Title & Document Type: 210A Square Wave Generator Instruction and Operating Manual

Manual Part Number: N/A

Revision Date: N/A

HP References in this Manual

This manual may contain references to HP or Hewlett-Packard. Please note that Hewlett-Packard's former test and measurement, semiconductor products and chemical analysis businesses are now part of Agilent Technologies. We have made no changes to this manual copy. The HP XXXX referred to in this document is now the Agilent XXXX. For example, model number HP8648A is now model number Agilent 8648A.

About this Manual

We've added this manual to the Agilent website in an effort to help you support your product. This manual provides the best information we could find. It may be incomplete or contain dated information, and the scan quality may not be ideal. If we find a better copy in the future, we will add it to the Agilent website.

Support for Your Product

Agilent no longer sells or supports this product. You will find any other available product information on the Agilent Test & Measurement website:

www.tm.agilent.com

Search for the model number of this product, and the resulting product page will guide you to any available information. Our service centers may be able to perform calibration if no repair parts are needed, but no other support from Agilent is available

INSTRUCTION AND OPERATING MANUAL
FOR

MODEL 210A
SQUARE WAVE GENERATOR
Serial 1112 and Above

HEWLETT-PACKARD COMPANY
395 PAGE MILL ROAD, PALO ALTO, CALIFORNIA, U. S. A.

General Description

The Model 210A Square Wave Generator is an excellent source of square waves having a fundamental frequency range of 20 to 10,000 cycles/sec. The instrument will operate with an input voltage of 2 to 200 volts and produce a maximum output voltage of 50 volts peak to peak, open circuit. An output attenuator is provided which will alternate the output voltage up to 70 DB. The output voltage is balanced to ground.

This square wave generator is useful for production and experimental tests of receivers, video amplifiers, networks, and transmitters.

Parts Substitutions

Difficulties in procuring some of the parts used in this instrument may cause the electrical or physical values to deviate from those shown in this instruction manual. These substitutions have been made so as not to impair the performance of this instrument. Whenever replacement of any of these parts is necessary, either the substitute value or the original value may be used.

INSTRUCTIONS

MODEL 210A

SQUARE WAVE GENERATOR

Specifications

Frequency Range --

20 to 10,000 cycles/sec.

Input Voltage --

2 to 200 volts

Input Impedance --

25,000 ohms

Output Voltage --

50 volts peak to peak, open circuit

Output Voltage Wave Shape --

Voltage rises to 90% of maximum in 1 microsecond. Flat top of wave decays less than 1%.

Internal Impedance --

1000 ohms balanced to ground

Output Attenuator --

Total attenuator 70 db in 5 db steps. Attenuator does not affect the wave shape of the output voltage at frequencies below 10,000 cycles/sec.

Power Supply Rating --

Voltage - 115 volts
Frequency - 50/60 cycles
Wattage - 100 watts

Overall Dimensions --

Cabinet Model -

15-1/4" wide x 7-1/4" high x 10-5/8" deep

Rack Model -

19" wide x 7" high x 10-3/4" deep

Panel - 19" wide x 7" high

Depth behind panel - 9-1/4"

Weight --

Cabinet - 37 pounds

Rack - 38 pounds

Operating Instructions

Inspection --

This instrument has been thoroughly tested and inspected before being shipped and is ready for use when received.

After the instrument is unpacked, the instrument should be carefully inspected for damage received in transit. If any shipping damage is found, follow the procedure outlined in the "Claim for Damage In Shipment" page at the back of this instruction book.

Controls and Terminals - -

INPUT - The binding posts marked INPUT and G are input terminals of the instrument. An external sine wave which is to be square is fed into the instrument through these terminals. The control marked INPUT is used to control the amplitude of the input voltage. This control is calibrated from 0 to 100 in arbitrary units.

OSC., 60 \wedge - This toggle switch is provided so that an external voltage or a 60 cycles voltage from a secondary of the power transformer, may be supplied to the input of the instrument. When the switch is in the OSC. position the external voltage is used. In the 60 \wedge position the voltage taken from the power transformer is used. The INPUT control does not control the amplitude of the internal voltage.

OFF, ON - This toggle switch controls the power supplied to the instrument from the power line. When the switch is in the ON position, the indicator in the center of the control panel is lighted.

DB - The attenuator is used to reduce an established output voltage by any number of decibels up to 70 db. The internal impedance remains constant regardless of the setting of the attenuator.

Output - This group of three binding posts are the output terminals of the instrument. The binding post marked G is connected to the chassis while the other two binding posts are connected to the attenuator.

Fuse - The fuse is located in a fuse block next to the power cable on the underside of the chassis. Remove the bottom plate to gain access to the fuse.

Operation --

The procedure for operating this instrument is as follows:

1. Turn the power switch to ON. Connect the OUTPUT terminals to the equipment under test.
2. If a 60 \wedge square wave is desired, set the OSC. -60 \wedge toggle switch to the 60 \wedge position.
3. Set the toggle switch to the OSC. position and apply a sine wave voltage of the desired frequency to the INPUT terminals if a square wave other than the frequency of the power line is desired.

CAUTION

The maximum voltage applied to the INPUT terminals must not exceed 200 volts RMS.

4. If the input voltage does not exceed approximately 25 volts, the INPUT control should be set at 100. This control may be used to reduce the input voltage when voltages above 25 volts are encountered.
5. Adjust the attenuator (DB) for desired output voltage. The internal impedance of the output circuit is 1000 ohms balanced to ground. This impedance is not affected by the setting of the attenuator.

The output circuit may be used for single ended operation by connecting the equipment being driven between the ground (G) terminal and either of the other OUTPUT terminals. It is necessary to use a coupling capacitor and grid resistor between the output of the Model 210A and the grid of the tube being driven when the output circuit is connected for single ended operation.

When balanced output is desired, the balance between the two sides of the output circuit can be measured with a voltmeter. Connect a DC voltmeter between the two OUTPUT terminals and measure the voltage. A voltage between the terminals of not more than 3 volts represents a satisfactory balance.

Circuit Description

The Model 210A Square Wave Generator is designed to change a sine wave into a square wave.

Tubes V1 and V2 amplify and clip the peaks of the sine wave applied to the input terminals of the instrument. Tube V3 serves as a phase inverter which feeds the partially squared wave to the two sections of the direct coupled amplifier consisting of tubes V4, V5, V6, V7. The two output tubes V5 and V7 feed into the output attenuator which controls the amplitude of the square wave obtained at the output terminals.

Two power supplies are provided to meet the requirements of the direct coupled amplifier.

Maintenance

Cover and Bottom Plate Removal --

The cover is removed by unscrewing the four screws which fasten the cover to the back of the instrument and sliding the cover toward the rear of the instrument.

The bottom plate is removed by unscrewing the four screws, one in each corner of the bottom plate, which fasten the plate to the chassis.

Tube Replacement --

When replacing tube V5 and/or V7, the output should be checked to see that the replacement tube has not caused excessive unbalance. It may be necessary to try several tubes before a satisfactory tube is found.

Trouble Shooting --

<u>Symptoms</u>	<u>Causes</u>	<u>Remedies</u>
Instrument inoperative (indicator lamp won't light, no square wave output)	Blown fuse	Clear short circuit and replace fuse
Instrument inoperative (Indicator lamp lights)	Defective tube; Check both 5Y3GT tubes first	Replace defective tube
	Short circuit in capacitor C5, C6AB, or C3.	Replace defective capacitor
	The resistance across C5 should be at least 11,000 ohms and the resistance across C6A should be at least 300,000 ohms.

CLAIM FOR DAMAGE IN SHIPMENT

The instrument should be tested as soon as it is received. If it fails to operate properly, or is damaged in any way, a claim should be filed with the carrier. A full report of the damage should be obtained by the claim agent, and this report should be forwarded to us. We will then advise you of the disposition to be made of the equipment and arrange for repair or replacement. Include model number, type number and serial number when referring to this instrument for any reason.

WARRANTY

Hewlett-Packard Company warrants each instrument manufactured by them to be free from defects in material and workmanship. Our liability under this warranty is limited to servicing or adjusting any instrument returned to the factory for that purpose and to replace any defective parts thereof (except tubes, fuses and batteries). This warranty is effective for one year after delivery to the original purchaser when the instrument is returned, transportation charges prepaid by the original purchaser, and which upon our examination is disclosed to our satisfaction to be defective. If the fault has been caused by misuse or abnormal conditions of operation, repairs will be billed at cost. In this case, an estimate will be submitted before the work is started.

If any fault develops, the following steps should be taken:

1. Notify us, giving full details of the difficulty, and include the model number, type number and serial number. On receipt of this information, we will give you service instruction or shipping data.
2. On receipt of shipping instruction, forward the instrument prepaid, and repairs will be made at the factory. If requested, an estimate of the charges will be made before the work begins provided the instrument is not covered by the warranty.

SHIPPING

All shipments of Hewlett-Packard instruments should be made via Railway Express. The instruments should be packed in a wooden box and surrounded by two to three inches of excelsior or similar shock-absorbing material.
