3:
Selecting Multiple
Subsystems

You can send multiple program commands and program queries for different subsystems on the same line by separating each command with a semicolon. The colon following the semicolon enables you to enter a new subsystem. For example:

```
<program mnemonic><data>;:<program mnemonic><data><terminator>
```

For example:

```
myScope.WriteString ":TIMEbase:REfERENCE CENTER;:DISPlay:VECTors ON"
```

NOTE

The leading colon before DISPlay:VECTors ON tells the parser to go back to the root of the command tree. The parser can then see the DISPlay:VECTors ON command. The space between REfERENCE and CENTer is required; so is the space between VECTors and ON.

Multiple commands may be any combination of compound and simple commands.

Query Return Values

Command headers immediately followed by a question mark (?) are queries. Queries are used to get results of measurements made by the instrument or to find out how the instrument is currently configured.

After receiving a query, the instrument interrogates the requested function and places the answer in its output queue. The answer remains in the output queue until it is read or another command is issued.

When read, the answer is transmitted across the bus to the designated listener (typically a controller). For example, the query :TIMEbase:RANGe? places the current time base setting in the output queue. When using the Keysight VISA COM library in Visual Basic, the controller statements:

```
Dim strQueryResult As String
myScope.WriteString ":TIMEbase:RANGe?"
strQueryResult = myScope.ReadString
```

pass the value across the bus to the controller and place it in the variable strQueryResult.

NOTE

Read Query Results Before Sending Another Command. Sending another command or query before reading the result of a query clears the output buffer (the current response) and places a Query INTERRUPTED error in the error queue.

Infinity Representation	The representation of infinity is +9.9E+37. This is also the value returned when a measurement cannot be made.
--------------------------------	--

All Oscilloscope Commands Are Sequential

IEEE 488.2 makes the distinction between sequential and overlapped commands:

- *Sequential commands* finish their task before the execution of the next command starts.
- *Overlapped commands* run concurrently. Commands following an overlapped command may be started before the overlapped command is completed.

All of the oscilloscope commands are sequential.

VISA COM Example in Visual Basic .NET

To compile and run this example in Microsoft Visual Studio 2008:

- 1 Open Visual Studio.
- 2 Create a new Visual Basic, Windows, Console Application project.
- 3 Cut-and-paste the code that follows into the C# source file.
- 4 Edit the program to use the VISA address of your oscilloscope.
- 5 Add a reference to the VISA COM 5.5 Type Library:
 - a Right-click the project you wish to modify (not the solution) in the Solution Explorer window of the Microsoft Visual Studio environment.
 - b Choose **Add Reference...**
 - c In the Add Reference dialog, select the **COM** tab.
 - d Select **VISA COM 5.5 Type Library**; then click **OK**.
 - e Right-click the project you wish to modify (not the solution) in the Solution Explorer window of the Microsoft Visual Studio environment and choose **Properties**; then, select "InfiniiVision.VisaComInstrumentApp" as the **Startup object**.
- 6 Build and run the program.

For more information, see the VISA COM Help that comes with Keysight IO Libraries Suite 16.

VISA COM Example in Python

You can use the Python programming language with the "comtypes" package to control Keysight oscilloscopes.

The Python language and "comtypes" package can be downloaded from the web at <http://www.python.org/> and <http://starship.python.net/crew/theller/comtypes/>, respectively.

To run this example with Python and "comtypes":

- 1 Cut-and-paste the code that follows into a file named "example.py".
- 2 Edit the program to use the VISA address of your oscilloscope.
- 3 If "python.exe" can be found via your PATH environment variable, open a Command Prompt window; then, change to the folder that contains the "example.py" file, and enter:

```
python example.py
```

```

VISA Example in C#

To compile and run this example in Microsoft Visual Studio 2008:

- 1 Open Visual Studio.
- 2 Create a new Visual C#, Windows, Console Application project.
- 3 Cut-and-paste the code that follows into the C# source file.
- 4 Edit the program to use the VISA address of your oscilloscope.
- 5 Add Keysight's VISA header file to your project:
 - a Right-click the project you wish to modify (not the solution) in the Solution Explorer window of the Microsoft Visual Studio environment.
 - b Click **Add** and then click **Add Existing Item...**
 - c Navigate to the header file, visa32.cs (installed with Keysight IO Libraries Suite and found in the Program Files\IVI Foundation\VISA\Win64\agvisa\include directory), select it, but *do not click the Open button*.
 - d Click the down arrow to the right of the **Add** button, and choose **Add as Link**.

You should now see the file underneath your project in the Solution Explorer. It will have a little arrow icon in its lower left corner, indicating that it is a link.
- 6 Build and run the program.

For more information, see the tutorial on using VISA in Microsoft .NET in the VISA Help that comes with Keysight IO Libraries Suite 16.

VISA Example in Visual Basic .NET

To compile and run this example in Microsoft Visual Studio 2008:

- 1 Open Visual Studio.
- 2 Create a new Visual Basic, Windows, Console Application project.
- 3 Cut-and-paste the code that follows into the Visual Basic .NET source file.
- 4 Edit the program to use the VISA address of your oscilloscope.
- 5 Add Keysight's VISA header file to your project:
 - a Right-click the project you wish to modify (not the solution) in the Solution Explorer window of the Microsoft Visual Studio environment.
 - b Choose **Add** and then choose **Add Existing Item...**
 - c Navigate to the header file, visa32.vb (installed with Keysight IO Libraries Suite and found in the Program Files\IVI Foundation\VISA\Win64\agvisa\include directory), select it, but *do not click the Open button*.
 - d Click the down arrow to the right of the **Add** button, and choose **Add as Link**.
 You should now see the file underneath your project in the Solution Explorer. It will have a little arrow icon in its lower left corner, indicating that it is a link.
 - e Right-click the project again and choose **Properties**; then, select "InfiniiVision.VisaInstrumentApp" as the **Startup object**.
- 6 Build and run the program.

For more information, see the tutorial on using VISA in Microsoft .NET in the VISA Help that comes with Keysight IO Libraries Suite 16.

VISA Example in Python

You can use the Python programming language with the PyVISA package to control Keysight oscilloscopes.

The Python language and PyVISA package can be downloaded from the web at <http://www.python.org/> and <http://pyvisa.readthedocs.org/>, respectively.

To run this example with Python and PyVISA:

- 1 Cut-and-paste the code that follows into a file named "example.py".
- 2 Edit the program to use the VISA address of your oscilloscope.
- 3 If "python.exe" can be found via your PATH environment variable, open a Command Prompt window; then, change to the folder that contains the "example.py" file, and enter:

```

python example.py

To compile and run this example in Microsoft Visual Studio 2008:

- 1 Open Visual Studio.
- 2 Create a new Visual C++, Win32, Win32 Console Application project.
- 3 In the Win32 Application Wizard, click **Next >**. Then, check **Empty project**, and click **Finish**.
- 4 Cut-and-paste the code that follows into a file named "example.c" in the project directory.
- 5 In Visual Studio 2008, right-click the Source Files folder, choose **Add > Add Existing Item...**, select the example.c file, and click **Add**.
- 6 Edit the program to use the SICL address of your oscilloscope.
- 7 Choose **Project > Properties....** In the Property Pages dialog, update these project settings:
 - a Under Configuration Properties, Linker, Input, add "sicl32.lib" to the Additional Dependencies field.
 - b Under Configuration Properties, C/C++, Code Generation, select Multi-threaded DLL for the Runtime Library field.
 - c Click **OK** to close the Property Pages dialog.
- 8 Add the include files and library files search paths:
 - a Choose **Tools > Options....**
 - b In the Options dialog, select **VC++ Directories** under Projects and Solutions.
 - c Show directories for **Include files**, and add the include directory (for example, Program Files\Agilent\IO Libraries Suite\include).
 - d Show directories for **Library files**, and add the library files directory (for example, Program Files\Agilent\IO Libraries Suite\lib).
 - e Click **OK** to close the Options dialog.
- 9 Build and run the program.

SCPI.NET Examples

These programming examples show how to use the SCPI.NET drivers that come with Keysight's free Command Expert software.

While you can write code manually using SCPI.NET drivers (as described in this section), you can also use the Command Expert software to:

- Connect to instruments and control them interactively using SCPI command sets.
- Quickly prototype and test command sequences.
- Generate C#, VB.NET, or C/C++ code for command sequences.
- Find, download, and install SCPI command sets.
- Browse command trees, search for commands, and view command descriptions.

The Command Expert suite also comes with Add-ons for easy instrument control and measurement data retrieval in NI LabVIEW, Microsoft Excel, Keysight VEE, and Keysight SystemVue.

For more information on Keysight Command Expert, and to download the software, see: <http://www.keysight.com/find/commandexpert>

SCPI.NET Example in C#

To compile and run this example in Microsoft Visual Studio 2008:

- 1 Install the Keysight Command Expert software and the command set for the oscilloscope.
- 2 Open Visual Studio.
- 3 Create a new Visual C#, Windows, Console Application project.
- 4 Cut-and-paste the code that follows into the C# source file.
- 5 Edit the program to use the address of your oscilloscope.
- 6 Add a reference to the SCPI.NET driver:
 - a Right-click the project you wish to modify (not the solution) in the Solution Explorer window of the Microsoft Visual Studio environment.
 - b Choose **Add Reference...**
 - c In the Add Reference dialog, select the **Browse** tab, and navigate to the ScpiNetDrivers folder.

- Windows XP: C:\Documents and Settings\All Users\Agilent\Command Expert\ScpiNetDrivers
 - Windows 7: C:\ProgramData\Agilent\Command Expert\ScpiNetDrivers
- d** Select the .dll file for your oscilloscope, for example **AgInfiniiVision4000X_03_11.dll**; then, click **OK**.

7 Build and run the program.

SCPI.NET Example in IronPython

You can also control Keysight oscilloscopes using the SCPI.NET library and Python programming language on the .NET platform using:

- IronPython (<http://ironpython.codeplex.com/>) which is an implementation of the Python programming language running under .NET.

To run this example with IronPython:

- 1 Install the Keysight Command Expert software and the command set for the oscilloscope.
- 2 Cut-and-paste the code that follows into a file named "example.py".
- 3 Edit the program to use the address of your oscilloscope.
- 4 If the IronPython "ipy.exe" can be found via your PATH environment variable, open a Command Prompt window; then, change to the folder that contains the "example.ipy" file, and enter:

```

ipy example.ipy
