

UNIX/Windows operating system differences: How they might affect the 3070 software

Why are UX and WN different?

UNIX and Windows operating systems have initially been developed for very different end users.

- UNIX was initially conceived by computer professionals and eventually became widely used by university students and faculty and therefore has fewer constraints. Its basic premise is that the user knows what he/she is doing. To this end, it's more flexible and offers more opportunities to mess us.
- Windows, on the other hand, started off as a commercial product, aimed at home users with potentially, very little computer knowledge. Therefore, it has more checks and less flexibility when it comes to letting the users perform "expert level" tasks.
