HP 82000 Software Rev. 6.1.1

Dear User of the HP 82000 IC Test System,

the Böblingen Semiconductor Test Division is pleased to announce the release of a new revision of the System Software for the HP 82000. With this package you will find your update materials, so you can install this enhanced version on your test system and its workstation. The software update includes DDS tapes for the system software. Update Instructions, also part of this package, will give you the pertinent information for updating your system software.

We have again received feedback from you, our customers, requesting added functionality, suggesting improvements for ease of use, and for eliminating some restrictions and bugs that you may have run across. We've tried to reflect those inputs that should help you gain most from for your IC test tasks. We therefore hope you will recognize an added value with the enhancements that are now at your disposal.

HP 82000 Software Rev. 6.1.1 is the first release supporting the UNIX 10.20 revision and is thus fully year 2000 compliant. Please refer to the enclosed guide for details of the installation.

The attached Software Release Bulletin reflects the status of the bugs that have been reported. Open issues are classified and possible workarounds are given.

Due to the obsolesence of the HP82000 hardware his release will be the final distribution for software. We thank you for choosing HP as your test equipment vendor with the HP82000 and hope to continue our relationship on the HP83000 platform.

Yours sincerely,

Frank Holzapfel

Customer Support Engineer
