# Chapter 1

## Introduction

This introductory chapter is a brief explanation of the content and format of the Communicator/1000.

### 1.1 Purpose of the Communicator/1000 and how to use it.

The Communicator/1000 accompanies software, firmware and/or manual updates. It is designed to be a reference document to describe product changes and to give general considerations on how to incorporate these changes in the system.

The Communicator/1000 performs basically three functions:

- 1) Describe the *changes* that have occurred *within* a product for both maintenance and enhancements (Chapter 2).

If the change is in response to a Service Request from the field, this is noted. The descriptions are meant to be a quick overview to give the user a condensed look at the changes. More specific information must be obtained from the particular product's updated manuals.

When changes made to a product affect the generation, loading, or installation of that product, mention is made in Chapter 4. Major usage changes are also mentioned in Chapter 4. Again, for specific instructions you should refer to the appropriate manual.

- 2) List the *Current Revision Codes, Updated Media* and *Manual Part Numbers* for each product (Chapter 3). This chapter indicates:

- the current revision codes for the software modules and firmware belonging to a product,
- the software media part numbers and firmware that are being shipped in this update cycle; these media will contain the updated software for a particular product,
- the part numbers of the manuals that are being updated in this update cycle.

Chapter 3 is not intended to replace the Software Numbering Catalog or Software Numbering File for each product, but rather it is intended to be a quick reference source for revision codes and a help in determining what media and manuals will be received by a customer for a particular product.

3) Describe different *media formats* sent to a customer along with a brief explanation of the *Software Update Procedures* associated with each media (Chapter 5).

All software media can be read by HP-supported utilities which are described in various manuals. The user is directed to the appropriate reference manual for more specific instructions.

How to use the Communicator/1000:

The following are some suggestions to help you use the Communicator/1000 as a reference:

- When you receive the Communicator/1000, check Chapter 1 for any changes that might have occurred in the Communicator/1000 format and could affect how you will use it.
- Depending on the products for which you have a subscription service and the media you have chosen, you will receive a set of software and/or firmware media and manuals. If you are unfamiliar with the media you have received, check Chapter 5 for a description of the media format and suggestions for update procedures.
- Before you regenerate your system or load any software on-line, be sure to look through Chapter 4 to see if there have been any changes to load or generation procedures.
- Chapter 3 can be used to resolve any confusion concerning what software or manuals you should have received. Any software files or manuals that have been deleted from or added to the product will be highlighted there.
- Chapter 2, along with the updates you receive for your manuals, describes the corrections and enhancements made in this update cycle.

|             |
|-------------|
| <b>NOTE</b> |
|-------------|

The Communicator/1000 is only a quick reference document for an update cycle and is not intended to supersede the product manuals. Refer to the product manuals for the precise information on how to use the product.

## 1.2 Update Naming Convention

The naming convention used in the past for update cycles was:

x.yy where: x = A,B,C, etc  
yy= last 2 digits of year

e.g. A.83 = the first software update in 1983.

However, in order to decouple the update cycles from the calendar year, the naming convention has been changed to

X.YZ where: X corresponds to a major operating system release  
Y corresponds to a minor operating system or subsystem release  
Z corresponds to a revision to a release

This naming convention will be used in all references to a particular cycle.

This current update cycle is called 'DSD4.0' or '4.00' - that is, major operating system release number FOUR.

Note that in certain literature such as the Software Status Bulletin (SSB), the '.' is replaced by a '0' for convenience. Therefore, release 4.00 is also known as 4000 in some places.

The software in an update may be of different revision codes. This means that the revision code of a software product does not indicate the update cycle in which that software product will be released. An example might be that update 5.00 is released in May 1987 and contains Graphics software of revision 2540, Image software of revision 2601, DD.00 driver of revision 2640, etc.

The next update will be revision 4.10 or 4010.

### 1.3 Communicator/1000 Format Changes

Continuing the change introduced in the A.85 Communicator, the format of chapter 3 allows for the use of the new hierarchical file system on RTE-A and RTE-6/VM. Those changes were

- The file name field was expanded from six characters to twenty-one. To accomodate this, the module field was eliminated.
- For products that are shipped in the hierarchical file format, path names are given on a separate line to help identify where specific parts can be found.

These changes affect subsystems that run only on RTE-A and RTE-6/VM (e.g., Debug/1000 and Image/1000-II). Other subsystems remain unchanged (in format).

Another small change was carried over in chapter 3: a star (\*) appears after the product name for all products that support the hierarchical file system. This was in response to input we received at an Interex conference some time ago.

New to this DSD4.0 Communicator are the following:

1. Chapter 2 is much better organized, thus easier to use.
2. Chapter 3 contains the latest firmware information.
3. Chapter 4 includes usage information as well.
4. Chapter 5 has been updated.

We hope that all these improvements are helpful.

## Chapter 2

# Description of Software Changes

This chapter describes the reasons behind the software changes in this update. Changes that were initiated by Service Requests filed are listed with their SR numbers.

The entries are categorized into three types: Problem/Solution, Enhancement, and Note. A Problem/Solution entry describes a problem along with the actions taken by Hewlett-Packard to fix it. An Enhancement entry similarly describes a modification to software that improves its utility or simplicity of usage. Finally, a Note contains useful information about a change that may impact the user but is not directly related to a software fix or enhancement.

The products are sorted by their part numbers. For each product, the entries are grouped by their affected functional area (if applicable). For example, RTE-A has "Bootex" entries first, followed by those of "Build". Under each functional area, the entries are further grouped by Problem/Solution, Enhancements, then Notes, where the SR numbers are sorted numerically. Please see the SR Index for a numerical list of ALL the SR numbers. We hope that this format will make the Communicator much easier to use.

For more information on individual filenames that have changed, please refer to chapter 3.

## 2.1 (24398B) Peripheral Diagnostics (L,A-Series)

### 2.1.1 EXER

**SR# NONE**

**ENHANCEMENT:** EXER is enhanced to support the 7907 disc and to work on-line.

## 2.2 (24612A) Offline Diagnostics (A-Series)

### 2.2.1 24612A

#### SR# 2200021287

**PROBLEM:** When executing test 8 of the SFD (system functional diagnostics) to test the battery backup circuitry, a parity error is observed on the A900 on an average of 1 in 50 power cycles. VCP then reports "PTEST ERROR 340 204".

**SOLUTION:** The SFD (system functional diagnostics) has been fixed to stop writing to memory after 5 msec. This allows the powerfail test to complete successfully.

#### SR# 2200023838

**PROBLEM:** When the A-series I/O extender control card (IOC) is the first card after the CPU, the System Function Diagnostic (SFD) fails.

OSUTL FAILED  
LINE 410 STOP  
A reg = 77b B reg = 21b

**SOLUTION:** relative address in SFD is 2277b  
We delayed the execution of the .SIP (skip if interrupt pending) instruction after the i/o reset (CLC 0,C).

#### SR# 5000063412

**PROBLEM:** During an access to the CS80 disc unit a Bad DSJ is reported. This results from a request release command from the disc controller which is not being answered by the diagnostics.

**SOLUTION:** The disc driver now checks for a release request from the CS80 drive. It will now send the release command to the controller, so the CS80 disc can take itself off-line for maintenance (Auto head align., etc.)

#### SR# NONE

PROBLEM: The MCD fails when the log device is the line printer.

SOLUTION: Modified the LP driver for the diagnostic so it now works for the 263x printers when executing the MCD diagnostics.

## 2.3 (91711B) Online Diagnostics (M,E,F-Series)

### 2.3.1 TXPM1/TXPM2/TXPM3

#### SR# 2200002378

PROBLEM: TXPFO cannot be reloaded after entry points have been changed. Programs loaded with LINK still use software entries.

SOLUTION: TXPFO now reminds user that LINK snap files must be rebuilt. These include SNAP.6 on FMGR disk LUs and SNAP.SNP::LIBRARIES for CI disks. Run LINDX for runstring information. Note that neither the operating system or system-generated programs can take advantage of optional firmware even after the CH (change) option is run. Only programs that are reloaded AFTER the CH option is run will be affected.

Also, %\$TXPF has been added to the Primary to allow reloading TXPFO without requiring the 91711B product tape. The CH option has been moved from parameter #2 to parameter #5 to match other 91711B program runstrings.

#### SR# 2200013268

PROBLEM: TXPM1 could not run without programs TXPM2 and TXPM3 first RP'd. Also, multiple copies of TXPM1 could not be run due to partition assignment conflicts.

SOLUTION: TXPM1 now RP's a copy of both TXPM1 and TXPM2 using IDRPL. This requires that TXPM2 and TXPM3 reside on an FMGR disk LU. The clones are uniquely named for each copy of TXPM1 that is run. The renaming takes place in the 3rd character to allow 26 names for the slaves. Each copy of TXPM will use 2 names (ie, TXP33 will clone

TXA33 and TXB33 for session 33).

**SR# 2200023069**

**PROBLEM:** TXPFO was updated for RTE-6 but not made backward compatible.

**SOLUTION:** TXPFO now handles both EMA and VMA correctly. Also, TXPFO will report errors when the appropriate firmware is missing or when inappropriate firmware is present (ie, VMA in RTE-4B). This change requires that TXPFO be loaded in a specific order (#TXPFO). The merged relocatable (%\$TXPF) supplied with the Primary is correctly ordered.

**SR# 2200057018**

**PROBLEM:** When TXPFO is run without selecting all firmware to be checked, several misleading error messages are emitted.

**SOLUTION:** TXPFO has been changed to eliminate the partial testing and is no longer interactive. All installed firmware is tested as appropriate to the CPU type. Several new warnings and error messages have been added. A runstring help command (RU, TXPFO, ?) has been added.

Repeated passes may be made, and a time delay between passes can be specified. All runtime information can be suppressed and the results are always returned in globals 1P thru 5P. The M-series CPU is now tested. TXPFO grew approximately 1 or 2 pages to 21 to 25 pages.

The S-register would be destroyed by TXPFO tests..this is now retained. TXPFO cannot function on non-MX series computers. A check is made for this condition. The CH option is syntaxed when run in RTE-4. Memory Protect errors could occur when testing non-existent firmware. This is due to MEF-computer handling of undefined opcodes. TXPFO now skips firmware tests that could cause this condition (ie, SIS tests in an E-series).

A number of F-series computers have SIGNAL/1000 ROMs. These are now tested.

**SR# 2200057430**

**PROBLEM:** CS80 versions of the Primary report track errors when running TXPFO with the CHange command.

**SOLUTION:** TXPFO now calculates the system library addresses correctly and reports entry points that could not be found.

**SR# NONE**

PROBLEM: TXPFO will halt older E-series computers when testing for DS ROMs that are not present.

SOLUTION: TXPFO no longer tests for DS ROMs in E-series; only M or F-series computers.

**SR# NONE**

PROBLEM: Naming convention for merge files vs. LOADR/LINK directives.

SOLUTION: #TXPF is now the LOADR/LINK file to load the composite relocatable %TXPF, and \*TXPF is a new part number that contains the MERGE commands for creating %TXPF.

**SR# NONE**

PROBLEM: TXPFO would produce undefined externals when loaded.

SOLUTION: The entry points .SWP, .UMPY, .MYAD, .LDAS and .STAS were removed from &RPTBL since they were never completed in the RTE-6 firmware release. The entry points .EMAP and .EMIO may be undefined in RTE-6 unless \$EMCLB is generated-in or searched while loading TXPFO. The entry points UNSCR or PRSCR (and others) will occur if SIGNAL/1000 is not installed.

TXPFO is designed to work when force-loaded. This is how TXPFO determines that an entry point is not in the system library. The only entry points that cannot be undefined for TXPFO are from the %DECAR library; most start with the letter Q (ie, QWRIT, QOCTR, etc). TXPFO will MP or DM under these conditions. TXPFO undef's can be satisfied from libraries searched online; however, RP's cannot be changed for online libraries and a error message will be issued when appropriate.

**SR# NONE**

PROBLEM: The RTE-6 operating system ROMs were not tested. Useful information was not being reported from the RTE-6 ROMs.

SOLUTION: The RTE-6 operating system ROMs are now tested. In addition, the RTE-6 selftest returns information about the RPL switches on the main CPU board, and contents of the installed loader ROMs can be read back. This information is now formatted and reported in the verbose mode (when parameter #3 is positive). If parameter #3 is +2 then a complete listing of the installed loader ROMs' code is also done to aid in identifying loader ROM problems. RTE-6 operating system entry points are now tested.

**SR# NONE**

PROBLEM: TXPM1 did not save a copy of the MAT entry before changing the entry to a non-SHEMA partition.  
SOLUTION: TXPM1 now saves and restores the MAT entry correctly. Comments added to &NPART to clarify this requirement.

**SR# NONE**

PROBLEM: TXPF2 needs more information, pass control, time delays.  
SOLUTION: A 3 level output control value has been added to TXPF2 to allow deleting all output, normal and verbose output (same as TXPM1). Pass and error counts are returned in globals 1P-5P. Pass count may be negative to run forever. Time delays between passes may be in -milliseconds or +seconds. Runstring information can be shown with ? as the first parameter (RU,TXPF2,?).

**SR# NONE**

PROBLEM: TXPF1 needs more information, pass control, time delays.  
SOLUTION: A 3 level output control value has been added to TXPF1 to allow deleting all output, normal and verbose output (same as TXPM1). Pass and error counts are returned in globals 1P-5P. Pass count may be negative to run forever. Time delays between passes may be in -milliseconds or +seconds. Runstring information can be shown with ? as the first parameter (RU,TXPF1,?).

**SR# NONE**

PROBLEM: TXPM0 needs more information, pass control, time delays.  
SOLUTION: A 3 level output control value has been added to TXPM0 to allow deleting all output, normal and verbose output (same as TXPM1). Pass and error counts are returned in globals 1P-5P. Pass count may be negative to run forever. Time delays between passes may be in -milliseconds or +seconds. Runstring information can be shown with ? as the first parameter (RU,TXPM0,?).

**SR# NONE**

PROBLEM: System-generated errors were cryptically reported.  
SOLUTION: Calls to MESSS that failed would show only the RTE response but not the text sent to RTE. For instance, if TXPM2 was loaded as a type 3 program and then sized to 28 pages, the error message "SIZE ERROR" would be shown and TXPM1 would stop without further comment. The error message now shows both the command and the response.

**SR# NONE**

PROBLEM: Undefined (downed) partitions would stop TXPM1.  
SOLUTION: An error in scanning the memory allocation tables would allow TXPM1 to try assigning a slave to the undefined partition. This has been fixed; now, a parity error that downs a partition will not stop the test procedure.

**SR# NONE**

PROBLEM: Testing memory online with other applications causes excessive delays.  
SOLUTION: TXPM1 has an optional time delay that allows either -millisecond delays or +seconds up to +32767 (9 hours). This delay is executed after each pass of a complete memory test. The priority for TXPM1 is now 98 and the slaves, TXPM2 and TXPM3 are 99. TXPM1 should always have a lower priority value than the slaves to allow proper operation with multiple copies of TXPM1 running at the same time.

**SR# NONE**

PROBLEM: If TXPM2 is loaded with LOADR, the program type defaults to 3 and thus could not be assigned to partitions set up for large background programs.  
SOLUTION: TXPM1 checks TXPM2's program type before continuing and will comment appropriately.

**SR# NONE**

PROBLEM: It is not clear what TXPM1 is doing during the partition tests.  
SOLUTION: TXPM1 has quiet, normal and verbose mode controlled by the 3rd parameter in the runstring. In the verbose mode, every partition test is commented in detail. To aid long-term testing, TXPM1 also passes test results back in 1P-5P globals.

**SR# NONE**

PROBLEM: Shared EMA (SHEMA) partitions were tested without restriction. This would corrupt shared data in a system where SHEMA programs were active.  
SOLUTION: SHEMA tests are now optional. TXPM1 will comment if

SHEMA is present but not tested.

**SR# NONE**

PROBLEM: TXPM1 would not respond to system BREAK.  
SOLUTION: TXPM1 and the 2 slaves, TXPM2 and TXPM3 now respond to system BREAK.

**SR# NONE**

ENHANCEMENT: TXPM1 will display runstring parameters when run with ? as the first parameter (RU, TXPM1, ?). In addition, the pass count may be negative to specify run forever.

## 2.4 (91747A) DataShare/1000

### 2.4.1 DATASHARE

**SR# 2200021188**

ENHANCEMENT: The CI version of D.RTR has been enhanced to include DataShare/1000 features, and this version of D.RTR has been put into the DataShare product (the RTE-6/RTE-A version of D.RTR will not have the DataShare features). DataShare will still only work with FMGR cartridges (i.e., no sharing is done with CI files), but CI volumes can now coexist on a system with DataShare cartridges.

This update eliminates the need for \$FMP6C, which was used to load HP utilities on a DataShare system; utilities can now be loaded using the standard \$FMP6 library. DataShare still has its own versions of %BMPG1, %BMPG2 (containing the updated D.RTR), and %BMPG3, as well as other DataShare-specific software.

## 2.4.2 OPERATING SYSTEM

### SR# 2200005686

**PROBLEM:** Only up to 63 shareable EMA programs are allowed; the maximum of 256 shareable EMA programs causes problems.

**SOLUTION:** This problem has been fixed by allowing SHEMA programs to share ID-EXTensions if the data in them is the same. A shared count is kept in the last word of the extension (count -1) and when it goes negative, the ID-EXT is released. Changes were made to the system library routines IDDUP, IDRPL, as well as to MLLDR, LOADR, \$CNFX and the system OF routine. In addition the system SZ routine was changed to disallow changing the MSEG size if the program uses SHEMA, since the MSEG size is in the ID-EXT. In addition the following routines were added to the system library (note, these routines are not for general use and are included here only for completeness): \$FINDIDEXT, \$SETIDEXT, \$SETDRIDEXT, \$LKL2, \$FREEIDEXT.

Shared ID-EXTs are supported by all system code except the generator. Such programs may be loaded by MLLDR, or LOADR as well as RPed or RUn after a LINK load. \$CNFX correctly accounts for them if the system is reconfigured after such programs are added to the system by MLLDR or LOADR.

Error 31 is added to \$CNFX. It indicates that \$CNFX has run out of ID-EXTs. This is possible if programs are reconfigured such that programs that once shared ID-EXTs can no longer do so.

## 2.5 (91750A) DS/1000-IV

### 2.5.1 DEXEC 99

#### SR# 2200019687

PROBLEM: If a program is both "dormant saving resources" and in the "time list" DEXEC 99 reports "dormant saving resources" (TL bit is not set in the returned status).

SOLUTION: PGMAD (an internal DS/1000-IV module) is fixed to report the state of the program as in the time list if it is both in the time list and dormant saving resources.

## 2.5.2 DSINF

### SR# NONE

PROBLEM: DSINF will report statistics for DS cards which are not present in the system. This is due to the facts that if an LU is set down with a request pending and then brought back up, the request is completed with a no abort return and bit 0 of the status word set.

SOLUTION: DSINF now checks bit 0 of the status word upon return from the attempted reads and reports any error.

### SR# NONE

PROBLEM: The M/E/F version of DSINF incorrectly checks to see if it was running on an RTE-6 system when processing the LU command. It always uses 8 bits from the DRT as the EQT number. On MIII and RTE-4 systems the EQT is only 6 bits. This may cause DSINF to not report any information on the specified LU.

SOLUTION: The check has been corrected.

## 2.5.3 DSLIN

### SR# 2200013151

PROBLEM: DSLIN will initialize a Bisync link with a buffer size larger than the maximum System Available Memory which will ever be available.

SOLUTION: DSLIN now attempts to allocate the amount of S.A.M.

specified as the buffer's size. DSLIN will still initialize the link with the selected buffer size but will WARN the user if the buffer specified is not now or will never be available. It is up to the user to take corrective action.

**SR# NONE**

**PROBLEM:** DSLIN could report up to three buffer sizes to the user when run with the default parameters. In some cases, the buffer size reported for the card is not in fact the buffer size used by the card.

**SOLUTION:** The default buffer size for the link is now set to the lesser of the configured buffer size and 1024. This prevents DSLIN from attempting to initialize the link with a buffer size larger than the 3000 INP can accept. If an SSLC card is being used on the 3000 the user may override the default with a buffer size of 1072 words (the maximum the SSLC card will accept).

**SR# NONE**

**PROBLEM:** DSLIN does not expect an OPEN option from a command file, even though the CLOSE option could be specified. This causes some confusion in the use of DSLIN command files.

**SOLUTION:** DSLIN now expects all input except the LU number to be in the command file.

**SR# NONE**

**PROBLEM:** If the the user hits carriage return in response to a prompt from the program DSLIN, the program will loop until aborted.

**SOLUTION:** The input routines have been modified to correctly handle null input.

## 2.5.4 DSMOD

**SR# NONE**

PROBLEM: DSMOD accepts commands only in upper case.

SOLUTION: Now DSMOD accepts commands in lower case as well as upper case.

## 2.5.5 Device Status

SR# NONE

PROBLEM: In checking the dynamic status of a tape drive, bit 4 of the returned status word indicates beginning of the tape on RTE-A but may indicate an error on other systems. When checking the status of the device, this bit is interpreted as an error and logging is marked down.

SOLUTION: The program QUEX and the subroutine D\$WLG have been modified to not mark logging down if this bit is set.

## 2.5.6 HP1000-HP3000 links.

SR# 5000101220

SR# 2200015214

SR# 2200015198

PROBLEM: Carriage control was not always handled correctly when converting from 3000 FWRITE format to 1000 REIO format. Problems included no CR/LF before new RMOTE prompt, no CR/LF for FORTRAN I/O and an extra CR/LF for FORTRAN ACCEPT statements.

SOLUTION: Several fixes were made to forms control handling in subroutine D3KMS.

## 2.5.7 HP3000 Logon UDCs

SR# 5000053165

PROBLEM: Attempts to read or write more than about 133 words from/to the terminal from an HP3000 logon UDC will fail. This problem is seen when running RMOTE and logging on to a 3000 account whose logon UDC runs a program which attempts such reads/writes. The problem is due to the fact that the HELLO subroutine must buffer the read/write data in a 133 word buffer in subroutine D3KMS.

SOLUTION: The program RMOTE and the subroutine HELLO have been modified to allow read/write data to be buffered at the end of RMOTE's partition. The length of data which may be read/written during logon is now determined by the size of RMOTE's partition. Any other program calling the HELLO subroutine is still restricted to a limit of 133 word reads and writes during logon.

## 2.5.8 LOG3K

SR# NONE

PROBLEM: LOG3K truncated a warning message to the user.

SOLUTION: The full message is now printed.

## 2.5.9 LUMAP

SR# 5000056119

PROBLEM: LUMAP's buffer length is defined as 521 instead of 512.

SOLUTION: Changed the buffer length to 512.

## 2.5.10 NS/1000 compatability

SR# NONE

ENHANCEMENT: Added new entry points for NS/1000. Also moved the

entry point D\$XS5 from D\$EQT into RESA so that D\$EQT is no longer required in labeled common on RTE-A systems.

### 2.5.11 PROGL

**SR# NONE**

**PROBLEM:** PROGL reports checksum error if PROGL's class number is bad. The portion of the code which is responsible for terminating PROGL in the case of a bad class number is incorrect.

**SOLUTION:** Now PROGL aborts if the class number is bad.

### 2.5.12 PTOP

**SR# 5000052464**

**PROBLEM:** Optional user buffer is overwritten in a GET call for any request other than PWRIT. The optional user buffer address is always passed to RTE GET call. This causes the buffer to be overwritten.

**SOLUTION:** Now the optional buffer is passed to RTE GET call only if the request is a PWRIT.

### 2.5.13 QUEX

**SR# NONE**

**PROBLEM:** QUEX uses the configured buffer size when checking for an acceptable buffer size from the 3000. This buffer size may, in fact, be larger than what the PSI card has been configured to use.

**SOLUTION:** QUEX now accepts the lesser of the requested buffer size, the communications buffer, and the cards configured buffer size. The communications buffer size

is determined by the selection of a "buffer library" as described in the Network Managers Manual.

**SR# NONE**

**PROBLEM:** Program QUEX never sends an accept to a DS/3000 termination request. The next message sent by DS/1000-IV is mistaken for a reply to the termination request. Under certain timing conditions this would cause the line to become unavailable for DS traffic.

**SOLUTION:** QUEX has been modified to send a termination reply to the 3000 rather than sending a disconnect request to the PSI card.

**SR# NONE**

**PROBLEM:** When QUEX received a reply from the 3000 for which there was no master TCB the buffer was flushed but not reported.

**SOLUTION:** In such cases QUEX now reports (via QCLM) a possible timeout to the system console.

## 2.5.14 RMOTE

**SR# NONE**

**PROBLEM:** Current command files didn't function correctly.

**SOLUTION:** New command files have been created, based upon the type of system the user is loading on (e.g. RTE-A, RTE-6/VM).

**SR# NONE**

**PROBLEM:** RMOTE receives an MPE file system error 43 if an attempt is made to move a type 1 file to the 3000. The problem is due to RMOTE using a read request length of 384 for all file types. For all but type 1 files, one record (up to 384 words) will be returned. For type 1 files a full 384 words is returned which is longer than the record length of the 3000 file.

SOLUTION: For type 1 files RMOTE always uses a length of 128 words on the read request.

## 2.5.15 RTMLG

SR# 2200045468

PROBLEM: When a program is relocated using RTMLG and DEBUG is appended to the program, the program doesn't work when run in the RTE-M system for which it was relocated.

SOLUTION: Corrected definition of constant 'DEBUG' in RTML4.

SR# 2200024315

SR# 2200053363

PROBLEM: RTMLG reports FMP -32 error on termination. Errors for file close were being checked incorrectly.

SOLUTION: Eliminated error check on file close.

SR# 5000046045

PROBLEM: Non-standard linkages between subroutines in different segments did not allow LINK to be used to Load RTMLG.

SOLUTION: Moved some entry points into the modules that called them, replaced some special routines with standard system routine calls. LINK now works for RTMLG.

SR# 5000081497

PROBLEM: RTMLG reports ERR NM (no memory) in RTE-6/VM. A non-standard LIMEM routine in LGLIB was used.

SOLUTION: Replaced with call to system routine.

SR# NONE

ENHANCEMENT: RTMLG will now load and run on RTE-A. It will not, however, talk to CI files.

## 2.5.16 Timeouts

SR# 2200015206  
SR# 5000083956

**PROBLEM:** Setting of terminal timeouts was actually implemented at A.85. The old timeouts were not, however, correctly restored at that time. This problem has been fixed on local terminals. If running RMOTE on a mapped terminal the user may find that their terminal timeout has been set to zero after exiting. This is due to the fact that current drivers do not all provide a means of retrieving the old terminal timeout for later restoration.

**SOLUTION:** The original timeout is now restored correctly on local terminals.

## 2.5.17 Undefined Externals

SR# NONE

**PROBLEM:** Both RMOTE and LOG3K calls the system routine SPOPEN which does not exist on RTE-A/XL systems. This required these programs to be force-loaded on these systems.

**SOLUTION:** The call to SPOPEN has been replaced by a call to a new routine D\$OPN. On RTE-A/XL systems this routine is a stub which returns an error to the caller. On all other systems the routine just makes the call to SPOPEN.

## 2.6 (91781A) RJE/1000-II

### 2.6.1 \$opsy

SR# 5000084475

PROBLEM: Need to renegotiate the B-register on driver returns for RTE-A only.  
SOLUTION: Added the RTE-A A.85 and DSD4.0 opsy number (-53).

## 2.6.2 Files

SR# 5000098632

PROBLEM: Type 2 files do not have the same EOF indicator as do all others. When sending a type 2 file a FMP -12 error would occur.  
SOLUTION: Added code to test for and handle type 2 files.

## 2.6.3 PSI LU

SR# NONE

PROBLEM: When an LU is unassigned and RINIT tries to initialize it a fatal error occurs. The LURQ system call returns a good value when it locks an unassigned LU.  
SOLUTION: The code now uses the lockedLU call to check to see if the LU is locked. Added error message to determine if the LU is down or unassigned.

## 2.6.4 Post-processor

SR# NONE

ENHANCEMENT: Added a post-processor that uses IBM JCL comments to determine the destination of the host's streams.

## 2.6.5 Runstring

SR# 5000075606

PROBLEM: The user interface program (RJE) only permitted a 80 character runstring. This was due to the lack of the runstring compiler option. A user could not specify all

SOLUTION: eight possible filenames if they were long filenames.  
Added the runstring option -- 600 characters is the maximum length.

## 2.6.6 Termination Message

SR# NONE

PROBLEM: If RJE terminates before the log file is opened then the termination message is not displayed properly on the system console.

SOLUTION: Added a delay after submitting message to allow class I/O to complete the write to the system console.

## 2.6.7 Timeout

SR# 5000094482

SR# 5000094490

PROBLEM: The timeout period on the card lu's was too short.

SOLUTION: Lengthened it.

## 2.7 (91782A) DSN/MRJE 1000

### 2.7.1 Error Messages

SR# NONE

PROBLEM: Under certain conditions a bad configuration file could cause the message "Bad configuration file." to be output twice.

SOLUTION: Repaired the incorrect code.

SR# NONE

PROBLEM: Undocumented debugging message "proc\_link end". This

message has no meaning for the user.  
**SOLUTION:** Deleted the message from the code in the line monitor.

## 2.7.2 Files

### SR# 2200012153

**PROBLEM:** A null byte was being written as the first byte of a punch record.

**SOLUTION:** The punch SRCB is now being written out as the first byte of the punch record. This is analogous to the print records in print files.

### SR# 2200013425

**PROBLEM:** The security code in the queue file namr wasn't supported: the cartridge reference was misused as the security code.

**SOLUTION:** We corrected the fopen call that mangled the file namr.

### SR# 2200011502

### SR# 2200013615

### SR# 5000094359

**PROBLEM:** MRJE did not use the file size parameter in the FMGR namr and had a fixed size file extent.

**SOLUTION:** It now supports the full FMGR namr.

### SR# NONE

**PROBLEM:** If a user specified a security code or cartridge reference on the download file, it was ignored. It was not sent to DCTF1 (which handles the download file).

**SOLUTION:** Now the full download file namr is sent to DCTF1 and DCTF1 supports and uses these additional fields.

### SR# NONE

**ENHANCEMENT:** The configuration file now is user-editable. A user can make her configuration file with either EDIT/1000 or MRJE/1000. Since the file is a standard text file, comments can be included on each line. If MRJE generates the file, it also adds comments to each line (with line numbers). This enhancement is to make MRJE/1000 and RJE/1000 more similar.

### 2.7.3 LU's

SR# 2200027110

SR# 5000084681

PROBLEM: Double digit LU's were not usable and even if they were, LU's greater than 63 could not be used.

SOLUTION: Changed the source to use all digits of a LU and to use xluex calls.

### 2.7.4 Protocol

SR# 5000051664

PROBLEM: The standard sequence to end a file is to send an end-of-file record. However some hosts just send a new request on the same data stream without an end-of-file record. This is shorthand for "I want to end the old job and start a new one". MRJE/1000 would hang when the host tries to drop the line; it assumes that another job was due.

SOLUTION: MRJE now understands the implicit end-of-file. It ends the old job and starts a new one.

### 2.7.5 XFTTY

SR# 2200028365

PROBLEM: RTE-A A.85 PCO introduced an entry point XFTTY for RTE-6 compatability. Since MRJE already had this entry point (for the same reason) there was a duplicate entry point.

SOLUTION: Removed the entry point XFTTY from MRJE since the OS has this now.

## 2.8 (91784A) PMF/1000

### 2.8.1 PMF under RTE-6

#### SR# NONE

PROBLEM: PMFMG could not start all of the PMF modules under RTE-6/VM because RTE6/VM version 4.0 does not allow the MSEG size to be changed after a program is RP'ed.

SOLUTION: PMF no longer attempts to change the MSEG size dynamically. SIZE\_PROCESS (in HOSIO) now does SZ,name,EMA\_size instead of SZ,name,EMA\_size,1 (We also added \$Range=Off\$ in this code, to be consistent with the option we specify in the PASCAL run-string.)

## 2.9 (91823A) Control/1000

### 2.9.1 CONTROL 1000

#### SR# 2200026179

PROBLEM: On a Control/1000 system (REV 2320) various problems occurred -- memory protect violations on D.RTR, DS communications errors, system halts -- when doing either of the following two things:

- 1) Chaining with a combination of analog and digital calls.
- 2) Reading from a RELAY MUX card (25504) while running REMAT.

The problem is with ID\*70. The driver does two dummy reads, which are later thrown away, when reading from either an ANALOG INPUT or RELAY MUX card. Anticipatory reads uses 4 quads for setting up the cards for valid readings. The 1st quad is used to select R200 of the MCI card, 2nd and 3rd quads are the dummy reads, and the 4th quad is the actual read.

## SOFTWARE CHANGES (91823A)

The problem involves a one word variable which holds the results of the dummy read (in fact, it holds the garbage address). The variable is in the driver code space instead of in the DVTX area. If DS is being run simultaneously, then ID\*66 is mapped in. At the logical location of the variable, ID\*66 might expect a different value than what is in the dummy variable. Thus DS Communication Error is reported.

**SOLUTION:** The fix to this problem is to put the variable (garbage read address) in the DVTX area instead of the driver code space.

Also, as a precaution, the modifier table for the control bits (DLY,BLK CHP) of Register R200 of the MCI card are put into the DVTX area instead of in ID\*70 code space, just like the anticipatory garbage read address.

Due to the fixes, the DVTX area will grow from 88 words to 97 words -- one for the garbage read address and 8 for the modifier table.

## 2.10 (92049A) Microprogramming

### 2.10.1 Library

**SR# 2200027169**

**PROBLEM:** MPARA will not load with the current revision of the pascal library.

**SOLUTION:** Recompiled all the sources for MPARA.

### 2.10.2 WLOAD

**SR# 2200017970**

**PROBLEM:** WLOAD would MP or UI when the LU command was used.

**SOLUTION:** The Pascal NOABORT compiler directive was added to the external declaration of the XLUEX 13 call (GET\_INTERFACE\_TYPE). The Pascal compiler will then execute the next Pascal statement for the abort return of the XLUEX routine. In addition to the above fix, all EXEC 1, 2, and 13 calls were changed to XLUEX. This will allow WLOAD to access a WCS card with an LU greater than 63.

## 2.11 (92068A) RTE-IVB Operating System

### 2.11.1 ACCOUNTS

#### SR# 2200005579

**PROBLEM:** "New,user" command specifies in the documentation a total limit of 60 for SST spares plus disc limit. Altering a user above this maximum correctly produces the error. However, creating a user above this maximum would create an account with a corrupt SCB. "List,user" shows illegal values and logging-on would create a session that can't be logged-off.

**SOLUTION:** Fixed in the 4.0 update.

#### SR# 2200019539

**PROBLEM:** ACCTS encryption algorithm sometimes puts invalid data in for password. Altering a user's password with the AL,U,<user>.@ can corrupt the user's password. There are actually two conditions where corruption can occur.

- 1) AL,U,<user>.@
- 2) AL,U,@.<group>

**SOLUTION:** Fixed in the DSD4.0.

#### SR# 5000079913

## SOFTWARE CHANGES (92068A)

**PROBLEM:** A.85 ACCTS will abort with a MP error when you try to link a new user to another user. Module ACNWU was writing to a buffer that is not big enough.

**SOLUTION:** This is fixed in the DSD 4.0 update.

### 2.11.2 DVA37

#### **SR# 2200002790**

**PROBLEM:** Control zero [call exec(3,lu)] does not always provide an untalk on the bus.

**SOLUTION:** An untalk/unlisten is now always done before all control requests.

#### **SR# 2200018663**

**PROBLEM:** There were multiple SRQ schedules when only 1 SRQ occurred. It has been observed occasionally that more than one alarm program schedule will result from a single device SRQ.

**SOLUTION:** Some flags are incorrectly set and cleared. A new bit (bit 6) is defined for the HPIB config word and if it is set for a device, then all SRQ's would be disabled for that bus until the device service program reenables them with a control 31b request and optional parameter not = -1. This allows the service program and driver to handle devices like this and avoid extra schedules or avoid not being able to detect unclaimed SRQ's.

### 2.11.3 DVC12

#### **SR# 5000014043**

**PROBLEM:** DVC12 is not re-entrant; a unique copy of the driver must be gen'ed for each 12821 - CIPER printer on the system.

**SOLUTION:** A second copy of DVC12 will be supplied called DVD12. It is made by changing entry points CC12 to CD12 and IC12 to ID12. If a third copy is needed contact your support representative.

**SR# 5000054437**

**PROBLEM:** DVC12 has problems processing timeouts and often generates an illegal interrupt.

**SOLUTION:** During the power fail state, resume processing the current write request instead of exiting the driver and trying to reenter at the top of IC12 via \$upio and letting the TBG go to 0.

**SR# 5000058008**

**PROBLEM:** DVC12 does not handle Ciper error C6 and C8 (data overrun and protocol errors) correctly. This often would crash the system or loop in the driver with interrupt system off.

**SOLUTION:** The code has been changed to explicitly define packet header numbers. The return jump is fixed as well.

**SR# 5000035956**

**ENHANCEMENT:** DVC12 is enhanced to process eqt word 5 status identical to DVB12 except for bit 6.

**SR# NONE**

**ENHANCEMENT:** DVC12 is enhanced to use fewer base page and current page links. It is also modified to not configure on interrupt entry as this was, at times, causing it to loop (probably due to some other failure). Since DVC12 may only be used with one printer, it does need not to reconfigure. For this same reason we are also releasing DVD12, a clone of DVC12 for those who have two printers. In addition, since the driver already keeps almost everything internally, it is changed to not require an EQT extension (X=0).

Additional changes are made to support compressed mode printing (IPARM=3 on control RQ 3003b) and to reconfigure the lines per inch option on powerfail recovery. This driver underwent major surgery with this change and should prove to be much more reliable than in the past.

#### 2.11.4 DVR31

SR# 2200022475

PROBLEM: DVR31 track map call returns the wrong number for sectors per track. The code starting at \$SPCL (line 703) expects to find the # sect/track prior to \$TB31. The generator does not supply this word. This will cause FC to fail when talking to a 7900 disk.

SOLUTION: The driver is modified to supply always the number of sectors per track in the returned track map.

#### 2.11.5 DVR32

SR# 2200002949

PROBLEM: DVR32 incorrectly calculates the number of sectors to verify, resulting in IO NR or IO TO errors.

SOLUTION: The driver is modified to properly calculate the number of sectors involved.

#### 2.11.6 FORMT

SR# 2200006197

PROBLEM: FORMT does not allow formatting LU's > 63. This is a problem in a Datasafe environment where logical LU's are > 63.

SOLUTION: Modify FORMT so LU >63 can be formatted. EQTRQ is also modified so that a system LU > 63 can be modified.

SR# 2200012070

PROBLEM: FORMT cannot spare a spare track. FORMT assumes that a subchannel ends on the last track and does not include spare tracks.

SOLUTION: Add number of spare tracks to total number of tracks for a given LU.

**SR# 2200013565**

**PROBLEM:** FORMT aborts with I007 when using the 93581C Dual Disc Driver. IFDVR checks EQT word 4 bit 11 to see if the driver processes it's own time-out bit. The 93581C dual disc driver (type 32) modifies this so that it looks like an ICD disc. (Only MAC discs are supported by this driver.) At this point, the disc library routines are all confused.

**SOLUTION:** We modified IFDVR such that it uses a different method for determining whether a disc is a MAC or ICD disc. It issues an EXEC request with icode of 2200b on specific lu (use track 0, sector 0). This will return the track map table entry. It checks bit 15 of word 5.

**SR# 2200014670**

**SR# 2200032292**

**PROBLEM:** FORMT requires a capability of exactly 60 to re-format lu 2 or 3.

**SOLUTION:** Allow formatting of LU 2 or 3 if capability is > 60.

**SR# 2200055889**

**PROBLEM:** FORMT cannot format LU'S not in SST.

**SOLUTION:** We changed all EXEC calls in DSCLB to XLUEX with the non-session bit set.

**SR# NONE**

**ENHANCEMENT:** Allow commands given to FORMT to be entered in lower case.

## 2.11.7 GENERATOR

**SR# 2200028126**

**PROBLEM:** A.)Customer submitted an answer file to us that worked at A.84 (2401) With the necessary changes for A.85 (2440), the same answer file causes a GEN ERR 07 -

symbol table overflow. Customer has tried many variations (like leaving out Image) and still got the problem.

The RTE-IVB generator has three words (relative 0,1,2) which define the number of tracks to use for ENT/EXTs, NAMs, and fixups. These are too small.

B.)The RT4GN program needs to have its segments RP'ed to run.

SOLUTION: A.)Changed the number of tracks for ENT/EXTs to 3 and for NAMs to 5.

B.)The generator was changed to call EXEC to get free memory bounds, instead of searching for RT4G3 (its largest segment). This allows T5IDM to do the full job and the segments no longer have to be RPed.

## 2.11.8 INTRINSIC ROUTINES

SR# 2200058362

PROBLEM: ISIGN(IA,IB) where IA and IB are single integer arguments return a result of 0 when IA=3 and IB=0. By definition, the result should be 3.

SOLUTION: The code is changed to return the correct value.

## 2.11.9 KEYS

SR# 2200014746

PROBLEM: Priority of KYDMP in NAM record is too high (10).

SOLUTION: The priority will be changed to 99 .

## 2.11.10 LIBRARY FUNCTIONS

SR# 2200002675

**PROBLEM:** RHPAR fails to return runstrings if a program terminates saving resources and then gets scheduled in the normal way. On the second call to RHPAR the routine checks to see if it has been called before; if so, it does not bother to collect the runstring that was passed. Since the program terminated saving resources, the second string will not be given to it.

**SOLUTION:** RHPAR is changed to call EXEC for the runstring on each entry. If EXEC returns a zero length string, RHPAR assumes the string it got last time (or some prior time) is still valid and uses it. This allows the user to use RHPAR for strings which result from a son program returning as well as the terminate saving resources condition.

### 2.11.11 LUPRN

**SR# NONE**

**NOTE:** LUPRN is made compatible with FTN7X; QSUBS routines are removed.

### 2.11.12 MATH ROUTINES

**SR# 5000078808**

**PROBLEM:** Math library routine DSINH (.DSNH) when evaluated with argument = 0.0d0 should return 0.0d0 . However what is returned into the four words that comprise the double precision result is 000000b,000000b,000000b,177776b.

**SOLUTION:** The routine (.DSNH) divides the result by 2 by subtracting 2 from the exponent... without checking for 0 first. The missing test for zero result has been added before the subtract.

### 2.11.13 POWER FAIL

**SR# 2200008235**

**PROBLEM:** On a system with the 93770 Specials TBG-TOD clock, it is possible for a TBG tick to occur during power fail recovery. There are several instructions at the beginning of the power recovery routine which occur before a CLC 0,C is issued. Since the Specials TBG has an external power source it will continue to tick even if power is lost.

**SOLUTION:** The power fail routine is modified to do the CLC 0,C before allowing any other interrupt. This is done by moving some code to the "down" routine and by making the JMP to the "up" routine indirect.

**SR# 2200013367**

**PROBLEM:** When several power sags occur, the HP1000 powerfail/auto-restart does not appear to work properly. The symptoms include application programs as well as HP programs aborting due to memory protects, dynamic mapping or "RQ" errors.

**SOLUTION:** In as much as this is a software problem, we have changed some code in the power fail routine to plug some holes that are inherent in the hardware.

## 2.11.14 SPOOLING

**SR# 2200010272**

**PROBLEM:** Spool files occasionally hang in queue and will not outspool -- GASP commands are ineffectual (i.e., RS, CS or UP). Problem seems to occur randomly (no known cause). The same sequence of commands that caused the problem once will work most of the time. The size of the offending output seems always to be less than one page in length. The only way to get rid of the spool file is by the KS command.

**SOLUTION:** Several internal problems in SMP have been fixed in DSD4.0. This should fix the problem.

**SR# 2200014449**

**PROBLEM:** RTE-IVB spooler leaves files opened even after the user logs off. The customer had equivalenced a file to the spool LU and when he logged off, he failed to do :CS,LU - but the system should have cleaned up anyway. It did not. Another customer had the same problem with an earlier revision of RTE-4B. It disappeared after regen'ing to 2126 software.

**SOLUTION:** At DSD4.0, we fixed the RTE-6 spool system and made it a part of RTE-IV. This should fix the problem.

**SR# 2200053785**

**PROBLEM:** When reading from a spooled tape, the IEOF does not work. All other methods for finding the end of file such as the A-register status work properly.

This was caused by the spool driver (DVS43 and OS6SP) clearing the status word before checking the request type.

**SOLUTION:** Fixed at DSD4.0. The fix was done in the RTE-6 spool driver which, with this revision, is also used in RTE-IVB.

## 2.12 (92069A) Image/1000 (A,E,F-Series)

### 2.12.1 %NO/DS.

**SR# 2200001107**

**ENHANCEMENT:** The IMAGE installation file was unclear as to how the library %NO\DS should be used to load QUERY and RECOV. The installation files have been changed to specifically search %NO\DS instead of assuming it has been generated into the system.

## 2.12.2 %NO\DS renamed

### SR# NONE

PROBLEM: The file, %NO\DS 92069-12005, was incompatible with the TF utility. TF is used to build the Cupertino Binary tapes for every PCO cycle.

SOLUTION: %NO\DS was renamed to %NO\_DS.

## 2.12.3 DBBLD

### SR# 5000080440

PROBLEM: DBBLD MP's when NOLIST is selected. DBBLD was passing a negative number of bytes to EWRIT for reporting error messages. EWRIT only accepts a positive word count.

SOLUTION: We changed the EWRIT calls to positive word counts.

## 2.12.4 DBDS

### SR# 5000065623

PROBLEM: DBDS was using its own parsing routine that incorrectly parsed the namr.

SOLUTION: The system routine NAMR is now used in place of DBDS' parsing routine.

## 2.12.5 DBGET

### SR# 5000072272

PROBLEM: A DBGET doing a chained read returns an Err 160 upon encountering an empty record (eg, a chained read gets interrupted and another program deletes the record that the chained read was pointing to) which means that a data structure corruption exists. An Err 114 (record is empty) would be more appropriate in this case.

SOLUTION: The DBGET intrinsic has been modified to return Err 114 instead of Err 160 in the above situation.

## 2.12.6 DBLOD

**SR# 5000011718**

**PROBLEM:** If a database is corrupted such that a manual master key is lost or duplicated, DBLOD will eventually produce an error (returned by DBPUT), then quit. This is a problem since the remainder of the data is not recovered.

**SOLUTION:** DBLOD will now report the error and the data in the record which caused the error; DBLOD then continues to process the rest of the DBULD tape or file, attempting to recover as much data as possible.

**SR# 5000071894**

**PROBLEM:** A customer wanted to increase the size of a compound item which was the last item in a detail from 58 to 64. He first did a DBULD, modified his schema to increase the compound item, ran DBDS, and finally, DBLOD. Everything was fine except that the compound item was now empty.

**SOLUTION:** This is a 'User Misunderstanding'. DBLOD performed correctly according to the manual's description. DBLOD truncated the compound item because it did not completely fill the newly defined 64-element item. This is documented in the Reference Manual.

## 2.12.7 DBOPN

**SR# 5000051979**

**PROBLEM:** The eighth program to attempt opening a database gets the wrong error back from the DBOPN call. It expects error 131 but receives error 129 (root file open exclusively to another program). The root cause lies in the FMP error -8, which IMAGE interprets to mean 'exclusively open', but which can also mean 'already open 7 times'.

**SOLUTION:** The program DBCOP, which manages resource numbers, will check first for the database being open 7 times, thus trapping that particular error before attempting to open the root file. Thus, an FMP error -8 will always refer to the file being opened exclusively. QUERY also was

modified to wait for a database for errors 129 or 131.

### 2.12.8 DSEXT

**SR# 5000054445**

**PROBLEM:** The IMAGE manual states that the subroutine DSEXT must be called in the main of a user's segmented program which makes remote database calls. However, no such subroutine DSEXT exists.

**SOLUTION:** We created the subroutine DSEXT (which is really a Fortran/Pascal-callable interface to #MAST).

### 2.12.9 IMAGE

**SR# 2200026161**

**PROBLEM:** When opening and closing multiple databases within a program, it is possible that IMAGE will re-use an empty DCB (assuming it is in use) and eventually cause a memory protect error.

**SOLUTION:** Code now checks that a DCB is really in use before using it.

### 2.12.10 Manuals

**SR# 2200014894**

**PROBLEM:** The program size examples on pp. 1-2 of the Configuration Guide are misleading. Program sizes can vary from revision to revision, and from system to system depending on the amount of firmware available, etc. The manual should clarify this or refer the user to examine the appropriate LOADR/LINK command file.

**SOLUTION:** We clarified the program size in the Configuration Guide.

**SR# 2200015693**

**PROBLEM:** The Manual does not specify the size of the Query scratch file that it requires, nor the fact that it uses

one at all. Query reports 'scratch file allocation error' if there is insufficient space.

SOLUTION: The manual has been updated to define the 'scratch file allocation error' and what caused it.

**SR# 5000031831**

PROBLEM: Update to Users Reference Manual dated Jan 1983 has its table of contents incorrect on pages viii a/b. It does not correctly list section 4 "Host Language Access".

SOLUTION: The index has been corrected.

**SR# 5000038737**

PROBLEM: Manual error: Update 5 for Image-I Users Reference Manual pp. 3-5 lists 4 possible open modes for Query: 1, 3, 5, and 8. However, mode 5 is invalid and is not accepted by Query.

SOLUTION: Manual has been corrected.

**SR# 5000062794**

PROBLEM: In the December 1983 update to the reference manual, some important information about deleting data using Query was inadvertently omitted from chapter 3.

SOLUTION: The appropriate information was added back to the manual.

**SR# 5000066365**

PROBLEM: In Chapter 5 of the Configuration Guide, RTE-A System Generation, it states that DBCOP should be relocated. This should not be done during system generation. However, DBCOP should be RP'd in the welcome file.

SOLUTION: The Configuration Guide has been updated with the correct information.

## 2.12.11 QUERY

**SR# 2200011833**

PROBLEM: QUERY's help file contained 2 misspellings, one incorrect syntax in the example for the FIND command and mode 5 was listed as a possible mode for opening the database (only true for IMAGE-II).

SOLUTION: We fixed the QUERY help file.

**SR# 2200016527**

**PROBLEM:** If DS is in the system, but a local-only QUERY is loaded, the %NO\DS relocatable is searched improperly, resulting in some entry points being satisfied in SSGA (system common) when not expected. The result is an UI (unimplemented instruction) error on an RTE-A system.

**SOLUTION:** Fixed the installation files to correctly load QUERY regardless of DS, and independent of any entry points generated into the operating system.

**SR# 5000056531**

**PROBLEM:** A QUERY report of a numeric value, with an edit mask smaller than 6 digits, would report incorrect values. Internally, QUERY was not calculating the correct number of significant digits, and worse, it was truncating digits off the right hand side.

**SOLUTION:** We corrected the algorithm for editing numeric values.

## 2.12.12 RECOV

**SR# NONE**

**PROBLEM:** A program name under 5 characters is not accepted by the program RECOV. Additionally, RECOV continues to prompt for a program to recover, even if no programs remain to be recovered.

**SOLUTION:** Code blank-pad program names to 5 places and quits if there are no programs to recover.

## 2.12.13 Utilities

**SR# 2200013599**

**PROBLEM:** RTE-A magnetic tape driver cannot recognize manual rewind of tape. Hence it may believe the tape is still at EOT and generate errors for subsequent reads/writes to the tape.

**SOLUTION:** Programmatically rewind the tape when EOT is sensed.

**SR# NONE**

**PROBLEM:** In several IMAGE utilities, the terms DOUBLE PRECISION,

EXTENDED PRECISION and COMPLEX are used to create real-value variables with byte sizes of 6 or 8. However, it is possible to override the default sizes of DOUBLE, EXTENDED and COMPLEX in a system generation, yielding unpredictable results from one system to another.

SOLUTION: Code now specifically declares real variables as REAL\*6 or REAL\*8 as appropriate.

## 2.13 (92070A) RTE-L Operating System

### 2.13.1 AUTO RESTART

#### SR# 2200053306

PROBLEM: When AUTOR is compiled using FTN4X, and then run, it generates runtime error 496 - ILLEGAL FORMAT STATEMENT.

SOLUTION: We changed the DIMENSION statement and the CALL RMPAR statements in &AUTOR to be

```
DIMENSION ITM(5),ITMX(5)
20 CALL RMPAR(ITM)
```

### 2.13.2 FMP

#### SR# 2200053405

PROBLEM: When accessing a type 2 file, the READF routine would sometimes write data beyond the end of the DCB, possibly over-writing user code.

SOLUTION: The correct bit masking is now used by the R/W\$ routine.

### 2.13.3 ID.37

SR# 2200050310

PROBLEM: The ID.37 control 0B request is supposed to send an SDC (selected device clear) if parm2 is 0; it is supposed to send an IFC (interface clear) and an SDC if parm2 is non-zero. In the second case only the IFC was sent.

SOLUTION: ID.37 is changed to now always send an SDC. If parm2 is non-zero, an IFC is sent first.

### 2.13.4 ID\*50

SR# 2200050260

PROBLEM: ID\*50 could be enabled to schedule a program upon receipt of an asynchronous (ie. unsolicited) interrupt. The programmer would do an EXEC 3 call with a subfunction of 20B to enable program scheduling. If the program name (supplied with the exec call) does not have an ID-segment, an error message should be returned to the programmer. Instead, the driver returns a successful completion status

SOLUTION: The driver (ID\*50) has been fixed to take the correct exit.

### 2.13.5 INTRINSIC ROUTINES

SR# 2200058362

PROBLEM: ISIGN(IA,IB) where IA and IB are single integer arguments return a result of 0 when IA=3 and IB=0. By definition, the result should be 3.

SOLUTION: The code is changed to return the correct value.

### 2.13.6 MATH ROUTINES

SR# 5000032763

PROBLEM: System routine DDINT does not work on A900 as documented. Real\*6 DDINT fails on all neg. fractional powers of 2, e.g.  $-1/2$ ,  $-1/4$ ,  $-1/8$ , etc. This problem occurs only with DDINT for REAL\*6 arguments. AINT for REAL\*4 and DDINT for REAL\*8 work fine.

SOLUTION: DDINT depends on a flag passed back from ENTIX. ENTIX was setting the flag incorrectly on negative fractional powers of two. ENTIX is changed to properly set the flag.

**SR# 5000078808**

PROBLEM: Math library routine DSINH (.DSNH) when evaluated with argument = 0.0d0 should return 0.0d0. However what is returned into the four words that comprise the double precision result is 000000b,000000b,000000b,177776b.

SOLUTION: The routine (.DSNH) divides the result by 2 by subtracting 2 from the exponent... without checking for 0 first. The missing test for zero result has been added before the subtract.

**2.13.7 SYSTEM LIBRARY****SR# 2200020214**

PROBLEM: The FTN4L compiler does not load in RTE-L because the routine GMS.C which is part of the system library (\$SYSLB 92070-12012) has externals that are not satisfied in any RTE-L library. The routine GMS.C has the following external references: C.OLY, COR.A, and ID.AD. The last two mentioned have not been in any RTE-L, XL, or A library.

SOLUTION: In \$SYSLB there is an incorrect library module GMS.C part # 92070-1X367. With this module FTN4L compiler would not load on RTE-L. To correct this the module GMS.C was removed and replaced with GMS.C module, part # 92071-1X391, from RTE-XL.

## 2.14 (92070B) RTE-L Operating System

### 2.14.1 ID.37

**SR# 2200050310**

**PROBLEM:** The ID.37 control 0B request is supposed to send an SDC (selected device clear) if parm2 is 0; it is supposed to send an IFC (interface clear) and an SDC if parm2 is non-zero. In the second case only the IFC was sent.

**SOLUTION:** ID.37 is changed to now always send an SDC. If parm2 is non-zero, an IFC is sent first.

### 2.14.2 ID\*50

**SR# 2200050260**

**PROBLEM:** ID\*50 could be enabled to schedule a program upon receipt of an asynchronous (ie. unsolicited) interrupt. The programmer would do an EXEC 3 call with a subfunction of 20B to enable program scheduling. If the program name (supplied with the exec call) does not have an ID-segment, an error message should be returned to the programmer. Instead, the driver returns a successful completion status

**SOLUTION:** The driver (ID\*50) has been fixed to take the correct exit.

### 2.14.3 INTRINSIC ROUTINES

**SR# 2200058362**

**PROBLEM:** ISIGN(IA,IB) where IA and IB are single integer arguments return a result of 0 when IA=3 and IB=0. By definition, the result should be 3.

**SOLUTION:** The code is changed to return the correct value.

## 2.14.4 MATH ROUTINES

### SR# 5000032763

PROBLEM: System routine DDINT does not work on A900 as documented. Real\*6 DDINT fails on all neg. fractional powers of 2, e.g.  $-1/2$ ,  $-1/4$ ,  $-1/8$ , etc. This problem occurs only with DDINT for REAL\*6 arguments. AINT for REAL\*4 and DDINT for REAL\*8 work fine.

SOLUTION: DDINT depends on a flag passed back from ENTIX. ENTIX was setting the flag incorrectly on negative fractional powers of two. ENTIX is changed to properly set the flag.

### SR# 5000078808

PROBLEM: Math library routine DSINH (.DSNH) when evaluated with argument = 0.0d0 should return 0.0d0. However what is returned into the four words that comprise the double precision result is 000000b,000000b,000000b,177776b.

SOLUTION: The routine (.DSNH) divides the result by 2 by subtracting 2 from the exponent... without checking for 0 first. The missing test for zero result has been added before the subtract.

## 2.15 (92071A) RTE-XL Operating System

### 2.15.1 FMGR

#### SR# NONE

PROBLEM: FMGR causes UI error when more than two colons are put between the file name and LU or CRN.

SOLUTION: Fixed at DSD4.0.

## 2.15.2 ID.37

### SR# 2200025379

PROBLEM: A serial poll timeout could cause the HP-IB to hang.  
SOLUTION: The driver is fixed to correctly check the flag. SPD (serial poll disable) is now sent to the interface card on an abort sequence in case an SPE (serial poll enable) had been sent.

## 2.15.3 INTRINSIC ROUTINES

### SR# 2200058362

PROBLEM: ISIGN(IA,IB) where IA and IB are single integer arguments return a result of 0 when IA=3 and IB=0. By definition, the result should be 3.

SOLUTION: The code is changed to return the correct value.

## 2.15.4 MACRO

### SR# 2200003780

PROBLEM: When you use the S (Symbolic Debug) option in the MACRO runstring to override options in the source file, the S does not appear in the MACRO line in the listing. Debug still works correctly.

SOLUTION: MACRO is changed to include the DEBUG option in the built control statement. (Note that the D option comes out as S because they are the same.)

### SR# 2200010611

PROBLEM: Macro aborts with an MP error if there are incorrect literal values.

SOLUTION: The literal processor is changed to pass back dummy values in both A and B in the error case, allowing assembly to continue.

**SR# 2200021261**

PROBLEM: If the O option is used to create old relocatables and OLDRE is not available, MACRO complains, but does not count it as an error. As a result, a program that schedules MACRO would be ignorant of any errors.

SOLUTION: MACR7 is modified to bump the error count on the schedule error.

**SR# 5000021378**

PROBLEM: The MACRO manual says that - DEF =F39.25 should work, but an ERROR 321 is generated.

SOLUTION: MACR2 and MACR3 are changed to allow =F literals as well as others in the DEF opcode.

**SR# 5000034231**

PROBLEM: In REV A.85 and earlier the MACRO assembler puts all the source in the swap file in spite of the fact that there is conditional code assembly (i.e. AIF,AELSEIF) and macros. All of the macros are placed in the swap file. The swap file is extremely large. In one case the swap file on the scratch cartridge took 750 tracks while the eventual program was only 2000 words. This user had a library with over 40 macros. The swap file should contain only the generated code with the macros that are needed.

SOLUTION: MACR1 has been changed to not keep unneeded lines in the IF file.

**SR# 5000071647**

PROBLEM: The include statement in a macro compilation allows a total of 32 characters in an include file name.

SOLUTION: Fixed in MACR1 to allow the full 64 character file names.

## 2.15.5 MATH ROUTINES

SR# 5000032763

PROBLEM: System routine DDINT does not work on A900 as documented. Real\*6 DDINT fails on all neg. fractional powers of 2, e.g.  $-1/2$ ,  $-1/4$ ,  $-1/8$ , etc. This problem occurs only with DDINT for REAL\*6 arguments. AINT for REAL\*4 and DDINT for REAL\*8 work fine.

SOLUTION: DDINT depends on a flag passed back from ENTIX. ENTIX was setting the flag incorrectly on negative fractional powers of two. ENTIX is changed to properly set the flag.

SR# 5000078808

PROBLEM: Math library routine DSINH (.DSNH) when evaluated with argument = 0.0d0 should return 0.0d0. However what is returned into the four words that comprise the double precision result is 000000b,000000b,000000b,177776b.

SOLUTION: The routine (.DSNH) divides the result by 2 by subtracting 2 from the exponent... without checking for 0 first. The missing test for zero result has been added before the subtract.

## 2.16 (92077A) RTE-A Operating System

### 2.16.1 ADVANCELINK

SR# NONE

ENHANCEMENT: Added monitor to support ADVLINK on RTE-A.

### 2.16.2 BOOTEX

**SR# 5000075812**

**PROBLEM:** To boot from a MUX, the select code must not be 20.

**SOLUTION:** This limitation no longer exists.

**SR# 2200016964**

**ENHANCEMENT:** BOOTEX used FMPReportError to report its FMP errors. BOOTEX did not allow enough time for D.RTR to be scheduled and print out the FMP -209 message before executing a halt 1 when the directory of the system file could not be found. BOOTEX is enhanced to report its own FMP errors.

### 2.16.3 BUILD

**SR# NONE**

**ENHANCEMENT:** BUILD include files are named &BUFMP and &BUGBL. The software naming convention for include files is to have the first character be a [. The names for the include files are changed to [BUFMP and [BUGBL.

### 2.16.4 CI

**SR# 2200018747**

**PROBLEM:** If you enter a command stack command and your terminal then times out, the last command displayed is executed by CI.

Example: CI> /  
          WH,AL  
          DL,/SYSTEM/  
          IO

          \_ (cursor waiting for user)

If the terminal then times out waiting for the user, IO is executed.

**SOLUTION:** A check has been added to see if a timeout occurred and to handle it properly when the command stack is displayed. Before, the timeout was ignored and the last

SOFTWARE CHANGES (92077A)

command displayed was executed.

SR# 2200018762

PROBLEM: CI's SET command with no parameters truncates the values of \$1 - \$9 to 76 characters each instead of 80.

SOLUTION: The length of the scratch variable used to manipulate these values has been increased because it was too small, causing truncation of its contents.

SR# 2200018804

PROBLEM: CI aborts with a Fortran string error when the user enters more than 80 slashes.

SOLUTION: CI now checks if more than 80 slashes were entered and truncates to 80 if 81 or more were entered.

SR# 2200020206

PROBLEM: CI's TM command does not work if time is set to be after 12 and the PM parameter is specified. A "No such time" error results.

SOLUTION: CI correctly handles the TM command now.

SR# 2200020362

PROBLEM: Timeout/logoff process does not restart if the user enters a command in the middle of the process.

SOLUTION: The variable which keeps track of how many consecutive timeouts have occurred is now reset after the user enters a command.

SR# 2200021378

PROBLEM: When CI or CM aborts due to an EXEC error, it is difficult to tell what program had the EXEC error.

SOLUTION: The EXEC error message code has been changed to include CI/CM to identify itself when reporting an EXEC error.

SR# 2200021386

SOFTWARE CHANGES (92077A)

PROBLEM: /m/ followed by /n, where m and n are both greater than about 25, causes a clear screen to be executed by CI while commands are being displayed and garbage to appear in the command stack.

SOLUTION: The code performing the /n command is only set up to handle n less than or equal to 22. Now it can handle any size n given in the /n command.

SR# 2200021394

PROBLEM: CI help files refer to "substitution parameters", which should be called "positional variables".

SOLUTION: The ?CI file has been changed to match the new term being used in the manuals.

SR# 2200021402

PROBLEM: CI does not give "Your programs:" message when a user logs off with active programs.

SOLUTION: The flag which makes sure "Your programs:" is printed only once when the user logs off with two or more active programs is being set before the message is ever printed. The code which does this has been deleted.

SR# 2200028373

PROBLEM: CI will let the user specify any file as the command stack in the WD command. But CI may print garbage and/or lock the terminal if the user tries to list the command stack with the "/" command if the file is not a type 3 or 4 file.

SOLUTION: CI now checks the type of the file specified as the command stack file in the WD command. If the file is not a type 3 or 4 file it prints a error message to the user and ignores the WD command. The user can still get a bad command stack, but CI will be able to list it without locking the terminal and the user can see there is a problem to be corrected.

SR# 5000056986

## SOFTWARE CHANGES (92077A)

**PROBLEM:** CI allows the user to specify an LU to be the command stack. This can cause a variety of problems: terminal hangs, etc.

**SOLUTION:** A check has been added to CI so that it does not allow the CI.STK file to be defined on any LU when the WD command is given.

### SR# 5000073379

**PROBLEM:** When CI is compiled with the CDS option and the terminal times out, the value of AUTO\_LOGOFF has no effect; the CI prompt is repeated. If only a carriage return is struck, the next timeout will start the AUTO\_LOGOFF sequence. After any other command, the AUTO\_LOGOFF feature is again disabled until only a carriage return is struck.

**SOLUTION:** The variables which control the AUTO\_LOGOFF process are now initialized to zero so that the first terminal timeout of a sequence starts the AUTO\_LOGOFF feature.

### SR# 5000080713

**PROBLEM:** CI does not let you transfer to a command file with a negative security code on a FMGR cartridge.

**SOLUTION:** The security code sent inside the file descriptor parameter is overwritten by the subroutine which determines if the file is a command file. Thus when CI tries to open the file to read the commands, it gives an illegal security code message. Now the security code in the file descriptor parameter is saved and put back in the return file descriptor.

## 2.16.5 CI HELP

### SR# 2200026716

**ENHANCEMENT:** Transfer files have been created to assist in copying the HP supplied help files in the form ?command to the /HELP directory with the "?" removed. These are \*COHLP, 92077-17259, for RTE-A and \*VCCOHL, 92078-17034, for VC+.

## 2.16.6 CI UTILITIES

### SR# 2200006015

PROBLEM: The DL command from CI will not display "type 0" files on FMGR cartridges.

SOLUTION: DL now displays "type 0" files on FMGR cartridges.

### SR# 2200010082

PROBLEM: A remote DL reports open files incorrectly. If a file is open on a remote node, the program name which DL reports as being the locking program is taken from the local node, not the remote node.

SOLUTION: DL now reports open files correctly.

### SR# 2200021436

PROBLEM: When the DL command is issued with the 'L' option on a directory on a remote system, the LU given as part of the location for the file is not correct - it is always 63.

SOLUTION: DL has been fixed to give the correct LU.

### SR# 2200022160

PROBLEM: FVERI does not interpret the runstring correctly with all disc LU's verifications and +L option.

SOLUTION: The "+L" now works correctly.

### SR# 2200023978

PROBLEM: Too many trailing blanks with the LU in the message "Verifying LU xxxxx".

SOLUTION: The message has been corrected.

**SR# 2200024455**

**PROBLEM:** The NLS message buffer is too small to hold a Japanese message.

**SOLUTION:** The buffer size is increased.

**SR# 5000070490**

**PROBLEM:** When doing an FSCON to change a FMGR cartridge to a CI volume, you can dismount it from a single session and then run the utility. When you want to mount it back again, you have to dismount it from all the other sessions and then mount it under CI.

**SOLUTION:** The appropriate manual has been documented to show this.

**SR# NONE**

**ENHANCEMENT:** The display format for FREES is changed. You can see the free area of all discs at a glance with a column-oriented format.

## 2.16.7 D.RTR

**SR# 2200024380**

**PROBLEM:** D.ERR does not allow enough space in its message buffer for a trailing null character.

**SOLUTION:** The buffer size has been increased by 1 word.

**SR# 2200024414**

**PROBLEM:** D.ERR doesn't correctly retrieve the NLS flag from the FmpError routine.

**SOLUTION:** The correct string length is now received.

**SR# 2200028654**

**PROBLEM:** If a type 6 file is RP'ed and the file is opened

exclusively by OPENF, no error results and the file can be written into by the program which opened it.

SOLUTION: If an RP'ed program file is opened with the OPENF call, write access is now disallowed on the file.

**SR# 5000060871**

PROBLEM: If a disc is genned to have more than 128 sectors per track, then D.RTR will destroy itself when trying to access the disc.

SOLUTION: In the mount process (from both the CI and FMGR MC commands), D.RTR now checks the number of sectors/track defined for the disc LU, and if it is greater than 128, an error -108 is returned. This is a new error meaning 'Illegal number of sectors per track'.

**2.16.8 DD\*33**

**SR# 2200007047**

PROBLEM: When inserting a linus tape in a CS80 tape drive, if a diagnostic error occurs, the CS80 Disc LU would go down on the next access of the drive.

SOLUTION: The driver has been fixed.

**SR# 5000014225**

PROBLEM: The setting of the EOF bit in the returned status from the CTD is inconsistent. In one instance, the EOF bit is set if the EOF block is contained in the length of the data read. In another instance, the EOF bit is set only on the actual read of the EOF block (no data returned as expected). The latter case should be correct. In both cases the transmission log is correct.

SOLUTION: The driver has been modified to check for EOF during a cache refill.

## 2.16.9 DDM30

SR# 2200017525

ENHANCEMENT: The 13037 correctable data algorithm is now implemented in DDM30.

## 2.16.10 DS SUPPORT

SR# 2200023325

PROBLEM: Systems routines for allocating and deallocating DSAM do not check the allocation word of the SHEMA table entry before renaming the entry.

SOLUTION: Corrected at DSD4.0.

SR# 2200025411

ENHANCEMENT: DS needed to have IDINFO enhanced so that if a program is dormant and saving resources and in the time list, the MEF state should come back to 100000b indicating time list suspended, instead of 140000b indicating saving resources.

## 2.16.11 DS TRANSPARENCY

SR# 2200023341

PROBLEM: If you edit the NODENAMES file, DSRTR does not see the changes.

SOLUTION: DSRTR has been modified so that, if it is scheduled without a runstring (i.e., 'RU,DSRTR'), it will re-read the nodenames file to update its internal tables. The correct action to take, then, is to edit the nodenames file to make corrections, then type 'RU,DSRTR' to force DSRTR to pick up the changes.

**SR# 5000007153**

**PROBLEM:** When the NODENAMES file is set up as described in the RTE-A System Generation and Installation Manual, accessing a node by name through DS transparency does not work. FMP returns a 'no such node' error. The problem is not having a comment field in the line.

**SOLUTION:** DSRTR does not require a comment field in the NODENAMES file anymore, but comments may be included if desired (they are ignored).

**2.16.12 DSAVE/DRSTR**

**SR# NONE**

**PROBLEM:** DSAVE and DRSTR report an internal error when a mirrored volume LU was specified to be saved or restored.

**SOLUTION:** DSAVE and DRSTR have been changed to check for mirrored volume disc LUs and issue either an error or a warning. DSAVE and DRSTR now access LUs greater than 63 because all EXEC 1, 2, 13 have been changed to XLUEX calls.

**2.16.13 EDIT**

**SR# 2200014571**

**PROBLEM:** If the list file is a printer, RTE-6 and RTE-A versions of Edit now do a page eject when it is closed. The list file is closed by a FCL command, or when a new list file is specified, or when Edit terminates.

**SOLUTION:** The printer is now kept LU-locked by Edit until the list file is closed.

**SR# 5000079970**

**PROBLEM:** Edit is not correctly resetting the page mode strap at start up.

SOLUTION: This is now corrected.

**SR# NONE**

PROBLEM: Read errors, while reading from a device, were reported twice.

SOLUTION: This is corrected in &NEWFI.

**SR# 5000023580**

ENHANCEMENT: The RTE-6 and RTE-A version of Edit now allows a leading slash in FMGR cartridge file names (there must not be a global directory that has the same name). This is related to SR5000023580.

## 2.16.14 EMA

**SR# 2200011908**

PROBLEM: According to the RTE-A Programmer's Reference Manual, the request transfer length (IDL) of a VMAREAD call ranges from 0 to 65534. However, when a 0 length is requested, a -243 error (illegal parameter) is returned.

SOLUTION: A decrement of the transfer length is removed (should not occur when length=0). This problem is fixed at DSD4.0.

**SR# 2200012617**

PROBLEM: VMAREAD, VMAWRITE, VREAD, and VWRITE don't check the length parameter for errors correctly if the file is of type 2. An invalid length (greater than the MSEG) may be accepted. The routine is only checking to make sure the data can map into MSEG+1 pages, not MSEG.

SOLUTION: An error code of -243 (parameter error) will now be returned when the transfer length is > MSEG. This problem is fixed in release DSD4.0.

**SR# 2200017616**

**PROBLEM:** EM82 errors occur when running several SHEMA programs accessing one SHEMA. The PTE is reinitialized by a first-time program. When a higher priority program interrupts and tries to access the last page of SHEMA, the page would be temporarily bad because of the reinitialization by the first program. Thus, the EM82 error is reported.

**SOLUTION:** \$INIT is rearranged and kept privileged during initialization. Fixed in DSD4.0.

**SR# 5000067702**

**PROBLEM:** When using VREAD to read a type 2 file, the IDL (data length request) parameter is ignored if it is less than the record length. VREAD will always read the entire record into the array. This can cause serious problems by overwriting other data or code. The problem is caused by the code checking for a type 2 file, and if in fact it is a type 2 file, it would use the record length from the DCB rather than the passed-in length as the request length.

**SOLUTION:** The code involved is eliminated so that now the passed-in length will be the request length no matter what the file type.

## 2.16.15 ERROR LOGGING

**SR# 5000051136**

**PROBLEM:** LOGIT does not do error checking of the length parameter. If LOGIT is called with a length that is negative or greater than 1024, severe problems can result (system crash).

**SOLUTION:** LOGIT now checks to make sure that the length is positive and less than 128 words since the spool system only prints 128 word records maximum.

## 2.16.16 EXER

### SR# NONE

ENHANCEMENT: EXER is enhanced to support the 7907 disc and to work on-line.

## 2.16.17 FC

### SR# 2200016055

PROBLEM: FC will not recognize device type 24, which is what the streaming tape drives require if they are going to stream.

SOLUTION: FC now recognizes LDTYP's return for streaming tape drives. LDTYP normally returns a value of 2200 for magnetic tapes (device type 23B), but it returns a 230 for streaming drives (device type 24B).

## 2.16.18 FILE I/O

### SR# 2200015644

PROBLEM: Files opened with USE='NONEXCLUSIVE' could not be purged by closing with STATUS='DELETE'.

SOLUTION: Fixed in the DSD 4.0 update for 1) old files, 2) new files, 3) new files & CDS, and 4) DS.

### SR# 2200019067

PROBLEM: The INQUIRE statement fails if another program opens the file in shared mode. .FFIN wants to open the file in exclusive mode. This fails if another program opens the file (even in shared mode). Thus no status information is returned to the INQUIRE calling program.

SOLUTION: Fixed in DSD4.0.

### SR# 2200025569

PROBLEM: If the NAME= parameter in an INQUIRE statement refers to a variable that is too small to hold the result, the byte just prior to the variable is set to blank (32 base 10). This problem exists only if \$FOLDF is used. No errors are generated to indicate any problem.

SOLUTION: The software has been corrected.

**SR# 5000058255**

PROBLEM: In a formatted READ of a direct-access file (an ANSI extension), if the internal I/O buffer (or LGBUF buffer) is too small, no error is reported. The record is treated as if it were blank beyond the buffer size.

SOLUTION: Error 496 is now reported.

## 2.16.19 FMGR

**SR# 2200011718**

PROBLEM: There is a problem in FMGR in the section where it swaps in a segment. When it checks to see if the segment it wants is already in memory, the test always fails, causing FMGR to swap segments in more often than it needs. This does not cause any errors to occur, it just slows FMGR down.

SOLUTION: FMGR is fixed.

**SR# 2200056291**

PROBLEM: Doing a FMGR CO command without specifying a CRN for the source file results in a FMGR-032 error.

SOLUTION: FMGR is fixed.

**SR# 2200058297**

PROBLEM: If the severity code in effect is anything but zero, the optional message in the FMGR 'PA' command is not sent to LU 1.

SOLUTION: FMGR is fixed.

**SR# 5000003061**

PROBLEM: PK fails in the combined CI/FMGR environment.

SOLUTION: PK has been fixed to work.

**SR# 5000052142**

PROBLEM: In FMGR, doing the following commands results in a memory protect error:

```
ll,<file that exists>
pl
```

SOLUTION: PL is now fixed.

## 2.16.20 FMP

**SR# 2200009738**

PROBLEM: If a type one or type two file is opened with FmpOpen, allowing extents (X option), and the last block of the file is written into, the file would be extended prematurely.

SOLUTION: The FMP routines for handling type 1 and 2 files now will set the EOF bit when the last record in the file has been written (when the extendability option is enabled). On the next write, the EOF bit will be cleared and an extent will be created. Note that for type 2 files, this only happens when the last record of the file fits exactly to the end of the last block of the file.

**SR# 2200012633**

PROBLEM: Using the 'CO' command from CI with masking, any user can copy files from a FMGR cartridge without needing to know the file's security code.

SOLUTION: The masking routines (used by the CI CO command) now will use the security code supplied by the user in the

SOFTWARE CHANGES (92077A)

original mask. If it is wrong, the masking operation will not succeed (PU will fail, etc.).

A side effect is the following enhancement to DL: if a zero is explicitly specified for the security code in the mask, DL will only find those files which have a zero security code. If no security code is explicitly given, DL will ignore the security codes when matching. This is also true of the file type (explicitly specifying zero for the file type causes DL to find only type zero files). Note that this is only a feature of FMGR files since CI files don't have security codes or type zero files.

**SR# 2200018317**

**PROBLEM:** Opening a type 1 or 2 file with a Pascal REWRITE to do sequential writes to the file causes an FMP -12 error. The manual claims that this should be legal. The problem is that FmpSetEOF is setting the EOF bit in the DCB.

**SOLUTION:** FmpSetEOF no longer sets the EOF bit in the DCB for type 1 or 2 files.

**SR# 2200018382**

**PROBLEM:** If FmpLastFileName is given a string with no name, e.g., '::', the user program will abort with a FTN7X runtime error.

**SOLUTION:** FmpLastFileName now correctly checks for a zero-length name.

**SR# 2200018655**

**PROBLEM:** If a 'Z' is used as an option in a CO command, or an FmpCopy call, the destination file doesn't get valid data transferred to it.

**SOLUTION:** FmpCopy now ignores a 'Z' in the option string.

**SR# 2200020875**

**PROBLEM:** The LI command displays only 1st 256 bytes of each record if the record size exceeds 256 bytes.

SOFTWARE CHANGES (92077A)

SOLUTION: LI can now display the whole record longer than 256 bytes.

**SR# 2200021360**

PROBLEM: CIX (FmpCopy) can get into an infinite loop when trying to copy a file with the D option onto a FMGR cartridge.

SOLUTION: FmpCopy's scratch name is now 'COxxx...', which puts a character from the system time into the 6th character of the file name. This will make the name unique on each try. Also, the break flag is checked inside of the loop which creates the scratch file - if the break flag is detected, FmpCopy will return a -235 error (break flag detected).

**SR# 2200022210**

PROBLEM: A program is executed and terminates saving resources. When the program is executed for the second time a new cloned version is run, not the terminated copy. If the program is first RP'ed this problem does not occur. If the program is linked with the SU option, the problem does not occur, but only one copy can run at a time.

SOLUTION: FmpRpProgram now checks if the program ID segment already exists and is dormant saving resources. If so, a new copy of the program is not cloned; the current program is used instead.

**SR# 2200023200**

PROBLEM: If a global directory name is exactly 16 characters long, and the working directory is set to a subdirectory of that global, the WD command reports only the global directory name and not the subdirectory.

SOLUTION: An internal variable in D.RTR was too short to pick up a full 16 character global directory name plus subdirectory names, and the subdirectory names were getting lost. This is now corrected.

**SR# 2200023358**

PROBLEM: The C.83 versions of D.RTR on RTE-6, and D.RTR on RTE-A do not recognize the 'bad track list' that is put into the cartridge header via the FMGR IN command. The FMGR

PK command may purge files created on that LU.

SOLUTION: This feature was added to FMGR a long time ago to support discs that did not do their own track sparing. Since all current discs do have an internal track sparing mechanism (except the 7900 disc), this feature is not needed anymore. The correction for this bug, then, is to remove the 'bad track list' option in the FMGR IN command. Now, if a list of bad tracks is given in the IN command, an error 56 (bad parameter) is issued.

**SR# 2200024059**

PROBLEM: FmpError does not return text for some errors that are documented in the manuals. These errors are:

-49, -54 thru -60, -63, -64, -68, -217, -219, -223, -227, -228, -231, -234, -243, -244, -247, -248, -250

SOLUTION: FmpError now returns text for all of these errors.

**SR# 2200025593**

PROBLEM: FmpWrite will write data past the EOT mark of a magtape, but FmpRead treats EOT as an EOF and will not return the data past the EOT, even if transparency mode has been turned on (transparency mode is turned on with a call to FmpSetIoOptions).

SOLUTION: FmpRead now sets the B register value in common /FMPREGS/ correctly so that it will be the actual length read when reading data past the EOT mark on a mag tape.

**SR# 5000040188**

PROBLEM: FMPRENAME can rename a file on a file manager disc to a name that contains lower case letters.

SOLUTION: The new file name is now upshifted before being created.

**SR# 5000066076**

PROBLEM: Programs loaded as system processes are being cloned, which is not supposed to happen. "Don't clone" is one feature of a system utility. If a system utility is

SOFTWARE CHANGES (92077A)

RP'ed already, and you request it to be RP'ed again, you get a clone if you specify the directory name in the RP command. If you don't specify the directory, it won't clone the program.

**SOLUTION:** FmpRpProgram now checks if the program already exists and is a system process before checking if the directory is specified. Even if the directory is specified, the system process will not be cloned. Note, you can still clone a system process if it is given a new name.

**SR# 5000071100**

**PROBLEM:** When dealing with remote-system files using FMP calls, access would fail on Open if the nodename given is not EXACTLY as written in the NodeNames file (i.e. the call is U/L case sensitive). This is not true when using interactive commands, such as thru CI.

**SOLUTION:** DSRTR now accepts upper or lower case node names in the NODENAMES file and in file descriptors (DSRTR upshifts all node name strings before using them).

**SR# 5000073908**

**PROBLEM:** If a program in the time list calls FmpUniqueName, the program gets removed from the time list.

**SOLUTION:** Rather than becoming time-suspended for 10 ms, FmpUniqueName now uses a different algorithm for insuring that it will create a unique name each time it is called: FmpUniqueName now remembers the time it was called last, and if less than 10 ms have gone by, it goes into a short loop waiting for the time to change. This loop will only be executed if FmpUniqueName is called twice within a 10 ms window.

**SR# NONE**

**ENHANCEMENT:** The routine DiscSize for RTE-A allows only 6 bit LU numbers. The routine has been changed to make a XLUEX call instead of a EXEC call.

**SR# NONE**

**NOTE:** The routine FmpLastFileName was corrected in \$FMP for SR #2200018382. A twin version of the routine exists in

\$FMPC and was corrected in the same way.

## 2.16.21 FMP LIBRARIES

### SR# 2200023101

**PROBLEM:** The integer-to-ascii conversion routines, for single and double integers, write over your code when a buffer is too small for the number needing converting.

**SOLUTION:** A check of the destination buffers size is made and used in determining how much information to return.

### SR# 2200023119

**PROBLEM:** If DINTTODECIMAL is sent the double integer value -2147483648, it returns the ascii string "-./,)(-\*,(".

**SOLUTION:** .DNG did not handle the number -2147483648 correctly, so it performed the calculation without the number. The software has been corrected.

### SR# 2200024570

**PROBLEM:** If a user's CDS program calls Calc\_Dest\_Name, and the CDS version of this routine is used (\$CDS is searched), the program will get strange errors or possibly abort.

**SOLUTION:** The optional (internally-used only) string parameter for Calc\_Dest\_Name is now handled correctly.

### SR# 2200023150

**ENHANCEMENT:** Added some right-justified integer conversion routines to go along with INTTODECIMAL, DINTTODECIMAL, INTTOOCTAL, and DINTTOOCTAL. They are INTTODECIMALR, DINTTODECIMALR, INTTOOCTALR, and DINTTOOCTALR.

## 2.16.22 FORMAT

### SR# 2200024521

**PROBLEM:** Some floating-point numbers do not round as expected on output; for example, 25039.5 in an F10.0 field prints as

25039.

SOLUTION: Some of these numbers now produce more pleasing output.

**SR# 5000019539**

PROBLEM: In FTN7X:

```
      READ(1,100) I
100 FORMAT(I1)
```

gives a \*RUNTIME ERROR\* 0494 @ 02022 for all characters except for D,d,E,e,.,-, and +.

SOLUTION: The software has been corrected.

**SR# 2200028597**

ENHANCEMENT: As of DSD 4.0 it is possible to change

- 1) the fill character used to fill output fields where the number did not fit,
- 2) the leading blank character, used to fill the left part of fields which are larger than necessary

The method of changing these characters is to store into the words at external symbols #FMLB and #FMFC.

```
eg. $alias /fill/='#FMFC',noallocate
      common /fill/ifill
      ifill - ichar('$')
```

**SR# NONE**

NOTE: Enhancement to allow list-directed READs to not require quote marks.

## 2.16.23 FORMT

**SR# 2200024125**

PROBLEM: FORMT IN command for HP-IB MAC disc causes MP error.

SOLUTION: Correct the IN command.

## 2.16.24 GENERATOR

### SR# 2200015404

PROBLEM: If you specify 0 words of SAM, SL,0,0 gives the error message 'Upper spool limit should be 1000 words less than SAM'.

SOLUTION: Segment 4 of RTAGN was fixed to check if the high buffer limit is zero. If so, the check for high buffer limit 1000 words less than SAM is skipped.

### SR# 2200019141

PROBLEM: The generator would only allow up to 255 words of table extension in a DVT extension (should be 512). If more than 255 words are specified, only N (mod 256) words are set aside.

SOLUTION: The generator DVT fix up entry structure is changed to allow a 9 bit field for the table extension for DVT fixup entries, and use a nine bit mask when allocating the table space.

### SR# 2200019208

PROBLEM: If the system checksum is calculated to be 0, a 0 is placed in \$CKSM in the output file, and a 1 is placed in the header record of the snap file as the system checksum.

SOLUTION: Segment 4 of RTAGN is fixed to increment the checksum (if it is 0) BEFORE it outputs it to the system file and snap file.

### SR# 2200019455

PROBLEM: If there are 32 pages of SAM and no spooling is used, SL,0,0 gives the error 'Upper spool limit should be 1000 words less than SAM'.

SOLUTION: Segment 4 of RTAGN now checks to see if there are 32 pages of SAM, and if so, it skips the high buffer limit

SOFTWARE CHANGES (92077A)

1000 words less than SAM check (high buffer limit can't be more than 6112 words).

**SR# 2200019810**

**PROBLEM:** The number of entry points specified in the header of the SNAP file does not match the actual number of entry points in the SNAP file. Also, the system ID checksum specified in the header record does not match the checksum actually calculated from the SNAP file.

**SOLUTION:** The snap file output routine is fixed to add the number of symbols in the snap file correctly, and to calculate the checksums correctly.

**SR# 2200020438**

**PROBLEM:** The SNAP file output routine assumes that TC tags have the same structure as JSB tags, which cause it to output the wrong logical address for TC tag entry points.

**SOLUTION:** The SNAP file output routine is fixed to know about the structure of TC tags.

**SR# 2200022624**

**PROBLEM:** The generator puts entry points into the snap from a library which was searched in the system relocation phase. Only some of the entry points are put in the SNAP file from the relocated (type 7) module, others are left out.

**SOLUTION:** Segment 2 of RTAGN was changed to tag all symbols entered in the symbol table during a library search, regardless of whether any ENTs had yet matched an undefined external or not (the symbols are removed from the symbol table if the module ends up not getting relocated).

**SR# 2200023044**

**PROBLEM:** The snap file has absolute entry points (P\$ symbols) in the system symbol area.

**SOLUTION:** Segment 4 of RTAGN was changed to enter the P\$ symbols as type 0 (system symbols) instead of type 3 (absolute).

**SR# 2200023051**

SOFTWARE CHANGES (92077A)

**PROBLEM:** The system common pointer in the snap file header is off if both system common and NLS messages are relocated.

**SOLUTION:** Segment 4 of RTAGN is changed to do three passes through the symbol table to output the snap file - one for RPLs and ABSs, one for system symbols, and one for system common symbols.

**SR# 2200024786**

**PROBLEM:** In a system without class genned in, FMP calls to type 0 files return FMP -17 errors. This is due to XREIO calls getting OP17 errors which used to work just fine.

**SOLUTION:** The generator is fixed to not update the symbol type of symbols which are already defined when it finds a symbol during a library search.

**SR# 2200024968**

**ENHANCEMENT:** The generator is enhanced so the 'NO SYSTEM MESSAGES INCLUDED' warning does not count as an error.

**SR# 2200024976**

**ENHANCEMENT:** RTAGN is modified to support the DATAPAIR/1000 product.

**SR# 2200025031**

**ENHANCEMENT:** The generator is enhanced to use the space between the end of the system relocation and the start of the OS/driver partitions. Any of the following tables which fit entirely in this space will be placed there (in first come, first served order):

- DVT extensions for LUs which are not in a node list
- the LU table
- the class table
- the resource number table
- ID segments
- memory descriptors
- swap descriptors
- the shared program table
- the system memory block

**SR# 2200025270**

**ENHANCEMENT:** The generator now puts its rev.code in word 100B of the generated system. BUILD puts its rev.code in word 101B of the built system and BOOTEX puts its rev.code in word 102B when it processes the system.

**2.16.25 HELP**

**SR# 2200019042**

**PROBLEM:** ?PS help had 2 LK commands. One is actually supposed to be LD.  
**SOLUTION:** Corrected the help file misspelling.

**2.16.26 HPIB LIBRARY**

**SR# 5000067280**

**PROBLEM:** When a call to the HPIB routine CNFG from a Fortran program is made, the program gets lost. This is because the instructions are hardcoded to the current page.  
**SOLUTION:** The Instructions IOR14, IOR15, AND14, and AND15 are moved to ADJLU.

**2.16.27 I/O**

**SR# 2200003723**

**PROBLEM:** The operating system is not write-protecting the system base page in the routine \$SETR.  
**SOLUTION:** \$SETR routine has been fixed to write-protect the system base page when it is done using it.

**SR# 2200015883**

SOFTWARE CHANGES (92077A)

**PROBLEM:** Doing a class get on an empty class with the NoWait and Save Buffer bits set will deallocate the class number. The documentation says it shouldn't.

**SOLUTION:** The problem is in \$G.CL in the CLASS module at entry point G.065. The logic of checking the bits was incorrect.

**SR# 2200019547**

**PROBLEM:** If a rethreaded request is sent to a spooled device, the system will crash. Here is a detailed description of how the problem occurs. In RTIOA rev C.83 at L.140 the system expects source SAM class block to be in T6 and destination SAM class block to be in XBLK. However code at L.03(line 862) says if rethread then jump around SAM setup(\$alc) of T6 and XBLK areas. This is done by jumping from L.132 to L.134 to L.140 which trashes SAM. In this case, because XBLK is zero, it writes in the first locations of SAM.

**SOLUTION:** At DSD4.0, the system no longer crashes, however some requests will still fail to complete. This will be addressed in the next update. Note that the fix is truly in &IORQ which used to be part of &RTIOA.

**SR# 2200020024**

**PROBLEM:** If a program makes a nonbuffered normal or class request to a spooled device, when the program terminates, it will stay in the ABORT IN PROCESS state forever. At update A.85, IORQ (I/O Request module) started bumping a counter for nonbuffered class requests. However, spooled requests are always buffered so the counter was erroneously being bumped.

**SOLUTION:** When a request is converted to a spool request, IORQ now strips out the buffered bit. Note that IORQ used to be a part of RTIOA.

**SR# 2200021857**

**PROBLEM:** Typing 'UP 14' to the RTE: prompt gets the message 'Usage: UP LU'. From RTE: the correct usage is 'UP,LU'

**SOLUTION:** All of the 'Usage:' messages that come from the OS are changed at the DSD 4.0 revision to include the commas.

**SR# 2200022244**

**PROBLEM:** If a request is made to an interface driver whose select code is equal to zero, the code that calls the interface driver will not work. P.DVR in RTIOA bypasses the code that sets up the return address if the select code is zero.

**SOLUTION:** This is fixed in DSD 4.0.

**SR# 2200025361**

**PROBLEM:** When a CDS program that uses EMA passes a buffer to the I/O system that lies in between the end of the partition and the MSEG, no error is returned. When doing the comparison for an illegal buffer, \$VBUF should compare with 077777b as well as 177777b.

**SOLUTION:** This will be fixed at the DSD4.0 update.

**SR# 2200026070**

**PROBLEM:** A system can go into an infinite loop when it tries to set up the map registers for a request. The I/O system does not reset the L bit in the DVT when it dequeues a request at Logical Done. If a request is queued on the DVT but has not been initiated and an unsolicited interrupt comes in from the device, if the physical driver sends the interrupt to the logical driver, this causes the logical driver to initiate the physical, \$SETR will look at the L bit which is no longer valid.

**SOLUTION:** This fix is in the module RTIOA.

**SR# 2200030692**

**PROBLEM:** If a device driver creates a dummy request and sends it to the interface driver when there aren't any real requests on the device, and then an error occurs on the interface, the error message will be sent to the LU specified by the bottom eight bits of trap cell 28 decimal (regardless of what type of device that is). This can be caused by tape unloads or head alignment requests from the CS/80 drives. The result can be as minor as error messages not being reported, or as severe as the error message being put on top of a disc's

SOFTWARE CHANGES (92077A)

bitmap. Logical Done in RTIOA did not expect to see an error if there was not a request on the DVT (lower fifteen bits of DVT2 being zero). It treated the zero as an ID segment address and added 28 to get to \$CON. Then the error message was dumped to this LU.

SOLUTION: RTIOA now checks to see if there is not a request and if so, treats the error handling the same as if it were an XSIO request (the error message will be sent to the system console). This fix will be in DSD 4.0.

**SR# 2200019992**

NOTE: FmpReportError now does not set the "no suspend bit" in the Exec call to the LU. This will cause the program to suspend if the LU is locked rather than just throw away the error message.

**2.16.28 ID\*37**

**SR# 2200010314**

PROBLEM: A serial poll timeout could cause the HP-IB to hang.  
SOLUTION: The driver is fixed to correctly check the flag. SPD (serial poll disable) is now sent to the interface card on an abort sequence in case an SPE (serial poll enable) had been sent.

**SR# 2200017459**

PROBLEM: The SRQ enable/disable flag used by control requests (subfunction 30b and 31b) is stored in the driver code instead of the IFT extension. In systems with multiple HP-IB cards, this causes all cards to be enabled or disabled.  
SOLUTION: The flag is now stored in the IFT extension.

**SR# 2200017822**

PROBLEM: In the past, parallel poll would always occur, whether PPoll devices existed or not. The driver normally masks out PPoll interrupts if no PPoll devices reside on the bus. The masking of the PPoll interrupt prevents the new HP-IB chips (ABI and Medusa) from issuing a PPoll. However, when interrupt status is retrieved, all

SOFTWARE CHANGES (92077A)

interrupts are unmasked. This allowed a PPoll to be issued when PPoll is to be turned off.

SOLUTION: The interrupt status routine (STAT2) in the driver is changed to enable the PPoll interrupt only if PPoll devices are present.

SR# 5000058610

PROBLEM: The ID\*37 control OB request is supposed to send an SDC (selected device clear) if parm2 is 0; it is supposed to send an IFC (interface clear) and an SDC if parm2 is non-zero. In the second case only the IFC was sent.

SOLUTION: ID\*37 is changed to always send an SDC. If parm2 is non-zero, an IFC is sent first.

SR# NONE

PROBLEM: This problem really consisted of two parts. The first problem is a lack of extended status. The second part of the problem lies with the PSTAT routine in the driver. When getting dynamic status, the high order bits in the HP-IB chip status register are altered because the read clocks the high order bits into the status word.

SOLUTION: For the first part: extended status information is now posted at the end of most read and write requests. For the second part: The order in which the HP-IB chip registers are read has been rearranged.

SR# NONE

ENHANCEMENT: Changes are made to ID\*37 to improve its performance and supportability. 1) Additional comments are added. 2) IFTX space is rearranged to place pointers to single item entries in a group. This allows the SETP instruction to set up pointers. 3) Moved code which places data in IFTX from driver pointer setup to first time code initialization. This only needs to happen once in the life of the system. 4) Removed unneeded saving of registers from DSRQ, PP?, ESRQ, and CFLG. 5) ID\*37 now uses the base page constants used by RTE-A to reduce driver code space and the number of base page links. 6) Added a check to ensure the IFTX area is large enough. If the IFTX were too small the driver would write over other I/O tables and cause unpredictable results. An IO-12 (IO-GE) error is now returned to indicate a generation problem.

## 2.16.29 ID\*50

## SR# 5000067355

**PROBLEM:** If ID\*50 is set up for program scheduling on an interrupt from the user device, and the program has been off'ed, ID\*50 would go ahead and call \$LIST to schedule the program anyway. Depending upon the status of the id segment previously used by the program, the wrong program could be scheduled, or RTE-A could crash.

**SOLUTION:** ID\*50 is modified to save the program name as well as id segment address. The program name is checked if the sequence counter has been incremented, to insure that the program still owns the id segment. The IFT Extension area is changed from 6 words to 9 words.

## SR# 5000062174

**ENHANCEMENT:** If a user device wants to use the PIC for reads/writes and asynchronous interrupts, AND the user device has device command and device flag tied together, then in certain configurations, the PIC would generate constant interrupts. This is because the user device treats device command assertion for interrupt the same as for read/write, i.e. immediate device flag, which generates an interrupt. To allow devices of this type to generate asynchronous interrupts, bit 7 of DVT parameter word 2 is now defined. When this bit is set, a CLF 30B will be issued before the interrupt system is re-enabled. This has the effect of cancelling the device flag (generated by device command tied to device flag) before the system sees the flag. The device can then assert device flag (or STO if IRQEN in register 31 is set) to signal an asynchronous interrupt. When bit 7 is clear, no CLF 30B is issued. Bit 7 should only be set for PIC devices having device command tied to device flag. If bit 7 is set in other instances, the PIC may lose an interrupt from the device. User devices should use STO-ST<sup>4</sup> to signal the device whether a read, write, or arm for interrupt is the reason for device command being asserted.

### 2.16.30 INTRINSIC ROUTINES

**SR# 2200058362**

**PROBLEM:** ISIGN(IA,IB) where IA and IB are single integer arguments return a result of 0 when IA=3 and IB=0. By definition, the result should be 3.

**SOLUTION:** The code is changed to return the correct value.

### 2.16.31 LIBRARY FUNCTIONS

**SR# 2200002675**

**PROBLEM:** RHPAR fails to return runstrings if a program terminates saving resources and then gets scheduled in the normal way. On the second call to RHPAR the routine checks to see if it has been called before; if so, it does not bother to collect the runstring that was passed. Since the program terminated saving resources, the second string will not be given to it.

**SOLUTION:** RHPAR is changed to call EXEC for the runstring on each entry. If EXEC returns a zero length string, RHPAR assumes the string it got last time (or some prior time) is still valid and uses it. This allows the user to use RHPAR for strings which result from a son program returning as well as the terminate saving resources condition.

**SR# 5000045187**

**PROBLEM:** When the ELAPSEDTIME subroutine is used across midnight, an incorrect value is returned.

**SOLUTION:** ElapsedTime is calculated as (the current time of day) - (the time of day when ResetTimer was last called). The problem is fixed by putting a check in ElapsedTime to detect if the elapsed time that is calculated is less than zero. If so, 24 hours (in miliseconds) is added to the result because the system time has crossed midnight to a new day.

**SR# NONE**

**ENHANCEMENT:** Enhanced system library to contain &BLDNM and DAYS70. &BLDNM builds the file names for the language processors, that is the source name and specified list, relocatable, etc.

DAYS70 takes a date code string and returns the integer number of days since 1970.

**2.16.32 LIF**

**SR# 2200007849**

**SR# 2200009324**

**PROBLEM:** The LIF utility program, used for transferring files from HP/1000 systems to HP/9000 systems, will not initialize a CS/80 tape prior to storing files on the tape.

**SOLUTION:** LIF now accepts CS/80 tapes which are used in FC format.

**SR# 5000078675**

**PROBLEM:** LIF does not work at A.85. The LIF utility aborts due to the \$OPSY call returning an unknown system code.

**SOLUTION:** Changed opsys check to accept RTE-A rev. A.85.

**2.16.33 LINK**

**SR# 2200020842**

**PROBLEM:** If LINK encounters problems while creating or writing to a list file (e.g. a non-existent directory), the message "Error on list file" is displayed many times. In the meantime, LINK does output the listing to the user's terminal.

**SOLUTION:** LINK now recognizes whether or not the list file is valid. If an error occurs, the listing is redirected to the user's terminal.

**SR# 2200023911**

PROBLEM: The RPL's \$\$\$LARGEMA1\$\$\$ and \$\$\$LARGEMA2\$\$\$ are not being initialized properly when EMA is not assigned. This affects the EMA\_LIMITS routine (part of Native Language Support).

SOLUTION: LINK now sets \$\$\$LARGEMA1\$\$\$ to zero in this case.

**SR# 2200026856**

PROBLEM: Simple EMA variable does not produce the correct symbol table records for Symbolic Debug. Thus Symbolic Debug cannot display EMA variables ("address out of range" error) because LINK built the .DBG file incorrectly.

SOLUTION: Link now correctly computes the EMA variable addresses and passes the the correct information to Symbolic Debug.

**SR# 2200027474**

PROBLEM: LINK sets the MSEG size of a program incorrectly. If the program being loaded requests an MSEG size of 2 or more (i.e. the \$MSEG directive in FTN7X), LINK makes the MSEG one page too small. Programs which use Vector Instruction Set firmware routines require the specification of MSEG, and therefore abort with EM87 errors (MSEG too small).

SOLUTION: LINK now uses the MSEG value specified in the program.

**SR# NONE**

PROBLEM: LINK uses an EXEC call to read commands, preventing itself from being swapped.

SOLUTION: An REIO call is now used.

**SR# NONE**

PROBLEM: The "duplicate entry point" warning (#139) is always reported when a module containing both code and RPL's is searched, confusing the user as to whether or not the program is loaded correctly.

SOLUTION: LINK now recognizes this case and does not issue a warning.

SR# NONE

ENHANCEMENT: RPL's are now given special treatment in "duplicate entry point" situations during (pass 1) linking:

- 1) If an RPL is relocated, it may be replaced by another RPL of a different value (but same name);
- 2) If an RPL is relocated, it may be replaced by a non-RPL (ENT or XENT) of the same name.

In both situations, a warning will be issued:

"Warning #141: RPL value replaced: entry\_point\_name"

SR# NONE

ENHANCEMENT: A new command has been added to LINK so that a single module can be relocated from a file which may contain multiple modules. The syntax of the command is

```
"rm filename symbolname"
```

where symbolname is an entry point for the desired module. If the file is indexed (with LINDX), the index is used to locate quickly the desired module; otherwise the file is searched in a linear fashion.

This command provides additional flexibility for loading programs:

- 1) It can be used to extract software versions of routines from a system library, which may be helpful in determining whether or not firmware is working (or installed). For example:

```
"rm $6sy1b .imap" (software equivalent of
                   a VMA routine)
```

- 2) When combined with the LINK "if" command, a LINK command file can be created as follows:

```
re %prog
if 6 rm %library sub6
if a rm %library suba
en
```

- 3) LINK can be used to determine the external references of a particular module:

```
CI.86> link
link Rev.2540 Use ? for help
link: rm $fmp6 fmpopen
```

FMPOPEN  
link: di  
  Undefined symbols:  
  .SST .ENTR .NFEX LURQ FMPASKDDOT FMPCLOSE  
link:

## 2.16.34 MACRO

### SR# 2200003780

PROBLEM: When you use the S (Symbolic Debug) option in the MACRO runstring to override options in the source file, the S does not appear in the MACRO line in the listing. Debug still works correctly.

SOLUTION: MACRO is changed to include the DEBUG option in the built control statement. (Note that the D option comes out as S because they are the same.)

### SR# 2200010611

PROBLEM: Macro aborts with an MP error if there are incorrect literal values.

SOLUTION: The literal processor is changed to pass back dummy values in both A and B in the error case, allowing assembly to continue.

### SR# 2200021261

PROBLEM: If the O option is used to create old relocatables and OLDRE is not available, MACRO complains, but does not count it as an error. As a result, a program that schedules MACRO would be ignorant of any errors.

SOLUTION: MACR7 is modified to bump the error count on the schedule error.

### SR# 5000021378

PROBLEM: The MACRO manual says that - DEF =F39.25 should work, but an ERROR 321 is generated.

SOLUTION: MACR2 and MACR3 are changed to allow =F literals as well as others in the DEF opcode.

**SR# 5000034231**

**PROBLEM:** In REV A.85 and earlier the MACRO assembler puts all the source in the swap file in spite of the fact that there is conditional code assembly (i.e. AIF,AELSEIF) and macros. All of the macros are placed in the swap file. The swap file is extremely large. In one case the swap file on the scratch cartridge took 750 tracks while the eventual program was only 2000 words. This user had a library with over 40 macros. The swap file should contain only the generated code with the macros that are needed.

**SOLUTION:** MACR1 has been changed to not keep unneeded lines in the IF file.

**SR# 5000071647**

**PROBLEM:** The include statement in a macro compilation allows a total of 32 characters in an include file name.

**SOLUTION:** Fixed in MACR1 to allow the full 64 character file names.

**SR# 2200014324**

**ENHANCEMENT:** MACRO/1000 has been changed to have a source name alias feature.

This name is used by DEBUG/1000 to identify the correct file and display it when the original source is Pascal or any other language which uses MACRO as its final pass.

MACRO has been enhanced to recognize an extension to the MACRO control statement of the form: +SF=file name. This file name will then be put in the NAM records of all modules assembled under this MACRO control statement. In order to allow room for this enhancement on the line, MACRO now handles continue lines on the control statement (except for macro library M runs).

At the same time the MACRO control statement has been enhanced to allow Pascal (and other higher level languages using MACRO as a final pass) to pass MACRO a version number to be put in the NAM record. The form of

## SOFTWARE CHANGES (92077A)

this extension is: +DC=<850802 where the '<' is optional and the date is the version number. This number is converted to days since 1970 and put in NAM record word 24. MACRO puts its version number in word 23.

Further enhancements for Pascal and others are as follows. Two new unary operators are defined:

|                |   |
|----------------|---|
| :SY:expression | Returns the external symbol number of the expression or 0 if the expression does not result in an external reference.   |
| :MR:expression | Returns the relocatability of the expression as an integer as follows:<br>0 - Absolute<br>1 - Program relocatable<br>2 - Base page relocatable<br>3 - Common relocatable (blank common)<br>4 - Pure code relocatable<br>5 - EMA relocatable (local EMA)<br>6 - Save relocatable<br>7 - External<br>9 - Allocate EMA<br>10 - Allocate SAVE<br>12 - Allocate COMMON<br>20 - Two or more of the above. |

In both cases the <expression> must meet the definability rules of the opcode with which it is used (e.g. if used with EQU it must be defined when found in pass 2; if used with ABS, it must be defined by pass 3).

MACR4, MACR5, and MACR6 were changed to have the same date code as the rest of the MACRO modules.

### 2.16.35 MATH ROUTINES

SR# 2200010595

PROBLEM: 'JSB .XFXD' library call causes UI violation error on A900 because there is a sharing of code that doesn't work with the microcode version of the library.

SOLUTION: The routine .XFXD has been recoded to call .DTBL (convert to \*8) and .TFXD (convert \*8 real to \*4 integer).

**SR# 5000032763**

**PROBLEM:** System routine DDINT does not work on A900 as documented. Real\*6 DDINT fails on all neg. fractional powers of 2, e.g. -1/2, -1/4, -1/8, etc. This problem occurs only with DDINT for REAL\*6 arguments. AINT for REAL\*4 and DDINT for REAL\*8 work fine.

**SOLUTION:** DDINT depends on a flag passed back from ENTIX. ENTIX was setting the flag incorrectly on negative fractional powers of two. ENTIX is changed to properly set the flag.

**SR# 5000078808**

**PROBLEM:** Math library routine DSINH (.DSNH) when evaluated with argument = 0.0d0 should return 0.0d0. However what is returned into the four words that comprise the double precision result is 000000b,000000b,000000b,177776b.

**SOLUTION:** The routine (.DSNH) divides the result by 2 by subtracting 2 from the exponent... without checking for 0 first. The missing test for zero result has been added before the subtract.

**2.16.35 MEMORY MANAGER****SR# 2200019158**

**PROBLEM:** Intermittently, the system would hang in \$sharepr of the MEMRY module when the priority of a shared program was lowered (increase number). The reason is that \$sharepr is not called properly from \$list in PROGS. The A and B registers are not set up with correct values.

**SOLUTION:** This is fixed in DSD4.0 update.

**SR# 2200024687**

**PROBLEM:** When a copy of a shared CDS program is loaded (one is already in memory) the code partition gets the priority of the program that was just loaded. Actually, the priority in the ID segment of the highest priority shared program should be used. This is caused by \$SORL (Swap Or Load) not searching for the ID segment with the

highest priority before assigning a priority.

SOLUTION: \$SORL (Swap Or Load) now calls a routine called \$SWPR (Switch Priority) which determines the proper priority for the program.

**SR# 500006353**

PROBLEM: When DEBUG is run on CDS programs, WHZAT shows that both the data and code partition are memory locked. However the code partition can be swapped out if another program needs the partition. When the program is swapped back in, WHZAT shows that the code partition is no longer memory locked. The problem is that the \$MAPS routine in EXEC did not clear the OV bit (set in LOAD) when a new segment is brought in off the disc.

SOLUTION: Changed \$MAPS code to clear the OV bit before the program is dispatched.

**SR# 5000016345**

PROBLEM: CDS programs will usually not run on discs that have 64 sectors per track.

SOLUTION: This is fixed at DSD 4.0.

**SR# 5000060863**

PROBLEM: System hangs when two large CDS shared programs are running. One easy way to reproduce this is to use Pascal. Run WHZAT to find that both data partitions are in memory (131 pages each) and the code partition (361 pages) is swapped out.

SOLUTION: The problem is in the operating system module MEMRY. The check to make sure that a sister code partition was not overlaid with its respective data partition was done incorrectly. Due to the large sizes of the PASCOMP code and data segments, the code partition would be overlaid with a data segment; then the data segment would need to be swapped out to make room for the code segment. At best this resulted in much thrashing and at worst a deadlock situation where there would not be enough room in the swap file to swap the data partition out so that the code could be brought in. In this case the PASCAL compiler would appear to completely die. We have fixed the code.

### 2.16.37 MESSS

SR# 2200024067

PROBLEM: The routine CHNGPR does not work. It will return good status without changing the priority of the program. CHNGPR calls MESSS with the length parameter stored in the B register. A fix to MESSS at the A.85 revision caused this to stop working.

SOLUTION: MESSS will once again be able to use the B register for the length parameter at revision DSD4.0.

### 2.16.38 MI2AB

SR# 2200020495

PROBLEM: MI2AB would erroneously report FMP error -209 (no such directory) or -15 (illegal filename) if the input file name had an even length. MI2AB was not using the string length information returned by GETST or REIO.

SOLUTION: MI2AB now uses the actual length of the passed string.

### 2.16.39 MODEM

SR# 2200008706

PROBLEM: The program MODEM aborts the IMAGE-II monitor DBMON. If a modem connection is broken, roll back recovery is forced on all open databases.

SOLUTION: MODEM is updated to special-case the program DBMON when disconnecting.

## 2.16.40 MULTIUSER/SESSION

### SR# 2200015768

**PROBLEM:** Sessions can exist in RTE-A with two or more programs having the same name. The ATACH and DTACH routines do not check a program's future session for this problem before moving it into the session.

**SOLUTION:** ATACH and DTACH now call the subroutine ProgramsId to determine if a program with the same name already exists in the session to which the program is being ATACH'ed or DTACH'ed. If one does exist, a -5 error is returned, and the ATACH/DTACH call is not successful. To access this error return with all forms of DTACH, use DTACH as a function call, rather than a subroutine call.

### SR# 2200017038

**PROBLEM:** Long passwords are not correctly handled.

**SOLUTION:** The maximum length of passwords has been changed from 16 characters to 14 characters.

### SR# 2200018796

**PROBLEM:** The SearchTable routine is used to find a user ID entry with a certain value in a certain word or portion of the word (superuser bit = 1, for example). It is possible that the value searched for is found in a table entry that was not in use. That is, the entry is filled with garbage left over from a previous session. The caller might then start manipulating this entry, or give information based on this entry, which is all invalid information.

**SOLUTION:** Modified SearchTable to return a user ID table entry only if the table entry is in use. One exception to this is when the status is being checked. In this case, the caller is looking at the status to see if it is 0, so an unused entry can be returned.

### SR# 2200022939

**PROBLEM:** Dormant, non-time-scheduled system utilities are not

removed from a user's session when the user logs off. Depending on how the utility functions, as of update A.85, SAM can be corrupted if that utility runs in that nonexistent session.

**SOLUTION:** When a session terminates, the OS (\$DECPC routine) cleans up all RP'ed programs belonging to the session. Non-system utilities have their ID segments removed (as done previous to this update). System utilities are attached to the SYSTEM session (instead of remaining in this now dormant session).

**SR# 2200023234**

**PROBLEM:** GetResetInfo may encounter problems when opening a seemingly good user configuration file. This problem is caused by GetResetInfo assuming a string of a certain length being passed by the caller. GetResetInfo then accesses the actual string and some information that comes after it in the program's memory. This information is usually harmless, but in some cases is interpreted to be file information.

**SOLUTION:** Modified GetResetInfo to use the string as declared by the caller. That is, no string length is assumed.

**SR# 2200025106**

**PROBLEM:** LOGON calls ATCRT to set the terminal lu in the \$CON word of its ID segment to the session number it is accessing. If this is a programmatic session, this is not a valid lu number. If LOGON aborts with this value in \$CON, the system crashes.

**SOLUTION:** ATCRT now checks the "lu" value passed. If it is larger than any lu genned into the system, lu 1 is put in as the caller's terminal lu value in the program ID segment.

**SR# 2200025239**

**PROBLEM:** System processes, not just superusers, should be able to atach/dtach programs in other sessions.

**SOLUTION:** Now system processes residing in a non-superuser session can atach/dtach programs in another session.

**SR# 5000051144**

**PROBLEM:** RTE-A VC+ system does not give user ability to fix problems when system runs out of SAM. User is given prompt (CM> or SYSTEM>), but anything the user enters is ignored because there is no room in SAM to save the input.

**SOLUTION:** PROMT now detects when the system is out of SAM (its class I/O requests fail). The multiuser system is disabled. Attempts to access CM, LOGON, or the SYSTEM> prompt are responded with an out of SAM error message. RTE is made available (RTE: prompt) at lu 1 or at the interrupting lu if lu 1 is not available. PROMT also starts up RESTR, a utility that will restore the system to normal multiuser operations once you have fixed the SAM problem. The SAM problem can be fixed (by you) by releasing blocks of SAM. You can do this by offing the offending program(s), for example. Once this has been done, enter GO,RESTR. To prepare for this situation, RP RESTR, SAM, and WH when you boot your system. They will be most useful in fixing the problem should it occur.

**2.16.41 OLDRE****SR# NONE**

**ENHANCEMENT:** The OLDRE routine now has a version that works with the CI file system. This is now the standard version on RTE-6/VM and RTE-A.

**2.16.42 OPERATING SYSTEM****SR# 2200020529**

**PROBLEM:** \$.CLA entry point is missing from dummy OS CLASS module, CLA..

**SOLUTION:** This is fixed in the DSD 4.0 update.

### 2.16.43 PARITY ERROR

**SR# 2200027458**

**PROBLEM:** The PERR module does not mask off the high byte of the parity error register when it is loaded in, which contains syndrome bits or other garbage. This causes the memory manager to try to down a non-existent page in some circumstances.

**SOLUTION:** The code now masks off the garbage bits before reporting the offending page.

### 2.16.44 PHYSICAL BACKUP

**SR# 5000065722**

**PROBLEM:** When doing two unit restores, some of the files from the second tape are written to the first disc unit.

**SOLUTION:** Table inside ARSTR will now be initialized before every restore operation.

**SR# NONE**

**PROBLEM:** ASAVE and ARSTR report an internal error when a mirrored volume LU is specified to be saved or restored.

**SOLUTION:** ASAVE and ARSTR are changed to check for mirrored volume disc LUs and issue either an error or a warning. ASAVE and ARSTR now access LUs greater than 63 because all EXEC 1, 2, and 13 calls are changed to XLUEX calls.

**SR# 5000051342**

**ENHANCEMENT:** CSYS has been enhanced to optionally place ASAVE/ARSTR header and trailer records around a VCP bootable file on CTD. This will allow ASAVE to append to a tape containing a memory based system. The "SA:<next-file-number>" option has been added to CSYS.

## 2.16.45 POWER FAIL

SR# 2200033480

PROBLEM: When a A.85 system gets a power fail warning, but does not actually lose power, the system is likely to crash. The reason is that bit 15 in the powerfail IFT word 7 is being set with the E-register value present when the powerfail occurred, rather than being unconditionally set to force a continuation entry.

SOLUTION: Cause IFT word 7 to have bit 15 set in some other way.

## 2.16.46 PRIMARY

SR# 2200021881

PROBLEM: The primary answer file has comments for all the DS modules which must be included when adding DS with the exception of %ID.66. This comment should be added. ie. \* RE,%ID.66::A3 ,,, include for DS!

SOLUTION: Corrected in DSD4.0.

SR# 2200022020

PROBLEM: #ANS, the answer file shipped with the RTE-A product, does not match the primary system in that the disc layout of the Micro 1000 internal disc is changed from 4 LU's (55, 56, 57, 58) to 2 LU's (55, 56)

SOLUTION: Fix to this problem is in the DSD 4.0 update.

## 2.16.47 PRINT

SR# 2200023960

PROBLEM: The message "LU xx is locked to program xxxxx" is not displayed correctly.

SOLUTION: The message has been corrected.

## 2.16.48 RESOURCE NUMBERS

### SR# 2200013250

PROBLEM: RNRQ does not always set the STATUS variable. With some errors, the A and B registers are set to RNxx, but STATUS is not set.

SOLUTION: The RNRQ routine has been modified to solve this problem. RNRQ now checks for the parameters passed. The status parameter is now optional. If present, it will always be set accordingly. The A&B register will now return an RN01 error code to indicate the wrong number of parameters was specified. The manuals have been updated to reflect these changes.

## 2.16.49 SYSTEM LIBRARY

### SR# 5000079160

PROBLEM: Fortran CDS EMA programs are aborting with MP, DM, UI, or sometimes just quitting when they are doing Fortran I/O. One early symptom is getting duplicate entry point warnings during Link. The problem occurs in programs doing Fortran I/O with EMA variables where, during Link, a non-CDS system format routine requires entry points that need to be satisfied with a CDS system format routine. Link, currently scanning the non-CDS library, attempts to bring in the non-CDS module which satisfies these references resulting in duplicate entry point warnings and a non-performing program. The routines that are giving us problems are the non-CDS routine .IAV. trying to pull in the cds routine .IAY., but getting the non-CDS .IIO. instead.

SOLUTION: The problem with .IAV. has been solved by creating a CDS version !IAV which has been placed in \$FCDS. The nonCDS routine .IAV. has been removed from \$6SYLB and \$SYSLB and placed into \$FLIB. This fix is in DSD 4.0.

## 2.16.50 SYSTEM MESSAGES

### SR# 2200018523

PROBLEM: The current segment number in the ID segment is not always correct, so sometimes the wrong segment number is printed in abort messages.

SOLUTION: ERLOG has been modified to obtain the current segment number from page 0 of the user code segment.

## 2.16.51 SYSTEM PARTITIONING

### SR# 2200024950

PROBLEM: There is a call to \$scmsg in the LOAD module. LOAD is a partitionable module and \$scmsg is a 4-parameter subroutine, which is not partitionable.

SOLUTION: The LOAD module now calls \$printer in UTIL, which makes the \$SCMSG call.

### SR# 2200025049

PROBLEM: The LOAD module is missing an OS,EX GEN record for the \$XEQ5 entry point, requiring that the LOAD and MEMRY modules be relocated in a particular order.

SOLUTION: The LOAD module now has an OS,EX record for the \$XEQ5 entry point, and thus MEMRY and LOAD can be relocated in any order in your system GEN.

### SR# 2200024984

ENHANCEMENT: The RTIOA, EXEC and IOMOD modules are so large that they are consuming base page links unnecessarily. These modules are now divided into 8 modules:

ABORT - Handles EXEC 6, EXEC 7, and abort processing

EXEC - Handles all interrupts, privileged mode, and initial EXEC

## SOFTWARE CHANGES (92077A)

processing  
IOMOD - Contains the code for linking and unlinking I/O requests, buffer limit checks, and I/O abort processing  
IORQ - Does initial I/O request processing  
MAPS - Contains the code pertaining to the dynamic mapping system  
PROGS - Contains the code for program scheduling  
RTIOA - Contains the code for logical and physical drivers  
UTIL - Contains everything else; includes the startup code, system global variables, unpartitionable parts of other modules, and various utility routines

### SR# 5000006387

ENHANCEMENT: In order to have more room in the system map, we have partitioned the CLASS, IORQ, TIME, and LOCK modules, in addition to those partitioned at A.85. Also, more base page links have been freed up. Please also see SR#2200024984.

## 2.16.52 Scheduling

### SR# 2200015156

PROBLEM: When the parent program schedules and terminates a child program at a high rate, MP, UI, and SCO4 errors occur. If the parent is of higher priority than the child, the problem goes away.

SOLUTION: EXEC 6 was not setting the son's OFF bit in the case where the son is in the process of being loaded from disc and the father terminates it. The load would be aborted, but the son would not be removed from the schedule list. Eventually the son would be run but it would not be in memory properly, leading to errors. The son's OFF bit is now being set in this case. By setting the OFF bit, the \$ZLST routine is later called (after the load abort completes) which leads to the son being aborted (removed from the schedule list).

### SR# 2200016824

PROBLEM: EXEC 12 scheduling with an execution multiple of > 2047 does not work properly.

SOLUTION: Modified mask in &TIME module to access the full 12 bits of the "multiple for resolution" field from the

SOFTWARE CHANGES (92077A)

program's ID segment. Previously, the most significant bit was lost.

**SR# 2200020354**

**PROBLEM:** AT command would cause the user's number of programs counter to be corrupted if the user time scheduled a system utility that resided in another session.

**SOLUTION:** Modify ON.. and TIME to handle this special case correctly.

**SR# 2200024182**

**PROBLEM:** If a parent program does an EXEC 6 call on child program, the EXEC 6 does not terminate the child program if it is I/O suspended.

**SOLUTION:** An error in the EXEC 6 code in the operating system caused this problem. The program's OF bit was not being set properly so the program did not terminate once the I/O request was flushed. The OF bit is now set as needed.

**2.16.53 TF**

**SR# 2200009704**

**PROBLEM:** TF aborts without a meaningful error message while restoring files from a tape if a file called "xx".dir is on the tape.

**SOLUTION:** When TF tries to backup a FMGR file called "xx".dir, it converts the "." to a "\*". This prevents any of these files from ever getting on the tape in the first place. If TF is restoring an FC tape with such a file, it no longer treats the file as a directory. In this case you can get an FMP error, but the rest of the files on the tape can be accessed.

**SR# 5000023325**

**PROBLEM:** TF group command causes an error if a 'C' or 'V' option is specified on some of the copy commands (in the group), while some of the other copy commands have no options specified at all.

**SOLUTION:** The 'C' and 'V' options both set the VERIFY flag for the

SOFTWARE CHANGES (92077A)

entire group, so TF is assuming that each line must have had an option in it since one of the option flags is set. Using TRIMLEN, a reference is made to the 0th location of a string that had a first location of 1. A simple check for the current number of options prevents the bad reference.

**SR# 5000046011**

**PROBLEM:** TF prints in column 1 which messes up the carriage control information for the printer when the list device is the printer LU.

**SOLUTION:** A call to FmpSetIoOptions is used to set the V bit in case the LL command references a device.

**SR# 2200008136**

**ENHANCEMENT:** In a multitape backup, TF takes all but the last tape offline when it is done rewinding.

**SR# 2200013193**

**ENHANCEMENT:** The LL command now applies to the CO (copy) command, not just the DL command.

**SR# 2200019075**

**ENHANCEMENT:** UNIX binary files being restored are now created to their actual size as a type 1 file.

**SR# 2200019091**

**ENHANCEMENT:** TF pads in zeros at the end of the last block of data for UNIX binary files.

**SR# 2200021410**

**ENHANCEMENT:** When restoring a file or set of files to a global directory that does not exist, the directory will be created on the LU it previously existed on, if possible.

**SR# 2200021485**

**ENHANCEMENT:** TF now accepts the 'C' option to clear the backup bit when restoring files.

**SR# 2200022897**

**ENHANCEMENT:** TF now rewinds after each tape in a multiple tape restore.

SR# 5000021550

ENHANCEMENT: A second EOF mark is added at the end of the tape.

## 2.16.54 TIME

SR# 5000044727

PROBLEM: If a program is scheduled to run tomorrow (after midnight) and the system time is changed to be past midnight, the program's time to execute is altered incorrectly.

SOLUTION: Modified &TIME (FIXIT routine) to check for the special case of system time being changed to be past midnight when there are time-relative scheduled programs to run after midnight. If this is the case, the execution time is modified appropriately to run within the next 24 hours (since you can schedule only within the next 24 hours).

## 2.16.55 VMA

SR# 2200006734

PROBLEM: VMAOpen with the "T" option invariably causes an error return of -15 (illegal name) or -6 (no such file). The name is ignored in the VMAOpen. Instead a scratch file name is produced. This name has imbedded blanks which cause the error when D.RTR is asked to open the file.

SOLUTION: VMAOpen is changed to use the name specified. If the name field is blank, or if this is a temporary file and a directory was not specified and the working directory is not set, it will use the options specified, but create its own name.

SR# 2200009050

PROBLEM: When the working directory is 0 (WD = 0) and a scratch CRN has not been specified (SC), the backing store file created for a VMA program is placed on the first FMGR

CRN. The BSF namr is a legal filename and the BSF is not purged on completion of the VMA program. The BSF name should be an illegal filename and the BSF should be purged on program completion.

SOLUTION: When a scratch cartridge has not been specified (\$SCRN=0) and the working directory is not set (Words 10 and 11 in the UID are -1) then create an illegal file name. This code is in &\$VMA\$. Fixed at revision DSD4.0.

**SR# 2200025437**

PROBLEM: VMAOPEN has problems using odd length filenames and options sometimes. It is using arithmetic shifts on byte addresses to convert them to word addresses. This causes string buffers that are located in the the range from 16k to 24k in the program to be accessed incorrectly.

SOLUTION: This is fixed in the DSD 4.0 update.

## 2.17 (92080A) Datacap/1000-II

### 2.17.1 Aborts

**SR# NONE**

PROBLEM: In normal operations, Datacap may experience normal but fatal errors from time to time, such as when a dataset is full. When this happens, Datacap should shut down gracefully. Instead, it was doing an MP.

SOLUTION: The abort processor was modified to shut down gracefully.

## 2.17.2 DCRCV

### SR# C700022723

PROBLEM: The INCLUDE option within DCRCV does not always work (as is the case with other options). Algorithms for time stamp checking were being done incorrectly.

SOLUTION: The checks of time stamp conditioning were changed in DCRCV to fix this.

## 2.17.3 Error Messages

### SR# 5000096651

PROBLEM: When a terminal sends back a status in error when doing an assigned transaction during transaction startup, the potential for a TMP 51 exists. This will cause the entire runtime system to be shut down.

SOLUTION: ZTMP was modified to trap on the --30-- error, and set itself in a state such that it doesn't think it is to start up a particular transaction. It will then ask for a transaction as if none were assigned, and the potential for the TMP 51 is eliminated.

### SR# NONE

PROBLEM: Datacap would abort intermittently with a TMS 29 error when devices would go down with an IONR.

SOLUTION: When a device goes down, an attempt to UP the LU is tried.

### SR# NONE

PROBLEM: When doing simple disc file storage on an RTE-VI system, TMP 99 Internal error 620 \*\* -5 would occur.

SOLUTION: The problem deals with values in the DCB for the disc file. FMP format has changed, and this is now reflected in Datacap's manipulation of the DCB. The problem was introduced at REV.2340 of RTE-VI.

## 2.17.4 Undefined Externals

### SR# NONE

PROBLEM: Image now has 2 versions of the READ routine, DBDRT and DBRED. One of these must be merged into \$DBMS1 along with %DBMS and %LOCAL.

SOLUTION: #DCIML is the merge file for \$DBMS1, and it has been updated for this modification.

## 2.18 (92081A) Image/1000-II

### 2.18.1 +DBCON

#### SR# 2200023291

PROBLEM: When the +DBCON file is created on RTE-6, it has the initial default protection of RW/R. When IMAGE is started, DBMON becomes part of system session which has no write access to the file +DBCON, hence DBMON quits.

SOLUTION: When creating +DBCON on RTE-6, Image sets its protections to RW/RW to allow system session programs to have read/write access.

### 2.18.2 Backup Utilities

#### SR# 2200025890

PROBLEM: If the user of a backup utility doesn't respond before the timeout on the terminal elapses, the utility was being terminated.

SOLUTION: The interactive prompt is repeated when the terminal times out instead of terminating the backup utility.

#### SR# 5000080465

PROBLEM: The IMAGE utilities DBRST and DBLOD attempt to determine

if a file contains any data by making an FmpRecordCount call, however, record count information is only kept for heirarchical files. FMGR files appear to be empty if an FmpRecordCount call is made against them.

**SOLUTION:** The check to determine if a file is empty has been removed. (It will be found out anyway at the first attempt to read from the file).

### 2.18.3 Conversion

#### **SR# NONE**

**ENHANCEMENT:** IMAGE/1000-II supported most CI files with the exception of the database root file and data sets at REV. DSD4.0. Now all files may reside on CI volumes.

#### **SR# NONE**

**ENHANCEMENT:** The IMAGE/1000-II root file format has changed to support databases on heirarchical directories. Rather than require databases to be unloaded and reloaded, a utility has been developed to adjust an existing root file to the REV. DSD4.0 format.

### 2.18.4 DBBLD

#### **SR# NONE**

**ENHANCEMENT:** DBBLD will now open the database with read/write shared access, rather than exclusive access. This will allow other users to read/modify the database while DBBLD is executing.

### 2.18.5 DBDS

#### **SR# 2200011791**

**PROBLEM:** DBDS often produces vague error messages like 'FMP error', without explaining even what the error number was.

**SOLUTION:** Made DBDS more informative about errors.

**SR# 5000080036**

**PROBLEM:** DBDS places a '1' in column one to force a page eject, then proceeds to echo schema lines beginning at column 1, which causes the first character of the schema file to be stripped off when printed on a line printer.

**SOLUTION:** The code now pads each schema line with a leading blank to insure correct output appears on a printer.

**SR# NONE**

**PROBLEM:** Comment printed by DBDS should be reworded more tactfully.

**SOLUTION:** Reworded comment printed by DBDS.

**2.18.6 DBFND**

**SR# NONE**

**PROBLEM:** The manual states that word 2 of the status array from DBFND will always contain zero, but is actually unchanged.

**SOLUTION:** Set word 2 of the status array to zero before returning from DBFND.

**2.18.7 DBGET**

**SR# 5000072264**

**PROBLEM:** When using DBGET for a remote database, the returned data is at an address one word higher than expected.

**SOLUTION:** We fixed an array index in the code which was subscripted one higher than it should be.

**2.18.8 DBINF**

**SR# 5000070235**

**PROBLEM:** If any data set is not accessible to a program (due to opening at some level below the highest), DBINF mode 204

## SOFTWARE CHANGES (92081A)

always returns the error 100 (illegal data set reference).  
SOLUTION: The code now ignores inaccessible data sets for DBINF mode 204.

### 2.18.9 DBLCK/DBUNL

SR# NONE

PROBLEM: The example programs sent with the product needed some corrections for locking and use of character data types.  
SOLUTION: Corrected the example programs.

### 2.18.10 DBLOD

SR# 5000104836

PROBLEM: When adding new data items to a data set, DBLOD puts data from the next record into the new items.  
SOLUTION: DBLOD now trims the new items from the item list on the DBPUT calls, thus leaving new items as blanks (if character) or zero (if numeric).

### 2.18.11 DBMEM

SR# 2200024851

PROBLEM: DBMEM does not return the current transaction number in status words 3-4. (Those words are left unchanged by DBMEM)  
SOLUTION: DBMEM will now return the current transaction number in words 3-4 of the status array.

### 2.18.12 DBMON

SR# 2200024554

PROBLEM: DBMON aborts with a VM82 error if the transaction log

## SOFTWARE CHANGES (92081A)

SOLUTION: fills and the current call being processed is a DBPUT. DBMON alters a data set identifier in the DBPUT message it receives. If DBMON needs to recover space in the transaction log file because it is becoming full, it would retry the DBPUT, but would calculate a bad VMA pointer and abort. DBMON no longer alters the original DBPUT message if a retry will be done.

### SR# 2200025908

PROBLEM: A re-occurrence of a bug in IMAGE: a program whose session number changes has its IMAGE resources cleaned up, but DBMON continues to accept messages from the program, eventually corrupting the database.

SOLUTION: We fixed DBMON to reject messages from cleaned up programs.

### SR# NONE

PROBLEM: Due to DBMON's modifications, its link command file needs to be updated with new WS and VS values.

SOLUTION: Updated DBMON.LOD.

## 2.18.13 DBOPN

### SR# NONE

PROBLEM: The new DBOPN which can handle hierarchical root files grew by over 2700 words due to calls to FmpWorkingDir, FmpParseName and FmpBuildName.

SOLUTION: The extra 2700 words of code are produced by the algorithm for analyzing the root file descriptor and appending it to the working directory(if any). Therefore, the file descriptor analysis code has been isolated in a single module, and a stub called SHORT\_DBOPN.REL can be searched or relocated in the application program to avoid the extra code; however, note that the application must pass a fully qualified descriptor of the root file to DBOPN.

## 2.18.14 DBPUT

### SR# 2200030296

PROBLEM: DBPUT does not return chain information in the status array for a put to a detail data set.  
SOLUTION: Chain information was not being returned from the routine performing the DBPUT; the information is now returned properly.

## 2.18.15 DBRFR

### SR# 5000096404

PROBLEM: DBRFR incorrectly handles input from a terminal. DBRFR gets the error -11 (DCB not open) when prompting for roll-forward log volume names or database root file names.  
SOLUTION: We now use FmpOpen for interactive and disc files. (Previously, interactive devices were treated with special EXEC calls, and were not accessed with standard FMP calls).

## 2.18.16 DBSPL

### SR# 2200023283

PROBLEM: Nothing is written to a magnetic tape that is defined as the roll-forward log. (A macro routine for getting a device LU from the DCB was not changed for the hierarchical DCB format at A.85; a magnetic tape then looked like a bit bucket).  
SOLUTION: We changed the device-LU routine to understand the new DCB format.

### SR# 2200023622

PROBLEM: Upon reaching the EOF of a roll-forward log file, DBSPL quits and IMAGE shuts down with a 'soft crash' condition. The IMAGE warning log contains the message 'UNEXPECTED IMAGE ERROR'.  
SOLUTION: DBSPL is expecting an error 12 (absolute value of the FMP eof-bof error -12), but was receiving the true -12 error code which was 'unexpected'. DBSPL now expects either the true or massaged error code.

### SR# 2200023648

SOFTWARE CHANGES (92081A)

PROBLEM: If DBSPL is RP'ed, DBRBR gets a cloned DBSPL which looks to DBRBR as though DBSPL failed to execute, since the real DBSPL ID segment looks dormant. DBRBR then quits with an error.

SOLUTION: FmpRunProgram clones a copy of an RP'ed program if the scheduling string is of the form 'XQ,DBSPL.RUN::PROGRAMS'. If the scheduling string is 'XQ,/PROGRAMS/DBSPL.RUN', then the RP'ed DBSPL will be executed.

2.18.17 DBSTR

SR# 5000086249

PROBLEM: DBSTR is unable to make a backup of a database if more than one tape is required. (FmpRead would not read data past the end-of-tape mark).

SOLUTION: A fix is made to FMP which allows the IMAGE backup utilities to determine how much data was read, even though FMP returns a length of -1 (end-of-tape detected) from the FmpRead call. The patch involves peeking into labeled common /FMPREGS/.

SR# 5000098517

PROBLEM: For multiple tape backups, if the terminal times out while DBSTR is prompting for the next tape to be mounted, DBSTR aborts with error 236 ('user requested abort'). The same symptom shows if a carriage return is done at the prompt.

SOLUTION: The 'mount next tape' algorithm was corrected to re-prompt if the answer to the prompt is not yes or no.

2.18.18 DBUPD

SR# 5000085571

PROBLEM: When performing a DBUPD on a large record (over 3k bytes) the last portion of the record (up to 450 words) is corrupted.

SOLUTION: DBMON has an upper limit of 2062 words for class I/O messages. It should be 2500 words. The last portion of the class message would be lost and random garbage in memory would be written to the database. The code has

been fixed.

## 2.18.19 DBUTL

### SR# 2200034157

**PROBLEM:** Executing the DBUTL 'RB' command at an RTE-6 system console could result in an error -226 if DBRBR is not RP'ed, or error 8 if RP'ed. The trouble was DBRBR making a PRTN call before closing its files which allowed DBUTL to be executing concurrently with DBRBR.

**SOLUTION:** DBRBR now makes a PRTN call just before terminating.

### SR# 5000083345

**PROBLEM:** When running DBUTL from a session other than MANAGER.SYS, DBUTL returns error -205 (no write access to file) and quits.

**SOLUTION:** Same as SR 2200023291, where +DBCON is created with read/write access for owner and others.

### SR# 5000084715

**PROBLEM:** DBUTL schedules the utilities DBRBR and DBRFR using FmpRunProgram. If FmpRunProgram returns an error, DBUTL attempts to write an error message to the user before opening the list file, hence no error message, but DBUTL terminates.

**SOLUTION:** The code now opens the list file before writing an error message.

### SR# 5000041285

**ENHANCEMENT:** DBUTL causes non-HP terminals to hang due to code which tries to set up for a command stack, assuming the terminal is 'smart'. DBUTL will only attempt to set up a command stack if the input is to be from a terminal. If input is from some non-interactive device or file, no command stack action will be taken.

### SR# NONE

**ENHANCEMENT:** DBUTL will allow blanks and commas to delimit command parameters. (Formerly only commas were allowed).

## 2.18.20 DD\*24

### SR# 5000051805

PROBLEM: IMAGE software assumes the only magnetic tape driver is DD\*23; IMAGE would not recognize an LU controlled by DD\*24 as a magnetic tape.

SOLUTION: It now accepts both DD\*23 and DD\*24 as magnetic tape drivers.

## 2.18.21 DEMON

### SR# 2200015982

PROBLEM: Both IMAGE/1000-II and CONTROL/1000 have a program called 'DEMON' with different functions; the two subsystems have difficulty co-existing.

SOLUTION: Changed IMAGE's DEMON to a more conventional name: DBCLN

## 2.18.22 Error Messages

### SR# 2200023606

PROBLEM: When IMAGE attempts to allocate a class number and none are available, an incorrect error is returned (138) implying that a class read/write had failed.

SOLUTION: The A-register is now checked after a CLRQ call to allocate a class number, to determine if the allocation succeeded. (Previously, only the abort return would return the correct error number; a normal return was assumed to have succeeded, but the class number would be zero and class reads/writes would naturally fail).

## 2.18.23 LINK

### SR# NONE

ENHANCEMENT: All Link command files for installing IMAGE programs were changed to place all common commands within the command file rather than in the Link run string.

**2.18.24 Log Files****SR# 2200023317**

**PROBLEM:** DBUTL gets error -216 when attempting to create IMAGE files on FMGR cartridges.

**SOLUTION:** DBUTL now ignores error -216 from FmpSetProtection calls. (-216 means "Can't do that to a FMGR file"; affects only RTE-6).

**SR# 2200024885**

**PROBLEM:** DBUTL run from a non-super user/non-manager.sys account will not be able to create log files on the /IMAGE2/ directory.

**SOLUTION:** Documented in the reference manual the file system restrictions that only the owner of a directory or super user may create a file on that directory. (MANAGER.SYS is typically the owner of /IMAGE2.DIR on RTE-6).

**SR# 2200024901**

**PROBLEM:** IMAGE will not be able to open a database if the transaction log file is on a FMGR volume. (DBMON reports error 142 indicating the transaction log file is full).

**SOLUTION:** FmpRecordCount is used to obtain the number of blocks in the transaction log file; for FMGR files, FmpRecordCount returns zero, which makes the transaction log file appear very small. FmpSize is now used.

**SR# 2200033175**

**PROBLEM:** When using the roll-forward logging without spooling, logging would prematurely end after switching to the spare roll-forward log. DBMON was misinterpreting the 'switching' message from DBSPL as a fatal logging error and assuming roll-forward logging had been disabled.

**SOLUTION:** DBMON now correctly handles non-fatal DBSPL messages.

**SR# 2200033183**

**PROBLEM:** When using roll-forward logging to a disc file, the file will appear corrupt to DBARC and DBRFR (roll-forward recovery program) due to a partially written log buffer at the end of the file. In addition, if no spare log is

defined when the file becomes full, and IMAGE is shut down at that point, DBSPL's buffer is not written anywhere and the log file gets re-used when IMAGE is next started up.

SOLUTION: DBSPL now checks to insure that room exists in the file to write the whole buffer before attempting the write, thus insuring no partial buffer appears at the end of the log. To solve the shutting down problem, a flag has been added to the +DBCON to prohibit shutdowns at 'critical' periods where DBSPL cannot shut down without losing data.

**SR# 5000067827**

PROBLEM: Roll-forward log files exceeding 32,767 blocks cannot be archived (DBUTL command AR).

SOLUTION: The program performing the archive (DBARC) has a 16-bit integer for the disc block number. This has been changed to a 32-bit value.

## 2.18.25 Manuals

**SR# 2200022145**

PROBLEM: Incorrect description of error 144.

SOLUTION: Fixed reference manual.

**SR# 2200024844**

PROBLEM: The IMAGE documentation is not helpful for what steps to take when the transaction log or roll-forward log becomes full.

SOLUTION: The IMAGE reference manual has been augmented to give the options for what steps can be taken to correct full-log conditions.

**SR# 5000053959**

PROBLEM: Error 235 is not specific enough about which file has become full.

SOLUTION: Explained that the backup storage file has become full.

**SR# 5000061002**

PROBLEM: Error 145 in the reference manual does not give any hints about how to recover from a logically-incorrect database.

SOFTWARE CHANGES (92081A)

SOLUTION: Gave some alternative workarounds in the manual.

SR# 5000074732

PROBLEM: IMAGE reference manual is misleading about what values may be used for the list parameter for DBUPD, DBGET and DBPUT calls.

SOLUTION: Corrected the item list description for DBUPD, DBGET and DBPUT in the reference manual.

SR# 5000096388

ENHANCEMENT: The manual does not give examples for what order DBUTL commands should be executed in, nor is it helpful in describing how logging, backup, and recovery interact. For this reason there will be example command files (both CI and DBUTL command files) which show how these various functions of IMAGE relate to each other, what needs to be done and in what order. The ZOO database will be used for examples.

2.18.26 NLS

SR# NONE

ENHANCEMENT: NLS has been implemented in the following IMAGE-II programs: QUERY, DBUTL, DBSTR, DBRST, DBRBR, DBRFR, DBLOD, DBULD, DBSPA and DBBLD. (DBMON, DBSPL and DBCLN do not produce messages).

2.18.27 QUERY

SR# 2200024703

PROBLEM: For 4-byte real items, QUERY finds too many records if the 'ILT' (is less than) relational operator is used, and finds no records if the 'IGT' (is greater than) operator is used.

SOLUTION: The 4-byte real comparison algorithm mistakenly uses a 4-byte integer for comparison with a 4-byte real, resulting in too many or not enough matches. The code has been fixed.

SR# 2200025791

SOFTWARE CHANGES (92081A)

PROBLEM: QUERY's DISPLAY command is unable to display some files, reporting a syntax error.  
SOLUTION: QUERY has some leftover code from REV.A.84 which looks at the first word of a DCB to determine whether the DCB is for a device or file. The obsolete code has been deleted.

**SR# 5000038232**

PROBLEM: The QUERY help command gave an incorrect example of the 'FIND' command syntax.  
SOLUTION: Corrected the FIND example.

**SR# 5000063099**

PROBLEM: When QUERY performs a FIND involving a chained read with more than one value to be found, QUERY finds the first qualifying record but not any succeeding ones.  
SOLUTION: Algorithm ended the FIND prematurely; algorithm has been corrected.

**SR# 5000081463**

PROBLEM: Duplicate of SR# 5000063099  
SOLUTION: Fixed algorithm bug.

**SR# 5000086017**

PROBLEM: QUERY reserves certain characters for syntax, and will not access files which contain those characters; (period or dot, equal sign, and quote).  
SOLUTION: The code now does not check for syntactical characters when processing a file name. Semicolon is still reserved, however.

**SR# 5000060210**

ENHANCEMENT: QUERY is now capable of reporting up to 512 characters per report line. (Former limit was 132; some HP printers are capable of up to 256 columns per line).

**SR# NONE**

ENHANCEMENT: QUERY in IMAGE/1000-II has a variety of new features:

- 1) The record numbers in a select file can be used by a different run of QUERY.
- 2) A new command, FINDA, will add more record

numbers to those already in a select file.

- 3) Abbreviations for various commands:  
 FIND abbreviated to F  
 FINDA abbreviated to FA  
 REPORT abbreviated to R  
 UPDATE abbreviated to U  
 EXIT abbreviated to EX, E, EN and END.
- 4) QUERY has a 20-line command stack, similar to EDIT/1000's.
- 5) FIND and FINDA commands can use wildcards on CHARACTER ITEM searches. (No wildcards for numeric items). The wildcard features are similar to the file system conventions:  
 A dash (-) represents one indefinite character.  
 An at-sign (@) represents zero or more indefinite characters.  
 Any other character is absolute.
- 6) REPORT ALL defaults to single-spacing; (formerly double-spaced). The default can be overridden by a supplied spacing value of 1 through 5 as follows:  
 REPORT ALL,,2; {Double spacing}  
 R ALL,,5; {blank lines between each item value}
- 7) Quotes (") are no longer required around item values, unless the item value contains a reserved syntax character (blank, comma and semicolon).  
 Old style: FIND item is "xyz" END;  
 New style: FIND item is xyz;  
                                   {'END' is optional, now}  
 or,      FIND item is "Tom Hirata";  
                                   {Quotes still required here}
- 8) 'END' keyword is not required on FIND and FINDA.

## 2.18.28 ZOO

### SR# NONE

PROBLEM: The example database ZOO supplied with the IMAGE product did not have any command files for creating and loading data into the database. The DBBLD data file, in

## SOFTWARE CHANGES (92081A)

particular, requires a non-default run string to be given and the correct run string is not intuitively obvious.

**SOLUTION:** Supplied an example command file to show how to create the ZOO database and load it with data.

## 2.19 (92084A) RTE-6/VM Operating System

### 2.19.1 \$6FCLB

**SR# NONE**

**NOTE:** The file \$6FCLB has been reinstated for release DSD 4.0.

### 2.19.2 ACCOUNTS

**SR# 2200001198**

**PROBLEM:** Repeatedly shutting down ACCTS with the RE (release memory) option and then bringing session back up causes system to lose all of available SAM. The \$BALC routine is not properly setting up links to system entry points during the return call (\$BRTN). Thus each new load from the disc is using invalid pointers.

**SOLUTION:** \$BALC has been changed to use fresh pointers on each entry.

**SR# 2200005579**

**PROBLEM:** "New,user" command specifies in the documentation a total limit of 60 for SST spares plus disc limit. Altering a user above this maximum correctly produces the error. However, creating a user above this maximum would create an account with a corrupt SCB. "List,user" shows illegal values and logging-on would create a session that can't be logged-off.

SOFTWARE CHANGES (92084A)

SOLUTION: Fixed in the DSD4.0 update.

**SR# 2200019539**

PROBLEM: ACCTS encryption algorithm sometimes puts invalid data in for password. Altering a user's password with the AL,U,<user>.@ can corrupt the user's password. There are actually two conditions where corruption can occur.

- 1) AL,U,<user>.@
- 2) AL,U,@.<group>

SOLUTION: Fixed in the DSD4.0.

**SR# 5000079913**

PROBLEM: A.85 ACCTS will abort with a MP error when you try to link a new user to another user. Module ACNWU was writing to a buffer that is not big enough.

SOLUTION: This is fixed in the DSD 4.0 update.

2.19.3 CI

**SR# 2200018747**

PROBLEM: If you enter a command stack command and your terminal then times out, the last command displayed is executed by CI.

Example: CI> /  
          WH,AL  
          DL,/SYSTEM/  
          IO  
          \_ (cursor waiting for user)

If the terminal then times out waiting for the user, IO is executed.

SOLUTION: A check has been added to see if a timeout occurred and to handle it properly when the command stack is displayed. Before, the timeout was ignored and the last command displayed was executed.

**SR# 2200018762**

SOFTWARE CHANGES (92084A)

PROBLEM: CI's SET command with no parameters truncates the values of \$1 - \$9 to 76 characters each instead of 80.

SOLUTION: The length of the scratch variable used to manipulate these values has been increased because it was too small, causing truncation of its contents.

SR# 2200018804

PROBLEM: CI aborts with a Fortran string error when the user enters more than 80 slashes.

SOLUTION: CI now checks if more than 80 slashes were entered and truncates to 80 if 81 or more were entered.

SR# 2200020206

PROBLEM: CI's TM command does not work if time is set to be after 12 and the PM parameter is specified. A "No such time" error results.

SOLUTION: CI correctly handles the TM command now.

SR# 2200020362

PROBLEM: Timeout/logoff process does not restart if the user enters a command in the middle of the process.

SOLUTION: The variable which keeps track of how many consecutive timeouts have occurred is now reset after the user enters a command.

SR# 2200021378

PROBLEM: When CI or CM aborts due to an EXEC error, it is difficult to tell what program had the EXEC error.

SOLUTION: The EXEC error message code has been changed to include CI/CM to identify itself when reporting an EXEC error.

SR# 2200021386

PROBLEM: /m/ followed by /n, where m and n are both greater than about 25, causes a clear screen to be executed by CI while commands are being displayed and garbage to appear in the command stack.

SOFTWARE CHANGES (92084A)

SOLUTION: The code performing the /n command is only set up to handle n less than or equal to 22. Now it can handle any size n given in the /n command.

SR# 2200021394

PROBLEM: CI help files refer to "substitution parameters", which should be called "positional variables".

SOLUTION: The ?CI file has been changed to match the new term being used in the manuals.

SR# 2200028373

PROBLEM: CI will let the user specify any file as the command stack in the WD command. But CI may print garbage and/or lock the terminal if the user tries to list the command stack with the "/" command if the file is not a type 3 or 4 file.

SOLUTION: CI now checks the type of the file specified as the command stack file in the WD command. If the file is not a type 3 or 4 file it prints a error message to the user and ignores the WD command. The user can still get a bad command stack, but CI will be able to list it without locking the terminal and the user can see there is a problem to be corrected.

SR# 5000056986

PROBLEM: CI allows the user to specify an LU to be the command stack. This can cause a variety of problems: terminal hangs, etc.

SOLUTION: A check has been added to CI so that it does not allow the CI.STK file to be defined on any LU when the WD command is given.

SR# 5000080713

PROBLEM: CI does not let you transfer to a command file with a negative security code on a FMGR cartridge.

SOLUTION: The security code sent inside the file descriptor parameter is overwritten by the subroutine which determines if the file is a command file. Thus when CI

## SOFTWARE CHANGES (92084A)

tries to open the file to read the commands, it gives an illegal security code message. Now the security code in the file descriptor parameter is saved and and put back in the return file descriptor.

### SR# NONE

ENHANCEMENT: There is a new CIX load file for LOADR called #CIX6.

## 2.19.4 CI UTILITIES

### SR# 2200006015

PROBLEM: The DL command from CI will not display "type 0" files on FMGR cartridges.

SOLUTION: DL now displays "type 0" files on FMGR cartridges.

### SR# 2200010082

PROBLEM: A remote DL reports open files incorrectly. If a file is open on a remote node, the program name which DL reports as being the locking program is taken from the local node, not the remote node.

SOLUTION: DL now reports open files correctly.

### SR# 2200021105

PROBLEM: PATH does not accept lower case character option in the command file. It does not recognize blank lines correctly in the command file.

SOLUTION: Fixed in DSD4.0.

### SR# 2200021436

PROBLEM: When the DL command is issued with the 'L' option on a directory on a remote system, the LU given as part of the location for the file is not correct - it is always 63.

SOLUTION: DL has been fixed to give the correct LU.

SOFTWARE CHANGES (92084A)

**SR# 2200022160**

PROBLEM: FVERI does not interpret the runstring correctly with all disc LU's verifications and +L option.

SOLUTION: The "+L" now works correctly.

**SR# 2200023978**

PROBLEM: Too many trailing blanks with the LU in the message "Verifying LU xxxxx".

SOLUTION: The message has been corrected.

**SR# 2200024455**

PROBLEM: The NLS message buffer is too small to hold a Japanese message.

SOLUTION: The buffer size is increased.

**SR# 5000067058**

PROBLEM: CMD gives an FMP-209 error when no /SYSTEM directory is found. CMD does not check for a FMP -209 error when trying to open CMD.HLP.

SOLUTION: CMD now checks for a FMP -209 Error when trying to open CMD.HLP.

**SR# 5000070490**

PROBLEM: When doing an FSCON to change a FMGR cartridge to a CI volume, you can dismount it from a single session and then run the utility. When you want to mount it back again, you have to dismount it from all the other sessions and then mount it under CI.

SOLUTION: The appropriate manual has been documented to show this.

**SR# 5000079301**

PROBLEM: The A.85 RTE-6/VM command file \*INCI does not include an entry to create the directory /CMDFILES (where CI

SOFTWARE CHANGES (92084A)

expects to find system-wide command files as a default).

SOLUTION: \*INCI will now create and set protection on the /CMDFILES and /CATALOGS directories.

**SR# NONE**

ENHANCEMENT: The display format for FREES is changed. You can see the free area of all discs at a glance with a column-oriented format.

## 2.19.5 D.RTR

**SR# 2200024380**

PROBLEM: D.ERR does not allow enough space in its message buffer for a trailing null character.

SOLUTION: The buffer size has been increased by 1 word.

**SR# 2200024414**

PROBLEM: D.ERR doesn't correctly retrieve the NLS flag from the FmpError routine.

SOLUTION: The correct string length is now received.

**SR# 2200028654**

PROBLEM: If a type 6 file is RP'ed and the file is opened exclusively by OPENF, no error results and the file can be written into by the program which opened it.

SOLUTION: If an RP'ed program file is opened with the OPENF call, write access is now disallowed on the file.

**SR# 5000033720**

PROBLEM: It is possible for the average user to use LINK to place a program type 6 file on LU 2, but that user can not then purge it (gets illegal access to LU 2 error). FMGR, on the other hand, can SP a file to LU 2 and it

can then be purged.

SOLUTION: CI has been enhanced to be able to purge the type 6 file on LU 2/3.

**SR# 5000060483**

PROBLEM: The performance of utilities like FC and TF, and some types of user-written programs, degraded considerably with the post C.83 D.RTR.

SOLUTION: The routine in D.RTR that checks FMGR open flags is corrected.

**SR# 5000060871**

PROBLEM: If a disc is genned to have more than 128 sectors per track, then D.RTR will destroy itself when trying to access the disc.

SOLUTION: In the mount process (from both the CI and FMGR MC commands), D.RTR now checks the number of sectors/track defined for the disc LU, and if it is greater than 128, an error -108 is returned. This is a new error meaning 'Illegal number of sectors per track'.

## 2.19.6 DRREL/DRRPL

**SR# 2200023218**

PROBLEM: The module INI2F, which is called by DRIVE, is used to find the basepage link to \$CIC within the possible area below SCOM. The test fails because the value is not found. On return, the message error 015 'Corrupt system' is printed and DRRPL completes immediatly.

SOLUTION: Start the search for the \$CIC link at word 100B.

## 2.19.7 DS TRANSPARENCY

**SR# 2200023341**

**PROBLEM:** If you edit the NODENAMES file, DSRTR does not see the changes.

**SOLUTION:** DSRTR has been modified so that, if it is scheduled without a runstring (i.e., 'RU,DSRTR'), it will re-read the nodenames file to update its internal tables. The correct action to take, then, is to edit the nodenames file to make corrections, then type 'RU,DSRTR' to force DSRTR to pick up the changes.

**SR# 5000007153**

**PROBLEM:** When the NODENAMES file is set up as described in the RTE-A System Generation and Installation Manual, accessing a node by name through DS transparency does not work. FMP returns a 'no such node' error. The problem is not having a comment field in the line.

**SOLUTION:** DSRTR does not require a comment field in the NODENAMES file anymore, but comments may be included if desired (they are ignored).

## 2.19.8 DVA37

**SR# 2200002790**

**PROBLEM:** Control zero [call exec(3,lu)] does not always provide an untalk on the bus.

**SOLUTION:** An untalk/unlisten is now always done before all control requests.

**SR# 2200018663**

**PROBLEM:** There were multiple SRQ schedules when only 1 SRQ occurred. It has been observed occasionally that more than one alarm program schedule will result from a single device SRQ.

**SOLUTION:** Some flags are incorrectly set and cleared. A new bit (bit 6) is defined for the HPIB config word and if it is set for a device, then all SRQ's would be disabled for that bus until the device service program reenables them with a control 31b request and optional parameter not = -1. This allows the service program and driver to

handle devices like this and avoid extra schedules or avoid not being able to detect unclaimed SRQ's.

## 2.19.9 DVC12

### SR# 5000014043

**PROBLEM:** DVC12 is not re-entrant; a unique copy of the driver must be gen'ed for each 12821 - CIPER printer on the system.

**SOLUTION:** A second copy of DVC12 will be supplied called DVD12. It is made by changing entry points CC12 to CD12 and IC12 to ID12. If a third copy is needed contact your support representative.

### SR# 5000054437

**PROBLEM:** DVC12 has problems processing timeouts and often generates an illegal interrupt.

**SOLUTION:** During the power fail state, resume processing the current write request instead of exiting the driver and trying to reenter at the top of IC12 via \$upio and letting the TBG go to 0.

### SR# 5000058008

**PROBLEM:** DVC12 does not handle Ciper error C6 and C8 (data overrun and protocol errors) correctly. This often would crash the system or loop in the driver with interrupt system off.

**SOLUTION:** The code has been changed to explicitly define packet header numbers. The return jump is fixed as well.

### SR# 5000035956

**ENHANCEMENT:** DVC12 is enhanced to process eqt word 5 status identical to DVB12 except for bit 6.

### SR# NONE

**ENHANCEMENT:** DVC12 is enhanced to use fewer base page and current page links. It is also modified to not configure on interrupt entry as this was, at times, causing it to loop (probably due to some other failure). Since DVC12 may only be used with one printer, it does need not to reconfigure. For this same reason we are also releasing DVD12, a clone of DVC12 for those who have two printers. In addition, since the driver already keeps almost everything internally, it is changed to not require an EQT extension (X=0).

Additional changes are made to support compressed mode printing (IPARM=3 on control RQ 3003b) and to reconfigure the lines per inch option on powerfail recovery. This driver underwent major surgery with this change and should prove to be much more reliable than in the past.

## 2.19.10 DVR31

### SR# 2200022475

**PROBLEM:** DVR31 track map call returns the wrong number for sectors per track. The code starting at \$SPCL (line 703) expects to find the # sect/track prior to \$TB31. The generator does not supply this word. This will cause FC to fail when talking to a 7900 disk.

**SOLUTION:** The driver is modified to supply always the number of sectors per track in the returned track map.

## 2.19.11 DVR32

### SR# 220002949

**PROBLEM:** DVR32 incorrectly calculates the number of sectors to verify, resulting in IO NR or IO TO errors.

**SOLUTION:** The driver is modified to properly calculate the number of sectors involved.

## 2.19.12 EDIT

### SR# 2200014571

PROBLEM: If the list file is a printer, RTE-6 and RTE-A versions of Edit now do a page eject when it is closed. The list file is closed by a FCL command, or when a new list file is specified, or when Edit terminates.

SOLUTION: The printer is now kept LU-locked by Edit until the list file is closed.

### SR# 5000079970

PROBLEM: Edit is not correctly resetting the page mode strap at start up.

SOLUTION: This is now corrected.

### SR# NONE

PROBLEM: Read errors, while reading from a device, were reported twice.

SOLUTION: This is corrected in &NEWFI.

### SR# 5000023580

ENHANCEMENT: The RTE-6 and RTE-A version of Edit now allows a leading slash in FMGR cartridge file names (there must not be a global directory that has the same name). This is related to SR5000023580.

## 2.19.13 EMA/VMA

### SR# 2200019562

PROBLEM: This problem occurs when a request is made for more words than are in mseg. VREAD does not give 1 record back for type 2 files. For a type 2 file, a request length of greater than 0 should return 1 record from vread.

SOLUTION: The fixed is in the DSD 4.0 update.

## 2.19.14 FILE I/O

### SR# 2200015644

PROBLEM: Files opened with USE='NONEXCLUSIVE' could not be purged by closing with STATUS='DELETE'.

SOLUTION: Fixed in the DSD 4.0 update for 1) old files, 2) new files, 3) new files & CDS, and 4) DS.

### SR# 2200019067

PROBLEM: The INQUIRE statement fails if another program opens the file in shared mode. .FFIN wants to open the file in exclusive mode. This fails if another program opens the file (even in shared mode). Thus no status information is returned to the INQUIRE calling program.

SOLUTION: Fixed in DSD4.0.

### SR# 2200025569

PROBLEM: If the NAME= parameter in an INQUIRE statement refers to a variable that is too small to hold the result, the byte just prior to the variable is set to blank (32 base 10). This problem exists only if \$FOLDF is used. No errors are generated to indicate any problem.

SOLUTION: The software has been corrected.

### SR# 5000056804

PROBLEM: In Fortran 77 rev 2401 the INQUIRE statement following an OPEN statement on a direct access file returns incorrect information.

SOLUTION: Fixed in the DSD4.0.

### SR# 5000058255

## SOFTWARE CHANGES (92084A)

**PROBLEM:** In a formatted READ of a direct-access file (an ANSI extension), if the internal I/O buffer (or LGBUF buffer) is too small, no error is reported. The record is treated as if it were blank beyond the buffer size.

**SOLUTION:** Error 496 is now reported.

### 2.19.15 FMGR

**SR# 5000045328**

**PROBLEM:** CN,6 resets forms length configuration in the printer.

**SOLUTION:** FMGR makes the correct control request now.

### 2.19.16 FMP

**SR# 2200009738**

**PROBLEM:** If a type one or type two file is opened with FmpOpen, allowing extents (X option), and the last block of the file is written into, the file would be extended prematurely.

**SOLUTION:** The FMP routines for handling type 1 and 2 files now will set the EOF bit when the last record in the file has been written (when the extendability option is enabled). On the next write, the EOF bit will be cleared and an extent will be created. Note that for type 2 files, this only happens when the last record of the file fits exactly to the end of the last block of the file.

**SR# 2200012633**

**PROBLEM:** Using the 'CO' command from CI with masking, any user can copy files from a FMGR cartridge without needing to know the file's security code.

**SOLUTION:** The masking routines (used by the CI CO command) now will use the security code supplied by the user in the

original mask. If it is wrong, the masking operation will not succeed (PU will fail, etc.).

A side effect is the following enhancement to DL: if a zero is explicitly specified for the security code in the mask, DL will only find those files which have a zero security code. If no security code is explicitly given, DL will ignore the security codes when matching. This is also true of the file type (explicitly specifying zero for the file type causes DL to find only type zero files). Note that this is only a feature of FMGR files since CI files don't have security codes or type zero files.

**SR# 2200018317**

**PROBLEM:** Opening a type 1 or 2 file with a Pascal REWRITE to do sequential writes to the file causes an FMP -12 error. The manual claims that this should be legal. The problem is that FmpSetEOF is setting the EOF bit in the DCB.

**SOLUTION:** FmpSetEOF no longer sets the EOF bit in the DCB for type 1 or 2 files.

**SR# 2200018382**

**PROBLEM:** If FmpLastFileName is given a string with no name, e.g., '::', the user program will abort with a FTN7X runtime error.

**SOLUTION:** FmpLastFileName now correctly checks for a zero-length name.

**SR# 2200018655**

**PROBLEM:** If a 'Z' is used as an option in a CO command, or an FmpCopy call, the destination file doesn't get valid data transferred to it.

**SOLUTION:** FmpCopy now ignores a 'Z' in the option string.

**SR# 2200020875**

**PROBLEM:** The LI command displays only 1st 256 bytes of each record if the record size exceeds 256 bytes.

SOFTWARE CHANGES (92084A)

SOLUTION: LI can now display the whole record longer than 256 bytes.

**SR# 2200021360**

PROBLEM: CIX (FmpCopy) can get into an infinite loop when trying to copy a file with the D option onto a FMGR cartridge.

SOLUTION: FmpCopy's scratch name is now 'COxxx...', which puts a character from the system time into the 6th character of the file name. This will make the name unique on each try. Also, the break flag is checked inside of the loop which creates the scratch file - if the break flag is detected, FmpCopy will return a -235 error (break flag detected).

**SR# 2200023200**

PROBLEM: If a global directory name is exactly 16 characters long, and the working directory is set to a subdirectory of that global, the WD command reports only the global directory name and not the subdirectory.

SOLUTION: An internal variable in D.RTR was too short to pick up a full 16 character global directory name plus subdirectory names, and the subdirectory names were getting lost. This is now corrected.

**SR# 2200023358**

PROBLEM: The C.83 versions of D.RTR on RTE-6, and D.RTR on RTE-A do not recognize the 'bad track list' that is put into the cartridge header via the FMGR IN command. The FMGR PK command may purge files created on that LU.

SOLUTION: This feature was added to FMGR a long time ago to support discs that did not do their own track sparing. Since all current discs do have an internal track sparing mechanism (except the 7900 disc), this feature is not needed anymore. The correction for this bug, then, is to remove the 'bad track list' option in the FMGR IN command. Now, if a list of bad tracks is given in the IN command, an error 56 (bad parameter) is issued.

**SR# 2200024059**

SOFTWARE CHANGES (92084A)

PROBLEM: FmpError does not return text for some errors that are documented in the manuals. These errors are:

-49, -54 thru -60, -63, -64, -68, -217, -219, -223, -227, -228, -231, -234, -243, -244, -247, -248, -250

SOLUTION: FmpError now returns text for all of these errors.

SR# 2200025593

PROBLEM: FmpWrite will write data past the EOT mark of a magtape, but FmpRead treats EOT as an EOF and will not return the data past the EOT, even if transparency mode has been turned on (transparency mode is turned on with a call to FmpSetIoOptions).

SOLUTION: FmpRead now sets the B register value in common /FMPREGS/ correctly so that it will be the actual length read when reading data past the EOT mark on a mag tape.

SR# 5000035261

PROBLEM: MANAGER.SYS does not have access to files on Group and Private cartridges through masking.

SOLUTION: FMPINITMASK calls CRNTOLU and OLDDUINFO which determine the cartridges the user has access to. CRNTOLU and OLDDUINFO call DSFSTAT with a parameter that restricts the users access regardless of the user. A check is now made in these routines for SUPERUSER which causes them to tell DSFSTAT not to restrict this user.

SR# 5000040188

PROBLEM: FMPRENAME can rename a file on a file manager disc to a name that contains lower case letters.

SOLUTION: The new file name is now upshifted before being created.

SR# 5000044289

PROBLEM: Using FmpCopy to copy files to a remote RTE-6 node, without specifying the cartridge reference number and a logon in the destination file name, the file will be created on the first mounted system cartridge, even if it is LU 2 or 3. The DS transparency handler TRFAS, if not explicitly given a name under which to log on at the

## SOFTWARE CHANGES (92084A)

remote system, will log on as non-session. TRFAS should log on under some default session, such as the default session defined for the DS subsystem.

**SOLUTION:** If not given a specific logon name, TRFAS will log on using the default logon name defined for DS/1000 (defined in the DINIT answer file when DS is initialized). If this default name has not been set, or if session has not been initialized, TRFAS will proceed in non-session mode.

The fix involves changes to both DSRTR (on the system initiating the DS transparency request) and TRFAS (on the system local to the files being accessed). If the DSRTR making the request is not this updated version, TRFAS will log on with the default logon name anyway. However, rather than logging on once when the file is opened and logging off when the file is closed, TRFAS will need to log on and log off for every request it receives from the old DSRTR (except for simple disc accesses) (The updated version of DSRTR passes a default logon request to the updated TRFAS which eliminates the extra log-on/log-off's). This means that security will be maintained on the system at the TRFAS-side, but at the cost of decreased performance on the DSRTR-side, until DSRTR is updated to the new revision. Note that the reverse mixed-revision situation (new DSRTR and old TRFAS) will work as it did before, that is, TRFAS will operate in non-session mode.

### **SR# 5000071100**

**PROBLEM:** When dealing with remote-system files using FMP calls, access would fail on Open if the nodename given is not EXACTLY as written in the NodeNames file (i.e. the call is U/L case sensitive). This is not true when using interactive commands, such as thru CI.

**SOLUTION:** DSRTR now accepts upper or lower case node names in the NODENAMES file and in file descriptors (DSRTR upshifts all node name strings before using them).

### **SR# 5000073908**

**PROBLEM:** If a program in the time list calls FmpUniqueName, the program gets removed from the time list.

**SOLUTION:** Rather than becoming time-suspended for 10 ms,

FmpUniqueName now uses a different algorithm for insuring that it will create a unique name each time it is called: FmpUniqueName now remembers the time it was called last, and if less than 10 ms have gone by, it goes into a short loop waiting for the time to change. This loop will only be executed if FmpUniqueName is called twice within a 10 ms window.

**SR# 5000074120**

**PROBLEM:** Programs that terminate saving resources are cloned and therefore never continue execution past the point of the exec 6 with saving resources option.

**SOLUTION:** Cloning in this manner is a feature of RTE-6; whenever a program is cloneable, it will be cloned. The documentation on terminating saving resources (Programmer's Reference Manual) and on running a program (RTE-6/VM CI User's Manual) now has information on how to run a program that terminates saving resources so that it will resume where it had left off.

**2.19.17 FMP LIBRARIES****SR# 2200023101**

**PROBLEM:** The integer-to-ascii conversion routines, for single and double integers, write over your code when a buffer is too small for the number needing converting.

**SOLUTION:** A check of the destination buffers size is made and used in determining how much information to return.

**SR# 2200023119**

**PROBLEM:** If DINTTODECIMAL is sent the double integer value -2147483648, it returns the ascii string "-./,)(-\*,(".

**SOLUTION:** .DNG did not handle the number -2147483648 correctly, so it performed the calculation without the number. The software has been corrected.

**SR# 2200023150**

**ENHANCEMENT:** Added some right-justified integer conversion routines to go along with INTTODECIMAL, DINTTODECIMAL, INTTOOCTAL, and DINTTOOCTAL. They are INTTODECIMALR,

DINTTODECIMALR, INTTTOOCTALR, and DINTTTOOCTALR.

**2.19.18 FORMAT****SR# 2200024521**

**PROBLEM:** Some floating-point numbers do not round as expected on output; for example, 25039.5 in an F10.0 field prints as 25039.

**SOLUTION:** Some of these numbers now produce more pleasing output.

**SR# 2200026476**

**PROBLEM:** TAB format does not work properly with internal files. (1) When reading or writing multi-record internal files, the T format descriptor did not work correctly after the first record. (2) When writing multi-record internal files with a list-directed (\*) write, if the data required more than two output records, an error 496 was generated. (3) The first record written by a list-directed write could exceed the specified record size limit by one character. The default limit is 72 characters; it may be changed by FFRCL. For internal files the limit is the record size; the above condition caused a spurious 496 error.

**SOLUTION:** Fixed in the 4.0 revision.

**SR# 5000019539**

**PROBLEM:** In FTN7X:

```
      READ(1,100) I
100 FORMAT(I1)
```

gives a \*RUNTIME ERROR\* 0494 @ 02022 for all characters except for D,d,E,e,.,-, and +.

**SOLUTION:** The software has been corrected.

**SR# 2200028597**

**ENHANCEMENT:** As of DSD 4.0 it is possible to change

## SOFTWARE CHANGES (92084A)

- 1) the fill character used to fill output fields where the number did not fit,
- 2) the leading blank character, used to fill the left part of fields which are larger than necessary

The method of changing these characters is to store into the words at external symbols #FMLB and #FMFC.

```
eg. $alias /fill/='#FMFC',noallocate
      common /fill/ifill
      ifill - ichar('$')
```

### SR# NONE

NOTE: Enhancement to allow list-directed READs to not require quote marks.

## 2.19.19 FORMT

### SR# 2200006197

PROBLEM: FORMT does not allow formatting LU's > 63. This is a problem in a Datasafe environment where logical LU's are > 63.

SOLUTION: Modify FORMT so LU >63 can be formatted. EQTRQ is also modified so that a system LU > 63 can be modified.

### SR# 2200012070

PROBLEM: FORMT cannot spare a spare track. FORMT assumes that a subchannel ends on the last track and does not include spare tracks.

SOLUTION: Add number of spare tracks to total number of tracks for a given LU.

### SR# 2200013565

PROBLEM: FORMT aborts with I007 when using the 93581C Dual Disc Driver. IFDVR checks EQT word 4 bit 11 to see if the driver processes its own time-out bit. The 93581C dual disc driver (type 32) modifies this so that it looks like an ICD disc. (Only MAC discs are supported by this

driver.) At this point, the disc library routines are all confused.

SOLUTION: We modified IFDVR such that it uses a different method for determining whether a disc is a MAC or ICD disc. It issues an EXEC request with icode of 2200b on specific lu (use track 0, sector 0). This will return the track map table entry. It checks bit 15 of word 5.

SR# 2200014670

SR# 2200032292

PROBLEM: FORMT requires a capability of exactly 60 to re-format lu 2 or 3.

SOLUTION: Allow formatting of LU 2 or 3 if capability is > 60.

SR# 2200055889

PROBLEM: FORMT cannot format LU'S not in SST.

SOLUTION: We changed all EXEC calls in DSCLB to XLUEX with the non-session bit set.

SR# NONE

ENHANCEMENT: Allow commands given to FORMT to be entered in lower case.

## 2.19.20 GENERATOR

SR# 2200019125

PROBLEM: In the driver writing manual on chapter 4-7 the use of SSGA with a privileged driver is recommended. However, the generator rejects such a link with error 52.

SOLUTION: This condition no longer is reported as an error by the generator.

SR# 2200021212

PROBLEM: A.85 RT6GN cannot handle RELC and REL commands in the

SOFTWARE CHANGES (92084A)

same generation. It works fine if all relocates are either REL or RELC but has problems with mixtures.

SOLUTION: The generator has been changed to clear the DCB before opening a file so as not to close the prior file.

**SR# 5000036582**

PROBLEM: The absolute binary bootstrap loader for a CS/80 disc will not load from paper tape or cartridge tape. The IPL loader gives a HALT 55B. The loader rom, however, works fine from disc.

The high address is 77743 overlaying the paper or cartridge tape loader.

SOLUTION: The generator is changed to load the bootstrap at 2011B (the same as the disc IPL loads it) and to set up its start address to be 2055B,I.

**SR# 5000074831**

PROBLEM: A.85 generator has problem handling driver partition overflow. The generator forgets to back up some pointers in the absolute file output routine. This causes all drivers after the one that fails to be loaded incorrectly (wrong address on the disc). When the new system is switched in and an incorrectly loaded driver is accessed the program may MP and/or the system crashes.

SOLUTION: The forgotten pointers are now saved and restored.

**SR# 5000102533**

PROBLEM: EXT references to ALLOCATE common would cause fixup entries to be built but never fixed up. This caused a GEN ERR 0 after the program load.

SOLUTION: The generator was changed to load and fixup the ALLOCATE common after the first module which has an EXT reference to it (provided it was not already loaded).

NOTE : ALLOCATE COMMON REFERED TO BY EXT CAUSED GEN ERR 0

**SR# NONE**

**PROBLEM:** The RTE-VI generator would put out module and file name messages for old relocatable modules.

**SOLUTION:** This message was supported to complete an error report on GEN record errors. The problem was that the GEN record error flag was not being loaded, and so the test was done on the NAM record program length word. When ever it was negative the report appeared. Negative program length entries appeared in output of some old compilers which did not know the true length of the module when the NAM record was generated. The Generator was changed to properly load the GEN record error flag.

**SR# NONE**

**ENHANCEMENT:** The RTE-VI generator (RT6GN) was changed to allow setting of the immediate reporting bit for CS80 Cartridge Tape Drives (CTDs). This bit is bit 14 of the first word of the track assignment table entry for the CTD. Immediate reporting allows the devices to stream - if data availability can keep up.

Note- This feature is only available for CTDs that are not physically integrated into a disc drive.

Syntax is CTD,<hpib add.>,<unit>,<volume>[,I]

Where: <hpib add.>,<unit>, and <volume> are as before and [,I] is the optional immediate reporting bit flag.

**SR# NONE**

**ENHANCEMENT:** RT6GN is enhanced to recognize the 7907, 7941, 7942, 7945, 7946 and the 9133 discs.

**SR# NONE**

**ENHANCEMENT:** In the past, file truncation was noted in the listing, but was not considered a GEN ERROR. It was elevated to a full GEN ERROR to alert the user. The SWITCH program will not switch an extended file, which is the most likely cause of the failure to truncate.

## 2.19.21 HELP

### SR# NONE

ENHANCEMENT: The help file header revision is updated to reflect changes of other modules in HELP.

### SR# NONE

ENHANCEMENT: HELP is modified to pass a default data file name of HELP.HLP::SYSTEM to CMD. If that file is not available, CMD will try !HELP::0 for backwards compatibility.

### SR# NONE

ENHANCEMENT: Several modules in the HELP program need to be modified in order to be compiled with the new pascal.

## 2.19.22 HP-IB LIBRARY

SR# 5000053702

SR# 2200055848

SR# 2200032565

PROBLEM: The HP-IB library routines (including CLEAR and RMOTE) do not mask the EQT number correctly and thus EQT's greater than 63 could not be used.

SOLUTION: The HP-IB library routines have been modified to check for the operating system type to and use the appropriate mask.

## 2.19.23 I/O

SR# 2200019992

NOTE: FmpReportError now does not set the "no suspend bit" in the Exec call to the LU. This will cause the program to suspend if the LU is locked rather than just throw away the error message.

## 2.19.24 INTRINSIC ROUTINES

### SR# 2200058362

PROBLEM: ISIGN(IA,IB) where IA and IB are single integer arguments return a result of 0 when IA=3 and IB=0. By definition, the result should be 3.

SOLUTION: The code is changed to return the correct value.

## 2.19.25 KEYS

### SR# 2200014746

PROBLEM: Priority of KYDMP in NAM record is too high (10).

SOLUTION: The priority will be changed to 99 .

## 2.19.26 LIBRARY FUNCTIONS

### SR# 2200002675

PROBLEM: RHPAR fails to return runstrings if a program terminates saving resources and then gets scheduled in the normal way. On the second call to RHPAR the routine checks to see if it has been called before; if so, it does not bother to collect the runstring that was passed. Since the program terminated saving resources, the second string will not be given to it.

SOLUTION: RHPAR is changed to call EXEC for the runstring on each entry. If EXEC returns a zero length string, RHPAR assumes the string it got last time (or some prior time) is still valid and uses it. This allows the user to use RHPAR for strings which result from a son program returning as well as the terminate saving resources condition.

**SR# 2200018481**

**PROBLEM:** The RHPAR/RCPAR/FPARM routines strip out the word 'NO' or 'NOW' from a program's run string if the word appears as the first parameter. For example, if the run string is "RU,PROG,NOW,P1,P2", the routines would return "P1" as the first parameter. The routines do this because the ON command in RTE-6/VM considers the NO or NOW as special cases to mean 'run the program now', and it expects the word to not be passed to the user. Since the ON command does not exist on RTE-A (and since it is not used often even on RTE-6), these routines should not treat the first parameter as special. The older and RTE-6-specific GETST routine still strips out the NO/NOW, and can be used on RTE-6 if necessary.

**SOLUTION:** The RHPAR routine (which FPARM calls) is changed to no longer strip the NOW parameter. In addition the RTE-VI O.S. is changed to strip the NOW from the run string in (and only in) the case of an ON command. GETST is also changed to use the RTE-A version which does not strip NOW from the run string.

**SR# 5000045187**

**PROBLEM:** When the ELAPSEDTIME subroutine is used across midnight, an incorrect value is returned.

**SOLUTION:** ElapsedTime is calculated as (the current time of day) - (the time of day when ResetTimer was last called). The problem is fixed by putting a check in ElapsedTime to detect if the elapsed time that is calculated is less than zero. If so, 24 hours (in miliseconds) is added to the result because the system time has crossed midnight to a new day.

**SR# NONE**

**ENHANCEMENT:** Enhanced system library to contain &BLDNM and DAYS70. &BLDNM builds the file names for the language processors, that is the source name and specified list, relocatable, etc.

DAYS70 takes a date code string and returns the integer number of days since 1970.

## 2.19.27 LIF

**SR# 2200007849**

**SR# 2200009324**

**PROBLEM:** The LIF utility program, used for transferring files from HP/1000 systems to HP/9000 systems, will not initialize a CS/80 tape prior to storing files on the tape.

**SOLUTION:** LIF now accepts CS/80 tapes which are used in FC format.

## 2.19.28 LINK

**SR# 2200002279**

**PROBLEM:** In the RTE-6 session environment, a user could load a high-priority program with LINK, even if the user's capability was less than 50 (the default capability required for the system "PR" command).

**SOLUTION:** If the user's capability is less than 50, LINK will not allow the program being loaded to have a priority higher than 99. If the requested priority is between 1 and 98, LINK will issue the following warning:

"Warning 145: Program priority changed to 99"

**SR# 2200014191**

**PROBLEM:** When loading a program in which the same symbol has been used to access different and incompatible data allocations (e.g. EMA in one program unit and named common in another), LINK reports the error #117 ("Allocate type mismatch") but does not report the offending symbol's name. In a large program it could take considerable time and effort to find the symbol.

**SOLUTION:** LINK's error message has been expanded to report the name of the symbol which has conflicting declarations:

"Allocate type mismatch"  
"Last module relocated: <module name>"  
"Last reference: <symbol name>"  
"Fatal error 117 - Link terminated"

**SR# 2200017699**

**PROBLEM:** Non-system managers can place a type 6 file on Lu 2/3 using LINK. They cannot however, replace an existing file on Lu 2/3 from LINK.

**SOLUTION:** Link now checks for ownership of program files and allows the creator of the program file to relink it, including files on LU 2 or LU 3. If a different user attempts to relink the program file, the following message will be issued:

The system manager (MANAGER.SYS) is allowed full capability to relink files and will never get this message. This is now noted in the LINK manual in the relinking section in chapter 4.

**SR# 2200019521**

**PROBLEM:** When the VMA size is greater than 32767, you will get a two page working set with the WS command.

**SOLUTION:** A problem with a single integer overflowing has been fixed and now WS sets the working set size correctly.

**SR# 2200024588**

**PROBLEM:** LINK would ignore the "WS,nn" command.

**SOLUTION:** LINK now sets the working set size to the number of pages specified in the "WS,nn" command.

**SR# 5000033803**

**PROBLEM:** It is possible to load an EMA program which does not contain the required EMA fault handler and status routines \$EMA\$, \$INIT, VMAST. This scenario comes about if all the following conditions are met.

- 1) The main program does not use EMA (i.e. no \$EMA declaration;
- 2) The main program calls subroutines which use EMA;
- 3) The subroutines are compiled separately from the main;
- 4) The user does not specify the EM command when running LINK;

LINK would create the program, but the program would abort (usually with a memory protect error or dynamic mapping violation) as soon as EMA is accessed.

SOLUTION: LINK now checks for this case and will issue the message:

"Error 120: Library module needs EMA"

The user should reload the program and specify the "EM" command.

SR# 5000036400

PROBLEM: LINK sets the MSEG size of a program incorrectly. If the program being loaded requests an MSEG size of two or more (i.e. the \$MSEG directive in FTN7X), LINK makes the MSEG one page too small. Programs which use Vector Instruction Set firmware routines require the specification of MSEG, and therefore would abort with EM87 errors (MSEG too small).

SOLUTION: LINK now uses the MSEG value specified in the program.

SR# NONE

PROBLEM: Some of LINK's message reporting was being done with EXEC calls, preventing LINK from being swapped if the output LU was unbuffered.

SOLUTION: The EXEC calls which do I/O have been changed to REIO calls.

SR# 5000045724

ENHANCEMENT: It is possible to relocate modules into a user program which have the same entry points as modules in SSGA or the operating system. Although this is a desirable capability, it sometimes occurs unintentionally, creating programs which do not execute properly. For example, DS/1000-IV programs might be loaded with copies of modules which are in SSGA, preventing them from executing properly. LINK will now issue warning messages for each entry point which exists in SSGA or the operating system and in a module relocated into the program:

"Warning #142: Conflict with SSGA or system entry point: <entry point name>"

This will alert the user that an entry point of the same name is in SSGA (or the memory-resident operating system).

**SR# 5000054692**

ENHANCEMENT: If LINK is unable to create the program (type 6) file because of insufficient disc space, it will issue a warning:

"Warning #137: Insufficient disc space for program file"

If LINK is run in the "interactive" mode, it will then issue a command prompt to the terminal so that the user may try to create the program file in a different directory with the "EN" command. LINK assumes an "interactive" mode if

- 1) Any command is entered interactively;  
or
- 2) Anything other than a ".LOD" file is specified in the runstring.

**SR# NONE**

ENHANCEMENT: A new command has been added to LINK so that a single module can be relocated from a file which may contain multiple modules. The syntax of the command is

"rm filename symbolname"

where symbolname is an entry point for the desired module. If the file is indexed (with LINDX), the index is used to locate quickly the desired module; otherwise the file is searched in a linear fashion.

This command provides additional flexibility for loading programs:

- 1) It can be used to extract software versions of routines from a system library, which may be helpful in determining whether or not firmware is working (or installed). For example:

```
"rm $6sy1b .imap" (software equivalent of
                   a VMA routine)
```

- 2) When combined with the LINK "if" command, a LINK command file can be created as follows:

```
re %prog
if 6 rm %library sub6
if a rm %library suba
```

en

- 3) LINK can be used to determine the external references of a particular module:

```
CI.86> link
link Rev.2540      Use ? for help
link: rm $fmp6 fmpopen
FMPOPEN
link: di
      Undefined symbols:
      .SST .ENTR .NFEX  LURQ  FMPASKDDOT  FMPCLOSE
link:
```

**SR# NONE**

ENHANCEMENT: RPL's are now given special treatment in "duplicate entry point" situations during (pass 1) linking:

- 1) If an RPL is relocated, it may be replaced by another RPL of a different value (but same name);
- 2) If an RPL is relocated, it may be replaced by a non-RPL (ENT or XENT) of the same name.

In both situations, a warning will be issued:

"Warning #141: RPL value replaced: entry\_point\_name"

The warning will also be issued for each RPL in the system library which has been redefined for this program.

## 2.19.29 LUPRN

**SR# NONE**

NOTE: LUPRN is made compatible with FTN7X; QSUBS routines are removed.

## 2.19.30 MACRO

**SR# 2200003780**

SOFTWARE CHANGES (92084A)

PROBLEM: When you use the S (Symbolic Debug) option in the MACRO runstring to override options in the source file, the S does not appear in the MACRO line in the listing. Debug still works correctly.

SOLUTION: MACRO is changed to include the DEBUG option in the built control statement. (Note that the D option comes out as S because they are the same.)

SR# 2200010611

PROBLEM: Macro aborts with an MP error if there are incorrect literal values.

SOLUTION: The literal processor is changed to pass back dummy values in both A and B in the error case, allowing assembly to continue.

SR# 2200021261

PROBLEM: If the O option is used to create old relocatables and OLDRE is not available, MACRO complains, but does not count it as an error. As a result, a program that schedules MACRO would be ignorant of any errors.

SOLUTION: MACR7 is modified to bump the error count on the schedule error.

SR# 5000021378

PROBLEM: The MACRO manual says that - DEF =F39.25 should work, but an ERROR 321 is generated.

SOLUTION: MACR2 and MACR3 are changed to allow =F literals as well as others in the DEF opcode.

SR# 5000034231

PROBLEM: In REV A.85 and earlier the MACRO assembler puts all the source in the swap file in spite of the fact that there is conditional code assembly (i.e. AIF,AELSEIF) and macros. All of the macros are placed in the swap file. The swap file is extremely large. In one case the swap file on the scratch cartridge took 750 tracks while the eventual program was only 2000 words. This user had a library with over 40 macros. The swap file should

SOFTWARE CHANGES (92084A)

contain only the generated code with the macros that are needed.

SOLUTION: MACR1 has been changed to not keep unneeded lines in the IF file.

SR# 5000071647

PROBLEM: The include statement in a macro compilation allows a total of 32 characters in an include file name.

SOLUTION: Fixed in MACR1 to allow the full 64 character file names.

SR# 2200014324

ENHANCEMENT: MACRO/1000 has been changed to have a source name alias feature.

This name is used by DEBUG/1000 to identify the correct file and display it when the original source is Pascal or any other language which uses MACRO as its final pass.

MACRO has been enhanced to recognize an extension to the MACRO control statement of the form: +SF=file name. This file name will then be put in the NAM records of all modules assembled under this MACRO control statement. In order to allow room for this enhancement on the line, MACRO now handles continue lines on the control statement (except for macro library M runs).

At the same time the MACRO control statement has been enhanced to allow Pascal (and other higher level languages using MACRO as a final pass) to pass MACRO a version number to be put in the NAM record. The form of this extension is: +DC=<850802 where the '<' is optional and the date is the version number. This number is converted to days since 1970 and put in NAM record word 24. MACRO puts its version number in word 23.

Further enhancements for Pascal and others are as follows. Two new unary operators are defined:

|                |   |
|----------------|---|
| :SY:expression | Returns the external symbol number of the expression or 0 if the expression does not result in an external reference. |
| :MR:expression | Returns the relocatability of the   |

expression as an integer as follows:

- 0 - Absolute
- 1 - Program relocatable
- 2 - Base page relocatable
- 3 - Common relocatable (blank common)
- 4 - Pure code relocatable
- 5 - EMA relocatable (local EMA)
- 6 - Save relocatable
- 7 - External
- 9 - Allocate EMA
- 10 - Allocate SAVE
- 12 - Allocate COMMON
- 20 - Two or more of the above.

In both cases the <expression> must meet the definability rules of the opcode with which it is used (e.g. if used with EQU it must be defined when found in pass 2; if used with ABS, it must be defined by pass 3).

MACR4, MACR5, and MACR6 were changed to have the same date code as the rest of the MACRO modules.

## 2.19.31 MATH ROUTINES

### SR# 5000032763

**PROBLEM:** System routine DDINT does not work on A900 as documented. Real\*6 DDINT fails on all neg. fractional powers of 2, e.g. -1/2, -1/4, -1/8, etc. This problem occurs only with DDINT for REAL\*6 arguments. AINT for REAL\*4 and DDINT for REAL\*8 work fine.

**SOLUTION:** DDINT depends on a flag passed back from ENTIX. ENTIX was setting the flag incorrectly on negative fractional powers of two. ENTIX is changed to properly set the flag.

### SR# 5000078808

**PROBLEM:** Math library routine DSINH (.DSNH) when evaluated with argument = 0.0d0 should return 0.0d0. However what is returned into the four words that comprise the double precision result is 000000b,000000b,000000b,177776b.

**SOLUTION:** The routine (.DSNH) divides the result by 2 by subtracting 2 from the exponent... without checking for

0 first. The missing test for zero result has been added before the subtract.

### 2.19.32 MLS UTILITIES

#### SR# 2200021170

PROBLEM: SGMTR doesn't recognize RPL records. The entry points that are defined in RPL records will display as undefined in SGMTR. INDXR and MLLDR handle the RPL records as they should.

SOLUTION: Added code to take care of the new RPL record format.

#### SR# 2200021170

PROBLEM: SGMTR does not recognize RPL records. The entry points that are defined in RPL records will display as undefined in SGMTR. INDXR and MLLDR handle the RPL records as they should.

SOLUTION: Code is added to take care of the new RPL record format.

#### SR# NONE

NOTE: Restructures SGMTR into %SGMTR and \$SGMTR

### 2.19.33 OLDRE

#### SR# NONE

ENHANCEMENT: The OLDRE routine now has a version that works with the CI file system. This is now the standard version on RTE-6/VM and RTE-A.

## 2.19.34 OPERATING SYSTEM

**SR# 2200004234**

**PROBLEM:** During a "slow boot", when echoing to a 2608S, the system console and printer, both list the current I/O configuration and ask RECONFIGURE I/O (yes/no). After the user answers no and presses return, the cursor returns but doesn't line feed and the system is gone!

**SOLUTION:** This problem is caused by the driver trying to go to \$UPIO before MAPOS is called to set up the OS partition maps (\$UPIO is in a partition). In this case the required code is in memory, but the MAPOS tables have not yet been set up. The fix is to change MAPOS to set up its tables and return to the caller. This allows us to change \$CNFG1 to call MAPOS as soon as the code is in memory. We also changed MAPOS to HALT if it is asked to map an OS module before its tables are set up. This takes care of the case of a bad disc configuration, where on boot the disc driver returns NOT READY and the OS tries to call the OS partition code to handle the NOT READY. This would happen if \$CNFG1 were trying to load the partitions. In this case, the code is NOT present in memory and the only solution is to HALT, whereas before the system would JMP to uninitialized memory. The HALT is HLT 47B.

**SR# 2200005686**

**PROBLEM:** Only up to 63 shareable EMA programs are allowed; the maximum of 256 shareable EMA programs causes problems.

**SOLUTION:** This problem has been fixed by allowing SHEMA programs to share ID-EXTensions if the data in them is the same. A shared count is kept in the last word of the extension (count -1) and when it goes negative, the ID-EXT is released. Changes were made to the system library routines IDDUP, IDRPL, as well as to MLLDR, LOADR, \$CNFX and the system OF routine. In addition the system SZ routine was changed to disallow changing the MSEG size if the program uses SHEMA, since the MSEG size is in the ID-EXT. In addition the following routines were added to the system library (note, these routines are not for general use and are included here only for completeness): \$FINDIDEXT, \$SETIDEXT, \$SETDRIDEXT, \$LKL2, \$FREEIDEXT.

SOFTWARE CHANGES (92084A)

Shared ID-EXTs are supported by all system code except the generator. Such programs may be loaded by MLLDR, or LOADR as well as RPed or RUn after a LINK load. \$CNFX correctly accounts for them if the system is reconfigured after such programs are added to the system by MLLDR or LOADR.

Error 31 is added to \$CNFX. It indicates that \$CNFX has run out of ID-EXTs. This is possible if programs are reconfigured such that programs that once shared ID-EXTs can no longer do so.

**SR# 2200007443**

**PROBLEM:** A SHEMA program is scheduled to run every 10 seconds and it is the only program running. The program is then suspended by the operator while it is dormant. When the program is restarted (sygo) the computer HALTS with 102050B. Halt 50 says that count of SHEMA programs has become negative.

**SOLUTION:** This problem is fixed in the \$LIST processor by adding code to track the case of a program going from dormant to operator suspend. In this case the \$LIST processor now does the same checks it does when a program goes from dormant to scheduled to see if the SHEMA count needs to be bumped.

**SR# 2200015479**

**PROBLEM:** On RTE-A, a feature exists which causes a program's ID segment to be removed when a program terminates (the temporary bit in the ID segment). With this feature, an XQ command will execute a program, then the ID segment will go away automatically when the program finishes. This feature is not available on RTE-6/VM, so that an XQ command will leave the ID segment laying around. RTE-6/VM should have the temporary ID segment feature also.

**SOLUTION:** We put a true PURGE on termination bit in the sign bit of the track word. All the appropriate code (i.e. IDDUP, IDRPL, OF, etc.) was changed to use this feature.

**SR# 2200024653**

**PROBLEM:** Cannot use SZ to increase EMA size unless it was

SOFTWARE CHANGES (92084A)

defaulted. SZ command should allow you to increase EMA size, even if EMA size was originally defaulted. Users of BASIC/1000 used to be able to size up EMA beyond amount allocated at load time.

SOLUTION: The size command has been changed to allow the user to change EMA size in all cases. The system now depends on EM errors to find cases where the user makes the size too small.

SR# 2200032334

PROBLEM: LU 6 and LU 7 point to buffered EQT 6. While listing to LU 7, the device (printer or terminal) is taken off line and an IONR message is displayed on log device. LU 7 is redirect to EQT 7 and listing is resumed on another device. When the listing finishes, the SAM buffer is deallocated but the device ref. table word 2 for LU 6 still has a SAM address. When EQT 6 is up'ed, the interrupt light on the front panel goes off and the operating system goes down.

SOLUTION: The code in &OS2SC and &OS5IO is changed to fix this problem.

SR# NONE

PROBLEM: In the past, code was added to RTCOM to allow immediate completion returns from drivers called by \$XSIO (the systems I/O) call. This code failed and caused a IO NR report and subsequent system crash.

SOLUTION: RTCOM is changed to correctly call the immediate completion code.

SR# NONE

PROBLEM: The user map for I/O control requests is not being set up correctly for extended background programs. Table area 1 is not mapped. If the driver is then entered in the user map, the system would crash. The code to test to see if the user map should be used is also wrong in that it looks at the buffer address before checking to see if it is a control request (in which case there is no buffer). Depending on the parameter passed with the control, the system could get into an indirect loop when the control is passed through \$XSIO, such as the case with DATASAFE.

SOLUTION: The code in RTEMA and RTCOM has been changed to check for control requests before looking for the buffer address.

**SR# NONE**

NOTE: A fix is made to OS6SN to make it compatible with \$DDT on boot up.

## 2.19.35 PHYSICAL BACKUP

**SR# 2200006155**

PROBLEM: PRSTR terminates after advancing the tape if the disc LU is not in the SST.

SOLUTION: Fix the code which locks the disc LU before advancing the tape.

**SR# 2200012179**

PROBLEM: PRSTR would position the tape incorrectly if the default file number was entered. PRSTR calls a routine (FFILE) which uses an incorrect mask to determine whether the tape was at EOT. The mask used is 400B and should be 200B.

SOLUTION: The mask used to determine EOT is changed from 400B to 200B.

**SR# 5000049577**

PROBLEM: PSAVE/PRSTR load command files have incorrect SZ command. PSAVE and PRSTR calculate the amount of memory needed at run time. The programs may load correctly but when the programs are run, there may not be enough memory for tape buffers.

SOLUTION: Modify load command files.

**SR# 5000088914**

PROBLEM: PSAVE aborts with an error code 19 when using a 7974 mag tape drive. PSAVE would attempt to back up the tape -- the mask used to verify that the tape position is incorrect.

SOLUTION: Changed the mask to the correct value.

## 2.19.36 POWER FAIL

### SR# 2200008235

PROBLEM: On a system with the 93770 Specials TBG-TOD clock, it is possible for a TBG tick to occur during power fail recovery. There are several instructions at the beginning of the power recovery routine which occur before a CLC 0,C is issued. Since the Specials TBG has an external power source it will continue to tick even if power is lost.

SOLUTION: The power fail routine is modified to do the CLC 0,C before allowing any other interrupt. This is done by moving some code to the "down" routine and by making the JMP to the "up" routine indirect.

### SR# 2200013367

PROBLEM: When several power sags occur, the HP1000 powerfail/auto-restart does not appear to work properly. The symptoms include application programs as well as HP programs aborting due to memory protects, dynamic mapping or "RQ" errors.

SOLUTION: In as much as this is a software problem, we have changed some code in the power fail routine to plug some holes that are inherent in the hardware.

## 2.19.37 SESSION MONITOR

### SR# 2200022558

PROBLEM: \$BALC sometimes destroys buffer in SAM during DS-1000

## SOFTWARE CHANGES (92084A)

initialization. It ignores the possibility that the block of SAM allocated may equal the block of free SAM removed. If this is the case \$BALC creates a zero length block of free SAM, wiping out the first two words of the following class buffer!

**SOLUTION:** \$BALC is changed to check for the case of allocation of the whole block.

### **SR# 5000081141**

**PROBLEM:** LOGON can have problems at A.85 when using the old accounts file +@CCT!. A.85 system gens, switches and boots up ok; Accounts structure is the same as one which works fine in rev A.84. But when certain users (maybe all users) try to log on to the new system, LOGON may report ERR 10, but then will DM or MP, abort, and generally refuse to allow those users to log on. ACCTS rev A.85 uses part of the +@CCT! file to save information on UDSPs, and there may have been garbage in that field for some user accounts. Now when A.85 comes up, LOGON gets confused for that user because he thinks the #UDSPs/depth is greater than the limit: 8/8

**SOLUTION:** LOGON is modified to detect a UDSP count that is greater than the 8/8 limit and issue the warning message.  
"LGON 16 NUMBER OF UDSP'S OR DEPTH INVALID  
UDSP NUMBER AND DEPTH SET TO 0,0"  
The user will then be logged on with a UDSP of 0/0. Fix is in the DSD 4.0 update.

## 2.19.38 SPOOLING

### **SR# 2200010272**

**PROBLEM:** Spool files occasionally hang in queue and will not outspool -- GASP commands are ineffectual (i.e., RS, CS or UP). Problem seems to occur randomly (no known cause). The same sequence of commands that caused the problem once will work most of the time. The size of the offending output seems always to be less than one page in length. The only way to get rid of the spool file is by the KS command.

**SOLUTION:** Several internal problems in SMP have been fixed in

DSD4.0. This should fix the problem.

**SR# 2200014852**

**PROBLEM:** In a busy system with spooling active, the set up of a write-only spool file with buffering would sometimes fail. Failure modes include loss of all data sent to the file and loss (crash) of the system. The cause of the problem is that SMP gets in a race condition with the spool driver due to the buffering. This means that SMP may disrupt the driver during the set-up by changing one of its flag words.

**SOLUTION:** This problem is fixed by changing the spool driver to handle dynamic status requests by just rejecting them (this also fixes another bug, e.g sr2200053785 logged against RTE-IV). The system never buffers a dynamic status request, so SMP is then changed to do a dynamic status request during the set-up to wait for the driver. This guarantees that the flag word is not in use when it is modified. Thinking ahead, we also realize that a related problem exists at spool close time. Since SMP usually runs at higher priority than its callers, it is possible that it writes the final buffer flush to the driver ahead of the final user's requests which might be in the buffer pool. It might even disable the EQT before these requests are processed, resulting in loss of data at the end of the file. To fix this problem, the spool lu is locked, forcing RTIOC to put the SMP requests after the lower priority user request and the dynamic status request is again used to wait for the whole string of requests to be processed. SMP can then disable the EQT and continue the file clean-up.

**SR# 2200031385**

**PROBLEM:** SPOUT aborts with I004 message while outputting very large spool file.

**SOLUTION:** This problem is caused by the 65536'th line causing an ISZ in OS6SP to skip. The instruction skipped is the LDB of the transmission log, thus a very large TLOG is returned. This causes SPOUT to attempt to send a very large line to the output device, resulting in the I004. The ISZ is now protected with a JMP \*+1.

**SR# 2200053785**

**PROBLEM:** When reading from a spooled tape, the IEOF does not work. All other methods for finding the end of file such as the A-register status work properly.

This was caused by the spool driver (DVS43 and OS6SP) clearing the status word before checking the request type.

**SOLUTION:** Fixed at DSD4.0. The fix was done in the RTE-6 spool driver which, with this revision, is also used in RTE-IVB.

**SR# 5000010009**

**PROBLEM:** The RTE-6/VM spooler allows multiple users to use the same spool file for outspooling at the same time. This causes somebody's output to be lost.

If a user-defined spool file is being used, a user at one terminal can enter a :SL,6,SPOOLF,,6 command and begin writing on LU 6. Meanwhile, another user at another terminal can enter the same command. When he begins writing to LU 6, he overwrites whatever the first user was doing. User 1 will be surprised when he gets his spooled output back.

Furthermore, when one of the users enters the :CS,6 command, SMP closes the file. The second user can still write to it. This would cause some interesting problems if someone purges the file and packs the disc!

**SOLUTION:** This is caused by SMP opening the file in each case. It is therefore blind to the fact that it was already open (to itself). Even worse, if for some SMP terminates, including shut downs and/or reboots, all the opens would be cleared by D.RTR.

SMP has been changed to reopen all files in the SPLCON file when it is restarted. If a file cannot be found the SPLCON entry is cleared and an appropriate message is sent to the system console. In addition, D.RTR has been modified to return, to SMP, a flag which indicates that it regards the file is already open to SMP. SMP now uses this flag to reject attempted spool setups of files which already are in use by SMP on behalf of the same, or another user.

**SR# NONE**

ENHANCEMENT: The RTE-6/VM spool system is enhanced to handle the byte length flag in files written by the CI file system (on FMGR discs).

**2.19.39 SWITCH**

**SR# 2200011130**

PROBLEM: When printing subchannels for prompt "TARGET ADDRESS/UNIT X FOR SUBCHANNELS", after subchannel 35 is printed, the "comma, space" is replaced with "35".  
EXAMPLE: ...32, 33, 34, 353536353735 The problem is that switch is set up for 32 maximum.

SOLUTION: The buffers are increased to allow the full 64 subchannels in the DSD 4.0 update.

**2.19.40 SYSTEM UTILITIES**

**SR# 2200023440**

PROBLEM: The PATH utility accepts a command line of only 80 characters.

SOLUTION: It is enhanced to accept up to 240 characters as a command line.

**SR# 2200053694**

PROBLEM: With some FMGR errors, INDXR doesn't print the name of the file which causes the error.

SOLUTION: Fixed in DSD4.0.

**SR# 2200053728**

PROBLEM: INDXR allows the same nam/ent symbol to be put into a library twice.

SOLUTION: Fix is in DSD 4.0 update. The user is now warned of the

duplicate NAM/ENT.

**SR# 5000065938**

**PROBLEM:** INDXR does not recognize RPL records. The index created will contain the NAM record, but no entry for the RPL. An undefined entry point message will result from SGMTR or MLLDR.

**SOLUTION:** Fixed in DSD4.0 update.

**SR# 2200021121**

**ENHANCEMENT:** INDXR is enhanced to talk to CI files.

**2.19.41 TF**

**SR# 2200009704**

**PROBLEM:** TF aborts without a meaningful error message while restoring files from a tape if a file called "xx".dir is on the tape.

**SOLUTION:** When TF tries to backup a FMGR file called "xx".dir, it converts the "." to a "\*". This prevents any of these files from ever getting on the tape in the first place. If TF is restoring an FC tape with such a file, it no longer treats the file as a directory. In this case you can get an FMP error, but the rest of the files on the tape can be accessed.

**SR# 5000023325**

**PROBLEM:** TF group command causes an error if a 'C' or 'V' option is specified on some of the copy commands (in the group), while some of the other copy commands have no options specified at all.

**SOLUTION:** The 'C' and 'V' options both set the VERIFY flag for the entire group, so TF is assuming that each line must have had an option in it since one of the option flags is set. Using TRIMLEN, a reference is made to the 0th location of a string that had a first location of 1. A simple check for the current number of options prevents the bad reference.

**SR# 5000046011**

**PROBLEM:** TF prints in column 1 which messes up the carriage control information for the printer when the list device is the printer LU.

**SOLUTION:** A call to FmpSetIoOptions is used to set the V bit in case the LL command references a device.

**SR# 2200008136**

**ENHANCEMENT:** In a multitape backup, TF takes all but the last tape offline when it is done rewinding.

**SR# 2200013193**

**ENHANCEMENT:** The LL command now applies to the CO (copy) command, not just the DL command.

**SR# 2200019075**

**ENHANCEMENT:** UNIX binary files being restored are now created to their actual size as a type 1 file.

**SR# 2200019091**

**ENHANCEMENT:** TF pads in zeros at the end of the last block of data for UNIX binary files.

**SR# 2200021410**

**ENHANCEMENT:** When restoring a file or set of files to a global directory that does not exist, the directory will be created on the LU it previously existed on, if possible.

**SR# 2200021485**

**ENHANCEMENT:** TF now accepts the 'C' option to clear the backup bit when restoring files.

**SR# 2200022897**

**ENHANCEMENT:** TF now rewinds after each tape in a multiple tape restore.

**SR# 5000021550**

**ENHANCEMENT:** A second EOF mark is added at the end of the tape.

## 2.19.42 WHZAT

### SR# 2200017913

PROBLEM: The 2608A prints 3 NULL characters at the beginning of each line of a WHZAT print-out (i.e. WH,6)

SOLUTION: WHZAT is fixed to not output the null characters. (At one time, they were used for display control.)

## 2.20 (92091A) HPSPICE

### 2.20.1 SPICE

#### SR# 2200018283

PROBLEM: At revision C.83, HPSpice did not load on RTE-6/VM due to the support libraries getting larger.

SOLUTION: This problem has been fixed by moving the Fortran formatter routines out of the main of SIMSP and into other nodes.

#### SR# 2200019190

PROBLEM: The function Pas.Parameters was modified in the B.83 revision of \$PLIB. Previously, Pas.Parameters either returned a one-word integer value that was the number of characters in the runstring or selected parameter, or it returned a zero if the selected parameter did not exist. The function was modified in B.83 to return a negative one if the selected parameter did not exist and no parameters followed.

SOLUTION: The HP interactive editor (SPICE) has been changed to correct a known problem which was due to a change in the pas.parameters function. Previously the SPICE program had to be run "SPICE,,," to avoid this problem. The change was made to Procedure Initialize in file &COMMS.

**SR# NONE**

**PROBLEM:** The simulator (SIMSP) gave runtime errors and MP errors when executed.

**SOLUTION:** The MLLDR command file for SIMSP (#SIMSP) was changed to move several additional routines of the FORTRAN formatter from the main and into the nodes.

**SR# NONE**

**NOTE:** SNF was changed to reflect these changes.

**SR# NONE**

**NOTE:** Due to a change in the Pascal compiler at revision B.84 the undefined entrypoints \$\$\$LARGEMA1\$\$\$ AND \$\$\$LARGEMA2\$\$\$ were reported. To correct this the MLLDR command file for SPICE (#SPICE) has been modified to add a search to %LH2 (pascal\_lh2.rel).

## 2.21 (92836A) Fortran-77 Compiler

### 2.21.1 \$ALIAS

**SR# 5000048223**

**PROBLEM:** \$ALIAS with absolute addresses does not work well when using equivalence and character data. When \$ALIAS is used to put a common block at an absolute address, and a character variable in that block has a byte address greater than 77777B, the high bit of that byte address is lost. Absolute byte addresses (from the \$ALIAS absolute common block mechanism) always have bit 15 zero.

**SOLUTION:** The software is corrected.

## 2.21.2 ARRAYS

### SR# 2200024034

PROBLEM: In non-CDS programs, constant subscripts on character arrays generated bad code.

SOLUTION: The software is corrected.

## 2.21.3 CDS

### SR# 2200024778

PROBLEM: In CDS mode, a STOP statement with a character variable (instead of constant) failed.

SOLUTION: The software is corrected.

### SR# NONE

ENHANCEMENT: Most of the entry points in the CDS version of the formatter and file I/O (BGCDs) are now called directly (using the "!" names) instead of thru interfaces (using the "." names).

## 2.21.4 COMMON

### SR# 2200024299

ENHANCEMENT: DATA statements can now initialize variables in blank and labelled COMMON (in non-block data module) with the following restrictions: 1) EMA cannot be initialized 2) Blank common cannot be initialized in block data subprogram.

### 2.21.5 Compiler Error

**SR# 2200018341**

**PROBLEM:** Variably dimensioned EMA arrays with variable lower bounds and "\*" upper bounds caused internal compiler errors. When a variably dimensioned EMA array has a variable lower bound and a "\*" upper bound, an internal compiler error is issued.

**SOLUTION:** The software is corrected.

**SR# 2200020743**

**PROBLEM:** The use of CONTINUE on the right-hand-side of a logical IF is legal, but FTN7X produces a warning 89.

**SOLUTION:** A CONTINUE statement on right side of a logical IF caused a warning 89: correct code is now generated, and warning is no longer produced.

**SR# 2200021600**

**PROBLEM:** A spurious error 17 is generated in common statements in the second BLOCKDATA subprogram in a file, in revision A.84.

**SOLUTION:** The problem does not occur at DSD4.0.

**SR# 2200022285**

**PROBLEM:** In PARAMETER statements, if the variable is of type CHARACTER and the value is numeric, the compiler fails with an MP, DM, UI, infinite loop, etc.

**SOLUTION:** The software is corrected.

**SR# 2200024117**

**PROBLEM:** When a single COMMON statement is used to declare multiple common blocks, and an EMA common block is followed by a non-EMA common block (in the same common statement) the compiler aborted with an internal error.

**SOLUTION:** The software is corrected.

**SR# 2200024547**

**PROBLEM:** In FTN7X revision A.85, the extra character in odd length records in the source is treated as if it were valid. Usually the character is blank, which is harmless. When the character is nonblank problems occur.

**SOLUTION:** The software is corrected.

**SR# 5000047332**

**PROBLEM:** The ISHFT function with a large constant shift count caused an internal compiler error. When the ISHFT function is used with a constant shift count greater than 16 (32 for double integer), an internal compiler error is produced.

**SOLUTION:** These problems could not be duplicated and are assumed to be fixed by other changes.

**SR# NONE**

**PROBLEM:** An internal compiler error is issued when using variably-dimensioned EMA arrays in CDS mode. Too little space is allocated for the temporary variables which hold copies of the variable dimensions.

**SOLUTION:** The software is corrected.

## 2.21.6 DEBUG

**SR# NONE**

**PROBLEM:** The DEBUG information for EMA formal parameters are incorrect.

**SOLUTION:** The software is corrected.

## 2.21.7 EMA

### SR# 2200023143

PROBLEM: When using local EMA with two or more EQUIVALENCE groups with the total size of local EMA exceeded 32K words, it is possible to get too little EMA allocated.

SOLUTION: The software is corrected.

### SR# 2200023572

PROBLEM: If an EMA variable is used as the starting or ending position value in a substring construct, bad code is generated. This caused a LINK error.

SOLUTION: The software is corrected.

## 2.21.8 ENTRY

### SR# 2200014019

PROBLEM: Three or more ENTRY statements with code on the same line causes FTN7X to MP. When the 's' option is used, FTN77 program with multiple ENTRY statements and multi-statement lines (e.g. ENTRY FOO (parm) \$ FOO=FUN(parm,6) \$ return) causes the compiler to MP (memory protect). If there are 3 such statements the compiler hangs (i.e. runs forever) after listing the module. If there are 4 or more statements the compiler MPs. The debug option must be on for the failure to exist. No problem occurs if the ENTRY statements are on their own lines.

SOLUTION: The problem is due to the presence of an executable statement following a non-executable statement on the same line, when DEBUG information is being generated. The software is corrected.

## 2.21.9 FTN7X Configuration File

### SR# 5000034744

PROBLEM: Fortran Configuration Guide is incorrect in specifying how to access extended LU's ( >63 ) in RTE-A. The guide says that Z\$CWD must be set correctly and %frpls searched when linking the user code. %frpls must be explicitly relocated, searching won't do it. %frpls as a system library does not work either.

SOLUTION: The configuration guide ("FTN7X) now indicates that the %FRPLS file must be relocated when loading the user program.

## 2.21.10 Functions

### SR# 5000083360

PROBLEM: In the A.85 compiler, using statement functions could cause a variety of problems.

SOLUTION: Statement functions now work correctly.

## 2.21.11 INTRINSIC

### SR# 2200020503

PROBLEM: There were two distinct problems with the INTRINSIC statement: 1) INTRINSIC statements caused a spurious warning 33 and acted like EXTERNAL statements. 2) At A.85, INTRINSIC statements could cause the compiler to fail (e.g. DM) when an EMA symbol table is used.

SOLUTION: The software is corrected.

## 2.21.12 Listing

### SR# 500009019

PROBLEM: When two or more users specify the printer as the list device during fortran compilation, the listings interleave with each other. FTN7X did not lock the list device when listing to a printer.

SOLUTION: FTN7X now locks the list device.

### SR# 5000064782

PROBLEM: The FTN7X listing file is incorrect for programs larger than 9999 lines.

SOLUTION: The listing is moved one character to the right to accomodate another digit in the line number. The new limit is 32767.

### SR# 5000047647

ENHANCEMENT: The source file name printed in the listing is limited to 26 characters. The compiler truncated longer names on the right, which is usually the useful part of the name. Now it truncates on the left, and puts ".." before the name to indicate that it is truncated.

## 2.21.13 NLS

### SR# NONE

ENHANCEMENT: FTN7X is changed to support other native languages. (NLS support)

## 2.21.14 Runstring

### SR# 5000082958

PROBLEM: Lowercase parameters in the RUN string confuse FTN7X.  
This has only been possible with CI since A.85.

SOLUTION: FTN7X now upshifts its run string.

## 2.21.15 Source File

SR# NONE

ENHANCEMENT: The name of the source file is now always put in the XNAM record. Previously, it was only put there under the 's' option.

## 2.22 (92842A) Graphics/1000-II AGP

### 2.22.1 JSERR

SR# 2200012989

PROBLEM: JSERR does not report AGP errors to the LU specified by the user. It would always display errors to the LU that scheduled the AGP program.

SOLUTION: JSERR does not properly store the requested error LU. By storing the error LU into common properly, the bug has been fixed.

## 2.23 (92857A) Basic/1000C

### 2.23.1 Aborts

#### SR# 2200018705

**PROBLEM:** The BASIC interpreter aborts with "ERROR: 21, SECONDARY ERROR: 13" when a "CM>" prompt is encountered during an edit session. Compiled BASIC programs also abort in a similar fashion if the prompt is encountered while writing to the CRT screen.

**SOLUTION:** This problem is due to changes in the A.85 operating system. CM now locks the terminal LU until it receives a response. BASIC will now check if the LU to which it is writing is the terminal LU ( i.e. LU 1 ). If so, BASIC will suspend if this LU has been locked. This change was made in both the BASIC interpreter and compiler.

#### SR# 2200028324

**PROBLEM:** Encountering certain syntax errors can cause the BASIC interpreter to abort with the error "Samurai Error".

**SOLUTION:** A fault in the mechanism for detecting segmentation errors has been corrected.

#### SR# 5000048504

**PROBLEM:** When executing a program in the BASIC interpreter on a "small" A-series ( i.e. only 512 KB of memory ), the error "ERROR (173) PROGRAM COULD NOT BE SCHEDULED" can occur. This happens when RBEX ( the interpreter's executor program ) cannot fit into the available main memory.

**SOLUTION:** The supplied link file for RBEX specifies a working set of 169 which can be inappropriate for smaller systems. Re-linking RBEX ( the LK command in LINK ) with a smaller working set would solve this problem. The BASIC/1000C Installation and Configuration Guide has been updated to include this information.

SOFTWARE CHANGES (92857A)

SR# 5000050484

PROBLEM: When linking compiled BASIC programs, a LINK error "Unsupported PCAL to old code" can occur.

SOLUTION: We deleted the SE command from the link files supplied with the BASIC compiler.

SR# 2200018986

SR# 5000055087

PROBLEM: The BASIC interpreter aborts in program preparation mode with "ERROR (109) OUT OF ROOM" when loading a large program.

SOLUTION: The BASIC editor has been converted into a VMA program and is no longer restricted to the 32k partition for its work space.

SR# NONE

PROBLEM: The BASIC interpreter loops indefinitely upon encountering certain internal errors.

SOLUTION: Changes to the error handler now enable the current DOFILE to be closed and control to be returned to the user.

## 2.23.2 BBMG

SR# 2200003632

PROBLEM: BBMG does not specify the names of the output files that it creates.

SOLUTION: BBMG now specifies the names of the info and relocatable files upon successful completion of a session.

SR# 2200019000

PROBLEM: BBMG does not overwrite the list file when new file system names are used. If a command file and a list file are specified in the runstring and the list file

already exists, BBMG reports an error referring to old-style filenames.

SOLUTION: BBMG can now overwrite files with new file system names.

### 2.23.3 CDS

#### SR# 2200019976

PROBLEM: The BASIC compiler generates bad code when using \$CDS ON with \$RESERVE n where n is less than 1024.

SOLUTION: The problem has been fixed by externalizing a subroutine in the compiler.

### 2.23.4 DOFILE

#### SR# 2200018556

PROBLEM: A program with an INPUT statement will not work correctly if the file containing the program is specified as the DOFILE in the BASIC interpreter runstring.

SOLUTION: This is a problem with the DOFILE initialization. When the current DOFILE ends, the previously nested DOFILE would not be initialized properly. Inserting a call to procedure init\_file\_names into the module DOFIO.PAS solved this problem.

#### SR# NONE

PROBLEM: During execution of a program, when the BASIC interpreter is getting input from a DOFILE and encounters end-of-file, control is not correctly transferred to the debugger.

SOLUTION: This is another DOFILE initialization problem. A call to the procedure init\_file\_names has been inserted into the module SYNIO.PAS.

### 2.23.5 Editor

**SR# NONE**

**PROBLEM:** Long lines are mishandled by the BASIC interpreter's line editor.

**SOLUTION:** Changes have been made to two edit routines.

### 2.23.6 Filenames

**SR# 5000074161**

**PROBLEM:** On an FMGR cartridge, the 2401 BASIC compiler does not accept non-default file specifiers.

**SOLUTION:** The BASIC compiler's runstring parsing routine has been corrected to accept non-default file specifiers.

### 2.23.7 Functions

**SR# 2200010587**

**PROBLEM:** The BASIC interpreter's SGN function returns the wrong value when the argument is of type DOUBLE.

**SOLUTION:** The wrong variable was being used to determine the type of the argument, which resulted in the wrong value being evaluated. This has been corrected.

### 2.23.8 GET

**SR# NONE**

**PROBLEM:** "GET" performance in the BASIC interpreter needs improvement.

**SOLUTION:** Changes include algorithmic improvements and the use of more efficient routines for table access.

2.23.9 I/O

**SR# 2200018358**

**SR# 5000040337**

**PROBLEM:** BASIC accepts LU numbers in the range 0 to 63. RTE-A currently supports LU numbers in the range 0 to 255.

**SOLUTION:** The appropriate EXEC and REIO calls have been replaced by their extended LU counterparts ( XLUEX and XREIO ). Changes have been made in both the interpreter and compiler.

**SR# 5000059634**

**PROBLEM:** The BASIC compiler does not properly default the list and relocatable files when they are not specified. The runstring "CBASIC,TEST.BAS,,-" will not set the list file to LU 0.

**SOLUTION:** When not specified, list and relocatable files are now defaulted to LU 0.

**SR# 5000087288**

**PROBLEM:** Certain cases involving the ON INTR GOTO statement can cause program flow problems in the BASIC interpreter.

**SOLUTION:** The handling of interrupts by the BASIC interpreter's branching routines has been corrected.

**SR# NONE**

**PROBLEM:** The BEXEC relocatable supplied with the BASIC interpreter does not have extended LU range capability.

**SOLUTION:** The new relocatable BXLUEX.REL will now be supplied to enable the user to communicate with LU's in the extended range 0..255.

## 2.23.10 Installation

### SR# NONE

PROBLEM: The BASIC interpreter install file for RTE-6 will use the wrong link command file if a load map is requested for RBEX.

SOLUTION: We corrected the LINK runstring in the file INSTALL\_6\_BAS.CMD.

## 2.23.11 Manuals

### SR# 2200015636

PROBLEM: The BASIC/1000C manual, page 13.3, is incorrect in describing the size of the type 2 file.

SOLUTION: The BASIC/1000C manual has been corrected.

### SR# 2200018366

PROBLEM: The BASIC/1000C manual's description of the use of SHEMA with the BASIC compiler is insufficient and should be expanded to detail all of the restrictions and possible dangers.

SOLUTION: The BASIC/1000C manual has been corrected.

### SR# 2200021063

PROBLEM: The BASIC/1000C manual's description of the use of BASIC with MLLDR needs clarification and correction.

SOLUTION: The BASIC/1000C manual has been corrected.

### SR# 5000005124

PROBLEM: The BASIC/1000C Installation and Configuration Guide contains errors regarding working set size for the interpreter on page 4-5. In addition, the benchmark information on page 4-7 does not specify time units.

SOLUTION: The BASIC/1000C Installation and Configuration Guide has been corrected.

SR# 5000056093

PROBLEM: The BASIC/1000C manual's explanation of the \$RESERVE directive needs clarification.

SOLUTION: The BASIC/1000C manual has been updated.

## 2.23.12 RINTR

SR# NONE

PROBLEM: Interrupts cannot be logged on an HPIB LU greater than 63. The HPIB library on RTE-A can accept LU's in the extended range 0-255.

SOLUTION: The interrupt handler, RINTR, has been updated to accept HPIB LU's in the extended range of 0-255 on RTE-A systems.

## 2.24 (92860A) Symbolic Debug/1000

### 2.24.1 Break

SR# 2200026187

PROBLEM: Debug cannot clear breakpoints outside the current segment or main.

SOLUTION: Fixed in the DSD 4.0 update.

SR# 5000017525

PROBLEM: A SEGLD that overlaid a segment with itself could cause a breakpoint in that segment to not be hit.

SOLUTION: Fixed in the DSD 4.0 update.

**SR# 5000042960**

PROBLEM: When setting a breakpoint at an entry point which has the same name as a local variable, Debug will set the breakpoint at the variable, not the entry point.

SOLUTION: Now Debug will properly "prefer" entry point names over variable names when setting breakpoints and when in profiling mode.

## 2.24.2 CDS

**SR# 2200017152**

PROBLEM: Debug cannot handle the last part of a large CDS routine.

SOLUTION: Fixed in the DSD 4.0 update.

**SR# 2200026211**

PROBLEM: Debug locks up or gives a syntax error message if a variable in an inactive CDS routine is used in a conditional breakpoint or tracepoint.

SOLUTION: Fixed in the DSD 4.0 update. These variables are legal to use.

**SR# 2200026195**

**SR# 2200026203**

**SR# 2200026245**

PROBLEM: Debug does not keep track of CDS segments properly. Symptoms include

- Incorrectly saying "Must be in current segment or main".
- Using the right address but the wrong segment for

SOFTWARE CHANGES (92860A)

- various commands.
- Not hitting breakpoints.
  - Not stepping into PCALX or PCALV calls.
  - Incorrectly saying a routine is not active.
  - Incorrectly reporting MP violations.

SOLUTION: Debug now does a far better job of handling segments, and does not treat non-CDS code in the data partition as if it were in a segment.

SR# 2200026260

PROBLEM: The Where command displays wrong values for parameters of recursive CDS routines. Parameters are always looked for in the most recent invocation of a routine, rather than the invocation being displayed.

SOLUTION: Parameters are now looked for only in the routine invocation being displayed.

SR# 2200026286

PROBLEM: Debug displays wrong suffixes after values for CDS locations or addresses. Octal contents of a location may be suffixed by the memory relocation type ('q' or 'c', rather than 'b'). Addresses may be suffixed by an arbitrary character.

SOLUTION: The suffixes as defined in the manual are now given.

SR# 2200016915

SR# 5000031633

PROBLEM: Debug cannot single step computed gotos in CDS mode.

SOLUTION: Fixed in the DSD 4.0 update.

SR# 5000064766

PROBLEM: Listing a subroutine in CDS mode could cause Debug to hang.

SOLUTION: Fixed in DSD 4.0.

### 2.24.3 Display

**SR# 2200026229**

**PROBLEM:** Debug cannot display the address of a location outside the current segment or main.

**SOLUTION:** Addresses can always be displayed.

**SR# 5000026328**

**PROBLEM:** Displaying an array using a type override directive (i.e. D X(3):C2) displays the wrong locations.

**SOLUTION:** Debug calculates the index based on the original type of the array, not the override type.

**SR# 5000033415**

**PROBLEM:** Debug does not use enough precision when displaying real numbers.

**SOLUTION:** An additional unit of precision is added when rounding.

**SR# 2200012732**

**SR# 5000075911**

**PROBLEM:** Debug does not display character data correctly if the string begins on an odd byte boundary.

**SOLUTION:** Fixed in the DSD 4.0 update.

**SR# 5000081208**

**PROBLEM:** Debug gives a "Packing type invalid" error when displaying an array with adjustable array declarators (variable dimensions).

**SOLUTION:** Fixed in the DSD 4.0 update.

#### 2.24.4 EMA

SR# 5000078501

SR# 5000081257

PROBLEM: Debug cannot display nor modify EMA variables.

SOLUTION: EMA variables not being displayed is caused by problems in FTN7X and RTE-A Link, which is now fixed.

#### 2.24.5 List

SR# 5000039867

PROBLEM: Debug can go into an infinite loop or report strange error messages when the List command is used to list an arbitrary file. This is caused by incorrectly calling symbol table support routines.

SOLUTION: Fixed in the DSD 4.0 update.

#### 2.24.6 Modify

SR# 5000056135

PROBLEM: Cannot modify X and Y registers on RTE-A.

SOLUTION: Fixed in the DSD 4.0 update.

#### 2.24.7 Running DEBUG

SR# 2200004192

PROBLEM: When using the :IH option in DEBUG, the program name must be given with a .RUN extension (i.e. DEBUG FOO.RUN:IH).

SOFTWARE CHANGES (92860A)

SOLUTION: Now just the program name is required. Note that the program is OFF'ed at the end of the session on RTE-A, even with the :IH option.

SR# 2200016568

PROBLEM: Debug creates new '@' files on the first cartridge in the cartridge list, rather than on the same cartridge as the original '@' file.

SOLUTION: Fixed in the DSD 4.0 update.

SR# 2200016048

SR# 2200020149

SR# 2200026252

PROBLEM: Debug gets an MP violation while exiting. This occurs when Debug tries to OF the debugged program and fails, perhaps because no ID segment exists for the program yet (during initialization).

SOLUTION: The program is only OF'ed if previously RP'ed.

SR# 2200026278

PROBLEM: Debug requests too much memory when prompting for the runstring on RTE-A, causing Debug to become memory-suspended.

SOLUTION: Debug now requests 256 bytes.

SR# 5000047449

PROBLEM: Debug can become memory suspended when the +L option is used.

SOLUTION: Fixed in the DSD 4.0 update. Session LUs are used rather than system LUs (for RTE-6).

SR# 5000069641

PROBLEM: Debug gives a "DCB not open swap file" error when debugging large programs.

SOLUTION: Fixed in the DSD 4.0 update.

**SR# 2200026328**

ENHANCEMENT: If Debug detects an error in the linking of stack frames a "Stack marker inconsistency detected" error is given. If the user suspects the stack chain is corrupt, entering the Where command will cause Debug to perform this check. Debug will no longer hang up on this condition.

**SR# 5000020081**

ENHANCEMENT: A RUN command is created to schedule programs while in Debug.

**SR# 5000050583**

ENHANCEMENT: If Debug cannot find a source file and must be told the new name, Debug remembers the new name while in that module. The user does not have to re-enter the name after each single step.

**SR# 5000028373**

**SR# 5000050666**

ENHANCEMENT: Programs that expect RMPAR parameters that are independent of the runstring parameters can be debugged from CI or FMGR. The +P option has been expanded to the form +P[:n1:n2:n3:n4:n5], where n1-n5 are the RMPAR parameter values to pass. Any RMPAR values not specified in the +P option are set from the runstring parameters, as usual.

**SR# 5000075879**

ENHANCEMENT: The buffer for Debug's runstring is expanded to 3K words so that larger buffers can be passed to programs being debugged.

## 2.24.8 Stepping

**SR# 2200017137**

## SOFTWARE CHANGES (92860A)

**PROBLEM:** If Link drops current page links after a line, Debug cannot single step the line.

**SOLUTION:** Debug now goes into emulation mode when current page links are found, increasing the chances that the line can be single stepped.

**SR# 5000065011**

**SR# 5000067090**

**PROBLEM:** Debug incorrectly reports MP violations when single stepping CDS programs.

**SOLUTION:** Fixed in the DSD 4.0 update.

**SR# 5000077792**

**PROBLEM:** Debug does not properly single step a VADD call in CDS mode; the program runs to completion.

**SOLUTION:** Fixed in the DSD 4.0 update.

## 2.25 (92861A) Graphics/1000-II DGL Version 2.0

### 2.25.1 26061A

**SR# NONE**

**ENHANCEMENT:** We have added new display devices for the 26061A vector to raster translator card by adding the library D0045.

### 2.25.2 Plotter

**SR# NONE**

ENHANCEMENT: We have added new display and locator devices for the 7586 plotter interfaced by RS232 by adding libraries D0068 and L0068.

~~SR# NONE~~

ENHANCEMENT: We have added new display devices for the 7550 plotter interfaced by RS232 by adding library D0065.

~~SR# NONE~~

ENHANCEMENT: We have added a new display device for the 7475 plotter interfaced by RS232 by adding library D0066.

~~SR# NONE~~

ENHANCEMENT: We have added new display and locator devices for the 7470 plotter interfaced by RS232 by adding libraries D0067 and L0067.

~~SR# NONE~~

ENHANCEMENT: We have added new display and locator devices for the 7440 plotter interfaced by either HP-IB or RS232 by adding libraries D0061, D0063, L0061, and L0063.

### 2.25.3 Polygon

~~SR# 2200005611~~

PROBLEM: There is a problem in filling two or more overlapping polygons with polygon edges and fill lines being coincident.

SOLUTION: We fixed the round off errors that were occurring.

### 2.25.4 Printer

~~SR# NONE~~

ENHANCEMENT: We have added new display devices for the HP2686 Laser Jet printer by adding library D0058.

### 2.25.5 Terminals

~~SR#~~ NONE

ENHANCEMENT: Added new display devices for the 2393 and 2397 terminals using libraries D0059; D0060, L0059, V0059, P0059, L0060, V0060 and P0060.

### 2.25.6 ZPGDD

~~SR#~~ NONE

PROBLEM: ZPGDD for the 2627 terminal handler would always outline the polygon with a solid line, even if the line style had been changed by a previous call to ZLSTL.

SOLUTION: ZPGDD is using the 2627 firmware to generate the boundary line. The 2627 firmware only supports solid boundary lines. ZPGDD has been changed to generate the boundary line in software, so that the current line style attribute would be displayed.

~~SR#~~ NONE

PROBLEM: ZPGDD for libraries D0047 and D0048 does not update the current point correctly.

SOLUTION: ZPGDD has been modified to update the current point.

## 2.26 (92862A) Graphics/1000-II AGP Version 2.0

### 2.26.1 JSERR

**SR# 2200012989**

**PROBLEM:** JSERR does not report AGP errors to the LU specified by the user. It would always display errors to the LU that scheduled the AGP program.

**SOLUTION:** JSERR does not properly store the requested error LU. By storing the error LU into common properly, the bug has been fixed.

### 2.26.2 WSP

**SR# 5000036079**

**PROBLEM:** Any WSP name of less than 6 characters sent into JDINT would return an error indicating that the WSP program was not found.

**SOLUTION:** A bug has been fixed in MNEW and MNEWL that involves incorrect extraction of the program name from a file descriptor.

**SR# 5000041509**

**PROBLEM:** In order to use a workstation program for AGP, the program has to be either RP'ed or in a file in the working directory. WSP's in the /PROGRAMS directory are not found.

**SOLUTION:** The ZMNTR program has been enhanced to also look in the PROGRAMS directory.

## 2.27 (94200B) PCIF/1000

### 2.27.1 Library

SR# NONE

ENHANCEMENT: Made additions to PCIF Library, PCTST, and tutorial for extended call enhancements.

## 2.28 (94202A) PCIF/1000 Handler for Allen-Bradley PCs

### 2.28.1 PC and HWY Handlers Enhancements

SR# 2200022673

ENHANCEMENT: Added support to Allen-Bradley 1771-KG interface module.

SR# C700021964

ENHANCEMENT: Added configuration screen six to allow setting the baud rate on the downloadable mux to other than 9600 baud.

SR# NONE

ENHANCEMENT: Additions to support Allen-Bradley PLC-3 PC.

## 2.29 (94203A) PCIF/1000 Handler for Modicon PCs

### 2.29.1 P/C and HWY Handlers Enhancements

**SR# NONE**

ENHANCEMENT: Additions to support Gould 484 and 984 PCs.

## 2.30 (94204A) PCIF/1000 Siemens Handler

### 2.30.1 Siemens Handlers

**SR# NONE**

ENHANCEMENT: To support S5-115U, S5-135U & S5-150U SIEMENS PCs.

## Chapter 3

# Current Revisions & Changes

This chapter lists the current revision codes for each software product, and notes any changes that have occurred to the product in this update cycle.

Those products that have been changed in this update cycle are marked with a '+' to the left of the product number. If a product has been updated, the listing will also include:

- a) Manuals and
- b) Software (and firmware) media

that have been updated (or added) in this update cycle, and are being distributed with the subscription services for this product.

If software has been updated for the product, then those modules that have been changed/added/deleted are marked with a '\*' to the left of the file name, and the type of update is shown to the right of the current revision code: updated files show the new revision code; added or deleted files are marked as 'New' or 'Deleted' (respectively).

Products that support the hierarchical file system are marked with an asterisk (\*) after the product name.

For specific information on updating systems in the new hierarchical file format, please refer to chapter 5.

Note that updated products may have only manual changes or only software changes. This is noted in the manual or media lists. The manual changes are listed in the format 'Edition#/Update#'. For example, '2/2' means edition 2, update 2 and '3/-' means edition 3, no update.

A history of the firmware for both the A and M/E/F Series machines is at the end of this chapter.

**3.1 (12824A) Vector Instruction Set**

Revision 4000  
Original Release

# These parts are bundled in with  
the 12101-60001 processor board.  
The 12101-60002 assembly no  
longer includes these PROMs.

Current Revisions (Firmware)

12101-60001  
12101-80002 (U0706)  
12101-80003 (U0806)  
12101-80021 (U1006)\*  
12101-80005 (U0506)  
12101-80006 (U0606)  
12101-80007 (U1106)  
12101-80008 (U0906)  
12101-80009 (U0305)  
12101-80010 (U0505)  
12101-80011 (U0605)#  
12101-80012 (U0705)#  
12101-80013 (U0805)#  
12101-80014 (U1005)#

\* Changed to fix bug. .FDIV with  
E-Register set returns incorrect  
results.  
(See S/N 12101A-01)

Revision 4000

# These parts are bundled in with  
the 12101-60001 processor board.  
The 12101-60002 assembly no  
longer includes these PROMs.

12101-60002  
12101-80024 (U0706)\*  
12101-80025 (U0806)\*  
12101-80027 (U1006)\*  
12101-80022 (U0506)\*  
12101-80023 (U0606)\*  
12101-80028 (U1106)\*  
12101-80026 (U0906)\*  
12101-80029 (U0305)\*  
12101-80030 (U0505)\*  
12101-80031 (U0605)\*  
12101-80032 (U0705)\*  
12101-80033 (U0805)\*  
12101-80013 (U1005)\*

\* Update 12101-60001 to 12101-60002  
by removing four socketed mapping  
PROMs (12101-80001, 80012, 80013,  
and 80014). Firmware adds Data2  
map instruction.

REQUIRED TO RUN RTE-A

(See S/N 2106AD-02)

Original Release

### 3.70.4 A600/A600+ VCP HISTORY

5180-0173 (U606)  
5180-0174 (U706)

Original Release

Revision 4

5180-0189 (U606)\*  
5180-0190 (U706)\*

\* Changed to fix bugs. Two power-fails in quick succession may result in an incorrect auto-restart. Booting remotely over FDL causes system to hang. Erroneous parity error message if memory is lost. Also several inconveniences are fixed and enhancements added.

Revision 6 (Supported)

(See S/N 12102A-01)

12102-80003 (U606)\*  
12102-80004 (U706)\*

\* Changed to run with VC+. Also adds boot loaders for 1600 BPI Map Tape, 3.5" Micro Floppy, and 10 Mb mini-winchester disc. VCP size is 8K and resides in EPROM. Included in 12107A A600+ Upgrade Kit.

(See S/N 2106AK-3)

Revision 4001 (Supported)

5180-4253 (U606)\*  
5180-4254 (U706)\*

\* Changed to fix bug. If system disc and CPU are powered up simultaneously the CPU will not auto boot.

(See S/N 2106AK-6A)

Revision 4004 (Supported)

5180-4263 (U606)\*  
5180-4264 (U706)\*

\* Changed to fix bug. Break disable did not work. Added boot loader for the 55 Mbyte disc drive.

Included in 12107A A600+ Upgrade Kit  
Included in ROM Upgrade Kit 5180-4267.

Revision 4011 (Supported)

### 3.70.5 A700 BASE SET HISTORY

12152-80011 (U91)  
12152-80012 (U101)  
12152-80013 (U111)  
12152-80014 (U121)

Original Release

12152-80031 (U91)\*  
12152-80032 (U101)\*  
12152-80033 (U111)\*  
12152-80034 (U121)\*

\* Changed to fix bug. DDS will skip incorrectly.

12152-80035 (U91)\*  
12152-80036 (U101)\*  
12152-80037 (U111)\*  
12152-80038 (U121)\*

\* Add Code and Data Separation Instructions. Also several bugs were fixed. .LWD1 and .LWD2 are not privileged instructions. Any instruction in the A/B-Registers which causes an MP violation freezes the computer.

REQUIRED TO RUN VC+

(See S/N 2107AK-01)

This firmware is included in upgrade kit 12152-60043.

(Supported)

12152-80053 (U91)\*  
12152-80054 (U101)\*  
12152-80055 (U111)\*  
12152-80056 (U121)\*

\*Changed to be compatible with the I/O Extender.

(Supported)

### 3.70.7 A700 VCP HISTORY

5180-0173 (U15)  
5180-0174 (U35)

Original Release

Revision 4

5180-0189 (U15)\*  
5180-0190 (U35)\*

\* Changed to fix bugs. Two power-fails in quick succession may result in an incorrect auto-restart. Booting remotely over FDL causes system to hang. Erroneous parity error message if memory is lost. Also several inconveniences are fixed and enhancements added.

Revision 6

(See S/N 12102A-01)

12152-80039 (U15)\*  
12152-80040 (U35)\*  
12152-80041 (U55)\*  
12152-80042 (U65)\*

\* Changed to run with VC+. Also adds boot loaders for 1600 BPI Map Tape, 3.5" Micro Floppy, and 10 Mb mini-winchester disc.

Revision 4001

(See S/N 2107AK-01)

12152-80043 (U15)\*  
12152-80044 (U35)\*  
12152-80045 (U55)\*  
12152-80046 (U65)\*

\* Changed to fix bug. If system disc and CPU are powered up simultaneously, the CPU will not auto boot.

Included in Upgrade Kit 12152-60043.

Revision 4004 (Supported)

(See S/N 2107AK-2A)

12152-80058 (U15)\*  
12152-80059 (U35)\*  
12152-80060 (U55)\*  
12152-80061 (U65)\*

\* Changed to fix bug. Break disable did work. Added boot loader for the 55 Mbyte disc drive.

Included in Upgrade Kit 12152-60064.

Revision 4011 (Supported)

\* Rewrite firmware to execute Code and Data Separation Instructions. Firmware change must be accompanied by a new Cache Control Board:

12203-60004.

REQUIRED TO RUN RTE-A AND VC+.

This firmware is included in the 12203A Opt 001 Retrofit Kit.

12203-80009 (U0908)\*  
12203-80010 (U1208)\*

\* Changed to fix bug. If system disc and CPU are powered up simultaneously, the CPU will not auto boot.

Revision 4004 (Supported)

(See S/N 2139A-2)

5180-4253 (U0908)  
5180-4254 (U1208)

These are new VCP ROMs to be used in the new A900 Cache board, part no. 12203-60011. The new board was needed for I/O Extender compatibility, and also includes field improvements. This set of ROMs is identical to those in the A600+.

Note: The old cache board, part no. 12203-60004, must have the old ROMs and the new cache board must have the new ROMs.

(See S/N 2139A-10)

5180-4263 (U0908)\*  
5180-4264 (U1208)\*

\* Changed to fix bug. Break disable did not work. To fix break disable the latest revision of the Base Set firmware is also needed. Added boot loader for the 55 Mbyte disc drive.

Included in Upgrade Kit 5180-4267.

Revision 4011 (Supported)

## ROM PART NUMBER HISTORY (3 of 4)

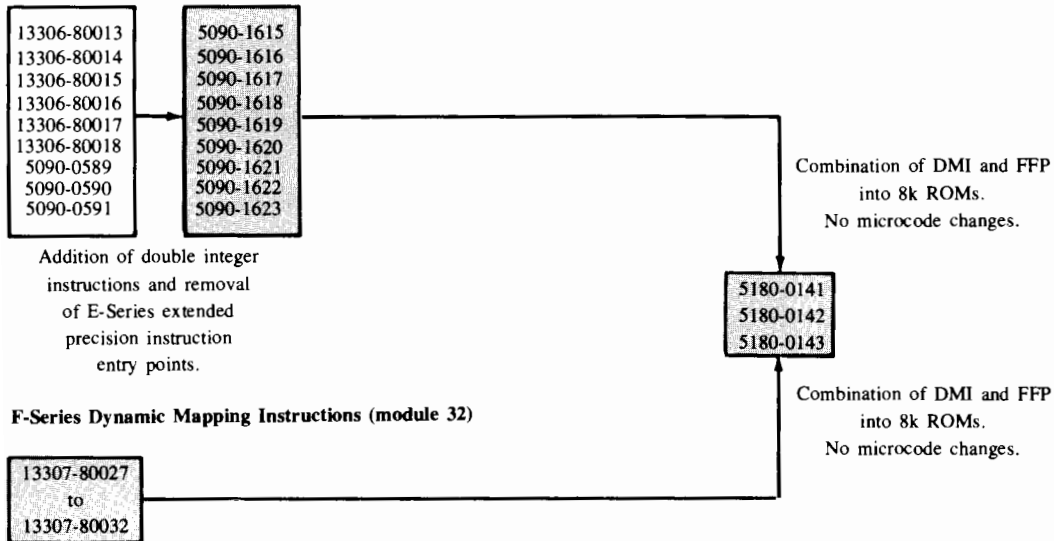

### E-Series Fast FORTRAN Processor ROMs (modules 33, 34, 35)

### E-Series Dynamic Mapping Instructions (module 32)

### F-Series Fast FORTRAN Processor ROMs (modules 33, 34, 35)

Original Release

## ROM PART NUMBER HISTORY (4 of 4)

### F-Series Scientific Instruction Set ROMs (modules 40, 41, 42, 43)

Addition of DPOLY, IATLG, FPWR, and TPWR routines as well as double precision capability.

Fix a bug in the /CMRT routine.

Combination of six 4k ROMs into three 8k ROMs. No microcode changes.

### F-Series Vector Instruction Set ROMs (modules 12, 13, 14, 15)

Original release.

Combination of six 4k ROMs into three 8k ROMs. No microcode changes.

### E/F-Series RTE-IVA/B Extended Memory Area ROMs (modules 36, 37)

Original release.

### E/F-Series DS/1000 ROMs (modules 38, 39)

Date code 1740

Date code 1813

Date code 1826

Date code 1913

Date code 2003

Date code 2003

Changed located of microcode addressing from modules 44/45 to 38/39.

Enhance download capability.

Enhance communication line noise immunity.

Removal of potential download problems.

Change ROM vendor for problems when installed on a FAB computer with in a 2 UCS boards.

# Chapter 4

## Usage Considerations

This chapter discusses any significant changes in generation, installation, and usage and their impact for the products that have changed in this revision. The Miscellaneous section at the end contains general information that is relevant to more than one product.

### 4.1 (24612A) Offline Diagnostics (A-Series)

The DDL source programs have been renamed. They were previously named @MOD (ex. @CPU and @IOM), but now start with the left-parenthesis ( ex. (CPU ).

### 4.2 (24398B) Peripheral Diagnostics (L, A-Series)

EXER has been enhanced to include the removable portion of the 7907 disc.

### 4.3 (91711B) Online Diagnostics (M,E,F-Series)

Several enhancements and bug fixes were added to this product at this revision. The following are the page requirements (F-Series) for changed programs:

|                 |                               |
|-----------------|-------------------------------|
| TXPF1 = 5 pages | TXPM0 = 5 pages               |
| TXPF2 = 5 pages | TXPM1 = 9 pages               |
|                 | TXPM2/TXPM3 = no size changes |

Page requirements will be somewhat higher for M and E series machines depending on the installed firmware.

There were several enhancements which made this product easier to use. TXPM1, TXPM2 and TXPM3 now respond to system break. TXPM1 has quiet, normal and verbose modes of operation. TXPM0, TXPF1 and TXPF2 all will show runstring information if the first parameter is "?". Please refer to the 91711B section in Chapter 2

for more information about these enhancements.

## 4.4 (91747A) Datashare/1000

### 4.4.1 Usage Changes

The major change in this revision is that the Datashare version of D.RTR can now also handle CI volumes and files (CI files cannot be shared, but they may co-exist on a system with shared FMGR cartridges). This means that all the standard RTE-6 utilities can be loaded onto a Datashare system using the same loading procedures as in a standard RTE-6 system; that is, the library \$FMP6C no longer needs to be used. Also, the system generation answer file can be set up the same as a standard RTE-6 answer file - with \$FMP6, CI and CIX utilities, etc. - with the normal Datashare additions: \$DSHAR library and appropriate track map table adjustments, and using the Datashare %BMPG1, %BMPG2, %BMPG3 files in place of the RTE-6 versions.

Only FMGR cartridges may be shared (as before), and these cartridges can only be manipulated (mounted, dismounted, initialized) by FMGR. However, the files on these shared cartridges may be accessed using both FMGR and CI file system subroutine calls, and with the normal RTE-6 utilities (CI, TF, EDIT, LINK, etc.)

One further note: in Datashare systems, LU 2 and 3 are typically made very large to make room for many type 6 files (type 6 files RP'ed from a system disc do not have to be copied to the system track area before being executed). With the introduction of CI volumes into the system, the user has the alternative of putting type 6 files on a CI volume (e.g., /PROGRAMS) because type 6 files RP'ed from a CI volume (using FmpRpProgram, FmpRunProgram, or the CI RP command) are also not copied to the system track area.

### 4.4.2 Size Changes

The major size change is that D.RTR on Datashare is now 32 pages

instead of 14 pages.

## 4.5 (91750A) DS/1000-IV

### 4.5.1 Changes to RTE-A Answer File

The DS/1000-IV driver ID.66 has been renamed to ID\*66 to conform to current file name conventions. All mentions of this driver must be modified in the generation answer file. In addition, the table extents needed has increased from 18 to 20 words (TX:20). The new generation record inside ID\*66 has 20 words specified, so that defaulting the TX: specification will bring in the correct extent size.

The module D\$EQT which was relocated in labeled common is no longer required in RTE-A systems. The only required entry point (D\$XS5) has been added to the module RESA which is also relocated in labeled common. D\$EQT should be removed completely from the generation.

The changes to ID.66 has the same impact on the generations for RTE-L and RTE-XL system. The deletion of D\$EQT applies only to RTE-A (not to L and XL).

### 4.5.2 Other Impacts

The programs RMOTE and LOG3K had to be forced-loaded on RTE-A/XL systems due to an undefined external reference to SPOP. This is no longer the case (i.e., do NOT force-load these programs anymore).

DSLIN, the program used to enable Bisync connections to a DS/3000 node, has been modified to ask an additional question at the beginning. This will require the user to modify their DSLIN command files. The new first question is "Open or Close this LU?". Valid answers are "OPEN", "CLOSE", or "/D" (for the default of open). This question has always been asked if DSLIN were run interactively, but a response of OPEN was always assumed if a command file was used. With this change, the responses to an interactive dialogue are more compatible with the responses expected in a command file. The LU to OPEN or CLOSE must still be

supplied in the run-string if a command file is used.

## 4.6 (91781A) RJE/1000-II

### 4.6.1 Enhancements

A new job management postprocessor example, ROUTE, has been added into the RJE product. The two pertinent files are ROUTE.PAS and the relocatable ROUTE.REL. The source code ROUTE.PAS may be compiled and used as is or be used as a point of departure for a custom processing module.

The purpose of this new postprocessor is to show how a simple job routing facility may be built using the RJE/1000-II feature set. The technique used involves including a special comment card image in the JCL portion of the file being submitted to the host. When the output of the job is returned, the file is scanned to retrieve this "ROUTE" card. The card image contains such information as the desired destination directory for the received data, a secondary postprocessor, etc.

### 4.6.2 Installation Changes

The transfer file used to load the RJE modules (RJE.CMD) has been changed to include the linking of the new postprocessor ROUTE. A description of this postprocessor can be found in the RJE-II reference manual (part number 91781-90001).

## 4.7 (91782A) DSN/MRJE 1000

### 4.7.1 Peripheral Support Changes

MRJE print formatting has been upgraded to support the 2563A, 2564A, and 2566A printers with option 214 (HPiB) on RTE-A systems only.

### 4.7.2 Installation Changes

A new revision of the PSI interface driver (DVN00) is required on RTE-6 systems. This driver replaces the A.85 DVN00. System

generation instructions provided in the MRJE/1000 Reference Manual (part number 91782-90001) still apply.

Revision DSD4.0 supports a user-editable configuration file for MRJE. This requires a conversion from all previous configuration files to this new format. Instructions for performing this process are described in chapter 3 of the MRJE Reference Manual.

The transfer file for loading the MRJE modules (MRJE.CMD) has been documented to facilitate installation. No other changes have been made to the installation process.

## 4.8 (91823A) Control/1000

ID.70, the Control/1000 driver, has been replaced by ID\*70. Please upgrade to this version as soon as possible since it contains some major fixes (see Chapter 2 in this Communicator).

An impact from these fixes is that the DVIX area has grown by nine words, from 88 to 97.

## 4.9 (92068A) RTE-IVB Operating System

The changes to RTE-IVB include bug fixes and porting of the spooling system from RTE-6/VM. RTE-IVB now has all the benefits of the bug fixes in RTE-6's spooling, in addition to freeing up some room in Table Area II.

Bug fixes in \$BALC may have indirect impact on existing customer systems. (\$BALC is called by DS and system session to allocate SAM.) If DS is generated in, \$BALC will require 17 more words in SSGA.

RTE-IVB shares some modules with RTE-6/VM, such as %DECAR, \$MATH, \$FLIB, \$FOLDF, and drivers. Please see the RTE-6 section for discussions about the size changes in these shared modules. Also note that the DVC12 line printer driver no longer needs extents (X=0).

Thus, no changes are needed in your A.85 answer file. Having a nonzero extent for DVC12 is not detrimental; it just wastes some

words in memory.

## 4.10 (92069A) Image/1000

### 4.10.1 File Name Changes

%NO\DS has been renamed to %NO\_DS to avoid problems with CI using '\ ' as a special character.

## 4.11 (92077A) RTE-A Operating System

### 4.11.1 Peripheral Support Changes

Support of the following peripherals has been added.

| Product<br>----- | Description and Interface<br>-----  |
|------------------|---|
| 2225A            | Thinkjet printer - interfaced via the MUX(12040)  |
| 2393A            | Monochrome terminal - interfaced via the MUX(12040) and ASIC(12005)                               |
| 2397A            | Color graphics terminal - interfaced via the MUX(12040) and ASIC(12005)                           |
| 2686B            | Laserjet with more memory - interfaced via the MUX(12040)   |
| 9133L            | 40MB hard disc with floppy drives - supported as a peripheral disc via the HP-IB(12009) interface |
| Vectra           | Personal computer terminal - interfaced via the MUX(12040)  |
| 2564A            | 600 LPM graphics printer - interfaced via the MUX(12040) and HP-IB(12009)                         |
| 7440A            | Low-cost 8-pen plotter - interfaced via the MUX (12040) and HP-IB(12009)                          |
| 7550A            | Desktop plotter - interfaced via the MUX(12040) and HP-IB(12009)                                  |
| 12120A accessory | 20MB hard disc and double-sided micro-floppy drive (630KB) for the Micro/1000 product line        |
| 12121A accessory | 20MB hard disc with no floppy drive for the Micro/1000 product line                               |

For more information about these new devices and how to generate them into the system, please refer to the System Generation and Installation Manual (92077-90034) and the individual peripheral

manuals.

#### 4.11.1.1 12120A and 12121A Accessories

Micro/1000 customers have the option to upgrade their present option 111 (15MB hard disc with single-sided floppy drives) to accessory product 12120A or 12121A. Please refer to the chapter "Procedure to Move 15MB System to a 20MB System Using Integrated Floppy Drives on Micro 1000 Products" in the Small Disc User's Manual (5958-9152).

#### 4.11.1.2 FORMA and ERTSH

In order to improve the reliability of the Micro/1000 integrated disc drives and to have a more comprehensive formatting/sparing capability, we are introducing two new utilities: FORMA and ERTSH.

The previous formatter FORMF does not necessarily locate all the defective areas on a disc, and therefore it does not spare them out of use. FORMA replaces the function of FO (format) with two commands: IN (initialize media) and SS (spare sector). FORMA when used with ERTSH (Error Rate Test program) produces more reliable results. The combination of FORMA and ERTSH completely replace the function of FORMF in the area of integrated hard disc formatting. However, FORMA and FORMF are not compatible. That is, a drive once formatted with FORMA should not be reformatted with FORMF. FORMF will still be used for all discs other than the Micro/1000's integrated disc. For information about their usage, please refer the RTE-A Utilities Manual (92077-90004).

### 4.11.2 Generation and Installation Changes

#### 4.11.2.1 Update Procedures

The update procedures at DSD4.0 are similar to those at A.85, but much simpler. Here is ONE easy way to do the updating.

1. Backup your system.
2. On your existing A.85 system, link up the new RTAGN, using the new \$LDRLN generator library.
3. Overlay the directory /CATALOGS with the new catalog files.
4. Modify your answer file, following the directions discussed in Generation Considerations below. Run RTAGN to get a new system and snap file.
5. Create a directory /TARGETPROGRAMS. Read and understand \*RTEA1, \*RTEA2, \*VC1 and \*VC2. Transfer to the command files \*RTEA1 and \*RTEA2 to link up essential RTE-A

programs and \*VC1 and \*VC2 for VC+ programs. That is,

```
TR *RTEA1 <newsnap> TARGETPROGRAMS
TR *RTEA2 <newsnap> TARGETPROGRAMS
TR *VC1 <newsnap> TARGETPROGRAMS <source>
TR *VC2 <newsnap> TARGETPROGRAMS
```

where <newsnap> = the snap file just generated  
 <source> = global directory where the DSD4.0  
 software is located

6. Copy the new system and snap files to the boot LU and copy the snap file to SNAP.SNP::SYSTEM.
7. Modify your boot file. The SY and SN commands should point to your new system and snap files. The programs RP'ed should come from /TARGETPROGRAMS. Also modify your welcome file to RP programs from /TARGETPROGRAMS.
8. Boot up your new system. Note: BOOTEX has changed due to some minor bug fixes (refer to Chapter 2) but your A.85 BOOTEX will work here as well. If you want to take advantage of these bug fixes, after your DSD4.0 system is up, you may want to overlay your BOOTEX with the new one or install a second BOOTEX after the existing one. Please refer to the RTE-A Generation and Installation manual (92077-90034) for more details about BOOTEX.
9. Rename /PROGRAMS to /OLDPROGRAMS and /TARGETPROGRAMS to /PROGRAMS. Copy all the DSD4.0 libraries to /LIBRARIES and the help files to /HELP. Also edit your boot file and welcome files to RP programs from /PROGRAMS again.

#### 4.11.2.2 The Primary Answer File

The primary system has been designed to be booted from either an ASIC or a MUX. To achieve this, the system console has to be dynamically configured during the boot process. Thus the system console is not configured into the answer file. DO NOT attempt this with your own generations -- it WILL NOT WORK. There is special software support (only available in the primary) to allow the system console to be left out of the generation and configured in at boot time.

If you intend to use #ANS as a model for your own generation answer file, you MUST configure in a system console. If you want your console on an ASIC, uncomment the lines starting with \*~ac by removing the "\*~ac" from the beginning of each line. If you want your console on PORT 0 of a MUX card, uncomment the lines starting with \*~mx by removing the "\*~mx" from the beginning of each line. When configuring in the system console, some lines in #ANS will have to be converted to comments as they are

## Usage Considerations

no longer needed. These lines are clearly marked in the relevant sections. Finally, don't forget to update the node lists when configuring in your system console.

#ANS is a non-VC+ system. To convert it to VC+, uncomment the lines starting with \*~vc by removing the "\*~vc" from the beginning of each line.

To configure DS/1000-IV into your system, uncomment the lines starting with \*~ds by removing the "\*~ds" from the beginning of each line.

The 15MB 248x Integrated Disc has two different layouts defined at DSD4.0: the new 2-LU layout and the original 4-LU layout. If you already have a 15MB disc with the 4-LU layout and you do not want to change, then comment out the new 2-LU layout and uncomment the old 4-LU layout and regenerate the system. Do NOT configure in both layouts simultaneously. If you want the new 2-LU scheme, no action is required because that is the new current system configuration.

### 4.11.2.3 Generation Considerations

The modifications that you need to make in your A.85 answer file involve system partitioning, file name changes and ID\*66.

DS driver ID\*66 now requires a table extent size of 20, not 18. A new generation record in ID\*66 has 20 words specified, so that defaulting the TX: specification will bring in the correct extent. The module D\$EQT which was relocated in labeled common is no longer required in RTE-A systems. The only required entry point (D\$XS5) has been added to the module RESA which is also relocated in labeled common. D\$EQT should be removed completely from the generation.

Please read the subsection "File Name Changes" in this RTE-A discussion for more details about file name changes.

DSD4.0 provides 2-3 additional pages of table space in the system map through extensions to system partitioning. As a consequence, the user needs to be aware of five NEW operating system modules:

ABORT  
IORQ  
PROGS  
MAPS  
UTIL

With the exception of IORQ, these new modules are not partitionable. This, however, does NOT mean a large increase in the size of the non-partitioned section of the O.S. with corresponding

## Usage Considerations

reduction in table space. The reason is that any code that could be partitioned was moved out of non-partitioned modules into partitioned modules, with the net effect of an increase in available table space in a fully partitioned system. In doing so, some previously non-partitioned modules have been made partitionable. In total, the partitionable modules are

|       |        |       |         |
|-------|--------|-------|---------|
| perr  | xcmd   | stat  | dsq     |
| vema  | lock * | load  | time *  |
| memry | iorq * | cdsfh | class * |

\* These modules are now partitionable at DSD4.0; they were not at A.85.

We STRONGLY suggest that you look at #ANS, the primary answer file, for ideas on how to set up partitioning for all these modules. (The DSD4.0 primary has been set-up as a fully partitioned system. That is, all partitionable modules have been partitioned.)

Here is a brief word about selecting modules to partition. Each time you put a module in a partition you are increasing the overhead of the system (in mapping into and out of the partition). Therefore your choice of which modules to partition can have a strong impact on the performance of your system. Below you will find a list of the partitionable modules in order of selection for a typical program development environment. Note, there are many environments where a different ordering would be much more suitable. Included with each module name is a brief description of the module's function. For detailed descriptions, please see the System Design Manual (part-number 92077-90013).

(In regard to partitionable modules involved in doing I/O -- if a module is involved in I/O operations, its performance is still a concern even though I/O is very slow compared to the CPU. The reason is that once an I/O request has been initiated, the OS can continue with other activities. Therefore the quicker an I/O request can be initiated the quicker the OS can go on with other activities, thus increasing the overall throughput of the system.)

| Module | Size      | Comment                         |
|--------|-----------|---------------------------------|
| -----  | -----     | -----                           |
| PERR   | 524 words | The parity error module is only |

## Usage Considerations

entered when there is a problem with memory (parity errors). This should always be the first choice in module selection for partitioning.

|       |           |   |
|-------|-----------|---|
| XCMND | 871 words | Handles various commands. This is not a performance-critical module.  |
| STAT  | 513 words | Handles more commands plus a few status information EXEC calls. This also is not a performance critical module. |
| LOCK  | 564 words | Handles LU locking and unlocking. Typically, it is not a time critical operation.                               |

The above four modules can be partitioned with very minimal impact on system performance. The modules below have to be chosen very carefully.

|       |            |  |
|-------|------------|--|
| VEMA  | 387 words  | Initializes VMAIO I/O requests. If the VMAIO routine is used heavily - that is, 30% or more of the I/O requests generated on the system - then special consideration should be given to this module.   |
| CDSFH | 711 words  | The CDS fault handler. This module is not relevant for non-VC+ systems. For VC+ systems, however, if a large percentage of your programs run in CDS mode and some of the segments reside on disc, partitioning this module will lead to performance degradation in the system as a whole, not necessarily just in the CDS program. The system's throughput would be reduced. |
| LOAD  | 1268 words | Loads and swaps in/out programs. If your system has a high dispatch rate (5 or more per second), avoid partitioning this module.   |
| DSQ   | 315 words  | Handles the Class I/O rethreading and used mainly by DS/1000-IV. Its performance is a concern if you have a large volume (20% of I/O) of DS  |

## Usage Considerations

traffic.

|       |            |   |
|-------|------------|---|
| TIME  | 982 words  | Handles any time-schedule requests. Its performance is not a concern if you have very little time-scheduling in your system.  |
| CLASS | 993 words  | The class system is used very heavily by the multi-user code in the system (CI, CM, PROMT, LOGON, LOGOF, etc). However, class I/O is usually coupled with human response, thus its performance under these conditions is not important (relative to the time spent waiting for user response. But if there is also much DS traffic, program to program communication or program to non-interactive device communication, its performance becomes a concern. |
| MEMRY | 1962 words | This is the memory manager and is typically very frequently used. Only partition this if you really need the space.   |
| IORQ  | 1028 words | Initializes I/O requests. Partition this only if you need the space. If you have critical real-time applications with high I/O volumes of short transactions (30% of I/O under 12 bytes), avoid partitioning this module.   |

In RTE-A, any routine from the system library that is needed by modules in O.S. partitions must be relocated in with the non-partitioned part of the O.S. With this in mind, A600 (not A600+) users need to be aware of the following paragraph. Other users (A600+, A700, A900) can skip it.

The two routines .DMP and .DDI must be relocated with the non-partitioned O.S. code because they are required by code that is in an O.S. partition. Do these two relocations at the end of the system relocation section. This has already been done for you in #ANS:

```
re,/rtea/$math,.dmp
re,/rtea/$math,.ddi
```

If you are using an A600+, A700 or A900, then the

references to .DMP and .DDI should be converted to a comment by placing an "\*" at the beginning of each line. If you fail to do this, duplicate entry point errors will appear in your generation.

#### 4.11.2.4 System Table Space

The difference in table space available in revisions A.85 and DSD4.0 RTE-A is due to four major factors:

1. The DSD4.0 generator has been enhanced to put tables in the space between the system relocation and the start of the driver partitions, if they fit, thus making use of space that was wasted before.
2. DSD4.0 RTE-A has four more modules partitioned (IORQ, CLASS, TIME and LOCK).
3. At DSD4.0, large operating system modules were segmented into smaller pieces to reduce their base page link requirements.
4. DSD4.0's tag area requirements have been reduced, by eliminating the need for tags for external routines.

The order in which modules are relocated and the number of page boundaries crossed can make significant differences in the number of pre-links, post-links, and base page links required to relocate a module (and thus the differences in the size of seemingly similar systems). Below are sample generated systems and their sizes. No attempt was made to align modules on page boundaries or re-order them to optimize the number of links used. All systems were generated with modules in the same order.

The comparisons were done with 4 different systems. All systems had 16 MUX LUs, 1 system console with CTUs, and 1 ID segment.

- Minimum - only required modules
- Small - The modules required to load and run programs (STRNG, SCHED, SYCOM, CLASS, LOAD, MEMRY, XCMND, and STAT) plus 10 CS80 LUs were added.
- Medium - DS, CDS, error logging and spooling capability (LOCK, TIME, OPMSG, ERLOG, SPOOL, DSQ, CDSFH) plus 7 DS LUs were added.
- Large - Powerfail, EMA/VMA, and parity error handling (ID\*43, VEMA, PERR) were added.

The systems had other resources as follows:

|         | class #'s | resource #'s | users | shared progs | mb   | max LU |
|---------|-----------|--------------|-------|--------------|------|--------|
|         | -----     | -----        | ----- | -----        | ---  | -----  |
| Minimum | 0         | 0            | 0     | 0            | 0    | 27     |
| Small   | 50        | 25           | 10    | 10           | 0    | 67     |
| Medium  | 100       | 50           | 20    | 20           | 1024 | 117    |
| Large   | 200       | 100          | 30    | 30           | 1024 | 217    |

## Usage Considerations

Each of these systems was generated in five different ways:

1. With no OS partitions and A.85 relocs and RTAGN (2440\_UN)
2. With no OS partitions and DSD4.0 relocs and RTAGN (2540\_UN)
3. With max A.85 OS partitions and A.85 relocs and RTAGN (2440\_PT)
4. With same OS partitions as #3, but DSD4.0 relocs and RTAGN (2540\_PT)
5. With max DSD4.0 OS partitions and DSD4.0 relocs and RTAGN (2540\_MX)

The following table summarizes the results.

| generated system | last word system | last word table | Base page left | # words wasted | tag area | # words table space | # MUX LU's | # ID segs |
|------------------|------------------|-----------------|----------------|----------------|----------|---------------------|------------|-----------|
| MIN_2440_UN      | 21032            | 31600           | 667            | 745            | 0        | 46177               | 200        | 261       |
| MIN_2540_UN      | 21525 (21770)    | 31335           | 1110           | 7              | 0        | 46442               | 202        | 263       |
| MIN_2440_PT      | 21032            | 31600           | 667            | 745            | 0        | 46177               | 200        | 261       |
| MIN_2540_PT      | 21525 (21770)    | 31335           | 1110           | 7              | 0        | 46442               | 202        | 263       |
| MIN_2540_MX      | 20007 (21771)    | 27621           | 1063           | 6              | 31       | 50156               | 210        | 274       |
| SML_2440_UN      | 36172            | 51512           | 352            | 1605           | 9        | 26265               | 117        | 152       |
| SML_2540_UN      | 36744 (37777)    | 50477           | 626            | 0              | 11       | 27300               | 122        | 159       |
| SML_2440_PT      | 26117            | 41512           | 513            | 1660           | 438      | 36265               | 159        | 207       |

The "last word of system" column is the last word relocated before starting OS/driver partition relocation. The numbers in parentheses under this column are the last word of system table relocated by the DSD4.0 generator in this space. Remember that the DSD4.0 generator now tries to insert system tables in the space after the regular system relocation and before the start of the OS/driver partition. Thus, the difference between these two numbers is savings you get in the system map at DSD4.0.

Addresses and numbers of words are in octal, numbers of MUX LUs and ID segments are in decimal. Note that for every 8 MUX LUs, one MUX

IFT must be generated, and that every ID segment requires 3 swap descriptors and 2 memory descriptors (4 MDs for CDS systems). These factors have been taken into account in the above table.

#### 4.11.2.5 Installation Considerations

Due to internal code growth within BOOTEK, boot command files that mount LU's containing a large number of global directories will cause FMP error -215 (too many directories). BOOTEK contains its own dedicated copy of D.RTR that is sized to 31 pages, while the regular run-time D.RTR is sized to 32. This difference is a result of the size restriction on BOOTEK as a whole. Since DSD4.0's D.RTR grew internally, there is less free memory used for open flags and global directories in BOOTEK's D.RTR, while the impact on the regular D.RTR is much less noticeable. The BOOTEK D.RTR will start having problems with about 46 global directories. When this happens, just mount fewer LU's from the boot file -- mount these LU's after boot-up.

\*VC1 now has a third parameter -- the name of the global directory where the RTE-A software resides. This is necessary so that the #CIXC and #CICDS load files can be modified to access files from both 92077(RTE-A) and 92078 (VC+) product directories. Please refer to the Virtual Code+ Installation Manual (92078-90001) for more information.

\*VC2 has been enhanced to link the RESTR program, which aids in restoring your VC+ system if you run out of SAM. For more information about the new RESTR, please see the RTE-A User's Manual (92077-90002), chapter 5.

Because new entry points were added to \$VCTR, programs linked on DSD4.0 systems cannot be transported back to any system of previous revisions. However, programs linked on pre-DSD4.0 systems can be transported to DSD4.0 systems.

Please make sure LINK's old catalog file is overlaid by the new catalog file, >LK000, on directory /Catalogs. If you have an old >LK000, an error FMP-401 may appear when you run LINK or certain LINK errors will be reported by number only and not decoded.

#### 4.11.3 Performance

Please refer to the RTE-A Performance Brief (part-number 5953-8753), available at your local sales office, for discussions about RTE-A's performance.

#### 4.11.4 Size Changes

As an aid for your software development efforts, we list here the size differences from the last update in operating system modules and system libraries. Dots are place-holders, meaning that the module does not exist at that update. The percentage difference reported on the last row of the table is the average percentage change of THOSE modules that have been changed. There is a summary following the table. The "#size difference" is the number of modules that existed in both A.85 and DSD4.0 and have changed in size. The "deletions" is the number of modules that existed in the A.85 column and not in DSD4.0, while "additions" is the number not in A.85 but in DSD4.0.

##### 4.11.4.1 Operating System Size Differences

| A.85        |        | DSD4.0      |        | Difference |       |
|-------------|--------|-------------|--------|------------|-------|

```

4.11.4.7 CI and CIX

At DSD4.0, CI's code has grown, leading to less free space for the command stack and user-defined variables. This may impact the user if many variables are defined and/or a very large command stack is needed and CI is sized to the minimum size. Therefore, CI should always be sized as large as possible for best performance. In addition, CIX's code has grown as well. Sizing the DSD4.0 CIX to the same size as A.85's will cause some file commands to run relatively slower. Sizing CIX larger will cause them to run faster. The

standard Link command files for CI and CIX have the largest sizes specified.

#### 4.11.5 File Name Changes

The following filenames have been changed in order to conform to the CI file system. This will require modifications to the user's answer file before generating version DSD4.0.

| Part #      | Old Name    | New Name      |
|-------------|-------------|---------------|
| -----       | -----       | -----         |
| 92077-16096 | 2441 %ID.43 | --> %ID*43    |
| 92077-16390 | 2540 %ID.01 | --> %ID*01    |
| 92077-16628 | 2536 %ID.27 | --> %ID*27    |
| 92077-16648 | 2402 %DD.24 | --> %DD*24    |
| 92077-16667 | 2540 %ID.50 | --> %ID*50    |
| 92077-16668 | 2540 %DD.33 | --> %DD*33    |
| 92077-16669 | 2540 %DD.30 | --> %DD*30    |
| 92077-16696 | 2540 %ID.37 | --> %ID*37    |
| 92077-16699 | 2540 %DD.00 | --> %DD*00    |
| 92077-16722 | 2441 %ID.36 | --> %ID*36    |
| 92077-16727 | 2441 %DD.20 | --> %DD*20    |
| 92077-16730 | 2441 %DD.23 | --> %DD*23    |
| 92077-16732 | 2441 %DD.36 | --> %DD*36    |
| 92077-16753 | 2441 %ID.52 | --> %ID*52    |
| 92077-16756 | 2540 %ID.00 | --> %ID*00    |
| 92077-16758 | 2441 %DD.12 | --> %DD*12    |
| 92077-17239 | 2440 #BIGLB | --> BIGLB.MRG |
| 92077-18073 | 2440 %BIGHD | --> &BIGLB    |
| 92078-17022 | 2440 *VC.1  | --> *VC1      |
| 92078-17024 | 2440 *VC.2  | --> *VC2      |
| 92078-17033 |             | --> BGCDS.MRG |

#### 4.11.6 Other Enhancements and Fixes

##### 4.11.6.1 AdvanceLink/1000

AdvanceLink's terminal emulation and file transfer capabilities for the Vectra, IBM PC, and the HP150 are now supported with the A-Series using a 12040B or 12040C multiplexer card. The personal computer must be connected to the multiplexer card with an RS-232 cable. The utility on the HP1000 side must be loaded as "/programs/monitor.run". The new system includes a help file called "monitor, a relocatable called %monitor and a load file called #monitor. Besides AdvanceLink's terminal emulation, files can be transferred from

MS-DOS to RTE and visa-versa. Notice that the AdvanceLink software MUST be purchased separately from Hewlett Packard. The only purpose of the monitor utility is to interact with AdvanceLink on the personal computer and transfer information to and from RTE-A.

#### 4.11.6.2 Future \$OPSY Values

The \$OPSY value did not change in this revision; it is still -53. However, we will change it in the future whenever we make extensive improvements to the operating system. The following information should be useful in helping you determine what \$OPSY might be used in the future on RTE-A and RTE-6. The planned values for RTE-A are -61, -125, -117, -101, and -109 (listed in order to be used). The planned future \$OPSY for RTE-6 is -25. Not all these numbers will necessarily be used; they will only be employed when new ones are needed. To make checking easier, the following ranges can be used to determine if the current operating system is RTE-6 or RTE-A:

RTE-6: -17 through -28  
RTE-A: -33 through -128

#### 4.11.6.3 LINK Warnings

There are two new warning messages, 140 and 141, that may be reported by LINK. Please refer to the LINK User's Manual (92077-90035) for an explanations of these.

#### 4.11.6.4 CDS VmaRead and VmaWrite

Before DSD4.0, a CDS VMA program could not use the CDS versions of FMP routines because the VMA routines (VmaRead and VmaWrite) were not themselves CDS, and non-CDS code cannot call CDS code. Thus, a user program's data space would be decreased by the amount VMA code. In this revision, we are supplying CDS versions of VmaRead and VmaWrite to help free up more DATA space for user programs. This is SR#2200010066.

#### 4.11.6.5 VMA Backing Store Files

Previously, backing store files that were created on the top FMGR cartridge would not be purged automatically. With DSD4.0, these files will be given names in the same format as if they were placed on the scratch cartridge, so that they will be automatically purged. This is SR#2200009050.

#### 4.11.6.6 Password Length

At DSD4.0, passwords will be restricted to 14 characters, shortened from 16, because LOGON does not process the 15th and 16th character

correctly. If a user tries to use 16 character passwords in DSD4.0, "Incorrect password" will be reported. Such passwords should be changed using the USERS program before the DSD4.0 system is brought up. This also affects programmatic logons. This is SR#2200017038.

#### 4.11.6.7 X.25

DDX00.REL is used for both the DVT and IFT statements in the answer file. However, due to a problem in the generator, using DDX00.REL in the DVT will cause generation errors. In order to avoid them, please remove the file name from the DVT statement. For example,

```
IFT,DDX00.REL,TX:1,EIDX00
DVT,,LU:60,TX:2,EIDX00
```

This is SR#2200032466 and it will be fixed in the next update.

### 4.11.7 Mirrored Image Driver

DSD4.0 RTE-A is incompatible with the Mirrored-Image portion (DDT33) of the Customized Engineering software product 93696T (Mirrored Image and Dual Port/Dual CPU Drivers). To obtain an updated version that is compatible with DSD4.0, please write to

Data Systems Division  
Hewlett Packard  
11000 Wolfe Road  
Cupertino, CA 95014-9974  
Attention: Lou Cortez

## 4.12 (92080A) Datacap/1000-II

The changes are all bug fixes. Please reinstall Datacap with the transfer file \*DATCA.

## 4.13 (92081A) Image/1000-II

### 4.13.1 New Files

Several new files have been added to the product: for example, command file examples of backup, logging and recovery. In addition, the name of the clean-up program has been changed from DEMON to DBCLN. Finally, a program called DBUPGRADE has been added to upgrade

Image-II rootfiles to Revision DSD4.0 format which allows databases to reside on CI volumes. For more information, please refer to the Image-II Reference Manual and the Image-II Database Management System: System Configuration Guide (92081-90003).

#### 4.13.2 Installation Changes

Image now requires the directory /CATALOGS for NLS (Native Language Support). Also, since the installation transfer files need MERGE, make sure MERGE is on /PROGRAMS or RP'ed before the transfer files are run.

#### 4.13.3 CI File System Enhancements

Prior to this revision, databases could only be on FMGR cartridges while all other Image files could be on CI volumes. For DSD4.0 we are introducing support of databases on CI volumes. Root file names can be up to 63 characters, while Data set names can be no longer than 6 characters, plus a four-character file extension. Utilities such as QUERY and DBUTL have been enhanced to follow CI conventions.

Note: On RTE-6, the CI directories must have read/write access for all users in order for IMAGE to function properly. This does not apply to RTE-A systems.

The following is just one easy way to upgrade your database into CI format.

1. Reload IMAGE-II.
2. Run DBUPGRADE on the root file with the root file residing on a FMGR disc LU.
3. Run DBUTL and re-enable the access for the database because the DBUPGRADE program disabled it when it performed the conversion.
4. Create a temporary CI directory on a volume large enough to accommodate the database.
5. Copy the database to this directory using the CI copy command.
6. Rename or dismount the FMGR LU that contains the old FMGR database.
7. Rename the temporary CI directory to the old FMGR CRN (cartridge reference number).
8. Run QUERY to check out the database on the new CI directory.
9. Reload ALL database application programs with the new IMAGE-II libraries.

Note: If all application programs are not reloaded, IMAGE error 138 may result from the DBOPN call when first trying to access the database. For another discussion on the DBUPGRADE procedure, please refer to the System Configuration Guide (92081-90003). For more information on DBUPGRADE, please refer to the

IMAGE/1000-II Reference manual, appendix H.

#### 4.13.4 Short\_Dbopen

To support databases on CI volumes, the DBOPN call causes additional routines to be loaded which results in a size increase of 2770 words. If this impacts the user, a workaround has been provided to reduce this size back to that of Revision A.85 by relocating the relocatable Short\_Dbopen.rel BEFORE the normal Image library. When using Short\_Dbopen.rel, the security code of the root file must be negative (that is, negate positive security codes). Otherwise, an error #117, incorrect security code, will be reported. Also, the full path name of the root file must be supplied in the DBOPN call. (This size increase only affects Image-II. Image-I does not support CI volumes.) For more information, please refer to the Image-II Reference Manual (92081-90001).

#### 4.13.5 Other Enhancements

Please refer to the IMAGE/1000-II Reference Manual (92081-90001) for more details of the items discussed here.

##### 4.13.5.1 QUERY

The "/" command allows you to display the commands which were entered during an interactive session. For security purposes, the level word will not appear in this command stack.

The following commands can be abbreviated.

- END (EN or E)
- EXIT (EX or E)
- FIND (F)
- FINDA (FA)
- REPORT (R)
- UPDATE REPLACE (U R)
- UPDATE DELETE (U D)
- UPDATE ADD (U A)

##### 4.13.5.2 FINDA

The FINDA command retrieves data entries from the database and appends the record addresses of the retrieved entries to the current select file. Before initiating this command, a FIND command should be executed.

#### 4.13.5.3 Wildcard Finds

When searching for a data item which consists of ASCII characters (type X data item), several values can be specified by using the wildcard characters "-" and "@".

#### 4.13.5.4 END

The END at the end of the FIND command is optional. You may now terminate this command string with just the semi-colon(;). This also applies to the new command FINDA. However, when using END in conjunction with the REPORT command it must be used in its complete form, i.e., END;.

#### 4.13.5.5 REPORT ALL Command

The REPORT ALL command now lets you specify the number of lines to skip between items of a data entry when printing. The default is single spacing. Also, in order to support printers with 512 columns, the print line length has been increased from 132 to 512 columns.

#### 4.13.5.6 Elimination of Quotes

Previously, item values were enclosed in quotes. At DSD4.0, the quotation marks are optional. However, when the item value contains commas, semi-colons, blanks or periods, it must be enclosed in quotes.

#### 4.13.5.7 DD\*24

IMAGE now supports the magnetic tape driver DD\*24 on RTE-A. This makes it possible for the 7974 and 7978 tape drives to use IMAGE utilities on RTE-A.

#### 4.13.5.8 Backup Format

The volume, file and data headers for the backup utilities have changed to accommodate new file names.

Old DBSTR tapes cannot be used by the new DBRST utility due to the change in the root file format. Therefore, it is recommended that the old DBSTR tape be restored using the DBRST of a corresponding revision on the existing system. Then convert the restored database into the new format by running DBUPGRADE. Create a new backup tape using the new DBSTR, after the new DSD4.0 IMAGE version is loaded.

If the operating system has already been converted into DSD4.0 and the new IMAGE version loaded on the system, restore the old DBSTR tape by using an old DBRST of the corresponding revision.

DBULD tapes from IMAGE/1000-I and II (including those tapes made from previous versions) are accepted by the new DBLOD.

## 4.14 (92084A) RTE-6/VM Operating System

### 4.14.1 Peripheral Support Changes

Support of the following peripherals has been added.

| Product | Description  |
|---------|--|
| -----   | -----  |
| 7907A   | 21 Mb/ 21Mb fixed/removable peripheral disc - interfaced via HP-IB(12821A)     |
| 7941A   | 24 Mb peripheral disc - interfaced via HP-IB(12821A)                           |
| 7942A   | 24 Mb peripheral disc with Cartridge tape drive - interfaced via HP-IB(12821A) |
| 7945A   | 55 Mb peripheral disc - interfaced via HP-IB(12821A)                           |
| 7946A   | 55 Mb peripheral disc with Cartridge tape drive - interfaced via HP-IB(12821A) |
| 2393A   | Monochrome graphics terminal - interfaced via the MUX(12792) and BACI(12966)   |
| 2397A   | Color graphics terminal - interfaced via the MUX(12792) and BACI(12966)        |
| 2686B   | Laserjet with more memory - interfaced via the MUX (12792)                     |
| Vectra  | Personal computer terminal - interfaced via the MUX(12792)                     |
| 7974A   | 800/1600 BPI Magnetic tape drive - interfaced via the HP-IB(12821A)            |
| 7440A   | 8-pin low-cost plotter - interfaced via the MUX(12792) and HP-IB(12821A)       |
| 2564A   | 600 LPM graphics printer - interfaced via the HP-IB(12821A)                    |
| 7550A   | Plotter - interfaced via the MUX(12792) and the HP-IB(12821A)                  |

For more details about these new devices and information on how to generate them into your system, please refer to the System Manager's Reference Manual (92084-90009) and the individual peripheral manuals.

The 7941A and 7945A are supported as "peripheral discs". Since these discs do not have a method of restoring primary operating systems to the disc media, they are not supported as "system discs". However, RTE-6/VM operating systems can be installed on the 7941A and 7945A by

using the utility SWITCH, and copying system files to the disc. The 7942A and 7946A are supported as "system discs". All four of these discs need the 12992J CS/80 loader ROM to boot.

The 7974A magnetic tape drive is now supported. !BCKOF has been enhanced to recognize this tape drive. In addition, a loader ROM and exerciser have been created. For more information, please refer to the Utility Programs Reference Manual (92084-90007).

#### 4.14.2 Generation Considerations

The following items affect your A.85 answer file.

%C6000 no longer exists and should be deleted from your answer file.

For the X.25 subsystem, make sure the table extent size for DVM00 is 33 words (X=33).

The line printer driver DVC12 has been modified to need no extents (X=0). Specifying a nonzero extent is not detrimental; it just wastes some words in memory.

#### 4.14.3 Installation Considerations

The installation transfer files have been improved in 4.0. They should provide the user an almost automatic installation of new software. The order of execution is important, however. You should start with the \*LODCI FMGR transfer file even if you generated CI and CIX into your system, which is recommended. Next, if you are using or plan to use the CI file system you will execute the CI transfer file \*INCI. This file will optionally schedule FMGR and execute the \*LOAD6 transfer file. You can also use the current (old) version of LINK and LINDX and \*INCI will make new ones for you. \*LODCI's main purpose is to create the SNAP file for LINK. Note: This SNAP file is only built once and requires you to anticipate the final location of the libraries referenced by the SNAP.

It is very IMPORTANT that you read and understand these transfer files before you start. Please pay attention to the assumptions of these files and follow the directions that are stated inside them.

#### 4.14.4 Size Changes

As an aid for your software development efforts, we list here the size differences from the last update in operating system modules and system libraries. Dots are place-holders, meaning that the module does not exist at that update. The percentage difference reported in

the last row of the table is the average percentage change of THOSE modules that have changed. There is a summary following the table. The "#size difference" is the number of modules that existed in both A.85 and DSD4.0 and have changed in size. The "deletions" is the number of modules that existed in the A.85 column and not in DSD4.0, while "additions" is the number not in A.85 but in DSD4.0.

4.14.4.1 Operating System Size Differences

\$6SYLB:

| A.85        |       | DSD4.0            |       | Difference |       |
|-------------|-------|-------------------|-------|------------|-------|
| Module Name | Size  | Module Name       | Size  | Words      | %     |
| EQTRQ       | 365   | EQTRQ             | 367   | 2          | 0%    |

|             | 1347   |             | 1348   | 1          | 0%    |

#size differences = 1  
 deletions = 0  
 additions = 0  
 total file size change = 1  
 total file % change = 0%

%DVB12:

| A.85        |       | DSD4.0      |       | Difference |       |
|-------------|-------|-------------|-------|------------|-------|
| Module Name | Size  | Module Name | Size  | Words      | %     |
| DVB12       | : 921 | --> DVB12   | : 934 | 13         | 1%    |
|             | ----- |             | ----- | -----      | ----- |
|             | 921   |             | 934   | 13         | 1%    |

#size differences = 1  
 deletions = 0  
 additions = 0  
 total file size change = 13  
 total file % change = 1%

%DVC12:

| A.85        |        | DSD4.0      |        | Difference |       |
|-------------|--------|-------------|--------|------------|-------|
| Module Name | Size   | Module Name | Size   | Words      | %     |
| DVC12       | : 1437 | --> DVC12   | : 1218 | -219       | -15%  |
|             | -----  |             | -----  | -----      | ----- |
|             | 1437   |             | 1218   | -219       | -15%  |

#size differences = 1  
 deletions = 0  
 additions = 0  
 total file size change = -219  
 total file % change = -15%

## Usage Considerations

%DVM33:

| A.85        |        | DSD4.0      |        | Difference |       |
|-------------|--------|-------------|--------|------------|-------|
| Module Name | Size   | Module Name | Size   | Words      | %     |
| DVM33       | : 1847 | --> DVM33   | : 1929 | 82         | 4%    |
|             | -----  |             | -----  | -----      | ----- |
|             | 1847   |             | 1929   | 82         | 4%    |

#size differences = 1  
 deletions = 0  
 additions = 0  
 total file size change = 82  
 total file % change = 4%

Note: In A.85, the code of DVM33 plus the subroutine code it pulls in totalled about two pages. In DSD4.0, the total of the two is much smaller (even though the code inside DVM33 grew slightly) so that the driver now fits comfortably into a 2-page partition.

%DVN00:

| A.85        |        | DSD4.0      |        | Difference |       |

### 4.14.4.5 CI and CIX

Please refer to "CI and CIX" in the RTE-A section.

### 4.14.5 File Name Changes

The following filename has been changed in order to conform to the CI file system.

| Part #      | Old Name    | New Name   |
|-------------|-------------|------------|
| -----       | -----       | -----      |
| 92084-16362 | 2540 %M.LIB | --> %M*LIB |

## 4.14.6 Other Enhancements

### 4.14.6.1 \$OPSY

Please refer to "Future \$OPSY Values" in the RTE-A section for a discussion about RTE-6's \$OPSY.

### 4.14.6.2 LINK

There are three new warning messages, 141, 142, and 143, that may be reported by LINK. Please refer to the LINK User's Manual (92084-90038) for an explanation of these.

### 4.14.6.3 RT6GN

The RTE-6 generator has been enhanced to allow it to build track map entries for stand-alone CTU's which use immediate reporting. Immediate reporting is required to allow streaming on these devices. In other words, the 9144 tape drive on the same HPIB as the system disc can perform streaming at DSD4.0. Please see the RTE-6/VM On-Line Generator Reference Manual (92084-90010) for details on CTU configuration.

## 4.15 (92836A) Fortran-77

The installation of FTN7X has been altered such that the compiler needs a new file called %FX000. Please see the installation guide file "FTN7X for all the details.

## 4.16 (92857A) Basic/1000C

### 4.16.1 Installation Changes

Two new relocatables, SAMA.REL and SAM6.REL are used by the Basic Interpreter at its load-time. The Pascal short-error handler (Pascal\_Error.rel) is used by the Basic Compiler utility BDAT on RTE-6 systems at its load-time. These files are now provided with the product.

### 4.16.2 Size Changes

The Basic Interpreter's editor (BASIC) is now a VMA program and can

load much larger user programs. As a result, a larger partition size (working set of 50 for optimum performance) is required for the editor.

## 4.17 (92860A) Symbolic Debug/1000

### 4.17.1 Installation Changes

This product is now shipped as merged relocatables DEBUGA.REL and DEBUG6.REL, and the file DEBUG.ISTL has been renamed to INSTALL.COMD. To install Debug:

1. Create a global directory /DEBUG and make it your working directory.
2. Restore the Debug software from the shipped media onto the /DEBUG directory.
3. From the CI prompt, enter

```
[tr,] install <os>
```

where <os> is replaced by A for RTE-A system or 6 for RTE-6. Example:

```
CI> install a
```

The install file contains the commands necessary to update /programs/debug.run, /programs/blddb.run, and /system/debug.err.

The install file will automatically OF DEBUG and BLDDDB in case previous versions are RP'ed, so the messages

```
NO SUCH PROG                (RTE-6)
No ID segment for this program... (RTE-A)
```

should be ignored.

## 4.18 (92861A) Graphics/1000-II DGL Version 2.0

Several peripheral handlers have been added to this product and they are documented in the updates to the Graphics/1000-II Version 2.0 Device Handlers Manual (92861-90003). The handlers added include HP2393 and HP2397 terminals, Laserjet and Laserjet Plus printers, HP26061A Vector Graphics PCA (for HP256X printers), and serial

plotter (the HP7440, HP7470, HP7475, HP7550, HP758X plotters) handlers, along with an HP-IB handler for the HP7440 plotter. Serial handlers are for the MUX card only. Configuration information is detailed in the respective handler sections of the Device Handlers Manual (part-number 92861-90003).

## 4.19 (92862A) Graphics/1000-II AGP Version 2.0

Please see the section for 92861A.

## 4.20 Miscellaneous

### 4.20.1 Source Recompile

For source/relocatable compatibility, all RTE-A and RTE-6/VM software have been recompiled with the latest compilers. Therefore, users linking these new relocatables should link with the latest versions of the RTE-A and RTE-6/VM libraries; otherwise, undefined external references will be reported.

In chapter 3, any relocatable with its revision number increased by one from A.85 to DSD4.0 means that this module has been changed only by recompilation. For example, 2440 becomes 2441.

### 4.20.2 RP List for Firmware

This section lists the RP's for the HP/1000 M-Series, HP/1000 E-Series and the HP/1000 F-Series, and specifies which RP's are operating system dependent. The following conventions have been chosen:

- ^ = Applies only to RTE-IVB and RTE-6/VM Operating Systems; it indicates that the specified RP does not need to be included in the Generation Answer File because it is part of the module RPLIB in the system library.
- + = Applies only to RTE-6/VM Operating System.
- = Applies only to RTE-IVB Operating System.

## Usage Considerations

Note that RTE-6/VM users now have transfer files that can be used during generation that contain this information. See the System Manager's Manual (92084-90010).

## 4.20.3 RP's for the HP/1000 M-Series

## Chapter 5

# Media Installation and Update Procedures

Customers on Support Services, AMS/RCS/SMS, will receive updates to software on paper tapes, mini-cartridges, mag tapes, flexible discs and/or CTDs, depending on the options they have ordered. This chapter contains information concerning the format of update/new media, and should be used in conjunction with your product's configuration/installation manuals when removing software from the media.

```
*****
*
*   Look at the media label and determine what format
*   is used. Then find the section in this chapter
*   which corresponds to the media format (sections
*   are organized by format). Follow the instructions
*   in that section to restore the files from the
*   media.
*
*****
```

### 5.1 General Information for Update Customers

1. *BACK UP YOUR DISC BEFORE PROCEEDING.*  
This will insure that you can always return to your original system and start over.
2. *VERIFY YOUR BACKUP COPY.*  
It is suggested that you make two copies and verify them both.
3. The typical procedure for updating your system is to replace the existing files on your system with the files supplied on the

media. You may, when it's possible, want to store the new file to disc on a different CRN or volume. Then, when you're sure it has transferred correctly, purge your old copy. This is just to ensure that you get a good copy of the new file before you destroy your old one.

After you have installed your software:

1. Generate your new system right away. If there have been any errors in the transfer process, they probably will be detected this way.
2. Check the revision codes of your software as they appear in the generation map against those listed in the software numbering catalog or file, and make sure you have not left out any modules.
3. Boot, initialize and use your newly generated system to make sure that it works correctly.
4. Make backup copies of your newly generated system. Use a new tape to backup your system. Keep the old copy until it's time to update once again, and then use it to backup the next 'new' system. This way you will keep at least two revisions backed-up by rotating your media.
5. Keep the update media together with your old backup media. If you discover problems later, you will always be able to get back to where you started and go through the installation procedure again.

**NOTE**

If Operating System software has not changed and there are no changes affecting your generation (e.g., generated-in libraries), then regeneration is not necessary and on-line reloading will be sufficient. Otherwise regeneration is necessary before reloading on-line.

## 5.2 Media Content

All the updates to the software for a product are distributed on the media requested by the customer. Depending on the product, there will be differences in what software is included on the media. The following table provides an overview of the different configurations possible with respect to update software content and format:

| Media Option       | Format                 | Operating Systems | Subsystems |
|--------------------|------------------------|-------------------|------------|
| 010 Paper Tape     | FMGR 'ST'              | (A)               | (A)        |
| 020 Mini-Cartridge | READR/SAVER            | (B)               | (B)        |
|                    | FMGR 'ST'              | (B)               | (B)        |
|                    | CI 'CO'                | -                 | (B)        |
| 022 CS/80 CTD      | FC                     | (C)               | (C)        |
|                    | TF                     | (C)               | (C)        |
|                    | VCP Bootable           | (C)               | (C)*       |
| 041 Floppy Disc    | Mountable<br>FMGR CRN  | (B)               | (B)        |
|                    | Mountable<br>CI volume | -                 | (B)        |
|                    |                        |                   |            |
| 042 Mini-Floppy    | Mountable<br>FMGR CRN  | (B)               | (B)        |
|                    | Mountable<br>CI volume | -                 | (B)        |
|                    |                        |                   |            |
| 044 Micro-Floppy   | Mountable<br>FMGR CRN  | (B)               | (B)        |
|                    | Mountable<br>CI volume | -                 | (B)        |
|                    |                        |                   |            |
| 050 Mag Tape 800   | READR/SAVER            | (C)               | (C)        |
|                    | FC                     | (C)               | (C)        |
|                    | FMGR 'ST'              | (C)               | (C)        |
|                    | TF                     | (C)               | (C)        |
| 051 Mag Tape 1600  | READR/SAVER            | (C)               | (C)        |
|                    | FC                     | (C)               | (C)        |
|                    | FMGR 'ST'              | (C)               | (C)        |
|                    | TF                     | (C)               | (C)        |

\* Restored Off-line

- (A) Only the files that have changed will be included on the media.
- (B) Each individual media part no. (i.e. one mini-cartridge, one disc, one mag tape) contains a certain subset of the files belonging to a product. If one or more of these files change, the entire media part containing that file or files will be shipped. For example, suppose the following media part numbers for a product contain the following files:

9xxxx-1xx01 - File A, File B, File C  
9xxxx-1xx02 - File D, File E  
9xxxx-1xx03 - File F, File G, File H

If file B, file F, and file H are updated, the customer receiving this option would receive the media part numbers 9xxxx-1xx01 and 9xxxx-1xx03. Notice that the customer would also get files A, C, and G even though these files haven't changed.

(C) All the files belonging to the product will be sent.

### 5.3 Media Installation Procedures

Software is stored on media in one of several formats. The above table shows the formats currently being used for different media types. Note that each physical media carries a label identifying the part number of the media, a description and a revision code.

On media with files to be restored to hard disc (e.g., all floppies; TF, FC, Saver, and FMGR 'ST' (store) tapes; and mini-cassettes) there is a file called "HPHPHP" which describes each of the software parts. Information provided for each part includes

Part number  
Software revision code  
Module number  
File type  
File name

All media (i.e., each tape, mini-cartridge, floppy, etc.), with a revision code after 2340 (all software updated at DSD4.0 is 2540 or greater) will have an HPHPHP file and a transfer file for getting the files off the media. The exception to this rule is diagnostics: they do not have the HPHPHP file.

The information in HPHPHP is helpful to the user who wants to know what files are on the medium. For example, if the medium was missing a software module that was listed in HPHPHP, the user would call his/her support office and request the missing software.

On each tape or mini-cartridge, HPHPHP is the first file. On floppies, HPHPHP is the first file appearing in the directory listing. The HPHPHP file has no part number. Diagnostics and

primary systems do not require an HPHPHP file.

## 5.4 'FC' Format for CS/80 CTD and Mag Tapes

Please consult with the Utilities Reference Manual (92077-90004 or 92084-90007) on how to use the 'FC' utility.

A CTD tape contains one or more products, each product being identified by a CRN (Graphics or other products may have more than one CRN). To find out if more than one CRN is on the tape, proceed as follows:

```
:ru,fc
FC:cl,-<lu>      where <lu> is the LU of the media
```

If only one CRN is on the tape do the following:

```
:ru,fc
FC:co,-<lu>{:xx},:yy,v
```

where      <lu> = is the LU of the CTD or mag tape drive  
             xx = CRN identifying the files for a given  
                   product on tape  
             yy = CRN on your disc.  
             v = verify

This will copy all the files from the tape with reference to CRN 'xx' onto the disc on CRN 'yy' and will verify each transfer. Files with duplicate names will not be copied and FMGR-002 errors will occur. Use the 'D' option if you want to replace the files that have duplicate names.

If more than one CRN is on the tape, use the FC group command as follows:

```
:ru,fc
FC:gr
FC:co,-<lu>{:x1},:y1,v
FC:co,-<lu>{:x2},:y2,v
.      .      .
.      .      .
.      .      .
FC:co,-<lu>{:xn},:yn,v
FC:eg
FC:ex
```

Commands to move CRNs from the tape to the destination disc cartridge. For example, co,-13{32754},:30,v moves CRN 32754 from the tape LU 13 to the disc CRN 30. Use a CO command for each CRN that is to be removed from the tape.

Where <lu> is the tape LU number, x1 through xn are the CRNs on the

tape that you wish to move to the disc, and y1 through yn are the destination CRNs or LUs to which the files will be stored.

## 5.5 'TF' Format for CS/80 CTD and Mag Tapes

Please consult with the Utilities Reference Manual (92077-90004 or 92084-90007) on how to use the 'TF' utility.

A CTD tape contains one or more products, each product being identified by a global directory. The HPHPHP file contains a list of all files on that tape. Here is an example on how to use 'TF':

```
CI> tf
TF: co,<lu>,,v
```

This would copy all files from the tape LU to your disc under the directory names that the files are stored on the tape.

The above is the preferred and less complicated way. However, if you want to selectively restore certain products, follow the directions below.

```
CI> tf
TF: co,<lu>{/global1/@},/global2/@,v
```

```
where    <lu>    = LU of the tape
         global1 = Global directory identifying the
                 files for a given product on the tape.
         global2 = Global directory on your system
         v      = verify
```

This will copy all the files from the tape with global directory /GLOBAL1 onto the disc on directory /GLOBAL2 and will verify each transfer. Files with duplicate names will not be copied and duplicate file errors will occur. To replace duplicate files, use the 'D' option.

## 5.6 READR/SAVER Format for Mini-Cassette and Mag Tapes

SAVER stores the software on to the tape file-by-file in a packed format. The tape can only be read using the READR utility; refer to the READR/SAVER Utility Reference Manual (92068-90016) for detailed information on how to update your files. The recommended procedure is to use the UPDATE function of READR to replace existing files on

the system with new files from tape.

With this update there are four library files for RTE-6/VM which cannot fit on a single mini-cartridge. The files each have been split into two parts. The files and their parts are

|           |     |                      |
|-----------|-----|----------------------|
| The file: | ... | has been split into: |
| \$TFLIB   | --- | \$TFLB1, \$TFLB2     |
| \$FMP6    | --- | \$FMP6X, \$FMP6Y     |
| \$FMP6C   | --- | \$FMP6CX, \$FMP6CY   |
| \$BMPG2   | --- | \$BMP2X, \$BMP2Y     |

It will be necessary for customers receiving updates in this format to use the MERGE utility (refer to the RTE-6/VM Utilities Reference Manual (92084-90007)) to merge the pieces back into the original libraries.

To restore files from a READR/SAVER mini-cartridge, use the following procedure:

|                        |                         |
|------------------------|-------------------------|
| <u>:ru,readr</u>       | ( run READR )           |
| Command? <u>mt,n1</u>  | ( n1 = source tape LU ) |
| Command? <u>oc,-n2</u> | ( n2 = destination LU ) |
| Command? <u>a1</u>     | ( restore all files )   |
| Command? <u>/e</u>     | ( exit READR )          |

READR may have to be resized if there are more files on the tape than READR can store in its program space.

## 5.7 FMGR ST Format for Mini-Cartridge and Mag Tapes

Usually, three or more files are stored on a tape. The first file is the HPHPHP file. The second file is a transfer file used to restore all the files from the medium. All the files, including the transfer file, are stored on tape in ST-format in the order in which they appear in the transfer file.

The following two procedures will restore the software from ST-formatted media.

- A. To restore files from a ST-formatted tape when there is an HPHPHP file as the first file and a FMGR transfer file as the second file, use the following procedure:

1. You can store the first file on the media, giving it the name HPHPHP, or you can skip the first file on the media.

Use the following command to store the first file on <lu>:

```
:st,<tapelu>,hphp:--<lu>
```

Or alternatively, use the following command to skip the first file:

```
:cn,<tapelu>,ff
```

2. Restore the transfer file from <tapelu> to <lu>:

```
:st,<tapelu>,<transfile>:--<lu>
```

3. List and review the transfer file to check all the values needed for the global variables used in the next step.

```
:li,<transfile>:--<lu>
```

4. Transfer control to the transfer file.

```
:tr,<transfile>:--<lu>,1G,2G,3G,4G
```

where 1G -- is the LU of the tape from which you are copying.  
 2G -- is the CRN or -LU to which you are copying.  
 3G -- is the optional security code to be put on files.  
 4G -- is the PURGE option to delete the files already on the LU to which you are copying.

- B. If the second file on the tape is not a FMGR restore transfer file, you need to use this method. Store down the directory file or first file on the tape. Modify the first file so as to store the files individually onto disc with FMGR ST commands, giving the disc files the file names specified in a directory file. When creating the disc files, use the file type according to the type given in the directory file. Also, it's recommended that a file size of -1 be specified so FMGR can make the file as big as it needs.

For example:

| Directory Entry | FMGR Command                         |
|-----------------|--------------------------------------|
| -----           | -----                                |
| FILEA S         | : <u>st,5,filea:rt:32767::</u> -1,as |
| FILEB B         | : <u>st,5,fileb:rt:32767::</u> -1,br |
| FILEC A         | : <u>st,5,filec:rt:32767::</u> -1,ba |
| FILED D         | : <u>st,5,filed:rt:32767::</u> -1,bn |

Remember, when restoring files from the tape, either purge the existing copy of the file before restoring the new one to disc, or store the file to a different CRN and purge the old file after the transfer is successful.

## 5.8 CI CO Format for Mini-Cartridge and Mag Tapes

To restore files from tapes in CI COpy format, use the following procedure:

1. You can either copy the first file from the media or skip the first file.

Use the following command to copy the first file from your media LU, giving it the name HPHPHP:

```
CI> co <lu> hphp
```

Or alternatively, use the following command to skip the first file on your media:

```
CI> cn <lu> ff
```

2. Copy the transfer file from the media to hard disc.

```
CI> co <lu> <transfile>
```

3. List and review the transfer file to check all the values needed for the global variables used in the next step.

```
CI> li <transfile>
```

4. Transfer control to the transfer file to restore the remaining files to the hard disc.

```
CI> tr <transfile> $1 $2 $3 $4
```

where \$1 = the LU of your media (same as the LU in step 1 above)  
 \$2 = the new file system LU to create the global directory

- used in conjunction with CRDIR command
- \$3 = destination CRN or -LU (if files are to be restored on FMGR CRNs rather than a CI volume)
- \$4 = security code (if files are to be restored on FMGR CRNs rather than a CI volume)

## 5.9 Floppies in FMGR Format

If you have CI on your system, please do the following:

1. Mount the drive while in FMGR.

```
CI> fmgr
:mc,<lu>
:ex
```

2. Copy the software to your CI volume. Note that you should use the 'D' option in the CO command if you are replacing files.

```
CI> co @:--<lu> @:--<dest crn> d
```

where <lu> is the LU of the drive and <dest crn> is your FMGR CRN or -LU.

3. Dismount the drive.

```
CI> dc,<lu>
```

Note that you can mount FMGR CRNs in FMGR and can dismount them in CI.

If you do not have CI on your system, please follow the procedure below:

1. Insert the floppy containing the software into the drive and mount the drive.

```
:mc,<lu>
```

2. List the transfer file FLPRST.

```
:li,flprst:--<lu>
```

Note the use of the four global parameters in FLPRST. Global parameters 1G (LU as in steps 1 and 2 above) and 2G (destination LU) are required. Global parameters 3G (security

code) and 4G (PURGE existing files of the same name) are optional.

3. Transfer control to file FLPRST.

```
:tr,flprst,-<lu>,<dest crn>[,sc,PURGE]
```

<lu> is the LU number of the source LU, and <dest crn> is the destination CRN or -LU. If you want the files being copied to <dest crn> to have a security code, specify a value for optional parameter SC. If you want a file on the floppy to overwrite a file by the same name that already exists on <dest crn>, include the word PURGE for the optional fourth parameter. (Note that the brackets indicate optional parameters.)

If a duplicate file exists on <dest crn> and the purge option was not used, you will get a FMGR -002 error. If you want to avoid this error, use the purge option. Otherwise, when you get the error, enter:

```
:tr
```

This will continue execution of the transfer file but will not replace the duplicate file on <dest crn>.

4. Dismount the drive.

```
:dc,-<lu>,rr
```

5. Repeat steps 1 through 4 for all floppies containing the software you are installing.

## 5.10 Floppies in CI Format

On CI formatted floppies, /F/RESTORE\_FLOPPY, a CI transfer file will restore the software to the hard disc. In addition, almost all CI formatted floppies have /F as the only global directory. This means that if you are supposed to be sent a file /PASCAL/PASCAL.LIB, you will instead be sent /F/PASCAL/PASCAL.LIB. All directories are subordinated to /F to allow the CI transfer file, RESTORE\_FLOPPY to put files in the correct directory without having a duplicate directory error. Note, however, that files on the hard disc will not have the /F global directory.

Restore software from a CI formatted floppy using the following procedure:

1. Make sure the directory /F does not already exist on any CI mounted volume. Verify this by entering:

```
CI> dl /
```

If a /F directory exists, rename the directory. The floppy has a /F global directory and if a /F directory already exists and is mounted before the user mounts his new floppy, CI will issue the following message and the contents of the floppy will be inaccessible:

Duplicate Directory /F

2. Insert the floppy containing the software into the drive and mount the drive.

```
CI> mc <lu>
```

3. List file RESTORE\_FLOPPY.

```
CI> li /f/restore floppy
```

RESTORE\_FLOPPY contains the commands to create directories and copy the software modules from the floppy to the hard disc. When listing the file, note the use of variable parameter \$1. You will supply a value for this parameter when transferring control to RESTORE\_FLOPPY. Also, note the file names used in the CO (copy) commands. When you transfer control to RESTORE\_FLOPPY, a file being copied from the floppy will overwrite a file on the hard disc that has the same name and destination path. If you want to save the file currently residing on the hard disc, either rename the file or copy the file to the removable media before transferring control to RESTORE\_FLOPPY.

4. Transfer control to file RESTORE\_FLOPPY.

```
CI> tr /f/restore floppy <lu>
```

Where <lu> at the end of the command indicates the LU where you would like to create the new global directories.

RESTORE\_FLOPPY contains CRDIR (create directory) commands. When a CRDIR command is executed and the directory already exists, a duplicate directory error message is issued and execution of RESTORE\_FLOPPY continues with the next command in the file. You can ignore the error message.

5. Dismount the drive.

CI> dc <lu>

6. Repeat steps 2 through 5 until you have copied all files from the floppies.

The rationale for the /F scheme is as follows. Suppose a floppy is sent without the /F directory and the top directory is called /PASCAL. Now the user wants to restore the floppy to disc. The destination directory can not be called /PASCAL because only one /PASCAL can exist at one time. So, the user will have to call the destination directory something else. The /F scheme will prevent this problem.

## 5.11 VCP Bootable Format for CS/80 CTD

"VCP Bootable" means that these files are loaded directly from tape into memory, then executed by following the instructions in the appropriate diagnostic manual. The CTD media update in this format replaces the older version of the media. Refer to the appropriate Diagnostic Manual.

## 5.12 Paper Tape

A single file is stored on the tape in FMGR 'ST' format. The file type of this file must be determined from the specific Software Numbering Catalog, Configuration Guide or Reference Manual for the product. The file is restored by using the FMGR 'ST' command (ex. :ST,4,FILEA:RT:32767::-1,BR).

## 5.13 Customized Update Tapes

### 5.13.1 TF Format for RTE-A and RTE-6

All Customized Update tapes for RTE-A and RTE-6 are now in TF format. Some products that were previously sent out in FC or are in FC format on other options will be shipped out in TF format on Customized Update tapes.

The following products are currently shipped out in various

Customized Update tapes:

| DIRECTORIES      | PROD.NAME          | PROD.NUMBER | STANDARD FMT |
|------------------|--------------------|-------------|--------------|
| -----            | -----              | -----       | -----        |
| /VIS/            | VIS for RTE-6/VM   | 12928A      | FC           |
| /D-LINK/         | Datalink           | 91732A      | FC           |
| /D-SAFE/         | Datasafe           | 91745A      | FC           |
| /D-SHARE/        | Datashare          | 91747A      | FC           |
| /DS/             | DS/1000            | 91750A      | FC           |
| /X.25/           | X.25               | 91751A      | TF           |
| /X.25_Srcs/      | X.25 Sources       | 91751X      | TF           |
| /RJE/            | RJE/1000           | 91781A      | TF           |
| /MRJE/           | MRJE/1000          | 91782A      | TF           |
| /PMF/            | PMF/1000           | 91784A      | TF           |
| /CONTROL/        | Control/1000       | 91823A      | FC           |
| /LAN/            | LAN/1000           | 12076A      | TF           |
| /A700_MICROPROG/ | Microprog for A700 | 92045A      | FC           |
| /A900_MICROPROG/ | Microprog for A900 | 92049A      | TF           |
| /D-PAIR/         | Datapair/1000      | 92050A      | TF           |
| /IMAGE1/         | Image/1000 I       | 92069A      | FC           |
| /RTE_A/          | RTE-A              | 92077A      | TF           |
| /VCPLUS/         | VCPlus             | 92078A      | TF           |
| /VCPLUS_SRCs/    | VCPlus Sources     | 92078X      | TF           |
| /D-CAP/          | Datacap/1000       | 92080A      | FC           |
| /IMAGE2/         | Image/1000 II      | 92081A      | TF           |
| /RTE-6/          | RTE-6 VM/OS        | 92084A      | TF           |
| /HPSPICE/        | HP Spice           | 92091A      | FC           |
| /PC-LINK/        | PC-Link/1000       | 92140A      | FC           |
| /Pascal/         | Pascal/1000        | 92833A      | TF           |
| /SIGNAL/         | Signal/1000        | 92835A      | FC           |
| /FTN7X/          | Fortran 77         | 92836A      | FC           |
| /DGL/            | DGL/1000           | 92841A      | FC           |
| /AGP/            | AGP/1000           | 92842A      | FC           |
| /DGL-SKEL/       | DGL-Skel           | 92843X      | FC           |
| /BASIC/          | Basic/1000-C       | 92857A      | TF           |
| /DEBUG/          | Symbolic Debug     | 92860A      | TF           |
| /GRAPHICSV2/     | DGL/1000 V2        | 92861A      | TF           |
| /GRAPHICSV2/     | AGP/1000 V2        | 92862A      | TF           |
| /PCIF/           | PCIF/1000 #1       | 94200B      | TF           |
| /PCIF/           | PCIF/Get Start #2  | 94200B      | TF           |
| /PCIF/AB/        | PCIF/AB Handler    | 94202A      | TF           |
| /PCIF/GM/        | PCIF/GM Handler    | 94203A      | TF           |
| /PCIF/SIEMENS/   | PCIF/Siemens Hndlr | 94204A      | TF           |
| /Forms/          | Forms/1000A        | 94250A      | TF           |
| /F1000/          | Forms/1000B        | 94250B      | TF           |

There are two methods for restoring the contents of the customized update tape to the hard disc:

1. The first method is to use TF to copy the entire tape to the

CI directories. Then copy the products that have FC as a standard format to a FMGR cartridge and purge the CI directory that was associated with it. This method is used if your system has a CI volume with enough space to contain all the files on the customized update tape.

```
CI> tf
TF: co <lu> ,, v (Copy tape to specified directories)
TF: ex
CI> co /Directory/ ::crnl p (One CO command for each product whose
standard format is FC)
```

For example, suppose Pascal, DataLink, Fortran 77, and Image-II are all on a single customized update tape. You would enter the following command sequence:

```
CI> tf
TF: co 9 ,, v (Copy the entire tape to a CI volume)
TF: ex
CI> co /ftn7x/ ::F7 p (Copy the contents of /FTN7X to cartridge F7
and purge directory /FTN7X)
CI> pu /ftn7x
CI> co /d-link/ ::D2 p (Copy the contents of /D-LINK to cartridge D2
and purge /D-LINK)
CI> pu /d-link
```

In this example, LU 9 is the LU of the tape drive on which the customized update tape is mounted. Cartridges F7 and D2 must exist on your system. Also, by defaulting the destination parameter in the TF CO command, Pascal and Image-II are copied to directories /PASCAL and /IMAGE2 respectively.

2. The second method is to enter TF and use the group copy command to copy all the products directly to the disc. This method is used if your system does not have a CI volume with enough space to contain all the files on the customized update tape.

Enter one TF CO command for each product in the customized update tape. All products whose standard format is FC are copied directly from the tape to a FMGR cartridge and all products whose standard format is TF are copied directly to a CI volume.

```
CI> tf
TF: gr
TF: co <lu>{/Directory/} ::crnl v (One TF CO command for each product
whose standard format is FC)
.
.
.
TF: co <lu>{/Directory/} ,, v (One TF CO command for each product
whose standard format is TF)
```

```

.
.
TF: eg
TF: ex

```

For example, suppose Pascal, DataLink, Fortran 77, and Image-II are all on a single customized update tape. You would use the following command sequence:

```

CI> tf
TF: gr
TF: co 9{/Pascal/},,v           (Copy Pascal to directory /PASCAL)
TF: co 9{/Image2/},,v          (Copy Image II to directory /Image2)
TF: co 9{/Ftn7x/},:F7,v        (Copy Fortran 7X to cartridge F7)
TF: co 9{/D-Link/},:D2,v      (Copy D-Link to cartridge D2)
TF: eg
TF: ex

```

In this example, LU 9 is the LU of the tape drive on which the customized update tape is mounted. Cartridges F7 and D2 must exist on your system.

As you can see from method 2 above, you can copy down products selectively if you do not have enough disc space or for some other reason.

### 5.13.2 FC Format for RTE-IVB and RTE-XL

Each customized tape may contain files from one or more CRNs. In order to remove these, do the following:

```

:RU,FC
FC: CL,-xx           Command to list CRNs stored on FC
                        tape, where xx is the source tape lu
                        (e.g. CL,-13 if CS80 tape lu is 13).

FC: GR
FC: CO,-xx{: :nnnn},dddd,VF Commands to move CRNs from tape
. . . . . to destination disc cartridge.
. . . . . (e.g. CO,-13{: :32754},30,VF
. . . . . moves CRN 32754 from tape to
. . . . . disc CRN 30). Use a CO command
FC: CO,-xx{: :nnnn},dddd,VF for each CRN that is to be
FC: EG                 removed from tape.

```

Where "nnnnn" is the CRN on tape that you wish to move to disc, and "dddd" is the destination disc CRN or LU onto which the information will be stored (refer to the Utilities Manual (92077-90004 or 92084-90007)) for more information on FC.

The following products are currently shipped out in various Customized Update tapes:

| CRN     | PROD.NAME      | PROD.NUMBER | STANDARD FMT |
|---------|----------------|-------------|--------------|
| -----   | -----          | -----       | -----        |
| ::32754 | RTE-IVB OS     | 92068A      | FC           |
| ::32699 | RTE-L MASTER   | 92070A      | FC           |
| ::32758 | RTE-LX MASTER  | 92071A      | FC           |
| ::32758 | RTE-LX SOURCES | 92071X      | FC           |
| ::32757 | IMAGE-L        | 92073A      | FC           |

## 5.14 Additional Formats

For media in other formats such as ASAVE, PUSHBUTTON SAVE, LSAVE, and READT/WRITT, refer to the appropriate utilities manual and/or installation guide.

Note that some subsystem software may have a transfer file or other means of restoring files from media. See the appropriate configuration guide or reference manual for specific information.
