Chapter 1
Introduction

This introductory chapter is a brief explanation of the content and format of the Communicator/1000. At the 6.0 release, a version of the Communicator/1000 has also been provided online in directory /HP1000_INFO/COMMUNICATOR60.LST. The new grep utility can be used to search the Communicator/1000 for keywords. It can also be printed to any line printer.

1.1 Purpose of the Communicator/1000 and how to use it.

The Communicator/1000 accompanies software and/or manual updates. It is designed to be a reference document to describe product changes and to give general considerations on how to incorporate these changes in the system.

The Communicator/1000 performs basically three functions:

1) Reports the *changes* that have occurred *within* a product for both maintenance and enhancements (Chapter 2).

If the change is in response to a Service Request, this is noted. The descriptions are meant to be a quick overview to give the user a condensed look at the changes. More specific information must be obtained from the particular product's updated manuals.

When changes made to a product affect the generation, loading, or installation of that product, mention is made in Chapter 4. Major usage changes are also mentioned in Chapter 4. Again, for specific instructions you should refer to the appropriate manual.

2) Lists the *Current Revision Codes, Updated Media* and *Manual Part Numbers* for current products (Chapter 3). This chapter indicates:

- the current revision codes for the software modules and firmware belonging to a product,
- the software media part numbers that are being shipped in this update cycle; these media will contain the updated software for a particular product,
- the part numbers of the manuals that are being updated in this update cycle.

Chapter 3 is not intended to replace the Software Numbering Catalog or Software Numbering File for each product, but rather it is intended to be a quick reference source for revision codes and a help in determining what media and manuals will be received by a customer for a particular product.

3) Characterizes the different *media formats* sent to a customer, along with a brief explanation of the *Software Update Procedures* associated with each media (Chapter 5).

All software media can be read by HP-supported utilities which are described in various manuals. The user is directed to the appropriate reference manual for more specific instructions.

How to use the Communicator/1000:

The following are some suggestions to help you use the Communicator/1000 as a reference:

- When you receive the Communicator/1000, check Chapter 1 for any changes that might have occurred in the Communicator/1000 format and could affect how you will use it.

- Depending on the products for which you have a subscription service and the media you have chosen, you will receive a set of software and/or and manuals. If you are unfamiliar with the media you have received, check Chapter 5 for a description of the media format and suggestions for update procedures.

- Before you regenerate your system or load any software on-line, be sure to look through Chapter 4 to see if there have been any changes to load or generation procedures.

- Chapter 3 can be used to resolve any confusion concerning what software or manuals you should have received. Any software files or manuals that have been deleted from or added to the product will be highlighted there.

- Chapter 2, along with the updates you receive for your manuals, describes the corrections and enhancements made in this update cycle.

- Appendix A is provided to assist you in upgrading your current 5.2 or 5.27 RTE-A system to a new 6.0 system.

- Appendix B is provided to assist you in upgrading your current 5.2 or 5.27 RTE-6/VM system to a new 6.0 system.

- Appendix C is a copy of the RTE-A primary answer file, PRIMARY.ANS. It is provided for reference purposes only.

NOTE

The Communicator/1000 is only a quick reference document for an update cycle and is not intended to supersede the product manuals. Refer to the product manuals for the precise information on how to use the product.

1.2 Naming and Revision Code Convention

The 5.24 release of NS-ARPA/1000 introduced a new revision numbering scheme. In the past, a revision 5.2 module contained the four-digit code of 5020, where the zero between the 5 and the 2 acted as a placeholder for the period. The next interim release based on the 5.2 minor release would contain the revision code 5021, and so forth.

For the purpose of coordinating the revision numbers of released code and patched code, the numbering scheme now uses all four digits of the revision code. The naming convention is as follows:

W.XYZ where:
- W corresponds to a major operating system release
- X corresponds to a minor operating system or subsystem release
- Y corresponds to an interim release
- Z corresponds to a patch release

This naming convention will be used in all references to a particular cycle. This current update cycle is 6.0, that is, a major operating system release.

Note that in certain literature, such as the Software Status Bulletin (SSB), the '.' is omitted, and the naming convention looks like 'revision 6000'. The zero is no longer a place holder for the period.

As in the past, the software in an update shipment may be of different revision codes. The revision code of a software module or product indicates the update cycle in which that software module or product was last updated. For example, a 6.0 update shipment may contain Graphics software with revision code 6000, Image software with revision code 5000, RTE-A modules with revision code 6000 and revision 5270, etc.

1.3 Revision Code History

The following is a history of the releases of RTE-A and their corresponding revision codes. In addition, there is a description included for the interim releases since 5.2.

RTE-A Release	Revision Code	Comments
C.83	2340	
A.84	2401	
A.85	2440	
4.0	2540	
4.1	4010	
5.0	5000	
5.1	5010	
5.2	5020	
5.21	5021	Original SCSI Release
5.22	5022	SCSI Update
5.23	5023	SCSI Update
5.24	5240	NS-ARPA/1000 Release
5.25	5250	SCSI Boot Release
5.26	5260	C/1000 Release with Debug/1000
5.27	5270	A990 Support, Misc. Enhancements
6.0	6000	HP 1000 Release

Chapter 2
Description of Software Changes

This chapter describes the reasons behind the software changes in this update. Changes that were initiated by Service Requests filed are listed with their SR numbers.

The entries are categorized into three types: Problem/Solution, Enhancement, and Note. A Problem/Solution entry describes a problem along with the actions taken by Hewlett-Packard to fix it. An Enhancement entry similarly describes a modification to software that improves its utility or simplicity of usage. Finally, a Note contains useful information about a change that may impact the user but is not directly related to a software fix or enhancement.

The products are sorted by their part numbers. For each product, the entries are grouped by their affected functional area (if applicable). For example, RTE-A has "Bootex" entries first, followed by those of "Build". Under each functional area, the entries are further grouped by Problem/Solution, Enhancements, then Notes, where the SR numbers are sorted numerically. Please see the SR Index for a numerical list of ALL the SR numbers. We hope that this format will make the Communicator much easier to use.

For more information on individual filenames that have changed, please refer to chapter 3.

2.1 (24612B) A-Series System and Peripheral Diagnostics

2.1.1 SCSI

SR# 5003078972

PROBLEM: The install_diags.cmd command file does not work to create a bootable 24612A SCSI DDS diagnostic tape.

The tape is built successfully, but when booted, it hangs.

SOLUTION: This problem has been fixed at the 6.0 release.

2.1.2 VSCSI

SR# 1653006395

ENHANCEMENT: A SCSI diagnostic has been added to the 92077A/24398B products, !VSCSI. It includes functions similar to those available for testing CS/80 devices using EXER.

This is needed so mass storage devices can be tested and can have the ability to spare bad blocks when connected to the HP 1000 via the 12016A SCSI interface.

2.2 (91750A) DS/1000-IV

2.2.1 INSTALLATION

SR# 5003004440

PROBLEM: The file *LDDS used /DS as root directory for DS/1000-IV relocatables. However, the product tape puts DS/1000-IV relocatables on /DS1000.

SOLUTION: The file *LDDS was changed so the default root directory for DS/1000-IV relocatables is /DS1000.

SR# NONE

ENHANCEMENT: DSVCP has been added to DS/1000-IV program loads. Also, DSRTR and TRFAS have been changed to load with SZ:+1.

2.2.2 PROGL

SR# 5000179465

PROBLEM: PROGL leaves files open. If PROGL is linked with a user-written version of the subroutine #DNFL and it is servicing multiple download requests with the same file number and different system files, it will only close the last file.

SOLUTION: PROGL has been modified to check file names instead of file numbers to determine if the system file should be closed on completion of a download.

2.2.3 REMAT

SR# NONE

PROBLEM: The IO and PL commands in REMAT would send output to the system console instead of the terminal REMAT was being executed from.

SOLUTION: REMAT has been modified to check the LU of the terminal where REMAT was executing and send this information to APLDR.

2.2.4 X.25

SR# NONE

PROBLEM: The mask used by the DS customizing subroutine, CSV66/CXL66, to clear the device type in the EQT/DVT was incorrect. The device type is cleared so that it can be set to 66b for DS use.

SOLUTION: The mask value has been corrected.

2.3 (91751A) DSN/X.25 1000

2.3.1 DSN/X.25

SR# NONE

PROBLEM: Due to the faster speed of the A990, the LAP-B Card configuration read-back completes with a device status error (card needs configuration data) when executed just after the downloading of configuration data.

SOLUTION: The DD*60 driver has been fixed to provide a 20 ms delay; this allows the downloading of the card configuration to complete properly.

SR# NONE

PROBLEM: PAD terminal status bits are not always set properly at linkup time.

SOLUTION: At 6.0, all PAD terminal status bits are set upon linkup indication.

SR# NONE

PROBLEM: If X.25/1000 is configured with more VC numbers than the network port, the recovery procedure fails. If XNET sends a Call on a VC not configured on the network, the DS connect request times out before the recovery procedure completes. Then DS sends a second connect request which causes a second VC table to be allocated to this EQT table, ending up with two VC tables linked to the same EQT table. The first VC is still waiting for a Clear Conf. The Clear on this VC is retried and, after a total of 6 minutes (2 X 3 minutes), a LinkDown indication is sent on this LU, causing the activities on the second VC to be disrupted.

SOLUTION: At 6.0, VC allocation is allowed only if the VC is in state P1.

SR# NONE

ENHANCEMENT: Program portability has been improved. The three words of the #X25A table have been moved into VCTR, and #X25A.REL is no longer relocated during the generation. Also, module /X25/REL/#X25A.REL,which is no longer used, has been deleted.

2.4 (91781A) RJE/1000-II

2.4.1 Structure Changes

SR# NONE

NOTE: Routine Pas.A1SharedSize has been modified to reflect ID segment changes at 6.0. Libraries PASCAL.LIB, PASCAL_CDS.LIB, and PASCAL_FMGR.LIB are affected by this change.

PLEASE NOTE that although IMAGE-II (92081A) and RJE-II (91781A) have been updated to have the Pascal libraries deleted from their product, updates for RJE-II and IMAGE-II will not be sent out at 6.0. Since the only change to these products is this deletion and the correct version of these libraries are sent out (and installed by) the Operating System, we felt that sending an "update" would just cause confusion.

2.5 (91790A) NS-ARPA/1000

2.5.1 BSD IPC

SR# 4701113423

PROBLEM: INPRO aborts with an SR violation error when more than three connection requests are queued for a BSD IPC server program. This will cause the NS-ARPA subsystem to lock up. If the LAN card continues to receive packets, SAM can fill up as well. The system must be rebooted to recover.

When a connection request is received and there are already three connection requests queued on a BSD IPC call socket, the call socket does not have sufficient memory to store the information from the fourth connection request. When this happens, Sigmod.IPCConnInd returns without calling DS_LeaveCritical. The next call to DS_EnterCritical causes the SR violation error.

SOLUTION: If three connect requests are already queued on a BSD IPC call socket, then new connect requests are ignored. The remote TCP will reissue the connect request when no acknowledgement is received.

SR# 5003030312

PROBLEM: The Fortran, C, and Pascal versions of the BSD IPC example programs use different methods to pass data back and forth. The C server example does not match the example in the BSD IPC manual.

SOLUTION: The examples have been rewritten to ensure all three versions (C, Pascal, Fortran) are using the same logic to accomplish one common goal.

2.5.2 DSCOPY

SR# 5003008466

PROBLEM: When a programmatic DSCOPY is run in the system session and a

user session is logged onto the system console, DSCOPY may become buffer limit suspended on LU 1. This occurs even though the LL option is set to a file and the SI option is specified.

SOLUTION: DSCOPY will now close the output file only if the output device is non-interactive.

SR# NONE

PROBLEM: DSCOPY of a multiple file mask produces the wrong filenames if the destination files exist.
SOLUTION: DSCOPY has beenmodified to use the correct filedescriptors.

SR# NONE

ENHANCEMENT: Symbolic links are a new feature at the 6.0 release. DSCOPY will now support symbolic links.

2.5.3 DSMOD

SR# 1653033076

PROBLEM: DSMOD's CN command does not work when used in a transfer file. The error message displayed is "/DSMOD: NODE SPEC. ERROR!".

SOLUTION: The error has been corrected. This fix will be included in the 6.0 release.

2.5.4 FMTRC

SR# 2200047969

ENHANCEMENT: Presently, tracing is only available in octal output. FMTRC has been enhanced to output the trace records in octal, hexadecimal, or NICE format. The NICE format will parse some of the protocols such as TCP and IP into the component fields.

2.5.5 FTP

SR# 1650165365

PROBLEM: An FTP to a VAX running FUSION hangs with both client and server in receive state when verbose is off and an open is done.

SOLUTION: FTP has been modified to correctly parse multiple replies.

SR# 4701067074

PROBLEM: FTP binary get of a FMGR type 1 file does not transfer extents.

SOLUTION: FTPSV and FTP have been modified to call FmpSize for FMGR files.

SR# 4701162040

PROBLEM: BINARY type 6 file transfers do not work between 6.0 and non-6.0 or non-RTE systems.

SOLUTION: Both the source and destination files are now forced to be type 1, thus removing the extents.

SR# NONE

PROBLEM: FTP.HELP does not include the -T option in the runstring.

SOLUTION: This has been fixed in the 6.0 release.

SR# 4701053660

ENHANCEMENT: The HP 1000 FTP server reports the file descriptor of the file being transferred in the 150 server reply to mget/mput.

SR# 4701062877

ENHANCEMENT: The 5.24 FTP does not calculate the file length for a type 2 file and requires that it be specified in the file descriptor. FTP will now calculate the size of type 1, 2, or 6 files from the number of bytes transferred. 6.0 to 6.0 file transfers will also transfer the size.

SR# 5000640045

ENHANCEMENT: FTP has been modified to recognize when the FTP server is an HP 1000. When FTP knows that the server is an HP 1000, it will set the transfer mode to BINARY and transfer the file type, size, and record length along with the file. A new user and server command, SYSTEM, has been implemented. The server will respond with its system type when this command is used.

2.5.6 INETD

SR# 5000621011

ENHANCEMENT: INETD has been added to NS-ARPA/1000 and ARPA/1000 to replace FTPMN and TNMON. Examples are provided for the configuration file, /etc/inetd.conf, and the file that maps service names to TCP ports, /etc/services. Usage and features are described in the on-line help file.

2.5.7 INITIALIZATION

SR# 4701072702

PROBLEM: The command file NSSTART_EZ.CMD incorrectly uses its positional variables.

NSSTART_EZ.CMD was created by combining the functions that previously were in UPNS.CMD, LANSTART.CMD, and RPDEFAULTS.CMD. The order for the parameters was changed to put the LAN LU first, since it is the only parameter that is never optional. The necessary change was not made to the EDIT command on line 102 and the CN command on line 111.

SOLUTION: The code has been changed to reflect the correct order as follows:

```
nsstart_ez.cmd lan_lu [node_name] [ip_address]
```

SR# 4701072710

PROBLEM: The command file NSSTART_EZ.CMD does not work correctly. It may run EDIT interactively or display the message "No such file USAGE" or "No such file START".

SOLUTION: There is an error in the IF command on line 81. An "IS" is missing.

Line 81 has been changed, from:
"IF $NS_TEMP = EDIT"
to:
"IF IS $NS_TEMP = EDIT".

SR# 4701072736

PROBLEM: The command file NSSTART_EZ.CMD fails when attempting to edit the file /system/nsfile.nsin. The edit command on line 102 of NSSTART_EZ.CMD is incorrect. The comma should be a vertical bar, "|".

In addition, when the edit command is executed, the file nsfile.nsin does not exist; therefore, the edit command must perform an exit and create (ec) instead of exit and replace (er).

SOLUTION: The file has been changed to modify the example default file and edit the node_name, ip_address, lan_lu, then exit and create the nsfile.nsin.

SR# 4701050328
SR# 5000637967

PROBLEM: NSINIT/NETINIT will not accept responses which begin with /D or /E for questions which require a filename.

SOLUTION: NSINIT/NETINIT has been modified to accept responses beginning with /D or /E that contain more than 2 characters when prompting for a filename.

SR# 1653001230

ENHANCEMENT: The default number of networking programs and sockets has been increased from 13 and 38 to 23 and 68, respectively. The default is adjusted to be higher if NFT is used in an NS-ARPA system. This will allow more TELNET and FTP connections in an

ARPA/1000 system.

2.5.8 INPRO

SR# 4701116749

PROBLEM: A bug in the A900 microcode (SR #4701-115980) can cause unpredictable behavior in INPRO. In one case, INPRO aborted due to an UI error. The A900 microcode bug causes instructions to be fetched from data space when CDS is on and interrupts are off. INPRO turns off interrupts while reading and updating its timer counter, NS_OS3. The effect depends on what is in the data space.

SOLUTION: INPRO has been modified so that the section which turns interrupts off (CLC 4 ... STC 4) is now non-CDS. This will avoid the bug in the A900 microcode.

2.5.9 INSTALLATION

SR# 4701109009

ENHANCEMENT: NS-ARPA and ARPA programs are now transportable between systems running the same version of RTE-A and networking software. This was accomplished by eliminating the use of non-transportable system entry points by the networking software. As part of this change, the networking modules that are generated into the system have been modified. NSPEC is no longer needed. NSABP is now partitionable. It is no longer necessary to search NSLIB for the DSGLO module during RTAGN's system relocation phase.

2.5.10 IPCLookup

SR# 1653025221

PROBLEM: IPCLookup ignores the retry count variable and hangs when the destination node doesn't exist. The retry count was not

checked against the maximum value; instead, the maximum timeout was checked.

SOLUTION: The retry count is now checked and, if it is exceeded, an error will be returned.

2.5.11 PING

SR# 1653001461

PROBLEM: PING does not return all socket resources if the user issues the BREAK command before PING has a chance to report that the given host is unreachable. In this case, only one socket out of the required two sockets will be freed. The other one will never be freed.

SOLUTION: PING will now reset the state of the socket before it terminates. This will allow the socket to be released.

2.5.12 REMAT

SR# NONE

PROBLEM: IO and PL commands in REMAT would send output to the system console instead of the terminal REMAT was being executed from.

SOLUTION: REMAT was modified to check the LU of the terminal where REMAT was executing, and send this information to APLDR.

2.5.13 TCP

SR# 4701126581

PROBLEM: Sockets created by programs using BSD IPC sometimes do not get cleaned up after the program calls shutdown and aborts.

SOLUTION: A timer is now set when a connection is in the FIN WAIT-2 state and the user's program has terminated.

2.5.14 TELNET

SR# 5000603407

PROBLEM: TELNET does not act correctly following a close command. If TELNET is given a hostname in its runstring, it should terminate after a close command, but it doesn't. If an invalid command is entered following the close, TELNET will display the Unknown Command message twice and then terminate. When this happens, the terminal port configuration does not get restored.

SOLUTION: TELNET's close command processing has been fixed. If a hostname is given in the runstring, the close command will terminate TELNET. When no hostname is specified in the runstring, TELNET will remain in command mode following a close command. Subsequent commands, valid and invalid, are now processed correctly.

SR# 5003030858

PROBLEM: The port protocol on a TELNET pseudo terminal LU cannot be set to HP-XON/XOFF. A CN,LU,34b,3 command will cause the following error message:

```
I/O device error on LU    xx    The reason is:
I/O request error
Request has been flushed
```

SOLUTION: TNSRV no longer rejects any control requests with function code 34b. TNSRV only needs to know whether it should send the DC1 on a read request, so it just checks bit 1 of the protocol word to determine if HP protocol is being used. It is left up to the drivers to determine if any request is illegal.

2.6 (92050A) Datapair/1000

2.6.1 SCSI Support

SR# NONE

NOTE: SCSI disk type (30B) is now supported on a Datapair system.

2.7 (92077A) RTE-A Operating System

2.7.1 APLDR

SR# 4701009985

PROBLEM: APLDR loads CDS programs with multiple code segments; however, when the program executes, it gets CS06 or MP errors.

SOLUTION: This has been fixed for the 6.0 release.

SR# 4700926014

ENHANCEMENT: As of the 6.0 release, APLDR can now write to LUs greater than 63.

2.7.2 BOOTEX

SR# 4701094318

PROBLEM: The BOOTEX command "SA", which sets the size of SAM and/or XSAM during a "slow boot", does not properly check for memory overflow when SAM and XSAM are distinct (as opposed to when SAM and XSAM are allocated from the same memory pool). BOOTEX neglects to add the size of XSAM to the total size of the system so far and therefore can incorrectly allow a command to allocate more memory than is available in the system.

SOLUTION: BOOTEX properly computes the SAM and XSAM size at 6.0.

SR# 5000493106

PROBLEM: If a user attempts to build the SWAP file on a cartridge without enough continuous free space, an infinite loop of error messages will begin. The error message is "Ran out of disc space, reducing SW file size by half". The problem occurs on a

system using the 5.1 version of BOOTEX.

SOLUTION: This has been fixed for the 6.0 release.

SR# 5000611590

PROBLEM: When booting a Datapair system and the Info files are inconsistent, BOOTEX asks, "Continue with which?"

The answer to this question is not intuitively obvious, unless the user has the manual.

SOLUTION: At 6.0, the message will be now displayed as:

Continue with which (0-exit,1-primary,2-secondary)?

2.7.3 CALLS UTILITY

SR# NONE

PROBLEM: The Calls utility doesn't send some output and prompts to the redirected LU when the "-L" runstring option is used. Debug/1000 uses this feature when its "+L:lu" runstring option is used.

SOLUTION: If the Calls "-L" option argument names an interactive LU or a symbolic link to an interactive LU, all menus and prompts will be redirected to that LU. Otherwise, these prompts are issued to the scheduling terminal.

SR# NONE

NOTE: The Calls utility, which performs online text display by keywords, is fully supported at 6.0. This utility was provided at 5.2 for use by Mail/1000 online help, but was not fully documented. At 6.0, online help and manual information is furnished. The CallM utility, which can be used to generate compressed input files for Calls, is also provided. These utilities are the RTE-A equivalents of the GENIX/CMD/HELP utilities on RTE-6/VM.

2.7.4 CI

SR# 5000616581

PROBLEM: CI is interpreting WHILE in an echo command as if it were the beginning of a WHILE-DO-DONE control. For example, an error is produced by including:

```
echo `error while creating file`
```

in a command file within a WHILE structure.

SOLUTION: As of 6.0, CI once again correctly handles the quoted `while`.

SR# 5003008094

PROBLEM: CN,1,20b and CN,1,21b enable and disable the local terminal, not the system console.

SOLUTION: The system console can now be enabled or disabled by using the commands CN,100001b,20b or CN,100001b,21b.

SR# 4700979310

ENHANCEMENT: When a program is RPed with the 'C' (clone) option, it is not obvious from documentation whether a permanent or temporary ID segment will be created.

Actually, if an RP is done without any options, it defaults to 'P', a permanent ID segment. However, if any option is given, the default becomes 'T', a temporary ID segment. To get a clone with a permanent ID segment, the command must be:

```
CI> RP,io.run,bla,cp
```

Both the RTE-A User's Manual (92077-90002) and the on-line help file (RP.HELP) will be changed to clarify this situation.

SR# 5000651034

ENHANCEMENT: An online help file is now provided for the CI POLL command.

2.7.5 CI UTILITIES

SR# 5003050799

ENHANCEMENT: For revision 6.0, CI will have a new, internal variable $DATC. This variable will provide the user with a quick answer to the question, "Which revision of RTE am I running?". CI will set it at start-up.

2.7.6 CS/80

SR# 1650009308

PROBLEM: XUTIL does not pass a negative number for the message buffer length.

SOLUTION: This has been fixed in the 6.0 release.

SR# 1650120865

PROBLEM: There is a problem setting the device timeout value for DD*33. If the user attempts to use the CN lu 26b command with a timeout value of 500, the system reports the following:

```
CI> cn 22 26b 500 -1
I/O device error on lu     22     The reason is:
I/O request error
Request has been flushed
Bad parameter
```

If a timeout value of 502 is used, then the call works as it

should.

SOLUTION: This has been fixed for the 6.0 release.

SR# 2200047894

ENHANCEMENT: An enhancement has been made to the CN commands so users can change the track map information in the DVT for a disk device.

The 'CN lu 76b' command can be used to change the track map information in the DVT.

SR# 5003065771

ENHANCEMENT: The CS/80 error parameter area is now displayed in decimal representation.

Computer Museum

2.7.7 CSYS

SR# 1650038414

ENHANCEMENT: At revision 6.0, CSYS will work with CTD LUs greater than 63.

SR# 1650098244

ENHANCEMENT: At revision 6.0, CSYS will write larger records to the CTD. This results in a substantial performance improvement.

2.7.8 DD*24

SR# 1650149104

ENHANCEMENT: DD*24 now permits a maximum buffer length of 32 KBytes on read requests, instead of the 16 KByte limit which is imposed by the 5.2 driver.

2.7.9 DRIVERS

SR# 5003012401

PROBLEM: When using FST to backup large files (6-30 Mbytes) to a 9145 32-track tape drive, the tape drive LU intermittently times out if a timeout value of 500 tics is set (the default). Setting the timeout to 12000 tics (2 minutes) appears to eliminate the problem.

The default timeout for the 32 track tape should be changed from 500 to some greater value that will keep FST from timing-out when backing up large data files.

SOLUTION: The default timeout value for the 9145 drive is now 20 seconds.

SR# NONE

NOTE: Gen records for the 650/A magneto-optical (MO) disk drives have been added to define the entire surface as a single disk LU. The two new gen records, M650A_1 and M650A_3, are described below:

Driver	Entry point	TX	DX	QU	BL	PR	TO	DT
DDQ30	DDQ30	20	8	FI	UN	0	2500	30B
Model	DP							
650/A with 92279A media (512 byte sectors)								
M650A_1	2:0	0	0	0	17925	64	100001b	
650/A with 92280A media (1024 byte sectors)								
M650A_3	2:0	0	0	0	19660	64	100003b	

2.7.10 EDIT

SR# 1650173021

PROBLEM: Edit/1000 revision 5.2 disables an RTE-A terminal's secondary program scheduling after screen-mode is used, if it was enabled before the screen mode and the secondary program is not "HPMDM". This happens only with the D MUX serial drivers.

SOLUTION: This has been fixed for the 6.0 release.

SR# 1653022194

PROBLEM: Edit/1000 displays a password at the bottom of the screen in screen mode if DS file transparency is used.

SOLUTION: Edit now removes the password and file security code when it displays the source file name on the screen mode bottom line, in response to the SH (show) and ?? (one line status) commands, and it the "closed file" message. It will display the password during the "Opened file" message, and "Created

file" message if the create is deferred to the "ER" or first "WR" command, and on any source file read or write error message.

Edit will continue to display the password in messages for files other than the source file.

2.7.11 FMGR

SR# 5003032201

PROBLEM: Adding a trailing comma to the TM command from FMGR sets the system clock to an incorrect value.

SOLUTION: This has been fixed for the 6.0 release.

2.7.12 FMP

SR# 1650171009

PROBLEM: The UDSP search does not work correctly if one of the search paths is a read-protected directory.

SOLUTION: At revision 6.0, the UDSP search for a file will skip any directories that are read-protected.

SR# 4700977256

PROBLEM: FmpCopy can create illegal filenames when the 'D' option is used. When the 'D' option is used, FmpCopy creates a 13 character temporary filename to use for the copy function. After a successful copy, the original dest file is purged and the temp copy is renamed to the dest name. If the original name is less than 13 characters and the full path is long, using the 13 character filename may cause the length of the full path to exceed 63 characters.

SOLUTION: At revison 6.0, FmpCopy will attempt to create temporary

filenames at the same length as the orignal destination filename.

SR# 4701112342

PROBLEM: FmpRunProgram can fail with a false error condition when the calling program's ID segment address happens to be the same as the value of ASCII characters in the 19th and 20th characters of a runstring.

SOLUTION: FmpRpProgram will now clear word 10 of the dcb before calling FmpOpen.

SR# 5000036608

PROBLEM: FMPCOPY fails when the buffer length is 16416 words or more. For large files (1000 blocks or more), only one block is copied with a bad EOF. Small files usually work OK. All copy operations work correctly if the buffer size is less than 16416 words.

SOLUTION: At revision 6.0, FmpCopy will cap the transfer length at 16k words.

SR# 5000126987

PROBLEM: The CLOSE utility is loaded with a load command file named #CLSDS, and its relocatable is %CLSDS. This is not documented anywhere.

SOLUTION: At revision 6.0, the relocatable for the close utility is in the file "close.rel". The link command file is named "close.lod".

SR# 1650029629

ENHANCEMENT: At revision 6.0, FmpOwner will use the 'Q' option when it opens a directory to determine ownership.

SR# 2200027656

ENHANCEMENT: The WD command will now accept a trailing slash on the directory name.

SR# 4701149682

ENHANCEMENT: At revision 6.0, FmpCopy has been enhanced to make better use of the buffer that is passed to it when performing I/O to or from a device. Prior to this revision, FmpCopy truncated records to or from devices at 256 bytes. When copying from a device to a device or from a device to a type 1 file, the maximum record size will be dependent on the size of the buffer passed to FmpCopy.

Also at revision 6.0, the CDS version FmpCopy has been enhanced to set the streaming bit when the destination device is a streaming tape drive. After writing the EOF, a dynamic status request is sent to the device to check for any errors.

2.7.13 FMP LIBRARIES

SR# 4701103234

PROBLEM: The RexBuildPattern routine incorrectly rejects some valid regular expressions. When an end of a class ']' is the last character of the expression, RexBuildPattern rejects the expression as illegal.

SOLUTION: This has been fixed for the 6.0 release.

2.7.14 FORMC

SR# 5000588889

ENHANCEMENT: At the 6.0 release, FORMC will no longer check a user's capability level if the 'FO' command is used to format floppies.

2.7.15 FREES

SR# 4700983270

PROBLEM: The FREES command gives an incorrect output with the +M option (output in MB).

SOLUTION: This has been fixed in the 6.0 release.

SR# NONE

NOTE: The +Q option has been added at 6.0 to return status from the FREES program to the father program.

2.7.16 FST

SR# 1650121053

PROBLEM: When running FST from a read-protected command file, FST aborts but does not set the $RETURN1 variable.

SOLUTION: This has been fixed at the 6.0 release.

SR# 2200039222

PROBLEM: If the scratch file is created in the default style and placed in /SCRATCH/, and the working directory is /SCRATCH/, then a backup file mask of '@' will include FST's scratch file.

SOLUTION: FST will now check the directory address of the scratch file so it will not select its own scratch file.

SR# 4701041053

PROBLEM: When restoring a TAR file with FST, FST tries to restore the './' and '../' entries when they exist on a TAR tape.

SOLUTION: This has been fixed at the 6.0 release.

SR# 4701042705

PROBLEM: To restore any files from a FST backup, FST must first be able to restore the entire directory file from the archive. For large FST backups on a DAT tape, this can easily require more than 100,000 free disk blocks.

SOLUTION: For revision 6.0, the MinDir option has been added to FST. This allows FST to create a minimum-sized directory file containing information for only those files being restored.

SR# 4701147256

PROBLEM: FST can create and verify tapes which cannot be read by FST after the backup. The problem only occurs when FST crosses a tape boundary, the YES option is not used, and the tape being overwritten was not previously written by FST or TF. Also, this does not happen with CTD tapes.

SOLUTION: This has been fixed for the 6.0 release.

SR# 4701148379

PROBLEM: FST does not restore a file that crosses a tape boundary when the DUP and VERIFY options are set and the file being restored already exists.

SOLUTION: This has been fixed for the 6.0 release.

SR# 5000563726

PROBLEM: The error "Clearing selections for TF restore" is produced when attempting to unselect files that were previously selected for FST backup. The error occurs if the tape that is loaded is a

TF format tape and the tape header has been read prior to selecting the files for backup. When the message is output, the UN command fails to clear the selected files.

SOLUTION: This has been fixed in the 6.0 release.

SR# 5000579656

PROBLEM: FST builds an incorrect destination filename for FMGR files when the destination mask is a FMGR LU.

SOLUTION: This has been fixed for the 6.0 release.

SR# 1650069294

ENHANCEMENT: At revision 6.0 of RTE-A, the 'RwndOff' option was added to FST. This will cause FST to take the media offline upon exit. (This will cause CTD tapes to unload.)

SR# 1650170860

ENHANCEMENT: At 6.0, FST will abort non-interactive executions when a single 'BA' command yields mulitple files with the same name.

SR# 1653010611

ENHANCEMENT: At revision 6.0, FST will backup remote files which are already open in shared mode. FST is not able to backup remote files which are open in exclusive mode.

SR# 2200040766

ENHANCEMENT: At revision 6.0 when restoring an FST tape, FST will create the FST directory file to be the exact size required.

SR# 2200040774

ENHANCEMENT: When FST restores a binary file from a tar archive, the final

block will be padded with nulls.

SR# 2200041558

ENHANCEMENT: At 6.0, FST will check the break flag between forward file commands.

SR# 4701036509

ENHANCEMENT: At revision 6.0, FST will only require the node to be specified when selecting files to be restored from a backup. Prior to 6.0, FST required both the node and the account information.

SR# 4701043992

ENHANCEMENT: At revision 6.0, FST was enhanced to read a start-up command file. This can be used to set up defaults for many of FST's commands.

SR# 5000158444

ENHANCEMENT: At revision 6.0, FST will allow the FST directory file to be located on a remote system using DS transparency.

SR# 5000159152

ENHANCEMENT: At revision 6.0, FST has an "Inhibit" option that will cause FST to inhibit the rewind between backup operations. FST will still rewind the tape upon exit.

SR# 5000181719

ENHANCEMENT: The Z option was added to FST at revision 6.0. This option will cause FST to pause when disk-full errors are encountered.

SR# 5000212670

ENHANCEMENT: At revision 6.0, FST will allow the "Verify" option to be disabled after the "Clear" backup bit option has been set. This will cause FST to clear the backup bit of every file which was backed-up, without verifying the archive's contents.

2.7.17 GENERATOR

SR# 1650021733

PROBLEM: RTAGN ignores the size specified for the snap file, eg. snp::::120. This means that extents are always created.

SOLUTION: This has been fixed at the 6.0 release.

SR# 1650140574

PROBLEM: The generator does not allow the maximum buffer limits to be specified, and this causes an error during the DVT definition phase. For example, the following statement will cause an error:

Dvt,/Rte_A/ddc00.rel,MHP_Printer:4,lu:24,BL:BU:4080:6112

SOLUTION: This has been fixed for the 6.0 release.

SR# 2200032466

PROBLEM: Generating X.25 into an A-series can cause the generation to fail. DDX00.rel contains a "PS" indicating pseudo driver. This works fine for the IFT statement but causes the DVT statement to return an error. Since the same relocatable is used for the IFT and DVT statement, the generator needs to ignore the "PS" for the DVT.

SOLUTION: This has been fixed for the 6.0 release.

SR# 2200033845

PROBLEM: If there is a comma at the end of the line in the IFT specification statement when using RTAGN, the generator may either parse the line correctly, or it may report a parameter error, depending on whether the line has an even or odd number of characters.

SOLUTION: This has been fixed for the 6.0 release.

SR# 2200045070

PROBLEM: RTAGN puts a default device type of 70 in the low order bits (0-5) of DVT6 instead of in bits 8-13.

SOLUTION: Because some software was depending on a device type of 0b, RTAGN now uses 0b as the default and puts it in bits 8-13 of DVT6. The RTE-A System Generation and Installation Manual now says the default device type is 0b.

SR# 5000084723

PROBLEM: RTAGN gives the wrong error count if a 'DI' command is placed in the wrong spot in the answer file.

SOLUTION: This has been fixed for the 6.0 release.

SR# 5000141796

PROBLEM: RTAGN only overlays the list, snap, and system file if the file descriptor, as opposed to the file name, begins with an apostrophe (') or caret (^). Thus, you can only overlay an existing file if the file is in your current working directory or in a global directory. Note that /GLOBAL/^FILE works because RTAGN manipulates it internally as ^FILE::GLOBAL.

SOLUTION: This has been fixed for the 6.0 release.

SR# 2200047563

ENHANCEMENT: RTAGN has been enhanced to treat 0 words of XSAM the same way it treats a null specification for XSAM.

SR# 4701112995

ENHANCEMENT: The default size for the system file was too small. It has now been increased to 1024 blocks.

SR# 5000264465

ENHANCEMENT: At 6.0, the generator will now report the number of available words in the system area that were not used.

2.7.18 HPCRT

SR# 4700970830

PROBLEM: The HpCrtStatus routine does not work properly. Either it MPs or else the status buffer contents are incorrect. The problem was that a temporary buffer was not being passed correctly.

SOLUTION: This has been fixed in the 6.0 release.

SR# 4701148296

PROBLEM: All the HpZ input routines work on the principle of parsing information from the previously declared input buffer at the 'current position', which is maintained in a global variable called HpZIbufPos. As each routine executes, it is supposed to update 'current position' upon exit so that a succeeding routine can parse the next piece of information from the buffer.

HpZHexI does not do this correctly in all cases. The problem is that the position varies depending upon how the routine terminated. For example, given the call 'HpZHexI(number,4)' to parse up to four hex characters, if the current position in an input line of 'ru,foo, 00FF,AB' points to the blank, it will be left pointing to the following comma upon return. This is correct behavior. If we give it an input line of 'ru,foo, FF,AB' instead, with the current position again at the blank, upon exit the pointer will be pointing to the 'A'. This is incorrect behavior resulting from the parse terminating on

condition rather than on count. HpZHexI is defined as returning 'true' if no number was parsed. This also does not work in all cases. The input buffer 'ru,foo, X' with an initial position pointing to the blank should return 'true' because 'X' is not a legal hexadecimal digit. It does not.

SOLUTION: This has been fixed in the 6.0 release.

SR# 5000527044

PROBLEM: The HpCrtReadChar routine does not set BIT 15 in the variable STATUS after a successful call, as indicated in the Relocatables Manual.

The same defect exists in HpCrtXReadChar.

SOLUTION: HpCrtReadChar and HpCrtXReadChar have both been fixed to set the sign bit of the status word on a normal return.

SR# 5003039347

PROBLEM: On an RTE-A 5.2 system, the return from an HPCrtQTDPort7 call is lu=0. On RTE-A 5.16, the value was 32767. Both of these are incorrect.

There are really two problems. The first is that there was a defect in the code when it was calculating an IFT offset. The second problem is that it wasn't documented that the Port_0_to_6_LU had to be configured as a modem port (bit 13 set when it was initialized with CN 30B) in order for the function to work.

SOLUTION: The code and the manual have been fixed for the 6.0 release.

2.7.19 HPMDM

SR# 1650157107

PROBLEM: Both the documentation on HPMDM in the RTE-A Driver Reference Manual and HPMDM's on-line help specify the command to select XON/XOFF protocol for a port as "HA=XX". However, the source file HPMDM.FTN as supplied actually uses "HA=XO".

SOLUTION: This has been fixed for the 6.0 release.

SR# 4701066613

PROBLEM: RTEA2.CMD says that the documentation for HPMDM is in the Utilities Manual. This is not correct; the documentation is in the Driver Reference Manual.

SOLUTION: This has been fixed for the 6.0 release.

SR# 5000479840

PROBLEM: HPMDM can hang in the HpMdmKill subroutine trying to "OF" a program which has locked the session LU passed to HPMDM.

SOLUTION: This has been fixed for the 6.0 release.

Computer Museum

SR# 5003007906

PROBLEM: HPMDM prints excess characters to the log device.

SOLUTION: This has been fixed for the 6.0 release.

SR# 5000398511

ENHANCEMENT: At revision 6.0, HPMDM will not display a message for LUs which are not in the HPMDM control block.

SR# 5003054148

ENHANCEMENT: At revision 6.0, the source for callb.ftn will include instructions for linking the program.

2.7.20 I/O

SR# 4701160457

PROBLEM: Powerfail on revision 5270 is not robust enough for repeated powerfails. This can be duplicated easily on systems with SCSI disks. Symptoms vary, from UI errors to halts.

SOLUTION: This has been fixed at the 6.0 release.

2.7.21 ID*52

SR# 4701067108

PROBLEM: A-Series CPU-CPU communications using ID*52 and the 12006A PIC card, as shipped, do not work. The problem is that ID*52 forces DVCMD to be pulsed at ~227 nsec; however, the filter on the PIC card filters out signals<525 nsec.

SOLUTION: This problem has been fixed at 6.0 by adding control requests to ID*52. This gives users the option to use either pulse mode or level mode DVCMD.

2.7.22 INSTALLATION

SR# 5003014449

PROBLEM: FPUT to floppies requires a timeout greater than 500 tics.

SOLUTION: The default timeout value for floppy drives is now changed to 7 seconds.

SR# 5003064311

PROBLEM: The file IMAGE6.CMD does not copy the library SHSLB.LIB to the libraries directory before it attempts linking the IMAGE programs. Some of the programs reference this library explicitly in order to resolve some undefined externals. These undefined externals can also be satisfied from other libraries, however the size of the programs increases.

SOLUTION: Both rtea1.cmd (for RTE-A) and inci.cmd (for RTE-6) have been updated to copy the SHSLB.LIB file to the proper destination library.

2.7.23 INSTL

SR# 4701076653

PROBLEM: At revision 5.27, INSTL option 'N' doesn't set the consoleless flag in BOOTEX.

SOLUTION: This has been fixed for the 6.0 release.

SR# 5003017830

ENHANCEMENT: INSTL can now enable CS/80 timeout retry by setting option = 'E'.

2.7.24 LI

SR# 4700983098

PROBLEM: If the 5.2 LI is loaded as a non-EMA/VMA program, as per the instructions in the .LOD file, then the message

LI: Insufficient free memory for record buffer; size LI up

is always reported.

SOLUTION: LI now reports this message only if there really is insufficient free memory.

SR# 4700983502

PROBLEM: If the directory information specifying the number of records for a file being listed by LI is incorrect or not up-to-date, LI quits listing the file at the number of records given by the out-of-date directory entry instead of continuing onward. A record count of zero is properly ignored, but there remains a problem for files which are kept open and appended to without updating the directory info, such as /SYSTEM/NS_EVENT.LOG of NS-ARPA/1000. Files updated by programs which did not properly close the file (e.g., were aborted) may also exhibit this behavior. LI should not blindly trust the directory but instead verify that there are no more records past the advertised limit.

SOLUTION: LI now uses the directory's notion of the end-of-file up until that EOF point is reached, at which time LI checks to see if an EOF mark is actually read. If not, LI stops claiming that it knows the EOF position and will read through the file to find the true EOF mark if necessary (as for the "$" command).

SR# 4700984773

PROBLEM: The LI program should check the BReak flag while performing "find-all" pattern searches via the "@" command.

SOLUTION: LI now checks the BReak flag and exits the pattern search if set.

2.7.25 LIF

SR# 4701013235

PROBLEM: LIF hangs in an infinite loop in the IADDR routine.

SOLUTION: This has been fixed at the 6.0 release.

2.7.26 LINK

SR# 5000593343

PROBLEM: The Link NA command no longer works at 5.2. It may cause an MP violation or other unpredictable results.

SOLUTION: The NA command now works as expected.

SR# 1650135145

ENHANCEMENT: Link will no longer generate the "Warning: File not indexed" message when the MS (Multiple Search) command is used, as the warning is inappropriate in this case.

SR# 2200041780

ENHANCEMENT: At 6.0, Link will recognize NLS relocatable catalog file names in the runstring as files to be relocated. The type extension must contain "R" as the first character, followed by 3 digits, i.e., TEAL.R000.

SR# 5000220517

ENHANCEMENT: At 6.0, LINK will include the sharable EMA label, if any, in the summary of information at the end of the .map file.

SR# 2200040956

PROBLEM: When MACRO is run to build a MACRO library and a 'table' is requested, the table lines are 1 character too short if the MACRO name is an odd number of characters. (The control statement used here is MACRO,M,T.)

SOLUTION: This has been fixed in &macr6 at revision 6.0.

SR# 2200040972

PROBLEM: If a MACRO library is built with a macro by the name of 'DATA', MACRO will fail when the library is referenced with a "DCB not open" error on the source file.

SOLUTION: This problem is fixed at 6.0. The MACRO opcode tables now all come from the same table source code so they will always be consistent. Further, an internel revision flag is kept with the table and is put in each MACRO library. If they mismatch, an error is generated.

The error is cleared by reprocessing the MACRO library with a special new option in MACRO.

SR# 2200047845

PROBLEM: If the file /libraries/$maclb.mlb is corrupted, running MACRO on prog.mac will result in the error message, "Illegal file position PROG.MAC" instead of any message pointing to the library.

SOLUTION: This has been fixed for the 6.0 release.

SR# 5000125724

PROBLEM: The MACRO/1000 Manual does not document the limit on the number of labels in a MACRO program. However, the real problem is that MACRO mismanages its symbol table space and, as a result, fails to handle as many symbols as it should.

SOLUTION: This has been corrected for the 6.0 release.

SR# 5000151662

PROBLEM: MACRO emits line number information for include files. DEBUG thinks these are main file line numbers and gets confused.

SOLUTION: At 6.0, Macro will process include files such that each module's DEBUG information will be complete if all code in that module comes from the same file as the Nam record. As a result, entire modules may be in include files without losing debug information. The DEBUG interface does not allow switching files within a module, so DEBUG information that would come from a file other than the Nam record will not be generated.

SR# 5000275271

PROBLEM: When compiling MACRO source which compiled correctly on revision 2540, error 217 (Incomplete expression in operand files) or error 290 (Not enough parameters in microcode call) occur.

SOLUTION: This has been fixed for the 6.0 release.

SR# NONE

ENHANCEMENT: The SEXT opcode was added to MACRO.

Soft EXT op code: SEXT foo

foo may be defined locally but if not is external. CALL can make the routine external while still allowing it to be defined locally.

SR# NONE

NOTE: MACRO was changed to allow the symbol table to be put in EMA/VMA.

2.7.27 MERGE

SR# 4701012120

PROBLEM: The MERGE utility does not always return the proper number of errors in $RETURN1, returning zero when errors occurred.

SOLUTION: At 6.0, MERGE will return non-zero in $RETURN1 for any errors which occur.

SR# 5000534800

PROBLEM: MERGE cannot accept an LU as the destination file; an "Illegal name" FMP error is reported. For example, "merge a b 1" reports this error.

SOLUTION: MERGE now builds a file descriptor without file type and main size fields for destination descriptors which specify an LU number.

SR# 4700974295

ENHANCEMENT: MERGE previously allowed up to 128 characters of source file names to be entered in the runstring. This limit has been increased to 256.

SR# NONE

NOTE: At 6.0, MERGE will not allow relocatables to be MERGE command files. Files of type 5 will be treated as files to be merged, rather than as command files, even if only one file to merge appears in the runstring.

2.7.28 MPACK

SR# 1650115683

ENHANCEMENT: At revision 6.0, MPACK will set the $RETURN1 variable to indicate successful completion. $RETURN1 will be zero if MPACK completes without any errors.

SR# 2200045229

ENHANCEMENT: At revision 6.0, when removing extents and truncating a file, MPACK will only require the contiguous free space on disk to be large enough to contain the final truncated version of the file. Prior to revision 6.0, MPACK required the free space to be at least as large as the total allocated size of the original file.

2.7.29 MUX

SR# 1653024646

PROBLEM: Ports configured for Half HP+XON/XOFF (203b) should not use the HP ENQ/ACK handshake. The MUX, however, still uses the ENQ/ACK handshake when a port configured for protocol 203b issues a CN 11 (formfeed) command.

SOLUTION: This has been fixed for the 6.0 release.

SR# 4701078576

PROBLEM: During initialization, D-MUXes may time-out or get driver-defined error 29 on A990 CPUs.

SOLUTION: This has been fixed for the 6.0 release.

SR# 4701115220

PROBLEM: Due to the faster speed of the A990, some of the timing loops within ID800 were executing too quickly. This caused the driver to time-out in some cases.

SOLUTION: This has been fixed for the 6.0 release.

2.7.30 Mail/1000

SR# 2200047910

PROBLEM: The visual mode message menu shows only the first two digits of each message number, which is not helpful for folders which contain more than 99 messages.

SOLUTION: The visual mode menu now displays 3 digits of the message number, right-justified.

SR# 2200048108

PROBLEM: When RMAIL detects an invalid address in the /mail/admin/addressbook.mail file, the error message reports garbage instead of the offending address. RMAIL then shuts down rather than continuing on with that address ignored.

SOLUTION: RMAIL now reports the proper address and continues onward with the next entry in the addressbook file.

SR# 4700948315

PROBLEM: RMAIL will append a dot (.) to single-label domain names found in a message if the local host has a single-label domain name. A single-label domain name is a hostname in which no ".DOMAIN.ORGANIZATION" appears, to use NS/ARPA terminology. Basically, it refers to hostnames which do not contain upper-level network information separated by dots. For example, if mail.cf specifies "domain localhost" and a message

comes through which is "To: software_samantha@DSD", then RMAIL will pass this message on to host DSD with the modified header "To: software_samantha@DSD." with a trailing dot after "DSD". This is illegal RFC-822 standard syntax and may confuse host DSD if the dot is unexpected.

SOLUTION: RMAIL now properly handles qualifying domain names when the local domain contains no upper-level network information. Fixed in the 6.0 release.

SR# NONE

NOTE: Mail/1000 supports the Domain Name System (DNS) at 6.0. DNS client versions of Mail/1000 programs Sendmail and SMTP may be loaded at Mail installation time. Optionally, a caching-only server may be installed that locally caches information retrieved from full-service nameservers elsewhere on the network.

SR# NONE

NOTE: At 6.0, Mail/1000 provides the utilities uuencode and uudecode for mailing binary files. These utilities are compatible with their UN*X namesakes.

2.7.31 OPERATING SYSTEM

SR# 4701093906

PROBLEM: The routine called by many RTE modules to verify that a buffer supplied by the user is "legal" can fail to detect the use of an invalid page. The routine is $VBUF of IOMOD, and it is called to check the validity of buffers used in EXEC read and write calls, among other uses. This routine may not catch a buffer which spans a user map register containing 177777b, that is, a page of the user's logical address space which has been set invalid, as by the RTE dispatcher or by EMA/VMA mapping instructions. An error such as I004 should be generated in this situation, but no error is detected.

SOLUTION: $VBUF properly rejects buffers which span user map registers

that contain either 177777b or 77777b, in addition to the other validity checks performed at 6.0.

SR# 5000590919

PROBLEM: A HALT 5 may occur when using the dummy version of the OPMSG RTE-A module from $SYSA.

The PRMSG entry point needs to be coded for a JSB calling sequence, rather than a JMP.

SOLUTION: The correct calling sequence is now coded.

2.7.32 PRIMARY

SR# 1650141333

PROBLEM: The example answer file which is supplied with RTE-A contains a misleading comment in the section which defines the system libraries. The specification of user libraries in the location suggested by the comment can result in errors when linking programs which use entry points in these libraries.

SOLUTION: This has been fixed for the 6.0 release.

SR# 4701090407

PROBLEM: At 5.27, a SCSI primary system cannot be generated using the second half of the primary.ans file.

SOLUTION: The second half of the primary.ans file has been corrected.

2.7.33 SAM

SR# NONE

PROBLEM: The SAM utility reports an unknown block when an unassigned LU is spooled. This problem was introduced at 5.2, when spooling of unassigned LUs was introduced.

SOLUTION: The SAM program now checks the spool node list off the dummy DVT for LU 0. Entry point DDV, which points to that DVT, has been moved into $VCTR to keep the SAM program transportable.

2.7.34 SCOM

SR# 5000562751

PROBLEM: Whenever Scom is run on a FMGR file with a negative security code, Scom reports "Incorrect security code" even if the security code is entered properly in the runstring.

SOLUTION: Scom no longer calls FmpFileName but instead uses the file descriptor as entered in the runstring. This corrects the problem.

2.7.35 SCSI

SR# 1653022913

PROBLEM: ASAVE and FST will fail verify if the 2GB SCSI DAT is on the same interface as the SCSI disk.

SOLUTION: This has been fixed for the 6.0 release.

SR# 1653030338

PROBLEM: Powerfail doesn't work if disks are SCSI. When doing a power-up cycle, the SCSI disk seems to take a long time compared to the CPU. If an I/O request has been pending on the SCSI disk, a special driver error 43 or the message "device not ready" is displayed on the console.

SOLUTION: This problem has been fixed for the 6.0 release.

SR# 4701148650

PROBLEM: SCSI boot doesn't work from a C1716M multifunctional 5.25" Optical Disk or from a C2247 hard disk.

SOLUTION: The SCSI firmware has been changed to fix this problem. Use the VSCSI 'TS' function to verify the new SCSI firmware, which is '921030.0006'.

SR# 5003018234

PROBLEM: The cartridge list is not updated when switching between FMGR and CI media on a 650A drive.

SOLUTION: This has been fixed for the 6.0 release.

SR# 5003022053

PROBLEM: The SCSI drivers contain a list of addresses to their extensions. The tape driver DDQ24 overwrites the last three internal addresses with data. The driver should be changed to use a store indirect instead of a store.

SOLUTION: This has been fixed for the 6.0 release.

SR# 5003022269

PROBLEM: When calling the routine NodeListBits in DDQ30, a flag for set/clear is passed from the E-register. In NodeListBits, the E-register is used to clear bit 15 of the address. This causes the routine to lose the original definition of the E-register.

SOLUTION: This has been fixed for the 6.0 release.

SR# 5003023671

PROBLEM: DDQ24 should return a 0 transfer log for a dynamic status request. Currently, it returns the length of the last SCSI data phase, which happens to be the length of the request sense data transfer.

SOLUTION: This has been fixed for the 6.0 release.

SR# 5003023689

PROBLEM: DDQ24 does not update status words upon exit when no error is encountered. This can lead to programs thinking that errors occurred due to bits set during driver communication between the device driver and the interface driver.

SOLUTION: This has been fixed for the 6.0 release.

SR# 5003031229

PROBLEM: TF is unable to append to a SCSI DDS tape, part of the C2212A subsystem. The following error occurs:

```
TF: co @ 5 a
Append option selected.

Current contents of tape:

Tape format:  TF
Title:        TF:  co @ 5 v
Date:         Tue Dec 10, 1991 11:28:36 am
```

```
Do you want to append to this tape (Y/N) ? y
Positioning tape beyond files previously written.
I/O device error on LU     5    The reason is:
Special driver defined error=     26
Request has been flushed
Tape i/o error.  Status is 1.
Can't append.
Command terminated.
TF:
```

SOLUTION: This has been fixed for the 6.0 release.

SR# 1653000380

ENHANCEMENT: SCSI drivers should return the recovered error in DVT6.

At 6.0, both DDQ30 and DDQ24 device drivers now return the "Recovered Error" in DVT6.

SR# 1653000406

ENHANCEMENT: Control request 16B has been implemented to enable/disable the DDQ24 driver to issue the request-sense command if the check condition occurred and the UE bit is set.

Example:

1. `CALL EXEC(3,lu+16b,1)` — disable the driver to issue request-sen if UE bit is set.

2. `CALL EXEC(1,20000b+lu,..)` — if the check condition occurred ($dv6 error bit is set), $dv18 indicates SCSI check condition error.

   A request sense Z-buffer call can get the request sense data.

   or

   `Call EXEC(1,lu,..)` — if the check condition occurred ($dv6 error bit is set), $dv16 indicates driv error.

SR# 4701103580

ENHANCEMENT: Previously, the SCSI interface driver IDQ35 enabled the pass-through mode if the transfer length was greater than 5120 words, which was hard-coded. At 6.0, users can set the pass-through fence.

DDQ30's dvp03 contains the RTE block number which is the pass-through fence. If driver parameter 3 is defaulted to a value of 0, IDQ35 will use a value of 24 RTE blocks (3072 words) for the pass-through fence. If the transfer length is greater than or equal to the pass-through fence, then the pass-through mode is enabled.

SR# 5003022079

ENHANCEMENT: The SCSI interface driver IDQ35 does a request sense when a check condition is issued by a device. Each device has a different amount of sense data that is valid and/or useful. In the past, IDQ35 always got 20 bytes. However, some devices go beyond this count for important information. If the device conforms strictly to the SCSI specification, the missed information cannot be retrieved on a subsequent call to get sense data.

At 6.0, IDQ35 can get more than 20 bytes of data on a check condition request sense. If the UE bit is set, check condition will return to the user program, which can then check the condition and use a Z-buffer call to request any size of the sense data.

2.7.36 SIGNALS

SR# 4701126623

PROBLEM: Signals are delivered in the wrong order. On page 13-2 of the Programmer's Reference Manual, the order that signals will be delivered is from 1 to 32. Currently, the order that the signals are being delivered is from 17 to 32 and then 1 to 16. When the two words that contain the bits that indicate that

signals are pending are examined, they are in the opposite order of the correct order.

SOLUTION: The code has been fixed to implement the correct order at revision 6.0.

SR# 5003066845

PROBLEM: The class number and the request type in the SglIO signal dependent data are sometimes invalid.

In the past, changes were made to handle class I/O requests being flushed. These changes broke the existing code under certain circumstances.

SOLUTION: The code and documentation have been fixed in the 6.0 release of RTE-A.

2.7.37 SPOOLING

SR# 4701091942

PROBLEM: If session accounting is not turned on ("AC,ON" in BOOT.CMD) then a session's spooling is not automatically terminated when the session logs off.

SOLUTION: At 6.0, the O/S spool cleanup procedures are executed at logoff time regardless of the state of session accounting.

2.7.38 SYSTEM LIBRARY

SR# 1653027680

PROBLEM: IFTTY returns -1 (TRUE) for unassigned LUs at 5.27. In previous versions of RTE-A, it returned 0 for unassigned LUs.

SOLUTION: This problem has been fixed for 6.0. IFTTY for RTE-A now checks the LUT to determine if an LU is unassigned and thus not

interactive.

2.7.39 Structure Changes

SR# NONE

NOTE: Routine Pas.A1SharedSize has been modified to reflect ID segment changes at 6.0. Libraries PASCAL.LIB, PASCAL_CDS.LIB, and PASCAL_FMGR.LIB are affected by this change.

PLEASE NOTE that although IMAGE-II (92081A) and RJE-II (91781A) have been updated to have the Pascal libraries deleted from their product, updates for RJE-II and IMAGE-II will not be sent out at 6.0. Since the only change to these products is this deletion and the correct version of these libraries are sent out (and installed by) the Operating System, we felt that sending an "update" would just cause confusion.

2.7.40 TF

SR# 1650116459

PROBLEM: TF does not correctly restore group and other protection bits.

SOLUTION: This has been fixed for the 6.0 release.

SR# 4701154088

PROBLEM: TF can memory protect when using a very large group of copy commands.

SOLUTION: This has been fixed for the 6.0 release.

2.7.41 VSCSI

SR# 5003065763

PROBLEM: VSCSI with the -ALL option to a DAT DDS tape does not gracefully handle the FMP test.

If a tape is loaded in the DAT drive, VSCSI reports:

"Illegal LU "

If no tape is loaded, VSCSI reports:

"Driver Error: Wrong media; No disk in drive"

along with FMP test failed.

SOLUTION: This has been fixed for the 6.0 release.

SR# 5003068007

PROBLEM: When !VSCSI is booted and run for the first time, it will report SCSI address 7 for HP-IB LUs 6 through 9, 15 through 19, and 24. When run a second time, a 'LU 02 abort' is reported.

SOLUTION: This has been fixed for the 6.0 release.

SR# 1653006395

ENHANCEMENT: A SCSI diagnostic has been added to the 92077A/24398B products, !VSCSI. It includes functions similar to those available for testing CS/80 devices using EXER.

This is needed so mass storage devices can be tested and can have the ability to spare bad blocks when connected to the HP 1000 via the 12016A SCSI interface.

SR# 4701080945

ENHANCEMENT: VSCSI has been enhanced to support SCSI function 25h: Query a disk unit and read back the total volume size.

Also, the VSCSI command UNITSIZE has been implemented at 6.0 to report the total number of blocks on the disk unit.

2.7.42 WH

SR# 5000490177

ENHANCEMENT: WH can now be instructed to issue "More..." prompts for any execution by including the "-p" flag in the runstring before the 2-character report style option (if specified). For example, "wh -p al" requests "More..." prompting for the AL report. "More..." prompting will not occur unless this option is specified. Note that use of prompting for program status listings is likely to introduce inaccuracies into the information reported, since the listing is not based on a snapshot of the system at some instant, reflecting instead the state of the system as each line is printed.

2.7.43 WHZAT

SR# 5000535922

ENHANCEMENT: If the WH listing is sent to a printer, a form feed will be issued at the end of the listing.

2.8 (92078A) RTE-A Virtual Code+

2.8.1 CI

SR# 1650058875

ENHANCEMENT: As of release 6.0, CI has "environment" variables. They can be accessed programmatically from applications in the same session. This capability exists only in the VC+ (92078A) version of CI.

SR# 1650097485

ENHANCEMENT: In the past, the SET command in CI displayed the variables in a random fashion. As of revision 6.0, CI displays all variables in a sorted order. This is available only in the VC+ (92078A) version of CI.

SR# 4701087478

ENHANCEMENT: CI has been enhanced to allow ksh-style command editing (emacs, gmacs, and vi) and csh-style filename completion.

SR# 5000430470

ENHANCEMENT: In the VC+ (92078A) version of CI only, the current working directory can be the prompt string. The maximum length of the prompt string has been increased to 78 characters to allow this to work. In addition, the WD command itself can be "redefined" to do this, using an alias and a function, as follows:

```
alias wd my_wd

function my_wd {
  \WD $1 $2
   set prompt $WD` >`
}
```

SR# 5000541086

ENHANCEMENT: As of revision 6.0, $PROMPT can be up to 78 characters long. This is available only with the VC+ (92078A) version of CI.

SR# 5000541953

ENHANCEMENT: CI now has two different areas for user-defined variables, local space and the Environment Variable Block (EVB). Both are configurable. The local space for variables can be set at load time via the LINK em command. This would then be the size for all users on the system.

The EVB is set for each user by GRUMP.

This is only available in the VC+ (92078A) version of CI.

SR# 5000593491

ENHANCEMENT: At 6.0, users now have the concept of a session environment. CI can "export" variables to the Environment Variable Block (EVB). Subsequent copies of CI can access these variables. Any program running in the specific session can also access these variables via the new EXEC(39) call. This is only available in VC+ (92078A).

2.8.2 CI UTILITIES

SR# 1650140723

PROBLEM: CLGON returns error -9 if the user's password contains a period. For example, if user TEST has password "ABC.DEF", calling CLGON with "TEST/ABC.DEF" results in the -9 error. Also, if the user tries to log on interactively, entering the password at the logon prompt ie: login: TEST/ABC.DEF <return> LOGON returns: "No such directory TEST/ABC::users"

SOLUTION: CLGON has been modified to allow a "period" in the user's password.

SR# 5000482547

PROBLEM: The GRUMP command PA (password) is not listed when responding to the GRUMP> prompt with a "?". However, details for the PA command are listed when responding to the GRUMP> prompt with "? PA".

SOLUTION: This has been fixed in the 6.0 release.

SR# 1650022285

ENHANCEMENT: At revision 6.0, the touch utility will be shipped with VCPLUS. The runstring option +B will cause a file's backup bit to be set; -B will cause the bit to be cleared.

SR# 1653010579

ENHANCEMENT: At revision 6.0, the 'cp' utility will be shipped with VC+. cp allows a directory tree to be copied while preserving the directory attributes of all the files.

2.8.3 D.RTR

SR# 4700921668

ENHANCEMENT: Symbolic links have been added to the RTE-A file system at revision 6.0.

SR# 5000581496

ENHANCEMENT: With revision 6.0 of the RTE-A product, the user may use the CDS version of D.RTR. The CDS version of D.RTR doubles the capacity of the open file table and global directory table.

SR# 4700921650

ENHANCEMENT: At revision 6.0, the CDS version of D.RTR can be configured at

link time to issue a 40b request to the SCSI driver every time a SCSI disk LU is mounted. D.RTR will also send a 41b request to the SCSI driver every time a SCSI disk LU is dismounted.

SR# 4701069450

ENHANCEMENT: At revision 6.0, the CDS version of D.RTR will compare the number of blocks/bit in the volume header against the blocks/bit calculated for the size of the disk being mounted. D.RTR will not mount volumes which do not have the correct information in the volume header.

SR# 5000581496

ENHANCEMENT: With revision 6.0 of the RTE-A product, the user may use the CDS version of D.RTR. The CDS version of D.RTR doubles the capacity of the open file table and global directory table.

2.8.4 FMP

SR# 1650027201

PROBLEM: FmpCopy will not successfully copy type 2 files to magnetic tape if the record length is greater than 128 words. When attempted, all the records are truncated to 128 words on the tape.

SOLUTION: At revision 6.0, FmpCopy will use the record length of a type 2 file as the transfer length when performing IO to or from a device. (Note that the user-supplied buffer must be large enough to contain the transfer buffer and, at the minimum, an additional 160 words for the DCBs. A -223 error will be returned if a type 2 file cannot be transferred to or from a device without truncating the records.)

SR# 4700977256

PROBLEM: FmpCopy can create illegal filenames when the 'D' option is used. When the 'D' option is used, FmpCopy creates a 13 character temporary filename to use for the copy function.

After a successful copy, the original dest file is purged and the temp copy is renamed to the dest name. If the original name is less than 13 characters and the full path is long, using the 13 character filename may cause the length of the full path to exceed 63 characters.

SOLUTION: At revison 6.0, FmpCopy will attempt to create temporary filenames at the same length as the orignal destination filename.

SR# 4701112342

PROBLEM: FmpRunProgram can fail with a false error condition when the calling program's ID segment address happens to be the same as the value of ASCII characters in the 19th and 20th characters of a runstring.

SOLUTION: FmpRpProgram will now clear word 10 of the dcb before calling FmpOpen.

SR# 5000036608

PROBLEM: FMPCOPY fails when the buffer length is 16416 words or more. For large files (1000 blocks or more), only one block is copied with a bad EOF. Small files usually work OK. All copy operations work correctly if the buffer size is less than 16416 words.

SOLUTION: At revision 6.0, FmpCopy will cap the transfer length at 16k words.

SR# 1650029629

ENHANCEMENT: At revision 6.0, FmpOwner will use the 'Q' option when it opens a directory to determine ownership.

SR# 4701149682

ENHANCEMENT: At revision 6.0, FmpCopy has been enhanced to make better use of the buffer that is passed to it when performing I/O to or from a device. Prior to this revision, FmpCopy truncated records to or from devices at 256 bytes. When copying from a

device to a device or from a device to a type 1 file, the maximum record size will be dependent on the size of the buffer passed to FmpCopy.

Also at revision 6.0, the CDS version FmpCopy has been enhanced to set the streaming bit when the destination device is a streaming tape drive. After writing the EOF, a dynamic status request is sent to the device to check for any errors.

2.8.5 FMP LIBRARIES

SR# 4701103234

PROBLEM: The RexBuildPattern routine incorrectly rejects some valid regular expressions. When an end of a class ']' is the last character of the expression, RexBuildPattern rejects the expression as illegal.

SOLUTION: This has been fixed for the 6.0 release.

2.8.6 GENERATOR

SR# 4701010736

PROBLEM: The lower bound of the class buffer limits must be <=4095 words. Values greater than this cause the bound to be treated as zero.

SOLUTION: At 6.0, the upper and lower bounds are stored in separate words, rather than squeezing both into one word. The limit of 8160 words for the upper bound is removed, as well as the limit of 4080 words difference between the upper and lower bounds. Entry points $SPBL and DSPBL have been replaced by $UpClassLimit, which contains the upper bound, and $NLowClassLimit, which contains the negated lower bound, both in words.

2.8.7 LANVCP

SR# 1650161489

PROBLEM: VCPMT sends messages to the scheduling terminal and not to the system console.

SOLUTION: This has been fixed for the 6.0 release.

2.8.8 MACRO

SR# 1650101089

PROBLEM: The macro &CDSONOFF incorrectly generates a PCAL type 1 calling sequence; it should generate type 0.

SOLUTION: At 6.0, the &CDSONOFF library was changed to use pcal 0 calls.

2.8.9 MULTIUSER/SESSION

SR# 1650097063

PROBLEM: Sometimes LOGON is unable to access the .GRP file when it should otherwise succeed.

SOLUTION: The file opening scheme for LOGON has been modified to further reduce the chances of this failure.

SR# 1653027888

PROBLEM: If a group has more than 448 users, the group table is corrupted after one of the higher-numbered users logs on and then off.

SOLUTION: As of 6.0, groups with more than 448 users will not have this problem.

SR# 4700923144

PROBLEM: Running VC1.CMD as part of installing VCPLUS onto a primary system for the first time produces error messages because the directory /USERS does not exist.

SOLUTION: VC1.CMD now checks for the existence of /USERS before attempting the copy.

SR# 5003044636

PROBLEM: When accounting is turned off, telnet sessions are not released at logoff time.

SOLUTION: This has been fixed at the 6.0 release.

SR# 1650062364

ENHANCEMENT: A command stack was added to Grump at revision 6.0 of VCPLUS.

SR# 1650161612

ENHANCEMENT: If a password entered with AL, US, or NU contains a space or comma, GRUMP terminates the password at that character. The user or System Manager would expect the password to be "MY CAT", and in reality it is "MY".

SOLUTION: In the case of changing the password via the NE or AL commands, an error message will always be issued in the interactive case. In the case of PA, the password command, the error checking will be done.

2.8.10 OPERATING SYSTEM

SR# 4701093559

PROBLEM: When an ID segment for a CDS program is created by cloning an

existing ID segment, the "current code segment" field is not initialized to the "initial code segment" field. This causes the dispatcher to set the maps incorrectly when the program is run. This is a problem only for programs which have the AL bit set, indicating that all segments must be in memory (as is the case for shared programs).

SOLUTION: At 6.0, the $IDRPL module sets the current code segment field to the initial code segment value, avoiding the problem.

2.9 (92081A) Image/1000-II

2.9.1 Structure Changes

SR# NONE

NOTE: Routine Pas.A1SharedSize has been modified to reflect ID segment changes at 6.0. Libraries PASCAL.LIB, PASCAL_CDS.LIB, and PASCAL_FMGR.LIB are affected by this change.

PLEASE NOTE that although IMAGE-II (92081A) and RJE-II (91781A) have been updated to have the Pascal libraries deleted from their product, updates for RJE-II and IMAGE-II will not be sent out at 6.0. Since the only change to these products is this deletion and the correct version of these libraries are sent out (and installed by) the Operating System, we felt that sending an "update" would just cause confusion.

2.10 (92084A) RTE-6/VM Operating System

2.10.1 CALLS

SR# NONE

NOTE: The Calls and CallM utilities are now shipped with the RTE-6/VM product, as well as with as RTE-A, since Calls is used by the online help facility of DEBUG/1000.

2.10.2 CI

SR# 5000616581

PROBLEM: CI is interpreting WHILE in an echo command as if it were the beginning of a WHILE-DO-DONE control. For example, an error is produced by including:

echo `error while creating file`

in a command file within a WHILE structure.

SOLUTION: As of 6.0, CI once again correctly handles the quoted `while`.

SR# 5000651034

ENHANCEMENT: An online help file is now provided for the CI POLL command.

2.10.3 CI UTILITIES

SR# 5003050799

ENHANCEMENT: For revision 6.0, CI will have a new, internal variable $DATC. This variable will provide the user with a quick answer to the question, "Which revision of RTE am I running?". CI will set it at start-up.

2.10.4 DVA37

SR# 4701070607

PROBLEM: The HPIB driver DVA37 is erroneously inserting an ACG and UCG command into the HPIB command sequence. This can cause some devices to hang because they cannot interpret these commands.

SOLUTION: This has been fixed for the 6.0 release.

2.10.5 DVS23

SR# 4700964262

PROBLEM: Under 5.2 RTE-6/VM, blank new tapes cannot be used on a DAT drive. The density is genned in at 1600. Nevertheless, the device times out when using a new blank tape.

SOLUTION: DVS23's set density control request has been modified. Using the control request 'CN lu 15b 1' or 'CN lu 15b 1600' to set the tape density will now allow a brand new DAT tape to be used.

2.10.6 EDIT

SR# 1653022194

PROBLEM: Edit/1000 displays a password at the bottom of the screen in screen mode if DS file transparency is used.

SOLUTION: Edit now removes the password and file security code when it displays the source file name on the screen mode bottom line, in response to the SH (show) and ?? (one line status) commands, and it the "closed file" message. It will display

the password during the "Opened file" message, and "Created file" message if the create is deferred to the "ER" or first "WR" command, and on any source file read or write error message.

Edit will continue to display the password in messages for files other than the source file.

2.10.7 FMP

SR# 4700977256

PROBLEM: FmpCopy can create illegal filenames when the 'D' option is used. When the 'D' option is used, FmpCopy creates a 13 character temporary filename to use for the copy function. After a successful copy, the original dest file is purged and the temp copy is renamed to the dest name. If the original name is less than 13 characters and the full path is long, using the 13 character filename may cause the length of the full path to exceed 63 characters.

SOLUTION: At revison 6.0, FmpCopy will attempt to create temporary filenames at the same length as the orignal destination filename.

SR# 4701112342

PROBLEM: FmpRunProgram can fail with a false error condition when the calling program's ID segment address happens to be the same as the value of ASCII characters in the 19th and 20th characters of a runstring.

SOLUTION: FmpRpProgram will now clear word 10 of the dcb before calling FmpOpen.

SR# 5000036608

PROBLEM: FMPCOPY fails when the buffer length is 16416 words or more. For large files (1000 blocks or more), only one block is copied with a bad EOF. Small files usually work OK. All copy operations work correctly if the buffer size is less than 16416 words.

SOLUTION: At revision 6.0, FmpCopy will cap the transfer length at 16k words.

SR# 5000126987

PROBLEM: The CLOSE utility is loaded with a load command file named #CLSDS, and its relocatable is %CLSDS. This is not documented anywhere.

SOLUTION: At revision 6.0, the relocatable for the close utility is in the file "close.rel". The link command file is named "close.lod".

SR# 1650029629

ENHANCEMENT: At revision 6.0, FmpOwner will use the 'Q' option when it opens a directory to determine ownership.

2.10.8 FMP LIBRARIES

SR# 4701103234

PROBLEM: The RexBuildPattern routine incorrectly rejects some valid regular expressions. When an end of a class ']' is the last character of the expression, RexBuildPattern rejects the expression as illegal.

SOLUTION: This has been fixed for the 6.0 release.

2.10.9 FORMC

SR# 5000588889

ENHANCEMENT: At the 6.0 release, FORMC will no longer check a user's capability level if the 'FO' command is used to format floppies.

2.10.10 FREES

SR# 4700983270

PROBLEM: The FREES command gives an incorrect output with the +M option (output in MB).

SOLUTION: This has been fixed in the 6.0 release.

SR# NONE

NOTE: The +Q option has been added at 6.0 to return status from the FREES program to the father program.

2.10.11 FST

SR# 1650121053

PROBLEM: When running FST from a read-protected command file, FST aborts but does not set the $RETURN1 variable.

SOLUTION: This has been fixed at the 6.0 release.

SR# 2200039222

PROBLEM: If the scratch file is created in the default style and placed in /SCRATCH/, and the working directory is /SCRATCH/, then a backup file mask of '@' will include FST's scratch file.

SOLUTION: FST will now check the directory address of the scratch file so it will not select its own scratch file.

SR# 4701041053

PROBLEM: When restoring a TAR file with FST, FST tries to restore the './' and '../' entries when they exist on a TAR tape.

SOLUTION: This has been fixed at the 6.0 release.

SR# 4701042705

PROBLEM: To restore any files from a FST backup, FST must first be able to restore the entire directory file from the archive. For large FST backups on a DAT tape, this can easily require more than 100,000 free disk blocks.

SOLUTION: For revision 6.0, the MinDir option has been added to FST. This allows FST to create a minimum-sized directory file containing information for only those files being restored.

SR# 4701147256

PROBLEM: FST can create and verify tapes which cannot be read by FST after the backup. The problem only occurs when FST crosses a tape boundary, the YES option is not used, and the tape being overwritten was not previously written by FST or TF. Also, this does not happen with CTD tapes.

SOLUTION: This has been fixed for the 6.0 release.

SR# 4701148379

PROBLEM: FST does not restore a file that crosses a tape boundary when the DUP and VERIFY options are set and the file being restored

already exists.

SOLUTION: This has been fixed for the 6.0 release.

SR# 5000563726

PROBLEM: The error "Clearing selections for TF restore" is produced when attempting to unselect files that were previously selected for FST backup. The error occurs if the tape that is loaded is a TF format tape and the tape header has been read prior to selecting the files for backup. When the message is output, the UN command fails to clear the selected files.

SOLUTION: This has been fixed in the 6.0 release.

SR# 5000579656

PROBLEM: FST builds an incorrect destination filename for FMGR files when the destination mask is a FMGR LU.

SOLUTION: This has been fixed for the 6.0 release.

SR# 1650170860

ENHANCEMENT: At 6.0, FST will abort non-interactive executions when a single 'BA' command yields mulitple files with the same name.

SR# 1653010611

ENHANCEMENT: At revision 6.0, FST will backup remote files which are already open in shared mode. FST is not able to backup remote files which are open in exclusive mode.

SR# 2200040766

ENHANCEMENT: At revision 6.0 when restoring an FST tape, FST will create the FST directory file to be the exact size required.

SR# 2200040774

ENHANCEMENT: When FST restores a binary file from a tar archive, the final block will be padded with nulls.

SR# 2200041558

ENHANCEMENT: At 6.0, FST will check the break flag between forward file commands.

SR# 4701036509

ENHANCEMENT: At revision 6.0, FST will only require the node to be specified when selecting files to be restored from a backup. Prior to 6.0, FST required both the node and the account information.

SR# 4701043992

ENHANCEMENT: At revision 6.0, FST was enhanced to read a start-up command file. This can be used to set up defaults for many of FST's commands.

SR# 5000158444

ENHANCEMENT: At revision 6.0, FST will allow the FST directory file to be located on a remote system using DS transparency.

SR# 5000159152

ENHANCEMENT: At revision 6.0, FST has an "Inhibit" option that will cause FST to inhibit the rewind between backup operations. FST will still rewind the tape upon exit.

SR# 5000181719

ENHANCEMENT: The Z option was added to FST at revision 6.0. This option will cause FST to pause when disk-full errors are encountered.

SR# 5000212670

ENHANCEMENT: At revision 6.0, FST will allow the "Verify" option to be disabled after the "Clear" backup bit option has been set. This will cause FST to clear the backup bit of every file which was backed-up, without verifying the archive's contents.

2.10.12 GENERATOR

SR# 4701133462

PROBLEM: RT6GN accepts "CS80" as a disk model in response to the question, "SYSTEM DISC MODEL?". for the question However, for the questoin, "DEVICE (MODEL, HP-IB ADDRESS, UNIT,VOLUME)?", it will not accept models beginning with "C" other than "CTD". The generator will accept "XXX", but not "CS80" or "C2200" for this question.

SOLUTION: This problem has been fixed for the 6.0 release. RT6GN will accept CS-80 disk models beginning with "C" for the question "DEVICE (MODEL,HP-IB ADDR,UNIT,VOLUME)?". Models such as "CS80" and "C2200A" will now be accepted and treated as unknown CS-80 disk models.

SR# 4701151381

PROBLEM: Under certain load situations, RT6GN can give the "FIXUPS NOT RESOLVED" error. When this error occurs, the program that the generator was loading will be corrupt. No error is given in the summary at the end of the generation.

SOLUTION: This has been fixed for the 6.0 release.

2.10.13 HPCRT

SR# 4700970830

PROBLEM: The HpCrtStatus routine does not work properly. Either it MPs or else the status buffer contents are incorrect. The problem was that a temporary buffer was not being passed correctly.

SOLUTION: This has been fixed in the 6.0 release.

SR# 4701148296

PROBLEM: All the HpZ input routines work on the principle of parsing information from the previously declared input buffer at the 'current position', which is maintained in a global variable called HpZIbufPos. As each routine executes, it is supposed to update 'current position' upon exit so that a succeeding routine can parse the next piece of information from the buffer.

HpZHexI does not do this correctly in all cases. The problem is that the position varies depending upon how the routine terminated. For example, given the call 'HpZHexI(number,4)' to parse up to four hex characters, if the current position in an input line of 'ru,foo, 00FF,AB' points to the blank, it will be left pointing to the following comma upon return. This is correct behavior. If we give it an input line of 'ru,foo, FF,AB' instead, with the current position again at the blank, upon exit the pointer will be pointing to the 'A'. This is incorrect behavior resulting from the parse terminating on condition rather than on count. HpZHexI is defined as returning 'true' if no number was parsed. This also does not work in all cases. The input buffer 'ru,foo, X' with an initial position pointing to the blank should return 'true' because 'X' is not a legal hexadecimal digit. It does not.

SOLUTION: This has been fixed in the 6.0 release.

SR# 5000527044

PROBLEM: The HpCrtReadChar routine does not set BIT 15 in the variable STATUS after a successful call, as indicated in the Relocatables Manual.

The same defect exists in HpCrtXReadChar.

SOLUTION: HpCrtReadChar and HpCrtXReadChar have both been fixed to set the sign bit of the status word on a normal return.

2.10.14 INSTALLATION

SR# 5000474064

PROBLEM: LOAD6.CMD does not work for type 6 files being targeted at FMGR cartridges.

SOLUTION: The LOAD6.CMD and INCI.CMD command files were updated to work with FMGR files. In addition, the security code parameter was ignored except for MLLDR. This has been fixed.

SR# 5003064311

PROBLEM: The file IMAGE6.CMD does not copy the library SHSLB.LIB to the libraries directory before it attempts linking the IMAGE programs. Some of the programs reference this library explicitly in order to resolve some undefined externals. These undefined externals can also be satisfied from other libraries, however the size of the programs increases.

SOLUTION: Both rtea1.cmd (for RTE-A) and inci.cmd (for RTE-6) have been updated to copy the SHSLB.LIB file to the proper destination library.

SR# NONE

NOTE: Several of the link/load files for RTE-6/VM have changed their name to the newer style file names with type extensions. The installation files (LOAD6.CMD and INCI.CMD) have been updated to reflect this.

2.10.15 LI

SR# 4700983098

PROBLEM: If the 5.2 LI is loaded as a non-EMA/VMA program, as per the instructions in the .LOD file, then the message

LI: Insufficient free memory for record buffer; size LI up

is always reported.

SOLUTION: LI now reports this message only if there really is insufficient free memory.

SR# 4700983502

PROBLEM: If the directory information specifying the number of records for a file being listed by LI is incorrect or not up-to-date, LI quits listing the file at the number of records given by the out-of-date directory entry instead of continuing onward. A record count of zero is properly ignored, but there remains a problem for files which are kept open and appended to without updating the directory info, such as /SYSTEM/NS_EVENT.LOG of NS-ARPA/1000. Files updated by programs which did not properly close the file (e.g., were aborted) may also exhibit this behavior. LI should not blindly trust the directory but instead verify that there are no more records past the advertised limit.

SOLUTION: LI now uses the directory's notion of the end-of-file up until that EOF point is reached, at which time LI checks to see if an EOF mark is actually read. If not, LI stops claiming that it knows the EOF position and will read through the file to find the true EOF mark if necessary (as for the "$" command).

SR# 4700984773

PROBLEM: The LI program should check the BReak flag while performing "find-all" pattern searches via the "@" command.

SOLUTION: LI now checks the BReak flag and exits the pattern search if set.

2.10.16 LIF

SR# 4701013235

PROBLEM: LIF hangs in an infinite loop in the IADDR routine.

SOLUTION: This has been fixed at the 6.0 release.

2.10.17 LINK

SR# NONE

PROBLEM: Revision codes in LINK were incorrect and inconsistent. The banner revision code was correct, but the help message revision code was incorrect.

SOLUTION: Both revision codes have been updated to 6000.

2.10.18 LUPRN

SR# 5000559732

PROBLEM: LUPRN will not execute properly if there is not a /SYSTEM directory. The message 'Cannot open "LUPRN driver name file; FMP error = -209' is displayed.

SOLUTION: LUPRN will now check for the absence of the file or the /SYSTEM directory.

Fixed in the 6.0 release of RTE-6/VM.

2.10.19 MACRO

SR# 2200040956

PROBLEM: When MACRO is run to build a MACRO library and a 'table' is requested, the table lines are 1 character too short if the MACRO name is an odd number of characters. (The control statement used here is MACRO,M,T.)

SOLUTION: This has been fixed in &macr6 at revision 6.0.

SR# 2200040972

PROBLEM: If a MACRO library is built with a macro by the name of 'DATA', MACRO will fail when the library is referenced with a "DCB not open" error on the source file.

SOLUTION: This problem is fixed at 6.0. The MACRO opcode tables now all come from the same table source code so they will always be consistent. Further, an internel revision flag is kept with the table and is put in each MACRO library. If they mismatch, an error is generated.

The error is cleared by reprocessing the MACRO library with a special new option in MACRO.

SR# 2200047845

PROBLEM: If the file /libraries/$maclb.mlb is corrupted, running MACRO on prog.mac will result in the error message, "Illegal file position PROG.MAC" instead of any message pointing to the library.

SOLUTION: This has been fixed for the 6.0 release.

SR# 5000125724

PROBLEM: The MACRO/1000 Manual does not document the limit on the number of labels in a MACRO program. However, the real problem is

that MACRO mismanages its symbol table space and, as a result, fails to handle as many symbols as it should.

SOLUTION: This has been corrected for the 6.0 release.

SR# 5000151662

PROBLEM: MACRO emits line number information for include files. DEBUG thinks these are main file line numbers and gets confused.

SOLUTION: At 6.0, Macro will process include files such that each module's DEBUG information will be complete if all code in that module comes from the same file as the Nam record. As a result, entire modules may be in include files without losing debug information. The DEBUG interface does not allow switching files within a module, so DEBUG information that would come from a file other than the Nam record will not be generated.

SR# 5000275271

PROBLEM: When compiling MACRO source which compiled correctly on revision 2540, error 217 (Incomplete expression in operand files) or error 290 (Not enough parameters in microcode call) occur.

SOLUTION: This has been fixed for the 6.0 release.

SR# NONE

ENHANCEMENT: The SEXT opcode was added to MACRO.

Soft EXT op code: SEXT foo

foo may be defined locally but if not is external. CALL can make the routine external while still allowing it to be defined locally.

SR# NONE

NOTE: MACRO was changed to allow the symbol table to be put in EMA/VMA.

2.10.20 MERGE

SR# 4701012120

PROBLEM: The MERGE utility does not always return the proper number of errors in $RETURN1, returning zero when errors occurred.

SOLUTION: At 6.0, MERGE will return non-zero in $RETURN1 for any errors which occur.

SR# 5000534800

PROBLEM: MERGE cannot accept an LU as the destination file; an "Illegal name" FMP error is reported. For example, "merge a b 1" reports this error.

SOLUTION: MERGE now builds a file descriptor without file type and main size fields for destination descriptors which specify an LU number.

SR# 4700974295

ENHANCEMENT: MERGE previously allowed up to 128 characters of source file names to be entered in the runstring. This limit has been increased to 256.

SR# NONE

NOTE: At 6.0, MERGE will not allow relocatables to be MERGE command files. Files of type 5 will be treated as files to be merged, rather than as command files, even if only one file to merge

appears in the runstring.

2.10.21 MPACK

SR# 1650115683

ENHANCEMENT: At revision 6.0, MPACK will set the $RETURN1 variable to indicate successful completion. $RETURN1 will be zero if MPACK completes without any errors.

SR# 2200045229

ENHANCEMENT: At revision 6.0, when removing extents and truncating a file, MPACK will only require the contiguous free space on disk to be large enough to contain the final truncated version of the file. Prior to revision 6.0, MPACK required the free space to be at least as large as the total allocated size of the original file.

2.10.22 MUX

SR# 4701161141

PROBLEM: If the WELCOM file contains only CN30 commands to initialize the MUX, the driver data structures are not completely initialized. In this state, the MUX will function correctly as soon as a normal write or read is processed. If instead a BREAK is received before any other activity, the MUX will hang.

SOLUTION: The driver code has been changed so that the CN30 command does not defeat the AutoGen code and leave the structures incompletely defined.

2.10.23 Miscellaneous

SR# NONE

NOTE: Throughout the RTE products, the word "disc" has been changed to reflect the new spelling, "disk". Please check and be sure you don't have any files that are looking for the old spelling. You can use the new 'grep' utility to search for "disc" in your files.

2.10.24 PRINT

SR# 4701108050

PROBLEM: PRINT0 fails to link in a minimum E-series configuration. Link reports "Program is too large" and terminates.

SOLUTION: The #prin0 link/loader command file has been changed to make the program EB (extended background).

2.10.25 SCOM

SR# 5000562751

PROBLEM: Whenever Scom is run on a FMGR file with a negative security code, Scom reports "Incorrect security code" even if the security code is entered properly in the runstring.

SOLUTION: Scom no longer calls FmpFileName but instead uses the file descriptor as entered in the runstring. This corrects the problem.

2.10.26 Structure Changes

SR# NONE

NOTE: Routine Pas.A1SharedSize has been modified to reflect ID segment changes at 6.0. Libraries PASCAL.LIB, PASCAL_CDS.LIB, and PASCAL_FMGR.LIB are affected by this change.

PLEASE NOTE that although IMAGE-II (92081A) and RJE-II (91781A) have been updated to have the Pascal libraries deleted from their product, updates for RJE-II and IMAGE-II will not be sent out at 6.0. Since the only change to these products is this deletion and the correct version of these libraries are sent out (and installed by) the Operating System, we felt that sending an "update" would just cause confusion.

2.10.27 TF

SR# 1650116459

PROBLEM: TF does not correctly restore group and other protection bits.

SOLUTION: This has been fixed for the 6.0 release.

SR# 4701154088

PROBLEM: TF can memory protect when using a very large group of copy commands.

SOLUTION: This has been fixed for the 6.0 release.

2.10.28 WHOSD

SR# 5000099606

ENHANCEMENT: At revision 6.0 of RTE, WHOSD will report all users of the specified LU, directory or file. WHOSD will now also report open files and active programs.

2.11 (92833A) Pascal/1000

2.11.1 Structure Changes

SR# NONE

NOTE: Routine Pas.A1SharedSize has been modified to reflect ID segment changes at 6.0. Libraries PASCAL.LIB, PASCAL_CDS.LIB, and PASCAL_FMGR.LIB are affected by this change.

PLEASE NOTE that although IMAGE-II (92081A) and RJE-II (91781A) have been updated to have the Pascal libraries deleted from their product, updates for RJE-II and IMAGE-II will not be sent out at 6.0. Since the only change to these products is this deletion and the correct version of these libraries are sent out (and installed by) the Operating System, we felt that sending an "update" would just cause confusion.

2.12 (92836A) Fortran-77 Compiler

2.12.1 DEBUG

SR# 1650140616

PROBLEM: DEBUG cannot display the value of some PARAMETER variables (named constants).

SOLUTION: Since the Fortran connections to DEBUG were developed, DEBUG has been enhanced so that it can handle named constants. At revision 6.0, Fortran has been updated to take advantage of this. Some data types, such as CHARACTER, may not be supported by DEBUG as named constants yet. Also, note that the value displayed may not be the declared value of the named constant. If a constant is passed to a subroutine that clobbers it (in violation of the standard), the displayed value can be either the original value or the clobbering value.

2.12.2 FORTRAN

SR# 1653008573

PROBLEM: If you try to use the $INCLUDE '...' type of entry, the complier fails with a disaster.

The error is: "Problem with include file: no such directory".

SOLUTION: The manual claims that include file names in $INCLUDE directives can be in quotes (as they can be in INCLUDE statements). This was not true and was never the intent. However, for HP-UX compatibility, the compiler will be enhanced at 6.0 to allow quoted file names in $INCLUDE directives.

SR# 4701085191

PROBLEM: FTN7X revision 5270 can erroneously report 105 errors when specifying $SET variables in the runstring and within a $IF/$ENDIF section.

SOLUTION: This has been fixed for the 6.0 release.

SR# 4701127480

PROBLEM: There were some major problems with the handling of $SET variables. The problems usually caused incorrect errors such as error 44 when a reference was made to a $SET variable. The problems were made worse when the cross-reference option (C) was used.

SOLUTION: The handling of $SET variables has been reworked for the 6.0 release.

SR# 4701147942

PROBLEM: The compiler incorrectly allowed a variable in an absolute common block to appear in a DATA statement. The resulting incorrect relocatable file caused an internal error in LINK.

SOLUTION: It is not possible to initialize a variable in an absolute common block using a DATA statement. The compiler will be changed at 6.0 to issue an error for this case, and the manual will be changed to indicate that variables in absolute common blocks may not appear in DATA statements.

SR# 5003052332

PROBLEM: When an assignment expression had a substring of an array element on the left side, it was possible, especially if the right side was not just a simple variable name, that an incorrect warning 106 would be generated.

SOLUTION: Array elements were not supposed to be checked for overlap; this particular check has been removed. Since the compiler was warning about many cases of potential overlap which were really OK, the check has now been placed under a compiler option. Overlap checking is now done only when the "p" option is used.

2.13 (92857A) Basic/1000C

2.13.1 BBMG

SR# NONE

PROBLEM: BBMG opened scratch files for read access only, but it also required write access to these files.

SOLUTION: This has been fixed in the 6.0 release.

2.13.2 COMPILER

SR# 1650025411

PROBLEM: Performing the BASIC/1000C function INT on a real variable and storing the value in an array of DOUBLE or INT either doesn't store the value or makes a program memory protect.

SOLUTION: This has been fixed in the 6.0 release.

SR# 1650042242

PROBLEM: When a BASIC/1000C program opens a type 2 file using 'ASSIGN @Fi TO File$; WIDTH 48,FORMAT OFF', a warning 57 is issued. The file is closed again using 'ASSIGN @Fi TO *'. After a few opens,the program gets aborted with a runtime error 109.

SOLUTION: This has been fixed in the 6.0 release.

SR# 1650141705

PROBLEM: The Basic compiler cannot be invoked from the CM prompt or XQed from the CI prompt.

SOLUTION: This has been fixed in the 6.0 release.

SR# 2200035865

PROBLEM: A compiled Basic program with `IF..THEN..ELSE' memory-protects at run time.

SOLUTION: This has been fixed in the 6.0 release.

SR# 5000116095

PROBLEM: When the BASIC/1000C compiler returns a value from the POS function into an EMA variable, the variable does not receive the value.

SOLUTION: This has been fixed in the 6.0 release.

SR# 5000126540

PROBLEM: The call to TIMEDAY with a local variable works fine; however, with an EMA variable, a call to TIMEDAY causes an EMA error, and the program aborts.

SOLUTION: This has been fixed in the 6.0 release.

SR# 5000139923

PROBLEM: When a Basic/1000C program has CDS ON and single-line functions that forward reference other single-line functions, the compiler does not always patch the forward reference properly.

SOLUTION: This has been fixed in the 6.0 release.

SR# 5000229104

PROBLEM: A compiled BASIC/1000C program which REDIMs a string array will abort with a runtime error.

SOLUTION: This has been fixed in the 6.0 release.

SR# 5000466789

PROBLEM: The function RPT$ in a compiled BASIC/1000C program doesn't work correctly if the count parameter is in EMA.

SOLUTION: This has been fixed in the 6.0 release.

SR# 5000476499

PROBLEM: If a BASIC/1000C program opens and closes a file in shared mode a number of times, the program will get Error 109.

SOLUTION: This has been fixed in the 6.0 release.

SR# NONE

PROBLEM: A compiled BASIC/1000C program could not perform output correctly if the Format string was in EMA.

SOLUTION: This has been fixed in the 6.0 release.

SR# 2200024026

ENHANCEMENT: The Basic/1000C compiler now has been enhanced to return values in the $RETURN variables as follows:

```
return1 = no. of errors
return2 = no. of source lines
return3 = no. of words in data segment (non-cds)
          no. of words in code segment (cds)
return4 = 0    (non-cds)
          no. of words in data segment (cds)
```

This is the same as Pascal.

2.13.3 DEBUG

SR# 1650121483

PROBLEM: Debug cannot display EMA variables for BASIC/1000C programs. Array elements also cannot be displayed correctly.

SOLUTION: This has been fixed in the 6.0 release.

2.13.4 I/O

SR# 1650016394

PROBLEM: If a string does not have its maximum length, the compiled Basic program (or Interpreter) will not output it with packed binary zero in case of binary I/O.

SOLUTION: This has been fixed in the 6.0 release.

SR# 2200027607

PROBLEM: The BASIC/1000C Interpreter does not report an error when a PRINT statement accesses a record greater than 32767. The Compiler reports an error message.

SOLUTION: This has been fixed in the 6.0 release. The compiler now does not report an error when a PRINT statement accesses a record greater than 32767.

SR# 2200036491

PROBLEM: BASIC/1000C does not suppress carriage control to printers.

SOLUTION: It has been decided not to suppress carriage control to printers. Instead, it has been documented in the 6.0 release of the BASIC/1000C Reference Manual (part number 92857-90001).

SR# 4700940460

PROBLEM: The HP-IB driver accepts a Secondary Address as optional parameter 1 of a read or write call. When the user attempts to address secondary address zero, this parameter is passed as 0. In any case, the driver looks at the parameter, and if it finds zero, assumes that no parameter was passed. The reason that BASIC was able to use secondary address zero in the interpreter but not in the compiler was that the interpreter treated secondary address zero as a special case and did the I/O 'manually' instead of using auto-addressing.

SOLUTION: The compiler has been fixed in the 6.0 release.

SR# 4700956045

PROBLEM: If a compiled BASIC/1000C program is loaded to use VMA working space, the input operation from a file will not be performed correctly.

SOLUTION: This has been fixed in the 6.0 release.

SR# 5000184333

PROBLEM: BASIC/1000C (Compiler/Interpreter) cannot open a write-protected file even if only for a read.

SOLUTION: This has been fixed in the 6.0 release.

SR# NONE

PROBLEM: When a BASIC/1000C program accesses LU 1, the interpreter will access the session LU, but the compiler will access the system console.

SOLUTION: This has been fixed in the 6.0 release.

2.13.5 INTERPRETER

SR# 4701078816

PROBLEM: When calling an external routine from the interpreter, the user is allowed to pass up to 3070 words of parameters. However, an SC04 gets generated with much less than 3070 words.

SOLUTION: This has been fixed at the 6.0 release.

SR# 5000297564

PROBLEM: A RE_SAVE in the Basic Interpreter will fail with an FMP error.

SOLUTION: This has been fixed in the 6.0 release.

SR# 5000466797

PROBLEM: The IF-THEN-ELSE statement containing the PRINT statement to print two arguments to a file produces the following errors:

```
  BUG ***22 encountered in BASIC EXECUTOR
or:
  ERROR: (31)  Exceeded width on PRINT when NOWRAP was in effect.
```

SOLUTION: This has been fixed in the 6.0 release.

2.13.6 LINK

SR# 5000264036

PROBLEM: When using LINK_E.LOD (or LINK_V.LOD, LINK_E_CDS.LOD, LINK_V_CDS.LOD) to link a compiled BASIC/1000C program, LINK will generate warning 187. These warning messages are not documented in the manual.

SOLUTION: These warning messages have been documented in the 6.0 release of the BASIC/1000C Reference Manual (part number 92857-90001).

2.13.7 Miscellaneous

SR# 5000129809

ENHANCEMENT: The compiler and the interpreter of BASIC/1000C used to be locked into memory for performance reasons. They are now enhanced to allow swapping.

2.13.8 RBEX

SR# NONE

PROBLEM: As of the 5.1 release, RBEX could not write to a file.

SOLUTION: This has been fixed in the 6.0 release.

2.14 (92860A) Symbolic Debug/1000

2.14.1 CALLS

SR# NONE

NOTE: The Calls and CallM utilities are now shipped with the RTE-6/VM product, as well as with as RTE-A, since Calls is used by the online help facility of DEBUG/1000.

2.14.2 CALLS UTILITY

SR# NONE

PROBLEM: The Calls utility doesn't send some output and prompts to the redirected LU when the "-L" runstring option is used. Debug/1000 uses this feature when its "+L:lu" runstring option is used.

SOLUTION: If the Calls "-L" option argument names an interactive LU or a symbolic link to an interactive LU, all menus and prompts will be redirected to that LU. Otherwise, these prompts are issued to the scheduling terminal.

SR# NONE

NOTE: The Calls utility, which performs online text display by keywords, is fully supported at 6.0. This utility was provided at 5.2 for use by Mail/1000 online help, but was not fully documented. At 6.0, online help and manual information is furnished. The CallM utility, which can be used to generate compressed input files for Calls, is also provided. These utilities are the RTE-A equivalents of the GENIX/CMD/HELP utilities on RTE-6/VM.

2.14.3 Miscellaneous

SR# NONE

NOTE: The two changes made to Debug at patch revision 5261 are included in the 6.0 release. The first change was to ship the correct CDS version of Debug, which was introduced at release 5.26 (revision 5260) but would not execute. The second change fixed a problem in the installation command file, INSTALL.CMD, which inhibited proper installation on RTE-6/VM.

2.14.4 XDB

SR# NONE

NOTE: At 6.0, a version of Debug/1000 with an Xdb-like user interface is included with the Debug product. Xdb will execute only on RTE-A systems with VC+.

2.15 (92861A) Graphics/1000-II DGL Version 2.0

2.15.1 CRT

SR# 2200026377

PROBLEM: The buffer that is returned from the keyboard function ZKYBD with a 12065 card is incorrect. The first half of the returned buffer is correct, the second half is rubbish, and the rest is blank-filled. The returned length (ACTUAL) is correct. Similar symptoms are exhibited by doing an REIO request with the buffer length specified as a byte count. The transmission log that is returned in this case, however, reflects the number of words that were transferred instead of the number of bytes, as it should.

This is a result of the fact that ID*50 and the 12065A always return a word count even when the user specifies a byte count. SR 4700-943357 addresses this anomaly. Currently, DGL is coded to expect this to happen. The problem comes about because DGL is using REIO to make the request, and REIO does not expect this condition.

SOLUTION: K0025 has been modified to specify a word count in revision 6.0.

Computer Museum

SR# 5000542993

PROBLEM: ZDINT on a 12065A (handler D0025) with bit 7 set in the control word prevents the screen from being cleared (as it should), but it also causes the screen to flash. The flash should not occur.

SOLUTION: The END_FRAME command was being sent to the card regardless of the setting of bit7. It should not be sent if bit7 is set. This change affects the Device Handler's Manual, in the 12065 section. The initialization sections of both the Graphics Display Device Handler (AGP Only) and the Graphics Display Device Handler (DGL Only) sections now has the first sentence of the "Graphics Memory" paragraph changed from: Screen cleared unless bit 7 is set... to: Screen cleared and graphics display turned on unless bit 7 is set...

Also, the last sentence of the paragraphs ("Graphics display is turned on.") has been removed.

2.15.2 DIDD

SR# 5000218404

PROBLEM: AGP/DGL should support LUs greater than 63.

SOLUTION: The AGP and DGL subroutines that take an LU parameter have been modified at 6.0 to allow LUs greater than 63.

2.15.3 PLOTTERS

SR# 1650164459

ENHANCEMENT: An HP-GL/2 handler for DGL has been added to support all of the new peripherals that use it. It provides increased speed as well as a decrease in memory requirements for some situations.

SR# 4700968859

ENHANCEMENT: The 7570 handlers (D0070 and D0071) now allow 7575A and 7576A as valid device identifiers returned from the plotter.

2.15.4 PRINTERS

SR# 1650170613

PROBLEM: Several problems in regards to paper handling exist when trying

to use the 2235 Rugged Writer Printer: 1) If a ZDINT is done with bit 7 clear on the D0074 handler, the formfeed that is done is not a conditional formfeed as is documented in the manual; rather, it is an unconditional formfeed.

2) If the D0053 or D0054 handlers are used instead (as suggested in the 2235 section of the Device Handlers Manual), a formfeed is not performed when a ZDINT is done regardless of the setting of bit 7.

3) The D0053 and D0054 handlers leave the paper at a position that is not top-of-form at the end of the job.

The cause of problems 1 and 2 is that the Rugged Writer doesn't support the vertical forms control escape sequence that the 293X printers did. When the 2235 handler was coded, an unconditional formfeed was sent to overcome this problem. A better solution is to send a reset escape sequence to the printer when a ZDINT is done without bit 7 set. Both the 239X and 2235 printers do a conditional formfeed when ZDINT is received. This should be done in D0053, D0054 and D0074.

The cause of problem 3 is that neither of the D0053 and D0054 handlers sends a reset at the end of a job.

SOLUTION: The handlers have been fixed, as detailed above, in the 6.0 release.

SR# 4700950691

PROBLEM: The QuietJet and QuietJet Plus will produce half size plots when low density is used after high density.

The density change escape sequence is only sent on the high resolution plot, and reset printer is never sent. This means that even though high resolution was not specified on the second plot, the density is not reset back to low resolution on the printer, but DGL assumes that it is.

SOLUTION: D0075 and D0076 have been modified at revision 6.0 to always send a set density command in order to ensure that the printer's density matches what the handler thinks it is.

SR# 5003011460

PROBLEM: D0077 leaves the LaserJet in a state that causes the next print to the device to be garbled.

SOLUTION: The handler now sends reset escape sequences instead of form feed characters at revision 6.0.

SR# 5000256099

ENHANCEMENT: A new handler to print color graphics on the PaintJet has been added at the 6.0 release.

2.15.5 TERMINALS

SR# 4701014407

PROBLEM: The 2397 DGL handler (D0060) asks the terminal if it has a locator even when the spooling bit is set. This results in the program aborting with an I011 error (Attempt to input to spooled LU). When the spool bit is set, the handler should assume that the terminal does not have a locator and should proceed without the inquiry.

The spool bit is not being checked before asking the terminal if it has a locator.

SOLUTION: The 6.0 version of D0060 has been modified to only inquire the terminal if the spool bit is not set.

SR# 4701038356

PROBLEM: The escape sequence "Ec *m1mm5Q" is output when a mark is displayed. The "m" immediately preceding the 5 is extraneous, and the action taken upon this by HP graphics terminals is undocumented. The terminals, however, appear to ignore it. The ZMARK code for this escape sequence should be changed to "Ec *m1m5Q" in order to minimize confusion.

SOLUTION: DIDD has had the extra character removed from the escape sequence at revision 6.0.

SR# 2200042424

ENHANCEMENT: The display handlers for the 2393A and 2397A terminals now recognize device IDs of 2393A and 2397A, respectively, in addition to the currently required device ID of 2390A.

2.16 (92862A) Graphics/1000-II AGP Version 2.0

2.16.1 DIDD

SR# 5000218404

PROBLEM: AGP/DGL should support LUs greater than 63.

SOLUTION: The AGP and DGL subroutines that take an LU parameter have been modified at 6.0 to allow LUs greater than 63.

2.16.2 JDINT

SR# 2200022442

ENHANCEMENT: The LU lock bit in the JDINT call was of questionable usefulness given the fact that AGP did not lock the LU until after the device was initialized. A disclaimer regarding this appeared in the paragraph describing the LU lock bit in the JDINT section of the "AGP Version 2.0 Supplement for HP 1000 Systems" (92862-90001). The code has been changed at 6.0 to lock the LU before the device is initialized, and the documentation of this restriction has been removed.

2.17 (94202A) PCIF/1000 Allen-Bradley Handlers

2.17.1 SUBREQUEST MESSAGES

SR# 2200046144

PROBLEM: Whenever an incoming message was NAK'd and retransmitted, the firmware would erroneously leave the bit set that tells the driver there is more data to this message. The driver would then come back and re-read the same data again, thinking that it was the rest of the message; this appended the message to itself. If the appended message was now longer that 250 bytes (the maximum for Allen-Bradley messages), the highway handler would throw this message away. PCIF would eventually time-out, returning an ERROR 38 to the caller.

SOLUTION: The firmware flag that tells the driver there is more data to the message is now cleared whenever a message is retransmitted after a NAK occurs.

SR# 2200046227

PROBLEM: Subrequest messages would get overwritten by subsequent incoming solicited messages that were retransmitted by the data highway. This was due to a buffer-full condition in the firmware buffers. A similar problem occurs for unsolicited messages.

SOLUTION: At 6.0, a separate buffer has been provided for each subrequest message so they don't overwrite other buffers.

SR# 2200045583
SR# 2200046359
SR# 2200046573
SR# 5000214007

PROBLEM: When a 'Cancel-first-buffer' command is sent to the card, the firmware replies by setting the flag but not clearing the backplane data buffer. When the driver picks up the data buffer from the backplane, it frequently contains garbage which sometimes translated into a command that meant that a powerfail occurred.

SOLUTION: This has been fixed for the 6.0 release.

2.18 (94203A) PCIF/1000 Gould-Modicon Handlers

2.18.1 BIT WRITES

SR# 2200045161

PROBLEM: On a GM 484 when there is an odd number of bytes, and the last byte contains less than 8 bits, PCIF swaps all bytes except the last one, which simply gets left-justified. When this takes place in procedure FMT_SWP_DATA_ARRAY, the last byte was being temporarily stored in a variable that wasn't being correctly restored.

SOLUTION: The highway handler now correctly restores the last byte.

2.18.2 MODBUS ADDRESSING

SR# 2200046219

PROBLEM: The variable that temporarily held the PC_Station_Number in procedure, VERIFY_BUFFER, was typed as a signed byte, hence, its maximum value was 127.

SOLUTION: The highway handler has been modified to hold the PC_Station_Number in an unsigned byte (max value 255).

2.19 (94250A) Forms/1000-A

2.19.1 FORMS

SR# 5000161125

PROBLEM: FORMS/1000 treats a timeout as if the enter key were pressed.

SOLUTION: FORMS/1000 now checks the driver bits correctly as specified in the RTE-6/VM Driver Reference Manual.

2.20 (94250B) Forms/1000-B

2.20.1 BUFFER READS

SR# 1650072983

PROBLEM: With F_GETBUFFER, data corruption can be caused by a mismatch between the buffer length variable and the actual length of the read in. This is because FORMS/1000 does not check the actual length of the receive buffer against the length passed to the routine.

SOLUTION: F_GETBUFFER will now validate the buffer length given by the user against the actual buffer length.

2.20.2 FORMS

SR# 1650028761

PROBLEM: When a form is displayed and the window line is on line 24, the

form can jump (the window line causes the form to jump a line, and then it is scrolled down one).

SOLUTION: The terminal setting InhEOLWrp is set ON when the window line is displayed, and left OFF at all other times as per normal.

SR# 5000400150

PROBLEM: At slower baud rates, F_ACTIVATERM will often cause an error 5. Any I/O outside of Forms/1000 before calling F_ACTIVATERM at slower speeds may not have completed when Forms tries to determine the status of the terminal.

SOLUTION: F_ACTIVATERM will try 3 times to check the status of a terminal before failing it. An interval of 1/10th of a second will separate each attempt.

2.20.3 PROGRAM SCHEDULING

SR# 1650044438

PROBLEM: FORMS/1000 always re-enables the primary program which can cause problems with other software scheduling FORMS/1000. The reason is that FORMS/1000 does not know whether the primary program was enabled before it started.

SOLUTION: An optional parameter has been added to the F_DEACTIVATERM to allow for the situation where the primary program does not want to be enabled on termination of FORMS/1000.

SR# 2200041228

PROBLEM: F_DEACTIVATERM only enables primary program scheduling, whereas F_ACTIVATERM disables both primary and secondary program scheduling.

SOLUTION: F_DEACTIVATERM now enables both primary and secondary program scheduling.

2.20.4 REAL FIELDS

SR# 1650119230

PROBLEM: FORMS/1000 does not check that a valid input to a real field will also be acceptable output to that same field.

SOLUTION: FORMS/1000 will only accept a real input as valid if it is an acceptable real output to the same field, if it is not, an error 26 will be generated.

2.21 (98170A) ARPA/1000

2.21.1 FMTRC

SR# 2200047969

ENHANCEMENT: Presently, tracing is only available in octal output. FMTRC has been enhanced to output the trace records in octal, hexadecimal, or NICE format. The NICE format will parse some of the protocols such as TCP and IP into the component fields.

2.21.2 FTP

SR# 1650165365

PROBLEM: An FTP to a VAX running FUSION hangs with both client and server in receive state when verbose is off and an open is done.

SOLUTION: FTP has been modified to correctly parse multiple replies.

SR# 4701067074

PROBLEM: FTP binary get of a FMGR type 1 file does not transfer extents.

SOLUTION: FTPSV and FTP have been modified to call FmpSize for FMGR files.

SR# 4701162040

PROBLEM: BINARY type 6 file transfers do not work between 6.0 and non-6.0 or non-RTE systems.

SOLUTION: Both the source and destination files are now forced to be type 1, thus removing the extents.

SR# NONE

PROBLEM: FTP.HELP does not include the -T option in the runstring.

SOLUTION: This has been fixed in the 6.0 release.

SR# 4701053660

ENHANCEMENT: The HP 1000 FTP server reports the file descriptor of the file being transferred in the 150 server reply to mget/mput.

SR# 4701062877

ENHANCEMENT: The 5.24 FTP does not calculate the file length for a type 2 file and requires that it be specified in the file descriptor. FTP will now calculate the size of type 1, 2, or 6 files from the number of bytes transferred. 6.0 to 6.0 file transfers will also transfer the size.

SR# 5000640045

ENHANCEMENT: FTP has been modified to recognize when the FTP server is an HP 1000. When FTP knows that the server is an HP 1000, it will set the transfer mode to BINARY and transfer the file type, size, and record length along with the file. A new user and server command, SYSTEM, has been implemented. The server will respond with its system type when this command is used.

2.21.3 INETD

SR# 5000621011

ENHANCEMENT: INETD has been added to NS-ARPA/1000 and ARPA/1000 to replace FTPMN and TNMON. Examples are provided for the configuration file, /etc/inetd.conf, and the file that maps service names to TCP ports, /etc/services. Usage and features are described in the on-line help file.

2.21.4 INITIALIZATION

SR# 4701050328
SR# 5000637967

PROBLEM: NSINIT/NETINIT will not accept responses which begin with /D or /E for questions which require a filename.

SOLUTION: NSINIT/NETINIT has been modified to accept responses beginning with /D or /E that contain more than 2 characters when prompting for a filename.

SR# 1653001230

ENHANCEMENT: The default number of networking programs and sockets has been increased from 13 and 38 to 23 and 68, respectively. The default is adjusted to be higher if NFT is used in an NS-ARPA system. This will allow more TELNET and FTP connections in an ARPA/1000 system.

2.21.5 INPRO

SR# 4701116749

PROBLEM: A bug in the A900 microcode (SR #4701-115980) can cause unpredictable behavior in INPRO. In one case, INPRO aborted due to an UI error. The A900 microcode bug causes instructions to be fetched from data space when CDS is on and interrupts are off. INPRO turns off interrupts while reading and updating its timer counter, NS_OS3. The effect depends on what is in the data space.

SOLUTION: INPRO has been modified so that the section which turns interrupts off (CLC 4 ... STC 4) is now non-CDS. This will avoid the bug in the A900 microcode.

2.21.6 INSTALLATION

SR# 4701109009

ENHANCEMENT: NS-ARPA and ARPA programs are now transportable between systems running the same version of RTE-A and networking software. This was accomplished by eliminating the use of non-transportable system entry points by the networking software. As part of this change, the networking modules that are generated into the system have been modified. NSPEC is no longer needed. NSABP is now partitionable. It is no longer necessary to search NSLIB for the DSGLO module during RTAGN's system relocation phase.

2.21.7 PING

SR# 1653001461

PROBLEM: PING does not return all socket resources if the user issues the BREAK command before PING has a chance to report that the given host is unreachable. In this case, only one socket out of the required two sockets will be freed. The other one will never be freed.

SOLUTION: PING will now reset the state of the socket before it terminates. This will allow the socket to be released.

2.21.8 RTE-A FILES

SR# NONE

PROBLEM: The RTE-A files which were included in the 5.24 version of ARPA/1000 are included in the 5.27 and 6.0 releases of RTE-A. They no longer need to be included in ARPA/1000.

SOLUTION: The RTE-A files will be removed from the 6.0 release of ARPA/1000.

2.21.9 TELNET

SR# 5000603407

PROBLEM: TELNET does not act correctly following a close command. If TELNET is given a hostname in its runstring, it should terminate after a close command, but it doesn't. If an invalid command is entered following the close, TELNET will display the Unknown Command message twice and then terminate. When this happens, the terminal port configuration does not get restored.

SOLUTION: TELNET's close command processing has been fixed. If a hostname is given in the runstring, the close command will terminate TELNET. When no hostname is specified in the runstring, TELNET will remain in command mode following a close command. Subsequent commands, valid and invalid, are now processed correctly.

SR# 5003030858

PROBLEM: The port protocol on a TELNET pseudo terminal LU cannot be set to HP-XON/XOFF. A CN,LU,34b,3 command will cause the following error message:

```
I/O device error on LU    xx    The reason is:
I/O request error
Request has been flushed
```

SOLUTION: TNSRV no longer rejects any control requests with function code 34b. TNSRV only needs to know whether it should send the DC1 on a read request, so it just checks bit 1 of the protocol word to determine if HP protocol is being used. It is left up to the drivers to determine if any request is illegal.

Chapter 3
Current Revisions & Changes

This chapter lists the current revision codes for each supported software product and notes any changes that have occurred to the product in this update cycle.

Those products that have been changed in this update cycle are marked with a '+' to the left of the product number. If a product has been updated, the listing will also include:

a) Manuals and

b) Software media

that have been updated (or added) in this update cycle and are being distributed with the subscription services for this product.

If software has been updated for the product, then those modules that have been changed/added/deleted are marked with a '*' to the left of the file name, and the type of update is shown to the right of the current revision code: updated files show the new revision code; added or deleted files are marked as 'New' or 'Deleted' (respectively).

At the 6.0 release, several files have changed part numbers. This has occurred primarily for two reasons. First, as you probably know, all files in HP1000 software products are assigned part numbers when the part changes. As one series of part numbers runs out, a new series must be created. This is what happened to several of the 92077-1xyyy series parts for certain types of files. Second, we decided that significant changes to the software should (in most cases) get a new part number so that older products that use the same part would not have to be changed. You will notice these changes primarily in the 92077A, 92078A, and 92084A products.

Note that updated products may have only manual changes or only software changes. This is noted in the manual or media lists. The manual changes are listed in the format 'Edition#/Update#' and/or 'Print Date'. For example, '2/2' means edition 2, update 2 and '3/-' means edition 3, no update. Also, E1292 means this manual ***edition*** was printed in December 1992. and U1292 means this manual ***update*** was printed in December 1992.

A history of the firmware for both the A and M/E/F Series machines and other miscellaneous interface cards are at the end of this chapter.

12101-80033 (U0805)
12101-80013 (U1005)

Revision 1001

* .FDV produces incorrect results for certain operands.

(See S/N 2106AK-04)

This firmware is included in upgrade kits 12101-60045 and 12101-60046.

3.33.6 A600+ Base Set Firmware

12105-80002 (U0405) 12105-80003 (U0505) 12105-80004 (U0605) 12105-80005 (U0705) 12105-80006 (U0805) 12105-80007 (U0905) 12105-80008 (U1005) 12105-80009 (U0308) 12105-80010 (U0808)	Revision 3 Original Release

12105-80024 (U0405)* 12105-80025 (U0505)* 12105-80026 (U0605)* 12105-80027 (U0705)* 12105-80028 (U0805)* 12105-80029 (U0905)* 12105-80030 (U1005)* 12105-80009 (U0308) 12105-80010 (U0808)	Revision 4 * Changed to fix bugs. .EXIT0, .EXIT1, and .EXIT2 changed to always read the CST from the code map. The JL, JLB, and JLY instructions were altered to execute one machine cycle faster (227 ns). (See S/N 2106BK-05)

3.33.7 A600/A600+ VCP Firmware History

5180-0173 (U606) 5180-0174 (U706)	Revision 4 Original Release
5180-0189 (U606)* 5180-0190 (U706)*	Revision 6 * Changed to fix bugs. Two power-fails in quick succession may result in an incorrect auto-restart. Booting remotely over FDL causes system to hang. Erroneous parity error message if memory is lost. Also several inconveniences are fixed and enhancements added. (See S/N 12102A-01)
12102-80003 (U606)* 12102-80004 (U706)*	Revision 4001 Changed to run with VC+. Also adds boot loaders for 1600 BPI Mag Tape, 3.5" Microfloppy, and 10 MB mini-winchester disc. VCP size is 8K and resides in EPROM. Included in 12107A A600+ Upgrade Kit. (See S/N 2106AK-3)
5180-4253 (U606)* 5180-4254 (U706)*	Revision 4004 * Changed to fix bug. If system disc and CPU are powered up simultaneously the CPU will not auto boot. (See S/N 2106AK-6A)
5180-4263 (U606)* 5180-4264 (U706)*	Revision 4011 * Changed to fix bug. Fixed break disable processing on the 12040B/C MUX. Added boot loader for the 55 Mbyte disc drive. Included in 12107A A600+ Upgrade Kit. Included in ROM Upgrade Kit 5180-4267.

5180-4271 (U606)*
5180-4272 (U706)*

Revision 4020

* A400 release, new I/O table in VCP power-up message. Supports the new serial I/O drivers introduced with RTE-A revision 4.1.

Included in upgrade kit p/n 5180-4274.

Required for D-MUX console.

5181-4286 (U908)*
5181-4287 (U1108)*

Vendor change from ceramic parts to plastic parts.

(See S/N 2436H-02)

5181-8604 (U908)*
5181-8605 (U1108)*

Revision 4021
SCSI Boot Capability

(See S/N 2436H-04)

5181-8657 (U908)#
5181-8658 (U1108)#

Vendor change.

(See S/N 2436H-05)

5181-8667 (U908)#
5181-8668 (U1108)#

Revision 4024

This firmware is included in upgrade kit 5181-8607.

(See S/N 2436H-06)

3.33.8 A700 Base Set Firmware History

12152-80011 (U91)
12152-80012 (U101)
12152-80013 (U111)
12152-80014 (U121)

Original Release

12152-80031 (U91)*
12152-80032 (U101)*
12152-80033 (U111)*
12152-80034 (U121)*

* Changed to fix bug. DDS will skip incorrectly.

12152-80035 (U91)*
12152-80036 (U101)*
12152-80037 (U111)*
12152-80038 (U121)*

* Add Code and Data Separation Instructions. Also several bugs were fixed. .LWD1 and .LWD2 are not privileged instructions. Any instruction in the A/B-Registers which causes an MP violation freezes the computer.

(See S/N 2107AK-01)

This firmware is included in upgrade kit 12152-60043.

REQUIRED TO RUN VC+

12152-80053 (U91)*
12152-80054 (U101)*
12152-80055 (U111)*
12152-80056 (U121)*

Revision 2500
(currently supported Base Set)

* Changed to be compatible with the I/O Extender.

3.33.9 A700 Floating Point History

3.33.10 A700 VCP HISTORY

5180-0173 (U15) 5180-0174 (U35)

Revision 4
Original Release

Revision 6

5180-0189 (U15)* 5180-0190 (U35)*

* Changed to fix bugs. Two power-fails in quick succession may result in an incorrect auto-restart. Booting remotely over FDL causes system to hang. Erroneous parity error message if memory is lost. Also several inconveniences are fixed and enhancements added.

(See S/N 12102A-01)

Revision 4001

12152-80039 (U15)* 12152-80040 (U35)* 12152-80041 (U55)* 12152-80042 (U65)*

* Changed to run with VC+. Also adds boot loaders for 1600 BPI Map Tape, 3.5" Micro Floppy, and 10 Mb mini-winchester disc.

(See S/N 2107AK-01)

Revision 4004

12152-80043 (U15)* 12152-80044 (U35)* 12152-80045 (U55)* 12152-80046 (U65)*

* Changed to fix bug. If system disc and CPU are powered up simultaneously, the CPU will not auto boot.

Included in Upgrade Kit 12152-60043.

(See S/N 2107AK-2A)

Revision 4011

12152-80058 (U15)* 12152-80059 (U35)* 12152-80060 (U55)* 12152-80061 (U65)*

* Changed to fix bug. Break disable did work. Added boot loader for the 55 Mbyte disc drive.

Included in Upgrade Kit 12152-60064.

12152-80065 (U15)*
12152-80066 (U35)*
12152-80067 (U55)*
12152-80068 (U65)*

Revision 4020

* A400 release, new I/O table in VCP power-up message. Supports the new serial I/O drivers introduced with RTE-A revision 4.1.

  Included in upgrade kit p/n 12152-64004.

  Required for D-MUX console.

12152-80069 (U15)*
12152-80070 (U35)*
12152-80071 (U55)*
12152-80072 (U65)*

Revision 4021
SCSI Boot Capability

* Firmware included in upgrade kit 12152-64005.

  (See S/N 2137B-05)

* Changed to fix:

  - self-test error after 50 or more power cycles (duplicated only with 50 Hz power).
  - base relativity problem with VIS instructions.
  - Cross map move bytes (MBxx) instructions now work for all cases.
  - Self-test diagnoses incorrectly with the first 1Mb bank in the 8 Mb memory board has a single bit error.

    (S/N 2139A-30)

  * This firmware is included in kit 12201-60103.

3.33.12 A900 VCP Firmware History

NOTE

The old cache board, part no. 12203-60004, must have the old ROMs (prefix 12203-) and the new cache board must have the new ROMs (prefix 5180-).

12203-80002 (U0908) 12203-80003 (U1208)	Original Release
12203-80005 (U0908)* 12203-80006 (U1208)*	Revision 4001 * REQUIRED TO RUN RTE-A AND VC+ Included in the 12203A Opt. 001 Retrofit Kit.
12203-80007 (U0908)* 12203-80008 (U1208)*	Revision 4001 * Add boot loaders for 1600 BPI Map Tape, 3.5" Microfloppy, and 10 Mb mini-winchester disc. VCP is now in 8K eproms. (See S/N 2139A-3)
12203-80009 (U0908)* 12203-80010 (U1208)*	Revision 4004 * Changed to fix bug. If system disc and CPU are powered up simultaneously, the CPU will not auto boot. (See S/N 2139A-2)

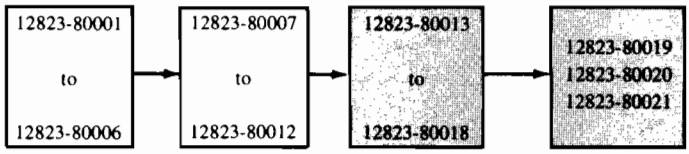
F-Series Scientific Instruction Set ROMs (modules 40, 41, 42, 43)

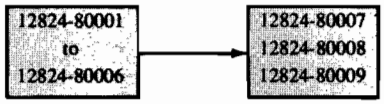


Addition of DPOLY, IATLG, FPWR, and TPWR routines as well as double precision capability.

Fix a bug in the /CMRT routine.

Combination of six 4k ROMs into three 8k ROMs. No microcode changes.

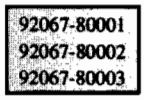
F-Series Vector Instruction Set ROMs (modules 12, 13, 14, 15)



Original release.

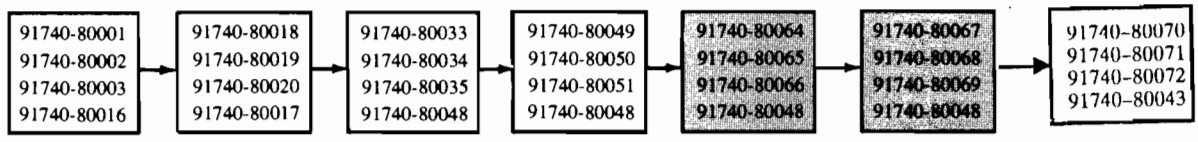
Combination of six 4k ROMs into three 8k ROMs. No microcode changes.

E/F-Series RTE-IVA/B Extended Memory Area ROMs (modules 36, 37)



Original release.

E/F-Series DS/1000 ROMs (modules 38, 39)



Date code 1740

Changed located of microcode addressing from modules 44/45 to 38/39.

Date code 1813

Enhance download capability.

Date code 1826

Enhance communication line noise immunity.

Date code 1913

Removal of potential download problems.

Date code 2003

Change ROM vendor for problems when installed on a FAB computer with in a 2 UCS boards.

Date code 2003

Date code 2540

Includes loader for 7974/8 tape No DS change.

3.33.15 PSI Firmware History

12007B 1000-1000 Modem Interface
12044A 1000-1000 Direct Connect Interface

91750-80008/80009	Original HDLC firmware.
91750-80021	This EPROM replaced 91750-80009. Refer to SN 12007B-04, 12044A-07.
5180-7233	The two 4k byte EPROMs were replaced with one 8k EPROM. Refer to SN 12007B-05, 12044A-08.
5181-6113	ROM from vendor changed. Refer to SN 12007B-09, 12044A-10.

12043A MRJE (Download)

5180-1966	
5180-7290	Refer to SN 12043A-05

12072A Data Link Slave Firmware

5180-1957	Original Data Link slave firmware.
5180-1965	Refer to SN 12072A-01.
5180-1974	No service note written.

12073A 1000-3000 Modem Interface
12082A 1000-3000 Direct Connect Interface

91750-80010/80011	Original BISYNC firmware.
91750-80012/80013	Refer to SN 12073A-1, 12082A-1.
91750-80016/80017	Refer to SN 12073A-2, 12082A-2.
5180-7263/7264	Refer to SN 12082-05 7/87.

12250A (MEF)
12075A X.25 (LAP-B) Modem Interface (A-Series)

5180-1958/1959	Original - Rev 2144 for X.25/1000, PCO 2201.
5180-1975/1976	LAP-B firmware Rev. 2323.
5180-7220/7221	Refer to SN 12075A-03. Rev. 2349.
5180-7232	The two 4k byte EPROMs were replaced with one 8k EPROM. Refer to SN 12075A-05. Rev. 2538.
5180-7260	Current Rev. 2648. Refer to SN 12075A-07.

12092A Multipoint Master Modem Interface

12092-80001/80002	Original Data Link/Multipoint Master firmware.
12092-80003/80004	Refer to SN 12092A-02.
12092-80005/80006	Refer to SN 12092A-05

3.33.16 12040 MUX Firmware History

ROM Part Number	Changes
12040-80001	Original 'A' version.
12040-80002	'A' version. Fixed port lockup due to powering down terminal.
5180-1970	'B' version of the product (12040B). Changes are: - round-robin buffer handling - no echo for control characters handled correctly - split baud rate groups added - character count reset fixed - cancel-all logic for parity fixed - ENQ/ACK handshake counter fixed - QTD modem box capability added - XON/XOFF added
5180-7227	'almost-a-C' version. (Not a warranty upgrade) Changes are: - ENQ/ACK timer changed to 10 seconds - control request can force XON - ports using parity now handle terminal power-downs - BREAK on odd parity ports no longer hangs port - KATAKANA (or character with hi-bit on) no longer hangs port if = terminator
C MUX	
5180-7228	'C' version (12040C, not a warranty upgrade) The only change was to set both BRG-0 and BRG-1 to 9600 baud to simplify use of the MUX as a console.
5181-6125	Vendor change only.
5181-8662	Vendor change only.
D MUX	
5180-7245	'D' version (12040D).
5180-7262	'D' version. Revision 4.11.

5180-7268	'D' version. Revision 5.02.
5180-7289	'D' version. Revision 5.19.
5180-7300	'D' version. Revision 5.20.
5181-8663	Vendor change only.

3.33.17 12076A LAN/1000 Card Firmware

U56	12076-81004	EPROM
U58	12076-81005	EPROM
U291	12076-81006	NOVRAM

3.33.18 12016A SCSI Firmware History

12016-80003	Original firmware (PC board part number 12016-60001).
12016-80005	PC board upgraded for reliability (new PC board part number 12016-60101).
12016-80009	Added SCSI Boot capability. Refer to S/N #12016A-03.

Chapter 4
Usage Considerations

This chapter discusses any significant changes in generation, installation, and usage and their impact for the products that have changed in this revision. Operating system module and system library size changes are also included.

The headers include the product number for that page. This should make it easier to find the usage considerations for a particular product.

4.1 Structure Changes

4.1.1 Pascal Libraries

Routine Pas.A1SharedSize has been modified to reflect ID segment changes at 6.0. Libraries PASCAL.LIB, PASCAL_CDS.LIB, and PASCAL_FMGR.LIB are affected by this change.

Please note that although IMAGE-II (92081A) and RJE-II (91781A) have been updated to have the Pascal libraries deleted from their product, updates for RJE-II and IMAGE-II will not be sent out at 6.0. Since the only change to these products is this deletion and the correct version of these libraries are sent out (and installed by) the Operating System, we feel that sending an "update" would just cause confusion.

4.1.2 Disc to Disk

Throughout the RTE products, the word "disc" has been changed to reflect the new spelling, "disk". Please check and be sure you don't have any files that are looking for the old spelling. You can use the new 'grep' utility to search for "disc" in your files.

4.2 (12016A) SCSI

4.2.1 Software Updates

The 12016A SCSI product includes the SCSI Reference Manual (part no. 12016-90001) and a tape of software necessary to use SCSI devices. This software is also shipped with the RTE-A operating system. Even after the 6.0 release, the tape included with the 12016A product will still contain software modules at revision 5270; this is for customers who run the SCSI product on a revision 5.2 or earlier RTE-A operating system. If you are updating your RTE-A operating system to 6.0, DO NOT use the software included with the SCSI product; use the software shipped with RTE-A. The 5.27 SCSI software is not compatible with the 6.0 RTE-A software.

4.3 (91751A) X.25/1000

4.3.1 Generation Considerations

The file /X25/REL/#X25A.REL no longer exists. The entry points it contained are now in VCTR. Delete the command RE /X25/REL/#X25A.REL from your answer file.

4.4 (91790A) NS-ARPA/1000

4.4.1 INETD

4.4.1.1 Description

Inetd is a monitor for NS-ARPA/1000 or ARPA/1000 systems that listens for incoming connections and schedules the appropriate server to handle the connection. Inetd will listen on up to 30 TCP protocol addresses (or "ports") at once, requiring fewer system resources than if separate programs were to listen for these connections. Inetd must be running before other hosts can connect to the local host through mail, ftp, or telnet. Inetd can be started only by superusers with appropriate privileges. It is started at network initialization time. Inetd also offers an extra level of security by allowing you to specify which hosts

may or may not use a service. A log of connections to services can optionally be kept in the file /etc/inetd.log, along with info about errors encountered and access denials. Currently, inetd supports the following services:

```
smtp   : simple mail transfer protocol
ftp    : file transfer protocol
telnet : TELNET virtual terminal
```

4.4.1.2 Installation

Prior to release 6.0, inetd was installed as part of the Mail/1000 product if SMTP service was installed (on RTE_A VC+ with NS-ARPA). The configuration file "inetd.conf" and the file "services", which maps service names to TCP ports, were both installed in the /SYSTEM directory; inetd was started with the command "xq inetd" in the Welcome file.

For release 6.0, inetd has been enhanced to support ftp and telnet and is installed as part of the NS-ARPA and ARPA products. It is no longer part of the RTE-A product. The installation script "install_ns1000" or "install_arpa" contains the appropriate commands for installing files needed by inetd, including the following files:

```
/programs/inetd.run : executable file for inetd monitor
/etc/inetd.conf     : configuration file that specifies services to
                      listen for
/etc/services       : file that maps services to the TCP port services use
```

Please refer to the on-line help file on inetd for how to set up the services in the "inetd.conf" and "services" files.

4.4.1.3 Important Notes

1. The location of the files "inetd.conf" and "services" have been changed from the directory /SYSTEM to /ETC. In addition, inetd is started up at NS initialization (nsinit) or ARPA initialization (netinit); therefore the "xq inetd" command in the Welcome file can be removed at 6.0.

2. Inetd replaces the ftp and telnet monitors, ftpmn and tnmon. Therefore these monitors should be removed from the /PROGRAMS directory.

4.4.2 Generation Considerations

At 6.0, NS-ARPA and ARPA programs are now transportable between systems running the same version of RTE-A and networking software. This was

accomplished by eliminating the use of non-transportable system entry points by the networking software. As part of this change, the networking modules that are generated into the system have been modified. NSPEC.REL is no longer needed and has been removed from the networking products. The other networking system module, NSABP, is now partitionable. Also, it is no longer necessary to search NSLIB for the DSGLO module during RTAGN's system relocation phase.

The following commands should be deleted from your RTAGN answer file. For ARPA/1000 systems, the global directory would be /ARPA1000.

```
RE /NS1000/REL/NSPEC.REL
SE /NS1000/LIB/NSLIB.LIB DSGLO
```

If you move NSABP into an OS partition, you must include NSABP in a PA command. Otherwise, a dummy version of NSABP will be included from $SYSA.

A few restrictions on program transportability should be noted. Some of the networking programs use labelled system common. These programs can only be moved to other systems with the same system common configuration. The networking software uses the cross map move byte instructions, MBxy, extensively. Older versions of the A900 microcode contain a bug in these instructions. So, programs linked with a snap file that includes an RPL file other than %rpl91 must not be run on an A900 without the latest firmware (Rev. 4). Chapter 3 contains a revision history of the A900 firmware and lists the part numbers for the each revision.

4.5 (92077A) RTE-A Operating System

4.5.1 Peripheral Support Changes

Many new peripherals have been supported since the 5.2 release. Please refer to the RTE-A System Generation and Installation Manual for a complete list of supported peripherals.

4.5.2 A990 Firmware

The RTE-A 6.0 Release includes new capabilities for EMA/VMA. There are now three E/VMA "models": Normal, Large, and Extended. The Extended E/VMA model is only available on A990 computers. Furthermore, to use Extended E/VMA, the firmware revision of the EPROM must be 10 (decimal) or greater. This is because the VMA instruction set microcode was modified at revision 10 for the new capability. The revision 10 EPROM also contains a fix for a bug in the .DIVD instruction (see SR number 4701-162396).

The A990 control store is a writeable control store, so it is possible to modify the instruction set microcode "on the fly", that is, while the computer is executing. If the firmware revision of the EPROM is 9 (decimal), then it is possible to upgrade the instruction set microcode programmatically. This is done with a program called DOWNLOAD. The DOWNLOAD program copies a microcode file (.mic) to control store and also copies the contents of the file to a SHEMA partition in main memory. The copy of microcode in main memory is used in case of power fail. The DOWNLOAD program sets a special flag in the RTE base page. The flag is two words, containing the physical page number of the SHEMA partition. When power returns after a power fail, the VCP looks at the flag and, if necessary, downloads the microcode from the main memory into control store before resuming execution.

The download program and the microcode upgrade file are included as part of the RTE-A 6.0 product. Also included is a program called A990FWID, which allows the user to determine the revision of the A990 EPROM.

To determine the revision of your EPROM, link and run the A990FWID program:

```
CI> wd /rte_a

CI> link a990fwid.lod /programs/a990fwid.run

CI> a990fwid
```

The A990 EPROM contains a directory. The directory contains an entry for the entire EPROM, as well as an entry for each separate piece (or product) in the EPROM.

The A990FWID program will read the entire EPROM directory. You need to look at the revision of product number zero, which is the product number of the entire EPROM. The output of A990FWID (for a revision 9 EPROM) looks like this:

Product Number (in octal)	Supercode/Revision octal	decimal	Product Description
000	000011	9	Entire EPROM
001	000024	20	VCP
002	000002	2	STST0 (Self-test module 0)
005	000001	1	XILINX (memory/IO)
003	000003	3	STSTC (Self-test module C)
011	000002	2	STSTD (Self-test module D)
012	000003	3	STSTE (Self-test module E)
013	000004	4	STSTF (Self-test module F)
014	000002	2	STSTG (Self-test module G)
015	000005	5	STSTH (Self-test module H)
210	000002	2	Baseset Microcode

1. If the revision of the entire EPROM is less than 9 decimal, then you have an EPROM that cannot be upgraded with the DOWNLOAD program. Contact your HP Service Representative to upgrade your EPROM.

2. If the revision of the entire EPROM is 9 decimal, you must use the DOWNLOAD program to download the revision 10 upgrade file.

3. If the revision of the entire EPROM is 10 decimal or greater, then you do not need to use the DOWNLOAD program.

To download the revision 10 upgrade file, link and run the DOWNLOAD program. The new microcode is in the file rev10upgrade.mic:

```
CI> wd /rte_a

CI> link download.lod /programs/download.run

CI> download rev10upgrade.mic
```

NOTE

Since this download operation must be done whenever the machine loses memory, you should put the download command into the system welcome file. This will upgrade the control store contents every time the machine is booted. Just add the following line to the BEGINNING of the welcome file:

```
download /rte_a/rev10upgrade.mic
```

The rev10upgrade.mic file can be copied to a different directory. Remember to change the above line in the welcome file to reflect the current location of the microcode file.

It is possible for the DOWNLOAD program to seriously hang the computer if bad microcode is downloaded. If this occurs, the machine can only be recovered by clearing memory, and cycling power. This is because if battery backup/auto restart is enabled, then the VCP keeps trying to reload the bad microcode every time power is cycled.

The DOWNLOAD program changes the name of the SHEMA partition containing the microcode to "A990 Firmware". This prevents the user from accidentally removing the SHEMA partition. Also, this prevents any subsequent execution of the DOWNLOAD program, since it will not be able to rename its SHEMA partition to that name. If the user wants to remove the microcode upgrade from control store (in effect, reverse the download process), then the machine must be made to lose memory power (that is,

memory is cleared(and then be rebooted.

4.5.3 Primary System Software

The Primary System has changed format at 6.0. It is no longer in ASAVE format but is in FST format. Instead of using ARSTR to load the Primary, a bootable subsystem !RESTORE is used to restore the tape; !RESTORE is a memory-based system that contains the FST utility. The !RESTORE program will prompt the user for information regarding system configuration, then creates the necessary directories and restores the Primary System files to these directories.

For more information, please refer to the RTE-A Primary System Software Installation Manual, part number 92077-90038.

4.5.4 Generation Considerations

4.5.4.1 New Module

A new module, %ENVRN, has been added at 6.0. This module allows the target system to perform EXEC(39) calls, which perform environment variable look-ups for various utilities (such as LI). This module must be relocated as /VCPLUS/%ENVRN in the "system relocation" section of the answer file. The module is partionable; use "PA,ENVRN" to do this before you relocate it.

Please note that if you use %RPL90 or %RPL91 in your system, you will need to relocate the modules mb10, mb12, and mb21 from xmb.rel (153 words) or all of xmb.rel (306 words). Otherwise, you will get undefined external errors.

If you have pre-4.0 RPL files, see the file PRIMARY.ANS in Appendix C for information on xmb modules.

4.5.5 6.0 Software Needed for Generation

The 6.0 revisions of the programs below must be used to upgrade to 6.0. A command file, upgrade60.cmd, is supplied with RTE-A to ease the loading of these programs. See the RTE-A COOKBOOK in Appendix B of the Communicator for details on the procedure.

4.5.5.1 RTAGN

Because of various changes to system entry points and the ID segment format, the 6.0 version of RTAGN is required to generate your 6.0 system. If an earlier revision is used, an error similar to:

```
Missing system entry point: $SHTB
```

will be issued. Check that RTAGN identifies itself as "Rev. 6000" in the banner line.

4.5.5.2 MACRO

The 6.0 version of MACRO is necessary to create macro libraries which can be used by the new MACRO. The standard installation command files will install the proper versions of $MACLB.MLB, $CDSLB.MLB, and $CDSONOFF.MLB. If an existing macro library is not recompiled with the new MACRO, an error will be generated when the 6.0 MACRO tries to use it:

```
21  >> Old macro library.  Try: 'MACRO,-3,,<maclib>'
```

Running MACRO with the suggested runstring will fix the problem. Any custom macro libraries present on your host may also be processed at this time. However, the pre-6.0 version of MACRO will no longer be able to use the library.

4.5.5.3 LINK

The 6.0 revision of LINK must be used to load programs for 6.0 systems because the ID segment format has changed. If an earlier revision of LINK is used, the .RUN files produced will incur an "Illegal program file" error when a 6.0 host attempts to RP them.

4.5.5.4 LINDX

The 6.0 revision of LINDX is required because the pre-6.0 LINDX cannot handle a library as large as $BIGLB has become. The installation files will merge together and index a version of $BIGLB. If the pre-6.0 LINDX is used for this purpose, it will report:

```
Not sized large enough
```

4.5.5.5 BUILD

The new revision of the BUILD program must be used to build a memory-based system at 6.0 for the same reasons the new RTAGN and LINK are needed. If an earlier revision of BUILD is used for a 6.0 system, an error similar to:

*** Illegal file position - snap file

will be generated.

4.5.6 CI Enhancements

4.5.6.1 New CI Variables

The following variables are now predefined by CI: $DATC, $HOME, and $OLDPWD. $PROMPT can now have a value of up to 78 characters.

4.5.7 PWD

4.5.7.1 Path Working Directory

A new command, PWD, has been added at 6.0. PWD displays the current working directory, similar to the pwd command in UN*X.

4.5.8 CD

4.5.8.1 Change Directory

The CD command can take either of two forms. In the first form, it changes the current directory to "argument". If "argument" is '-' the directory is changed to the previous directory ($OLDPWD). The default for "argument" is the value of the $HOME variable.

The second form of cd substitutes the string "new" for the string "old" in the current directory name, $WD, and tries to change to this new directory.

4.5.9 File System Enhancements

4.5.9.1 grep

grep, along with the utility fgrep, is new for the 6.0 release. grep and fgrep search files for lines matching a certain pattern, much the way the UN*X version of grep works. The difference between the two utilities is that grep supports regular expression patterns (similar to EDIT/1000), while fgrep supports fixed strings (making it a fast and compact way of finding text strings). As matches are found, they are copied to the

session LU. Both grep and fgrep are shipped with the RTE-A operating system.

4.5.9.2 ls

ls has been added to RTE-A for the 6.0 release. ls and its related commands list the contents of a directory. ls will report the name of any file matching the mask along with any other information requested. If no mask is supplied, the current working directory will be searched. The output is sorted in ascending collation order.

4.5.10 Mail/1000

Please refer to the MAIL/1000 Manual for details on using the enhancements to Mail/1000 at 6.0.

4.5.10.1 User Interface

Many changes have been made to allow more flexibility in file and folder handling, visual-mode presentation options, etc. For example, at 6.0, the "ignore" command arguments look like the following:

```
mask[:lines]
```

where <mask> is a pattern which matches header field names, and <lines> is the maximum number of lines to print of matching headers (from 0 to 255, default = 0). For example, "ignore to:3" prints up to 3 lines of "To:" header and suppresses any following lines.

4.5.10.2 DNS Client Support

Client support for the Domain Name Service (DNS) is provided at 6.0. If a customer's network is running a nameserver, then Mail/1000 may be configured to query that nameserver for mail routing and IP address info, in accordance with RFCs 1032-1035, 1123, etc.

4.5.10.3 Other Mail Standards

Sendmail replaces domains specified in message headers that are aliases for an official domain to the official name, as per the RFC-822 and RFC-1123 standards.

4.5.10.4 Host Routing

In addition to DNS client support, some other changes have been made to support unusual network setups and such. For example, at 6.0, the file /mail/admin/domainalias.cf may contain entries in the format:

```
fully.qualified.domain : |runstring
```

Here, runstring is a string suitable for FmpRunProgram that will be used to forward mail bound for fully.qualified.domain. The name of the temporary file that contains the message will be appended to the runstring. The message file will contain the routing envelope information at the top; this file is suitable for copying directly into another host's /mail/queue/ directory with name QMSG_x.QIN for further Mail/1000 processing.

4.5.10.5 New Mail Notification

The 6.0 release contains many enhancements in the area of new mail notification, including the ability for individual users to select different notification means based on message subject, sender, etc. Additional features include the following:

"notify off" turns off notifications for your session; "notify on" restores notifications. All notification messages sent while notification is off will be thrown away.

Session numbers may be used in place of logon names to direct messages solely to a single session. For instance, "notify 90 `I'll be back`" sends the message only to session 90.

Special user name "all" sends the message to all logged-on sessions.

4.5.10.6 Installation Process

The InstallMail.cmd file uses CI variables to determine the directories in which software will be installed, much like the NS-ARPA/1000 installation file.

4.5.10.7 uuencode/uudecode

The uuencode/uudecode utilities prepare a file for transmission via mail. Usage is as follows:

```
uuencode [-a] [-d remotedest] input output
uudecode [-a] filename [output]
```

Uuencode takes the named source file and produces an encoded version; this version is in ordinary text form and can be edited by EDIT/1000. The encoding uses only printable ASCII characters. The protections (or "mode") of the file and <remotedest> (for re-creation on the remote system) are included. The `-a' option causes RTE ASCII files to be translated to UNIX ASCII before the file is encoded (a newline character is inserted between each record). For files other than type 1 files or translated ASCII, the "remotedest" will include a full file descriptor including the file type and size.

Uudecode reads an encoded file, strips off any leading and trailing lines added by mailers and recreates the original file with the specified mode and name. The `-a' option causes uudecode to translate UNIX ASCII to RTE ASCII. (Newline characters are stripped out and interpreted as record separators.) If the "remotedest" does not include a file type, uudecode will by default create a type 1 file. If the `-a' option is supplied, the data will be decoded and translated to a type 4 ASCII file.

4.5.11 Size Changes

As an aid for your software development efforts, the size differences are listed here from the last update in the operating system modules and system libraries. Dots are place-holders, meaning that the module did not exist at that release. The percentage difference reported on the last row of the table is the average percentage change of those modules that have been changed. There is a summary following the table. The "# of size differences =" is the number of modules that existed in the 5.27 release and have changed in size. The "# of unique names: Rev.5270 =" line is the number of modules that existed in the 5.27 release and have been deleted at 6.0 release. The "# of unique names: Rev.6000 =" line is the number of modules that are new for the 6.0 release.

In addition we have given the size differences for BIGLB and BGCDS comparing these 6.0 libraries with and without symbolic links.

4.5.11.1 Operating System Size Differences

4.6 (92078A) VC+

4.6.1 CI Enhancements

There have been many changes to the CDS version of CI at 6.0, summarized below. Please refer to the RTE-A User's Manual for details on the new functionality.

4.6.1.1 Load File Name Changes

Two load file names have changed at 6.0: #CI is now CINC.LOD, and #CIC is now CI.LOD.

4.6.1.2 Command Aliases

Command aliasing has been implemented in VC+ at the 6.0 release. This allows a user to create new commands or cause standard commands to perform differently by replacing the original command with a new command: an alias. The new command can be a letter or a short word that, when typed, will be expanded by CI into the alias value. Anything that followed the alias in the original line now follows the expanded value.

4.6.1.3 Functions

Functions are similar to aliases. They can be thought of as memory-resident command files. Functions can include positional parameters and IF-THEN-ELSE or WHILE-DO-DONE constructs. They can be entered interactively from CI or via a CI command file.

4.6.1.4 Exporting Variables, Aliases, and Functions

At 6.0, users will be able to use CI's user variables in other programs, along with any defined aliases or functions, by exporting them to the Environment Variable Block (EVB). The syntax for SET has changed to allow for this capability. Individual exported variables can be accessed programmatically using the new EXEC(39) calls. (See the RTE-A Programmer's Reference Manual for more detail on these EXEC calls.) Note that the EVB uses dynamic memory and is non-swappable until the session logs off.

4.6.1.5 New CI Variables

The following variables are now predefined by CI: $COLUMNS, $DATC, $EVB_SIZE, $HOME, $KILLCHAR, $IFDVR, $LINES, and $OLDPWD. In addition, $KILLCHAR, $REPROMPT, and $VISUAL are initially undefined, but once defined have significance to CI. The following variables are automatically exported on start-up: $COLUMNS, $LINES, $HOME, $OLDPWD, and $WD. The last three variables must remain exported. $PROMPT can now have

a value of up to 78 characters.

4.6.1.6 CZ

The previous VC+ command CD, used to display or modify CDS code partition size, has been renamed to CZ to accommodate users who need this functionality.

4.6.1.7 Tilde Expansion

Tilde substitution involves substituting values of certain variables for the character "~" in a file name. A "~" by itself is replaced with the value of $HOME. "~+" is replaced with the value of $WD. "~-" is replaced with the value of $OLDPWD. In order for a ~string to be expanded, it must occur at the beginning of a parameter; also, it must either be at the end of the parameter or be followed by a "/".

4.6.1.8 Command Line Editing

By setting the $VISUAL CI variable, you can select the desired command line editing mode. The supported modes are EMACS, GMACS, VI, and CSH. The EMACS, GMACS, and VI modes enable command editing functions much like the HP-UX ksh program. Setting $VISUAL to CSH enables a mode that provides some of the editing features of the HP-UX csh program. In the CSH mode, only the file name completion, command line directory lists, and command line control functions are available. The csh-style history substitutions are not available.

While editing the current line, the $VISUAL editing mode allows you to edit lines that are longer than your current screen width by scrolling through the line. For lines that are longer than the current screen width, the following symbols are displayed at the end of the line:

> indicates that the line extends to the right.
< indicates that the line extends to the left.
* indicates that the line extends in both directions.

The current line is centered around the cursor as the cursor moves across the line. The default "viewing" width is 80 characters. Use the $COLUMNS variable to redefine the width.

Setting $VISUAL to EMACS, GMACS, VI, or CSH also has an effect on the functionality of the RTE command stack. By default, the RTE command stack routines do not insert duplicate lines in the stack. When setting $VISUAL, duplicate lines are allowed in the stack. To override this behavior, a ",NODUPES" can be added to the visual mode. For example, to use the VI editing mode without saving duplicate lines in the command stack, set $VISUAL to "VI,NODUPES".

The use of the $VISUAL editing modes is only supported when used with the HP 12040D 8-Channel MUX, the HP 12100A 4-Channel OBIO, or with a telnet psuedo terminal LU. FIFO mode is required when using the command editing features. When a port is not already in FIFO mode and command editing is enabled, the port will be reconfigured to enable FIFO mode after each prompt is issued. After the command line is terminated with the RETURN key, the previous state of the port is restored.

4.6.1.9 Command Editing Performance Considerations

For optimal performance when using command editing, the port should be configured to use FIFO mode and XON/XOFF handshaking. For example,

```
CI>     cn,$session,33b,100000b     !     enable     FIFO     CI>
cn,$session,34b,101b ! enable XON/XOFF Protocol (Force type 5)
```

When using XON/XOFF, the port must be in FIFO mode and the terminal's "G" (inhibit handshake) and "H" (inhibit DC2) straps must be set to allow the use of the standard RTE command stack and also the Edit/1000 screen mode function.

The required monitor program CMPLT should also be RP'ed and executed without wait in your WELCOME file as follows:

```
rp,/programs/cmplt.run
xq,cmplt
```

The CMPLT program performs the file name/command completion and the command line directory lists for the various command line editing modes. When a file name completion is requested, CMPLT is scheduled by CI to complete the file name. If CMPLT is already busy with another request, the system clones a copy of CMPLT for your request. To disable cloning, CMPLT can be linked as a system utility. In this case, when it is busy, the system will queue schedule CMPLT.

It is preferable to RP CMPLT as a permanent ID segment rather than a proto-id segment. When CMPLT is RP'ed as a permanent program and executed, it detaches into the system session and terminates serially reusable. Performance on global directory name completions or global directory lists is enhanced because CMPLT keeps a cache of the global directory names. When CMPLT is not RP'ed as a permanent program, the benefits of this cache are lost.

4.6.1.10 File Name and Command Name Completion

In addition to command line editing, the new features at 6.0 allow file name and command name completion. The user types enough of the name to be

unique, and CI fills in the rest. If the amount typed is not unique, the file or command name will be completed up to the point where the names differ.

If a name is the first word typed in a CI command line, command name completion is used; otherwise, file name completion is used.

4.6.2 Symbolic Links

The ability to use symbolic links is now part of the RTE-A/VC+ operating system. A symbolic link is a type of file that indirectly refers to a path name, which can be either a relative or an absolute path name. A symbolic link can refer to any FMP file, FMP directory, or logical unit. Symbolic links can also be used to refer to remote files by using the DS transparency syntax. At revision 6.0, WHOSD will report all users of the specified LU, directory, or file. WHOSD will now also report open files and active programs.

4.7 (92084A) RTE-6/VM Operating System

New functionality has been added to the RTE-6/VM product at the 6.0 release. A summary is below.

4.7.1 CI Enhancements

4.7.1.1 New CI Variables

The following variables are now predefined by CI: $DATC, $HOME, and $OLDPWD. $PROMPT can now have a value of up to 78 characters.

4.7.2 PWD

4.7.2.1 Path Working Directory

A new command, PWD, has been added at 6.0. PWD displays the current working directory, similar to the pwd command in UN*X.

4.7.3 CD

4.7.3.1 Change Directory

The CD command can take either of two forms. In the first form, it changes the current directory to "argument". If "argument" is '-' the directory is changed to the previous directory ($OLDPWD). The default for "argument" is the value of the $HOME variable.

The second form of cd substitutes the string "new" for the string "old" in the current directory name, $WD, and tries to change to this new directory.

4.7.4 WHOSD

4.7.4.1 Report Users of Directory

At revision 6.0, WHOSD will report all users of the specified LU, directory, or file. WHOSD will now also report open files and active programs.

4.7.5 CALLS

4.7.5.1 Online Help Facility

The Calls utility provides a general-purpose help facility, used either as a help subsystem for other programs or as the interface to a "database" of information grouped by keywords. Calls looks up keywords entered by the user in a catalog containing definitions of keywords and associated text, displaying that text. Additionally, the catalog can specify hierarchical groupings of keywords and can suggest related keywords that may be of further interest after the text for a certain keyword is viewed.

The runstring syntax is:

```
Calls [-flags] [keyword]
```

where

flags is a string of characters preceded by a dash (-). Where an argument is required, the next word in the runstring is consumed, delimited by blanks or a comma. The flags are:

C catalog

The name of the Calls catalog to use. By default, directory "/Catalogs/" and type extension ".call" are added to the given name. The default catalog is "/Catalogs/Calls.call".

L listfile

Divert the text listing to the named file. By default the text is listed to the terminal.

P pagesize

Set the number of lines per page for "More..." prompting on the terminal. The default size is 22 lines.

B

Build the index file and terminate. See the discussion below on index files.

keyword is the keyword for which the associated text is to be listed. If not given, then the default keyword ("[default]") for the selected catalog is listed.

For example, "calls -c utils -p 5" and "calls -cp utils 5" both use catalog "/Catalogs/Utils.call" and five lines per page.

At certain times Calls may prompt you to select another topic to display with:

Put cursor on desired name or type new name, press return.

This occurs when no topic keyword is given in the runstring, or when a mask is given. This also occurs when the topic selected has other topics associated with it, which you may want to also read.

When you press carriage return, Calls reads the line under the cursor from the screen, isolates the word under or to the left of the cursor, and uses that word as the new topic name. If there is no word to the left or under the cursor, Calls looks to the right of the cursor. If there is no word on the line at all, Calls terminates. Calls isolates the word by looking for blanks, commas or ')'s. To terminate Calls, type carriage return on a blank line.

If an unknown keyword is given, Calls lists the 16 keywords in ASCII-betical sequence around the given keyword, and then goes interactive as above.

The catalog is a text file, possibly compressed by the CallM utility, which acts as a data base containing keywords and explanatory text. The default catalog name is actually based on the name by which Calls is scheduled (that is, the second word in the received runstring). If Calls is RP'ed under a different name or the .RUN file is renamed, the new name becomes the default catalog name for that copy. For example, "rp calls utils" and then executing UTILS uses default file "/Catalogs/Utils.call".

The first time Calls is run on a catalog and after subsequent updates of the catalog, Calls builds a file called the index file in the same directory and with the same name as the catalog, but with type extension ".indx". More specifically, if the index file is missing or has an update timestamp that is older than the corresponding catalog, Calls rebuilds the index file. Calls will also attempt to rebuild the index if it appears that the index is invalid for the catalog, even if the update timestamps are in order. The index contains FMP internal file position pointers into the catalog file for the various topics, plus the keyword list and associated topic groupings. This means that the first person to run Calls on a catalog after an update must have write access into the catalog directory for the index file to be successfully created. It is suggested that the system manager installing a new catalog immediately run Calls on the catalog with the "-b" option to build the index.

Calls catalog files may be plain text files in the format given below, but more commonly the final catalog is built by the CallM utility, which

merges together plain text files and performs text compression on the result. Additionally, CallM can extract Calls catalogs from comments in source code. Enter "? callm" from CI for more information about the CallM utility.

4.7.6 Manual Updates

The manuals for the 6.0 update will be distributed at a later date. The manual numbering file, M92084, that is currently shipped with the product reflects the last manual update. A new manual numbering file with the correct manual information (along with an update sheet for Chapter 3 of the Communicator) will be provided with the 6.0 manuals.

4.7.7 Size Changes

As an aid for your software development efforts, the size differences are listed here from the last update in the operating system modules and system libraries. Dots are place-holders, meaning that the module did not exist at that release. The percentage difference reported on the last row of the table is the average percentage change of those modules that have been changed. There is a summary following the table. The "# of size differences =" is the number of modules that existed in the 5.27 release and have changed in size. The "# of unique names: Rev.5270 =" line is the number of modules that existed in the 5.27 release and have been deleted at 6.0 release. The "# of unique names: Rev.6000 =" line is the number of modules that are new for the 6.0 release.

4.7.7.1 Operating System Size Differences

There are no size changes in the Operating System for the 6.0 release.

4.7.7.2 Driver Size Differences

4.8 (92131A) QDM/1000

4.8.1 FORMS/1000 Libraries

The FORMS/1000 libraries that are part of the QDM/1000 software changed at the 6.0 release. The QDM/1000 software will be sent to customers on support for QDM/1000 under separate cover. Only those modules in QDM/1000 that are changing will be shipped. Refer to Chapter 3 in this document for a list of the changing FORMS/1000 libraries in the QDM product.

4.9 (92860A) Debug/1000

4.9.1 xdb Compatibility Mode

xdb provides an interface to Symbolic Debug/1000 that is similar to the xdb debugger for HP-UX. xdb provides a superset of Debug/1000 functionality; xdb contains all Debug/1000 functionality plus a new set of xdb-like commands. Any Debug/1000 command line may be entered by preceding it with a colon. Both xdb and Debug/1000 may be used on the same system. Note that in xdb mode, the term "current location" refers to the location currently listed on the screen rather than the point of suspension of execution.

Also note that the command stack saved in the .DBG file will contain either Debug/1000 commands, xdb commands, or both, depending on which utility has been used to debug the program in the past.

One useful feature of xdb is record/playback. This feature helps re-create program states and record all debugger output. It is particularly useful for bugs requiring a lengthy set-up.

Note: there is a significant difference between xdb/1000 and xdb for HP-UX in the area of record/playback. xdb/1000 does not implement separate files for "record" and "record-all". Turning on one of these features will close the file associated with the other, if any.

4.10 (92861A/92862A) AGP/DGL

See the AGP/DGL Device Handlers Manual for more information on the device handler changes to the Graphics software.

4.10.1 LUs > 63

The change to have AGP/DGL support LUs greater than 63 has been much-requested and has been implemented for the 6.0 release.

4.10.1.1 HP-GL/2 Handler

A new handler is required to drive new plotters and printers that support HP-GL/2. This handler is supplied with 6.0 and will meet the needs of future graphics peripherals supported on the HP 1000.

4.10.2 PaintJet Support

A new handler has been added to support devices such as the HP PaintJet and DeskJet 500C.

4.11 (98170A) ARPA/1000

4.11.1 INETD

4.11.1.1 Description

Inetd is a monitor for NS-ARPA/1000 or ARPA/1000 systems which listens for incoming connections and schedules the appropriate server to handle the connection. Inetd will listen on up to 30 TCP protocol addresses (or "ports") at once, requiring fewer system resources than if separate programs were to listen for these connections. Inetd must be running before other hosts can connect to the local host through mail, ftp, or telnet. Inetd can be started only by superusers with appropriate privileges. It is started at network initialization time. Inetd also offers an extra level of security by allowing you to specify which hosts may or may not use a service. A log of connections to services can optionally be kept in the file /etc/inetd.log, along with info about errors encountered and access denials. Currently, inetd supports the following services:

```
smtp   : simple mail transfer protocol
ftp    : file transfer protocol
telnet : TELNET virtual terminal
```

4.11.1.2 Installation

Prior to release 6.0, inetd was installed as part of the Mail/1000 product if SMTP service was installed (on RTE_A VC+ with NS-ARPA). The configuration file "inetd.conf" and the file "services", which maps service names to TCP ports, were both installed in the /SYSTEM directory; inetd was started with the command "xq inetd" in the Welcome file.

For release 6.0, inetd has been enhanced to support ftp and telnet and is installed as part of the NS-ARPA and ARPA products. It is no longer part of the RTE-A product. The installation script "install_ns1000" or "install_arpa" contains the appropriate commands for installing files needed by inetd, including the following files:

```
/programs/inetd.run : executable file for inetd monitor
/etc/inetd.conf     : configuration file that specifies services to
                      listen for
/etc/services       : file that maps services to the TCP port services use
```

Please refer to the on-line help file on inetd for how to set up the services in the "inetd.conf" and "services" files.

4.11.1.3 Important Notes

1. The location of the files "inetd.conf" and "services" have been changed from the directory /SYSTEM to /ETC. In addition, inetd is started up at NS initialization (nsinit) or ARPA initialization (netinit); therefore the "xq inetd" command in the Welcome file can be removed at 6.0.

2. Inetd replaces the ftp and telnet monitors, ftpmn and tnmon. Therefore these monitors should be removed from the /PROGRAMS directory.

4.11.2 Generation Considerations

At 6.0, NS-ARPA and ARPA programs are now transportable between systems running the same version of RTE-A and networking software. This was accomplished by eliminating the use of non-transportable system entry points by the networking software. As part of this change, the networking modules that are generated into the system have been modified. NSPEC.REL is no longer needed and has been removed from the networking products. The other networking system module, NSABP, is now partitionable. Also, it is no longer necessary to search NSLIB for the DSGLO module during RTAGN's system relocation phase.

The following commands should be deleted from your RTAGN answer file. For ARPA/1000 systems, the global directory would be /ARPA1000.

```
RE /NS1000/REL/NSPEC.REL
SE /NS1000/LIB/NSLIB.LIB DSGLO
```

If you move NSABP into an OS partition, you must include NSABP in a PA command. Otherwise, a dummy version of NSABP will be included from $SYSA.

A few restrictions on program transportability should be noted. Some of the networking programs use labelled system common. These programs can only be moved to other systems with the same system common configuration. The networking software uses the cross map move byte instructions, MBxy, extensively. Older versions of the A900 microcode contain a bug in these instructions. So, programs linked with a snap file that includes an RPL file other than %rpl91 must not be run on an A900 without the latest firmware (Rev. 4). Chapter 3 contains a revision history of the A900 firmware and lists the part numbers for the each revision.

Chapter 5
Media Installation and Update Procedures

Customers on Update Media subscription services will receive updates to software on magnetic tapes, CTDs, or DDS tapes, depending on the option they have ordered. This chapter contains information concerning the format of update/new media and should be used in conjunction with product configuration/installation manuals when removing software from the media.

```
**********************************************************
*   Look at the media label and determine what format    *
*   is used.  Then find the section in this chapter      *
*   which corresponds to the media format (sections      *
*   are organized by format).  Follow the instructions   *
*   in that section to restore the files from the        *
*   media.                                               *
**********************************************************
```

5.1 General Information for Update Customers

1. *BACK UP YOUR disk BEFORE PROCEEDING.*
   This will insure that you can always return to your original system and start over.

2. *VERIFY YOUR BACKUP COPY.*
   It is suggested that you make two copies and verify them both.

3. The typical procedure for updating your system is to replace the existing files on your system with the files supplied on the media. When possible, you may want to store the new file to disk on a different CRN or volume. Then, when you're sure it has transferred correctly, purge your old copy. This is just to ensure that you get a good copy of the new file before you destroy your old one.

After you have installed your software:

1. Generate your new system right away. If there have been any errors in the transfer process, they wiill probably be detected this way.

2. Check the revision codes of your software as they appear in the generation map against those listed in the software numbering catalog or file, and make sure you have not left out any modules.

3. Boot, initialize and use your newly generated system to make sure that it works correctly.

4. Make backup copies of your newly generated system. Use a new tape to backup your system. Keep the old copy until it is time to update once again, and then use it to backup the next 'new' system. This way you will keep at least two revisions backed-up by rotating your media.

5. Keep the update media together with your old backup media. If you diskover problems later, you will always be able to get back to where you started and go through the installation procedure again.

NOTE

If Operating System software has not changed and there are no changes affecting your generation (e.g., generated-in libraries), then regeneration is not necessary and on-line reloading will be sufficient. Otherwise regeneration is necessary before reloading on-line.

5.2 Media Installation Procedures

Software is stored on media in one of several formats. Note that each physical media carries a label identifying the part number of the media, a description, and a revision code.

On media with files to be restored to hard disk there is a file called "HPHPHP" which describes each of the software parts. Information provided for each part includes

Part number
Software revision code
Module number
File type
File name
Directory path

All media (i.e., each tape), with a revision code after 2340 (all software updated at DSD4.0 is 2540 or greater) will have an HPHPHP file. The exception to this rule is diagnostics: they do not have the HPHPHP file.

The information in HPHPHP is helpful if you want to know what files are on the medium. For example, if the medium was missing a software module that was listed in HPHPHP, you would call your support office and request the missing software.

On each tape HPHPHP is the first file. On floppies, HPHPHP is the first file appearing in the directory listing. The HPHPHP file has no part number. Diagnostics and primary systems do not require an HPHPHP file.

5.3 'FST' Format for Restoring TF or FST Format Tapes

Please consult with the *Utilities Reference Manual* (92077-90004 or 92084-90007) on how to use the 'FST' utility.

A tape contains one or more products, each product being identified by a global directory. The HPHPHP file contains a list of all files on that tape. Here is an example on how to use 'FST':

```
CI> fst
FST> mt,<lu>
FST> verify
FST> re
     (NOTE: If tape is in FST format, FST will report the file count.)
FST> go
FST> ex
```

This would copy all files from the tape LU to your disk under the directory names that the files are stored on the tape.

5.4 'TF' Format for Restoring TF Format Tapes

Please consult with the Utilities Reference Manual (92077-90004 or 92084-90007) on how to use the 'TF' utility.

A tape contains one or more products, each product being identified by a global directory. The HPHPHP file contains a list of all files on that tape. Here is an example on how to use 'TF':

```
CI> tf
TF: co,<lu>,,v
```

This would copy all files from the tape LU to your disk under the directory names that the files are stored on the tape.

The above is the preferred and less complicated way. However, if you want to selectively restore certain products, follow the directions below.

```
CI> tf
TF: co,<lu>{/global1/},/global2/,v
```

where
- <lu> = LU of the tape
- global1 = Global directory identifying the files for a given product on the tape.
- global2 = Global directory on your system
- v = verify

This will copy all the files from the tape with global directory /GLOBAL1 onto the disk on directory /GLOBAL2 and will verify each transfer. Files with duplicate names will not be copied and duplicate file errors will occur. To replace duplicate files, use the 'D' option.

5.5 VCP Bootable Format for CS/80 CTD

'VCP Bootable' means that these files are loaded directly from tape into memory, then executed by following the instructions in the appropriate diagnostic manual. The CTD media update in this format replaces the older version of the media. Refer to the appropriate diagnostic manual.

5.6 Customized Tapes

All Update tapes for RTE-A and RTE-6/VM are in FST format. Subsystems are customized in TF format.

The following products are currently shipped out in various Customized

Update tapes; not all are being sent out at this release:

DIRECTORIES	PROD.NAME	PROD.NUMBER	STANDARD FMT
/DS1000/	DS/1000	91750A	TF
/X25/	X.25	91751A	TF
/RJE/	RJE/1000-II	91781A	TF
/MRJE/	MRJE/1000	91782A	TF
/LAN/	LAN/1000	12076A	TF
/NS1000/	NS-ARPA/1000	91790A	TF
/DATAPAIR/	Datapair/1000	92050A	TF
/RTE_A/	RTE-A	92077A	FST
/VCPLUS/	VCPlus	92078A	TF
/IMAGE2/	Image/1000-II	92081A	TF
/RTE_6/	RTE-6 VM/OS	92084A	FST
/Pascal/	Pascal/1000	92833A	TF
/FTN7X/	Fortran 77	92836A	TF
/BASIC/	Basic/1000-C	92857A	TF
/DEBUG/	Symbolic Debug	92860A	TF
/GRAPHICSV2/DGL/	DGL/1000 V2	92861A	TF
/GRAPHICSV2/AGP/	AGP/1000 V2	92862A	TF
/PCIF/	PCIF/1000 #1	94200B	TF
/PCIF/	PCIF/Get_Start #2	94200B	TF
/PCIF/AB/	PCIF/AB Handler	94202A	TF
/PCIF/GM/	PCIF/GM Handler	94203A	TF
/FORMS/	Forms/1000A	94250A	TF
/F1000/	Forms/1000B	94250B	TF
/ARPA/	ARPA/1000	98170A	TF

There are two methods for restoring the contents of the customized update tape to the hard disk:

1. The first method is to use TF to copy the entire tape to the CI directories. Then copy the products that have FC as a standard format to a FMGR cartridge and purge the CI directory that was associated with it. This method is used if your system has a CI volume with enough space to contain all the files on the customized update tape.

   ```
   CI> tf
   TF: co <lu> ,, v              (Copy tape to specified directories)
   TF: ex
   CI> co /Directory/ ::crn1 p   (One CO command for each product whose
                                  standard format is FC)
   ```

   For example, suppose Pascal, Fortran 77, and Image-II are all on a single customized update tape. You would enter the following command sequence:

   ```
   CI> tf
   ```

```
TF: co 9 ,, v              (Copy the entire tape to a CI volume)
TF: ex
CI> co /ftn7x/ ::F7 p      (Copy the contents of /FTN7X to cartridge F7
CI> pu /ftn7x               and purge directory /FTN7X)
```

In this example, LU 9 is the LU of the tape drive on which the customized update tape is mounted. Cartridge F7 must exist on your system. Also, by defaulting the destination parameter in the TF CO command, Pascal and Image-II are copied to directories /PASCAL and /IMAGE2 respectively.

2. The second method is to enter TF and use the group copy command to copy all the products directly to the disk. This method is used if your system does not have a CI volume with enough space to contain all the files on the customized update tape.

   Enter one TF CO command for each product in the customized update tape. All products whose standard format is FC are copied directly from the tape to a FMGR cartridge and all products whose standard format is TF are copied directly to a CI volume.

```
CI> tf
TF: gr
TF: co <lu>{/Directory/} ::crn1 v  (One TF CO command for each product
     .                              whose standard format is FC)
     .
     .
TF: co <lu>{/Directory/} ,, v      (One TF CO command for each product
     .                              whose standard format is TF)
     .
     .
TF: eg
TF: ex
```

   For example, suppose Pascal, PCIF, Fortran 77, and Image-II are all on a single customized update tape. You would use the following command sequence:

```
CI> tf
TF: gr
TF: co 9{/Pascal/},,v          (Copy Pascal to directory /PASCAL)
TF: co 9{/Image2/},,v          (Copy Image II to directory /Image2)
TF: co 9{/Ftn7x/},::F7,v       (Copy Fortran 7X to cartridge F7)
TF: co 9{/PCIF/},::D2,v        (Copy PCIF to cartridge D2)
TF: eg
TF: ex
```

   In this example, LU 9 is the LU of the tape drive on which the customized update tape is mounted. Cartridges F7 and D2 must exist on your system.

As you can see from method 2 above, you can copy down products selectively if you do not have enough disk space.

5.7 Additional Formats

For media in other formats such as ASAVE, PUSHBUTTON SAVE, LSAVE, and READT/WRITT, refer to the appropriate utilities manual and/or installation guide.

Note that some subsystem software may have a transfer file or other means of restoring files from media. See the appropriate configuration guide or reference manual for specific information.

RTE-A 6.0 Installation Cookbook	APPENDIX A

This appendix is intended as a guide to assist you in updating your HP 1000 RTE-A system from version 5.2 or 5.27 to version 6.0. Before beginning, read the RTE-A (92077A) section in Chapter 4 of the Communicator. The RTE-A section explains any the changes and impacts and lists the names and sizes of each system library module.

1. **Backup your system with ASAVE.**

   Make sure you have a memory-based ARSTR system which you can use to restore the ASAVE of your system. Refer to Chapter 3 of the ***RTE-A Utilities Manual*** for details on ASAVE and ARSTR.

2. **Copy the 6.0 version of the RTE-A and VC+ products from tape to /RTE_A and /VCPLUS.**

   A. Begin by clearing some room on a CI volume and creating the global directories /RTE_A and /VCPLUS. Create the sub-directory /GEN/REV60 to hold the answer, system, and snap files. If /RTE_A and /VCPLUS already exist, then purge everything in them before loading the 6.0 software onto the system.

      /RTE_A will require about 40000 blocks, and /VCPLUS will require about 12000 blocks.

   B. Use FST to copy the software off the update tape to the newly created directories. For additional details on FST, consult the ***RTE-A Utilities Manual***.

```
CI> crdir /rte_a
CI> crdir /vcplus
CI> crdir /gen/rev60
CI> FST mt<tape lu>|re @|ve|go
```

3. **Modify your answer file for the 6.0 changes.**

   (Refer to the "Generation Considerations" section in Chapter 4 of the Communicator for more details.)

A. New modules: /vcplus/%ENVRN

If the target system is to perform the EXEC(39) call, which performs environment variable look-ups for various utilities such as LI, then this module must be relocated in the "System Generation" section of the answer file. This module is partionable; to partition, use the "PA,ENVRN" command in your answer file. See the ***RTE-A System Generation and Installation Manual*** for the number of words required in the tag area.

B. SCSI disks:

The 6.0 revision of DDQ30_GEN.REL has two new model names, and two model names have been changed.

It is recommended that you use the new model names, below. Which model name you use depends on which media you use. These new model are used to configure the media as all one LU.

model	description
M650A_1	use to make 92279A media all one LU
M650A_3	use to make 92280A media all one LU

If you don't want to use these new models, you will have to change the DVT commands in your answer file to use the new names, below. These models are used to divide the 307MB on the 92280A media.

The 6.0 revision of DDQ30_GEN.REL changed two model names to be consistent with the naming convention that ":A" is used for the large LU and ":B" is used for the small LU. The changes are:

old model	new model
M19MB_3:A	M19MB_3:B
M51MB_3:B	M51MB_3:A

C. NS-ARPA/1000 and ARPA/1000 changes:

The 6.0 revisions of NS-ARPA/1000 or ARPA/1000 software MUST be used in conjunction with the 6.0 RTE-A operating system.

The file /NS1000/REL/NSPEC.REL no longer exists, and it should not be relocated. The library search command "SE /NS1000/LIB/NSLIB.LI is no longer needed and can be deleted. For ARPA/1000 systems, the global directory for these modules is /ARPA1000.

Module NSABP is now partitionable. File /NS1000/REL/NSABP.REL

may be relocated into an OS partition.

D. X.25 changes:

The file /X25/REL/#X25A.REL no longer exists. The entry points it con are now in VCTR. Delete the command "RE /X25/REL/#X25A.REL from your answer file.

E. Miscellaneous:

These changes are unlikely to affect the answer file for most systems:

- o Module SAM is no longer optional. %SAM must be relocated; module "SAM.." is no longer available in $SYSA. Very few systems are currently generated without SAM.
- o Five words of XSAM (or SAM if no XSAM) will be consumed per ID segment. If there is insufficient XSAM/SAM for this purpose, then the system will not boot.
- o The real VEMA module must be relocated (from %VEMA, as opposed to "VEM.." from $SYSA) if the system is to use the new Large or Extended models of EMA/VMA. This will not affect any host that currently runs D.RTR, since the real VEMA must already be used.
- o The required tag area size is slightly higher; see the ***RTE-A*** System Generation and Installation Manual for the number of words required for each partitioned module.
- o Various restrictions on the values of class buffer limits (formerly known as spool buffer limits) have been removed. See Chapter 4 for more information.

4. **Generate your new 6.0 system.**

The 6.0 revisions of five programs must be used to upgrade to 6.0: RTAGN, MACRO, LINK, LINDX, and BUILD. These programs will run on your 5.2/5.27 system, and should be loaded using your existing 5.2/5.27 system libraries and snap file. The .RUN files should be placed in a temporary directory, where they can be used for installation purposes only -- don't put them in /PROGRAMS/, since the programs are incompatible with 5.2/5.27 systems.

A. Use the upgrade60.cmd file to load these programs.

A command file, upgrade60.cmd, is supplied with RTE-A to ease the loading of 6.0 versions of software needed for RTE-A 6.0

installation. This command file is to be run with your working directory set to a temporary directory created for this purpose. The directory may safely be /SCRATCH, if desired.

The .RUN files created by this command file are named RTAGN60.RUN, MACRO60.RUN, LINK60.RUN, LINDX60.RUN, and BUILD60.RUN. Each is created in the temporary directory. Once this command file completes, these five programs may be RP'ed as RTAGN, MACRO, LINK, LINDX, and BUILD before generating the new system and before executing rtea1.cmd, vc1.cmd, install_ns1000.cmd or any other software installation command files used.

See Chapter 4 for information on why this is necessary and for help with errors found during software installation.

```
crdir /tempdir LU
wd /tempdir
tr /rte_a/upgrade60 [rte_a_dir]
```

where:

LU = the LU for your temporary directory.

rte_a_dir = the directory where the RTE-A 6.0 software resides. The default is /RTE_A.

Now that the .RUN files have been created, they can be RP'ed as mentioned above, if desired:

```
rp /tempdir/rtagn60 rtagn
rp /tempdir/macro60 macro
rp /tempdir/link60  link
rp /tempdir/lindx60 lindx
rp /tempdir/build60 build
```

Note: once the entire 6.0 software installation is complete, you will want to remove these five ID segments. For example:

```
of rtagn id
of macro id
of link  id
of lindx id
of build id
```

When the temporary 6.0 programs are no longer needed, the contents of the temporary directory may be purged.

B. Use the following CI commands to generate the system, where

rtea60.ans is a copy of your 6.0 answer file:

```
CI> wd /gen/rev60
CI> ru rtagn rtea60.ans - - -
```

The last line will cause the generator to create 'rtea60.LST', 'rtea60.SYS', and 'rtea60.SNP'.

Be sure that the 6.0 relocatables and libraries are used in the generation. If RTAGN complains that any of the following entry points are missing, this probably indicates that a pre-6.0 version of the module has been relocated:

Defining module	New entry points
VCTR	$SHEMATBL
	$IDNBR
	$IDEXT
	$IDXSZ
	$MMPASS
	$RTNSHEMA
UTIL	$UPCLASSLIMIT
	$NLOWCLASSLIMIT
ABORT	$ABORTSHEMA
	$KILLSHTBL
VEMA	$XSHEMAREL

The following entry points no longer exist at 6.0, so undefined externals to these probably indicate that the referencing module is pre-6.0:

Formerly in VCTR:

```
$SHTB
$SH#
$SHSZ
$PENT
$VMAS
$CPLV
$SGNL
$IDNO
```

Formerly in other modules:

```
$SPBL
```

DSPBL

5. **Create /TARGETPROGRAMS and transfer to the command files to link up the essential RTE-A and VC+ programs:**

In the past, it was a requirement that the target software reside in a global directory. This is no longer the case. The software may exist in any directory or sub-directory.

Size requirements for an A-series system, with VC+, without subsystems:

```
/TARGETPROGRAMS uses about 15100 blocks
/LIBRARIES      uses about  7000 blocks
/HELP           uses about  1000 blocks
/CATALOGS       uses about   510 blocks
```

Note that these sizes are for a basic 6.0 RTE-A system that does not include any application software or other subsystems. Sizes of directories on individual systems may be much larger.

A. Create the directory using the following commands:

```
CI> crdir /targetprograms
CI> wd /rte_a
```

B. To preserve your 5.2/5.27 libraries, rename the existing /libraries to /libs527. Create a new /libraries for RTEA1.CMD to use for the 6.0 libraries. Be sure to specify the 'UPDATE' option in RTEA1.CMD, below.

If you wish to retain your old software, you may wish to rename /libraries to /libs60 and rename /libs527 to /libraries if you wish to retain your old system.

C. Decide whether you want symbolic link support.

/RTE_A/$BIGLB and /VCPLUS/$BGCDS are no longer shipped at 6.0. The proper versions must be built by RTEA1.CMD and VC1.CMD.

At 6.0, you must choose between two possible versions of various libraries: the version containing support for file system symbolic links and the version that does not. There are four libraries shipped that are affected:

Description	File without symbolic links	File with symbolic links

Non-CDS FMP	/RTE_A/$FMP	/RTE_A/$SFMP
CDS routines	/VCPLUS/$CDS	/VCPLUS/$SCDS

At RTE software installation time, you choose which version of the above libraries will be installed on your system. This is accomplished by setting CI variable $RTE_SLINK appropriately, as documented below.

The RTEA1.CMD and VC1.CMD files will build the proper version of $BIGLB.LIB and $BGCDS.LIB for your system if the "UPDATE" parameter is specified. The libraries built will contain the the desired versions of $[S]FMP and $[S]CDS, according to whether symbolic link support is requested in variable $RTE_SLINK.

D. Set CI variables to configure the software installed.

There are now seven CI variables that may be set prior to transferring to the RTEA1/RTEA2/VC1/VC2 installation command files. A description of each appears below:

$RTE_CDS

If "T", this tells the RTEA1 and RTEA2 command files that CDS versions of software will be installed via VC1.CMD and VC2.CMD. This simply causes RTEA1.CMD and RTEA2.CMD not to load non-CDS versions of programs that will be loaded as CDS later, thereby saving time. The non-CDS programs that will not be loaded are as follows:

CI CIX D.RTR DL LS GREP

The default is to load the non-CDS versions of these programs.

$RTE_HPMDM

If "T", the HPMDM modem controller utility will be loaded by RTEA2.CMD. This utility requires file hpmdm_table.rel to be relocated into the system common area of the target system. The default is to not load this utility.

$RTE_SLINK

If "T", the target system is to have the capability to create and access symbolic links in the file system. This causes the versions of $BIGLB and $BGCDS which can access symbolic links to be installed and the LNS utility to be loaded. The default is to install $BIGLB and $BGCDS versions that cannot access

symbolic links and to not load LNS.

Note that setting $RTE_SLINK = T does not make sense for non-VC+ systems or for systems where the CDS version of D.RTR is not loaded.

$RTE_A990

If "T", programs that are used only on A990 processors will be loaded: Clock, SetVcpString, Download, and A990fwid.

$RTE_LIBS

May be set to the directory name where libraries are to be copied. The default is "/LIBRARIES". Note that this does not cause LINK to search this directory when loading programs; it only allows an alternate directory structure to be used for the target system.

$RTE_CATS

May be set to the directory name where NLS catalogs are to be copied. The default is "/CATALOGS".

$RTE_HELP

May be set to the directory name where help files are to be copied. The default is "/HELP".

For example, to load a CDS system that runs HPMDM and uses symbolic links, using the default directories /LIBRARIES, /CATALOGS, and /HELP:

```
set rte_cds = T
set rte_hpmdm = T
set rte_slink = T
```

Then follow the steps below to transfer to the installation command files.

E. Transfer to RTEA1.CMD and RTEA2.CMD to link the programs.

NOTE

If you use the 'UPDATE' option, be sure you have a backup of

/LIBRARIES, /CATALOGS, and /HELP because the command file RTEA1.CMD uses the 'd' option (replace and delete old version) during the update.

NOTE

The name of the LINK NLS catalog file has changed from >LK000 to LINK.C000. The new catalog file must be present in the /CATALOGS directory for the 6.0 revision of LINK to run. If the "UPDATE" option is given to RTEA1.CMD and the $RTE_CATS variable is set to the default of "/CATALOGS", then RTEA1.CMD will install the catalog for you. If you do not specify the "UPDATE" option or if $RTE_CATS is set to another directory, then you must copy file LINK.C000 from /RTE_A to /CATALOGS prior to running RTEA1.CMD.

```
CI> rtea1,<snap>,/targetprograms,/rte_a,abort,update,rtea2
```

where:

<snap>	= new 6.0 snap file (following our convention, it would be /gen/rev60/rtea60.snp). The file must have the .SNP type extension.
/targetprograms	= directory to place newly-compiled programs.
/rte_a	= directory that contains new 6.0 RTE-A relocatables (may be a sub-directory).
abort	= will abort transfer file if an error occurs. If not specified, the transfer file will continue.
update	= will update /LIBRARIES, /CATALOGS, and /HELP. If not specified, the directories won't be updated.
rtea2	= will transfer to RTEA2.CMD. If not specified, RTEA1.CMD will return to CI.

NOTE

If you want to save the NON-CDS versions of CI and CIX and you did not use the $RTE_CDS flag in step 5D, you must rename these files at this time. The following transfer files will overlay these programs with CDS versions.

F. If you have the VC+ product, use VC1.CMD and VC2.CMD to link the VC+ programs as follows:

```
CI> wd /VCPLUS
CI> vc1,<snap>,/targetprograms,/rte_a,/vcplus,abort,update,vc2
```

where:

<snap>	= new 6.0 snap file (following our convention, /gen/rev60/rtea60.snp). The file must have the .SNP type extension.
/targetprograms	= directory to place newly compiled programs.
/rte_a	= directory that contains new 6.0 RTE-A relocatables (may be a sub-directory).
/vcplus	= directory that contains new 6.0 VC+ relocatables (may be a sub-directory).
abort	= will abort transfer file if an error occurs. If not specified, the transfer file will continue.
update	= will update /LIBRARIES, /CATALOGS, and /HELP. If not specified, the directories won't be updated.
vc2	= will transfer to VC2.CMD. If not specified, VC1.CMD will return to CI.

6. **BUILD your 6.0 memory-based system (if needed).**

If you are running memory-based, you MUST use the 6.0 revision of BUILD to create your 6.0 memory-based system. The upgrade60.cmd file should have already loaded a 6.0 BUILD on your pre-6.0 system for you.

7. **Copy new system and snap files to the bootable LU.**

For a bootable LU 16 as a FMGR cartridge, use the following:

```
CI> wd, /gen/rev60
CI> co rtea60.snp snp60::16
CI> co rtea60.sys sys60::16
```

If your bootable LU is a CI volume, or if you are booting from a CI volume but your bootex is on a FMGR cartridge, then you will need to copy the system and snap files to the /SYSTEM directory.

8. **Prepare to boot the 6.0 system.**

A. Set up the boot command file (usually BOOT.CMD) and Welcome file (usually WELCOMEn.CMD where n is a number from 1-99). Copies of your 5.2/5.27 boot command and welcome files can be used. Place these files on your bootable LU and on /SYSTEM, respectively. Be sure to specify your 6.0 system and snap files in the boot command file.
It is recommended you comment out any references to subsystem and application start-up at this time. After you have successfully booted your RTE-A/VC+ system, you can remove the comments and bring up your subsystems and applications.

Note that as of 5.27, there is no longer a requirement to have an 'EX' at the end of the Welcome file.

B. Install the 6.0 BOOTEX on your bootable LU.

NOTE

The 6.0 revision of BOOTEX is NOT backwards-compatible with your 5.2/5.27 system. If you still wish to access your old system, you will need a second copy of BOOTEX on your disk.

The 6.0 revision of BOOTEX must be used to slow-boot a 6.0 system. A disk-based system must be slow-booted at least once this way.

The 6.0 revision of /RTE_A/BOOTEX must be used as the "source" file to the INSTL utility (INSTL may be Rev.5020, Rev.5270, or Rev.6000). If an earlier revision of BOOTEX is used, an error similar to "All snap entry points not found: $SHSZ" is given after the "SN" command in the BOOT.CMD file. The FPUT utility may be run to put down your BOOTEX file. Refer to the ***RTE-A Utilities Manual*** for more information on how and when to use the INSTL and FPUT utilities.

The following is an example of how this could be done for a CI LU 16; your LU and file names may be different.

```
CI> instl,/system/rtea60.snp,/system/rtea60.sys,/gen/rev60/bootex,
    16,/rte_a/bootex

CI> fput,/gen/rev60/bootex,16
```

C. Set up the /programs directory :

After doing this, you will no longer be able to boot your old system. If you wish to have a way to boot the 5.2/5.27 system again in case your 6.0 system does not boot correctly, you need to make another boot.cmd file and another welcome file. You should use your existing 5.2/5.27 boot.cmd and welcome files for this step. In the boot.cmd file, you need to access all programs in the /old_progs directory. Be sure to RP CIX from the /old_progs directory in the boot command file. In the welcome file, the following two lines must be added at the top:

```
rn /programs /targetprograms
rn /old_progs /programs
```

To set up the /programs directory for 6.0, use the following:

```
CI> wd /programs
CI> rn /programs /old_progs
CI> rn /targetprograms /programs
```

9. **If running DATAPAIR/1000, then run PREPAIR on the 6.0 system file.**

As usual, systems running DataPair/1000 must be processed by the PREPAIR utility before booting. It is not necessary to run the 6.0 revision of PREPAIR.

10. **Boot your 6.0 system.**

If you placed your BOOTEX at sector 0, your boot string will look something like this:

```
VCP> %BDC27<boot command filename>
```

Perform the following steps only if you are satisfied that your new 6.0 system is working.

NOTE

If you want auto-boot after a power-up, you will need to have a 6.0 BOOTEX at sector 0 of the bootable LU.

11. Optional installation steps.

A. Create symbolic links (if desired).

A new command file, crlinks.cmd, may be executed on a 6.0 VC+ system with symbolic link capability to create several useful symbolic links. The links created are:

```
/programs/fgrep.run    -> /programs/grep.run
/programs/ll.run       -> /programs/ls.run
/programs/lsf.run      -> /programs/ls.run
/programs/lsx.run      -> /programs/ls.run
/programs/ftpls.run    -> /programs/ls.run
/programs/cp.run       -> /programs/lns.run
/programs/rm.run       -> /programs/lns.run
/programs/mv.run       -> /programs/lns.run
/help/fgrep            -> /help/grep
/help/ll               -> /help/ls
/help/lsf              -> /help/ls
/help/lsx              -> /help/ls
/help/uudecode         -> /help/uuencode
```

crlinks.cmd is shipped with VC+. The usage is:

```
wd /vcplus  (you must be in the vcplus directory)
crlinks [/programsdir] [/helpdir]
```

where programsdir defaults to /PROGRAMS

helpdir defaults to /HELP

B. Update MACRO libraries (if needed).

Macro libraries used by the 6.0 version of MACRO must be compiled by the new MACRO. If an existing macro library has not already been recompiled with the new MACRO, an error will be generated when the 6.0 MACRO tries to use it, as follows:

```
21  >> Old macro library.  Try: 'MACRO,-3,,,<maclib>'
```

Running MACRO with the suggested runstring will fix the problem.

12. Load Security/1000.

There are two programs that must be loaded, SECTL and STGEN, for Security/1000. If you used the VC+ transfer files VC1.CMD and VC2.CMD, then these programs should already be loaded.

13. **Initialize Security/1000.**

To initialize and turn on the security each time the system is booted, the following line MUST BE THE FIRST COMMAND in the Welcome file:

```
ru,sectl,+in[:<snap file name>],+on
```

If the snap file name is not supplied, /system/snap.snp will be the default name used. For more details please refer to the ***RTE-A System Manager's Manual***.

14. **Load other RTE subsystem software.**

Load any subsystems needed to for your RTE-A/VC+ system, such as languages, networking, DEBUG/1000, etc.

15. **Load your own application software.**

Due to the change in the ID segment size, all of your existing software will need to be reloaded.

16. **Backup your new system.**

A. Build a new memory based ARSTR system. Using the 6.0 BUILD, ARSTR, and the current 6.0 system and snap files, create the type 1 file holding the memory based system. Use CI's 'CO' command to copy that file to magnetic tape (or use CSYS to put it on Linus tape), and then put this tape in a safe place to be used for restore if you have a disk crash. You should check to see that you can boot the ARSTR system from the tape you just made.

B. Before this new 6.0 system is complete, make an ASAVE of your system that you can restore in case of a disk crash.

See the ***RTE-A Utilities Manual*** for more details on the above utilities.

This completes the update. The new system is now generated, installed, verified, and backed up.

RTE-6/VM 6.0 Installation Cookbook	APPENDIX B

This appendix is intended as a guide to assist you in updating your HP 1000 RTE-6/VM system from version 5.2 or 5.27 to version 6.0.

1. **BACK UP your system (LUs 2 and 3) with PSAVE.**

Make sure you have an up-to-date copy of !BCKOF on mag tape or cassette tape (264x terminals). If you do not, then use the transfer files provided with RTE-6/VM (*BCKMT or *BCKCT) to make up a current copy.

You may wish to back up your old RTE-6/VM software using FST or another backup utility.

2. **Copy the 6.0 version of RTE-6 from tape to the /RTE_6 directory.**

Begin by clearing some room on a CI volume and creating the global directory /RTE_6. If this directory already exists, then purge ALL the files in it before restoring any files to the system. You can then use TF or FST to restore the new files to the /RTE_6 directory.

3. **Modify your answer file to reflect the changes required for 6.0.**

You may want to keep a separate copy of your answer file for 6.0 (eg. create a new directory /GENS/R60 and copy your old answer file into it). There are no changes to the answer file required for the operating system at 6.0.

Other Subsystems

If you need to change anything in the answer file for any other subsystems, you should do that now.

4. **Run the generator and repeat the above cycle until the gen is to your satisfaction.**

5. **Switch in the new system.**

Now is the time to run SWTCH to install the new system. You do not want to autoboot. You may want to save the current cartridge list so the

current cartridges don't have to be remounted.

6. **Boot up the system.**

Typically at this point, the system will boot up but will output error messages according to which subsystems need to be reloaded. Ignore these for the time being. The system will create a new $SYENT file on LU 2 for you. Log onto a terminal as the system manager and set your working directory to /RTE_6.

7. **Reload programs.**

There are three files provided with the RTE-6/VM product which facilitate the loading of the RTE-6 software. These are the following:

*DOSNP	Creates the SNAP file for LINK
INCI.CMD	Loads the core CI file system utilities and copies $FMP6 to /LIBRARIES. This file can also create a CI volume if you do not have one.
LOAD6.CMD	Loads the remaining RTE-6 programs

The INCI.CMD and LOAD6.CMD files contain a considerable amount of documentation about the installation process. You may wish to read both of them carefully before executing them. In addition, some programs which are typically not used are commented out and therefore not linked; you may wish to review those choices and perhaps uncomment some lines or comment out others.

The *DOSNP command file must be run from FMGR and is provided to create the LINK SNAP file. If you want several libraries to be automatically searched by LINK, you may want to run LINDX yourself.

If you have Fortran programs containing $FILES m,n directives and you want those programs to have access to files on CI volumes (new file system), then you should include the library $FNEWF in your LINDX command AND you should copy it to the /LIBRARIES directory. For example:

```
LINDX,SYSTEM,SNAP.6::2,$FMP6.LIB::LIBRARIES,$FNEWF.LIB::LIBRARIES,+NL
CO,$FNEWF::RTE_6,$FNEWF.LIB::LIBRARIES
```

This will create the SNAP file on LU 2. It will be copied to /SYSTEM later in the installation process.

Many programs have attributes which are assigned at link time according to their LINK command files. Before proceeding with the linking process, you

may wish to modify some of these LINK command files to make the programs run better on your system:

Example 1: You can match the size of FST's SHEMA to the actual size you have assigned to the FST1 SHEMA partition in the generation. The file FST.LOD describes how to do this.

Example 2: The LI program can be made to run in an ordinary 32-page partition by inhibiting VMA/EMA usage according to the comments in LI.LOD.

INCI.CMD will take a number of parameters. The only place they are documented is in the INCI.CMD file itself; they are included here for your reference.

PARAMETER	USE
1	This can be INIT, LOAD, or BOTH. If you are upgrading, you need to use LOAD.
2	This is where the RTE-6 software resides. In this case, we are using /RTE_6.
3	Disk LU to initialize a CI volume. Leave this blank.

The following are optional parameters:

4	If LOAD6 is here, the LOAD6.CMD command file will be automatically executed.
5	Security Code for parameter 6.
6	This is where the programs will be put. If this is blank, they will be put into /PROGRAMS. If this is a FMGR CRN, then parameter 5 is used as the security code.
7	If this is NOLIBS, the command file will copy only $FMP6 to /LIBRARIES. If it is blank, INCI.CMD will pause to allow you to copy other libraries to /LIBRARIES.
8	Path for LINK maps. If this is blank, LINK will output a warning message: LINK: ignoring command /<prog>.map This can be ignored. If you would like to save the maps, enter the appropriate path for the directory. (Note: this directory must exist. It will not be created.)

Here is the command line we used with INCI.CMD:

INCI.LOAD,/RTE_6,,LOAD6,,,,/MAPS

This will load both the file utilities and the system programs, putting them into the /PROGRAMS directory, putting LINK managers into the /MAPS directory, and getting the software from /RTE_6. During this process, INCI will pause so that libraries can be moved that were put into the SNAP file earlier. You have to type all the commands yourself; for example:

CO /RTE_6/$PASCAL.LIB /LIBRARIES/PASCAL.LIB D

8. **Restore the CM prompt.**

The CM breakmode prompt is available in RTE-6 if the CM program is RP'd in the WELCOM file. CM is an exact copy of CI. If you want to have CM, include this command in the WELCOM file:

```
:RP,CI::2,CM
```

If you have generated CI into the system rather than loading it after generation, you first need to create a copy of CI on LU 2 so that the WELCOM file can RP it. From a FMGR prompt:

```
:SP,CI::2
```

9. **Load any subsystem software.**

This includes such subsystems as DS/1000, FTN7X, DEBUG, IMAGE/1000-II, PASCAL, BASIC/1000-C, etc.

10. **Reboot and verify that everything now works.**

After all the subsystems have been reloaded, you should now reboot and check that everything is functional. If there are any problems, then you need to fix them before proceeding.

11. **Backup your system.**

Now is the time to make the backup of your system. If you have an LU 3, then you will need to make a PSAVE of both LU 2 and LU 3. Making an FST backup of your CI volumes is also a good idea at this time.

This completes the update. The new system is now generated, installed, verified, and backed up.

RTE-A Primary Answer File	APPENDIX C

This appendix is a copy of the 6.0 RTE-A Primary System Generation Answer File. This is intended to be used as reference and is contained in the file PRIMARY.ANS under the RTE-A (92077A) product.

```
*
* Source: 92077-17326  REV.6000 <921123.1058>
*
* Primary.ans- RTE-A Primary System Generation Answer File to make
* primary.sys(#92077-16954), primary.snp (#92077-16955) and primary.lst
* (#92077-17278).
*
*     ************************************************************************
*     *                                                                      *
*     *   This half of the primary answer file is used only for Primary      *
*     *   System generation.  It is NOT to be used with a user system.       *
*     *   To use this answer file as a sample for generating another         *
*     *   system, delete the first half of this file, and continue with      *
*     *   the instructions on the second half.                               *
*     *                                                                      *
*     ************************************************************************
*
* This answer file is to be used in a PRIMARY memory-based system.  There
* is nothing generated into LU 1.  It is required that the startup program
* be LUCFG.RUN, which maps the I/O card which has VCP enabled to the correct
* select code, and the correct interface driver to LU 1.  This generation
* requires:
*     LU 1:   ID100 at select code 20B (double-mapped if VCP port)
*     LU 110: ID400 at select code 77B (double-mapped if VCP port)
*     LU 120: ID800 at select code 30B (double-mapped if VCP port)
*     LU 130: IDM00 at select code 23B (double-mapped if VCP port)
*
* Note that if mapping occurs, do not use the previous LU.  (If 12100A is
*   the VCP port, LU 110 should not be used, since there are now two LUs
*   pointing to the same hardware.)
*
*$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$*
*                                                                            *
*                                DISCLAIMER                                  *
```

```
*                                ==========                                  *
*                                                                            *
*    The Primary System is designed to be extremely flexible and serves      *
* two main purposes.  First, it is used as a verification tool for all       *
* supported peripherals on the A-Series.  Second, it is used to generate     *
* a customized system for the particular needs of the customer.              *
*                                                                            *
*    To provide maximum flexibility the Primary System is NOT necessarily    *
* the configuration that HP recommends for the final system generation.      *
* Depending on the mix and cabling of the peripherals connected, the         *
* possibility exists of configuring the system in an unsupported manner,     *
* which can adversely impact system operation and performance.  It is the    *
* responsibility of the user to be aware of these limitations and not        *
* violate the maximum number or mix of devices on a given interface to       *
* avoid the possibility of data corruption or diminished system performance.*
*                                                                            *
*    For support and configuration information, contact your local sales     *
* representative or customer engineer for the information.                   *
*                                                                            *

```

```
*     *   1.  Uncomment all required modules by removing the string          *
*     *       "*!REMOVE!".  Refer to the EDIT/1000 User's Guide, part no.    *
*     *       92074-90001, and the note at the bottom of these instructions  *
*     *       for information on how to use EDIT/1000 to edit this file.     *
*     *                                                                      *
*     *   2.  To select your system disk, remove *!REMOVESCSI! for SCSI      *
*     *       disk, remove *!REMOVEHPIB! and *!REMOVEHPIB64! for 64MB HP-IB  *
*     *       disk, or remove *!REMOVEHPIB! and *!REMOVEHPIB20! for 20MB     *
*     *       HP-IB disk.                                                    *
*     *                                                                      *
*     *   3.  If you want VC+ in your system, uncomment all VC+ modules      *
*     *       by removing the string "*!YESVC+!";  otherwise uncomment       *
*     *       the non-VC+ modules by removing the string "*!NO_VC+!".        *
*     *       VC+ is supplied with the HP 92078A Virtual Code+ package,      *
*     *       a product which allows a multiuser environment and spooling.   *
*     *                                                                      *
*     *   4.  If you have NS/1000 and LAN/1000 in your system, uncomment     *
*     *       all NS/1000 and LAN/1000 modules by removing the string        *
*     *       "*!YES_NS!";  otherwise, uncomment the non-NS modules by       *
*     *       removing the string "*!NO__NS!".  If you have NS/1000 but not  *
*     *       LAN/1000 in your system, refer to the NS subsystems' answer    *
*     *       file.                                                          *
*     *                                                                      *
*     *   5.  If you have APRA/1000 in your system, rename the "NS1000"      *
*     *       directory to "APRA1000" and comment the %adv00 driver and LU   *
*     *       mapping (lu 81 - 82) out.                                      *
*     *                                                                      *
*     *   6.  If you do not use an ASIC card as LU 1 (as generated in        *
*     *       this system) comment it out and change one of the              *
*     *       terminal LUs generated into the system (such as the            *
*     *       8-channel multiplexer) as LU 1.                                *
*     *                                                                      *
*     *   7.  Uncomment the "*" before the RPL file you will be using        *
*     *       according to your hardware configuration.  If you are using    *
*     *       the A600 (not the A600+), i.e., %RPL60, you will need to       *
*     *       remove the string "*!RPL60_!".  If you are using the A900 and  *
*     *       NS/1000, choose %RPL91 then either rpl_a900_rev4.rel (rev.4    *
*     *       firmware or later) or xmb.rel (pre rev.4 firmware).            *
*     *                                                                      *
*     *   8.  If you don't have NS/1000 in your system and you want to use   *
*     *       the DDC00/DDC01 modem handler, HPMDM.RUN, uncomment the        *
*     *       "*!YES_NS!" before HPMDM_TABLE.REL.  If you want to save       *
*     *       space, and not use terminal cassette tapes and slaved          *
*     *       devices, use DDC00.REL wherever DDC01.REL is specified.        *
*     *                                                                      *
*     *   9.  Run the RTE-A generator (RTAGN) on the answer file,            *
*     *       producing a new system and snap file.  Place them on           *
*     *       the /SYSTEM directory (on the LU mounted by BOOTEX).           *
```

```
*     *                                                                    *
*     *  10.  Create a new welcome command file (or copy WELCOME1.CMD).    *
*     *       Modify it to copy your new snap file to /SYSTEM/SNAP.SNP.    *
*     *                                                                    *
*     *  11.  Create a new boot command file (or copy BOOT.CMD).  Modify   *
*     *       this boot command file to designate the system and snap      *
*     *       files just created.  Also modify the startup program         *
*     *       (st,,nn) to indicate your new welcome file (welcomenn.cmd),  *
*     *       where nn is between 1 and 99.                                *
*     *                                                                    *
*     *  12.  Boot the new system as before, specifying the new boot       *
*     *       command file in the VCP> string.  In this way, you can save  *
*     *       the Primary System as a backup system.                       *
*     *                                                                    *
*     *   NOTE: EDIT/1000 can perform the string removal with the          *
*     *         command ".,$x/*!REMOVE!//" (this edit command removes      *
*     *         all occurences of "*!REMOVE!" from the current line        *
*     *         until the end of the file.  Be sure you are at the         *
*     *         first line you want to modify when you execute this        *
*     *         command.                                                   *
*     *                                                                    *
*     **********************************************************************

*
*$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$$*
*                                                                          *
*                                DISCLAIMER                                *
*                                ==========                                *
*                                                                          *
*    The Primary System is designed to be extremely flexible and serves    *
* two main purposes.  First, it is used as a verification tool for all     *
* supported peripherals on the A-Series.  Second, it is used to generate   *
* a customized system for the particular needs of the customer.            *
*                                                                          *
*    To provide maximum flexibility the primary system is NOT necessarily  *
* the configuration that HP recommends for the final system generation.    *
* Depending on the mix and cabling of the peripherals connected, the       *
* possibility exists of configuring the system in an unsupported manner,   *
* which can adversely impact system operation and performance.  It is the  *
* responsibility of the user to be aware of these limitations and not      *
* violate the maximum number or mix of devices on a given interface to     *
* avoid the possibility of data corruption or diminished system performance.*
*                                                                          *
*    For support and configuration information, contact your local sales   *
* representative or customer engineer for the information.                 *
*                                                                          *
