Warranty

The material contained in this document is provided “as is,” and is subject to being changed, without notice, in future editions. Further, to the maximum extent permitted by applicable law, Agilent disclaims all warranties, either express or implied, with regard to this manual and any information contained herein, including but not limited to the implied warranties of merchantability and fitness for a particular purpose. Agilent shall not be liable for errors or for incidental or consequential damages in connection with the furnishing, use, or performance of this document or of any information contained herein. Should Agilent and the user have a separate written agreement with warranty terms covering the material in this document that conflict with these terms, the warranty terms in the separate agreement shall control.

Technology Licenses

The hardware and/or software described in this document are furnished under a license and may be used or copied only in accordance with the terms of such license.

Restricted Rights Legend

If software is for use in the performance of a U.S. Government prime contract or subcontract, Software is delivered and licensed as “Commercial computer soft-

ware” as defined in DFAR 252.227-7014 (June 1995), or as a “commercial item” as defined in FAR 2.101(a) or as “Restricted computer software” as defined in FAR 52.227-19 (June 1987) or any equivalent agency regulation or contract clause. Use, duplication or disclosure of Software is subject to Agilent Technologies’ standard commercial license terms, and non-DOD Departments and Agencies of the U.S. Government will receive no greater than Restricted Rights as defined in FAR 52.227-19(c)(1-2) (June 1987). U.S. Government users will receive no greater than Limited Rights as defined in FAR 52.227-14 (June 1987) or DFAR 252.227-7015 (b)(2) (November 1995), as applicable in any technical data.

In This Document

Agilent EasyEXPERT software contains the application library which supports the characteristic measurements of CMOS devices, TFT, BJT, diode, resistor, capacitor, varactor, memory, nanotechnology devices such as CNT FET, and so on. The application library includes more than one hundred test definitions. And they are classified into the following categories.

- BJT
- CMOS
- Discrete
- Generic Test
- Memory
- Mixed Signal
- Nano Tech
- Power Device
- Reliability
- Sample
- Structure
- TFT
- Utility
- WGFMU
- IGBT
- Interconnection
- MISCAP
- Power BJT
- Power Diode
- PMIC, Power MOSFET, SiC

What is described in the reference sections

Reference section contains detailed description of test definitions. The test definitions are listed in alphabetical order. Each entry explains one test definition and provides the information following to the next terms. Some sections may not follow to some terms and may follow to the terms not in this table.

Term	Description
Description	Brief explanation of the test definition.
Device Under Test	DUT name. The number of terminals, the connection information, and the other information may be included.
Required Modules and Accessories	Lists the required accessories, modules, and/or equipment. The connection information may be included.
Required Test Definition	Lists the test definitions if they are used in this test definition.
Device Parameters	Lists the parameters changeable in the Device Parameters area of the EasyEXPERT Application Test screen.
Test Parameters	Lists the parameters changeable in the Test Parameters area of the EasyEXPERT Application Test screen.
Extended Test Parameters	Lists the parameters changeable in the dialog box opened by clicking the Extended Setup button.
Measurement Parameters	Lists the parameters measured by this test definition.
User Function and Analysis Function	Lists the parameters used for the user function or the analysis function.
X-Y Plot or X-Y Graph	Lists the parameters to be displayed in the X-Y Graph Plot area, List Display area, or Parameters area on the Data Display window.
List Display	
Parameters Display Area	
Auto Analysis	Lists the parameters used for the auto analysis function.
Test Output: X-Y Graph	Lists the parameters defined in the Test Output tab screen of the Test Definition window. The parameters will be displayed in the X-Y Graph Plot area, List Display area, or Parameters area on the Data Display window.
Test Output: List Display	
Test Output: Parameters	

Revision number

The test definitions are managed by using the revision number shown below.

Revision Number	Description
A.01.xx	Test definitions supported by EasyEXPERT A.01.xx and later.
A.01.20	Test definitions updated from A.01.xx or supported by EasyEXPERT A.02.00 and later.
A.02.00	This number is used by the Subsite move test definition only.
A.03.00	Test definitions supported by EasyEXPERT A.03.00 and later.
A.03.10	Test definitions supported by EasyEXPERT A.03.10 and later.
A.03.11	Test definitions supported by EasyEXPERT A.03.11 and later.
A.03.20	Test definitions supported by EasyEXPERT A.03.20 and later.
A.04.00	Test definitions supported by EasyEXPERT A.04.00 and later.

NOTE

Application Library

The application library is a set of test definitions effective for the EasyEXPERT application test execution mode. The application test can be performed by selecting a test definition and setting the test condition for the actual DUT (device under test). And the setup can be saved as the dedicated test setup for the DUT.

All test definitions are just sample. If the samples damage your devices, Agilent Technologies is NOT LIABLE for the damage.

NOTE

If you delete a test definition

Application library should be recovered. Import the test definition by using the Import Test Definition... function of the Library button. The original test definitions are stored in the following folder.

C:\Program Files\Agilent\B1500\EasyEXPERT\Application Tests

Supported Analyzer and Required Equipment

Each test definition (Library) supports the following analyzer, and requires the following accessories, modules, and/or equipment.

Category	Test definition name	Supported analyzer	Required equipment and quantity
BJT	BC Diode Fwd	B1500A,4155B/C,4156B/C	SMU 2
	BC Diode Rev	B1500A,4155B/C,4156B/C	SMU 2
	BVcbo	B1500A,4155B/C,4156B/C	SMU 2

1 BJT

1. BC Diode Fwd:	Base-Collector junction forward characteristics (A.01.20)
2. BC Diode Reverse:	Base-Collector junction reverse characteristics (A.01.20)
3. BVcbo:	Base-Collector junction breakdown voltage (A.01.20)
4. BVcei:	Emitter-Collector breakdown voltage (A.01.20)
5. BVceo:	Emitter-Collector breakdown voltage, opened base (A.01.20)
6. BVebo:	Emitter-Base breakdown voltage (A.01.20)
7. CS Diode Fwd:	Collector-Substrate junction forward characteristics (A.01.20)
8. CS Diode Reverse:	Collector-Substrate junction reverse characteristics (A.01.20)
9. Ctc-Freq Log:	Ctc-f characteristics (A.01.20)
10. Ctc-Vc:	Ctc-Vcb characteristics (A.01.20)
11. Cte-Ve:	Cte-Veb characteristics (A.01.20)
12. Cts:	Cts-Vsc characteristics (A.01.20)
13. EB Diode Fwd:	Emitter-Base junction forward characteristics (A.01.20)
14. EB Diode Rev:	Emitter-Base junction reverse characteristics (A.01.20)
15. G-Plot ConstVce Pulse:	Ic-Vb characteristics, Vce=const, SMU Pulse (A.01.11)
16. G-Plot ConstVce Pulse[3]:	Ic-Vb characteristics, Vce=const, 3-terminal, SMU Pulse (A.01.11)
17. G-Plot ConstVce:	Gummel characteristics, Vce=constant (A.01.20)
18. G-Plot ConstVce[3]:	Gummel characteristics, Vce=constant, 3-terminal (A.01.20)
19. G-Plot Vbc=0V Pulse:	Ic-Ve characteristics, Vbc=0, SMU Pulse (A.01.11)
20. G-Plot Vbc=0V Pulse[3]:	Ic-Ve characteristics, Vbc=0, 3-terminal, SMU Pulse (A.01.11)
21. G-Plot Vbc=0V:	Gummel characteristics, Vbc=0 (A.01.20)
22. G-Plot Vbc=0V[3]:	Gummel characteristics, Vbc=0, 3-terminal (A.01.20)
23. hfe-Vbe ConstVce:	hfe-Ic characteristics, Vce=constant (A.01.20)
24. hfe-Vbe Vbc=0V:	hfe-Ic characteristics, Vbc=0 (A.01.20)
25. Ic-Vc Ib:	Ic-Vc characteristics, Ib sweep (A.01.20)
26. Ic-Vc Ib[3]:	Ic-Vc characteristics, 3-terminal, Ib sweep (A.01.20)
27. Ic-Vc Pulse Ib:	Ic-Vc characteristics, Ib sweep, SMU Pulse (A.01.11)
28. Ic-Vc Pulse Ib[3]:	Ic-Vc characteristics, 3-terminal, Ib sweep, SMU Pulse (A.01.11)
29. Ic-Vc Pulse Vb:	Ic-Vc characteristics, Vb sweep, SMU Pulse (A.01.11)
30. Ic-Vc Pulse Vb[3]:	Ic-Vc characteristics, 3-terminal, Vb sweep, SMU Pulse (A.01.11)
31. Ic-Vc Vb:	Ic-Vc characteristics, Vb sweep (A.01.20)
32. Ic-Vc Vb[3]:	Ic-Vc characteristics, 3-terminal, Vb sweep (A.01.20)
33. Rb:	Base resistance (flyback method, 4-terminal) (A.01.20)
34. Re+Rc:	Collector resistance (including Emitter resistance, flyback method, 4-terminal) (A.01.20)
35. Re:	Emitter resistance (flyback method, 4-terminal) (A.01.20)
36. Simple Gummel Plot:	Evaluation of Gummel characteristics (Vce=const) (A.01.10)
37. Vbe-Le:	hfe,Vbe-Le characteristics (A.01.20)
38. Vbe-We:	hfe,Vbe-Le characteristics (A.01.20)

2 CMOS

1. BVdss:	Breakdown voltage between source and drain (A.01.20)
2. BVgso:	Breakdown voltage between gate and source (A.01.20)
3. Cgb-AC Level:	Cgb-Vosc characteristics (A.01.11)
4. Cgb-Freq Log:	Cgb-f characteristics (A.01.20)
5. Cgb-Vg HighVoltage:	Cgb-Vg characteristics using SCUU (A.01.11)
6. Cgb-Vg:	Cgb-Vg characteristics (A.01.11)
7. Cgc-Freq Log:	Cgc-f characteristics (A.01.20)
8. Cgc-Vg:	Cgc-Vg characteristics (A.01.11)
9. Cgg-Freq Linear:	Cgg-f characteristics (A.01.20)
10. Cgg-Freq Log:	Cgg-f characteristics (A.01.20)
11. Cgg-Vg 2Freq:	Cgg-Vg characteristics, 2-frequency method (A.01.11)
12. Cgg-Vg:	Cgg-Vg characteristics (A.01.11)
13. IdRdsGds:	Drain resistance/conductance (A.01.20)
14. Id-Vd pulse:	Id-Vd characteristics, SMU Pulse (A.01.11)
15. Id-Vd pulse[3] :	Id-Vd characteristics (3-terminal), SMU Pulse (A.01.11)
16. Id-Vd:	Id-Vd Characteristics (A.01.20)
17. Id-Vd[3]:	Id-Vd Characteristics (3-terminal) (A.01.20)
18. Id-Vg pulse:	Id-Vg characteristics, SMU Pulse (A.01.12)
19. Id-Vg Vpulse[3]:	Id-Vg characteristics (3-terminal), SMU Pulse (A.01.11)
20. Id-Vg:	Id-Vg Characteristics (A.01.20)
21. Id-Vg[3]:	Id-Vg Characteristics (3-terminal) (A.01.20)
22. IonIoffSlope:	On current, off current, and subthreshold slope (A.01.20)
23. Isub-Vg:	Isub-Lg characteristics (A.01.20)
24. QSCV[4]	C-Vg, Ig-Vg (4-terminal) (A.03.00)
25. QSCV C Offset Meas	Offset capacitance measurement
26. Simple Cgb :	Evaluation of gate-substrate capacitance versus gate voltage (A.01.10)
27. Simple Vth :	Evaluation of Threshold Voltage (Vth) (A.01.20)
28. Vth Const Id:	Constant current Vth (A.01.20)
29. Vth gmMax :	Linear region Vth (A.01.20)
30. Vth gmMax and Id:	Extrapolation Vth and Constant Vth (A.04.00)
31. VthAndCgg-Vg ASU:	Cgg-Vg, Id-Vg, using ASU (A.01.20)
32. VthAndCgg-Vg SCUU:	Cgg-Vg, Id-Vg, using SCUU (A.01.20)
33. Vth-Lg:	Vth-Lg characteristics (A.01.20)
34. Vth-Wg:	Vth-Wg characteristics (A.01.20)

3 Discrete

1. BJT GummelPlot: Bipolar transistor gummel characteristics (A.01.20)
2. BJT Ic-Vc Ib : Bipolar transistor Ic-Vc characteristics (A.01.20)
3. Diode IV Fwd: Diode forward bias characteristics (A.01.20)
4. Diode IV Rev: Diode reverse bias characteristics (A.01.20)
5. FET Id-Vd: MOSFET Id-Vd characteristics (A.01.20)
6. FET Id-Vg : MOSFET Id-Vg characteristics (A.01.20)

Contents

4 Generic Test

1. C-f C-f characteristics of condenser (2 terminals) (A.03.00)
2. C-t C-t characteristics of condenser (2 terminals) (A.03.00)

5 Memory

1. Flash Ccf-V: Flash memory cell Control Gate to Floating Gate capacitance (A.01.11)
2. Flash Cfb-V: Flash memory cell Floating Gate-Substrate capacitance (A.01.11)
3. Flash Cgg-Vcg: Flash memory cell Gate capacitance (A.01.11)
4. NandFlash2 Endurance 3devices: Repeatedly tests write/erase on a NAND-type flash memory cell, simultaneously using three devices (A.01.20).
5. NandFlash2 Endurance: NAND flash memory cell endurance test (A.01.20)
6. NandFlash2 IV-Erase-IV: NAND flash memory cell Id-Vg, Erase, Id-Vg (A.01.20)
7. NandFlash2 IV-Write-IV: NAND flash memory cell Id-Vg, Write, Id-Vg (A.01.20)
8. NandFlash2 Retention(ErasedCell): NAND flash memory cell Data retention test after Erase (A.01.20)
9. NandFlash2 Retention(WrittenCell): NAND flash memory cell Data retention test after Write (A.01.20)
10. NandFlash2 Vth(ErasingTimeDependence): NAND flash memory cell erasing time dependence test (A.01.20)
11. NandFlash2 Vth(WritingTimeDependence): NAND flash memory cell writing time dependence test (A.01.20)
12. NandFlash2 WordDisturb(ErasedCell): NAND flash memory cell erase-disturb test (A.01.20)
13. NandFlash2 WordDisturb(WrittenCell): NAND flash memory cell read-disturb test (A.01.20)
14. NandFlash3 Endurance: NAND flash memory cell endurance test (A.03.10)
15. NandFlash3 IV-Erase-IV: NAND flash memory cell Id-Vg, Erase, Id-Vg (A.03.10)
16. NandFlash3 IV-Write-IV: NAND flash memory cell Id-Vg, Write, Id-Vg (A.03.10)
17. NandFlash3 Retention(ErasedCell): NAND flash memory cell Data retention test after Erase (A.03.10)
18. NandFlash3 Retention(WrittenCell): NAND flash memory cell Data retention test after Write (A.03.10)
19. NandFlash3 Vth(ErasingTimeDependence): NAND flash memory cell erasing time dependence test (A.03.10)
20. NandFlash3 Vth(WritingTimeDependence): NAND flash memory cell writing time dependence test (A.03.10)
21. NandFlash3 WordDisturb(ErasedCell): NAND flash memory cell erase-disturb test (A.03.10)
22. NandFlash3 WordDisturb(WrittenCell): NAND flash memory cell read-disturb test (A.03.10)
23. NorFlash Endurance: NOR flash memory cell endurance test (A.03.10)
24. NorFlash IV-Erase-IV: NOR flash memory cell Id-Vg, Erase, Id-Vg (A.03.10)
25. NorFlash IV-Write-IV: NOR flash memory cell Id-Vg, Write, Id-Vg (A.03.10)
26. NorFlash Retention(ErasedCell): NOR flash memory cell Data retention test after Erase (A.03.10)
27. NorFlash Retention(WrittenCell): NOR flash memory cell Data retention test after Write (A.03.10)
28. NorFlash Vth(ErasingTimeDependence): NOR flash memory cell erasing time dependence test (A.03.10)
29. NorFlash Vth(WritingTimeDependence): NOR flash memory cell writing time dependence test (A.03.10)
30. NorFlash WordDisturb(ErasedCell): NOR flash memory cell word disturb test after Erase (A.03.10)
31. NorFlash WordDisturb(WrittenCell): NOR flash memory cell word disturb test after Write (A.03.10)

Contents

- 32. NorFlash DataDisturb(ErasedCell):
NOR flash memory cell data disturb test after Erase (A.03.10)
- 33. NorFlash DataDisturb(WrittenCell):
NOR flash memory cell data disturb test after Write (A.03.10)

6 Mixed Signal

1. BJT Varactor CV Mismatch: BJT Varactor capacitance CV characteristics mismatch (A.01.11)
2. Diff-R Mismatch: Diffusion resistor R-I characteristics mismatch, Kelvin connection (A.01.11)
3. Diode IV Fwd Mismatch: Diode forward bias characteristics mismatch (A.01.20)
4. Diode IV Rev Mismatch: Diode reverse bias characteristics mismatch (A.01.20)
5. G-Plot ConstVce Mismatch: Gummel characteristics mismatch, Vce=Const (A.01.20)
6. G-Plot ConstVce Mismatch[3]: Gummel characteristics mismatch, Vce=Const, 3-terminal (A.01.20)
7. G-Plot Vbc=0V Mismatch: Gummel characteristics mismatch, Vbc=0 V (A.01.20)
8. G-Plot Vbc=0V Mismatch[3]: Gummel characteristics mismatch, Vbc=0, 3-terminal (A.01.20)
9. Ic-Vc Ib Mismatch: Ic-Vce characteristics mismatch, Ib sweep (A.01.20)
10. Ic-Vc Ib Mismatch[3]: Ic-Vce characteristics mismatch, Ib sweep, 3-terminal (A.01.20)
11. Ic-Vc Vb Mismatch: Ic-Vce characteristics mismatch, Vb sweep (A.01.20)
12. Ic-Vc Vb Mismatch[3]: Ic-Vce characteristics mismatch, Vb sweep, 3-terminal (A.01.20)
13. Id-Vd Mismatch: Id-Vd characteristics mismatch (A.01.20)
14. Id-Vd Mismatch[3]: Id-Vd characteristics mismatch, 3-terminal (A.01.20)
15. Id-Vg Mismatch: Id-Vg characteristics mismatch (A.01.20)
16. Id-Vd Mismatch[3]: Id-Vd characteristics mismatch, 3-terminal (A.01.20)
17. MIM CV Mismatch: MIM capacitor C-V characteristics mismatch (A.01.11)
18. MOS Varactor CV Mismatch: MOS Varactor capacitance CV characteristics mismatch (A.01.11)
19. Poly-R Mismatch: Resistor R-I characteristics mismatch, Kelvin connection (A.01.11)

Contents

7 NanoTech

1. CNT Differential R[AC]: CNT Differential R-V characteristics (A.01.20)
2. CNT Gate Leak: CNT FET Ig-Vg characteristics (A.01.20)
3. CNT Id-Time: CNT FET Id-Time Characteristic (A.01.20)
4. CNT Id-Vd: CNT FET Id-Vd characteristics (A.01.20)
5. CNT Id-Vg: Carbon Nano Tube FET Id-Vg characteristics (A.01.20)
6. CNT Id-Vg-Time: CNT FET Ig-Vg characteristics (A.01.20)
7. CNT IV Sweep: CNT Differential I-V characteristics (A.01.20)
8. CNT R-I Kelvin 2SMU: CNT R-I characteristics, Kelvin connection (A.01.20)
9. CNT R-V Kelvin 2SMU: CNT R-V characteristics, Kelvin connection (A.01.20)
10. CNT Vth gmMax: CNT FET linear region Vth (A.01.20)

8 Power Device

1. BVdss[3] PwrDevice: Breakdown voltage between source and drain (A.01.20)
2. BVgso[3] PwrDevice: Breakdown voltage between gate and source (A.01.20)
3. Id-Vd pulse[3] PwrDevice: Id-Vd characteristics (3-terminal), SMU Pulse (A.01.20)
4. Id-Vd[3] PwrDevice: Id-Vd Characteristics (3-terminal) (A.01.20)
5. Id-Vg pulse[3] PwrDevice: Id-Vg characteristics (3-terminal), SMU Pulse (A.01.20)
6. Id-Vg[3] PwrDevice: Id-Vg Characteristics (3-terminal) (A.01.20)
7. Vth Const Id[3] PwrDevice:
Constant current Vth (A.01.20)
8. Vth gmMax[3] PwrDevice: Linear region Vth (A.01.20)

9 Reliability

1. BJT EB RevStress 3devices: Emitter-Base junction Reverse bias Stress test, 4 terminals, 3 devices (A.01.20)
2. BJT EB RevStress 3devices[3]: Emitter-Base junction Reverse bias Stress test, 3 terminals, 3 devices (A.01.20)
3. BJT EB RevStress: Emitter-Base junction Reverse bias Stress test, 4 terminals (A.01.20)
4. BJT EB RevStress2: Emitter-Base junction Reverse bias Stress test, 4 terminals (A.03.10)
5. BJT EB RevStress[3]: Emitter-Base junction Reverse bias Stress test, 3 terminals (A.01.20)
6. BJT EB RevStress2[3]: Emitter-Base junction Reverse bias Stress test, 3 terminals (A.03.10)
7. BTI 3devices: Bias Temperature Instability test, 4 terminals, 3 devices (A.01.20)
8. BTI 3devices[3]: Bias Temperature Instability test, 3 terminals, 3 devices (A.01.20)
9. BTI: Bias Temperature Instability test, 4 terminals (A.01.20)
10. BTI2: Bias Temperature Instability test, 4 terminals (A.03.10)
11. BTI[3]: Bias Temperature Instability test, 3 terminals (A.01.20)
12. BTI2[3]: Bias Temperature Instability test, 3 terminals (A.03.10)
13. Charge Pumping: Evaluation of the interface state using charge pumping method (A.01.20)
14. Charge Pumping2: Evaluation of the interface state using charge pumping method (A.03.10)
15. EM Istress: Electromigration test, current stressed, 4 SMUs (A.01.20)
16. EM Istress2: Electromigration test, current stressed, 4 SMUs (A.03.10)
17. EM Istress[2]: Electromigration test, current stressed, 2 SMUs (A.01.20)
18. EM Istress2[2]: Electromigration test, current stressed, 2 SMUs (A.03.10)
19. EM Istress[6]: Electromigration test, current stressed, 6 SMUs (A.01.20)
20. EM Istress2[6]: Electromigration test, current stressed, 6 SMUs (A.03.10)
21. EM Vstress: Electromigration test, voltage stressed, 4 SMUs (A.01.20)
22. EM Vstress2: Electromigration test, voltage stressed, 4 SMUs (A.03.10)
23. EM Vstress[2]: Electromigration test, voltage stressed, 2 SMUs (A.01.20)
24. EM Vstress2[2]: Electromigration test, voltage stressed, 2 SMUs (A.03.10)
25. EM Vstress[6]: Electromigration test, voltage stressed, 6 SMUs (A.01.20)
26. EM Vstress2[6]: Electromigration test, voltage stressed, 6 SMUs (A.03.10)

34. TDDB Istress2: TDDB Test, current stressed (A.03.10)
35. TDDB Vstress 3devices: TDDB Test, voltage stressed, 3 devices (A.01.20)
36. TDDB Vstress2 3devices: TDDB Test, voltage stressed, 3 devices (A.03.10)
37. TDDB Vstress: TDDB Test, voltage stressed (A.01.20)
38. TDDB Vstress2: TDDB Test, voltage stressed (A.03.10)
39. Timing On-the-fly NBTI Timing On-the-fly NBTI Test (A.03.11)
40. TZDB: TZDB Test of oxide layer (A.01.20)
41. V-Ramp: Insulator lifetime evaluation, voltage stressed (A.01.20)

10 Structure

1. BVgb ThinOx: MOS capacitor Ig-Vg characteristics (A.01.20)
2. BVgb: MOS capacitor Gate-Substrate breakdown voltage (A.01.20)
3. Cgb-Freq[2] Log: Cgb-f characteristics, 2 terminals (A.01.20)
4. Cgb-Vg 2Freq: MOS capacitor Cgb-Vg characteristics, 2-frequency method (A.01.11)
5. Cgb-Vg[2]: MOS capacitor Cgb-Vg characteristics (A.01.11)
6. Cj-Freq Log: Cj-f characteristics, junction device (A.01.20)
7. Cj-V: Junction capacitance Cj-V characteristics (A.01.11)
8. Diode BVAndCj-V ASU: Diode junction capacitance and breakdown voltage measurement using ASUs (A.01.20)
9. Diode BVAndCj-V SCUU: Diode junction capacitance and breakdown voltage measurement using SCUU (A.01.20)
10. Ig-Vg Iforce: MOS capacitor Ig-Vg characteristics, current sweep (A.01.20)
11. Ig-Vg Vforce: MOS capacitor Ig-Vg characteristics, voltage sweep (A.01.20)
12. Interconnect CouplingCap: Interconnection capacitance (A.01.11)
13. Interconnect OverlapCap: Layer to layer film capacitance (A.01.11)
14. Junction BV: Junction device breakdown voltage (A.01.20)
15. Junction DcParam: Junction device DC parameters (Is,N,Rs) (A.01.20)
16. Junction IV Fwd: Diode forward bias characteristics (A.01.20)
17. Junction IV Rev: Diode reverse bias characteristics (A.01.20)
18. QSCV[2] C-Vg, Ig-Vg (2-terminal) (A.03.00)
19. QSCV C Offset Meas: Offset capacitance measurement
20. Rdiff-I kelvin: Diffusion resistor R-I characteristics, Kelvin connection (A.01.11)
21. Rdiff-I: Diffusion resistor R-I characteristics (A.01.11)
22. Rdiff-V kelvin: Diffusion resistor R-V characteristics, Kelvin connection (A.01.20)
23. Rdiff-V: Diffusion resistor R-V characteristics (A.01.20)
24. R-I DVM: Low resistance measurement using 3458A, current force (A.01.20)
25. R-I kelvin: Resistor R-I characteristics, Kelvin connection (A.01.11)
26. R-I: Resistor R-I characteristics (A.01.11)
27. R-V DVM: Low resistance measurement using 3458A, voltage force (A.01.20)
28. R-V kelvin: Resistor R-V characteristics, Kelvin connection (A.01.20)
29. R-V: Resistor R-V characteristics (A.01.20)
30. VanDerPauw Square: Van Der Pauw pattern sheet resistance (A.01.11)

Contents

11 TFT

1. TFT Id-Vd: TFT Id-Vd characteristics (A.01.20)
2. TFT Id-Vg: TFT Id-Vg characteristics (A.01.20)

38. Vbe-We:	hfe,Vbe-Le characteristics (A.01.20)

1.1 BC Diode Fwd: Base-Collector junction forward characteristics (A.01.20)

[Supported Analyzer]

B1500A, 4155B, 4155C, 4156B, 4156C

[Description]

Measures the Base-Collector junction forward characteristics of BJT. Emitter and Substrate are opened.

[Device Under Test]

Bipolar transistor

[Device Parameters]

Polarity: NPN (SMUs force the specified value) or PNP (SMUs force the negative specified value).

Lb: Base length

Wb: Base width

Temp: Temperature

Imax: Current compliance

[Test Parameters]

IntegTime: Integration time

Collector: SMU connected to Collector terminal, primary sweep voltage output

VcStart: Sweep start voltage for Collector terminal

VcStop: Sweep stop voltage for Collector terminal

VcStep: Sweep step voltage for Collector terminal

Base: SMU connected to Base terminal, constant voltage output

[Extended Test Parameters]

Vb: Base voltage

HoldTime: Hold time

DelayTime: Delay time

BaseMinRng: Minimum range for the base current measurement

CollectorMinRng: Minimum range for the collector current measurement

[Measurement Parameters]

Collector current Icollector

Base current Ibase

[User Function]

IcPerArea=Icollector/Lb/Wb

IbPerArea=Ibase/Lb/Wb

[X-Y Plot]

X axis: Collector voltage Vcollector (LINEAR)

Y1 axis: Collector current Icollector (LOG)

Y2 axis: Collector current Icollector (LINEAR)

Y3 axis: Base current Ibase (LOG)

Y4 axis: Base current Ibase (LINEAR)

1 BJT

1.2 BC Diode Reverse: Base-Collector junction reverse characteristics (A.01.20)

[Supported Analyzer]

B1500A, 4155B, 4155C, 4156B, 4156C

[Description]

Measures the Base-Collector junction reverse characteristics of BJT. Emitter and Substrate are opened.

[Device Under Test]

Bipolar transistor

[Device Parameters]

Polarity: NPN (SMUs force the specified value) or PNP (SMUs force the negative specified value).

Lb: Base length

Wb: Base width

Temp: Temperature

[Test Parameters]

IntegTime: Integration time

Collector: SMU connected to Collector terminal, primary sweep voltage output

VcStart: Sweep start voltage for Collector terminal

VcStop: Sweep stop voltage for Collector terminal

VcStep: Sweep step voltage for Collector terminal

IcLimit: Collector current compliance

Base: SMU connected to Base terminal, constant voltage output

[Extended Test Parameters]

Vb: Base voltage

HoldTime: Hold time

DelayTime: Delay time

BaseMinRng: Minimum range for the base current measurement

CollectorMinRng: Minimum range for the collector current measurement

[Measurement Parameters]

Collector current Icollector

Base current Ibase

[User Function]

$IcPerArea = I_{collector} / Lb / Wb$

$IbPerArea = I_{base} / Lb / Wb$

[X-Y Plot]

X axis: Collector voltage Vcollector (LINEAR)

Y1 axis: Collector current Icollector (LOG)

Y2 axis: Base current Ibase (LOG)

1.3 *BVcbo: Base-Collector junction breakdown voltage (A.01.20)*

[Supported Analyzer]

B1500A, 4155B, 4155C, 4156B, 4156C

[Description]

Measures the collector current vs collector voltage characteristics, and extracts the Base-Collector junction breakdown voltage (BVcbo). Emitter and Substrate are opened.

[Device Under Test]

Bipolar transistor

[Device Parameters]

Polarity: NPN (SMUs force the specified value) or PNP (SMUs force the negative specified value).

Lb: Base length

Wb: Base width

Temp: Temperature

[Test Parameters]

IntegTime: Integration time

Ic@BVcbo: Collector current to decide the breakdown

Collector: SMU connected to Collector terminal, primary sweep voltage output

VcStart: Sweep start voltage for Collector terminal

VcStop: Sweep stop voltage for Collector terminal

VcStep: Sweep step voltage for Collector terminal

Base: SMU connected to Base terminal, constant voltage output

[Extended Test Parameters]

Vb: Base voltage

HoldTime: Hold time

DelayTime: Delay time

CollectorMinRng: Minimum range for the collector current measurement

BaseMinRng: Minimum range for the base current measurement

[Measurement Parameters]

Collector current Icollector

Base current Ibase

For the all terminals, the SMU current compliance is set to $Ic@BVcbo * 1.1$.

[User Function]

$IcPerArea = I_{collector} / Lb / Wb$

$IbPerArea = I_{base} / Lb / Wb$

[Analysis Function]

$BVcbo = @L1X$ (X interrupt of Line1)

[X-Y Plot]

X axis: Collector voltage Vcollector (LINEAR)

Y1 axis: Collector current Icollector (LOG)

Y2 axis: Base current Ibase (LOG)

[Parameters Display Area]

Base-Collector junction breakdown voltage BVcbo

[Auto Analysis]

Line1: Vertical line through Y1 data at $I_{collector} = Ic@BVcbo$

1 BJT

1.4 *BV_{cei}: Emitter-Collector breakdown voltage (A.01.20)*

[Supported Analyzer]

B1500A, 4155B, 4155C, 4156B, 4156C

[Description]

Measures the collector current vs collector voltage characteristics, and extracts the Emitter-Collector junction breakdown voltage (BV_{cei}). Substrate is opened.

[Device Under Test]

Bipolar transistor

[Device Parameters]

Polarity: NPN (SMUs force the specified value) or PNP (SMUs force the negative specified value).

Le: Emitter length

We: Emitter width

Temp: Temperature

[Test Parameters]

IntegTime: Integration time

Ic@BV_{cei}: Collector current to decide the breakdown

Collector: SMU connected to Collector terminal, primary sweep voltage output

VcStart: Sweep start voltage for Collector terminal

VcStop: Sweep stop voltage for Collector terminal

VcStep: Sweep step voltage for Collector terminal

Base: SMU connected to Base terminal, constant current output

Ib: Base current

VbLimit: Base voltage compliance

Emitter: SMU connected to Emitter terminal, constant voltage output

[Extended Test Parameters]

Ve: Emitter voltage

HoldTime: Hold time

DelayTime: Delay time

CollectorMinRng: Minimum range for the collector current measurement

[Measurement Parameters]

Collector current Icollector

Emitter current Iemitter

Base voltage Vbase

For the all terminals, the SMU current compliance is set to Ic@BV_{cei}*1.1.

[User Function]

IcPerArea=Icollector/Le/We

IePerArea=Iemitter/Le/We

[Analysis Function]

BV_{cei}=@L1X (X interrupt of Line1)

[X-Y Plot]

X axis: Collector voltage Vcollector (LINEAR)

Y1 axis: Collector current Icollector (LOG)

Y2 axis: Emitter current Iemitter (LOG)

[Parameters Display Area]

Emitter-Collector junction breakdown voltage BV_{cei}

[Auto Analysis]

Line1: Vertical line through Y1 data at Icollector=Ic@BV_{cei}

1.5 BVceo: Emitter-Collector breakdown voltage, opened base (A.01.20)

[Supported Analyzer]

B1500A, 4155B, 4155C, 4156B, 4156C

[Description]

Measures the collector current vs collector voltage characteristics, and extracts the Emitter-Collector junction breakdown voltage (BVceo). Base and Substrate are opened.

[Device Under Test]

Bipolar transistor

[Device Parameters]

Polarity: NPN (SMUs force the specified value) or PNP (SMUs force the negative specified value).

Le: Emitter length

We: Emitter width

Temp: Temperature

[Test Parameters]

IntegTime: Integration time

Ic@BVceo: Collector current to decide the breakdown

Collector: SMU connected to Collector terminal, primary sweep voltage output

VcStart: Sweep start voltage for Collector terminal

VcStop: Sweep stop voltage for Collector terminal

VcStep: Sweep step voltage for Collector terminal

Emitter: SMU connected to Emitter terminal, constant voltage output

[Extended Test Parameters]

Ve: Emitter voltage

HoldTime: Hold time

DelayTime: Delay time

CollectorMinRng: Minimum range for the collector current measurement

[Measurement Parameters]

Collector current Icollector

Emitter current Iemitter

For the all terminals, the SMU current compliance is set to Ic@BVceo*1.1.

[User Function]

IcPerArea=Icollector/Le/We

IePerArea=Iemitter/Le/We

[Analysis Function]

BVceo=@L1X (X interrupt of Line1)

[X-Y Plot]

X axis: Collector voltage Vcollector (LINEAR)

Y1 axis: Collector current Icollector (LOG)

Y2 axis: Emitter current Iemitter (LOG)

[Parameters Display Area]

Emitter-Collector junction breakdown voltage BVceo

[Auto Analysis]

Line1: Vertical line through Y1 data at Icollector=Ic@BVceo

1 BJT

1.6 *BVebo: Emitter-Base breakdown voltage (A.01.20)*

[Supported Analyzer]

B1500A, 4155B, 4155C, 4156B, 4156C

[Description]

Measures the emitter current vs emitter voltage characteristics, and extracts the Emitter-Base junction breakdown voltage (BV_{ebo}). Collector and Substrate are opened.

[Device Under Test]

Bipolar transistor

[Device Parameters]

Polarity: NPN (SMUs force the specified value) or PNP (SMUs force the negative specified value).

Le: Emitter length

We: Emitter width

Temp: Temperature

[Test Parameters]

IntegTime: Integration time

Ie@BV_{ebo}: Emitter current to decide the breakdown

Emitter: SMU connected to Emitter terminal, primary sweep voltage output

VeStart: Sweep start voltage for Emitter terminal

VeStop: Sweep stop voltage for Emitter terminal

VeStep: Sweep step voltage for Emitter terminal

Base: SMU connected to Base terminal, constant voltage output

[Extended Test Parameters]

Vb: Base voltage

HoldTime: Hold time

DelayTime: Delay time

EmitterMinRng: Minimum range for the emitter current measurement

BaseMinRng: Minimum range for the base current measurement

[Measurement Parameters]

Emitter current I_{emitter}

Base current I_{base}

For the all terminals, the SMU current compliance is set to Ie@BV_{ebo}*1.1.

[User Function]

IePerArea=I_{emitter}/Le/We

IbPerArea=I_{base}/Le/We

[Analysis Function]

BV_{ebo}=@L1X (X interrupt of Line1)

[X-Y Plot]

X axis: Emitter voltage V_{emitter} (LINEAR)

Y1 axis: Emitter current I_{emitter} (LOG)

Y2 axis: Base current I_{base} (LOG)

[Parameters Display Area]

Emitter-Base junction breakdown voltage BV_{ebo}

[Auto Analysis]

Line1: Vertical line through Y1 data at I_{emitter}=Ie@BV_{ebo}

1.7 CS Diode Fwd: Collector-Substrate junction forward characteristics (A.01.20)

[Supported Analyzer]

B1500A, 4155B, 4155C, 4156B, 4156C

[Description]

Measures the Collector-Substrate junction forward characteristics of BJT. Base and Emitter are opened.

[Device Under Test]

Bipolar transistor, 4 terminals

[Device Parameters]

Polarity: NPN (SMUs force the specified value) or PNP (SMUs force the negative specified value).

Lc: Collector length

Wc: Collector width

Temp: Temperature

Imax: Current compliance

[Test Parameters]

IntegTime: Integration time

Subs: SMU connected to Substrate, primary sweep voltage output

VsubsStart: Sweep start voltage for Substrate

VsubsStop: Sweep stop voltage for Substrate

VsubsStep: Sweep step voltage for Substrate

Collector: SMU connected to Collector terminal, constant voltage output

[Extended Test Parameters]

Vc: Collector voltage

HoldTime: Hold time

DelayTime: Delay time

CollectorMinRng: Minimum range for the collector current measurement

SubsMinRng: Minimum range for the substrate current measurement

[Measurement Parameters]

Substrate current Isubs

Collector current Icollector

[User Function]

$IcPerArea = I_{collector} / Lc / Wc$

$IsubsPerArea = I_{subs} / Lc / Wc$

[X-Y Plot]

X axis: Substrate voltage Vsubs (LINEAR)

Y1 axis: Substrate current Isubs (LINEAR)

Y2 axis: Substrate current Isubs (LOG)

Y3 axis: Collector current Icollector (LINEAR)

Y4 axis: Collector current Icollector (LOG)

1 BJT

1.8 CS Diode Reverse: Collector-Substrate junction reverse characteristics (A.01.20)

[Supported Analyzer]

B1500A, 4155B, 4155C, 4156B, 4156C

[Description]

Measures the Collector-Substrate junction reverse characteristics of BJT. Base and Emitter are opened.

[Device Under Test]

Bipolar transistor, 4 terminals

[Device Parameters]

Polarity: NPN (SMUs force the specified value) or PNP (SMUs force the negative specified value).

Lc: Collector length

Wc: Collector width

Temp: Temperature

[Test Parameters]

IntegTime: Integration time

Subs: SMU connected to Substrate, primary sweep voltage output

VsubsStart: Sweep start voltage for Substrate

VsubsStop: Sweep stop voltage for Substrate

VsubsStep: Sweep step voltage for Substrate

IsubsLimit: Substrate current compliance

Collector: SMU connected to Collector terminal, constant voltage output

[Extended Test Parameters]

Vc: Collector voltage

HoldTime: Hold time

DelayTime: Delay time

CollectorMinRng: Minimum range for the collector current measurement

SubsMinRng: Minimum range for the substrate current measurement

[Measurement Parameters]

Substrate current Isubs

Collector current Icollector

[User Function]

$IcPerArea = I_{collector} / Lc / Wc$

$IsubsPerArea = I_{subs} / Lc / Wc$

[X-Y Plot]

X axis: Substrate voltage Vsubs (LINEAR)

Y1 axis: Substrate current Isubs (LOG)

Y2 axis: Collector current Icollector (LOG)

1.9 Ctc-Freq Log: Ctc-f characteristics (A.01.20)

[Supported Analyzer]

B1500A

[Description]

Measures BJT's characteristics of base-to-collector capacitance (Ctc, linear) vs frequency (f, log). The measurement frequency is 10 points per decade.

For a more accurate measurement, perform correction data measurement at the measurement frequency before starting the capacitance measurement.

If the measurement frequency is not included in the list of default frequencies below, click the Advanced Options... button and set the measurement frequency on the Frequency area of the Advanced Options for CMU Calibration window.

Default frequencies:

1 k, 2 k, 5 k, 10 k, 20 k, 50 k, 100 k, 200 k, 500 k, 1 M, 1.2 M, 1.5 M, 2 M, 2.5 M, 2.7 M, 3 M, 3.2 M, 3.5 M, 3.7 M, 4 M, 4.2 M, 4.5 M, 5 MHz

[Device Under Test]

Bipolar transistor, 4 terminals

Connect CMU High and CMU Low to the collector terminal and base terminal respectively. For the emitter and substrate, connect GNDU.

[Required Modules and Accessories]

Agilent B1520A MFCMU 1 unit

[Device Parameters]

Polarity: NPN (CMU forces the specified value) or PNP (CMU forces the negative specified value)

Le: Emitter length

We: Emitter width

Temp: Temperature

[Test Parameters]

IntegTime: Integration time

Base: CMU connected between Base and Collector

FreqStart: Sweep start frequency

NoOfDecade: Number of decades for data collection

OscLevel: Measurement signal level

Vcb: Collector-Base voltage, constant voltage output

[Extended Test Parameters]

G_Min: Minimum transconductance value for graph

G_Max: Maximum transconductance value for graph

Cp_Min: Minimum capacitance value for graph

Cp_Max: Maximum capacitance value for graph

[Measurement Parameters]

Parallel capacitance Cp

Conductance G

[User Function]

Circular constant $PI=3.141592653589$

Frequency $Frequency=Freq$

Dissipation factor $D=G/(2*PI*Freq*Cp)$

1 BJT

Parallel resistance $R_p=1/G$
Series capacitance $C_s=(1+D^2)*C_p$
Reactance $X=-1/(2*PI*Freq*C_s)$
Series resistance $R_s=D*abs(X)$
Impedance $Z=sqrt(R_s^2+X^2)$
Phase Theta= $atan(X/R_s)$

[X-Y Plot]

X axis: Frequency Freq (LOG)
Y1 axis: Base-Collector capacitance (parallel capacitance) C_p (LINEAR)
Y2 axis: Conductance G (LINEAR)

1.10 Ctc-Vc: Ctc-Vcb characteristics (A.01.20)

[Supported Analyzer]

B1500A

[Description]

Measures the Base-Collector capacitance (Ctc), and plots the Ctc-Vcb characteristics.

For a more accurate measurement, perform correction data measurement at the measurement frequency before starting the capacitance measurement.

If the measurement frequency is not included in the list of default frequencies below, click the Advanced Options... button and set the measurement frequency on the Frequency area of the Advanced Options for CMU Calibration window.

Default frequencies:

1 k, 2 k, 5 k, 10 k, 20 k, 50 k, 100 k, 200 k, 500 k, 1 M, 1.2 M, 1.5 M, 2 M, 2.5 M, 2.7 M, 3 M, 3.2 M, 3.5 M, 3.7 M, 4 M, 4.2 M, 4.5 M, 5 MHz

[Device Under Test]

Bipolar transistor

Connect Base to the CMU Low, Collector to the CMU High, and the other terminals to the GNDU.

[Device Parameters]

Polarity: NPN (CMU forces the specified value) or PNP (CMU forces the negative specified value).

Le: Emitter length

We: Emitter width

Lb: Base length

Wb: Base width

Temp: Temperature

[Test Parameters]

IntegTime: Integration time

FREQ: Measurement frequency

OscLevel: Measurement signal level

Base: CMU connected between Base and Collector (CV sweep measurement)

VcbStart: DC bias start voltage

VcbStop: DC bias stop voltage

VcbStep: DC bias step voltage

[Extended Test Parameters]

HoldTime: Hold time

DelayTime: Delay time

[Measurement Parameters]

Parallel capacitance Cp

Conductance G

[User Function]

$PI=3.141592653589$

$D=G/(2*PI*FREQ*Cp)$

$Rp=1/G$

$Cs=(1+D^2)*Cp$

$X=-1/(2*PI*FREQ*Cs)$

1.13 EB Diode Fwd: Emitter-Base junction forward characteristics (A.01.20)

[Supported Analyzer]

B1500A, 4155B, 4155C, 4156B, 4156C

[Description]

Measures the Emitter-Base junction forward characteristics of BJT. Collector and Substrate are opened.

[Device Under Test]

Bipolar transistor

[Device Parameters]

Polarity: NPN (SMUs force the specified value) or PNP (SMUs force the negative specified value).

Le: Emitter length

We: Emitter width

Temp: Temperature

Imax: Current compliance

[Test Parameters]

IntegTime: Integration time

Emitter: SMU connected to Emitter terminal, primary sweep voltage output

VeStart: Sweep start voltage for Emitter terminal

VeStop: Sweep stop voltage for Emitter terminal

VeStep: Sweep step voltage for Emitter terminal

Base: SMU connected to Base terminal, constant voltage output

[Extended Test Parameters]

Vb: Base voltage

HoldTime: Hold time

DelayTime: Delay time

EmitterMinRng: Minimum range for the emitter current measurement

BaseMinRng: Minimum range for the base current measurement

[Measurement Parameters]

Emitter current Iemitter

Base current Ibase

[User Function]

$I_{ePerArea} = I_{emitter} / Le / We$

$I_{bPerArea} = I_{base} / Le / We$

[X-Y Plot]

X axis: Emitter voltage Vemitter (LINEAR)

Y1 axis: Emitter current Iemitter (LINEAR)

Y2 axis: Emitter current Iemitter (LOG)

Y3 axis: Base current Ibase (LINEAR)

Y4 axis: Base current Ibase (LOG)

1 BJT

1.14 EB Diode Rev: Emitter-Base junction reverse characteristics (A.01.20)

[Supported Analyzer]

B1500A, 4155B, 4155C, 4156B, 4156C

[Description]

Measures the Emitter-Base junction reverse characteristics of BJT. Collector and Substrate are opened.

[Device Under Test]

Bipolar transistor

[Device Parameters]

Polarity: NPN (SMUs force the specified value) or PNP (SMUs force the negative specified value).

Le: Emitter length

We: Emitter width

Temp: Temperature

[Test Parameters]

IntegTime: Integration time

Emitter: SMU connected to Emitter terminal, primary sweep voltage output

VeStart: Sweep start voltage for Emitter terminal

VeStop: Sweep stop voltage for Emitter terminal

VeStep: Sweep step voltage for Emitter terminal

IeLimit: Emitter current compliance

Base: SMU connected to Base terminal, constant voltage output

[Extended Test Parameters]

Vb: Base voltage

HoldTime: Hold time

DelayTime: Delay time

EmitterMinRng: Minimum range for the emitter current measurement

BaseMinRng: Minimum range for the base current measurement

[Measurement Parameters]

Emitter current Iemitter

Base current Ibase

[User Function]

$IePerArea = Iemitter / Le / We$

$IbPerArea = Ibase / Le / We$

[X-Y Plot]

X axis: Emitter voltage Vemitter (LINEAR)

Y1 axis: Emitter current Iemitter (LOG)

Y2 axis: Base current Ibase (LOG)

1.15 G-Plot ConstVce Pulse: Ic-Vb characteristics, Vce=const, SMU Pulse (A.01.11)

[Supported Analyzer]

B1500A, 4155B, 4155C, 4156B, 4156C

[Description]

Measures the collector current vs base voltage characteristics. The SMU pulse is used for the Collector voltage output.

[Device Under Test]

Bipolar transistor, 4 terminals

[Device Parameters]

Polarity: NPN (SMUs force the specified value) or PNP (SMUs force the negative specified value).

Le: Emitter length

We: Emitter width

Temp: Temperature

IcMax: Collector current compliance

[Test Parameters]

Base: SMU connected to Base terminal, primary sweep voltage output

VbStart: Sweep start voltage for Base terminal

VbStop: Sweep stop voltage for Base terminal

VbStep: Sweep step voltage for Base terminal

Collector: SMU connected to Collector terminal, constant voltage output

IcPerArea=Icollector/Le/We

[X-Y Plot]

X axis: Base voltage Vbase (LINEAR)

Y1 axis: Collector current Icollector (LINEAR)

1 BJT

1.16 G-Plot ConstVce Pulse[3]: Ic-Vb characteristics, Vce=const, 3-terminal, SMU Pulse (A.01.11)

[Supported Analyzer]

B1500A, 4155B, 4155C, 4156B, 4156C

[Description]

Measures the collector current vs base voltage characteristics. The SMU pulse is used for the Collector voltage output.

[Device Under Test]

Bipolar transistor, 3 terminals

[Device Parameters]

Polarity: NPN (SMUs force the specified value) or PNP (SMUs force the negative specified value).

Le: Emitter length

We: Emitter width

Temp: Temperature

IcMax: Collector current compliance

[Test Parameters]

Base: SMU connected to Base terminal, primary sweep voltage output

VbStart: Sweep start voltage for Base terminal

VbStop: Sweep stop voltage for Base terminal

VbStep: Sweep step voltage for Base terminal

Collector: SMU connected to Collector terminal, constant voltage output

Vc: Collector voltage

PulsePeriod: Pulse period

PulseWidth: Pulse width

BaseValue: Pulse base value

Emitter: SMU connected to Emitter terminal, constant voltage output

[Extended Test Parameters]

Ve: Emitter voltage

HoldTime: Hold time

DelayTime: Delay time

[Measurement Parameters]

Collector current Icollector

[User Function]

$IcPerArea = I_{collector} / Le / We$

[X-Y Plot]

X axis: Base voltage Vbase (LINEAR)

Y1 axis: Collector current Icollector (LINEAR)

1.17 G-Plot ConstVce: Gummel characteristics, Vce=constant (A.01.20)

[Supported Analyzer]

B1500A, 4155B, 4155C, 4156B, 4156C

[Description]

Measures the collector current vs base voltage characteristics and the base current vs base voltage characteristics, extracts the current amplification factor hfe, and plots the gummel characteristics.

[Device Under Test]

Bipolar transistor, 4 terminals

[Device Parameters]

Polarity: NPN (SMUs force the specified value) or PNP (SMUs force the negative specified value).

Le: Emitter length

We: Emitter width

Temp: Temperature

IcMax: Collector current compliance

[Test Parameters]

IntegTime: Integration time

1.36 Simple Gummel Plot: Evaluation of Gummel characteristics (Vce=const) *(A.01.10)*

[Supported Analyzer]

B1500A, 4155B, 4155C, 4156B, 4156C

[Application]

This application evaluates the Gummel characteristics of a NPN BJT with three terminals.

[Device Measured]

Single NPN device with three terminals.

[Parameter Setting]

Test parameters are specified for NPN device under test.

[Description of Measurement]

Base and Collector voltage, referenced to emitter voltage (0 V), sweeps synchronously in accordance with the test parameter setting.

Currents flowing in base and collector terminals are measured while the synchronized voltages sweep.

[Plot Display]

Collector and base currents in log scale, as well as the current amplification factor (Beta) in linear scale, are plotted versus base voltage on the linear horizontal axis.

1.37 Vbe-Le: hfe, Vbe-Le characteristics (A.01.20)

[Supported Analyzer]

B1500A

[Description]

Measures hfe (current amplification factor)-Vbe (voltage between base and emitter) characteristics of BJT with different Le (emitter length) and plots hfe and Vbe's dependency on Le.

[Device Under Test]

Bipolar transistor, 4 terminals

[Required Modules and Accessories]

Agilent B2200A or B2201A switching matrix 1 unit
 GPIB cable

Connect B2200A/B2201A to B1500A with measurement cables and GPIB cable.

Set information on B1500A SMU channel's connection to the B2200A/B2201A input port properly on the Switching Matrix tab screen of the Configuration window.

Set the output channel number of B2200A/B2201A connected to each terminal of a device under test properly in the B#/C#/E#/Sb# field (# is an integer from 1 to 12) of Test Parameters area.

The maximum number of devices connected at once depends on the number of matrix modules mounted on B2200A/B2201A. Maximum three devices can be connected to one module at once.

[Setting of Le#/B#/C#/E#/Sb# field (# is an integer from 1 to 12)]

Set one device for Le#(emitter length)/B#(base)/C#(collector)/E#(emitter)/Sb#(substrate).
 Le1<Le2<Le3... must be satisfied. Enter zero for a field with no device.

[Device Parameters]

Polarity: NPN (SMUs force the specified value) or PNP (SMUs force the negative specified value)

2.1 *BV_{dss}: Breakdown voltage between source and drain (A.01.20)*

[Supported Analyzer]

B1500A, 4155B, 4155C, 4156B, 4156C

[Description]

Measures the breakdown voltage between source and drain of MOSFET.

[Device Under Test]

MOSFET, 4 terminals

[Device Parameters]

Polarity: Nch (SMUs force the specified value) or Pch (SMUs force the negative specified value).

Lg: Gate length

Wg: Gate width

Temp: Temperature

[Test Parameters]

IntegTime: Integration time

Is@BV_{dss}: Source current to decide the breakdown

Drain: SMU connected to Drain, primary sweep voltage output

VdStart: Sweep start voltage for Drain

VdStop: Sweep stop voltage for Drain

VdStep: Sweep step voltage for Drain

Gate: SMU connected to Gate, constant voltage output

Subs: SMU connected to Substrate, constant voltage output

Source: SMU connected to Source, constant voltage output

[Extended Test Parameters]

Vg: Gate voltage

Vs: Source voltage

Vsubs: Substrate voltage

HoldTime: Hold time

DelayTime: Delay time

DrainMinRng: Minimum range for the drain current measurement

GateMinRng: Minimum range for the gate current measurement

SubsMinRng: Minimum range for the substrate current measurement

[Measurement Parameters]

Drain current I_{drain}

Source current I_{source}

Gate current I_{gate}

Substrate current I_{subs}

For the source terminal, the SMU current compliance is set to Is@BV_{dss}*1.1.

[User Function]

Source current per unit gate width I_{sourcePerWg}=I_{source}/Wg

Drain current per unit gate width I_{drainPerWg}=I_{drain}/Wg

[Analysis Function]

BV_{dss}=@L1X (X intercept of Line1)

[X-Y Plot]

X axis: Drain voltage V_{drain} (LINEAR)

2 CMOS

Y1 axis: Drain current I_{drain} (LOG)

Y2 axis: Source current I_{source} (LOG)

[List Display]

Gate current I_{gate}

Substrate current I_{subs}

[Parameters Display Area]

Breakdown voltage between source and drain BV_{dss}

[Auto Analysis]

Line1: Vertical line through Y2 data at $I_{\text{source}}=I_{\text{s}}@BV_{\text{dss}}$

2.2 *BVgso*: Breakdown voltage between gate and source (A.01.20)

[Supported Analyzer]

B1500A, 4155B, 4155C, 4156B, 4156C

[Description]

Measures the breakdown voltage between gate and source of MOSFET when drain is opened.

[Device Under Test]

MOSFET, 4 terminals

[Device Parameters]

Polarity: Nch (SMUs force the specified value) or Pch (SMUs force the negative specified value).

Lg: Gate length

Wg: Gate width

Temp: Temperature

[Test Parameters]

IntegTime: Integration time

Is@BVgso: Source current to decide the breakdown

Gate: SMU connected to Gate, primary sweep voltage output

VgStart: Sweep start voltage for Gate

VgStop: Sweep stop voltage for Gate

VgStep: Sweep step voltage for Gate

Subs: SMU connected to Substrate, constant voltage output

Source: SMU connected to Source, constant voltage output

[Extended Test Parameters]

Vsubs: Substrate voltage

Vs: Source voltage

HoldTime: Hold time

DelayTime: Delay time

GateMinRng: Minimum range for the gate current measurement

SourceMinRng: Minimum range for the source current measurement

SubsMinRng: Minimum range for the substrate current measurement

[Measurement Parameters]

Source current Isource

Gate current Igate

Substrate current Isubs

For the all terminals, the SMU current compliance is set to Is@BVgso*1.1.

[User Function]

Gate current per Gate unit area IgatePerGateArea=Igate/Lg/Wg

[Analysis Function]

BVgso=@L1X (X intercept of Line1)

[X-Y Plot]

X axis: Gate voltage Vgate (LINEAR)

Y1 axis: Source current Isource (LOG)

Y2 axis: Gate current Igate (LOG)

2 CMOS

2.3 Cgb-AC Level: Cgb-Vosc characteristics (A.01.11)

[Supported Analyzer]

B1500A

[Description]

Measures the Gate-Substrate capacitance (Cgs), and plots the Cgs-Vosc characteristics.

DC bias output is fixed at -Vgs. Oscillator level (Vosc) is changed from -OscStart to -OscStop in -OscStep steps. The CMU performs spot measurement of the parallel capacitance (Cp) and conductance (G) at each oscillator level.

For a more accurate measurement, perform correction data measurement at the measurement frequency before starting the capacitance measurement.

If the measurement frequency is not included in the list of default frequencies below, click the Advanced Options... button and set the measurement frequency on the Frequency area of the Advanced Options for CMU Calibration window.

Default frequencies:

1 k, 2 k, 5 k, 10 k, 20 k, 50 k, 100 k, 200 k, 500 k, 1 M, 1.2 M, 1.5 M, 2 M, 2.5 M, 2.7 M, 3 M, 3.2 M, 3.5 M, 3.7 M, 4 M, 4.2 M, 4.5 M, 5 MHz

[Device Under Test]

MOSFET, 4 terminals

Connect Gate to the CMU Low and Substrate to the CMU High. And connect Drain and Source to the specified SMU.

[Device Parameters]

Polarity: Nch (CMU/SMU forces the specified value) or Pch (CMU/SMU forces the negative specified value).

Lg: Gate length

Wg: Gate width

Temp: Temperature

[Test Parameters]

IntegTime: Integration time

OscStart: Oscillator level (Vosc) start voltage

OscStop: Vosc stop voltage

OscStep: Vosc step voltage

FREQ: Measurement frequency

Gate: CMU connected between Gate and Substrate (CV spot measurement)

Vgs: DC bias. Gate-Substrate voltage.

Source: SMU connected to Source terminal (constant voltage output)

[Extended Test Parameters]

Vs: Source voltage

IsLimit: Source current compliance

HoldTime: Hold time

DelayTime: Delay time

[Measurement Parameters]

2 CMOS

2.4 Cgb-Freq Log: Cgb-f characteristics (A.01.20)

[Supported Analyzer]

B1500A

[Description]

Measures MOSFET's characteristics of gate-to-substrate capacitance (Cgb, linear) vs frequency (f, log). The measurement frequency is 10 points per decade.

For a more accurate measurement, perform correction data measurement at the measurement frequency before starting the capacitance measurement.

If the measurement frequency is not included in the list of default frequencies below, click the Advanced Options... button and set the measurement frequency on the Frequency area of the Advanced Options for CMU Calibration window.

Default frequencies:

1 k, 2 k, 5 k, 10 k, 20 k, 50 k, 100 k, 200 k, 500 k, 1 M, 1.2 M, 1.5 M, 2 M, 2.5 M, 2.7 M, 3 M, 3.2 M, 3.5 M, 3.7 M, 4 M, 4.2 M, 4.5 M, 5 MHz

[Device Under Test]

MOSFET, 4 terminals

Connect Gate to the CMU Low and Substrate to the CMU High. And connect Drain and Source to the GNDU.

[Required Modules and Accessories]

Agilent B1520A MFCMU 1 unit

[Device Parameters]

Polarity: Nch (CMU forces the specified value) or Pch (CMU forces the negative specified value)

2 CMOS

2.5 *Cgb-Vg High Voltage: Cgb-Vg characteristics using SCUU (A.01.11)*

[Supported Analyzer]

B1500A

[Description]

Measures the Gate-Substrate capacitance (Cgs), and plots the Cgs-Vg characteristics.

DC bias output is performed from -VgsStart to -VgsStop in -VgsStep steps. The CMU performs spot measurement of the parallel capacitance (Cp) and conductance (G) at each bias output. SCUU enables the maximum 100 V DC bias.

For a more accurate measurement, perform correction data measurement at the measurement frequency before starting the capacitance measurement.

If the measurement frequency is not included in the list of default frequencies below, click the Advanced Options... button and set the measurement frequency on the Frequency area of the Advanced Options for CMU Calibration window.

Default frequencies:

1 k, 2 k, 5 k, 10 k, 20 k, 50 k, 100 k, 200 k, 500 k, 1 M, 1.2 M, 1.5 M, 2 M, 2.5 M, 2.7 M, 3 M, 3.2 M, 3.5 M, 3.7 M, 4 M, 4.2 M, 4.5 M, 5 MHz

[Device Under Test]

MOSFET, 4 terminals

Connect Gate and Substrate to the SCUU. And connect Drain and Source to the specified SMU.

[Required Modules and Accessories]

One MFCMU module, three SMU modules, and a set of SCUU/GSWU are required.

SCUU connections: Output1: Substrate, Output2: Gate

Connection wire must be connected between the GSWU and the DUT interface High/Low guard lines.

[Device Parameters]

Polarity: Nch (CMU/SMU forces the specified value) or Pch (CMU/SMU forces the negative specified value).

2.8 Cgc-Vg: Cgc-Vg characteristics (A.01.11)

[Supported Analyzer]

B1500A

[Description]

Measures the Gate-Channel capacitance (C_{gc}), and plots the Cgc-Vg characteristics.

DC bias output is performed from -VgsStart to -VgsStop in -VgsStep steps. The CMU performs spot measurement of the parallel capacitance (C_p) and conductance (G) at each bias output. The substrate voltage is changed simultaneously with the DC bias output to keep the Channel-Substrate voltage constant. The SMU works as the constant voltage source and realizes the secondary sweep by repeating the output change every DC bias sweep.

For a more accurate measurement, perform correction data measurement at the measurement frequency before starting the capacitance measurement.

If the measurement frequency is not included in the list of default frequencies below, click the Advanced Options... button and set the measurement frequency on the Frequency area of the Advanced Options for CMU Calibration window.

Default frequencies:

1 k, 2 k, 5 k, 10 k, 20 k, 50 k, 100 k, 200 k, 500 k, 1 M, 1.2 M, 1.5 M, 2 M, 2.5 M, 2.7 M, 3 M, 3.2 M, 3.5 M, 3.7 M, 4 M, 4.2 M, 4.5 M, 5 MHz

[Device Under Test]

MOSFET, 4 terminals

Connect Gate to the CMU Low, and Drain-Source to the CMU High. And connect Substrate to the specified SMU.

[Device Parameters]

2 CMOS

2.9 Cgg-Freq Linear: Cgg-f characteristics (A.01.20)

[Supported Analyzer]

B1500A

[Description]

Measures the gate capacitance (C_{gg}, linear) vs frequency (f, linear) characteristics of MOSFET.

For a more accurate measurement, perform correction data measurement at the measurement frequency before starting the capacitance measurement.

If the measurement frequency is not included in the list of default frequencies below, click the Advanced Options... button and set the measurement frequency on the Frequency area of the Advanced Options for CMU Calibration window.

Default frequencies:

1 k, 2 k, 5 k, 10 k, 20 k, 50 k, 100 k, 200 k, 500 k, 1 M, 1.2 M, 1.5 M, 2 M, 2.5 M, 2.7 M, 3 M, 3.2 M, 3.5 M, 3.7 M, 4 M, 4.2 M, 4.5 M, 5 MHz

[Device Under Test]

MOSFET, 4 terminals

Connect Gate to the CMU Low, and Drain-Source-Substrate to the CMU High.

[Required Modules and Accessories]

Agilent B1520A MFCMU 1 unit

[Device Parameters]

Polarity: Nch (CMU forces the specified value) or Pch (CMU forces the negative specified value)

Lg: Gate length

Wg: Gate width

Temp: Temperature

[Test Parameters]

IntegTime: Integration time

FreqStart: Sweep start frequency

NoOfPoint: Number of measurement points

OscLevel: Measurement signal level

Gate: CMU connected to Gate terminal, CV sweep measurement

Vgs: Voltage for Gate terminal, constant voltage output

[Extended Test Parameters]

G_Min: Minimum transconductance value for graph

G_Max: Maximum transconductance value for graph

Cp_Min: Minimum capacitance value for graph

Cp_Max: Maximum capacitance value for graph

[Measurement Parameters]

Parallel capacitance Cp

Conductance G

[User Function]

Circular constant $PI=3.141592653589$

Frequency $Frequency=Freq$

Dissipation factor $D=G/(2*PI*Freq*Cp)$

Parallel resistance $Rp=1/G$

2 CMOS

2.10 Cgg-Freq Log: Cgg-f characteristics (A.01.20)

[Supported Analyzer]

B1500A

[Description]

Measures the gate capacitance (C_{gg}, linear) vs frequency (f, log) characteristics of MOSFET. The measurement frequency is 10 points per decade.

For a more accurate measurement, perform correction data measurement at the measurement frequency before starting the capacitance measurement.

If the measurement frequency is not included in the list of default frequencies below, click the Advanced Options... button and set the measurement frequency on the Frequency area of the Advanced Options for CMU Calibration window.

Default frequencies:

1 k, 2 k, 5 k, 10 k, 20 k, 50 k, 100 k, 200 k, 500 k, 1 M, 1.2 M, 1.5 M, 2 M, 2.5 M, 2.7 M, 3 M, 3.2 M, 3.5 M, 3.7 M, 4 M, 4.2 M, 4.5 M, 5 MHz

[Device Under Test]

MOSFET, 4 terminals

Connect Gate to the CMU Low, and Drain-Source-Substrate to the CMU High.

[Required Modules and Accessories]

2 CMOS

2.11 Cgg-Vg 2Freq: Cgg-Vg characteristics, 2-frequency method (A.01.11)

[Supported Analyzer]

B1500A

[Description]

Measures the Gate capacitance (C_{gg}), and plots the C_{gg}-V_g characteristics. The C_{gg} value is given by the following formula. Then C1 and C2 are capacitance, D1 and C2 are dissipation factor measured at the frequency (f1 and f2).

$$C_{gg} = [f1^2 * C1 * (1 + D1^2) - f2^2 * C2 * (1 + D2^2)] / [f2^2 - f1^2]$$

For a more accurate measurement, perform correction data measurement at the measurement frequency before starting the capacitance measurement.

If the measurement frequency is not included in the list of default frequencies below, click the Advanced Options... button and set the measurement frequency on the Frequency area of the Advanced Options for CMU Calibration window.

Default frequencies:

1 k, 2 k, 5 k, 10 k, 20 k, 50 k, 100 k, 200 k, 500 k, 1 M, 1.2 M, 1.5 M, 2 M, 2.5 M, 2.7 M, 3 M, 3.2 M, 3.5 M, 3.7 M, 4 M, 4.2 M, 4.5 M, 5 MHz

[Device Under Test]

MOSFET, 4 terminals

Connect Gate to the CMU Low, and the other terminals to the CMU High.

[Device Parameters]

Polarity: Nch (CMU forces the specified value) or Pch (CMU forces the negative specified value).

Lg: Gate length

Wg: Gate width

2.13 IdRdsGds: Drain resistance/conductance (A.01.20)

[Supported Analyzer]

B1500A, 4155B, 4155C, 4156B, 4156C

[Description]

Extracts the early voltage, drain resistance, and drain conductance from the drain current vs drain voltage characteristics of MOSFET.

[Device Under Test]

MOSFET, 4 terminals

[Device Parameters]

Polarity: Nch (SMUs force the specified value) or Pch (SMUs force the negative specified value).

Lg: Gate length

Wg: Gate width

Temp: Temperature

IdMax: Drain current compliance

[Test Parameters]

IntegTime: Integration time

Drain: SMU connected to Drain terminal, primary sweep voltage output

VdStart: Sweep start voltage for Drain terminal

VdStop: Sweep stop voltage for Drain terminal

VdStep: Sweep step voltage for Drain terminal

Gate: SMU connected to Gate terminal, secondary sweep voltage output

VgStart: Sweep start voltage for Gate terminal

VgStop: Sweep stop voltage for Gate terminal

VgStep: Sweep step voltage for Gate terminal

Subs: SMU connected to Substrate, constant voltage output

B1500A, 4155B, 4155C, 4156B, 4156C

[Description]

Measures the drain current vs gate voltage characteristics of MOSFET.

[Device Under Test]

MOSFET, 3 terminals

[Device Parameters]

Polarity: Nch (SMUs force the specified value) or Pch (SMUs force the negative specified value).

Lg: Gate length

Wg: Gate width

Temp: Temperature

IdMax: Drain current compliance

[Test Parameters]

IntegTime: Integration time

Gate: SMU connected to Gate terminal, primary sweep voltage output

VgStart: Sweep start voltage for Gate terminal

VgStop: Sweep stop voltage for Gate terminal

VgStep: Sweep step voltage for Gate terminal

Drain: SMU connected to Drain terminal, secondary sweep voltage output

VdStart: Sweep start voltage for Drain terminal

VdStop: Sweep stop voltage for Drain terminal

VdStep: Sweep step voltage for Drain terminal

Source: SMU connected to Source terminal, constant voltage output

[Extended Test Parameters]

Vs: Source voltage

IgLimit: Gate current compliance

HoldTime: Hold time

DelayTime: Delay time

DrainMinRng: Minimum range for the drain current measurement

[Measurement Parameters]

Drain current Idrain

[User Function]

IdrainPerWg: Drain current per unit gate width $\text{IdrainPerWg} = \text{Idrain} / \text{Wg}$

gm: Transconductance $\text{gm} = \text{diff}(\text{Idrain}, \text{Vgate})$

gmPerWg: Transconductance per unit gate width $\text{gmPerWg} = \text{diff}(\text{IdrainPerWg}, \text{Vgate})$

[X-Y Plot]

X axis: Gate voltage Vgate (LINEAR)

Y1 axis: Drain current Idrain (LINEAR)

Y2 axis: Drain current Idrain (LOG)

[List Display]

Drain current per unit gate width IdrainPerWg

Transconductance gm

Transconductance per unit gate width gmPerWg

2 CMOS

2.22 IonIoffSlope: On current, off current, and subthreshold slope (A.01.20)

[Supported Analyzer]

B1500A, 4155B, 4155C, 4156B, 4156C

[Description]

Extracts the on current, off current, and subthreshold slope from the Id-Vg characteristics.

[Device Under Test]

MOSFET, 4 terminals

[Device Parameters]

Polarity: Nch (SMUs force the specified value) or Pch (SMUs force the negative specified value).

Lg: Gate length

Wg: Gate width

Temp: Temperature

IdMax: Drain current compliance

[Test Parameters]

IntegTime: Integration time

Gate: SMU connected to Gate terminal, primary sweep voltage output

VgStart: Sweep start voltage for Gate terminal, $V_{gStart} < 0$

VgStop: Sweep stop voltage for Gate terminal, $V_{gStop} = V_d$

VgStep: Sweep step voltage for Gate terminal

Drain: SMU connected to Drain terminal, constant voltage output

Vd: Drain voltage

Subs: SMU connected to Substrate, constant voltage output

Vsubs: Substrate voltage

Source: SMU connected to Source terminal, constant voltage output

[Extended Test Parameters]

Vs: Source voltage

IgLimit: Gate current compliance

IsubsLimit: Substrate current compliance

HoldTime: Hold time

DelayTime: Delay time

DrainMinRng: Minimum range for the drain current measurement

[Measurement Parameters]

Drain current Idrain

[User Function]

$Slope = 1 / \text{diff}(\text{lgt}(\text{Idrain}), V_{gate})$

$SlopeMin = \text{min}(\text{abs}(Slope))$

[Analysis Function]

$I_{on} = @L1Y1$ (Y1 intercept of Line1)

$I_{off} = @L2Y1$ (Y1 intercept of Line2)

[X-Y Plot]

X axis: Gate voltage Vgate (LINEAR)

Y1 axis: Drain current Idrain (LOG)

Y2 axis: Slope (LINEAR)

[Parameters Display Area]

SlopeMin: minimum Slope value

Ion: on current (drain current at $V_g=V_{gStop}$)

Ioff: off current (drain current at $V_g=0$)

[Auto Analysis]

Line1: Horizontal line through the Y1 data at $V_{gate}=V_d(=V_{gStop})$

Line2: Horizontal line through the Y1 data at $V_{gate}=0$

Marker: Point of $Slope=SlopeMin$

2 CMOS

2.23 *Isub-Vg: Isub-Lg characteristics (A.01.20)*

[Supported Analyzer]

B1500A, 4155B, 4155C, 4156B, 4156C

[Description]

Measures the substrate current vs gate voltage characteristics of MOSFET.

[Device Under Test]

MOSFET, 4 terminals

[Device Parameters]

Polarity: Nch (SMUs force the specified value) or Pch (SMUs force the negative specified value)

Lg: Gate length

Wg: Gate width

Temp: Temperature (deg C)

[Test Parameters]

IntegTime: Integration time (SHORT, MEDIUM, LONG) default: MEDIUM

Gate: SMU connected to Gate terminal, primary sweep voltage output

Drain: SMU connected to Drain terminal, secondary sweep voltage output

Subs: SMU connected to Substrate terminal, constant voltage output

Source: SMU connected to Source terminal, constant voltage output

VgStart: Sweep start voltage for Gate terminal

VgStop: Sweep stop voltage for Gate terminal

VgStep: Sweep step voltage for Gate terminal

VdStart: Sweep start voltage for Drain terminal

VdStop: Sweep stop voltage for Drain terminal

VdStep: Sweep step voltage for Drain terminal

[Extended Test Parameters]

HoldTime: Hold time

DelayTime: Delay time

Vsubs: Substrate terminal voltage

IgLimit: Gate current compliance

IdLimit: Drain current compliance

IsubsLimit: Substrate current compliance

Vs: Source terminal voltage

DrainMinRng: Minimum range for drain current measurement

SubsMinRng: Minimum range for substrate current measurement

GateMinRng: Minimum range for gate current measurement

[Measurement Parameters]

Substrate current Isubs

[X-Y Plot]

X axis: Gate voltage Vgate (LINEAR)

Y1 axis: Substrate current Isubs (LOG)

[List Display]

Gate voltage Vgate

Substrate current Isubs

Drain current Idrain

Gate current Igate

2.24 QSCV[4]: C-Vg, Ig-Vg (4-terminal) (A.03.00)

[Supported Analyzer]

B1500A

[Description]

Measures the oxide film capacitance of a MOSFET by using the quasi-static CV method, and plots the C-V characteristics.

To obtain the measurement data after the capacitance offset cancel, perform the QSCV C Offset Meas application test before this test.

[Device Under Test]

MOSFET, 4 terminals

[Device Parameters]

Polarity: Nch (SMUs force the specified value) or Pch (SMUs force negative specified value)

Lg: Gate length

Wg: Gate width

Temp: Temperature

[Test Parameters]

Source: SMU connected to Source terminal, constant voltage output

Drain: SMU connected to Drain terminal, constant voltage output

Gate: SMU connected to Gate terminal, primary sweep (QSCV) voltage output

Subs: SMU connected to Substrate terminal, constant voltage output

IMeasSMU: SMU to measure current and capacitance, connected to Gate terminal or Substrate terminal

Vstart: Sweep start voltage

Vstop: Sweep stop voltage

Vstep: Sweep step voltage

QSCVMeasV: QSCV measurement voltage

I_Comp: Current compliance

LeakCompen: Leakage current compensation on/off

MeasRange: Current measurement range used for the QSCV measurement, fixed range

Integ_C: Integration time for the capacitance measurement

Integ_L: Integration time for the leakage current measurement

HoldTime: Hold time

DelayTime: Delay time

IOffsetCancel: QSCV smart operation enable/disable

IOffsetSink: SMU to perform QSCV smart operation, connected to terminal which connected to IMeasSMU

QSCV smart operation is effective for QSCV measurements with a large leakage current. The SMU set as the IOffsetSink performs the current force operation to minimize the measurement error caused by an offset current.

[Extended Test Parameters]

StepDelay: Step delay time

OutputRange: Ranging type for voltage output

SwpMode: Sweep mode

VCompSinkSMU: Voltage compliance of SMU for QSCV smart operation

Cmin: Minimum capacitance value for graph

Cmax: Maximum capacitance value for graph

IgMin: Minimum leakage current value for graph

IgMax: Maximum leakage current value for graph

[Measurement parameters]

2 CMOS

Capacitance C
Leakage current IgLeak

[X-Y Graph]

X axis: Gate Voltage Vg (LINEAR)
Y1 axis: Capacitance C (LINEAR)
Y2 axis: Leakage current Ig (LINEAR)

[List Display]

Gate voltage Vg
Capacitance C
Leakage current Ig

2.25 QSCV C Offset Meas: Offset capacitance measurement (A.03.00)

[Supported Analyzer]

B1500A

[Description]

Measures the offset capacitance of the cables and DUT interface by using the QSCV method when measurement terminals are open.

[Device Under Test]

MOS capacitance, 2 terminals

[Device Parameters]

Polarity: Nch (SMUs force the specified value) or Pch (SMUs force negative specified value)

Lg: Gate length

Wg: Gate width

Temp: Temperature

[Test Parameters]

IMeasSMU: SMU to measure current and capacitance, connected to Gate terminal or Substrate terminal

MeasRange: Current measurement range used for the QSCV measurement, fixed range

Integ_C: Integration time for the capacitance measurement

Integ_L: Integration time for the leakage current measurement

HoldTime: Hold time

DelayTime: Delay time

[Extended Test Parameters]

StepDelay: Step delay time

[Measurement parameters]

Capacitance C

[List Display]

Capacitance C

2.26 Simple Cgb : Evaluation of gate-substrate capacitance versus gate voltage (A.01.10)

[Supported Analyzer]
B1500A

[Application]

This application evaluates the gate-substrate capacitance of an Nch MOSFET.

For a more accurate measurement, perform correction data measurement at the measurement frequency before starting the capacitance measurement.

If the measurement frequency is not included in the list of default frequencies below, click the Advanced Options... button and set the measurement frequency on the Frequency area of the Advanced Options for CMU Calibration window.

Default frequencies:

1 k, 2 k, 5 k, 10 k, 20 k, 50 k, 100 k, 200 k, 500 k, 1 M, 1.2 M, 1.5 M, 2 M, 2.5 M, 2.7 M, 3 M, 3.2 M, 3.5 M, 3.7 M, 4 M, 4.2 M, 4.5 M, 5 MHz

[Device Measured]

Single device with four terminals.

[Parameter Setting]

Test parameters are specified for NMOS device under test.

Swept bias voltage parameters are specified by the gate voltage referenced to the source voltage (V_{gs}).

[Description of Measurement]

Gate voltage (V_{gs}) sweeps in accordance with the test parameter setting.

Gate capacitances are measured with Cp-G model applied while the bias voltage sweeps.

[Plot Display]

Measured gate capacitances in linear scale are plotted versus substrate voltage on the linear horizontal axis.

2.27 Simple Vth : Evaluation of Threshold Voltage (Vth) (A.01.20)

[Supported Analyzer]

B1500A, 4155B, 4155C, 4156B, 4156C

[Application]

This application evaluates the threshold voltage (Vth) of a Nch MOSFET.

[Device Measured]

Single device with four terminals.

[Parameter Setting]

Test parameters are specified for NMOS device under test.

Swept bias voltage parameters are specified by the gate voltage referenced to the source voltage (Vg).

[Description of Measurement]

Gate voltage (Vg) sweeps in accordance with the test parameter setting.

Currents flowing in drain terminal are measured while the gate voltage sweeps.

[Plot Display]

Measured drain currents and transconductance in linear scale are plotted versus gate voltage on the linear horizontal axis.

Maximum transconductance value (Gmmax) and threshold voltage (Vth) are extracted from the measurement data, then displayed in the parameters display area.

2 CMOS

2.28 *Vth Const Id: Constant current Vth (A.01.20)*

[Supported Analyzer]

B1500A, 4155B, 4155C, 4156B, 4156C

[Description]

Measures the drain current vs gate voltage characteristics, and extracts the threshold voltage (V_{th}) by using the constant current method.

[Device Under Test]

MOSFET, 4 terminals

[Device Parameters]

Polarity: Nch (SMUs force the specified value) or Pch (SMUs force the negative specified value).

Lg: Gate length

Wg: Gate width

Temp: Temperature

IdMax: Drain current compliance

[Test Parameters]

IntegTime: Integration time

Id@Vth: Drain current to decide the V_{th}

Gate: SMU connected to Gate terminal, primary sweep voltage output

VgStart: Sweep start voltage for Gate terminal

VgStop: Sweep stop voltage for Gate terminal

VgStep: Sweep step voltage for Gate terminal

Drain: SMU connected to Drain terminal, constant voltage output

Vd: Drain voltage

Subs: SMU connected to Substrate, constant voltage output

Vsubs: Substrate voltage

Source: SMU connected to Source terminal, constant voltage output

[Extended Test Parameters]

Vs: Source voltage

IgLimit: Gate current compliance

IsubsLimit: Substrate current compliance

HoldTime: Hold time

DelayTime: Delay time

DrainMinRng: Minimum range for the drain current measurement

[Measurement Parameters]

Drain current Idrain

[User Function]

gm=diff(Idrain,Vgate)

[Analysis Function]

Vth=@L1X (X intercept of Line1)

[X-Y Plot]

X axis: Gate voltage Vgate (LINEAR)

Y1 axis: Drain current Idrain (LINEAR)

Y2 axis: Drain current Idrain (LOG)

[List Display]

Transconductance gm

[Parameters Display Area]

Threshold voltage Vth

[Auto Analysis]

Line1: Vertical line for Y1 at Idrain=Id@Vth

2.29 *Vth gmMax : Linear region Vth (A.01.20)*

[Supported Analyzer]

B1500A, 4155B, 4155C, 4156B, 4156C

[Description]

Extracts the threshold voltage (V_{th}) by using the extrapolation method for the linear region of the drain current vs gate voltage characteristics.

[Device Under Test]

MOSFET, 4 terminals

[Device Parameters]

Polarity: Nch (SMUs force the specified value) or Pch (SMUs force the negative specified value).

Lg: Gate length

Wg: Gate width

Temp: Temperature

IdMax: Drain current compliance

[Test Parameters]

IntegTime: Integration time

Gate: SMU connected to Gate terminal, primary sweep voltage output

VgStart: Sweep start voltage for Gate terminal

VgStop: Sweep stop voltage for Gate terminal

VgStep: Sweep step voltage for Gate terminal

Drain: SMU connected to Drain terminal, constant voltage output

Vd: Drain voltage

Subs: SMU connected to Substrate, constant voltage output

Vsubs: Substrate voltage

Source: SMU connected to Source terminal, constant voltage output

[Extended Test Parameters]

Vs: Source voltage

IgLimit: Gate current compliance

IsubsLimit: Substrate current compliance

HoldTime: Hold time

DelayTime: Delay time

DrainMinRng: Minimum range for the drain current measurement

[Measurement Parameters]

Drain current Idrain

[User Function]

$gm = \text{diff}(I_{\text{drain}}, V_{\text{gate}})$

[Analysis Function]

$gmMax = \max(gm)$

$V_{on} = @L1X$ (X intercept of Line1)

$V_{th} = V_{on} - V_d/2$

V_{th} is given by the following formula.

$V_{th} = V_g(gmMax) - I_d(gmMax)/gmMax$

$V_d/2$ is necessary to compensate the secondary term of V_d in theory.

2 CMOS

[X-Y Plot]

X axis: Gate voltage V_{gate} (LINEAR)

Y1 axis: Drain current I_{drain} (LINEAR)

Y2 axis: Transconductance g_m (LINEAR)

Y3 axis: Drain current I_{drain} (LOG)

[Parameters Display Area]

Threshold voltage V_{th}

Maximum g_m value g_{mMax}

[Auto Analysis]

Line1: Tangent line for Y1 at $g_m=g_{mMax}$

2.30 *Vth gmMax and Id: Extrapolation Vth and Constant Vth (A.04.00)*

[Supported Analyzer]

B1500A, 4155B, 4155C, 4156B, 4156C

[Description]

Measures MOSFET Id-Vg characteristics, and extracts the threshold voltage (Vth) by the extrapolation method and the threshold voltage (Vth@Id) by the constant current method.

[Device Under Test]

MOSFET, 4 terminals

[Device Parameters]

Polarity: Nch (SMUs force the specified value) or Pch (SMUs force the negative specified value).

Lg: Gate length

Wg: Gate width

Temp: Temperature

IdMax: Drain current compliance

[Test Parameters]

IntegTime: Integration time

Id@Vth: Drain current to decide Vth by the constant current method

Gate: SMU connected to Gate terminal, primary sweep voltage output

VgStart: Sweep start voltage for Gate terminal

VgStop: Sweep stop voltage for Gate terminal

VgStep: Sweep step voltage for Gate terminal

Drain: SMU connected to Drain terminal, constant voltage output

Vd: Drain voltage

Subs: SMU connected to Substrate, constant voltage output

Source: SMU connected to Source terminal, constant voltage output

[Extended Test Parameters]

Vs: Source voltage

IgLimit: Gate current compliance

IsubsLimit: Substrate current compliance

HoldTime: Hold time

DelayTime: Delay time

DrainMinRng: Minimum range for the drain current measurement

[Measurement Parameters]

Drain current Idrain

[User Function]

gm=diff(Idrain,Vgate)

[Analysis Function]

gmMax=max(gm)

Von=@L1X (X intercept of Line1)

Vth=Von-Vd/2

Vth@Id=@MX (X coordinate of Marker)

Vth is given by the following formula.

$Vth = Vg(gmMax) - Id(gmMax) / gmMax$

2 CMOS

$V_d/2$ is necessary to compensate the secondary term of V_d in theory.

[X-Y Plot]

X axis: Gate voltage V_{gate} (LINEAR)

Y1 axis: Drain current I_{drain} (LINEAR)

Y2 axis: Transconductance g_m (LINEAR)

Y3 axis: Drain current I_{drain} (LOG)

[Parameters Display Area]

Threshold voltage by extrapolation method V_{th}

Maximum g_m value g_{mMax}

Threshold voltage by constant current method $V_{th@I_d}$

[Auto Analysis] set in $V_{th_g_{mMax}}$ and I_d test definition

Line1: Tangent line for Y1 at $g_m=g_{mMax}$

[Auto Analysis] set after $V_{th_g_{mMax}}$ and I_d test definition

Marker: Data point specified by $I_{drain}=I_d@V_{th}*Polarity$

2.31 *VthAndCgg-Vg ASU: Cgg-Vg, Id-Vg, using ASU (A.01.20)*

[Supported Analyzer]

B1500A

[Description]

Measures the gate capacitance vs gate voltage characteristics, the drain current vs gate voltage measurement by using one MFCMU, two sets of HRSMU/ASU, and one SMU.

For a more accurate measurement, perform correction data measurement at the measurement frequency before starting the capacitance measurement.

If the measurement frequency is not included in the list of default frequencies below, click the Advanced Options... button and set the measurement frequency on the Frequency area of the Advanced Options for CMU Calibration window.

Default frequencies:

1 k, 2 k, 5 k, 10 k, 20 k, 50 k, 100 k, 200 k, 500 k, 1 M, 1.2 M, 1.5 M, 2 M, 2.5 M, 2.7 M, 3 M, 3.2 M, 3.5 M, 3.7 M, 4 M, 4.2 M, 4.5 M, 5 MHz

[Device Under Test]

MOSFET, 4 terminals

[Required Modules and Accessories]

One MFCMU module, two sets of HRSMU/ASU, and one SMU module are required.

ASU#1 connections: Output: Gate, SMU: HRSMU, AUX: MFCMU Low

ASU#2 connections for Cgg-Vg: Output: other 3 terminals, SMU: HRSMU, AUX: MFCMU High

ASU#2 connections for Id-Vg: Output: Source and Substrate, SMU: HRSMU, AUX: MFCMU High

Connection wire must be connected between the CMU Return terminals of ASUs.

Setting of ASU I/O Path, ASU tab, Configuration window: AUX

[Device Parameters]

Polarity: Nch (CMU/SMU forces the specified value) or Pch (CMU/SMU forces the negative specified value).

Lg: Gate length

Wg: Gate width

Temp: Temperature

[Test Parameters]

GateAC: CMU connected to Gate terminal (CV sweep measurement)

2.33 Vth-Lg: Vth-Lg characteristics (A.01.20)

[Supported Analyzer]

B1500A

[Description]

Measures the Id-Vg characteristics of MOSFET with different Lg (gate length) and plots the Vth's dependency on Lg (threshold voltage).

[Device Under Test]

MOSFET, 4 terminals

[Required Modules and Accessories]

Agilent B2200A or B2201A switching matrix 1 unit
 GPIB cable

Connect B2200A/B2201A to B1500A with a measuring cable and GPIB cable.

Set information on B1500A SMU channel's connection to the B2200A/B2201A input port properly on the Switching Matrix tab screen of the Configuration window.

Set the output channel number of B2200A/B2201A connected to each terminal of a device under test properly in the G#/D#/E#/S#/Sb# field (# is an integer from 1 to 12) of Test Parameters area.

The maximum number of devices connected at once depends on the number of matrix modules mounted on B2200A/B2201A. Maximum three devices can be connected to one module at once.

[Setting of Lg#/G#/D#/S#/Sb# field (# is an integer from 1 to 12)]

Set one device for Lg#(gate length)/G#(gate)/D#(drain)/S#(source)/Sb#(substrate). Lg1<Lg2<Lg3... must be satisfied. Enter zero for a field with no device.

[Device Parameters]

Polarity: Nch (SMUs force the specified value) or Pch (SMUs force the negative specified value)

Temp: Temperature (deg C)

IdMax: Drain current compliance

[Test Parameters]

IntegTime: Integration time

GateSMU: SMU connected to Gate terminal, primary sweep voltage output

DrainSMU: SMU connected to Drain terminal, constant voltage output

SbSMU: SMU connected to Substrate, constant voltage output

SourceSMU: SMU connected to Source terminal, constant voltage output

VgStart: Sweep start voltage for Gate terminal

VgStop: Sweep stop voltage for Gate terminal

VgStep: Sweep step voltage for Gate terminal

Vd: Drain voltage, ideally at around 100mV

Vsubs: Substrate voltage

Wg: Gate width

Lg1 - Lg12: Gate length for MOSFETs

G1 - G12: SWM Pin Assign setting for Gate of devices

D1 - D12: SWM Pin Assign setting for Drain of devices

S1 - S12: SWM Pin Assign setting for Source of devices

Sb1 - Sb12: SWM Pin Assign setting for Subs of devices

[Extended Test Parameters]

Vs: Source voltage

IgLimit: Gate current compliance

2 CMOS

IsubsLimit: Substrate current compliance
HoldTime: Hold time
DelayTime: Delay time
Vth_Min: Minimum Vth value for graph scale
Vth_Max: Maximum Vth value for graph scale
gmMax_Min: Minimum gmMax value for graph scale
gmMax_Max: Maximum gmMax value for graph scale
DrainMinRng: Minimum range for drain current measurement

[Measurement Parameters]

Idrain: Drain current

[User Function]

gm=diff(Idrain,Vgate)

[Analysis Function]

gmMax=max(gm)
Von=@L1X (X intercept of Line1)
Vth=Von-Vd/2

Vth is given by the following formula.
 $V_{th} = V_g(gm_{Max}) - I_d(gm_{Max}) / gm_{Max}$
Vd/2 is for compensation of the secondary term of Vd in the theoretical formula.

[Auto Analysis]

Line1: Tangent line for Y1 at gm=gmMax

[X-Y Plot]

X axis: Gate voltage Vgate (LINEAR)
Y1 axis: Drain current Idrain (LINEAR)
Y2 axis: Transconductance gm (LINEAR)
Y3 axis: Drain current Idrain (LOG)

[List Display]

Gate voltage Vgate
Source voltage Vsource
Drain voltage Vdrain
Substrate voltage Vsubs
Drain current Idrain
Transconductance gm

[Parameters Display Area]

Threshold voltage Vth
Maximum transconductance value gmMax

[Test Output: X-Y Graph]

Maximum transconductance value gmMaxList

2.34 *Vth-Wg: Vth-Wg characteristics (A.01.20)*

[Supported Analyzer]

B1500A

[Description]

Measures the Id-Vg characteristics of MOSFET with different Wg (gate width) and plots the Vth's dependency on Wg (threshold voltage).

[Device Under Test]

MOSFET, 4 terminals

[Required Modules and Accessories]

Agilent B2200A or B2201A switching matrix 1 unit

GPIB cable

Connect B2200A/B2201A to B1500A with a measuring cable and GPIB cable.

Set information on B1500A SMU channel's connection to the B2200A/B2201A input port properly on the Switching Matrix tab screen of the Configuration window.

Set the output channel number of B2200A/B2201A connected to each terminal of a device under test properly in the G#/D#/E#/S#/Sb# field (# is an integer from 1 to 12) of Test Parameters area.

The maximum number of devices connected at once depends on the number of matrix modules mounted on B2200A/B2201A. Maximum three devices can be connected to one module at once.

[Setting of Wg#/G#/D#/S#/Sb# field (# is an integer from 1 to 12)]

Set one device for Wg#(gate width)/G#(gate)/D#(drain)/S#(source)/Sb#(substrate). Wg1<<Wg2<<Wg3... must be satisfied. Enter zero for a field with no device.

[Device Parameters]

Polarity: Nch (SMUs force the specified value) or Pch (SMUs force the negative specified value)

Temp: Temperature (deg C)

IdMax: Drain current compliance

[Test Parameters]

IntegTime: Integration time

GateSMU: SMU connected to Gate terminal, primary sweep voltage output

DrainSMU: SMU connected to Drain terminal, constant voltage output

SbSMU: SMU connected to Substrate, constant voltage output

SourceSMU: SMU connected to Source terminal, constant voltage output

VgStart: Sweep start voltage for Gate terminal

VgStop: Sweep stop voltage for Gate terminal

VgStep: Sweep step voltage for Gate terminal

Vd: Drain voltage, ideally at around 100mV

Vsubs: Substrate voltage

Lg: Gate length

Wg1 - Wg12: Gate width for MOSFETs

G1 - G12: SWM Pin Assign setting for Gate of devices

D1 - D12: SWM Pin Assign setting for Drain of devices

3.3 Diode IV Fwd: Diode forward bias characteristics (A.01.20)

[Supported Analyzer]

B1500A, 4155B, 4155C, 4156B, 4156C

[Description]

Measures the forward bias anode voltage vs anode current characteristics.

[Device Under Test]

Diode

[Device Parameters]

Temp: Temperature

Imax: Current compliance

[Test Parameters]

IntegTime: Integration time

Anode: SMU connected to Anode terminal, primary sweep voltage output

VanodeStart: Sweep start voltage for Anode terminal

VanodeStop: Sweep stop voltage for Anode terminal

VanodeStep: Sweep step voltage for Anode terminal

Cathode: SMU connected to Cathode terminal, constant voltage output

[Extended Test Parameters]

Vcathode: Cathode voltage

HoldTime: Hold time

DelayTime: Delay time

AnodeMinRng: Minimum range for the anode current measurement

[Measurement Parameters]

Anode current Ianode

[X-Y Plot]

X axis: Anode voltage Vanode (LINEAR)

Y1 axis: Anode current Ianode (LINEAR)

Y2 axis: Anode current Ianode (LOG)

3 Discrete

3.4 Diode IV Rev: Diode reverse bias characteristics (A.01.20)

[Supported Analyzer]

B1500A, 4155B, 4155C, 4156B, 4156C

[Description]

Measures the reverse bias anode voltage vs anode current characteristics.

[Device Under Test]

Diode

[Device Parameters]

Temp: Temperature

[Test Parameters]

IntegTime: Integration time

Anode: SMU connected to Anode terminal, primary sweep voltage output

VanodeStart: Sweep start voltage for Anode terminal

VanodeStop: Sweep stop voltage for Anode terminal

VanodeStep: Sweep step voltage for Anode terminal

IanodeLimit: Anode current compliance

Cathode: SMU connected to Cathode terminal, constant voltage output

DelayTime: Delay time

DrainMinRng: Minimum range for the drain current measurement

[Measurement Parameters]

Drain current Idrain

[User Function]

gm: Transconductance $gm = \text{diff}(\text{Idrain}, \text{Vgate})$

[X-Y Plot]

X axis: Gate voltage Vgate (LINEAR)

Y1 axis: Drain current Idrain (LINEAR)

Y2 axis: Drain current Idrain (LOG)

Y3 axis: Transconductance gm (LINEAR)

4 Generic Test

1. Generic C-f C-f characteristics of capacitor (2 terminals) (A.03.00)
2. Generic C-t C-t characteristics of capacitor (2 terminals) (A.03.00)

4.1 Generic C-f: C-f characteristics of capacitor (2 terminals) (A.03.00)

[Supported Analyzer]
B1500A, B1505A

[Description]

Measures the capacitance and conductance vs frequency characteristics.

For a more accurate measurement, perform Open/Short/Load correction at the measurement frequency before starting the capacitance measurement.

If the measurement frequency is not included in the list of default frequencies below, click the Advanced Options... button and set the measurement frequency on the Frequency area of the Advanced Options for CMU Calibration window.

Default frequencies:

1 k, 2 k, 5 k, 10 k, 20 k, 50 k, 100 k, 200 k, 500 k, 1 M, 1.2 M, 1.5 M, 2 M, 2.5 M, 2.7 M, 3 M, 3.2 M, 3.5 M, 3.7 M, 4 M, 4.2 M, 4.5 M, 5 MHz

[Device Under Test]

Capacitor, 2 terminals

For a more accurate measurement, connect CMU High to device's Low and CMU Low to device's High.

[Required Modules and Accessories]

Agilent B1520A MFCMU 1 unit

[Test Parameters]

Port1: CMU connected between capacitance

Vbias: DC bias voltage

FreqStart: Sweep start frequency

FreqStop: Sweep stop frequency

NoOfSteps: Number of measurements

OscLevel: Measurement signal level

Single_Double: Sweep direction (Single/Double)

Linear_Log: Frequency scale (Linear/Log)

OnAbnormalStatus: Auto abort function set up

5 Memory

5.1 *Flash Ccf-V: Flash memory cell Control Gate to Floating Gate capacitance (A.01.11)*

[Supported Analyzer]
B1500A

[Description]

Measures the Control Gate to Floating Gate capacitance (Ccf), and plots the Ccf-V characteristics.

For a more accurate measurement, perform correction data measurement at the measurement frequency before starting the capacitance measurement.

If the measurement frequency is not included in the list of default frequencies below, click the Advanced Options... button and set the measurement frequency on the Frequency area of the Advanced Options for CMU Calibration window.

Default frequencies:

1 k, 2 k, 5 k, 10 k, 20 k, 50 k, 100 k, 200 k, 500 k, 1 M, 1.2 M, 1.5 M, 2 M, 2.5 M, 2.7 M, 3 M, 3.2 M, 3.5 M, 3.7 M, 4 M, 4.2 M, 4.5 M, 5 MHz

[Device Under Test]

Flash memory cell

Connect the Control Gate to CMU High and the Floating Gate to CMU Low.

Connect the other terminals to the ground unit (GNDU).

[Device Parameters]

Lg: Gate length

Wg: Gate width

Temp: Temperature

M: Number of cells connected in parallel. M=1 for the single cell.

[Test Parameters]

IntegTime: Integration time

FREQ: Measurement frequency

OscLevel: Measurement signal level

ControlGate: CMU connected between Control Gate and Floating Gate (CV sweep measurement)

5.2 *Flash Cfb-V: Flash memory cell Floating Gate-Substrate capacitance (A.01.11)*

[Supported Analyzer]
B1500A

[Description]

Measures the Floating Gate-Substrate capacitance (Ccf), and plots the Cfb-V characteristics.

DC bias output is performed from -VfbStart to -VfbStop in -VfbStep steps.

For a more accurate measurement, perform correction data measurement at the measurement frequency before starting the capacitance measurement.

If the measurement frequency is not included in the list of default frequencies below, click the Advanced Options... button and set the measurement frequency on the Frequency area of the Advanced Options for CMU Calibration window.

Default frequencies:

1 k, 2 k, 5 k, 10 k, 20 k, 50 k, 100 k, 200 k, 500 k, 1 M, 1.2 M, 1.5 M, 2 M, 2.5 M, 2.7 M, 3 M, 3.2 M, 3.5 M, 3.7 M, 4 M, 4.2 M, 4.5 M, 5 MHz

[Device Under Test]

Flash memory cell

Connect the Control Gate to ground unit (GNDU), the Floating Gate to CMU Low, and the other terminals to CMU High.

[Device Parameters]

Lg: Gate length

Wg: Gate width

Temp: Temperature

M: Number of cells connected in parallel. M=1 for the single cell.

[Test Parameters]

IntegTime: Integration time

FREQ: Measurement frequency

OscLevel: Measurement signal level

FloatingGate: CMU connected between Floating Gate and Substrate (CV sweep measurement)

VfbStart: DC bias start voltage

VfbStop: DC bias stop voltage

VfbStep: DC bias step voltage

[Extended Test Parameters]

HoldTime: Hold time

DelayTime: Delay time

[Measurement Parameters]

Parallel capacitance Cp

Conductance G

[User Function]

$PI=3.141592653589$

$D=G/(2*PI*FREQ*Cp)$

$Rp=1/G$

$Cs=(1+D^2)*Cp$

$X=-1/(2*PI*FREQ*Cs)$

$R_s = D * \text{abs}(X)$
 $Z = \text{sqrt}(R_s^2 + X^2)$

5 Memory

5.3 *Flash Cgg-Vcg: Flash memory cell Gate capacitance (A.01.11)*

[Supported Analyzer]

B1500A

[Description]

Measures the Gate capacitance (Cgg), and plots the Cgg-Vcs characteristics.

DC bias output is performed from -VcsStart to -VcsStop in -VcsStep steps.

For a more accurate measurement, perform correction data measurement at the measurement frequency before starting the capacitance measurement.

If the measurement frequency is not included in the list of default frequencies below, click the Advanced Options... button and set the measurement frequency on the Frequency area of the Advanced Options for CMU Calibration window.

Default frequencies:

1 k, 2 k, 5 k, 10 k, 20 k, 50 k, 100 k, 200 k, 500 k, 1 M, 1.2 M, 1.5 M, 2 M, 2.5 M, 2.7 M, 3 M, 3.2 M, 3.5 M, 3.7 M, 4 M, 4.2 M, 4.5 M, 5 MHz

[Device Under Test]

Flash memory cell

Open the Floating Gate, and connect the Control Gate to CMU Low and the other terminals to CMU High.

5 Memory

5.4 NandFlash2 Endurance 3devices: Repeatedly tests write/erase on a NAND-type flash memory cell, simultaneously using three devices (A.01.20)

[Supported Analyzer]
B1500A

[Description]

Repeatedly tests write/erase on a NAND-type flash memory cell. Plots the number of writes/erases vs threshold voltage characteristic. Maximum three devices can be measured at once.

[Device Under Test]

NAND-type flash memory cell, 4 terminals x 3 devices

When some device is destroyed during write/erase, a desired voltage may not be applied to other devices.

[Required Modules and Accessories]

Agilent B2200A or B2201A switching matrix 1 unit

Agilent 81110A pulse generator (2-output, PGU1 and PGU2) 1 unit

GPIB cable

Connect 81110A, B2200A/B2201A and B1500A with measurement cables and GPIB cables.

Set information on B1500A SMU channel's connection to the B2200A/B2201A input port properly on the Switching Matrix tab screen of the Configuration window.

Set information on 81110A output channel's connection to B2200A/B2201A input port properly in the PulseGate and PulseDrain fields of the Test Parameters area. Set B2200A/B2201A input ports connected to the output channel of a gate pulse and drain pulse in these fields.

Set the output channel number of B2200A/B2201A connected to each terminal of a measured device properly in the Tr#Gate/Tr#Drain/Tr#Source/Tr#Subs field (# is an integer from 1 to 3) of the Test Parameters area.

[Device Parameters]

Lg: Gate length

Wg: Gate width

Temp: Temperature (deg C)

IdMax: Drain current compliance

[Test Parameters]

IntegTime: Integration time

TotalWriteAndEraseCycles: Number of write/erase cycles

Tr1Gate - Tr3Gate: SWM Pin Assign setting for Gate of devices

Tr1Drain - Tr3Drain: SWM Pin Assign setting for Drain of devices

Tr1Source - Tr3Source: SWM Pin Assign setting for Source of devices

Tr1Subs - Tr3Subs: SWM Pin Assign setting for Subs of devices

PgAdd: GPIB address of pulse generator

PulseGate: B2200A/B2201A input port for Gate pulse

PulseDrain: B2200A/B2201A input port for Drain pulse

ErasePeriod: Write/Erase pulse period

EraseDelay: Write/Erase pulse delay

EraseWidth: Write/Erase pulse width

EraseLeadTime: Pulse leading edge transition time

EraseTrailTime: Pulse trailing edge transition time

Verase: Pulse voltage output level, High

BaseValue: Pulse voltage output level, Low

[Test Parameters for Vth Acquisition]

MeasGate: SMU connected to Gate terminal
 MeasDrain: SMU connected to Drain terminal
 MeasSource: SMU connected to Source terminal
 VgStart: Sweep start voltage for Gate terminal
 VgStop: Sweep stop voltage for Gate terminal
 VgStep: Sweep step voltage for Gate terminal
 Vd: Drain voltage
 IgLimit: Gate current compliance
 Id@Vth: Current determining the threshold voltage

[Extended Test Parameters for Vth Acquisition]

Vs: Source voltage
 HoldTime: Hold time
 DelayTime: Delay time
 Vth_Min: Minimum Vth value for graph scale
 Vth_Max: Maximum Vth value for graph scale
 DrainMinRng1: Minimum range for drain current measurement on device 1
 DrainMinRng2: Minimum range for drain current measurement on device 2
 DrainMinRng3: Minimum range for drain current measurement on device 3

[Test Setup Details]

Refer to "NandFlash2 IV-Write-IV" and "NandFlash2 IV-Erase-IV."

5.5 *NandFlash2 Endurance: NAND flash memory cell endurance test (A.01.20)*

[Supported Analyzer]

B1500A

[Description]

Performs the endurance test for the NAND type flash memory cell and plots the number of write/erase operation vs threshold voltage characteristics.

[Device Under Test]

NAND-type flash memory cell

Connect the Control Gate to the ASU1 Output, and the Drain to the ASU2 Output.

Open the Floating Gate, and connect the other terminals to the ASU3 Output.

[Required Modules and Accessories]

Agilent 81110A pulse generator (2-output, PGU1 and PGU2) 1 unit

HRSMU/ASU 3 sets (ASU1, ASU2, and ASU3)

ASU1 connections: Output: Control Gate, SMU: HRSMU, AUX: PGU1

ASU2 connections: Output: Drain, SMU: HRSMU, AUX: PGU2

ASU3 connections: Output: Source and Substrate, SMU: HRSMU, AUX: PGU2

Setting of ASU I/O Path, ASU tab, Configuration window: AUX

[Device Parameters]

Lg: Gate length

Wg: Gate width

Temp: Temperature

IdMax: Drain current compliance

[Test Parameters]

Gate: SMU connected to Gate terminal, primary sweep voltage output

Drain: SMU connected to Drain terminal, constant voltage output

Source: SMU connected to Source and Substrate terminals, constant voltage output

VgStart: Sweep start voltage for Gate terminal

VgStop: Sweep stop voltage for Gate terminal

VgStep: Sweep step voltage for Gate terminal

Vd: Drain voltage

Id@Vth: Drain current to decide the Vth

IntegTime: Integration time

TotalWriteAndEraseCycles: Total number of write/erase operation

WritePulsePeriod: Write pulse period

WritePulseDelay: Write pulse delay

WritePulseWidth: Write pulse width

WriteLeadingTime: Write pulse leading edge transition time

WriteTrailingTime: Write pulse trailing edge transition time

Vwrite: Write pulse output level

ErasePulsePeriod: Erase pulse period

ErasePulseDelay: Erase pulse delay

ErasePulseWidth: Erase pulse width

EraseLeadingTime: Erase pulse leading edge transition time

EraseTrailingTime: Erase pulse trailing edge transition time

Verase: Erase pulse output level

[Extended Test Parameters]

5 Memory

Vs: Source voltage

IgLimit: Gate current compliance

[Test Output: X-Y Graph]

X axis: Number of write/erase operation (LOG)

Y1 axis: Threshold voltage after write VthWrittenList (LINEAR)

Y2 axis: Threshold voltage after erase VthErasedList (LINEAR)

[Test Setup Details]

See NandFlash2 IV-Write-IV and NandFlash2 IV-Erase-IV.

5.6 *NandFlash2 IV-Erase-IV: NAND flash memory cell Id-Vg, Erase, Id-Vg (A.01.20)*

[Supported Analyzer]
B1500A

[Description]

Measures the Id-Vg characteristics of NAND-type flash memory cell, performs the data erase operation, measures the Id-Vg characteristics again, and plots the both Id-Vg characteristics on a graph. Uses pulse generator (2-output) 1 unit and HRSMU/ASU 2 sets.

Before the Id-Vg measurements, the initial pulse will be applied to the device under test.

[Device Under Test]

NAND-type flash memory cell

Connect the Control Gate to a SMU and the Drain to the ASU1 Output.

Open the Floating Gate. And connect the other terminals to the ASU2 Output.

[Required Modules and Accessories]

Agilent 81110A pulse generator (2-output, PGU1 and PGU2) 1 unit

HRSMU/ASU 2 sets (ASU1 and ASU2)

ASU1 connections: Output: Drain, SMU: HRSMU, AUX: PGU1

ASU2 connections: Output: Source and Substrate, SMU: HRSMU, AUX: PGU1

Setting of ASU I/O Path, ASU tab, Configuration window: AUX

PGU1 is connected to keep the setup for the data write operation.

[Device Parameters]

Lg: Gate length

Wg: Gate width

Temp: Temperature

IdMax: Drain current compliance

[Test Parameters]

IntegTime: Integration time

Gate: SMU connected to Gate terminal, primary sweep voltage output

Drain: SMU connected to Drain terminal, constant voltage output

VgStart: Sweep start voltage for Gate terminal

VgStop: Sweep stop voltage for Gate terminal

VgStep: Sweep step voltage for Gate terminal

Vd: Drain voltage

Id@Vth: Drain current to decide the Vth

Source: SMU connected to Source and Substrate terminals, constant voltage output

PulsePeriod: Erase pulse period

PulseDelay: Erase pulse delay

PulseWidth: Erase pulse width

LeadingTime: Pulse leading edge transition time

TrailingTime: Pulse trailing edge transition time

Verase: Erase pulse output level

[Extended Test Parameters]

IgLimit: Gate current compliance

HoldTime: Hold time

5 Memory

DelayTime: Delay time
BaseValue: Erase pulse base value
PgAdd: GPIB address of pulse generator
NoOfPulse: Number of output pulses for the erase operation

[Initial pulse setup parameters]

Pulse period Period2=50 s
Pulse delay Delay2=0 s
Pulse duty cycle Dcyc2=50 %
Pulse output level Level2=0 V
Pulse base value Base2=200 mV
Number of output pulses TrigCount=1

The parameters are defined in the ForcePG2 setup of the Test Contents, and can be changed by using the Test Definition editor.

[Measurement Parameters]

Drain current Idrain (defined in Id-Vg_Initial and Id-Vg_Erased setup)

[User Function]

IdrainPerWg=Idrain/Wg (defined in Id-Vg_Initial and Id-Vg_Erased setup)

[Analysis Function]

Threshold voltage after Write operation VthWritten

5.8 *NandFlash2 Retention(ErasedCell): NAND flash memory cell Data retention test after Erase (A.01.20)*

[Supported Analyzer]
B1500A

[Description]

Performs the data retention test for the NAND type flash memory cell after the erase operation, and plots the accumulated time vs threshold voltage characteristics. The test is performed as follows.

1. Applies the erase pulse.
2. Measures the Id-Vg characteristics, and extracts the threshold voltage (Vth).
3. If the accumulated time is 100 seconds or less:
Performs the drain current sampling measurement, 10 seconds in 1 second step.
After the sampling measurement, measures the Id-Vg characteristics and extracts Vth.
4. If the accumulated time is more than 100 seconds:
Performs the drain current sampling measurement, 100 seconds in 10 seconds step.
After the sampling measurement, measures the Id-Vg characteristics and extracts Vth.
5. Repeats 3 or 4 until that the accumulated time overs the specified TotalRetentionTime.
The available TotalRetentionTime value is 10 to 10000 seconds.

[Device Under Test]

NAND-type flash memory cell

Connect the Source and Substrate to the ASU1 Output, and the Drain to the ASU2 Output.
Open the Floating Gate, and connect the other terminals to the PGU2 output terminal.

[Required Modules and Accessories]

Agilent 81110A pulse generator (2-output, PGU1 and PGU2) 1 unit
HRSMU/ASU 2 sets (ASU1 and ASU2)

ASU1 connections: Output: Source and Substrate, SMU: HRSMU, AUX: PGU1

ASU2 connections: Output: Drain, SMU: HRSMU, AUX: PGU1

Setting of ASU I/O Path, ASU tab, Configuration window: AUX

PGU1 is connected to keep the setup for the data write operation.

[Device Parameters]

Lg: Gate length

Wg: Gate width

Temp: Temperature

IdMax: Drain current compliance

[Test Parameters]

PulsePeriod: Erase pulse period

PulseDelay: Erase pulse delay

5 Memory

PulseWidth: Erase pulse width

Verase: Erase pulse output level

LeadingTime: Pulse leading edge transition time

TrailingTime: Pulse trailing edge transition time

TotalRetentionTime: Time to continue the test. 10 to 10000 seconds.

[Extended Test Parameters]

IgLimit: Gate current compliance

HoldTime: Hold time

DelayTime: Delay time

BaseValue: Erase pulse base value

PgAdd: GPIB address of pulse generator

NoOfPulse: Number of output pulses for the erase operation

[Test Output: X-Y Graph]

X axis: Time TimeList (LOG)

Y1 axis: Threshold voltage VthList (LINEAR)

[Test Setup Details]

See NandFlash2 IV-Erase-IV.

5.9 *NandFlash2 Retention(WrittenCell): NAND flash memory cell Data retention test after Write (A.01.20)*

[Supported Analyzer]
B1500A

[Description]

Performs the data retention test for the NAND type flash memory cell after the write operation, and plots the accumulated time vs threshold voltage characteristics. The test is performed as follows.

1. Applies the write pulse.
2. Measures the Id-Vg characteristics, and extracts the threshold voltage (Vth).
3. If the accumulated time is 100 seconds or less:
Performs the drain current sampling measurement, 10 seconds in 1 second step.
After the sampling measurement, measures the Id-Vg characteristics and extracts Vth.
4. If the accumulated time is more than 100 seconds:
Performs the drain current sampling measurement, 100 seconds in 10 seconds step.
After the sampling measurement, measures the Id-Vg characteristics and extracts Vth.
5. Repeats 3 or 4 until that the accumulated time overs the specified TotalRetentionTime.
The available TotalRetentionTime value is 10 to 10000 seconds.

[Device Under Test]

NAND-type flash memory cell
Connect the Control Gate to the ASU Output, and the Drain to a SMU.
Open the Floating Gate, and connect the other terminals to a SMU.

[Required Modules and Accessories]

Agilent 81110A pulse generator (2-output, PGU1 and PGU2) 1 unit
HRSMU/ASU 1 set

ASU connections: Output: Control Gate, SMU: HRSMU, AUX: PGU1

X axis: Time TimeList (LOG)

Y1 axis: Threshold voltage VthList (LINEAR)

[Test Setup Details]

See NandFlash2 IV-Write-IV.

5.10 NandFlash2 Vth(ErasingTimeDependence): NAND flash memory cell erasing time dependence test (A.01.20)

[Supported Analyzer]
B1500A

[Description]

Performs the erasing time dependence test of the NAND-type flash memory cell, and plots the accumulated erasing time (accumulated pulse width) vs threshold voltage characteristics.

[Device Under Test]

NAND-type flash memory cell
Connect the Control Gate to a SMU, and the Drain to the ASU2 Output.
Open the Floating Gate, and connect the other terminals to the ASU1 Output.

[Required Modules and Accessories]

Agilent 81110A pulse generator (2-output, PGU1 and PGU2) 1 unit
HRSMU/ASU 2 sets (ASU1 and ASU2)

ASU1 connections: Output: Source and Substrate, SMU: HRSMU, AUX: PGU1

ASU2 connections: Output: Drain, SMU: HRSMU, AUX: PGU1

Setting of ASU I/O Path, ASU tab, Configuration window: AUX

[Device Parameters]

Lg: Gate length
Wg: Gate width
Temp: Temperature
IdMax: Drain current compliance

[Test Parameters]

Gate: SMU connected to Gate terminal, primary sweep voltage output
Drain: SMU connected to Drain terminal, constant voltage output
Source: SMU connected to Source terminal, constant voltage output
VgStart: Sweep start voltage for Gate terminal
VgStop: Sweep stop voltage for Gate terminal
VgStep: Sweep step voltage for Gate terminal
Vd: Drain voltage
Vs: Source voltage
Id@Vth: Drain current to decide the Vth
IntegTime: Integration time
PulsePeriod: Erase pulse period
PulseDelay: Erase pulse delay
PulseWidth: Total accumulated pulse width
CheckNoOfTimes: Number of Vth measurement operation
Verase: Erase pulse output level

Line1: Vertical line for Y1 at Idrain=Id@Vth

[Test Output: X-Y Graph]

X axis: Accumulated erasing pulse width EraseTimeList (LOG)

Y1 axis: Threshold voltage Vth (LINEAR)

5.11 NandFlash2 Vth(WritingTimeDependence): NAND flash memory cell writing time dependence test (A.01.20)

[Supported Analyzer]
B1500A

[Description]
Performs the writing time dependence test of the NAND-type flash memory cell, and plots the accumulated writing time (accumulated pulse width) vs threshold voltage characteristics.

[Device Under Test]
NAND-type flash memory cell
Connect the Control Gate to the ASU Output, and the Drain to a SMU.
Open the Floating Gate, and connect the other terminals to a SMU.

[Required Modules and Accessories]
Agilent 81110A pulse generator (2-output, PGU1 and PGU2) 1 unit
HRSMU/ASU 1 set

ASU connections: Output: Control Gate, SMU: HRSMU, AUX: PGU1
Setting of ASU I/O Path, ASU tab, Configuration window: AUX

[Device Parameters]
Lg: Gate length
Wg: Gate width
Temp: Temperature
IdMax: Drain current compliance

[Test Parameters]
Gate: SMU connected to Gate terminal, primary sweep voltage output
Drain: SMU connected to Drain terminal, constant voltage output
Source: SMU connected to Source terminal, constant voltage output
VgStart: Sweep start voltage for Gate terminal
VgStop: Sweep stop voltage for Gate terminal
VgStep: Sweep step voltage for Gate terminal
Vd: Drain voltage
Vs: Source voltage
Id@Vth: Drain current to decide the Vth
IntegTime: Integration time
PulsePeriod: Write pulse period
PulseDelay: Write pulse delay
PulseWidth: Total accumulated pulse width
CheckNoOfTimes: Number of Vth measurement operation
Vwrite: Write pulse output level

5.12 NandFlash2 WordDisturb(ErasedCell): NAND flash memory cell erase-disturb test (A.01.20)

[Supported Analyzer]
B1500A

[Description]
Performs the erase-disturb test of the NAND-type flash memory cell, and plots the accumulated stress time vs threshold voltage characteristics.

[Device Under Test]
NAND-type flash memory cell
Connect the Control Gate to the ASU1 Output, and the Drain to the ASU2 Output.
Open the Floating Gate, and connect the other terminals to the ASU3 Output.

[Required Modules and Accessories]
Agilent 81110A pulse generator (2-output, PGU1 and PGU2) 1 unit
HRSMU/ASU 3 sets (ASU1, ASU2, and ASU3)

ASU1 connections: Output: Control Gate, SMU: HRSMU, AUX: PGU1
ASU2 connections: Output: Drain, SMU: HRSMU, AUX: PGU2
ASU3 connections: Output: Source and Substrate, SMU: HRSMU, AUX: PGU2
Setting of ASU I/O Path, ASU tab, Configuration window: AUX

[Device Parameters]
Lg: Gate length
Wg: Gate width
Temp: Temperature
IdMax: Drain current compliance

[Test Parameters]
Gate: SMU connected to Gate terminal, primary sweep voltage output
Drain: SMU connected to Drain terminal, constant voltage output
Source: SMU connected to Source terminal, constant voltage output
VgStart: Sweep start voltage for Gate terminal
VgStop: Sweep stop voltage for Gate terminal
VgStep: Sweep step voltage for Gate terminal
VgStress: Stress voltage for Gate terminal
Vd: Drain voltage
Vs: Source voltage
Id@Vth: Drain current to decide the Vth
IntegTime: Integration time
TotalStressTime: Total accumulated stress time
CheckNoOfTimes: Number of Vth measurement operation
PulsePeriod: Erase pulse period
PulseDelay: Erase pulse delay
PulseWidth: Erase pulse width
Verase: Erase pulse output level
LeadingTime: Pulse leading edge transition time
TrailingTime: Pulse trailing edge transition time

[Extended Test Parameter]

5 Memory

IgLimit: Gate current compliance
HoldTime: Hold time
DelayTime: Delay time
BaseValue: Erase pulse base value
PgAdd: GPIB address of pulse generator
NoOfPulse: Number of output pulses for the erase operation

[Measurement Parameters]

Drain current Idrain

[Analysis Function]

Vth=@L1X (X intercept of Line1)

[Auto Analysis]

Line1: Vertical line for Y1 at Idrain=Id@Vth

[Test Output: X-Y Graph]

X axis: Accumulated stress time StressTimeList (LOG)

Y1 axis: Threshold voltage Vth (LINEAR)

5.13 NandFlash2 WordDisturb(WrittenCell): NAND flash memory cell read-disturb test (A.01.20)

[Supported Analyzer]
B1500A

[Description]
Performs the read-disturb test of the NAND-type flash memory cell, and plots the accumulated stress time vs threshold voltage characteristics.

[Device Under Test]
NAND-type flash memory cell
Connect the Control Gate to the ASU Output, and the Drain to a SMU.
Open the Floating Gate, and connect the other terminals to a SMU.

[Required Modules and Accessories]
Agilent 81110A pulse generator (2-output, PGU1 and PGU2) 1 unit
HRSMU/ASU 1 set

ASU connections: Output: Control Gate, SMU: HRSMU, AUX: PGU1
Setting of ASU I/O Path, ASU tab, Configuration window: AUX

[Device Parameters]
Lg: Gate length
Wg: Gate width
Temp: Temperature
IdMax: Drain current compliance

[Test Parameters]
Gate: SMU connected to Gate terminal, primary sweep voltage output
Drain: SMU connected to Drain terminal, constant voltage output
Source: SMU connected to Source terminal, constant voltage output
VgStart: Sweep start voltage for Gate terminal
VgStop: Sweep stop voltage for Gate terminal
VgStep: Sweep step voltage for Gate terminal
VgStress: Stress voltage for Gate terminal
Vd: Drain voltage
Vs: Source voltage
Id@Vth: Drain current to decide the Vth
IntegTime: Integration time
TotalStressTime: Total accumulated stress time
CheckNoOfTimes: Number of Vth measurement operation
PulsePeriod: Write pulse period
PulseDelay: Write pulse delay
PulseWidth: Write pulse width
Vwrite: Write pulse output level
LeadingTime: Pulse leading edge transition time
TrailingTime: Pulse trailing edge transition time

[Extended Test Parameter]
IgLimit: Gate current compliance
HoldTime: Hold time
DelayTime: Delay time

5 Memory

BaseValue: Write pulse base value
PgAdd: GPIB address of pulse generator
NoOfPulse: Number of output pulses for the write operation

[Measurement Parameters]

Drain current Idrain

[Analysis Function]

Vth=@L1X (X intercept of Line1)

[Auto Analysis]

Line1: Vertical line for Y1 at Idrain=Id@Vth

[Test Output: X-Y Graph]

X axis: Accumulated stress time StressTimeList (LOG)
Y1 axis: Threshold voltage Vth (LINEAR)

5.14 NandFlash3 Endurance: NAND flash memory cell endurance test (A.03.10)

[Supported Analyzer]

B1500A

[Description]

Performs the endurance test for the NAND type flash memory cell and plots the number of write/erase operation vs threshold voltage characteristics.

[Device Under Test]

NAND-type flash memory cell

[Required Modules and Accessories]

Agilent B1525A SPGU 1 unit
Selector (16440A/16445A 2 sets or HRSMU/ASU 3 sets)

[Device Parameters]

Lg: Gate length
Wg: Gate width
Temp: Temperature
IdMax: Drain current compliance

[Test Parameters]

Gate: SMU connected to Gate terminal, primary sweep voltage output
Drain: SMU connected to Drain terminal, constant voltage output
Source: SMU connected to Source and Substrate terminals, constant voltage output
Pgate: SPGU channel connected to Gate terminal via Selector
Psource: SPGU channel connected to Drain, Source, and Substrate via Selector
VgStart: Sweep start voltage for Gate terminal
VgStop: Sweep stop voltage for Gate terminal
VgStep: Sweep step voltage for Gate terminal
Vd: Drain voltage
Id@Vth: Drain current to decide the Vth
IntegTime: Integration time
TotalWriteAndEraseCycles: Total number of write/erase operation
WritePulsePeriod: Write pulse period
WritePulseDelay: Write pulse delay
WritePulseWidth: Write pulse width
WriteLeadingTime: Write pulse leading edge transition time
WriteTrailingTime: Write pulse trailing edge transition time
Vwrite: Write pulse output level
ErasePulsePeriod: Erase pulse period
ErasePulseDelay: Erase pulse delay
ErasePulseWidth: Erase pulse width
EraseLeadingTime: Erase pulse leading edge transition time
EraseTrailingTime: Erase pulse trailing edge transition time
Verase: Erase pulse output level
MeasTiming: Timing to perform Vth measurement

[Extended Test Parameters]

Vs: Source voltage
IgLimit: Gate current compliance
HoldTime: Hold time
DelayTime: Delay time

5 Memory

BaseValue: Write pulse base value
DrainMinRng: Minimum range of drain current measurement

[Measurement Parameters]

Drain current Idrain

[Analysis Function]

Vth@Id=@L1X (X intercept of Line1)

[Auto Analysis]

Line1: Vertical line for Y1 at Idrain=Id@Vth

[X-Y Plot]

X axis: Gate voltage Vgate (LINEAR)

Y1 axis: Drain current Idrain (LOG)

[List Display]

Gate voltage Vgate

Drain current Idrain

[Test Output: X-Y Graph]

X axis: Number of write/erase cycles CycleList (LOG)

Y1 axis: Threshold voltage after write VthWrittenList (LINEAR)

Y2 axis: Threshold voltage after erase VthErasedList (LINEAR)

[Test Output: List Display]

Number of write/erase cycles CycleList

Threshold voltage after write VthWrittenList

Threshold voltage after erase VthErasedList

[Test Setup Details]

See NandFlash3 IV-Write-IV and NandFlash3 IV-Erase-IV.

TotalWriteAndEraseCycles should be 10, 100, 1000, 10000, 100000, or 1000000.

5.15 NandFlash3 IV-Erase-IV: NAND flash memory cell Id-Vg, Erase, Id-Vg (A.03.10)

[Supported Analyzer]
B1500A

[Description]

Measures the Id-Vg characteristics of NAND-type flash memory cell, performs the data erase operation, measures the Id-Vg characteristics again, and plots the both Id-Vg characteristics on a graph. Before the Id-Vg measurements, the initial pulse will be applied to the device under test.

[Device Under Test]

NAND-type flash memory cell

[Required Modules and Accessories]

Agilent B1525A SPGU 1 unit
Selector (16440A/16445A 1 set or HRSMU/ASU 2 sets)

[Device Parameters]

Lg: Gate length
Wg: Gate width
Temp: Temperature
IdMax: Drain current compliance

[Test Parameters]

Gate: SMU connected to Gate terminal, primary sweep voltage output
Drain: SMU connected to Drain terminal, constant voltage output
Source: SMU connected to Source and Substrate terminals, constant voltage output
PSource: SPGU channel connected to Drain and Source via Selector
VgStart: Sweep start voltage for Gate terminal
VgStop: Sweep stop voltage for Gate terminal
VgStep: Sweep step voltage for Gate terminal
Vd: Drain voltage
Id@Vth: Drain current to decide the Vth
IntegTime: Integration time
PulsePeriod: Erase pulse period
PulseDelay: Erase pulse delay
PulseWidth: Erase pulse width
Verase: Erase pulse output level
LeadingTime: Pulse leading edge transition time
TrailingTime: Pulse trailing edge transition time

[Extended Test Parameters]

Vs: Source voltage
IgLimit: Gate current compliance
HoldTime: Hold time
DelayTime: Delay time
BaseValue: Erase pulse base value
NoOfPulse: Number of output pulses for the erase operation
DrainMinRng: Minimum range of drain current measurement

5 Memory

[Measurement Parameters]

Drain current Idrain

[User Function]

$I_{\text{drainPerWg}} = I_{\text{drain}} / W_{\text{g}}$

[Analysis Function]

$V_{\text{thAfter}} = @L1X$ (X intercept of Line1)

[Auto Analysis]

Line1: Vertical line for Y1 at $I_{\text{drain}} = I_{\text{d}} @ V_{\text{th}}$

[X-Y Plot]

X axis: Gate voltage V_{gate} (LINEAR)

Y1 axis: Drain current Idrain (LINEAR)

Y2 axis: Drain current Idrain (LOG)

[List Display]

Gate voltage V_{gate}

Drain voltage V_{drain}

Drain current Idrain

[Test Output: X-Y Graph]

X axis: Gate voltage V_{gateList} (LINEAR)

Y1 axis: Drain current before Erase operation $I_{\text{dInitialList}}$ (LOG)

Y2 axis: Drain current after Erase operation $I_{\text{dErasedList}}$ (LOG)

[Test Output: List Display]

Gate voltage V_{gateList}

Drain current before Erase operation $I_{\text{dInitialList}}$

Drain current after Erase operation $I_{\text{dErasedList}}$

[Test Output: Parameters]

Threshold voltage before Erase operation $V_{\text{thInitial}}$

Threshold voltage after Erase operation V_{thErased}

5.16 NandFlash3 IV-Write-IV: NAND flash memory cell Id-Vg, Write, Id-Vg (A.03.10)

[Supported Analyzer]

B1500A

[Description]

Measures the Id-Vg characteristics of NAND-type flash memory cell, performs the data write operation, measures the Id-Vg characteristics again, and plots the both Id-Vg characteristics on a graph.

Before the Id-Vg measurements, the initial pulse will be applied to the device under test.

[Device Under Test]

NAND-type flash memory cell

[Required Modules and Accessories]

Agilent B1525A SPGU 1 unit

Selector (16440A/16445A 1 set or HRSMU/ASU 1 sets)

[Device Parameters]

Lg: Gate length

Wg: Gate width

Temp: Temperature

IdMax: Drain current compliance

[Test Parameters]

Gate: SMU connected to Gate terminal, primary sweep voltage output

Drain: SMU connected to Drain terminal, constant voltage output

Source: SMU connected to Source and Substrate terminals, constant voltage output

Pgate: SPGU channel connected to Gate terminal via Selector

VgStart: Sweep start voltage for Gate terminal

VgStop: Sweep stop voltage for Gate terminal

VgStep: Sweep step voltage for Gate terminal

Vd: Drain voltage

Id@Vth: Drain current to decide the Vth

IntegTime: Integration time

PulsePeriod: Write pulse period

PulseDelay: Write pulse delay

PulseWidth: Write pulse width

Vwrite: Write pulse output level

LeadingTime: Pulse leading edge transition time

TrailingTime: Pulse trailing edge transition time

[Extended Test Parameters]

Vs: Source voltage

IgLimit: Gate current compliance

HoldTime: Hold time

DelayTime: Delay time

BaseValue: Write pulse base value

NoOfPulse: Number of output pulses for the write operation

DrainMinRng: Minimum range of drain current measurement

5 Memory

[Measurement Parameters]

Drain current Idrain

[User Function]

IdrainPerWg=Idrain/Wg

[Analysis Function]

VthAfter=@L1X (X intercept of Line1)

[Auto Analysis]

Line1: Vertical line for Y1 at Idrain=Id@Vth

Drain current after Write operation IdWrittenList

[Test Output: Parameters]

Threshold voltage before Write operation VthInitial

Threshold voltage after Write operation VthWritten

5.17 NandFlash3 Retention(ErasedCell): NAND flash memory cell Data retention test after Erase (A.03.10)

[Supported Analyzer]
B1500A

[Description]
Performs the data retention test for the NAND type flash memory cell after the erase operation, and plots the accumulated time vs threshold voltage characteristics.

[Device Under Test]
NAND-type flash memory cell

[Required Modules and Accessories]
Agilent B1525A SPGU 1 unit
Selector (16440A/16445A 1 set or HRSMU/ASU 2 sets)

[Device Parameters]
Lg: Gate length
Wg: Gate width
Temp: Temperature
IdMax: Drain current compliance

[Test Parameters]
Gate: SMU connected to Gate terminal, primary sweep voltage output
Drain: SMU connected to Drain terminal, constant voltage output
Source: SMU connected to Source and Substrate terminals, constant voltage output
Psource: SPGU channel connected to Drain, Source, and Substrate via Selector
VgStart: Sweep start voltage for Gate terminal
VgStop: Sweep stop voltage for Gate terminal
VgStep: Sweep step voltage for Gate terminal

5.18 NandFlash3 Retention(WrittenCell): NAND flash memory cell Data retention test after Write (A.03.10)

[Supported Analyzer]
B1500A

[Description]

Performs the data retention test for the NAND type flash memory cell after the write operation, and plots the accumulated time vs threshold voltage characteristics.

[Device Under Test]

NAND-type flash memory cell

[Required Modules and Accessories]

Agilent B1525A SPGU 1 unit
Selector (16440A/16445A 1 set or HRSMU/ASU 1 set)

[Device Parameters]

Lg: Gate length
Wg: Gate width
Temp: Temperature
IdMax: Drain current compliance

[Test Parameters]

Gate: SMU connected to Gate terminal, primary sweep voltage output
Drain: SMU connected to Drain terminal, constant voltage output
Source: SMU connected to Source and Substrate terminals, constant voltage output
Pgate: SPGU channel connected to Gate terminal via Selector
VgStart: Sweep start voltage for Gate terminal
VgStop: Sweep stop voltage for Gate terminal
VgStep: Sweep step voltage for Gate terminal
Vd: Drain voltage
Id@Vth: Drain current to decide the Vth
IntegTime: Integration time
PulsePeriod: Write pulse period
PulseDelay: Write pulse delay
PulseWidth: Write pulse width
Vwrite: Write pulse output level
LeadingTime: Pulse leading edge transition time
TrailingTime: Pulse trailing edge transition time
TotalRetentionTime: Time to continue the test. 10 to 10000 seconds
MeasTiming: Timing to perform Vth measurement

See NandFlash3 IV-Write-IV.

5.19 NandFlash3 Vth(ErasingTimeDependence): NAND flash memory cell erasing time dependence test (A.03.10)

[Supported Analyzer]
B1500A

[Description]

Performs the erasing time dependence test of the NAND-type flash memory cell, and plots the accumulated erasing time (accumulated pulse width) vs threshold voltage characteristics. The test is performed as follows.

1. Applies the erase pulse with pulse width specified by the first element of the PulseWidth parameter.
2. Measures the Id-Vg characteristics, and extracts the threshold voltage (Vth).
3. Applies the erase pulse with pulse width specified by the next element of the PulseWidth parameter.
4. Measures the Id-Vg characteristics, and extracts the threshold voltage (Vth).
5. Repeats 3 and 4 until that the pulse width becomes StopPulseWidth.

[Device Under Test]

NAND-type flash memory cell

[Required Modules and Accessories]

Agilent B1525A SPGU 1 unit
Selector (16440A/16445A 1 set or HRSMU/ASU 2 set)

[Device Parameters]

Lg: Gate length
Wg: Gate width
Temp: Temperature
IdMax: Drain current compliance

[Test Parameters]

Gate: SMU connected to Gate terminal, primary sweep voltage output
Drain: SMU connected to Drain terminal, constant voltage output
Source: SMU connected to Source terminal, constant voltage output
Psource: SPGU channel connected to Drain, Source, and Substrate via Selector
VgStart: Sweep start voltage for Gate terminal
VgStop: Sweep stop voltage for Gate terminal
VgStep: Sweep step voltage for Gate terminal
Vd: Drain voltage
Id@Vth: Drain current to decide the Vth
IntegTime: Integration time
PulseDelay: Erase pulse delay
PulseWidth: List of erase pulse width
StopPulseWidth: Pulse width to stop testing

5.20 NandFlash3 Vth(WritingTimeDependence): NAND flash memory cell writing time dependence test (A.03.10)

[Supported Analyzer]
B1500A

[Description]

Performs the writing time dependence test of the NAND-type flash memory cell, and plots the accumulated writing time (accumulated pulse width) vs threshold voltage characteristics. The test is performed as follows.

1. Applies the write pulse with pulse width specified by the first element of the PulseWidth parameter.
2. Measures the Id-Vg characteristics, and extracts the threshold voltage (Vth).
3. Applies the write pulse with pulse width specified by the next element of the PulseWidth parameter.
4. Measures the Id-Vg characteristics, and extracts the threshold voltage (Vth).
5. Repeats 3 and 4 until that the pulse width becomes StopPulseWidth.

[Device Under Test]

NAND-type flash memory cell

[Required Modules and Accessories]

Agilent B1525A SPGU 1 unit
Selector (16440A/16445A 1 set or HRSMU/ASU 1 set)

[Device Parameters]

Lg: Gate length
Wg: Gate width
Temp: Temperature
IdMax: Drain current compliance

[Test Parameters]

Gate: SMU connected to Gate terminal, primary sweep voltage output
Drain: SMU connected to Drain terminal, constant voltage output
Source: SMU connected to Source terminal, constant voltage output
Pgate: SPGU channel connected to Gate terminal via Selector

5.21 NandFlash3 WordDisturb(ErasedCell): NAND flash memory cell erase-disturb test (A.03.10)

[Supported Analyzer]

B1500A

[Description]

Performs the erase-disturb test of the NAND-type flash memory cell, and plots the accumulated stress time vs threshold voltage characteristics.

[Device Under Test]

NAND-type flash memory cell

[Required Modules and Accessories]

Agilent B1525A SPGU 1 unit

Selector (16440A/16445A 2 set or HRSMU/ASU 3 set)

[Device Parameters]

Lg: Gate length

Wg: Gate width

Temp: Temperature

IdMax: Drain current compliance

[Test Parameters]

Gate: SMU connected to Gate terminal, primary sweep voltage output

Drain: SMU connected to Drain terminal, constant voltage output

Source: SMU connected to Source terminal, constant voltage output

Pgate: SPGU channel connected to Gate terminal via Selector

Psource: SPGU channel connected to Drain, Source, and Substrate via Selector

VgStart: Sweep start voltage for Gate terminal

VgStop: Sweep stop voltage for Gate terminal

VgStep: Sweep step voltage for Gate terminal

VgStress: Stress voltage for Gate terminal

Vd: Drain voltage

Id@Vth: Drain current to decide the Vth

IntegTime: Integration time

5.23 NorFlash Endurance: NOR flash memory cell endurance test (A.03.10)

[Supported Analyzer]

B1500A

[Description]

Performs the endurance test for the NOR type flash memory cell and plots the number of write/erase operation vs threshold voltage characteristics.

[Device Under Test]

NOR-type flash memory cell

[Required Modules and Accessories]

Agilent B1525A SPGU 2 units
Selector (16440A/16445A 2 sets or HRSMU/ASU 3 sets)

[Device Parameters]

Lg: Gate length
Wg: Gate width
Temp: Temperature
IdMax: Drain current compliance

[Test Parameters]

Gate: SMU connected to Gate terminal, primary sweep voltage output
Drain: SMU connected to Drain terminal, constant voltage output
Source: SMU connected to Source terminal, constant voltage output
Subs: SMU connected to Substrate terminal, constant voltage output
Pgate: SPGU channel connected to Gate terminal via Selector
Pdrain: SPGU channel connected to Drain terminal via Selector
Psource: SPGU channel connected to Source terminal via Selector
VgStart: Sweep start voltage for Gate terminal
VgStop: Sweep stop voltage for Gate terminal
VgStep: Sweep step voltage for Gate terminal
Vd: Drain voltage
Id@Vth: Drain current to decide the Vth
IntegTime: Integration time
TotalWriteAndEraseCycles: Total number of write/erase operation
WritePeriod: Write pulse period
WriteGateDelay: Gate write pulse delay
WriteGateWidth: Gate write pulse width
WriteGateVwrite: Gate write pulse output level
WriteGateLeadingTime: Gate write pulse leading edge transition time
WriteGateTrailingTime: Gate write pulse trailing edge transition time
WriteDrainDelay: Drain write pulse delay
WriteDrainWidth: Drain write pulse width
WriteDrainVwrite: Drain write pulse output level
WriteDrainLeadingTime: Drain write pulse leading edge transition time
WriteDrainTrailingTime: Drain write pulse trailing edge transition time

ErasePeriod: Erase pulse period
EraseGateDelay: Gate erase pulse delay
EraseGateWidth: Gate erase pulse width
EraseGateVerase: Gate erase pulse output level
EraseGateLeadingTime: Gate erase pulse leading edge transition time

5 Memory

EraseGateTrailingTime: Gate erase pulse trailing edge transition time
EraseSourceDelay: Source erase pulse delay
EraseSourceWidth: Source erase pulse width
EraseSourceVerase: Source erase pulse output level
EraseSourceLeadingTime: Source erase pulse leading edge transition time
EraseSourceTrailingTime: Source erase pulse trailing edge transition time

MeasTiming: Timing to perform Vth measurement

[Extended Test Parameters]

Vs: Source voltage
Vsub: Substrate voltage
IgLimit: Gate current compliance
HoldTime: Hold time
DelayTime: Delay time
BaseValue: Pulse base value
DrainMinRng: Minimum range of drain current measurement

[Measurement Parameters]

Drain current Idrain

[Analysis Function]

Vth@Id=@L1X (X intercept of Line1)

[X-Y Plot]

X axis: Gate voltage Vgate (LINEAR)
Y1 axis: Drain current Idrain (LOG)

[List Display]

Gate voltage Vgate
Drain current Idrain

[Test Contents: Auto Analysis]

Line1: Vertical line for Y1 at Idrain=Id@Vth

[Test Output: X-Y Graph]

X axis: Number of write/erase cycles CycleList (LOG)
Y1 axis: Threshold voltage after write VthWrittenList (LINEAR)
Y2 axis: Threshold voltage after erase VthErasedList (LINEAR)

[Test Output: List Display]

Number of write/erase cycles CycleList
Threshold voltage after write VthWrittenList
Threshold voltage after erase VthErasedList

[Test Setup Details]

See NorFlash IV-Write-IV and NorFlash IV-Erase-IV.
TotalWriteAndEraseCycles should be 10, 100, 1000, 10000, 100000, or 1000000.

5.24 NorFlash IV-Erase-IV: NOR flash memory cell Id-Vg, Erase, Id-Vg (A.03.10)

[Supported Analyzer]
B1500A

[Description]
Measures the Id-Vg characteristics of NOR-type flash memory cell, performs the data erase operation, measures the Id-Vg characteristics again, and plots the both Id-Vg characteristics on a graph.
Before the Id-Vg measurements, the initial pulse will be applied to the device under test.

[Device Under Test]
NOR-type flash memory cell

[Required Modules and Accessories]
Agilent B1525A SPGU 1 unit
Selector (16440A/16445A 1 set or HRSMU/ASU 2 sets)

[Device Parameters]
Lg: Gate length
Wg: Gate width
Temp: Temperature
IdMax: Drain current compliance

[Test Parameters]
Gate: SMU connected to Gate terminal, primary sweep voltage output
Drain: SMU connected to Drain terminal, constant voltage output
Source: SMU connected to Source terminal, constant voltage output
Subs: SMU connected to Substrate terminal, constant voltage output
Pgate: SPGU channel connected to Gate terminal via Selector
Psource: SPGU channel connected to Source terminal via Selector
VgStart: Sweep start voltage for Gate terminal
VgStop: Sweep stop voltage for Gate terminal
VgStep: Sweep step voltage for Gate terminal
Vd: Drain voltage
Id@Vth: Drain current to decide the Vth
IntegTime: Integration time
PulsePeriod: Erase pulse period
GateDelay: Gate erase pulse delay
GateWidth: Gate erase pulse width
GateVerase: Gate erase pulse output level
GateLeadingTime: Gate pulse leading edge transition time
GateTrailingTime: Gate pulse trailing edge transition time
SourceDelay: Source erase pulse delay
SourceWidth: Source erase pulse width
SourceVerase: Source erase pulse output level
SourceLeadingTime: Source pulse leading edge transition time
SourceTrailingTime: Source pulse trailing edge transition time

[Extended Test Parameters]
Vs: Source voltage
Vsubs: Substrate voltage
IgLimit: Gate current compliance

5 Memory

HoldTime: Hold time
DelayTime: Delay time
BaseValue:Pulse base value
NoOfPulse: Number of output pulses for the erase operation
DrainMinRng: Minimum range of drain current measurement

[Measurement Parameters]

Drain current Idrain

[User Function]

$I_{\text{drainPerWg}} = I_{\text{drain}} / W_g$

[Analysis Function]

$V_{\text{thAfter}} = @L1X$ (X intercept of Line1)

[X-Y Plot]

X axis: Gate voltage Vgate (LINEAR)
Y1 axis: Drain current Idrain (LINEAR)
Y2 axis: Drain current Idrain (LOG)

Threshold voltage after Erase operation VthErased

5.25 *NorFlash IV-Write-IV: NOR flash memory cell Id-Vg, Write, Id-Vg* (A.03.10)

[Supported Analyzer]
B1500A

[Description]

Measures the Id-Vg characteristics of NOR-type flash memory cell, performs the data write operation, measures the Id-Vg characteristics again, and plots the both Id-Vg characteristics on a graph. Before the Id-Vg measurements, the initial pulse will be applied to the device under test.

[Device Under Test]

NOR-type flash memory cell

[Required Modules and Accessories]

Agilent B1525A SPGU 1 unit
Selector (16440A/16445A 1 set or HRSMU/ASU 2 sets)

[Device Parameters]

Lg: Gate length
Wg: Gate width
Temp: Temperature
IdMax: Drain current compliance

[Test Parameters]

Gate: SMU connected to Gate terminal, primary sweep voltage output
Drain: SMU connected to Drain terminal, constant voltage output
Source: SMU connected to Source terminal, constant voltage output
Subs: SMU connected to Substrate terminal, constant voltage output
Pgate: SPGU channel connected to Gate terminal via Selector
Pdrain: SPGU channel connected to Drain terminal via Selector
VgStart: Sweep start voltage for Gate terminal
VgStop: Sweep stop voltage for Gate terminal
VgStep: Sweep step voltage for Gate terminal
Vd: Drain voltage
Id@Vth: Drain current to decide the Vth
IntegTime: Integration time
PulsePeriod: Write pulse period
GateDelay: Gate write pulse delay
GateWidth: Gate write pulse width
GateVwrite: Gate write pulse output level
GateLeadingTime: Gate pulse leading edge transition time
GateTrailingTime: Gate pulse trailing edge transition time
DrainDelay: Drain write pulse delay
DrainWidth: Drain write pulse width
DrainVwrite: Drain write pulse output level
DrainLeadingTime: Drain pulse leading edge transition time
DrainTrailingTime: Drain pulse trailing edge transition time

[Extended Test Parameters]

Vs: Source voltage
Vsubs: Substrate voltage
IgLimit: Gate current compliance

5 Memory

HoldTime: Hold time
DelayTime: Delay time
BaseValue: Pulse base value
NoOfPulse: Number of output pulses for the write operation
DrainMinRng: Minimum range of drain current measurement

[Measurement Parameters]

Drain current Idrain

[User Function]

$I_{\text{drainPerWg}} = I_{\text{drain}} / W_g$

[Analysis Function]

$V_{\text{thAfter}} = @L1X$ (X intercept of Line1)

[X-Y Plot]

X axis: Gate voltage Vgate (LINEAR)
Y1 axis: Drain current Idrain (LINEAR)
Y2 axis: Drain current Idrain (LOG)

[List Display]

Gate voltage Vgate
Drain voltage Vdrain
Drain current Idrain

[Test Contents: Auto Analysis]

[Test Output: List Display]

Gate voltage VgateList
Drain current before Write operation IdInitialList
Drain current after Write operation IdWrittenList

[Test Output: Parameters]

Threshold voltage before Write operation VthInitial
Threshold voltage after Write operation VthWritten

5.26 NorFlash Retention(ErasedCell): NOR flash memory cell Data retention test after Erase (A.03.10)

[Supported Analyzer]
B1500A

[Description]
Performs the data retention test for the NOR type flash memory cell after the erase operation, and plots the accumulated time vs threshold voltage characteristics.

[Device Under Test]
NOR-type flash memory cell

[Required Modules and Accessories]
Agilent B1525A SPGU 1 unit
Selector (16440A/16445A 1 set or HRSMU/ASU 2 sets)

[Device Parameters]
Lg: Gate length
Wg: Gate width
Temp: Temperature
IdMax: Drain current compliance

[Test Parameters]
Gate: SMU connected to Gate terminal, primary sweep voltage output
Drain: SMU connected to Drain terminal, constant voltage output
Source: SMU connected to Source terminal, constant voltage output
Subs: SMU connected to Substrate terminal, constant voltage output
Pgate: SPGU channel connected to Gate terminal via Selector
Psource: SPGU channel connected to Source terminal via Selector
VgStart: Sweep start voltage for Gate terminal
VgStop: Sweep stop voltage for Gate terminal
VgStep: Sweep step voltage for Gate terminal
Vd: Drain voltage
Id@Vth: Drain current to decide the Vth
IntegTime: Integration time
PulsePeriod: Erase pulse period
GateDelay: Gate erase pulse delay
GateWidth: Gate erase pulse width
GateVerase: Gate erase pulse output level
GateLeadingTime: Gate pulse leading edge transition time
GateTrailingTime: Gate pulse trailing edge transition time
SourceDelay: Source erase pulse delay
SourceWidth: Source erase pulse width
SourceVerase: Source erase pulse output level
SourceLeadingTime: Source pulse leading edge transition time
SourceTrailingTime: Source pulse trailing edge transition time
TotalRetentionTime: Time to continue the test. 10 to 10000 seconds.
MeasTiming: Timing to perform Vth measurement

[Extended Test Parameters]
Vs: Source voltage
Vsubs: Substrate voltage

5 Memory

IgLimit: Gate current compliance
HoldTime: Hold time
DelayTime: Delay time
BaseValue: Pulse base value
NoOfPulse: Number of output pulses for the erase operation
DrainMinRng: Minimum range of drain current measurement

[Measurement Parameters]

Drain current Idrain

[User Function]

$I_{\text{drainPerWg}} = I_{\text{drain}} / W_{\text{g}}$

[Analysis Function]

$V_{\text{th@Id}} = @L1X$ (X intercept of Line1)

[X-Y Plot]

X axis: Gate voltage Vgate (LINEAR)
Y1 axis: Drain current Idrain (LINEAR)
Y2 axis: Drain current Idrain (LOG)

[List Display]

[Test Output: List Display]

Time TimeList
Threshold voltage VthList

[Test Setup Details]

See NorFlash IV-Erase-IV.

5.27 NorFlash Retention(WrittenCell): NOR flash memory cell Data retention test after Write (A.03.10)

[Supported Analyzer]
B1500A

[Description]
Performs the data retention test for the NOR type flash memory cell after the write operation, and plots the accumulated time vs threshold voltage characteristics.

[Device Under Test]
NOR-type flash memory cell

[Required Modules and Accessories]
Agilent B1525A SPGU 1 unit
Selector (16440A/16445A 1 set or HRSMU/ASU 2 set)

[Device Parameters]
Lg: Gate length
Wg: Gate width
Temp: Temperature
IdMax: Drain current compliance

[Test Parameters]
Gate: SMU connected to Gate terminal, primary sweep voltage output
Drain: SMU connected to Drain terminal, constant voltage output
Source: SMU connected to Source terminal, constant voltage output
Subs: SMU connected to Substrate terminal, constant voltage output
Pgate: SPGU channel connected to Gate terminal via Selector
Pdrain: SPGU channel connected to Drain terminal via Selector
VgStart: Sweep start voltage for Gate terminal
VgStop: Sweep stop voltage for Gate terminal
VgStep: Sweep step voltage for Gate terminal
Vd: Drain voltage
Id@Vth: Drain current to decide the Vth
IntegTime: Integration time
PulsePeriod: Write pulse period
GateDelay: Gate write pulse delay
GateWidth: Gate write pulse width
GateVwrite: Gate write pulse output level
GateLeadingTime: Gate pulse leading edge transition time
GateTrailingTime: Gate pulse trailing edge transition time
DrainDelay: Drain write pulse delay
DrainWidth: Drain write pulse width
DrainVwrite: Drain write pulse output level
DrainLeadingTime: Drain pulse leading edge transition time
DrainTrailingTime: Drain pulse trailing edge transition time
TotalRetentionTime: Time to continue the test. 10 to 10000 seconds.
MeasTiming: Timing to perform Vth measurement

[Extended Test Parameters]
Vs: Source voltage
Vsubs: Substrate voltage

5 Memory

IgLimit: Gate current compliance
HoldTime: Hold time
DelayTime: Delay time
BaseValue: Pulse base value
NoOfPulse: Number of output pulses for the write operation
DrainMinRng: Minimum range of drain current measurement

[Measurement Parameters]

Drain current Idrain

[User Function]

$I_{\text{drainPerWg}} = I_{\text{drain}} / W_{\text{g}}$

[Analysis Function]

$V_{\text{th@Id}} = @L1X$ (X intercept of Line1)

[Test Setup Details]

See NorFlash IV-Write-IV.

5.28 *NorFlash Vth(ErasingTimeDependence): NOR flash memory cell erasing time dependence test (A.03.10)*

[Supported Analyzer]

B1500A

[Description]

Performs the erasing time dependence test of the NOR-type flash memory cell, and plots the accumulated erasing time (accumulated pulse width) vs threshold voltage characteristics. The test is performed as follows.

1. Applies the erase pulse with pulse width specified by the first element of the SourceWidth parameter.
2. Measures the Id-Vg characteristics, and extracts the threshold voltage (Vth).
3. Applies the erase pulse with pulse width specified by the next element of the SourceWidth parameter.
4. Measures the Id-Vg characteristics, and extracts the threshold voltage (Vth).
5. Repeats 3 and 4 until that the pulse width becomes StopPulseWidth.

[Device Under Test]

NOR-type flash memory cell

[Required Modules and Accessories]

Agilent B1525A SPGU 1 unit

Selector (16440A/16445A 1 set or HRSMU/ASU 2 set)

[Device Parameters]

Lg: Gate length

Wg: Gate width

Temp: Temperature

IdMax: Drain current compliance

[Test Parameters]

Gate: SMU connected to Gate terminal, primary sweep voltage output

Drain: SMU connected to Drain terminal, constant voltage output

Source: SMU connected to Source terminal, constant voltage output

Subs: SMU connected to Substrate terminal, constant voltage output

Pgate: SPGU channel connected to Gate terminal via Selector

Psource: SPGU channel connected to Source terminal via Selector

VgStart: Sweep start voltage for Gate terminal

VgStop: Sweep stop voltage for Gate terminal

VgStep: Sweep step voltage for Gate terminal

Vd: Drain voltage

Id@Vth: Drain current to decide the Vth

IntegTime: Integration time

GateWidthOffset: Gate erase pulse width offset

GateVerase: Gate erase pulse output level

5.29 NorFlash Vth(WritingTimeDependence): NOR flash memory cell writing time dependence test (A.03.10)

[Supported Analyzer]
B1500A

[Description]

Performs the writing time dependence test of the NOR-type flash memory cell, and plots the accumulated writing time (accumulated pulse width) vs threshold voltage characteristics. The test is performed as follows.

1. Applies the write pulse with pulse width specified by the first element of the DrainWidth parameter.
2. Measures the Id-Vg characteristics, and extracts the threshold voltage (Vth).
3. Applies the write pulse with pulse width specified by the next element of the DrainWidth parameter.
4. Measures the Id-Vg characteristics, and extracts the threshold voltage (Vth).
5. Repeats 3 and 4 until that the pulse width becomes StopPulseWidth.

[Device Under Test]

NOR-type flash memory cell

[Required Modules and Accessories]

Agilent B1525A SPGU 1 unit
Selector (16440A/16445A 1 set or HRSMU/ASU 2 set)

[Device Parameters]

Lg: Gate length
Wg: Gate width
Temp: Temperature
IdMax: Drain current compliance

5.33 NorFlash DataDisturb(WrittenCell): NOR flash memory cell Data disturb test after Write (A.03.10)

[Supported Analyzer]
B1500A

[Description]
Performs the data disturb test of the NOR-type flash memory cell after the write operation, and plots the accumulated stress time vs threshold voltage characteristics.

[Device Under Test]
NOR-type flash memory cell

[Required Modules and Accessories]
Agilent B1525A SPGU 1 unit
Selector (16440A/16445A 1 set or HRSMU/ASU 2 set)

[Device Parameters]
Lg: Gate length
Wg: Gate width
Temp: Temperature
IdMax: Drain current compliance

[Test Parameters]
Gate: SMU connected to Gate terminal, primary sweep voltage output
Drain: SMU connected to Drain terminal, constant voltage output
Source: SMU connected to Source terminal, constant voltage output
Subs: SMU connected to Substrate terminal, constant voltage output
Pgate: SPGU channel connected to Gate terminal via Selector
Pdrain: SPGU channel connected to Drain terminal via Selector
VgStart: Sweep start voltage for Gate terminal
VgStop: Sweep stop voltage for Gate terminal
VgStep: Sweep step voltage for Gate terminal
VdStress: Stress voltage for Drain terminal
Vd: Drain voltage
Id@Vth: Drain current to decide the Vth
IntegTime: Integration time
PulsePeriod: Write pulse period
GateDelay: Gate write pulse delay
GateWidth: Gate write pulse width
GateVwrite: Gate write pulse output level
GateLeadingTime: Gate pulse leading edge transition time
GateTrailingTime: Gate pulse trailing edge transition time
DrainDelay: Drain write pulse delay
DrainWidth: Drain write pulse width
DrainVwrite: Drain write pulse output level
DrainLeadingTime: Drain pulse leading edge transition time
DrainTrailingTime: Drain pulse trailing edge transition time
TotalStressTime: Total accumulated stress time
CheckNoOfTimes: Number of Vth measurement operation

[Extended Test Parameters]
Vs: Source voltage

18. MOS Varactor CV Mismatch: MOS Varactor capacitance CV characteristics mismatch (A.01.11)
19. Poly-R Mismatch: Resistor R-I characteristics mismatch, Kelvin connection (A.01.11)

6.1 BJT Varactor CV Mismatch: BJT Varactor capacitance CV characteristics mismatch (A.01.11)

[Supported Analyzer]
B1500A

[Description]

Measures the BJT varactor capacitance (C-Vce characteristics) of device A, and measures the C-Vce characteristics of device B. After that, calculates the differences between capacitance values by using the following formula, and plots the results.

$\Delta C_p = (C_{pBList} - C_{pAList}) / C_{pAList} * 100$ for parallel capacitance
 $\Delta C_s = (C_{sBList} - C_{sAList}) / C_{sAList} * 100$ for series capacitance

For a more accurate measurement, perform correction data measurement at the measurement frequency before starting the capacitance measurement.

If the measurement frequency is not included in the list of default frequencies below, click the Advanced Options... button and set the measurement frequency on the Frequency area of the Advanced Options for CMU Calibration window.

Default frequencies:

1 k, 2 k, 5 k, 10 k, 20 k, 50 k, 100 k, 200 k, 500 k, 1 M, 1.2 M, 1.5 M, 2 M, 2.5 M, 2.7 M, 3 M, 3.2 M, 3.5 M, 3.7 M, 4 M, 4.2 M, 4.5 M, 5 MHz

[Device Under Test]

Bipolar junction transistor, 4 terminals, 2 ea.

Connect Base to the CMU Low, Collector to the CMU High, and the other terminals to the GNDU.

[Device Parameters]

Polarity: NPN (CMU forces the specified value) or PNP (CMU forces the negative specified value).

Lb: Base length

Wb: Base width

Temp: Temperature

[Test Parameters]

IntegTime: Integration time

FREQ: Measurement frequency

OscLevel: Measurement signal level

Collector: CMU connected between Collector and Base (CV sweep measurement)

VcbStart: DC bias start voltage

VcbStop: DC bias stop voltage

VcbStep: DC bias step voltage

[Extended Test Parameters]

HoldTime: Hold time

DelayTime: Delay time

[Measurement Parameters]

Parallel capacitance Cp

Conductance G

[User Function]

To specify the device, A or B is added to the actual variable names.

6 Mixed Signal

$PI=3.141592653589$
 $Dval=Gval/(2*PI*FREQ*Cpval)$
 $Rpval=1/Gval$
 $Csval=(1+Dval^2)*Cpval$
 $Xval=-1/(2*PI*FREQ*Csval)$
 $Rsval=Dval*abs(Xval)$
 $Zval=sqrt(Rsval^2+Xval^2)$
 $Thetaval=atan(Xval/Rsval)$
 $Vceval=Vcollector$

[X-Y Graph]

To specify the device, A or B is added to the actual variable names.

X axis: Collector-Emitter voltage Vceval (LINEAR)

Y1 axis: Collector capacitance (parallel capacitance) Cpval (LINEAR)

Y2 axis: Conductance Gval (LINEAR)

[List Display]

To specify the device, A or B is added to the actual variable names.

Collector-Emitter voltage Vceval

Parallel capacitance Cpval

Conductance Gval

Series capacitance Csval

Series resistance Rsval

Parallel resistance Rpval

Dissipation factor Dval

Reactance Xval

Impedance Zval

Phase Thetaval

[Test Output: X-Y Graph]

X axis: Collector-Emitter voltage VceList (LINEAR)

Y1 axis: Collector capacitance (parallel capacitance) CpAList (LINEAR)

Y2 axis: Collector capacitance (parallel capacitance) CpBList (LINEAR)

Y3 axis: Differences between Cp DeltaCp (LINEAR)

6.2 *Diff-R Mismatch: Diffusion resistor R-I characteristics mismatch, Kelvin connecton (A.01.11)*

[Supported Analyzer]
B1500A

[Description]
Measures the resistance vs input current characteristics of diffusion resistors, and plots the differences between the devices.

[Device Under Test]
Resistor, 2 terminals, 2 ea.
with substrate

[Device Parameters]
Polarity: Ntype (SMUs force the specified value) or Ptype (SMUs force the negative specified value).
L: Resistor length
W: Resistor width
Temp: Temperature

[Test Parameters]
IntegTime: Integration Time
Port1: SMU connected to device A high terminal, primary sweep current output
Port2: SMU connected to device B high terminal, synchronous sweep current output
I1Start: Port1/Port2 sweep start current
I1Stop: Port1/Port2 sweep stop current
I1Step: Port1/Port2 sweep step current
Port3: SMU connected to device A/B low terminal, constant voltage output
Subs: SMU connected to Substrate, constant voltage output
VM1: SMU connected to device A high terminal, constant current output
VM2: SMU connected to device A low terminal, constant current output
VM3: SMU connected to device B high terminal, constant current output
VM4: SMU connected to device B low terminal, constant current output

[Extended Test Parameters]
IM1: VM1 output current
IM2: VM2 output current
IM3: VM3 output current
IM4: VM4 output current
V3: Port3 output voltage
Vsubs: Substrate voltage
V1Limit: Port1 voltage compliance
VM1Limit: VM1 voltage compliance
I3Limit: Port3 current compliance
IsubsLimit: Substrate current compliance
HoldTime: Hold time
DelayTime: Deley time

[Measurement Parameters]
Device A input current Iport1
Device B input current Iport2
Device A terminal voltage Vvm1, Vvm2
Device B terminal voltage Vvm3, Vvm4

6 Mixed Signal

[User Function]

$$\Delta V_A = V_{vm1} - V_{vm2}$$

$$\Delta V_B = V_{vm3} - V_{vm4}$$

$$R_A = \Delta V_A / I_{port1}$$

$$R_B = \Delta V_B / I_{port2}$$

$$R_{sheet_A} = R_A / (W/L)$$

$$R_{sheet_B} = R_B / (W/L)$$

$$\Delta R = (R_A - R_B) / R_A * 100$$

[X-Y Plot]

X axis: Device input current Iport1 (LINEAR)

Y1 axis: Device A voltage between terminals DeltaV_A (LINEAR)

Y2 axis: Device B voltage between terminals DeltaV_B (LINEAR)

Y3 axis: Device A resistance R_A (LINEAR)

Y4 axis: Device A resistance R_B (LINEAR)

Y5 axis: Rate-of-change between R_A and R_B Delta_R (LINEAR)

6.3 Diode IV Fwd Mismatch: Diode forward bias characteristics mismatch (A.01.20)

[Supported Analyzer]

B1500A

[Description]

Measures the forward bias anode voltage vs anode current characteristics, and plots the differences between the devices.

[Device Under Test]

Diode, 2 ea.

[Device Parameters]

L: Junction length

W: Junction width

Temp: Temperature

IMax: Current compliance

[Test Parameters]

IntegTime: Integration time

AnodeA: SMU connected to the device A Anode terminal, primary sweep voltage output

AnodeB: SMU connected to the device B Anode terminal, synchronous sweep voltage output

VanodeStart: Sweep start voltage for Anode terminal

VanodeStop: Sweep stop voltage for Anode terminal

VanodeStep: Sweep step voltage for Anode terminal

Cathode: SMU connected to Cathode terminal, constant voltage output

[Extended Test Parameters]

Vcathode: Cathode voltage

HoldTime: Hold time

DelayTime: Delay time

AnodeMinRng: Minimum range for the anode current measurement

[Measurement Parameters]

Anode current IanodeA, IanodeB

[User Function]

$\Delta_I_{anode} = (I_{anodeA} - I_{anodeB}) / I_{anodeA} * 100$

[X-Y Plot]

X axis: Anode voltage VanodeA (LINEAR)

Y1 axis: Anode current IanodeA (LINEAR)

Y2 axis: Anode current IanodeB (LINEAR)

Y3 axis: Differences between anode current Δ_I_{anode} (LINEAR)

6 Mixed Signal

6.4 Diode IV Rev Mismatch: Diode reverse bias characteristics mismatch (A.01.20)

[Supported Analyzer]
B1500A

[Description]
Measures the reverse bias anode voltage vs anode current characteristics, and plots the differences between the devices.

[Device Under Test]
Diode, 2 ea.

[Device Parameters]
L: Junction length
W: Junction width
Temp: Temperature

[Test Parameters]
IntegTime: Integration time
AnodeA: SMU connected to the device A Anode terminal, primary sweep voltage output
AnodeB: SMU connected to the device B Anode terminal, synchronous sweep voltage output
VanodeStart: Sweep start voltage for Anode terminal
VanodeStop: Sweep stop voltage for Anode terminal
VanodeStep: Sweep step voltage for Anode terminal
IanodeLimit: Anode current compliance
Cathode: SMU connected to Cathode terminal, constant voltage output

[Extended Test Parameters]
Vcathode: Cathode voltage
HoldTime: Hold time
DelayTime: Delay time
AnodeMinRng: Minimum range for the anode current measurement

[Measurement Parameters]
Anode current IanodeA, IanodeB

[User Function]
 $\Delta_Ianode = (IanodeA - IanodeB) / IanodeA * 100$

[X-Y Plot]
X axis: Anode voltage VanodeA (LINEAR)
Y1 axis: Anode current IanodeA (LINEAR)
Y2 axis: Anode current IanodeB (LINEAR)
Y3 axis: Differences between anode current Δ_Ianode (LINEAR)

6.5 *G-Plot ConstVce Mismatch: Gummel characteristics mismatch, Vce=Const (A.01.20)*

[Supported Analyzer]
B1500A

[Description]
Measures the collector current vs base voltage characteristics and the base current vs base voltage characteristics, extracts the current amplification factor hfe, and plots the gummel characteristics.

[Device Under Test]
Bipolar transistor, 4 terminals, 2 ea.

[Device Parameters]
Polarity: NPN (SMUs force the specified value) or PNP (SMUs force the negative specified value).
Le: Emitter length
We: Emitter width
Temp: Temperature
IcMax: Collector current compliance

[Test Parameters]
IntegTime: Integration time
BaseA: SMU connected to Device A Base terminal, primary sweep voltage output
BaseB: SMU connected to Device B Base terminal, synchronous sweep voltage output
VbStart: Sweep start voltage for Base terminal
VbStop: Sweep stop voltage for Base terminal
VbStep: Sweep step voltage for Base terminal
Emitter: SMU connected to Emitter terminal, constant voltage output
CollectorA: SMU connected to Device A Collector terminal, constant voltage output
CollectorB: SMU connected to Device B Collector terminal, constant voltage output
Vc: Collector voltage
Subs: SMU connected to Substrate, constant voltage output
Vsubs: Substrate voltage
IsubsLimit: Substrate current compliance

[Extended Test Parameters]
Ve: Emitter voltage
HoldTime: Hold time
DelayTime: Delay time
BaseMinRng: Minimum range for the base current measurement
CollectorMinRng: Minimum range for the collector current measurement

[Measurement Parameters]
Collector current IcollectorA
Collector current IcollectorB
Base current IbaseA
Base current IbaseB

[User Function]
 $hfe_A = I_{collectorA} / I_{baseA}$
 $hfe_B = I_{collectorB} / I_{baseB}$
 $\Delta_hfe = (hfe_A - hfe_B) / hfe_A * 100$
 $\Delta_I_{collector} = (I_{collectorA} - I_{collectorB}) / I_{collectorA} * 100$

6 Mixed Signal

Vbe=VbaseA

[X-Y Plot]

X axis: Base-Emitter voltage Vbe (LINEAR)

Y1 axis: Collector current IcollectorA (LOG)

Y2 axis: Base current IbaseA (LOG)

Y3 axis: Collector current IcollectorB (LOG)

Y4 axis: Base current IbaseB (LOG)

Y5 axis: Current amplification factor hfe_A (LINEAR)

Y6 axis: Current amplification factor hfe_B (LINEAR)

Y7 axis: Differences of hfe Delta_hfe (LINEAR)

6.6 *G-Plot ConstVce Mismatch[3]: Gummel characteristics mismatch, Vce=Const, 3-terminal (A.01.20)*

[Supported Analyzer]
B1500A

[Description]
Measures the collector current vs base voltage characteristics and the base current vs base voltage characteristics, extracts the current amplification factor hfe, and plots the gummel characteristics.

[Device Under Test]
Bipolar transistor, 3 terminals, 2 ea.

6.17 MIM CV Mismatch: MIM capacitor C-V characteristics mismatch (A.01.11)

[Supported Analyzer]

B1500A

[Description]

Measures the MIM capacitance (C-V characteristics) of device A, and measures the C-V characteristics of device B. After that, calculates the differences between capacitance values by using the following formula, and plots the results.

$$\Delta C_p = (C_{pBList} - C_{pAList}) / C_{pAList} * 100 \text{ for parallel capacitance}$$

$$\Delta C_s = (C_{sBList} - C_{sAList}) / C_{sAList} * 100 \text{ for series capacitance}$$

For a more accurate measurement, perform correction data measurement at the measurement frequency before starting the capacitance measurement.

If the measurement frequency is not included in the list of default frequencies below, click the Advanced Options... button and set the measurement frequency on the Frequency area of the Advanced Options for CMU Calibration window.

Default frequencies:

1 k, 2 k, 5 k, 10 k, 20 k, 50 k, 100 k, 200 k, 500 k, 1 M, 1.2 M, 1.5 M, 2 M, 2.5 M, 2.7 M, 3 M, 3.2 M, 3.5 M, 3.7 M, 4 M, 4.2 M, 4.5 M, 5 MHz

7.1 CNT Differential R[AC]: CNT Differential R-V characteristics (A.01.20)

[Supported Analyzer]

B1500A

[Description]

Measures the conductance of a CNT 2-terminal device and plots differential R-V (resistance vs voltage) characteristics. This test is designed to calculate resistance as the inverse of conductance. Additionally, the level of a measurement signal is specified by a peak-to-peak value (normally effective value).

For a more accurate measurement, perform correction data measurement at the measurement frequency before starting the capacitance measurement.

If the measurement frequency is not included in the list of default frequencies below, click the Advanced Options... button and set the measurement frequency on the Frequency area of the Advanced Options for CMU Calibration window.

[Supported Analyzer]

B1500A, 4155B, 4155C, 4156B, 4156C

[Description]

Measures the gate current vs gate voltage (I_g - V_g) characteristics of CNT FET.

Measures I_g before and after applying V_g by using the primary sweep SMU that forces the start and stop voltages only, and extracts the I_g - V_g characteristics by altering the stop value repeatedly.

[Device Under Test]

Carbon Nano Tube FET capacitor, 2 terminals

Connect SMU to the back gate and side gate and make the source and drain open.

[Device Parameters]

Polarity: Forward (SMUs force the specified value) or Reverse (SMUs force the negative specified value)

L: CNT length

D: CNT diameter

Temp: Temperature

[Test Parameters]

IntegTime: Integration time

BackGate: SMU connected to Back Gate terminal, primary sweep voltage output

SideGate: SMU connected to Side Gate terminal, constant voltage output

VbgStart: Pulse peak start (sweep start) voltage for Back Gate terminal

VbgStop: Pulse peak stop (sweep stop) voltage for Back Gate terminal

VbgStep: Pulse peak step (sweep step) voltage for Back Gate terminal

VbgLow: Pulse base voltage (primary sweep start voltage)

[Extended Test Parameters]

HoldTime: Hold time

DelayTime: Delay time

Vsg: Side Gate terminal voltage

IbgLimit: Back Gate current compliance

BackGateMinRng: Minimum range for Back Gate current measurement

SideGateMinRng: Minimum range for Side Gate current measurement

[Measurement Parameters]

Ibackgate: Back Gate current

[X-Y Plot]

X axis: Back Gate voltage Vbackgate (LINEAR)

Y1 axis: Back Gate current Ibackgate (LOG)

[List Display]

Vbackgate: Back Gate voltage

Ibackgate: Back Gate current

[Test Output: X-Y Graph]

X axis: Back Gate voltage Vbackgate (LINEAR)

Y1 axis: Back Gate current Ibackgate (LOG)

Y2 axis: Back Gate current with pulse base voltage applied Ibackgate@LowVbg (LOG)

[Test Output: List Display]

V_backgate: Back Gate voltage
I_backgate: Back Gate current
I_backgate@LowVbg: Back Gate current with pulse base voltage applied

[Test Output: Parameters]

V_backgate: Back Gate voltage
I_backgate: Back Gate current
I_backgate@LowVbg: Back Gate current with pulse base voltage applied

7.3 CNT Id-Time: CNT FET Id-Time Characteristic (A.01.20)

[Supported Analyzer]
B1500A, 4156B, 4156C

[Description]

This Algorithm evaluates the drain current with drain voltage for the gate condition change which is used as the DNA or the antibody sensor.

The IV curves between drain and source is measured with the gate condition change which indicat amount of the DNA or the antibody on the gate surface as a sensor.

The Algorithm is applied the time dependent measurement.

[Device Under Test]

CNT FET, 4 terminals

[Device Parameters]

Polarity: Forward (SMUs force the specified value) or Reverse (SMUs force the negative specified value).

L: CNT length

D: CNT diameter

Temp: Temperature

IdMax: Drain current compliance

[Test Parameters]

BackGate: SMU connected to Backgate terminal, secondary sweep voltage output

Source: SMU connected to Source terminal, constant voltage output

Drain: SMU connected to Drain terminal, primary sweep voltage output

SideGate: SMU connected to Sidegate, constant voltage output

VbgStart: Sweep start voltage for Backgate terminal

VbgStop: Sweep stop voltage for Backgate terminal

VbgStep: Sweep step voltage for Backgate terminal

VdStart: Sweep start voltage for Drain terminal

VdStop: Sweep stop voltage for Drain terminal

VdStep: Sweep step voltage for Drain terminal

Vsg: Sidegate voltage

IntegTime: Integration time

T1Stop: T1 stop time

T1Step: T1 step time

T2Stop: T2 stop time

T2Step: T2 step time

[Extended Test Parameters]

Vs: Source voltage

IgLimit: Backgate current compliance

HoldTime: Hold time

DelayTime: Delay time

DrainMinRng: Minimum range for the drain current measurement

[Measurement Parameters]

Drain current Idrain

Time ACC_TIME

ACC_TIME shows total time of T1Step or T2Step and measured time.

$ACC_TIME = ACC_TIME + T1Step \text{ or } T2Step + \text{Measured time of Id-Vd}$

[X-Y Plot]

X axis: Drain voltage V_{drain} (LINEAR)

Y1 axis: Drain current I_{drain} (LINEAR)

7 Nano Tech

7.4 CNT Id-Vd: CNT FET Id-Vd characteristics (A.01.20)

[Supported Analyzer]

B1500A, 4155B, 4155C, 4156B, 4156C

[Description]

Measures the drain current vs drain voltage characteristics of Carbon Nano Tube FET.

[Device Under Test]

Carbon Nano Tube FET, 4 terminals

[Device Parameters]

Polarity: Forward (SMUs force the specified value) or Reverse (SMUs force the negative specified value).

L: CNT length

D: CNT diameter

Temp: Temperature

IdMax: Drain current compliance

[Test Parameters]

IntegTime: Integration time

Drain: SMU connected to Drain, primary sweep voltage output

VdStart: Sweep start voltage for Drain

VdStop: Sweep stop voltage for Drain

VdStep: Sweep step voltage for Drain

BackGate: SMU connected to Backgate, secondary sweep voltage output

VbgStart: Sweep start voltage for Backgate

VbgStop: Sweep stop voltage for Backgate

VbgStep: Sweep step voltage for Backgate

IgLimit: Backgate current compliance

SideGate: SMU connected to Sidegate, constant voltage output

Source: SMU connected to Source, constant voltage output

[Extended Test Parameters]

Vsg: Sidegate voltage

Vs: Source voltage

HoldTime: Hold time

DelayTime: Delay time

DrainMinRng: Minimum range for the drain current measurement

[Measurement Parameters]

Drain current Idrain

[X-Y Plot]

X axis: Drain voltage Vdrain (LINEAR)

Y1 axis: Drain current Idrain (LINEAR)

7.5 CNT Id-Vg: Carbon Nano Tube FET Id-Vg characteristics (A.01.20)

[Supported Analyzer]

B1500A, 4155B, 4155C, 4156B, 4156C

[Description]

Measures the drain current vs gate voltage characteristics of Carbon Nano Tube FET.

[Device Under Test]

Carbon Nano Tube FET, 4 terminals

[Device Parameters]

Polarity: Forward (SMUs force the specified value) or Reverse (SMUs force the negative specified value).

L: CNT length

D: CNT diameter

Temp: Temperature

IdMax: Drain current compliance

[Test Parameters]

IntegTime: Integration time

BackGate: SMU connected to Backgate, primary sweep voltage output

VbgStart: Sweep start voltage for Backgate

VbgStop: Sweep stop voltage for Backgate

VbgStep: Sweep step voltage for Backgate

IgLimit: Backgate current compliance

Drain: SMU connected to Drain, secondary sweep voltage output

VdStart: Sweep start voltage for Drain

VdStop: Sweep stop voltage for Drain

VdStep: Sweep step voltage for Drain

SideGate: SMU connected to Sidegate, constant voltage output

Source: SMU connected to Source, constant voltage output

[Extended Test Parameters]

Vsg: Sidegate voltage

Vs: Source voltage

HoldTime: Hold time

DelayTime: Delay time

DrainMinRng: Minimum range for the drain current measurement

[Measurement Parameters]

Drain current Idrain

[X-Y Plot]

X axis: Backgate voltage Vbackgate (LINEAR)

Y2 axis: Drain current Idrain (LOG)

7 Nano Tech

7.6 CNT Id-Vg-Time: CNT FET Ig-Vg characteristics (A.01.20)

[Supported Analyzer]

B1500A, 4156B, 4156C

[Description]

Measures the Id-Vg characteristics of CNT FET repeatedly at a specified interval until specified time elapses. This test is designed to use a gate electrode as a sensor and consider the adsorption of DNA and antibody to the gate electrode as a change in Ids. Used for evaluation of a time change in characteristics.

[Device Under Test]

Carbon Nano Tube FET, 4 terminals

[Device Parameters]

Polarity: Forward (SMUs force the specified value) or Reverse (SMUs force the negative specified value)

L: CNT length

D: CNT diameter

Temp: Temperature

IdMax: Drain current compliance

[Test Parameters]

IntegTime: Integration time

Drain: SMU connected to Drain, primary sweep voltage output

VdStart: Sweep start voltage for Drain

VdStop: Sweep stop voltage for Drain

VdStep: Sweep step voltage for Drain

BackGate: SMU connected to Back Gate, secondary sweep voltage output

VbgStart: Sweep start voltage for Back Gate

VbgStop: Sweep stop voltage for Back Gate

VbgStep: Sweep step voltage for Back Gate

SideGate: SMU connected to Side Gate, constant voltage output

Vsg: Side Gate voltage

Source: SMU connected to Source, constant voltage output

T1Stop: T1 stop time

T1Step: T1 step time

T2Stop: T2 stop time

T2Step: T2 step time

[Extended Test Parameters]

Vs: Source voltage

IbgLimit: Back Gate current compliance

HoldTime: Hold time

DelayTime: Delay time

DrainMinRng: Minimum range for drain current measurement

[Measurement Parameters]

Drain current Idrain

Time ACC_TIME

ACC_TIME is displayed after adding the sum of T1Step (or T2Step) and the actual measurement time.

ACC_TIME = ACC_TIME + T1Step (or T2Step) + Id-Vg measurement time

[User Function]

ACC_TIME: Elapsed time

MaxTS: Maximum time stamp value

[X-Y Plot]

X axis: Back Gate voltage Vbackgate (LINEAR)

Y1 axis: Drain current Idrain (LINEAR)

[List Display]

Vbackgate: Back Gate voltage

Idrain: Drain current

Vsidegate: Side Gate voltage

ACC_TIME: Elapsed time

[Test Setup Details]

Refer to "CNT Id_Vg."

7 Nano Tech

7.7 CNT IV Sweep: CNT Differential I-V characteristics (A.01.20)

[Supported Analyzer]

B1500A, 4155B, 4155C, 4156B, 4156C

[Description]

Measures the I-V (current vs voltage) characteristics of a CNT 2-terminal device.

This test definition allows one to select the direction of a sweep from "Single" and "Double." When the sweep start/stop value is not 0 V, outputs a sweep from 0 V to the start value or from the stop value to 0 V to protect a device.

[Device Under Test]

Carbon Nano Tube FET, 2 terminals

[Device Parameters]

Temp: Temperature

[Test Parameters]

IntegTime: Integration time

Port1: SMU connected to device under test, primary sweep voltage output

Port2: SMU connected to device under test, constant voltage output

V1Start: Sweep output start voltage

V1Stop: Sweep output stop voltage

V1Step: Sweep output step voltage

I1Limit: Port1 current compliance

SweepDirection: Sweep direction

[Extended Test Parameters]

HoldTime: Hold time

DelayTime: Delay time

V2: Port2 voltage

Y_Min: Minimum Y axis value

Y_Max: Maximum Y axis value

R_Max: Maximum Y axis resistance value

Port1MinRng: Minimum range for Port1 current measurement

[Measurement Parameters]

Iport1: Port1 current

[User Function]

Resistor terminal voltage $\Delta V = V_{port1} - V_{port2}$

Resistance $R = \Delta V / I_{port1}$

[X-Y Plot]

X axis: Voltage ΔV (LINEAR)

Y1 axis: Measured current I_{port1} (LINEAR)

Y2 axis: Resistance R (LINEAR)

[List Display]

ΔV : Voltage

I_{port1} : Measured current

R : Resistance value

7.8 CNT R-I Kelvin 2SMU: CNT R-I characteristics, Kelvin connection (A.01.20)

[Supported Analyzer]

B1500A, 4155B, 4155C, 4156B, 4156C

[Description]

Measures the electric resistance of a CNT 2-terminal device and plots R-I (resistance vs current) characteristics. This test is designed to apply a current between terminals of devices, measure a voltage and calculate resistance. Kelvin connection is used for connecting SMU to a device.

[Device Under Test]

Carbon Nano Tube FET, 2 terminals

[Device Parameters]

L: CNT length
D: CNT diameter
Temp: Temperature

[Test Parameters]

IntegTime: Integration time
Port1: SMU connected to resistor, primary sweep current output
I1Start: Sweep output start current
I1Stop: Sweep output stop current
I1Step: Sweep output step current
V1Limit: Port1 voltage compliance
Port2: SMU connected to resistor, constant voltage output

[Extended Test Parameters]

HoldTime: Hold time
DelayTime: Delay time
V2: Port2 voltage

[Measurement Parameters]

Vport1: Port1 voltage

[User Function]

Circular constant $PI=3.141592653589$
Resistor terminal voltage $\Delta V=V_{port1}-V_{port2}$
Resistance $R=\Delta V/I_{port1}$
Sheet resistance $R_{sheet}=R*((PI*D)/L)$

[X-Y Plot]

X axis: Current I_{port1} (LINEAR)
Y1 axis: Resistance R (LINEAR)
Y2 axis: Measured voltage ΔV (LINEAR)

[List Display]

I_{port1} : Input current
R: Resistance value
 ΔV : Resistor terminal voltage
 R_{sheet} : Sheet resistance

7 Nano Tech

7.9 CNT R-V Kelvin 2SMU: CNT R-V characteristics, Kelvin connection (A.01.20)

[Supported Analyzer]

B1500A, 4155B, 4155C, 4156B, 4156C

[Description]

Measures the electric resistance of a CNT 2-terminal device and plots R-V (resistance vs voltage) characteristics. This test is designed to apply a voltage between terminals of devices, measure a current and calculate the resistance. Kelvin connection is used for connecting SMU to a device.

[Device Under Test]

Carbon Nano Tube FET, 2 terminals

[Device Parameters]

L: CNT length
D: CNT diameter
Temp: Temperature

[Test Parameters]

IntegTime: Integration time
Port1: SMU connected to resistor, primary sweep voltage output
V1Start: Sweep output start voltage
V1Stop: Sweep output stop voltage
V1Step: Sweep output step voltage
IILimit: Port1 current compliance
Port2: SMU connected to resistor, constant voltage output
V2: Port2 voltage

[Extended Test Parameters]

HoldTime: Hold time
DelayTime: Delay time
Port1MinRng: Minimum range for Port1 current measurement

[Measurement Parameters]

Iport1: Port1 current

[User Function]

Circular constant $PI=3.141592653589$
Resistor terminal voltage $\Delta V=V_{port1}-V_{port2}$
Resistance $R=\Delta V/I_{port1}$
Sheet resistance $R_{sheet}=R*((PI*D)/L)$

[X-Y Plot]

X axis: Voltage ΔV (LINEAR)
Y1 axis: Measured current I_{port1} (LINEAR)
Y2 axis: Resistance R (LINEAR)

[List Display]

ΔV : Input voltage
 I_{port1} : Measured current
R: Resistance value
 R_{sheet} : Sheet resistance

7.10 CNT Vth gmMax: CNT FET linear region Vth (A.01.20)

[Supported Analyzer]

B1500A, 4155B, 4155C, 4156B, 4156C

[Description]

Extracts the threshold voltage (Vth) from linear region data by using the extrapolation method for the measurement of CNT FET Id-Vg characteristics.

[Device Under Test]

Carbon Nano Tube FET, 4 terminals

[Device Parameters]

Polarity: Forward (SMUs force the specified value) or Reverse (SMUs force the negative specified value)

L: CNT length

D: CNT diameter

Temp: Temperature

IdMax: Drain current compliance

[Test Parameters]

IntegTime: Integration time

BackGate: SMU connected to Back Gate, primary sweep voltage output

VbgStart: Sweep start voltage for Back Gate

VbgStop: Sweep stop voltage for Back Gate

VbgStep: Sweep step voltage for Back Gate

Drain: SMU connected to Drain, constant voltage output

Vd: Drain voltage, ideally at around 100mV

SideGate: SMU connected to Side Gate, constant voltage output

Source: SMU connected to Source, constant voltage output

[Extended Test Parameters]

Vsg: Side Gate voltage

Vs: Source voltage

IbgLimit: Back Gate current compliance

HoldTime: Hold time

DelayTime: Delay time

gm_Min: Minimum transconductance value for Y axis

gm_Max: Maximum transconductance value for Y axis

DrainMinRng: Minimum range for drain current measurement

[Measurement Parameters]

Drain current Idrain

[User Function]

gm=diff(Idrain,Vbackgate)

[Analysis Function]

gmMax=max(gm)

Von=@L1X (X intercept of Line1)

Vth=Von-Vd/2

Vth is given by the following formula.

$$V_{th} = V_g(gm_{Max}) - I_d(gm_{Max}) / gm_{Max}$$

Vd/2 is for compensation of the secondary term of Vd in the theoretical formula.

7 Nano Tech

[Auto Analysis]

Line1: Tangent line for Y1 at gm=gmMax

[X-Y Plot]

X axis: Back Gate voltage Vbackgate (LINEAR)

Y1 axis: Drain current Idrain (LINEAR)

Y2 axis: Transconductance gm (LINEAR)

Y3 axis: Drain current Idrain (LOG)

[List Display]

8.1 *BVdss*[3] PwrDevice: Breakdown voltage between source and drain (A.01.20)

[Supported Analyzer]
B1500A

[Description]
Measures the breakdown voltage between source and drain of a power MOSFET. Forces drain sweep voltage in the direction of FET on, and monitors breakdown.

[Device Under Test]
Power MOSFET, 3 terminals

[Device Parameters]
Polarity: Nch (SMUs force the specified value) or Pch (SMUs force the negative specified value).
Lg: Gate length
Wg: Gate width
Temp: Temperature

[Test Parameters]
IntegTime: Integration time
Is@BVdss: Source current deemed to be a breakdown
Drain: SMU connected to Drain, primary sweep voltage output
VdStart: Sweep start voltage for Drain
VdStop: Sweep stop voltage for Drain
VdStep: Sweep step voltage for Drain
Gate: SMU connected to Gate, constant voltage output
Vg: Gate voltage
Source: SMU connected to Source, constant voltage output
BaseOffsetV: Base offset voltage

Base offset voltage is added to the specified voltage. For example, the gate start voltage will be $V_{gStart} + \text{BaseOffsetV}$.

[Extended Test Parameters]
Vs: Source voltage
HoldTime: Hold time
DelayTime: Delay time
DrainMinRng: Minimum range for drain current measurement
GateMinRng: Minimum range for gate current measurement
IgLimit: Gate current compliance

[Measurement Parameters]
Drain current Idrain
Source current Isource

For the Source terminal, the SMU current compliance is set to $I_{s@BVdss} * 1.1$.

[User Function]
 $I_{sourcePerWg} = I_{source} / Wg$: Source current per unit gate width
 $I_{drainPerWg} = I_{drain} / Wg$: Drain current per unit gate width

Drain current Idrain

[User Function]

$I_{drainPerWg} = I_{drain} / Wg$: Drain current per unit gate width

$gm = \text{diff}(I_{drain}, V_{gate})$: gm: Transconductance

$gmPerWg = \text{diff}(I_{drainPerWg}, V_{gate})$: Transconductance per unit gate width

[X-Y Plot]

X axis: Gate voltage V_{gate} (LINEAR)

Y1 axis: Drain current I_{drain} (LINEAR)

Y2 axis: Drain current I_{drain} (LOG)

8 Power Device

[List Display]

Gate voltage V_{gate}

Source voltage V_{source}

Drain voltage V_{drain}

Drain current I_{drain}

Transconductance g_m

Drain current per unit gate width $I_{drainPerWg}$

Transconductance per unit gate width g_{mPerWg}

8.7 *Vth Const Id[3] PwrDevice: Constant current Vth (A.01.20)*

[Supported Analyzer]

B1500A

[Description]

Measures the drain current vs gate voltage characteristics, and extracts the threshold voltage (Vth) by using the constant current method.

[Device Under Test]

Power MOSFET, 3 terminals

[Device Parameters]

Polarity: Nch (SMUs force the specified value) or Pch (SMUs force the negative specified value).

Lg: Gate length

Wg: Gate width

Temp: Temperature

IdMax: Drain current compliance

[Test Parameters]

IntegTime: Integration time

Id@Vth: Drain current to decide the Vth

Gate: SMU connected to Gate terminal, primary sweep voltage output

VgStart: Sweep start voltage for Gate terminal

VgStop: Sweep stop voltage for Gate terminal

VgStep: Sweep step voltage for Gate terminal

Drain: SMU connected to Drain terminal, constant voltage output

Vd: Drain voltage

Source: SMU connected to Source terminal, constant voltage output

BaseOffsetV: Base offset voltage

Base offset voltage is added to the specified voltage. For example, the gate start voltage will be VgStart+BaseOffsetV.

[Extended Test Parameters]

Vs: Source voltage

IgLimit: Gate current compliance

HoldTime: Hold time

DelayTime: Delay time

DrainMinRng: Minimum range for drain current measurement

[Measurement Parameters]

Drain current Idrain

[User Function]

gm=diff(Idrain,Vgate)

[Analysis Function]

Vth=@L1X (X intercept of Line1)

[Auto Analysis]

Line1: Vertical line for Y1 at Idrain=Id@Vth

[X-Y Plot]

8 Power Device

X axis: Gate voltage V_{gate} (LINEAR)
Y1 axis: Drain current I_{drain} (LINEAR)
Y2 axis: Drain current I_{drain} (LOG)

[List Display]

Gate voltage V_{gate}
Drain current I_{drain}
Source voltage V_{source}
Drain voltage V_{drain}
Transconductance g_m

[Parameters Display Area]

Threshold voltage V_{th}

8.8 *Vth gmMax[3] PwrDevice: Linear region Vth (A.01.20)*

[Supported Analyzer]

B1500A

[Description]

Extracts the threshold voltage (V_{th}) by using the extrapolation method for the linear region of the drain current vs gate voltage characteristics.

[Device Under Test]

Power MOSFET, 3 terminals

[Device Parameters]

Polarity: Nch (SMUs force the specified value) or Pch (SMUs force the negative specified value).

Lg: Gate length

Wg: Gate width

Temp: Temperature

IdMax: Drain current compliance

[Test Parameters]

IntegTime: Integration time

Gate: SMU connected to Gate terminal, primary sweep voltage output

VgStart: Sweep start voltage for Gate terminal

VgStop: Sweep stop voltage for Gate terminal

VgStep: Sweep step voltage for Gate terminal

Drain: SMU connected to Drain terminal, constant voltage output

Vd: Drain voltage, ideally at around 100mV

Source: SMU connected to Source terminal, constant voltage output

BaseOffsetV: Base offset voltage

Base offset voltage is added to the specified voltage. For example, the gate start voltage will be $V_{gStart} + \text{BaseOffsetV}$.

[Extended Test Parameters]

Vs: Source voltage

IgLimit: Gate current compliance

HoldTime: Hold time

DelayTime: Delay time

gm_Min: Minimum gm value for graph scale

gm_Max: Maximum gm value for graph scale

DrainMinRng: Minimum range for drain current measurement

[Measurement Parameters]

Drain current Idrain

[User Function]

$gm = \text{diff}(\text{Idrain}, V_{gate})$

[Analysis Function]

$gmMax = \max(gm)$

$V_{on} = @L1X$ (X intercept of Line1)

$V_{th} = V_{on} - V_d/2$

V_{th} is given by the following formula.

8 Power Device

$$V_{th} = V_g(gm_{Max}) - I_d(gm_{Max})/gm_{Max}$$

$V_d/2$ is for compensation of the secondary term of V_d in the theoretical formula.

[Auto Analysis]

Line1: Tangent line for Y1 at $gm=gm_{Max}$

[X-Y Plot]

X axis: Gate voltage V_{gate} (LINEAR)

Y1 axis: Drain current I_{drain} (LINEAR)

Y2 axis: Transconductance gm (LINEAR)

Y3 axis: Drain current I_{drain} (LOG)

9.1 *BJT EB RevStress 3 devices: Emitter-Base junction Reverse bias Stress test, 4 terminals, 3 devices (A.01.20)*

[Supported Analyzer]

B1500A

[Description]

Performs the bipolar transistor Emitter-Base junction reverse bias stress test, and plots the accumulated stress time vs collector current/base current/current amplification factor characteristics. Maximum three devices can be measured by a test execution. This test is performed as follows.

1. performs initial characterization
2. applies stress voltage
3. performs interim characterization
4. saves measurement data
5. repeats 2 to 4 until TotalStressTime elapses

[Device Under Test]

Bipolar transistor, 4 terminals, 3 devices

[Required Accessories]

Agilent B2200A or B2201A switching matrix 1 unit
 GPIB cable

Connect B2200A/B2201A to B1500A with a measuring cable and GPIB cable.

Set information on B1500A SMU channel's connection to the B2200A/B2201A input port properly on the Switching Matrix tab screen of the Configuration window.

Set the output channel number of B2200A/B2201A connected to each terminal of a device under test properly in the Tr#Base/Tr#Collector/Tr#Emitter/Tr#Subs field (# is an integer from 1 to 3) of Test Parameters area.

[Device Parameters]

Polarity: NPN (SMUs force the specified value) or PNP (SMUs force the negative specified value)

Le: Emitter length

We: Emitter width

Temp: Temperature (deg C)

IcMax: Maximum collector current value

[Test Parameters]

IntegTime: Integration time (SHORT, MEDIUM, LONG)

Tr#Base: SWM Pin Assign setting for Base of devices

Tr#Collector: SWM Pin Assign setting for Collector of devices

Tr#Emitter: SWM Pin Assign setting for Emitter of devices

Tr#Subs: SWM Pin Assign setting for Subs of devices

where, # is an integer from 1 to 3.

[Test Parameters for Sampling_Stress]

TotalStrsTime: Total stress time

Tr#StrsEmitter: SMU connected to Emitter terminal of devices, constant voltage output

StrsBase: SMU connected to Base terminal, constant voltage output

StrsCollector: SMU connected to Collector terminal, constant voltage output

StrsSubs: SMU connected to Substrate terminal, constant voltage output

Tr#VeStrs: Stress voltage for Emitter terminal of devices

where, # is an integer from 1 to 3.

9.5 *BJT EB RevStress[3]: Emitter-Base junction Reverse bias Stress test, 3 terminals (A.01.20)*

[Supported Analyzer]
B1500A

[Description]

Performs the bipolar transistor Emitter-Base junction reverse bias stress test, and plots the accumulated stress time vs collector current/base current/current amplification factor characteristics.

This test is performed as follows.

1. performs initial characterization
2. applies stress voltage
3. performs interim characterization
4. saves measurement data
5. repeats 2 to 4 until TotalStressTime elapses

[Device Under Test]

Bipolar transistor, 3 terminals

[Device Parameters]

Polarity: NPN (SMUs force the specified value) or PNP (SMUs force the negative specified value)

Le: Emitter length

We: Emitter width

Temp: Temperature (deg C)

IcMax: Maximum collector current value

[Test Parameters]

IntegTime: Integration time (SHORT, MEDIUM, LONG)

TotalStressTime: Total stress time

Collector: SMU connected to Collector terminal, constant voltage output

Base: SMU connected to Base terminal, constant voltage output

Emitter: SMU connected to Emitter terminal, primary sweep voltage output

[Test Parameters for Sampling_Stress]

VeStress: Stress voltage for Emitter terminal

[Test Parameters for IvSweep_hfe]

Ic@hfe: Collector current determining the hfe

VbStart: Sweep start voltage for Base terminal

VbStop: Sweep stop voltage for Base terminal

VbStep: Sweep step voltage for Base terminal

Vc: Collector voltage

[Extended Test Parameters]

[Extended Test Parameters for Sampling_Stress]

IeStressLimit: Emitter current compliance

VbStress: Stress voltage for Base terminal

VcStress: Stress voltage for Collector terminal

[Extended Test Parameters for IvSweep_hfe]

HoldTime: Hold time

DelayTime: Delay time

BaseMinRng: Minimum range for base current measurement

CollectorMinRng: Minimum range for collector current measurement
 Ve: Emitter voltage
 hfe_Min: Minimum hfe value for graph scale
 hfe_Max: Maximum hfe value for graph scale

[User Function]

[User Function for Sampling_Stress]
 Maximum elapsed time value MaxTime=max(Time)
 Stress time StressTime=AccTime+Time

[User Function for IvSweep_hfe]
 $hfe = I_{collector} / I_{base}$

[Analysis Function]

[Analysis Function for IvSweep_hfe]
 $I_b @ I_c = @L1X$ (X intercept of Line1)
 $hfe @ I_c = @L2Y3$ (X intercept of Line2)

[Auto Analysis]

[Auto Analysis for IvSweep_hfe]
 Line1: Horizontal line for Y1 at $I_{collector} = I_c @ hfe$
 Line2: Horizontal line for Y3 at $I_{collector} = I_c @ hfe$

[Test Output: X-Y Graph]

X axis: Accumulated stress time TimeList (LOG)
 Y1 axis: Collector current IcList (LOG)
 Y2 axis: Y1 accumulation data at $I_{collector} = I_c @ hfe$ $I_b @ IcList$ (LOG)
 Y3 axis: Y3 accumulation data at $I_{collector} = I_c @ hfe$ $I_{hfe} @ IcList$ (LINEAR)

9.7 BTI 3 devices: Bias Temperature Instability test, 4 terminals, 3 devices (A.01.20)

[Supported Analyzer]

B1500A

[Description]

Performs the bias temperature instability test, and plots the accumulated stress time vs threshold voltage/drain current characteristics. Maximum three devices can be measured by a test execution. This test is performed as follows.

1. performs initial characterization
2. applies stress voltage
3. performs interim characterization
4. saves measurement data
5. repeats 2 to 4 until TotalStressTime elapses

[Device Under Test]

MOSFET, 4 terminals, 3 devices

[Required Accessories]

Agilent B2200A or B2201A switching matrix 1 unit

GPIB cable

Connect B2200A/B2201A to B1500A with a measuring cable and GPIB cable.

Set information on B1500A SMU channel's connection to the B2200A/B2201A input port properly on the Switching Matrix tab screen of the Configuration window.

Set the output channel number of B2200A/B2201A connected to each terminal of a device under test properly in the Tr#Gate/Tr#Drain/Tr#Source/Tr#Subs field (# is an integer from 1 to 3) of Test Parameters area.

[Device Parameters]

Polarity: Nch (SMUs force the specified value) or Pch (SMUs force the negative specified value)

Lg: Gate length

Wg: Gate width

Temp: Temperature (deg C)

[Test Parameters]

IntegTime: Integration time (SHORT, MEDIUM, LONG)

Tr#Gate: SWM Pin Assign settings for Gate terminal of devices

Tr#Drain: SWM Pin Assign settings for Drain terminal of devices

Tr#Source: SWM Pin Assign settings for Source terminal of devices

Tr#Subs: SWM Pin Assign settings for Substrate terminal of devices

where, # is an integer from 1 to 3.

[Test Parameters for Sampling_Stress]

TotalStrsTime: Total stress time

Tr#StrsGate: SMU connected to Gate terminal of devices, constant voltage output

StrsSource: SMU connected to Gate terminal of devices, constant voltage output (drain/subs short)

Tr#VgStrs: Gate terminal stress voltage for the devices

VsStrs: Source terminal stress voltage

where, # is an integer from 1 to 3.

9 Reliability

[Test Parameters for IvSweep_ConstId]

MeasGate: SMU connected to the basic characteristics acquisition Gate terminal, primary sweep voltage output

MeasDrain: SMU connected to the basic characteristics acquisition Drain terminal, constant voltage output

MeasSource: SMU connected to the basic characteristics acquisition Source terminal, constant voltage output

Id@Vth: Drain current to decide the Vth, per unit area

VgStart1: Sweep start voltage for Gate terminal

VgStop1: Sweep stop voltage for Gate terminal

VgStep1: Sweep step voltage for Gate terminal

Vd1: Drain terminal voltage, constant value

[Test Parameters for IvSweep_gmmax]

MeasGate: SMU connected to the basic characteristics acquisition Gate terminal, primary sweep voltage output

MeasDrain: SMU connected to the basic characteristics acquisition Drain terminal, constant voltage output

MeasSource: SMU connected to the basic characteristics acquisition Source terminal, constant voltage output

VgStart2: Sweep start voltage for Gate terminal

VgStop2: Sweep stop voltage for Gate terminal

VgStep2: Sweep step voltage for Gate terminal

9.11 BTI[3]: Bias Temperature Instability test, 3 terminals (A.01.20)

[Supported Analyzer]

B1500A

[Description]

Performs the bias temperature instability test, and plots the accumulated stress time vs threshold voltage/drain current characteristics.

This test is performed as follows.

1. performs initial characterization
2. applies stress voltage
3. performs interim characterization
4. saves measurement data
5. repeats 2 to 4 until TotalStressTime elapses

[Device Under Test]

MOSFET, 3 terminals

[Device Parameters]

Polarity: Nch (SMUs force the specified value) or Pch (SMUs force the negative specified value)

Lg: Gate length

Wg: Gate width

Temp: Temperature (deg C)

[Test Parameters]

IntegTime: Integration time (SHORT, MEDIUM, LONG)

TotalStressTime: Total stress time

Gate: SMU connected to Gate terminal, primary sweep voltage output

Drain: SMU connected to Drain terminal, constant voltage output

Source: SMU connected to Source terminal, constant voltage output

VgStress: Gate terminal stress voltage

[Test Parameters for IvSweep_ConstId]

Id@Vth: Drain current to decide the Vth, per unit area

VgStart1: Sweep start voltage for Gate terminal

VgStop1: Sweep stop voltage for Gate terminal

VgStep1: Sweep step voltage for Gate terminal

Vd1: Drain terminal voltage, constant value

[Test Parameters for IvSweep_gmmax]

VgStart2: Sweep start voltage for Gate terminal

9.13 Charge Pumping: Evaluation of the interface state using charge pumping method (A.01.20)

[Supported Analyzer]
B1500A

[Description]

Measures the Substrate current vs Gate pulse base voltage characteristics, and extracts the interface state density (Nss). This test uses the Agilent 81110A pulse generator.

[Test Setup used in this test definition]

ForcePGC: Used to apply Gate pulse
I/V-t Sampling: Used to perform the Substrate current measurement
ResetPG: Used to reset the pulse generator

[Device Under Test]

MOSFET, 3 terminals or 4 terminals

[Device Parameters]

Polarity: Nch (SMUs force the specified value) or Pch (SMUs force the negative specified value).
Lg: Gate length
Wg: Gate width
Temp: Temperature

[Test Parameters]

IntegTime: Integration time
Source: SMU connected to Source, constant voltage output
Vs: Source voltage
IsLimit: Source current compliance
Subs: SMU connected to Substrate, constant voltage output
Vsubs: Substrate voltage
IsubsLimit: Substrate current compliance

[Extended Test Parameters]

SubsMinRng: Minimum range for the substrate current measurement

[Test Parameters for Gate Pulse]

PulseLevel: Pulse output level
VbaseStart: Sweep start value of Gate pulse base voltage
VbaseStop: Sweep stop value of Gate pulse base voltage
VbaseStep: Sweep step value of Gate pulse base voltage
PulsePeriod: Pulse period
PulseDelay: Pulse delay
DutyCycle: Duty cycle
LeadingTime: Leading transition time
TrailingTime: Trailing transition time
PgAdd: GPIB address of Agilent 81110A

[Test Output: X-Y Graph]

X axis: Gate pulse base voltage VbaseList (LINEAR)
Y1 axis: Substrate current IcpList (LOG)

[Test Output: Parameters]

Interface state density Nss

[Nss calculation]

$Nss = IcpMax / q * PulsePeriod / Lg / Wg$

9 Reliability

9.14 Charge Pumping2: Evaluation of the interface state using charge pumping method (A.03.10)

[Supported Analyzer]

B1500A

[Description]

Measures the Substrate current vs Gate pulse base voltage characteristics, and extracts the interface state density (Nss).

[Required Modules and Accessories]

Agilent B1525A SPGU 1 unit

[Device Under Test]

MOSFET, 3 terminals or 4 terminals

[Device Parameters]

Polarity: Nch (SMUs force the specified value) or Pch (SMUs force the negative specified value).

Lg: Gate length

Wg: Gate width

Temp: Temperature

[Test Parameters]

Source: SMU connected to Source, constant voltage output

Subs: SMU connected to Substrate, constant voltage output

Gate: SPGU connected to Gate, pulse voltage output

PulsePeriod: Pulse period

PulseDelay: Pulse delay

DutyCycle: Duty cycle

PulseLevel: Pulse output level

LeadingTime: Leading transition time

TrailingTime: Trailing transition time

VbaseStart: Sweep start value of Gate pulse base voltage

VbaseStop: Sweep stop value of Gate pulse base voltage

VbaseStep: Sweep step value of Gate pulse base voltage

Vs: Source voltage

IsubsLimit: Substrate current compliance

$Nss = IcpMax / q * PulsePeriod / Lg / Wg$

9 Reliability

9.15 EM Istress: Electromigration test, current stressed, 4 SMUs (A.01.20)

[Supported Analyzer]

B1500A

[Description]

Performs the Electromigration (EM) test, and plots the stress time vs resistance characteristics. This test is performed by the sampling measurement mode.

[Device Under Test]

Wiring (resistor), 4 terminals

[Device Parameters]

L: Length of pattern

W: Width of pattern

Temp: Temperature

[Test Parameters]

Port1: SMU for Port1 stress force

Port2: SMU for Port2 stress force

VM1: SMU for Port1 voltage monitor

VM2: SMU for Port2 voltage monitor

TotalStressTime: Total stress time.

StopCondition: Measurement stop condition (%changes of wire resistance)

I1Stress: Port1 stress current

IntegTime: Integration time

[Extended Test Parameters]

V2: Port2 terminal voltage

V1Limit: Port1 voltage compliance

I2Limit: Port2 current compliance

HoldTime: Hold time

[User Function]

I_{Port1PerArea} (A/cm²) Port1 terminal current per unit area

I_{Port2PerArea} (A/cm²) Port2 terminal current per unit area

 Time to failure given by monitoring extrusion lines E_FailureTime

9 Reliability

9.21 EM Vstress: Electromigration test, voltage stressed, 4 SMUs (A.01.20)

[Supported Analyzer]

B1500A

[Description]

Performs the Electromigration (EM) test, and plots the stress time vs resistance characteristics. This test is performed by the sampling measurement mode.

[Device Under Test]

Wiring (resistor), 4 terminals

[Device Parameters]

L: Length of pattern

W: Width of pattern

Temp: Temperature

[Test Parameters]

Port1: SMU for Port1 stress force

Port2: SMU for Port2 stress force

VM1: SMU for Port1 voltage monitor

VM2: SMU for Port2 voltage monitor

TotalStressTime: Total stress time.

StopCondition: Measurement stop condition (%changes of wire resistance)

V1Stress: Port1 stress voltage

NoOfSamples: Number of samples

IntegTime: Integration time

[Extended Test Parameters]

V2: Port2 terminal voltage

I1Limit: Port1 current compliance

HoldTime: Hold time

Port1MinRng: Minimum range for the port1 current measurement

[User Function]

I_{Port1PerArea} (A/cm²) Port1 terminal current per unit area

I_{Port2PerArea} (A/cm²) Port2 terminal current per unit area

R (ohm) Resistance of wiring

DeltaR (%) Difference from initial resistance

[X-Y Plot]

X axis: Stress time TimeList (LOG)

Y1 axis: Port1 terminal current I_{port1List} (LOG)

Y2 axis: Resistance RList (LINEAR)

Y3 axis: Difference from initial resistance DeltaRList (LINEAR)

9.22 EM Vstress2: Electromigration test, voltage stressed, 4 SMUs (A.03.10)

[Supported Analyzer]

B1500A

[Description]

Performs the Electromigration (EM) test, and plots the stress time vs resistance characteristics. This test is performed by the sampling measurement mode.

[Device Under Test]

Wiring (resistor), 4 terminals

[Device Parameters]

L: Length of pattern

W: Width of pattern

Temp: Temperature

[Test Parameters]

9.23 EM Vstress[2]: Electromigration test, voltage stressed, 2 SMUs (A.01.20)

[Supported Analyzer]

B1500A

[Description]

Performs the Electromigration (EM) test, and plots the stress time vs resistance characteristics. This test is performed by the sampling measurement mode as shown below.

1. applies stress voltage
2. performs measurement and saves measurement data
3. calculates the device failure time

[Device Under Test]

Wiring device, 2 terminals

[Device Parameters]

D: Wiring pattern length

W: Wiring pattern width

Temp: Temperature (deg C)

[Test Parameters]

IntegTime: Integration time

TotalStressTime: Total stress time

StopCondition: Measurement stop condition (%changes of wire resistance)

Port1: SMU connected to Port1, constant voltage output

Port2: SMU connected to Port2, constant voltage output

V1Stress: Port1 stress voltage

[Extended Test Parameters]

V2: Port2 voltage

I1Limit: Port1 current compliance

HoldTime: Hold time

Port1MinRng: Minimum range for Port1 current measurement

[User Function]

Wiring resistance value $R = V_{port1} / I_{port1}$

[Test Output: X-Y Graph]

X axis: Accumulated stress time TimeList

Y1 axis: Port1 current Iport1List

Y2 axis: Wiring resistance value RList

9 Reliability

9.25 EM Vstress[6]: Electromigration test, voltage stressed, 6 SMUs (A.01.20)

[Supported Analyzer]

B1500A

[Description]

Performs the Electromigration (EM) test for a wiring device with extrusion lines, and plots the stress time vs resistance characteristics. This test is performed by the sampling measurement mode as shown below.

1. applies stress voltage
2. performs measurement and saves measurement data
3. calculates the device failure time

[Device Under Test]

Wiring device with extrusion lines, 6 terminals

[Device Parameters]

D: Wiring pattern length
W: Wiring pattern width
Temp: Temperature (deg C)

[Test Parameters]

IntegTime: Integration time
TotalStressTime: Total stress time
StopCondition: Measurement stop condition 1 (%changes of wire resistance)
ExtCondition: Measurement stop condition 2 (current to extrusion line)
Port1: SMU connected to Port1, constant voltage output
Port2: SMU connected to Port2, constant voltage output
Port3: SMU connected to Extrusion Line, constant voltage output
Port4: SMU connected to Extrusion Line, constant voltage output
VM1: SMU for Port1 voltage monitoring, constant voltage output
VM2: SMU for Port2 voltage monitoring, constant voltage output
V1Stress: Port1 stress voltage

[Extended Test Parameters]

V2: Port2 voltage
V3: Port3 voltage
V4: Port4 voltage
IM1: VM1 output current
IM2: VM2 output current
I1Limit: Port1 current compliance
I3Limit: Port3 current compliance
I4Limit: Port4 current compliance
HoldTime: Hold time
DelayTime: Delay time
Port1MinRng: Minimum range for Port1 current measurement

[User Function]

Potential difference between lines $\Delta V = VM1 - VM2$
Wiring resistance value $R = \Delta V / I_{port1}$

[Test Output: X-Y Graph]

X axis: Accumulated stress time TimeList
Y1 axis: Wiring resistance value RList
Y2 axis: Port1 current Iport1List

Y3 axis: Port3 current Iport3List
Y4 axis: Port4 current Iport4List

 Time to failure given by monitoring extrusion lines E_FailureTime

9 Reliability

9.27 HCI 3 devices: Hot Carrier Injection test, 4 terminals, 3 devices (A.01.20)

[Supported Analyzer]

B1500A

[Description]

Performs the hot carrier injection test, and plots the accumulated stress time vs threshold voltage/drain current characteristics. Maximum three devices can be measured by a test execution. This test is performed as follows.

1. performs initial characterization
2. applies stress voltage
3. performs interim characterization
4. saves measurement data
5. repeats 2 to 4 until TotalStressTime elapses

[Device Under Test]

MOSFET, 4 terminals, 3 devices

[Required Accessories]

Agilent B2200A or B2201A switching matrix 1 unit
GPIB cable

Connect B2200A/B2201A to B1500A with a measuring cable and GPIB cable.

Set information on B1500A SMU channel's connection to the B2200A/B2201A input port properly on the Switching Matrix tab screen of the Configuration window.

Set the output channel number of B2200A/B2201A connected to each terminal of a device under test properly in the Tr#Gate/Tr#Drain/Tr#Source/Tr#Subs field (# is an integer from 1 to 3) of Test Parameters area.

[Device Parameters]

Polarity: Nch (SMUs force the specified value) or Pch (SMUs force the negative specified value)

Lg: Gate length

Wg: Gate width

Temp: Temperature (deg C)

[Test Parameters]

IntegTime: Integration time (SHORT, MEDIUM, LONG)

Tr#Gate: SWM Pin Assign settings for Gate terminal of devices

Tr#Drain: SWM Pin Assign settings for Drain terminal of devices

Tr#Source: SWM Pin Assign settings for Source terminal of devices

Tr#Subs: SWM Pin Assign settings for Substrate terminal of devices

where, # is an integer from 1 to 3.

[Test Parameters for Sampling_Stress]

TotalStrsTime: Total stress time

Tr#StrsGate: SMU connected to Gate terminal of devices, constant voltage output

Tr#StrsDrain: SMU connected to Drain terminal of devices, constant voltage output

StrsSource: SMU connected to Source terminal of devices, constant voltage output

StrsSubs: SMU connected to Substrate terminal of devices, constant voltage output

Tr#VgStrs: Gate terminal stress voltage for the devices

Tr#VdStrs: Drain terminal stress voltage for the devices

VsubsStrs: Substrate terminal stress voltage for the devices

VsStrs: Source terminal stress voltage for the devices

where, # is an integer from 1 to 3.

[Test Parameters for IvSweep_ConstId]

MeasGate: SMU connected to the basic characteristics acquisition Gate terminal, primary sweep voltage output

MeasDrain: SMU connected to the basic characteristics acquisition Drain terminal, constant voltage output

MeasSource: SMU connected to the basic characteristics acquisition Source terminal, constant voltage output

MeasSubs: SMU connected to the basic characteristics acquisition Substrate terminal, constant voltage output

Id@Vth: Drain current to decide the Vth, per unit area

VgStart1: Sweep start voltage for Gate terminal

VgStop1: Sweep stop voltage for Gate terminal

VgStep1: Sweep step voltage for Gate terminal

Vd1: Drain terminal voltage

[Test Parameters for IvSweep_gmmax]

MeasGate: SMU connected to the basic characteristics acquisition Gate terminal, primary sweep voltage output

MeasDrain: SMU connected to the basic characteristics acquisition Drain terminal, constant voltage output

MeasSource: SMU connected to the basic characteristics acquisition Source terminal, constant voltage output

MeasSubs: SMU connected to the basic characteristics acquisition Substrate terminal, constant voltage output

VgStart2: Sweep start voltage for Gate terminal

VgStop2: Sweep stop voltage for Gate terminal

VgStep2: Sweep step voltage for Gate terminal

Vd2: Drain voltage

[Test Parameters for Sampling_Ids]

MeasGate: SMU connected to the basic characteristics acquisition Gate terminal, primary sweep voltage output

MeasDrain: SMU connected to the basic characteristics acquisition Drain terminal, constant voltage output

MeasSource: SMU connected to the basic characteristics acquisition Source terminal, constant voltage output

MeasSubs: SMU connected to the basic characteristics acquisition Substrate terminal, constant voltage output

Vg3: Gate terminal voltage

Vd3: Drain terminal voltage

[Extended Test Parameters]

[Extended Test Parameters for IvSweep_ConstId]

HoldTime: Hold time

DelayTime: Delay time

Vsubs: Substrate terminal voltage

Vs: Source terminal voltage

IgLimit: Gate current compliance of devices

IdLimit: Drain current compliance of devices

Drain current Idrain

[Measurement Parameters by IvSweep_Ids]

Drain current Idrain

[User Function]

[User Function for IvSweep_ConstId]

Maximum drain current value IdMax= $\max(\text{abs}(\text{Idrain}))$ (For initial measurement only)

[User Function for IvSweep_gmmax]
 Maximum drain current value $IdMax = \max(\text{abs}(Idrain))$ (For initial measurement only)
 Transconductance $gm = \text{diff}(Idrain, Vgate)$
 Maximum transconductance value $gmMax = \max(gm)$

[Analysis Function]
 [Analysis Function for IvSweep_ConstId]
 $Vth@Id = @L1X$ (X intercept of Line1)

[Analysis Function for IvSweep_gmmax]
 $Vth@Gm = @L1X$ (X intercept of Line1)

[Auto Analysis]
 [Auto Analysis for IvSweep_ConstId]
 Line1: Vertical line for Y1 at $Idrain = Id@Vth$

[Auto Analysis for IvSweep_gmmax]
 Line1: Tangent line for Y1 at $gm = gmMax$

9.30 J-Ramp: Insulator lifetime evaluation, current stressed (A.01.20)

[Supported Analyzer]

B1500A

[Description]

Measures the time vs current/voltage characteristics with current stress, and extracts the lifetime of the gate oxide, insulator and so on.

[Device Under Test]

MOS capacitor, oxide layer, insulator and so on

[Device Parameters]

Polarity: Nch (SMUs force the specified value) or Pch (SMUs force the negative specified value).

Lg: Gate length

Wg: Gate width

Temp: Temperature

[Test Parameters]

IntegTime: Integration time

TimeMax: Maximum value of X axis

Gate: SMU connected to Gate, primary sweep, current output

IgStart: Sweep start current

IgStop: Sweep stop current

VgLimit: Gate voltage compliance

Subs: SMU connected to Substrate, constant voltage output

[Extended Test Parameters]

Vsubs: Substrate voltage

HoldTime: Hold time

DelayTime: Delay time

SubsMinRng: Minimum range for the substrate current measurement

[User Function]

 $I_{gatePerArea} = I_{gate} / L_g / W_g$ $I_{subsPerArea} = I_{subs} / L_g / W_g$ $Q_{bdi} = \text{integ}(I_{gate}, \text{Time}) / L_g / W_g$

[Test Output: X-Y Graph]

9.31 TDDB Istress 3devices: TDDB Test, current stressed, 3 devices (A.01.20)

[Supported Analyzer]

B1500A

[Description]

Performs the TDDB (time dependent dielectric breakdown) test, and plots the stress time vs voltage characteristics. This test is performed by the sampling measurement mode. This test also supports 3-device connection.

[Device Under Test]

MOS capacitor, insulator, oxide layer, and so on

[Device Parameters]

Polarity: Nch (SMUs force the specified value) or Pch (SMUs force the negative specified value).

L: Length of pattern

W: Width of pattern

Temp: Temperature

[Test Parameters]

Port1: SMU connected to Port1 terminal

Port2: SMU connected to Port2 terminal

Port3: SMU connected to Port3 terminal

Port4: SMU connected to Port4 terminal

TotalStressTime: Total stress time.

StopCondition: Terminal voltage to decide the breakdown

I1Stress: Port1 stress current

I2Stress: Port2 stress current

I3Stress: Port3 stress current

NoOfSamples: Number of samples

IntegTime: Integration time

[Extended Test Parameters]

V4: Port4 terminal voltage

V1Limit: Port1/Port2/Port3 voltage compliance

I4Limit: Port4 current compliance

9.39 Timing On-the-fly NBTI (A.03.11)

[Supported Analyzer]

B1500A

[Description]

This test examines the MOSFET Negative Bias Temperature Instability test. The output is a plot of the drain current versus cumulative stress time. The time sampling characteristics of drain current is plotted between the stress cycles. Test is performed as follows.

1. Measures drain current (measures using Sampling_Ids classic test and the results are stored in IdsList.)
2. The stress is applied based on the Stress_Time_List parameter table. The stress time can be adjusted with roughly 100 ms accuracy by properly adjusting the Stress_T_adj parameter.
3. Measurements of the Id in the step 1 are repeated.
4. Perform measurements by repeating step2 and step3 till the cumulative stress time exceeds the TotalStressTime. TotalStressTime can be set from 10 sec to 10,000 sec

[Device Under test]

MOSFET, 4 terminals

[Device Parameters]

Polarity: Nch or Pch

Temp: Temperature

[Test Parameters]

Sampling measurements: Perform Id sampling measurements after applying negative bias stress.

Sampling Time Parameters: Set sampling time parameters for Id characterization.

- SamplingInterval: Set sampling time interval for Id characterizes.
- SamplingNumber: Set sampling number for sampling measurements.
- NegativeHoldTime: Set sampling time under the negative bias stress before starting the id sampling characterization.
- Id sampling characterization is made by the parameters Vg, Vd, Vsubs, and Vs.

Negative Bias Stress: Apply a specified stress for NBTI degradation test.

- TotalStressTime: Specify the maximum negative bias stress time
- Stress condition is defined by the parameters VgStress, VdStress, VsubStress, and VsStress.

[Extended Test Parameters]

IgLimit : Set Current compliance of Gate SMU.

IdLimit: Set Current compliance of Drain SMU.

IsubLimit: Set Current compliance of Bulk SMU.

NBTI_PlotTime: Sampling time of the data used for NBTI degradation plot.

RecordSamplingData: On saves the Id sampling data and OFF does not save the data.

YaxStress: Set Y axis maximum of the graph display under the stress condition.

YaxIdMin: Set Y axis maximum under the Id sampling measurements.

YaxStressMin: Set Y axis minimum of the graph display under the stress condition.

HSADC_AvN : Set averaging of HSADC. Additional sampling is performed with 45 us interval, and averaged data is returned.

[Device_ID_Override]

DEVICE ID display in the Results area is made as “new_device_id @ measurement time” if this parameter is set to Y.

9 Reliability

[Sampling Timing adjustment]

SamplingDelay: Adjust this parameter so as the start timing of the sampling measurement observed in the oscilloscope becomes the same as the sampling start display (is Stress_time_at_ in the Parameter display).

Note: Recommend to use the default 50 ms.

Stress_T_adj: Time (negative) for adjusting the stress time accuracy which depends on the measurement setup or a PC speed used for Desktop EasyEXPERT.

Note: Stress_T_adj parameter is adjusted so as the Stree_time_at_ display in the Sampling_Ids graph becomes closer to the end value of the previous stress time. Default value is tuned for the use on the B1500A EasyEXPERT and the RecordSamplingData=ON condition.

[Test Output: X-Y plot]

X axis: Cumulative stress time or sampling time

Y-axis: Id

9.40 TZDB: TZDB Test of oxide layer (A.01.20)

[Supported Analyzer]

B1500A

[Description]

Performs the TZDB (time zero dielectric breakdown) test, and plots the current vs voltage characteristics.

[Device Under Test]

MOS capacitor, oxide layer, and so on

[Device Parameters]

Polarity: Nch (SMUs force the specified value) or Pch (SMUs force the negative specified value).

Lg: Gate length

Wg: Gate width

Temp: Temperature

[Test Parameters]

IntegTime: Integration time

Gate: SMU connected to Gate, primary sweep, voltage output

VgStart: Sweep start voltage

VgStop: Sweep stop voltage

VgStep: Sweep step voltage

IgLimit: Gate current compliance

Subs: SMU connected to Substrate, constant voltage output

[Extended Test Parameters]

Vsubs: Substrate voltage

HoldTime: Hold time

DelayTime: Delay time

GateMinRng: Minimum range for the gate current measurement

SubsMinRng: Minimum range for the substrate current measurement

[User Function]

 $I_{gatePerArea} = I_{gate} / L / W$ $I_{subsPerArea} = I_{subs} / L / W$

[X-Y Plot]

X axis: Gate voltage V_{gate} (LINEAR)Y1 axis: Gate current I_{gate} (LOG)Y2 axis: Gate current per unit area $I_{gatePerArea}$ (LOG)

10.1 BVgb ThinOx: MOS capacitor Ig-Vg characteristics (A.01.20)

[Supported Analyzer]

B1500A, 4155B, 4155C, 4156B, 4156C

[Description]

Extracts the gate current vs gate voltage (Ig-Vg) characteristics of MOS capacitor which has an ultra thin gate insulator. The primary sweep channel applies the quasi-pulsed voltage to Gate terminal, and measures Gate current at both pulse base and peak. The measurements are repeated $\text{ABS}(\text{VgStop}-\text{VgStart})/\text{VgStep}$ times to extract the Ig-Vg characteristics. The pulse base value is the primary sweep start value and can be set by the VgLow parameter. The pulse peak value is the primary sweep stop value and corresponds to Vg.

[Device Under Test]

MOS capacitor

[Device Parameters]

Polarity: Nch (SMUs force the specified value) or Pch (SMUs force the negative specified value).

Lg: Gate length

Wg: Gate width

Temp: Temperature

[Test Parameters]

IntegTime: Integration time

Gate: SMU connected to Gate, primary sweep voltage output

VgStart: Pulse peak start value

VgStop: Pulse peak stop value

VgStep: Pulse peak step value

VgLow: Pulse base value, primary sweep start value

IgLimit: Gate current compliance

Subs: SMU connected to Substrate, constant voltage output

Vsubs: Substrate voltage

VgStart, VgStop, VgStep values are used to calculate the primary sweep stop value.

[Extended Test Parameters]

HoldTime: Hold time

DelayTime: Delay time

GateMinRng: Minimum range for the gate current measurement

SubsMinRng: Minimum range for the substrate current measurement

[Measurement Parameters]

Gate current Igate

Substrate current Isubs

[User Function]

Gate current per Gate unit area $I_{\text{gatePerArea}} = I_{\text{gate}}/L_{\text{g}}/W_{\text{g}}$

Substrate current per Gate unit area $I_{\text{subsPerArea}} = I_{\text{subs}}/L_{\text{g}}/W_{\text{g}}$

[Calculation After Measurement]

Buffer=getVectorData("Vgate")

V_gate=storeAt(Vgate,I,1,at(Buffer,2,1))

Buffer=getVectorData("Igate")

I_gate=storeAt(Igate,I,1,at(Buffer,2,1))

I_gate@LowVg=storeAt(Igate,I,1,at(Buffer,1,1))

10 Structure

```
Val=at(Buffer,1,1)
Val=Val/Lg/Wg*1E-12
I_gate@LowVgPerArea=storeAt(I_gate@LowVgPerArea,I,1,Val)
Buffer=getVectorData("IgatePerArea")
I_gatePerArea=storeAt(I_gatePerArea,I,1,at(Buffer,1,1))
I=I+1
```

[Test Output: X-Y Graph]

```
X axis: Gate voltage V_gate (LINEAR)
Y1 axis: Gate current I_gate (LOG)
Y2 axis: Gate current at pulse base voltage I_gate@LowVg (LOG)
```

[Test Output: List Display]

```
Gate voltage V_gate
Gate current I_gate
Gate current at pulse base voltage I_gate@LowVg
Gate current per Gate unit area I_gatePerArea
I_gate@LowVg per Gate unit area I_gate@LowVgPerArea
```

10.2 BVgb: MOS capacitor Gate-Substrate breakdown voltage (A.01.20)

[Supported Analyzer]

B1500A, 4155B, 4155C, 4156B, 4156C

[Description]

Measures the gate current vs gate voltage characteristics and extracts the breakdown voltage between gate and substrate (BVgb) of MOS capacitor.

[Device Under Test]

MOS capacitor

[Device Parameters]

Polarity: Nch (SMUs force the specified value) or Pch (SMUs force the negative specified value).

Lg: Gate length

Wg: Gate width

Temp: Temperature

[Test Parameters]

IntegTime: Integration time

Ig@BVgb: Gate current to decide the breakdown

Gate: SMU connected to Gate, primary sweep voltage output

VgStart: Sweep start voltage for Gate

VgStop: Sweep stop voltage for Gate

VgStep: Sweep step voltage for Gate

Subs: SMU connected to Substrate, constant voltage output

Vsubs: Substrate voltage

[Extended Test Parameters]

HoldTime: Hold time

DelayTime: Delay time

GateMinRng: Minimum range for the gate current measurement

[Measurement Parameters]

Gate current Igate

For the all terminals, the SMU current compliance is set to $Ig@BVgb * 1.1$.

[User Function]

Gate current per Gate unit area $Igate_Area = Igate / Lg / Wg$

[Analysis Function]

$BVgb = @L1X$ (X intercept of Line1)

[X-Y Plot]

X axis: Gate voltage Vgate (LINEAR)

Y1 axis: Gate current Igate (LOG)

Y2 axis: Gate current per Gate unit area Igate_Area (LOG)

[Parameters Display Area]

Gate-Substrate breakdown voltage BVgb

[Auto Analysis]

Line1: Vertical line through Y1 data at $Igate = Ig@BVgb$

10 Structure

10.3 Cgb-Freq[2] Log: Cgb-f characteristics, 2 terminals (A.01.20)

[Supported Analyzer]

B1500A

[Description]

Measures MOS capacitor's characteristics of gate-to-substrate capacitance (Cgb, linear) vs frequency (f, log). The measurement frequency is 10 points per decade.

For a more accurate measurement, perform correction data measurement at the measurement frequency before starting the capacitance measurement.

If the measurement frequency is not included in the list of default frequencies below, click the Advanced Options... button and set the measurement frequency on the Frequency area of the Advanced Options for CMU Calibration window.

Default frequencies:

1 k, 2 k, 5 k, 10 k, 20 k, 50 k, 100 k, 200 k, 500 k, 1 M, 1.2 M, 1.5 M, 2 M, 2.5 M, 2.7 M, 3 M, 3.2 M, 3.5 M, 3.7 M, 4 M, 4.2 M, 4.5 M, 5 MHz

[Device Under Test]

MOS capacitor, 2 terminals

Connect CMU High and CMU Low to the substrate and gate respectively.

[Required Modules and Accessories]

Agilent B1520A MFCMU 1 unit

[Device Parameters]

Polarity: Nch (CMU forces the specified value) or Pch (CMU forces the negative specified value)

Lg: Gate length

Wg: Gate width

Temp: Temperature (deg C)

[Test Parameters]

IntegTime: Integration time

FreqStart: Sweep start frequency, LOG sweep

NoOfDecade: Number of decades for data collection

OscLevel: Measurement signal level

Gate: CMU connected to Gate terminal

Vgs: Voltage for Gate terminal, constant voltage

[Extended Test Parameters]

G_Min: Minimum transconductance value for graph

G_Max: Maximum transconductance value for graph

Cp_Min: Minimum capacitance value for graph

Cp_Max: Maximum capacitance value for graph

[Measurement Parameters]

Parallel capacitance Cp

Conductance G

[User Function]

10 Structure

10.4 Cgb-Vg 2Freq: MOS capacitor Cgb-Vg characteristics, 2-frequency method (A.01.11)

[Supported Analyzer]
B1500A

[Description]

Measures the Gate-Substrate capacitance (Cgb) by using two-frequency method, and plots the Cgb-Vg characteristics.

DC bias output is performed from -VgbStart to -VgbStop in -VgbStep steps.

The Cgb value is given by the following formula. Then C1 and C2 are capacitance, D1 and C2 are dissipation factor measured at the frequency (f1 and f2).

$$C_{gb} = [f1^2 * C1 * (1 + D1^2) - f2^2 * C2 * (1 + D2^2)] / [f2^2 - f1^2]$$

For a more accurate measurement, perform correction data measurement at the measurement frequency before starting the capacitance measurement.

If the measurement frequency is not included in the list of default frequencies below, click the Advanced Options... button and set the measurement frequency on the Frequency area of the Advanced Options for CMU Calibration window.

Default frequencies:

1 k, 2 k, 5 k, 10 k, 20 k, 50 k, 100 k, 200 k, 500 k, 1 M, 1.2 M, 1.5 M, 2 M, 2.5 M, 2.7 M, 3 M, 3.2 M, 3.5 M, 3.7 M, 4 M, 4.2 M, 4.5 M, 5 MHz

[Device Under Test]

MOS capacitor

Connect Gate to the CMU Low, and Substrate to the CMU High.

[Device Parameters]

Polarity: Nch (CMU forces the specified value) or Pch (CMU forces the negative specified value).

Lg: Gate length

10.10 Ig-Vg Iforce: MOS capacitor Ig-Vg characteristics, current sweep (A.01.20)

[Supported Analyzer]

B1500A, 4155B, 4155C, 4156B, 4156C

[Description]

Measures gate current vs gate voltage (Ig-Vg) characteristics of MOS capacitor gate insulator.

[Device Under Test]

MOS capacitor

[Device Parameters]

Polarity: Nch (SMUs force the specified value) or Pch (SMUs force the negative specified value).

Lg: Gate length

Wg: Gate width

Temp: Temperature

[Test Parameters]

IntegTime: Integration time

Gate: SMU connected to Gate terminal, primary sweep current output

IgStart: Sweep start current for Gate terminal

IgStop: Sweep stop current for Gate terminal

VgLimit: Gate voltage compliance

Subs: SMU connected to Substrate, constant voltage output

Vsubs: Substrate voltage

[Extended Test Parameters]

HoldTime: Hold time

DelayTime: Delay time

SubsMinRng: Minimum range for the substrate current measurement

[Measurement Parameters]

Gate voltage Vgate

Substrate current Isubs

[User Function]

IgatePerArea: Gate current per unit gate area $I_{gatePerArea} = I_{gate} / L_g / W_g$

IsubsPerArea: Substrate current per unit gate area $I_{subsPerArea} = I_{subs} / L_g / W_g$

[X-Y Plot]

X axis: Gate current Igate (LOG)

Y1 axis: Gate voltage Vgate (LINEAR)

10.11 Ig-Vg Vforce: MOS capacitor Ig-Vg characteristics, voltage sweep (A.01.20)

[Supported Analyzer]

B1500A, 4155B, 4155C, 4156B, 4156C

[Description]

Measures gate current vs gate voltage (Ig-Vg) characteristics of MOS capacitor gate insulator.

[Device Under Test]

MOS capacitor

[Device Parameters]

Polarity: Nch (SMUs force the specified value) or Pch (SMUs force the negative specified value).

Lg: Gate length

Wg: Gate width

Temp: Temperature

[Test Parameters]

IntegTime: Integration time

Gate: SMU connected to Gate terminal, primary sweep voltage output

VgStart: Sweep start voltage for Gate terminal

VgStop: Sweep stop voltage for Gate terminal

VgStep: Sweep step voltage for Gate terminal

IgLimit: Gate current compliance

Subs: SMU connected to Substrate, constant voltage output

Vsubs: Substrate voltage

[Extended Test Parameters]

HoldTime: Hold time

DelayTime: Delay time

GateMinRng: Minimum range for the gate current measurement

SubsMinRng: Minimum range for the substrate current measurement

[Measurement Parameters]

Gate current Igate

Substrate current Isubs

[User Function]

IgatePerArea: Gate current per unit gate area $I_{gatePerArea} = I_{gate} / L_g / W_g$

IsubsPerArea: Substrate current per unit gate area $I_{subsPerArea} = I_{subs} / L_g / W_g$

[X-Y Plot]

X axis: Gate voltage Vgate (LINEAR)

Y1 axis: Gate current Igate (LOG)

Gate voltage Vgate

Gate current Igate

Substrate current Isubs

10 Structure

10.12 Interconnect CouplingCap: Interconnection capacitance (A.01.11)

[Supported Analyzer]

B1500A

[Application]

Measures the interconnection capacitance, and plots the C-V characteristics.

For a more accurate measurement, perform correction data measurement at the measurement frequency before starting the capacitance measurement.

If the measurement frequency is not included in the list of default frequencies below, click the Advanced Options... button and set the measurement frequency on the Frequency area of the Advanced Options for CMU Calibration window.

Default frequencies:

1 k, 2 k, 5 k, 10 k, 20 k, 50 k, 100 k, 200 k, 500 k, 1 M, 1.2 M, 1.5 M, 2 M, 2.5 M, 2.7 M, 3 M, 3.2 M, 3.5 M, 3.7 M, 4 M, 4.2 M, 4.5 M, 5 MHz

[Device Under Test]

Capacitor generated between two interconnections in the same layer

[Device Parameters]

L: Metal length

Temp: Temperature

[Test Parameters]

IntegTime: Integration time

FREQ: Measurement frequency

OscLevel: Measurement signal level

MetalA: CMU connected between MetalA and MetalB (CV sweep measurement)

Vstart: DC bias start voltage

Vstop: DC bias stop voltage

Vstep: DC bias step voltage

[Extended Test Parameters]

HoldTime: Hold time

DelayTime: Delay time

[Measurement Parameters]

Parallel capacitance Cp

Conductance G

[User Function]

$PI=3.141592653589$

$D=G/(2*PI*FREQ*Cp)$

$Rp=1/G$

$Cs=(1+D^2)*Cp$

$X=-1/(2*PI*FREQ*Cs)$

$Rs=D*abs(X)$

$Z=sqrt(Rs^2+X^2)$

$Theta=atan(X/Rs)$

$CsPerLength=Cs/L$

$CpPerLength=Cp/L$

[X-Y Graph]

X axis: DC bias VmetalA (LINEAR)
Y1 axis: Interconnection capacitance (parallel capacitance) Cp (LINEAR)
Y2 axis: Dissipation factor D (LINEAR)
Y3 axis: Conductance G (LINEAR)

10 Structure

10.14 Junction BV: Junction device breakdown voltage (A.01.20)

[Supported Analyzer]

B1500A, 4155B, 4155C, 4156B, 4156C

[Description]

Measures the junction device reverse bias characteristics, and extracts the breakdown voltage.

[Device Under Test]

Junction device, diode

[Device Parameters]

L: Junction length

W: Junction width

Temp: Temperature

[Test Parameters]

IntegTime: Integration time

Ianode@BV: Anode current to decide the breakdown

Anode: SMU connected to Anode terminal, primary sweep voltage output

VanodeStart: Sweep start voltage for Anode terminal

VanodeStop: Sweep stop voltage for Anode terminal

VanodeStep: Sweep step voltage for Anode terminal

Cathode: SMU connected to Cathode terminal, constant voltage output

[Extended Test Parameters]

Vcathode: Cathode voltage

HoldTime: Hold time

DelayTime: Delay time

AnodeMinRng: Minimum range for the anode current measurement

[Measurement Parameters]

Anode current Ianode

Cathode current Icathode

[User Function]

IanodePerArea=Ianode/L/W

IcathodePerArea=Icathode/L/W

[Analysis Function]

BV=@L1X (X intercept of Line1)

[X-Y Plot]

X axis: Anode voltage Vanode (LINEAR)

Y1 axis: Anode current Ianode (LINEAR)

Y2 axis: Anode current Ianode (LOG)

Y3 axis: Cathode current Icathode (LINEAR)

Y4 axis: Cathode current Icathode (LOG)

[List Display]

Anode voltage V_{anode}

Anode current I_{anode}

Anode current per unit area $I_{anodePerArea}$

Cathode current $I_{cathode}$

Cathode current per unit area $I_{cathodePerArea}$

[Parameters Display Area]

Junction breakdown voltage BV

[Auto Analysis]

Line1: Vertical line through Y1 data at $I_{anode}=I_{anode}@BV$

10 Structure

10.15 Junction DcParam: Junction device DC parameters (Is,N,Rs) (A.01.20)

[Supported Analyzer]

B1500A, 4155B, 4155C, 4156B, 4156C

[Description]

Measures the forward bias anode voltage vs anode current characteristics, and extracts the slope minimum value (N_Min), the reverse direction saturation current minimum value (IsMin, IsMin2), and the series resistance (Rs).

[Device Under Test]

Junction device, diode

[Device Parameters]

L: Junction length
W: Junction width
Temp: Temperature
Imax: Current compliance

[Test Parameters]

IntegTime: Integration time
Anode: SMU connected to Anode terminal, primary sweep voltage output
VanodeStart: Sweep start voltage for Anode terminal
VanodeStop: Sweep stop voltage for Anode terminal
VanodeStep: Sweep step voltage for Anode terminal
Cathode: SMU connected to Cathode terminal, constant voltage output

[Extended Test Parameters]

Vcathode: Cathode voltage
HoldTime: Hold time
DelayTime: Delay time
AnodeMinRng: Minimum range for the anode current measurement

[Measurement Parameters]

Anode current Ianode
Cathode current Icathode

[User Function]

$I_{anodePerArea} = I_{anode} / L / W$
 $I_{cathodePerArea} = I_{cathode} / L / W$
 $V_t = k * (Temp + 273.15) / q$
 $N = 1 / V_t / (\text{diff}(\log(I_{anode}), V_{anode}))$
 $N_Min = \min(N)$
 $Slope = \text{diff}(\log(I_{anode}), V_{anode})$
 $I_s = \log(I_{anode}) - Slope * V_{anode}$
 $I_{sMin} = \min(I_s)$
 $SmplNum = \text{abs}((V_{anodeStop} - V_{anodeStart}) / V_{anodeStep}) + 1$
 $I_{Rs} = \text{at}(I_{anode}, SmplNum, 1)$
 $\Delta V_{Rs} = V_{anodeStop} - N_Min * V_t * \log(I_{Rs} / I_{sMin})$
 $R_s = \Delta V_{Rs} / I_{Rs}$

10 Structure

10.18 QSCV[2]: C-Vg, Ig-Vg (2-terminal) (A.03.00)

[Supported Analyzer]

B1500A

[Description]

Measures the oxide film capacitance of a MOSFET by using the quasi-static CV method, and plots the C-V characteristics.

To obtain the measurement data after the capacitance offset cancel, perform the QSCV C Offset Meas application test before this test.

[Device Under Test]

MOS capacitance, 2 terminals

[Device Parameters]

Polarity: Nch (SMUs force the specified value) or Pch (SMUs force negative specified value)

Lg: Gate length

Wg: Gate width

Temp: Temperature

[Test Parameters]

Gate: SMU connected to Gate terminal, primary sweep (QSCV) voltage output

Subs: SMU connected to Substrate terminal, constant voltage output

IMeasSMU: SMU to measure current and capacitance, connected to Gate terminal or Substrate terminal

Vstart: Sweep start voltage

Vstop: Sweep stop voltage

Vstep: Sweep step voltage

QSCVMeasV: QSCV measurement voltage

I_Comp: Current compliance

LeakCompen: Leakage current compensation on/off

MeasRange: Current measurement range used for the QSCV measurement, fixed range

Integ_C: Integration time for the capacitance measurement

Integ_L: Integration time for the leakage current measurement

HoldTime: Hold time

DelayTime: Delay time

IOffsetCancel: QSCV smart operation enable/disable

IOffsetSink: SMU to perform QSCV smart operation, connected to terminal which connected to IMeasSMU

QSCV smart operation is effective for QSCV measurements with a large leakage current. The SMU set as the IOffsetSink performs the current force operation to minimize the measurement error caused by an offset current.

[Extended Test Parameters]

StepDelay: Step delay time

OutputRange: Ranging type for voltage output

SwpMode: Sweep mode

VCompSinkSMU: Voltage compliance of SMU for QSCV smart operation

Cmin: Minimum capacitance value for graph

Cmax: Maximum capacitance value for graph

IgMin: Minimum leakage current value for graph

IgMax: Maximum leakage current value for graph

[Measurement parameters]

Capacitance C

Leakage current I_{gLeak}

[X-Y Graph]

X axis: Gate Voltage V_g (LINEAR)

Y1 axis: Capacitance C (LINEAR)

Y2 axis: Leakage current I_g (LINEAR)

[List Display]

Gate voltage V_g

Capacitance C

Leakage current I_g

10 Structure

10.19 QSCV C Offset Meas: Offset capacitance measurement (A.03.00)

[Supported Analyzer]

B1500A

[Description]

Measures the offset capacitance of the cables and DUT interface by using the QSCV method when measurement terminals are open.

[Device Under Test]

MOS capacitance, 2 terminals

[Device Parameters]

Polarity: Nch (SMUs force the specified value) or Pch (SMUs force negative specified value)

Lg: Gate length

Wg: Gate width

Temp: Temperature

[Test Parameters]

IMeasSMU: SMU to measure current and capacitance, connected to Gate terminal or Substrate terminal

MeasRange: Current measurement range used for the QSCV measurement, fixed range

Integ_C: Integration time for the capacitance measurement

Integ_L: Integration time for the leakage current measurement

HoldTime: Hold time

DelayTime: Delay time

[Extended Test Parameters]

StepDelay: Step delay time

[Measurement parameters]

Capacitance C

[List Display]

Capacitance C

10.20 Rdiff-I kelvin: Diffusion resistor R-I characteristics, Kelvin connection (A.01.11)

[Supported Analyzer]

B1500A

[Description]

Measures the resistance vs current characteristics (R-I characteristic).

[Device Under Test]

Diffusion resistor, 3 terminals

Connect the Port1 and VM1 modules to a terminal, the Port2 and VM2 modules to the other terminal.

[Device Parameters]

Polarity: Ntype (SMUs force the specified value) or Ptype (SMUs force the negative specified value).

L: Resistor length

W: Resistor width

Temp: Temperature

[Test Parameters]

IntegTime: Integration time

Port1: SMU connected to resistor, primary sweep current output

I1Start: Primary sweep start current

I1Stop: Primary sweep stop current

I1Step: Primary sweep step current

V1Limit: Port1 voltage compliance

Subs: SMU connected to substrate, secondary sweep voltage output

VsubsStart: Secondary sweep start voltage

VsubsStop: Secondary sweep stop voltage

VsubsStep: Secondary sweep step voltage

IsubsLimit: Subs current compliance

Port2: SMU connected to resistor, constant voltage output

VM1: SMU connected to resistor, constant current output

VM2: SMU connected to resistor, constant current output

[Extended Test Parameters]

V2: Port2 output voltage

IM1: VM1 output current

IM2: VM2 output current

HoldTime: Hold time

DelayTime: Delay time

[Measurement Parameters]

Port1 measurement voltage V1

VM1 measurement voltage Vm1

VM2 measurement voltage Vm2

[User Function]

Voltage between terminals $\Delta V = V_{m1} - V_{m2}$

Resistance $R = \Delta V / I_1$

Sheet resistance $R_{sheet} = R * W / L$

[X-Y Graph]

10 Structure

10.24 R-I DVM: Low resistance measurement using 3458A, current force (A.01.20)

[Supported Analyzer]

B1500A

[Description]

Measures the low resistance of a 2-terminal device. SMU forces current and DVM (3458A) measures voltage between terminals. Resistance is calculated from the output value of a current and measured value of a voltage between terminals. For the purpose of excluding thermoelectric power, this test is designed to measure resistance again by switching the direction of voltage and to get the average value of resistance as a test result.

[Device Under Test]

Resistor element, 2 terminals

[Required Modules and Accessories]

Agilent 3458A digital multimeter 1 unit
 GPIB cable

[Required Test Definition]

Measure Diff-V

[Device Parameters]

L: Resistor length
 W: Resistor width
 Temp: Temperature (deg C)

[Test Parameters]

IntegTime: Integration time
 Port1: SMU connected to resistor, current output
 I1: Applied current
 V1Limit: Port1 voltage compliance
 Port2: SMU connected to resistor, constant voltage output
 GPIB_Adr: GPIB address of DVM

[Extended Test Parameters]

V2: Port2 output voltage
 HoldTime: Hold time
 DelayTime: Delay time
 PortMinRng: Minimum range for port current measurement

[Measurement Parameters]

Rav: Average resistance value of 2 measurements

10.25 R-I kelvin: Resistor R-I characteristics, Kelvin connection (A.01.11)

[Supported Analyzer]

B1500A, 4155B, 4155C, 4156B, 4156C

[Description]

Measures the resistance vs current characteristics (R-I characteristic).

[Device Under Test]

Resistor, 2 terminals

Connect the Port1 and VM1 modules to a terminal, the Port2 and VM2 modules to the other terminal.

[Device Parameters]

L: Resistor length

W: Resistor width

Temp: Temperature

[Test Parameters]

IntegTime: Integration time

Port1: SMU connected to resistor, primary sweep current output

I1Start: Sweep start current

I1Stop: Sweep stop current

I1Step: Sweep step current

V1Limit: Port1 voltage compliance

Port2: SMU connected to resistor, constant voltage output

VM1: SMU connected to resistor, constant current output

VM2: SMU connected to resistor, constant current output

[Extended Test Parameters]

V2: Port2 output voltage

IM1: VM1 output current

IM2: VM2 output current

HoldTime: Hold time

DelayTime: Delay time

[Measurement Parameters]

Port1 measurement voltage V1

VM1 measurement voltage Vm1

VM2 measurement voltage Vm2

[User Function]

Voltage between terminals $\Delta V = V_{m1} - V_{m2}$ Resistance $R = \Delta V / I1$ Sheet resistance $R_{sheet} = R * W / L$

10 Structure

10.27 R-V DVM: Low resistance measurement using 3458A, voltage force (A.01.20)

[Supported Analyzer]
B1500A

[Description]

Measures the low resistance of a 2-terminal device. SMU forces voltage and measures current, and DVM (3458A) measures voltage between terminals. Resistance is calculated from the measured value of a current and that of a voltage between terminals. For the purpose of excluding thermoelectric power, this test is designed to measure resistance again by switching the direction of voltage and to get the average value of resistance as a test result.

[Device Under Test]

Resistor element, 2 terminals

[Required Modules and Accessories]

Agilent 3458A digital multimeter 1 unit
GPIB cable

[Required Test Definition]

Measure Diff-V

[Device Parameters]

L: Resistor length
W: Resistor width
Temp: Temperature (deg C)

[Test Parameters]

IntegTime: Integration time
Port1: SMU connected to resistor, voltage output
V1: Applied voltage
IILimit: Port1 current compliance
Port2: SMU connected to resistor, constant voltage output
GPIB-Adr: GPIB address of DVM

[Extended Test Parameters]

V2: Output voltage
HoldTime: Hold time
DelayTime: Delay time
PortMinRng: Minimum range for port current measurement

[Measurement Parameters]

[Measurement Parameters for first measurement (Vpos)]
Iport2: Measured current

[Measurement Parameters for second measurement (Vneg)]

IsmuList: Measured current
RList: Resistance value

[Test Output: Parameters]

Rav: Average resistance value of 2 measurements

10 Structure

10.28 R-V kelvin: Resistor R-V characteristics, Kelvin connection (A.01.20)

[Supported Analyzer]

B1500A, 4155B, 4155C, 4156B, 4156C

[Description]

Measures the resistance vs voltage characteristics (R-V characteristic).

[Device Under Test]

Resistor, 2 terminals

Connect the Port1 and VM1 modules to a terminal, the Port2 and VM2 modules to the other terminal.

[Device Parameters]

L: Resistor length

W: Resistor width

Temp: Temperature

[Test Parameters]

IntegTime: Integration time

Port1: SMU connected to resistor, primary sweep voltage output

V1Start: Sweep start voltage

V1Stop: Sweep stop voltage

V1Step: Sweep step voltage

I1Limit: Port1 current compliance

Port2: SMU connected to resistor, constant voltage output

TFT

11 TFT

1. TFT Id-Vd: TFT Id-Vd characteristics (A.01.20)
2. TFT Id-Vg: TFT Id-Vg characteristics (A.01.20)

11.1 TFT Id-Vd: TFT Id-Vd characteristics (A.01.20)

[Supported Analyzer]

B1500A, 4155B, 4155C, 4156B, 4156C

[Description]

Measures the drain current vs drain voltage characteristic of TFT.

[Device Under Test]

Thin Film Transistor, 3 terminals

[Device Parameters]

Polarity: Nch (SMUs force the specified value) or Pch (SMUs force the negative specified value).

Lg: Gate length

Wg: Gate width

Temp: Temperature

IdMax: Drain current compliance

[Test Parameters]

IntegTime: Integration time

Drain: SMU connected to Drain terminal, primary sweep voltage output

VdStart: Sweep start voltage for Drain terminal

VdStop: Sweep stop voltage for Drain terminal

VdStep: Sweep step voltage for Drain terminal

Gate: SMU connected to Gate terminal, secondary sweep voltage output

VgStart: Sweep start voltage for Gate terminal

VgStop: Sweep stop voltage for Gate terminal

VgStep: Sweep step voltage for Gate terminal

Source: SMU connected to Source terminal, constant voltage output

[Extended Test Parameters]

Vs: Source voltage

IgLimit: Gate current compliance

HoldTime: Hold time

DelayTime: Delay time

DrainMinRng: Minimum range for the drain current measurement

[Measurement Parameters]

Drain current Idrain

[User Function]

gds: Output conductance $gds = \text{diff}(\text{Idrain}, \text{Vdrain})$

Rds: Output resistance $Rds = 1/gds$

[X-Y Graph]

12.6 ForcePGC: PG Output1 Continuous Output (A.01.20)

[Supported Analyzer]

B1500A, B1505A, 4155B, 4155C, 4156B, 4156C

[Description]

Sets Output1 of Agilent 81110A Pulse Generator, and triggers continuous pulse output. Pulse leading/trailing edge transition time can be set.

Execute ResetPG to stop pulse output before the specified pulses are applied.

[Required Modules and Accessories]

Agilent 81110A Pulse Generator (2-output, PGU1 and PGU2)

GPIB cable

[Test Parameters]

Address: GPIB address of Agilent 81110A Pulse Generator

Period1: Pulse period [s]

Delay1: Pulse delay time [s]

Dcyc1: Duty cycle [%]

LeadTime1: Pulse leading edge transition time [s]

TrailTime1: Pulse trailing edge transition time [s]

Level1: Pulse High level [V]

Base1: Pulse Low level [V]

ExtImp1: Load impedance [ohm]

12.7 Measure Diff-V: Voltage measurement by 3458A (A.01.20)

[Supported Analyzer]

B1500A, B1505A, 4155B, 4155C, 4156B, 4156C

[Description]

Performs voltage measurement between two terminals by using Agilent 3458A Digital Multimeter. Measurement data is stored to DVM_Val variable.

[Required Modules and Accessories]

Agilent 3458A Digital Multimeter
GPIB cable

[Input Parameters]

Adrs: GPIB address of Agilent 3458A Digital Multimeter

[Test Output: Analysis Parameters]

DVM_Val: Voltage measurement data [V]

12 Utility

12.8 QSCV C Offset Meas: Offset capacitance measurement (A.03.00)

[Supported Analyzer]

B1500A

[Description]

Measures the offset capacitance of the cables and DUT interface by using the QSCV method when measurement terminals are open.

[Device Under Test]

MOS capacitance, 2 terminals

[Device Parameters]

Polarity: Nch (SMUs force the specified value) or Pch (SMUs force negative specified value)

Lg: Gate length

Wg: Gate width

Temp: Temperature

[Test Parameters]

IMeasSMU: SMU to measure current and capacitance, connected to Gate terminal or Substrate terminal

MeasRange: Current measurement range used for the QSCV measurement, fixed range

Integ_C: Integration time for the capacitance measurement

Integ_L: Integration time for the leakage current measurement

HoldTime: Hold time

DelayTime: Delay time

[Extended Test Parameters]

StepDelay: Step delay time

[Measurement parameters]

Capacitance C

[List Display]

Capacitance C

12.9 ResetPG: PG reset (A.01.20)

[Supported Analyzer]

B1500A, B1505A, 4155B, 4155C, 4156B, 4156C

[Description]

Resets Agilent 81110A Pulse Generator.

[Required Modules and Accessories]

Agilent 81110A Pulse Generator (2-output, PGU1 and PGU2)
GPIB cable

[Input Parameter]

GPIB address of Agilent 81110A Pulse Generator

12 Utility

12.10 Subsite move: Probing next subsite (A.02.00)

[Supported Analyzer]

B1500A, B1505A, 4155B, 4155C, 4156B, 4156C

[Description]

Moves wafer prober chuck to the next subsite, reads device ID from the prober, and sets it to the Device ID of the test record.

[Supported Probers]

While this application test supports Cascade Microtech, SUSS MicroTec and Vector Semiconductor wafer prober drivers as standard basis, you may specify a command path name into the CustomProber entry field to operate with a non-standard wafer prober driver.

[Test Parameters]

ProberType: Type of wafer prober

CustomProber: Command path name for non-standard wafer probers

If CustomProber is not blank, ProberType field is ignored.

12.11 CVSweep4284_a: C-V measurement by 4284A/E4980A (A.03.10)

[Supported Analyzer]

B1500A, B1505A, 4155B, 4155C, 4156B, 4156C

[Description]

Performs the capacitance vs DC bias voltage measurement by using Agilent 4284A/E4980A LCR meter.

[Device Under Test]

Capacitor, 2 terminals

Connect the LCR meter high terminal to the DUT low terminal and the LCR meter low terminal to the DUT high terminal.

[Required Modules and Accessories]

Agilent 4284A Precision LCR Meter or Agilent E4980A Precision LCR Meter
 GPIB cable

[Test Parameters]

Address: GPIB address of LCR meter
 Osc_Level: Measurement signal level
 Frequency: Measurement frequency
 Integ_Time: Integration time
 Vstart: C-V measurement start voltage
 Vstop: C-V measurement stop voltage
 Sweep_Pts: Number of sweep points
 Cmax: Maximum value of graph axis for plotting capacitance

[Extended Test Parameters]

Delay_Time: Delay time
 Hold_Time: Hold time
 Real_Time_Display: Run time automatic update of graph display

[Measurement Parameters]

Capacitance Cdata
 Dissipation factor Dispersion

[X-Y Graph]

X axis: Bias voltage Vsweep (LINEAR)
 Y1-axis: Parallel capacitance Cdata (LINEAR)
 Y2-axis: Dissipation factor Dispersion (LINEAR)

[List Display]

Bias voltage Vsweep
 Parallel capacitance Cdata
 Dissipation factor Dispersion

WGFMU

13 WGF MU

1. Fast BTI(AC stress Id-Sampling): Bias Temperature Instability Test, using WGF MU (A.03.20)
2. Fast BTI(DC stress Id-Sampling): Bias Temperature Instability Test, using WGF MU (A.03.20)
3. Fast BTI(AC stress Id-Vg): Bias Temperature Instability Test, using WGF MU (A.03.20)
4. Fast BTI(DC stress Id-Vg): Bias Temperature Instability Test, using WGF MU (A.03.20)
5. TRANSIV DC IdVd: Id-Vd characteristics, using RSU (A.03.20)
6. TRANSIV DC IdVg: Id-Vg characteristics, using RSU (A.03.20)
7. WGF MU Pattern Editor: WGF MU Pattern Editor (A.03.20)

13.1 Fast BTI(AC stress Id-Sampling): Bias Temperature Instability Test, using WGF MU (A.03.20)

[Supported Analyzer]

B1500A

[Description]

Performs the bias temperature instability test with the AC stress, and plots the accumulated stress time vs drain current characteristics. This test is performed by repeating the following steps for the accumulated stress time defined in Accumulated_Stress_Time.

1. AC stress output
2. Drain current measurement

[Device Under Test]

MOSFET, 3 or 4 terminals

Drain and gate must be connected to WGF MU channel through RSU.

Source and substrate must be connected to WGF MU ground which is the outer conductor of the RSU Output terminals used for Drain and Gate.

[Required Modules and Accessories]

Agilent B1530A WGF MU 1 unit

Agilent B1531A RSU 2 set

[Device Parameters]

Polarity: Nch (forces specified value) or Pch (forces negative specified value)

Temp: Temperature (deg C)

L: Gate length

W: Gate width

[Test Parameters]

GateCh: WGF MU channel connected to Gate terminal

DrainCh: WGF MU channel connected to Drain terminal

IdMeasRange: Drain current measurement range (for Id measurement)

IdStressRange: Drain current measurement range (for AC stress)

RangeChangeHold: Wait time at the transition from stress to measurement

RangeChangeHold must be set to minimize the impact of the range change.

[Stress Setup]

VgStress: AC stress peak voltage for Gate terminal

VgStressBase: AC stress base voltage for Gate terminal

VdStress: AC stress peak voltage for Drain terminal

VdStressBase: AC stress base voltage for Drain terminal

StressFreq: Set frequency of stress.

StressEdge: Set rise and fall time of stress pulses.

StressDuty: Set duty ratio of stress pulses.

Accumulated_Stress_Time: Accumulated stress time

Accumulated stress time can be defined by using the Define vector data dialog box. Enter the accumulated stress time values in the first column from up to down. To open the Define vector data dialog box, click the left button in the Accumulated_Stress_Time field. Clicking the * button on the dialog box increases the entry fields.

[Meas Setup]

13 WGF MU

VgMeas: Gate voltage for Id measurement

VdMeas: Drain voltage for Id measurement

MeasDelay: Delay time until the measurement is started after the transition to the measurement voltage is started

MeasInterval: Sampling interval (for Id measurement)

MeasPoints: Number of the Id measurement points

IntegTime: Integration time for one measurement point

TransEdge: Voltage change time between the stress voltage and the measurement voltage, for both Gate and Drain terminals

SeqDelay: Device delay time

Lin_Log: Linear (linear sampling), Log10 (10 points/decade log sampling), or Log25 (25 points/decade log sampling)

PointToPlot: Data index to specify the Id measurement data used for result data plot

Device delay time must be set to avoid that the high voltage is applied to the drain and gate terminals simultaneously at the transition between stress and measurement. The value depends on the device under test, TransEdge value, and such.

PointToPlot must be 1 to MeasPoints. PointToPlot=1 specifies the first measurement data.

[Device_ID_Setup]

Device_ID_Override: Y (sets the New_Device_ID value to the Device ID) or N (does not set)

New_Device_ID: Device ID

[Pattern_Validate_Setup]

PatternValidateFile: Absolute path name of the file for checking WGF MU output waveform.

[Extended Test Parameters]

VgForceRange: Gate voltage output range

VdForceRange: Drain voltage output range

[Test Output: X-Y Graph]

Id-AccumulatedStressTime: Drain current vs Accumulated stress time characteristics

13.2 Fast BTI(DC stress Id-Sampling): Bias Temperature Instability Test, using WGFMU (A.03.20)

[Supported Analyzer]

B1500A

[Description]

Performs the bias temperature instability test with the DC stress, and plots the accumulated stress time vs drain current characteristics. This test is performed by repeating the following steps for the accumulated stress time defined in Accumulated_Stress_Time.

1. DC stress output
2. Drain current measurement

[Device Under Test]

MOSFET, 3 or 4 terminals

Drain and gate must be connected to WGFMU channel through RSU.

Source and substrate must be connected to WGFMU ground which is the outer conductor of the RSU Output terminals used for Drain and Gate.

[Required Modules and Accessories]

Agilent B1530A WGFMU 1 unit

Agilent B1531A RSU 2 set

[Device Parameters]

Polarity: Nch (forces specified value) or Pch (forces negative specified value)

Temp: Temperature (deg C)

L: Gate length

W: Gate width

[Test Parameters]

GateCh: WGFMU channel connected to Gate terminal

DrainCh: WGFMU channel connected to Drain terminal

IdMeasRange: Drain current measurement range (for Id measurement)

IdStressRange: Drain current measurement range (for DC stress)

RangeChangeHold: Wait time at the transition from stress to measurement

RangeChangeHold must be set to minimize the impact of the range change.

[Stress Setup]

VgStress: Stress voltage for Gate terminal

VdStress: Stress voltage for Drain terminal

Accumlated_Stress_Time: Accumulated stress time

Accumulated stress time can be defined by using the Define vector data dialog box. Enter the accumulated stress time values in the first column from up to down. To open the Define vector data dialog box, click the left button in the Accumlated_Stress_Time field. Clicking the * button on the dialog box increases the entry fields.

[Meas Setup]

VgMeas: Gate voltage for Id measurement

VdMeas: Drain voltage for Id measurement

MeasDelay: Delay time until the measurement is started after the transition to the measurement voltage is started

MeasInterval: Sampling interval (for Id measurement)

MeasPoints: Number of the Id measurement points

IntegTime: Integration time for one measurement point

TransEdge: Voltage change time between the stress voltage and the measurement voltage, for both Gate and Drain terminals

13 WGFMU

SeqDelay: Device delay time

Lin_Log: Linear (linear sampling), Log10 (10 points/decade log sampling), or Log25 (25 points/decade log sampling)

PointToPlot: Data index to specify the Id measurement data used for result data plot

Device delay time must be set to avoid that the high voltage is applied to the drain and gate terminals simultaneously at the transition between stress and measurement. The value depends on the device under test, TransEdge value, and such.

PointToPlot must be 1 to MeasPoints. PointToPlot=1 specifies the first measurement data.

[Device_ID_Setup]

Device_ID_Override: Y (sets the New_Device_ID value to the Device ID) or N (does not set)

New_Device_ID: Device ID

[Extended Test Parameters]

VgForceRange: Gate voltage output range

VdForceRange: Drain voltage output range

[Test Output: X-Y Graph]

Id-AccumulatedStressTime: Drain current vs Accumulated stress time characteristics

13.3 Fast BTI(AC stress Id-Vg): Bias Temperature Instability Test, using WGF MU (A.03.20)

[Supported Analyzer]

B1500A

[Description]

Performs the bias temperature instability test with the AC stress, and plots the accumulated stress time vs threshold voltage characteristics. This test is performed by repeating the following steps for the accumulated stress time defined in Accumulated_Stress_Time.

1. AC stress output
2. Id-Vg measurement

[Device Under Test]

MOSFET, 3 or 4 terminals

Drain and gate must be connected to WGF MU channel through RSU.

Source and substrate must be connected to WGF MU ground which is the outer conductor of the RSU Output terminals used for Drain and Gate.

[Required Modules and Accessories]

Agilent B1530A WGF MU 1 unit

Agilent B1531A RSU 2 set

[Device Parameters]

Polarity: Nch (forces specified value) or Pch (forces negative specified value)

Temp: Temperature (deg C)

L: Gate length

W: Gate width

Id_at_Vth: Drain current to decide the Vth

[Test Parameters]

GateCh: WGF MU channel connected to Gate terminal

DrainCh: WGF MU channel connected to Drain terminal

IdMeasRange: Drain current measurement range (for Id-Vg measurement)

IdStressRange: Drain current measurement range (for AC stress)

RangeChangeHold: Wait time at the transition from stress to measurement

RangeChangeHold must be set to minimize the impact of the range change.

[Stress Setup]

VgStress: AC stress peak voltage for Gate terminal

VgStressBase: AC stress base voltage for Gate terminal

VdStress: AC stress peak voltage for Drain terminal

VdStressBase: AC stress base voltage for Drain terminal

StressFreq: Set frequency of stress.

StressEdge: Set rise and fall time of stress pulses.

StressDuty: Set duty ratio of stress pulses.

Accumulated_Stress_Time: Accumulated stress time

Accumulated stress time can be defined by using the Define vector data dialog box. Enter the accumulated stress time values in the first column from up to down. To open the Define vector data dialog box, click the left button in the Accumulated_Stress_Time field. Clicking the * button on the dialog box increases the entry fields.

[Meas Setup]

VgStart: Sweep start voltage for Gate terminal

VgStop: Sweep stop voltage for Gate terminal

13 WGF MU

StepNum: Number of measurement points (number of sweep steps) per 1 sweep

StepRise: Step voltage change time (not available for the ramp sweep)

Sweep: Step (step sweep) or Ramp (ramp sweep)

Slope: Single (VgStart to VgStop) or Dual (VgStart to VgStop to VgStart)

VdMeas: Drain voltage for the Id-Vg measurement

SeqDelay: Device delay time

TransEdge: Voltage change time between the stress voltage and the measurement voltage, for both Gate and Drain terminals

IntegTime: Integration time for one measurement point

StepDelay: Step delay time

Hold: Hold time

Device delay time must be set to avoid that the high voltage is applied to the drain and gate terminals simultaneously at the transition between stress and measurement. The value depends on the device under test, TransEdge value, and such.

Step delay time is defined as the time from the step output start to the step measurement start.

Hold time is defined as the time from the measurement voltage output start to the sweep operation start. For the Dual slope, the hold time is taken at the sweep start of both forward sweep and reverse sweep.

[Device_ID_Setup]

Device_ID_Override: Y (sets the New_Device_ID value to the Device ID) or N (does not set)

New_Device_ID: Device ID

[Pattern_Validate_Setup]

PatternValidateFile: Absolute path name of the file for checking WGF MU output waveform.

[Extended Test Parameters]

VgForceRange: Gate voltage output range

VdForceRange: Drain voltage output range

StepMargin: Time from the step measurement end to the next step output start (not available for the ramp sweep)

[Test Output: X-Y Graph]

Id-t: Drain current vs Time characteristics

Id-Vg: Drain current vs Gate voltage characteristics

Vth-AccumulatedStressTime: Threshold voltage vs Accumulated stress time characteristics

13.4 Fast BTI(DC stress Id-Vg): Bias Temperature Instability Test, using WGF MU (A.03.20)

[Supported Analyzer]

B1500A

[Description]

Performs the bias temperature instability test with the DC stress, and plots the accumulated stress time vs threshold voltage characteristics. This test is performed by repeating the following steps for the accumulated stress time defined in Accumulated_Stress_Time.

1. DC stress output
2. Id-Vg measurement

[Device Under Test]

MOSFET, 3 or 4 terminals

Drain and gate must be connected to WGF MU channel through RSU.

Source and substrate must be connected to WGF MU ground which is the outer conductor of the RSU Output terminals used for Drain and Gate.

[Required Modules and Accessories]

Agilent B1530A WGF MU 1 unit

Agilent B1531A RSU 2 set

[Device Parameters]

Polarity: Nch (forces specified value) or Pch (forces negative specified value)

Temp: Temperature (deg C)

L: Gate length

W: Gate width

Id_at_Vth: Drain current to decide the Vth

[Test Parameters]

GateCh: WGF MU channel connected to Gate terminal

DrainCh: WGF MU channel connected to Drain terminal

IdMeasRange: Drain current measurement range (for Id-Vg measurement)

IdStressRange: Drain current measurement range (for DC stress)

RangeChangeHold: Wait time at the transition from stress to measurement

RangeChangeHold must be set to minimize the impact of the range change.

[Stress Setup]

VgStress: Stress voltage for Gate terminal

VdStress: Stress voltage for Drain terminal

Accumulated_Stress_Time: Accumulated stress time

Accumulated stress time can be defined by using the Define vector data dialog box. Enter the accumulated stress time values in the first column from up to down. To open the Define vector data dialog box, click the left button in the Accumulated_Stress_Time field. Clicking the * button on the dialog box increases the entry fields.

[Meas Setup]

VgStart: Sweep start voltage for Gate terminal

VgStop: Sweep stop voltage for Gate terminal

StepNum: Number of measurement points (number of sweep steps) per 1 sweep

StepRise: Step voltage change time (not available for the ramp sweep)

Sweep: Step (step sweep) or Ramp (ramp sweep)

Slope: Single (VgStart to VgStop) or Dual (VgStart to VgStop to VgStart)

VdMeas: Drain voltage for the Id-Vg measurement

13 WGFMU

SeqDelay: Device delay time

TransEdge: Voltage change time between the stress voltage and the measurement voltage, for both Gate and Drain terminals

IntegTime: Integration time for one measurement point

StepDelay: Step delay time

Hold: Hold time

Device delay time must be set to avoid that the high voltage is applied to the drain and gate terminals simultaneously at the transition between stress and measurement. The value depends on the device under test, TransEdge value, and such.

Step delay time is defined as the time from the step output start to the step measurement start.

Hold time is defined as the time from the measurement voltage output start to the sweep operation start. For the Dual slope, the hold time is taken at the sweep start of both forward sweep and reverse sweep.

[Device_ID_Setup]

Device_ID_Override: Y (sets the New_Device_ID value to the Device ID) or N (does not set)

[Test Output: X-Y Graph]

Id-t: Drain current vs Time characteristics

Id-Vg: Drain current vs Gate voltage characteristics

Vth-AccumlatedStressTime: Threshold voltage vs Accumulated stress time characteristics

13.5 TRANSIV DC IdVd: Id-Vd characteristics, using RSU (A.03.20)

[Supported Analyzer]

B1500A

[Description]

Measures the drain current vs drain voltage characteristics of MOSFET.

[Device Under Test]

MOSFET, 3 or 4 terminals

Drain and gate must be connected to SMU through RSU.

Source and substrate must be connected to WGF MU ground which is the outer conductor of the RSU Output terminals used for Drain and Gate.

[Required Modules and Accessories]

Agilent B1530A WGF MU 1 unit

Agilent B1531A RSU 2 set

[Device Parameters]

Polarity: Nch (SMU forces specified value) or Pch (SMU forces negative specified value)

L: Gate length

W: Gate width

Temp: Temperature (deg C)

IdLimit: Drain current compliance

[Test Parameters]

Gate: SMU connected to Gate terminal, secondary sweep voltage output

VgStart: Sweep start voltage for Gate terminal

VgStop: Sweep stop voltage for Gate terminal

VgStep: Sweep step voltage for Gate terminal

Drain: SMU connected to Drain terminal, primary sweep voltage output

VdStart: Sweep start voltage for Drain terminal

VdStop: Sweep stop voltage for Drain terminal

VdStep: Sweep step voltage for Drain terminal

[Extended Test Parameters]

IgLimit: Gate current compliance

IntegTime: Integration time

HoldTime: Hold time

DelayTime: Delay time

[Measurement Parameters]

Drain current Id

[User Function]

IdPerW: Drain current per unit gate width $IdPerW=Id/W$

[X-Y Plot]

X axis: Gate voltage Vd (LINEAR)

Y1 axis: Drain current Id (LINEAR)

[List Display]

Gate voltage Vg

Drain voltage Vd

Drain current Id

Drain current per unit gate width IdPerW

13 WGFMU

13.6 TRANSIV DC IdVg: Id-Vg characteristics, using RSU (A.03.20)

[Supported Analyzer]

B1500A

[Description]

Measures the drain current vs gate voltage characteristics of MOSFET.

[Device Under Test]

MOSFET, 3 or 4 terminals

Drain and gate must be connected to SMU through RSU.

Source and substrate must be connected to WGFMU ground which is the outer conductor of the RSU Output terminals used for Drain and Gate.

[Required Modules and Accessories]

Agilent B1530A WGFMU 1 unit

Agilent B1531A RSU 2 set

[Device Parameters]

Polarity: Nch (SMU forces specified value) or Pch (SMU forces negative specified value)

L: Gate length

W: Gate width

Temp: Temperature (deg C)

IdLimit: Drain current compliance

[Test Parameters]

Gate: SMU connected to Gate terminal, primary sweep voltage output

VgStart: Sweep start voltage for Gate terminal

VgStop: Sweep stop voltage for Gate terminal

VgStep: Sweep step voltage for Gate terminal

Drain: SMU connected to Drain terminal, secondary sweep voltage output

VdStart: Sweep start voltage for Drain terminal

VdStop: Sweep stop voltage for Drain terminal

VdStep: Sweep step voltage for Drain terminal

[Extended Test Parameters]

IgLimit: Gate current compliance

IntegTime: Integration time

HoldTime: Hold time

DelayTime: Delay time

[Measurement Parameters]

Drain current Id

[User Function]

IdPerW: Drain current per unit gate width $IdPerW=Id/W$

[X-Y Plot]

X axis: Gate voltage Vg (LINEAR)

Y1 axis: Drain current Id (LINEAR)

[List Display]

Gate voltage Vg

Drain voltage Vd

Drain current Id

Drain current per unit gate width IdPerW

13.7 WGFMU Pattern Editor (A.03.20)

[Supported Analyzer]

B1500A

[Description]

Performs the WGFMU channel output setup and the measurement setup.

Set the ExecutionMode to Run Vector and click the Single button to perform the WGFMU channel output and measurement.

[Test Parameters]

ExecutionMode: Execution mode

Run Vector: Performs the waveform output and measurement

Pattern Validation: Displays the waveform and measurement setup, for debugging

[WGFMU1 and WGFMU2]

Enable: Enable (uses the channel) or Disable (does not use)

Channel: WGFMU channel to use

OperationMode: Operation mode

PG Vmeas (PG mode, voltage measurement)

Fast IV Imeas (Fast IV mode, current measurement)

Fast IV Vmeas (Fast IV mode, voltage measurement)

VForceRange: Voltage output range

Auto, 3V, 5V, -10V to 0V, or 0V to 10V

InitMeasRange: Measurement range

For current measurement: 1uA, 10uA, 100uA, 1mA, or 10mA

For voltage measurement: 5V or 10V

[Pattern]

RepeatCount: Repeat count of waveform data and measurement event data

WaveformCh1: Channel1 waveform data

WaveformCh2: Channel2 waveform data

MeasurementEvent: Measurement event data

Waveform data and measurement event data can be defined by using the Define vector data dialog box. To open the Define vector data dialog box, click the left button of each field. Clicking the * button on the dialog box increases the row.

Waveform data:

Column 1: Time (absolute value)

Column 2: Voltage output value

Measurement event data:

Column 1: Sampling measurement start time (absolute value)

Column 2: Number of measurement points per one sampling

Column 3: Sampling interval

Column 4: Averaging time per one point measurement

Column 5: Ch1 range event

Column 6: Ch2 range event

For the column 5 and 6, 0 is set normally. For the current measurement, setting a number from 1 to 5 enables the range event. This changes the current measurement range to the specified range when the sampling measurement is started.

1: 1uA, 2: 10uA, 3: 100uA, 4: 1mA, 5: 10mA

To set the range event only without the measurement event, enter 0 to the column 2 and set the column 5 and 6.

13 WGFMU

To obtain the stable result for the current measurement with range changing, set the sampling measurement start time to the value which exceeds 100 micro seconds after the range is changed.

[Output_to_File_for_PatternValidation] Not effective for Run Vector mode

Output_Enable: Enable or Disable

Enable (saves the waveform and measurement setup data to the file specified by Output_Filename)

Disable (does not save)

Output_Filename: Absolute path name of the file to save the waveform and measurement setup data

[DataDisplay_for_RunVector] Not effective for Pattern Validation mode

DataDisplay_PatternValidation: PatternValidation data display mode

Disable (does not display PatternValidation data during measurement)

Enable_Waveform (displays Waveform during measurement)

Enable_Waveform_MeasTiming (displays Waveform and MeasTiming during measurement)

DataDisplay_Mode: Data Display window display mode

x(time)_y(meas): Time for X axis and measurement data for Y axis

x(meas1)_y(meas2): Ch1 measurement data for X axis and Ch2 measurement data for Y axis

[Extended Test Parameters]

LogToFile: Enable or Disable

Enable (logs error and warning)

Disable (does not log)

LogFile: Absolute path name of the log file

WarningLevel: Warning level

Off: No warning is reported

Severe: Severe warning is reported

Normal: Normal warning is reported

Information: Information warning is reported

IForceRange1: Current measurement range when the sampling measurement is started

1uA, 10uA, 100uA, 1mA, or 10mA

This value is effective until the range is changed by the range event.

Result_Update_Interval_s: Interval of updating the measurement result. 2 to 100 seconds.

14

IGBT

14 IGBT

1. Cce: IGBT Cce-Vc characteristics (A.04.00)
2. Cgc: IGBT Cgc-Vc characteristics (A.04.00)
3. Cge: IGBT Cge-Vg characteristics (A.04.00)
4. Ic(off)-Vce: IGBT Ic(off)-Vce characteristics (A.04.00)
5. Ic-Vce: IGBT Ic-Vce characteristics, SMU Pulse (A.04.00)
6. Ic-Vge: IGBT Ic-Vge characteristics, SMU Pulse (A.04.00)
7. TDDB Constant V: Constant voltage TDDB (A.04.00)
8. Vce(sat): IGBT Vce(sat) characteristics, SMU Pulse (A.04.00)
9. Vth Vge(off): IGBT Vth or Vge(off) measurement (A.04.00)

14.1 Cce: IGBT Cce-Vc characteristics (A.04.00)

[Supported Analyzer]

B1505A

[Description]

Measures Collector-Emitter capacitance (Cce), and plots Cce-Vc characteristics.

For a more accurate measurement, perform correction data measurement at the measurement frequency before starting the capacitance measurement.

If the measurement frequency is not included in the list of default frequencies below, click the Advanced Options... button and set the measurement frequency on the Frequency area of the Advanced Options for CMU Calibration window.

Default frequencies:

1 k, 2 k, 5 k, 10 k, 20 k, 50 k, 100 k, 200 k, 500 k, 1 M, 1.2 M, 1.5 M, 2 M, 2.5 M, 2.7 M, 3 M, 3.2 M, 3.5 M, 3.7 M, 4 M, 4.2 M, 4.5 M, 5 MHz

[Device Under Test]

IGBT, 3 terminals

Connect Collector, Emitter, and Gate to the High Voltage Bias-T High, Low, and AC Guard respectively.

Or, connect Collector, Emitter, and Gate to the Test Fixture MFCMU High, MFCMU Low, and AUX circuit common respectively.

[Required Modules and Accessories]

Agilent B1520A MFCMU 1 unit

Agilent N1260A High Voltage Bias-T or Agilent N1259A Test Fixture with the option N1259A-020

[Device Parameters]

Polarity: Nch (SMU forces the specified value) or Pch (SMU forces the negative specified value).

Temp: Temperature

YAxisCceMin: Y axis (Cce) minimum value

YAxisCceMax: Y axis (Cce) maximum value

[Test Parameters]

Memo: Memorandum

IntegTime: Integration time

Frequency: Measurement frequency

OscLevel: Measurement signal level

Scale: Scale of DC bias sweep, LINEAR, LOG10, LOG25, or LOG50

Collector: CMU used for the capacitance measurement

VcBias: SMU used for the DC bias sweep source

VcStart: DC bias sweep start voltage

VcStop: DC bias sweep stop voltage

VcLinearStep: DC bias sweep step voltage, effective if Scale=LINEAR

IcLimit: Collector current compliance

B1505A

[Description]

Measures Ic-Vce characteristics. SMU pulse is used for the Collector-Emitter voltage output.

[Device Under Test]

IGBT, 3 terminals

[Device Parameters]

Polarity: Nch (SMUs force the specified value) or Pch (SMUs force the negative specified value).

Temp: Temperature

[Test Parameters]

Memo: Memorandum

Collector: SMU connected to Collector terminal, primary sweep voltage output

VcStart: Sweep start voltage for Collector terminal

VcStop: Sweep stop voltage for Collector terminal

VcLinearStep: Sweep step voltage for Collector terminal, effective if Scale=LINEAR

PulsePeriodMode: Pulse period mode, AUTO or MANUAL

ManualPulsePeriod: Pulse period, effective if PulsePeriodMode=MANUAL

PulseWidth: Pulse width

Gate: SMU connection to Gate terminal, secondary sweep voltage output

VgStart: Sweep start voltage for Gate terminal

VgStop: Sweep stop voltage for Gate terminal

VgStep: Sweep step voltage for Gate terminal

Emitter: GNDU connected to Emitter terminal

Scale: Scale of sweep, LINEAR, LOG10, LOG25, or LOG50

IcLimit: Collector current compliance

PcLimit: Collector power compliance

[Extended Test Parameters]

PulseBase: Pulse base voltage

PulseAvgCnt: Pulse averaging count

IgLimit: Gate current compliance

HoldTime: Hold time

IcZero: Y axis (Ic) minimum value

MeasurementTime: Actual measurement time for a pulse period

[Measurement Parameters]

Collector current Icollector

Gate current Igate

[User Function]

Ta: Temperature Ta=Temp

[X-Y Plot]

For Scale=LINEAR:

X axis: Collector voltage Vcollector (LINEAR)

Y axis: Collector current Icollector (LINEAR)

For Scale=LOG10, LOG25, or LOG50:

14 IGBT

X axis: Collector voltage $V_{\text{collector}}$ (LOG)

Y axis: Collector current $I_{\text{collector}}$ (LOG)

[List Display]

Collector voltage $V_{\text{collector}}$

Collector current $I_{\text{collector}}$

Gate voltage V_{gate}

Gate current I_{gate}

[Parameter Display Area]

Temperature $T_a = \text{Temp}$

14.6 *Ic-Vge: IGBT Ic-Vge characteristics, SMU Pulse (A.04.00)*

[Supported Analyzer]

B1505A

[Description]

Measures Ic-Vge characteristics. SMU pulse is used for the Collector-Emitter voltage output.

[Device Under Test]

IGBT, 3 terminals

[Device Parameters]

Polarity: Nch (SMUs force the specified value) or Pch (SMUs force the negative specified value).

Temp: Temperature

YAxisgfeMin: Y axis (gfe) minimum value

YAxisgfeMax: Y axis (gfe) maximum value

[Test Parameters]

Memo: Memorandum

Gate: SMU connected to Gate terminal, primary sweep voltage output

VgStart: Sweep start voltage for Gate terminal

VgStop: Sweep stop voltage for Gate terminal

VgStep: Sweep step voltage for Gate terminal

PulsePeriodMode: Pulse period mode, AUTO or MANUAL

ManualPulsePeriod: Pulse period, effective if PulsePeriodMode=MANUAL

PulseWidth: Pulse width

Collector: SMU connected to Collector terminal, secondary sweep voltage output

VcStart: Sweep start voltage for Collector terminal

VcStop: Sweep stop voltage for Collector terminal

VcPoint: Number of collector voltage sweep steps

Emitter: GNDU connected to Emitter terminal

IcLimit: Collector current compliance

[Extended Test Parameters]

PulseBase: Pulse base voltage

PulseAvgCnt: Pulse averaging count

IgLimit: Gate current compliance

HoldTime: Hold time

MeasurementTime: Actual measurement time for a pulse period

[Measurement Parameters]

Collector current Icollector

Gate current Igate

[User Function]

gfe: Forward transconductance $gfe = \text{diff}(I_{\text{collector}}, V_{\text{gate}})$

Ta: Temperature $Ta = \text{Temp}$

[Analysis Function]

gfeMax = max(gfe)

Vth = @L1X (X intercept of Line1)

[Auto Analysis]

Line1: Tangent for Y2 data at the point of $gfe = gfeMax$

14 IGBT

[X-Y Plot]

X axis: Gate voltage V_{gate} (LINEAR)

Y1 axis: Forward transconductance g_{fe} (LINEAR)

Y2 axis: Collector current $I_{collector}$ (LINEAR)

[List Display]

Collector voltage $V_{collector}$

Collector current $I_{collector}$

Gate voltage V_{gate}

Gate current I_{gate}

Forward transconductance g_{fe}

[Parameter Display]

Temperature T_a

Maximum value of forward transconductance g_{feMax}

Threshold voltage V_{th}

14.7 TDDB Constant V: Constant voltage TDDB (A.04.00)

[Supported Analyzer]

B1505A

[Description]

Performs TDDB (Time Dependent Dielectric Breakdown) test and plots stress time vs leak current characteristics using I/V-t Sampling measurement.

[Device Under Test]

MOS capacitor etc., 2 terminals

[Device Parameters]

Polarity: Nch (SMUs force the specified value) or Pch (SMUs force the negative specified value).

Temp: Temperature

[Test Parameters]

Memo: Memorandum

IntegTime: Integration time

TotalStressTime: Total stress time, 10 s to 10000 s

FailureCondition: Stress current to decide the breakdown

PointPerDecade: Number of samples for one decade

Interval: Sampling interval

Port1: SMU connected to Port1 terminal

VStress: Stress voltage

Port2: SMU connected to Port2 terminal

[Extended Test Parameters]

ILimit: Current compliance

HoldTime: Hold time

MinRange: Minimum current measurement range

StoringRuntimeData: Data save during stress output, Yes or No

IStressZero: Minimum value of IStress for Y axis

[Measurement Parameters]

Stress current IStress

[User Function]

Ta: Temperature Ta=Temp

Qbdval: Charge per unit time $Qbdval = \text{integ}(IStress, Time)$

DN: Number of data $DN = \text{dim1Size}(Index)$

[X-Y Plot]

X axis: Stress time Time (LOG)

Y axis: Stress current IStress (LOG)

Temperature Ta=Temp

14.8 $V_{ce(sat)}$: IGBT $V_{ce(sat)}$ characteristics, SMU Pulse (A.04.00)

[Supported Analyzer]

B1505A

[Description]

Measures Collector-Emitter saturation voltage characteristics. SMU pulse is used for the Collector-Emitter current output.

[Device Under Test]

IGBT, 3 terminals

[Device Parameters]

Polarity: Nch (SMUs force the specified value) or Pch (SMUs force the negative specified value).

Temp: Temperature

[Test Parameters]

Memo: Memorandum

Collector: SMU connected to Collector terminal, primary sweep current output

IcStart: Sweep start current for Collector terminal

IcStop: Sweep stop current for Collector terminal

IcLinearStep: Sweep step current for Collector terminal, effective if Scale=LINEAR

PulsePeriodMode: Pulse period mode, AUTO or MANUAL

ManualPulsePeriod: Pulse period, effective if PulsePeriodMode=MANUAL

PulseWidth: Pulse width

Gate: SMU connected to Gate terminal, secondary sweep voltage output

Vg: Gate voltage

Emitter: GNDU connected to Emitter terminal

VcLimit: Collector voltage compliance

Scale: Scale of sweep, LINEAR, LOG10, LOG25, or LOG50

[Extended Test Parameters]

PulseBase: Pulse base current

PulseAvgCnt: Pulse averaging count

IgLimit: Gate current compliance

HoldTime: Hold time

VcZero: Y axis ($V_{collector}$) minimum value

MeasurementTime: Actual measurement time for a pulse period

[Measurement Parameters]

Collector current $I_{collector}$ Collector voltage $V_{collector}$

[User Function]

Ta: Temperature $T_a=Temp$

[X-Y Plot]

For Scale=LINEAR:

X axis: Collector current $I_{collector}$ (LINEAR)Y axis: Collector voltage $V_{collector}$ (LINEAR)

For Scale=LOG10, LOG25, or LOG50:

X axis: Collector current $I_{collector}$ (LOG)Y axis: Collector voltage $V_{collector}$ (LOG)

14 IGBT

[List Display]

Collector current $I_{\text{collector}}$

Collector voltage $V_{\text{collector}}$

Gate voltage V_{gate}

Gate current I_{Gate}

[Parameter Display Area]

Temperature $T_a = \text{Temp}$

14.9 Vth Vge(off): IGBT Vth or Vge(off) measurement (A.04.00)

[Supported Analyzer]

B1505A

[Description]

Measures Ic-Vge characteristics and extracts threshold voltage or cutoff voltage.

[Device Under Test]

IGBT, 3 terminals

[Device Parameters]

Polarity: Nch (SMUs force the specified value) or Pch (SMUs force the negative specified value).

Temp: Temperature

[Test Parameters]

Memo: Memorandum

Gate: SMU connected to Gate terminal, primary sweep voltage output

VgStart: Sweep start voltage for Gate terminal

VgStop: Sweep stop voltage for Gate terminal

VgStep: Sweep step voltage for Gate terminal

Collector: SMU connected to Collector terminal

Vc: Collector voltage

Emitter: GNDU connected to Emitter terminal

Ic@Vth_Vgeoff: Collector current to decide Vth or Vge(off)

MeasMode: Measurement parameter, Vth or Vgeoff

IntegTime: Integration time

IcLimit: Collector current compliance

[Extended Test Parameters]

IgLimit: Gate current compliance

HoldTime: Hold time

DelayTime: Delay time

IcZero: Y axis (Icollector) minimum value

IcMinRange: Minimum range for the collector current measurement

IgMinRange: Minimum range for the gate current measurement

[Measurement Parameters]

Collector current Icollector

Gate current Igate

[User Function]

Ta: Temperature Ta=Temp

[Analysis Function]

In case of Vth measurement,

Vth=@MX (X coordinate of Marker)

In case of Vge(off) measurement,

Vgeoff=@MX (X coordinate of Marker)

[Auto Analysis]

Marker: Icollector=Ic@Vth_Vgeoff

14 IGBT

[X-Y Plot]

For MeasMode= V_{geoff} :

Cutoff voltage V_{geoff}

15 Interconnection

1. Residual R: R-I characteristics of interconnection residual resistance, SMU Pulse (A.04.00)

15.1 Residual R: R-I characteristics of interconnection residual resistance, SMU Pulse (A.04.00)

[Supported Analyzer]
B1505A

[Description]
Measures the residual resistance vs current characteristics of Interconnection. SMU pulse is used for current output.

[Device Under Test]
Interconnection, 2 terminals

[Device Parameters]
YAxisResidualRMin: Y axis (ResidualR) minimum value
YAxisResidualRMax: Y axis (ResidualR) maximum value

[Test Parameters]
Memo: Memorandum
Port1: SMU connected to Port1 terminal, primary sweep current output
IStart: Sweep start current for Port1 terminal
IStop: Sweep stop current for Port1 terminal
ILinearStep: Sweep step current for Port1 terminal, effective if Scale=LINEAR
VLimit: Voltage compliance
PulsePeriodMode: Pluse period mode, AUTO or MANUAL
ManualPulsePeriod: Pulse period, effective if PulsePeriodMode=MANUAL
PulseWidth: Pulse width
Port2: GNDU connected to Port2 terminal
Scale: Scale of sweep, LINEAR, LOG10, LOG25, or LOG50

[Extended Test Parameters]
PulseBase: Pulse base current
PulseAvgCnt: Pulse averaging count
HoldTime: Hold time
MeasurementTime: Actural measurement time for a pulse period

[Measurement Parameters]
Measure voltage Vm

[User Function]
ResidualR: Residual resistance $\text{ResidualR} = V_m / I_f$
Ta: Temperature $T_a = \text{Temp}$

[X-Y Plot]
For Scale=LINEAR:
X axis: Force current I_f (LINEAR)
Y axis: Residual resistance ResidualR (LINEAR)

For Scale=LOG10, LOG25, or LOG50:

MISCAP

16 MISCAP

1. BV: MISCAP Gate-Body breakdown voltage measurement (A.04.00)
2. C(MISCAP): MISCAP C-V characteristics (A.04.00)
3. I_{leak}-V: MISCAP I-V characteristics (A.04.00)
4. TDDB Constant V: Constant voltage TDDB (A.04.00)

16.1 BV: MISCAP Gate-Body breakdown voltage measurement (A.04.00)

[Supported Analyzer]

B1505A

[Description]

Measures MISCAP Gate current vs voltage characteristics and extracts the Gate-Body breakdown voltage.

[Device Under Test]

MISCAP, 2 terminals

[Device Parameters]

Polarity: Nch (SMUs force the specified value) or Pch (SMUs force the negative specified value).

Temp: Temperature

[Test Parameters]

Memo: Memorandum

IntegTime: Integration time

Gate: SMU connected to Gate terminal, primary sweep current output

IgStart: Sweep start current for Gate terminal

IgStop: Sweep stop current for Gate terminal

IgStep: Sweep step current for Gate terminal

Body: GNDU connected to Body terminal

Ileak@BV: Gate current to decide breakdown voltage BV

VgLimit: Gate voltage compliance

16 MISCAP

16.2 C(MISCAP): MISCAP C-V characteristics (A.04.00)

[Supported Analyzer]
B1505A

[Description]

Measures MISCAP Gate-Body capacitance, and plots the C-V characteristics.

For a more accurate measurement, perform correction data measurement at the measurement frequency before starting the capacitance measurement.

If the measurement frequency is not included in the list of default frequencies below, click the Advanced Options... button and set the measurement frequency on the Frequency area of the Advanced Options for CMU Calibration window.

Default frequencies:

1 k, 2 k, 5 k, 10 k, 20 k, 50 k, 100 k, 200 k, 500 k, 1 M, 1.2 M, 1.5 M, 2 M, 2.5 M, 2.7 M, 3 M, 3.2 M, 3.5 M, 3.7 M, 4 M, 4.2 M, 4.5 M, 5 MHz

[Device Under Test]

MISCAP, 2 terminals

Connect Gate and Body to CMU Low and CMU High respectively.

[Device Parameters]

Polarity: Nch (CMU forces the specified value) or Pch (CMU forces the negative specified value).

Temp: Temperature

YAxisCMin: Y1 axis (C) minimum value

YAxisCMax: Y1 axis (C) maximum value

YAxisGMin: Y2 axis (G) minimum value

YAxisGMax: Y2 axis (G) maximum value

[Test Parameters]

Memo: Memorandum

IntegTime: Integration time

Frequency: Measurement frequency

OscLevel: Measurement signal level

Gate: CMU used for C-V measurement

VgStart: DC bias sweep start voltage

VgStop: DC bias sweep stop voltage

VgStep: DC bias sweep step voltage

17.6 *Vce(sat)-Ic: Vce(sat)-Ic characteristics (A.04.00)*

[Supported Analyzer]

B1505A

[Description]

Measures $V_{ce(sat)}$ - I_c and $V_{be(sat)}$ - I_c characteristics. SMU pulse is used for Collector current output and Base current output.

[Device Under Test]

Power BJT, 3 terminals

[Device Parameters]

Polarity: NPN (SMUs force the specified value) or PNP (SMUs force the negative specified value).

Temp: Temperature

[Test Parameters]

Memo: Memorandum

Scale: Scale of sweep, LINEAR, LOG10, LOG25, or LOG50

Collector: SMU connected to Collector terminal, primary sweep current output

$I_{cIbRatio}$: Ratio between Collector current and Base current ($I_{base}=I_{collector}/I_{cIbRatio}$)

I_{cStart} : Sweep start current for Collector terminal

I_{cStop} : Sweep stop current for Collector terminal

$I_{cLinearStep}$: Sweep step current for Collector terminal, effective if Scale=LINEAR

PulsePeriodMode: Pulse period mode, AUTO or MANUAL

ManualPulsePeriod: Pulse period, effective if PulsePeriodMode=MANUAL

$I_{cPulseWidth}$: Pulse width of Collector current

$I_{bPulseWidth}$: Pulse width of Base current

Base: SMU connection to Base terminal, synchronous sweep current output

Emitter: GNDU connected to Emitter terminal

V_{cLimit} : Collector voltage compliance

[Extended Test Parameters]

$I_{cPulseBase}$: Pulse base current for Collector terminal

$I_{bPulseBase}$: Pulse base current for Base terminal

PulseAvgCnt: Pulse averaging count

HoldTime: Hold time

$I_{cPulseDelayTime}$: Delay time of Collector current pulse

$I_{bPulseDelayTime}$: Delay time of Base current pulse

V_{bLimit} : Base voltage compliance

V_{cZero} : Y1 axis ($V_{collector}$) minimum value

V_{bZero} : Y2 axis (V_{base}) minimum value

MeasurementTime: Actual measurement time for a pulse period

[Measurement Parameters]

Collector voltage $V_{collector}$

Collector current $I_{collector}$

Base voltage V_{base}

Base current I_{base}

[User Function]

T_a : Temperature $T_a=Temp$

[X-Y Plot]

17 Power BJT

For Scale=LINEAR:

X axis: Collector current $I_{\text{collector}}$ (LINEAR)

Y1 axis: Collector voltage $V_{\text{collector}}$ (LINEAR)

Y2 axis: Base voltage V_{base} (LINEAR)

For Scale=LOG10, LOG25, or LOG50:

X axis: Collector current $I_{\text{collector}}$ (LOG)

Y1 axis: Collector voltage $V_{\text{collector}}$ (LOG)

Y2 axis: Base voltage V_{base} (LOG)

[List Display]

Collector voltage $V_{\text{collector}}$

Collector current $I_{\text{collector}}$

Base voltage V_{base}

Base current I_{base}

[Parameter Display Area]

Temperature T_a =Temp

18 Power Diode

1. C_j - V_r : Junction capacitance C_j - V_r characteristics (A.04.00)
2. I_f - V_f : Diode forward bias characteristics, SMU voltage pulse (A.04.00)
3. I_r - V_r : Diode reverse bias characteristics (A.04.00)
4. V_f : Diode forward bias characteristics, SMU current pulse (A.04.00)

18.1 *C_j-V_r: Junction capacitance C_j-V_r characteristics (A.04.00)*

[Supported Analyzer]

B1505A

[Description]

Measures the junction capacitance by applying the reverse bias, and plots the C_j-V_r characteristics.

For a more accurate measurement, perform correction data measurement at the measurement frequency before starting the capacitance measurement.

If the measurement frequency is not included in the list of default frequencies below, click the Advanced Options... button and set the measurement frequency on the Frequency area of the Advanced Options for CMU Calibration window.

Default frequencies:

1 k, 2 k, 5 k, 10 k, 20 k, 50 k, 100 k, 200 k, 500 k, 1 M, 1.2 M, 1.5 M, 2 M, 2.5 M, 2.7 M, 3 M, 3.2 M, 3.5 M, 3.7 M, 4 M, 4.2 M, 4.5 M, 5 MHz

[Device Under Test]

Junction device, diode, 2 terminals

Connect Cathode and Anode to the High Voltage Bias-T High and Low respectively.

Or, connect Cathode and Anode to the Test Fixture MFCMU High and MFCMU Low respectively.

[Required Modules and Accessories]

Agilent B1520A MFCMU 1 unit

Agilent N1260A High Voltage Bias-T or Agilent N1259A Test Fixture with the option N1259A-020

[Device Parameters]

Temp: Temperature

YAxisCjMin: Y1/Y2 axis (C_j) minimum value

YAxisCjMax: Y1/Y2 axis (C_j) maximum value

[Test Parameters]

Memo: Memorandum

IntegTime: Integration time

Frequency: Measurement frequency

OscLevel: Measurement signal level

Cathode: CMU used for the capacitance measurement

VrStart: Reverse bias sweep start voltage

VrStop: Reverse bias sweep stop voltage

VrLinearStep: Reverse bias sweep step voltage, effective if Scale=LINEAR

IrLimit: Reverse current compliance

Scale: Scale of the reverse bias sweep, LINEAR, LOG10, LOG25, or LOG50

VrBias: SMU used for the reverse DC bias sweep source

[Extended Test Parameters]

HoldTime: Hold time

DelayTime: Delay time

IrZero: Y3 axis (I_r) minimum value

IrMinRange: Minimum range for the reverse current measurement

[Measurement Parameters]

Junction capacitance C_j

Reverse current I_r

18 Power Diode

[User Function]

Ta: Temperature Ta=Temp

[X-Y Plot]

For Scale=LINEAR:

X axis: Reverse bias V_r (LINEAR)

Y1 axis: Junction capacitance C_j (LINEAR)

Y2 axis: Junction capacitance C_j (LOG)

Y3 axis: Reverse current I_r (LOG)

For Scale=LOG10, LOG25, or LOG50:

X axis: Reverse bias V_r (LOG)

Y1 axis: Junction capacitance C_j (LINEAR)

Y2 axis: Junction capacitance C_j (LOG)

Y3 axis: Reverse current I_r (LOG)

[List Display]

Reverse bias V_r

Junction Capacitance C_j

Reverse current I_r

[Parameter Display Area]

Temperature Ta=Temp

18.2 If-Vf: Diode forward bias characteristics, SMU voltage pulse (A.04.00)

[Supported Analyzer]

B1505A

[Description]

Measures the forward bias voltage vs current characteristics. SMU voltage pulse is used for the forward bias output.

[Device Under Test]

Junction device, diode, 2 terminals

[Device Parameters]

Temp: Temperature

[Test Parameters]

Memo: Memorandum

Anode: SMU connected to Anode terminal, primary sweep voltage output

VfStart: Sweep start voltage for Anode terminal

VfStop: Sweep stop voltage for Anode terminal

VfLinearStep: Sweep step voltage for Anode terminal, effective if Scale=LINEAR

Cathode: GNDU connected to Cathode terminal

PulsePeriodMode: Pulse period mode, AUTO or MANUAL

ManualPulsePeriod: Pulse period, effective if PulsePeriodMode=MANUAL

PulseWidth: Pulse width

IfLimit: Current compliance

Scale: Scale of sweep, LINEAR, LOG10, LOG25, or LOG50

[Extended Test Parameters]

PulseBase: Pulse base voltage

PulseAvgCnt: Pulse averaging count

HoldTime: Hold time

IfZero: Y axis (If) minimum value

MeasurementTime: Actual measurement time for a pulse period

[Measurement Parameters]

Forward current If

[User Function]

Ta: Temperature Ta=Temp

19.8 TDDDB Constant V: Constant voltage TDDDB (A.04.00)

[Supported Analyzer]
B1505A

[Description]
Performs TDDDB (Time Dependent Dielectric Breakdown) test and plots stress time vs leak current characteristics using I/V-t Sampling measurement.

[Device Under Test]
MOS capacitor etc., 2 terminals

[Device Parameters]
Polarity: Nch (SMUs force the specified value) or Pch (SMUs force the negative specified value).
Temp: Temperature

[Test Parameters]
Memo: Memorandum
IntegTime: Integration time
TotalStressTime: Total stress time, 10 s to 10000 s
FailureCondition: Stress current to decide the breakdown
PointPerDecade: Number of samples for one decade
Interval: Sampling interval
Port1: SMU connected to Port1 terminal
VStress: Stress voltage
Port2: SMU connected to Port2 terminal

[Extended Test Parameters]
ILimit: Current compliance
HoldTime: Hold time
MinRange: Minimum current measurement range
StoringRuntimeData: Data save during stress output, Yes or No
IStressZero: Minimum value of IStress for Y axis

[Measurement Parameters]
Stress current IStress

[User Function]
Ta: Temperature Ta=Temp
Qbdval: Charge per unit time $Qbdval = \text{integ}(IStress, Time)$
DN: Number of data $DN = \text{dim1Size}(Index)$

[X-Y Plot]
X axis: Stress time Time (LOG)
Y axis: Stress current IStress (LOG)

[List Display]
Stress time Time
Stress current IStress
Stress voltage ConstantV

[Parameter Display]
Temperature Ta

19 PMIC, Power MOSFET, SiC

[Test Output: X-Y Graph]

X axis: Stress time TimeList (LOG)

Y axis: Stress current IStressList (LOG)

[Test Output: List Display]

Stress time TimeList

Stress current IStressList

Charge for device failure QbdList

[Parameter Display Area]

Device failure time Timebd

Device failure charge Qbd

Temperature Ta=Temp

19.9 Vth Vgs(off): Vth or Vgs(off) measurement (A.04.00)

[Supported Analyzer]

B1505A

[Description]

Measures Drain current vs Gate-Source voltage characteristics and extracts the threshold voltage or the cutoff voltage.

[Device Under Test]

Power MOSFET, 3 terminals

[Device Parameters]

Polarity: Nch (SMUs force the specified value) or Pch (SMUs force the negative specified value).

Temp: Temperature

[Test Parameters]

Memo: Memorandum

Gate: SMU connected to Gate terminal, primary sweep voltage output

VgStart: Sweep start voltage for Gate terminal

VgStop: Sweep stop voltage for Gate terminal

VgStep: Sweep step voltage for Gate terminal

Drain: SMU connected to Drain terminal

Vd: Drain voltage

Source: GNDU connected to Source terminal

Id@Vth_Vgsoff: Drain current to decide Vth or Vgs(off)

MeasMode: Measurement parameter, Vth or Vgsoff

IntegTime: Integration time

IdLimit: Drain current compliance

[Extended Test Parameters]

IgLimit: Gate current compliance

HoldTime: Hold time

DelayTime: Delay time

IdZero: Y axis (Idrain) minimum value

IdMinRange: Minimum range for the drain current measurement

IgMinRange: Minimum range for the gate current measurement

[Measurement Parameters]

Drain current Idrain

Gate current Igate

[User Function]

Ta: Temperature Ta=Temp

[Analysis Function]

For MeasMode=Vth:

Vth=@MX (X coordinate of Marker)

For MeasMode=Vgsoff:

Vgsoff=@MX (X coordinate of Marker)

[Auto Analysis]

Marker: Idrain=Id@Vth_Vgsoff

19 PMIC, Power MOSFET, SiC

[X-Y Plot]

X axis: Gate voltage V_{gate} (LINEAR)

Y1 axis: Drain current I_{drain} (LINEAR)

Y2 axis: Drain current I_{drain} (LOG)

[List Display]

Drain voltage V_{drain}

Drain current I_{drain}

Gate voltage V_{gate}

Gate current I_{gate}

[Parameter Display Area]

Temperature $T_a = \text{Temp}$

For MeasMode= V_{th} :

Threshold voltage V_{th}

For MeasMode= V_{gsoff} :

Cutoff voltage V_{gsoff}
