Notice.

The information contained in this document is subject to change without notice. Companies, names, and data used in examples herein are fictitious unless otherwise noted. Agilent Technologies makes no warranty of any kind with regard to this material, including but not limited to, the implied warranties of merchantability and fitness for a particular purpose. Agilent Technologies shall not be liable for errors contained herein or for incidental or consequential damages in connection with the furnishing, performance, or use of this material.

Restricted Rights Legend.

Use, duplication, or disclosure by the U.S. Government is subject to restrictions as set forth in subparagraph (c) (1)(ii) of the Rights in Technical Data and Computer Software clause at DFARS 252.227-7013 for DOD agencies, and subparagraphs (c) (1) and (c) (2)of the Commercial Computer Software Restricted Rights clause at FAR 52.227-19 for other agencies.

Safety Symbols.

CAUTION

The *caution* sign denotes a hazard. It calls attention to a procedure which, if not correctly performed or adhered to, could result in damage to or destruction of the product. Do not proceed beyond a caution sign until the indicated conditions are fully understood and met.

WARNING

The warning sign denotes a hazard. It calls attention to a procedure which, if not correctly performed or adhered to, could result in injury or loss of life. Do not proceed beyond a warning sign until the indicated conditions are fully understood and met.

The instruction man-A ual symbol. The product is marked with this warning symbol when it is necessary for the user to refer to the instructions in the manual

The laser radiation /₩A symbol. This warning symbol is marked on products which have a laser output.

> The AC symbol is used to indicate the required nature of the line module input power.

The ON symbols are used to mark the positions of the instrument power line switch.

• The OFF symbols are used to mark the positions of the instrument power line switch

The CE mark is a reg-**(** istered trademark of the European Community.

The CSA mark is a registered trademark of the Canadian Standards Association.

This text denotes the ISM1-A instrument is an Industrial Scientific and Medical Group 1 Class A product.

Typographical Conventions.

The following conventions are used in this book:

Key type for keys or text located on the keyboard or instrument.

Softkey type for key names that are displayed on the instrument's screen.

Display type for words or characters displayed on the computer's screen or instrument's display.

User type for words or characters that you type or enter.

Emphasis type for words or characters that emphasize some point or that are used as place holders for text that you type.

п

The Agilent 8702D—At a Glance

The Agilent 8702D Programmer's Guide shows you how to program the instrument. The programming syntax conforms to the IEEE 488.2 Standard Digital Interface for Programmable Instrumentation.

Chapter 1, "Writing Programs" provides information on addressing the instrument, debugging programs, and other important tasks. Each programming command is documented in Chapter 3, "Language Reference". Chapter 4, "Graphics Language Reference" documents graphics commands for drawing objects on the display. Refer to Chapter 2, "Examples" for a list of practical examples using common measurement tasks.

Writing Programs

Writing Programs

This chapter provides a general introduction to programming the Agilent 8702D. It covers topics such as command syntax, addressing the instrument, initializing the instrument, and returning measurement results to the computer.

Before you begin programming, you should first become proficient at making manual measurements as explained in the *Agilent 8702D User's Guide*. Once you learn the techniques and softkey presses needed to make a measurement, you can refer to Table 5-4, "Keys versus Programming Commands," on page 5-21 to locate the equivalent programming command.

NOTE:

The Agilent 8702D conforms to IEEE 488.1 and IEC-625 standards for interfacing instruments.

General Information

The Agilent 8702D occupies two GPIB addresses: the instrument itself and the display. The display address is derived from the instrument address as described in "Drawing Graphics on the Display" on page 1-32. These addresses are stored in short-term, non-volatile memory and are not affected when you press PRESET or cycle the power. The default address for the Agilent 8702D is device 16, and the display address is device 17.

There is also an address for the system controller. This address refers to the controller when the Agilent 8702D is being used in pass-control mode. This is the address that control is passed back to when the Agilent 8702D-controlled operation is complete.

You can change the GPIB address from the front panel as described in "To change the GPIB address" on page 1-7.

GPIB status lights

When the Agilent 8702D is connected to the GPIB, the front-panel GPIB status lights indicate the current status of the Agilent 8702D. These lights have the following definitions:

- R = Remote operation
- L = Listen mode
- T = Talk mode
- S = Service request (SRQ) asserted by the Agilent 8702D

Remote mode and front-panel lockout

Whenever the instrument is controlled by a computer, the front-panel GPIB remote status light, R, is turned on, and the instrument keys are disabled. Press the LOCAL key to restore front panel control of the instrument.

Consult the documentation for your programming environment to determine which commands are used to put an instrument in the remote and local lockout modes. These are not Agilent 8702D commands; they control GPIB control lines and do not send any characters to the Agilent 8702D.

Initialize the instrument at the start of every program

It is good practice to initialize the instrument at the start of every program. This ensures that the bus and all appropriate interfaces are in a known state. HP BASIC provides a CLEAR command which clears the interface buffer and also resets the instrument's parser. (The parser is the program that reads the instructions that you send.) Whenever the instrument is under remote programming control, it should be in the single measurement acquisition mode. This is automatically accomplished when the RST is used. The RST command initializes the instrument to the factory preset state:

CLEAR 716 OUTPUT 716;"RST"

Notice in the example above, that the commands are sent to an instrument address of 716. This indicates address 16 on an interface with select code 7. Pressing the PRESET key does not change the GPIB address. Pressing the PRESET key resets the instrument to either the factory preset state or a user-defined preset state.

Rules for writing commands

The Agilent 8702D accepts letters, changing lowercase to uppercase, numbers, decimal points, +, -, semicolons, carriage returns and line feeds. Leading zeros, spaces, carriage returns, and unnecessary terminators are ignored, except when inserted between a command and a numerical or string argument. If the analyzer does not recognize a character as appropriate, it generates a syntax error message and recovers at the next terminator.

For example, the CHAN command must be entered as CHAN1 or CHAN2. Inserting a space in the syntax (CHAN 1) results in an error. However, a space must be entered between the MARK2 command and its argument. For example, MARK2 1.4GHZ.

Units and terminators

The Agilent 8702D outputs data in basic units and assumes these basic units when it receives an input (unless the input is otherwise qualified). The basic units and allowable expressions can be found below. Both uppercase and low-ercase letters are acceptable.

Table 1-1. Terminator Codes

S	Seconds	HZ	Hertz
MS	Milliseconds	KHZ	Kilohertz
US	Microseconds	MHZ	Megahertz
NS	Nanoseconds	GHZ	Gigahertz
PS	Picoseconds	DB	dB or dBm
FS	Femtoseconds	V	Volts
		1	

Terminators are used to indicate the end of a command. This allows the Agilent 8702D to recover to the next command in the event of a syntax error. The semicolon (;) is the recommended command terminator. The line-feed character (LF) and the GPIB EOI line can also be used as terminators. Again, the Agilent 8702D will ignore the carriage-return character (CR).

Capability	Description
SH1	Full-source handshake.
AH1	Full-acceptor handshake.
T6	Basic talker, answers serial poll, unaddresses if MLA is issued. No talk-only mode.
L4	Basic listener, unaddresses if MTA is issued. No listen-only mode.
SR1	Complete service request (SRQ) capabilities.
RL1	Complete remote/local capability including local lockout.
PPO	Does not respond to parallel poll.
DC1	Complete device clear.
DT1	Responds to a Group Execute Trigger (GET) in the hold-trigger mode.
C1,C2,C3	System controller capabilities in system-controller mode.
C10	Pass control capabilities in pass-control mode.

Table 1-2. GPIB Interface Capabilities

Capability	Description
E2	Tri-state drivers.
LEO	No extended listener capabilities.
TE0	No extended talker capabilities.

To select the communication mode

- $1~\ensuremath{\mathsf{Press}}$ the LOCAL key.
- $2\ \mbox{Press TALKER/LISTENER}$ so that this softkey is underlined.

To change the GPIB address

- $1 \ \ {\rm Press\ the\ LOCAL\ key}.$
- **2** Press SET ADDRESSES.
- 3 Press ADDRESS: 8702.
- ${f 4}$ Use the front-panel knob or keys to enter the new GPIB address.

Selecting the GPIB Device Mode

Three different device modes are possible for the Agilent 8702D:

- talker/listener mode
- system-controller mode
- pass-control mode

Performing an instrument preset does not affect the selected bus mode, although the bus mode will return to talker/listener mode if the line power is cycled.

Talker/listener mode

This is the mode that is normally used for remote programming of the Agilent 8702D. In talker/listener mode, the Agilent 8702D and all peripheral devices are controlled from an external instrument controller. The controller can command the Agilent 8702D to talk and other devices to listen. The Agilent 8702D and peripheral devices cannot talk directly to each other unless the computer sets up a data path between them. This mode allows the Agilent 8702D to act as either a talker or a listener, as required by the control-ling computer for the particular operation in progress.

While in this mode, the Agilent 8702D can make a plot or print using the OUT-PPLOT; or OUTPPRIN; commands. The Agilent 8702D will wait until it is addressed to talk by the system controller and then dump the display to a plotter/printer that the system controller has addressed to listen. Use of the commands PLOT; and PRINALL; require control to be passed to another controller.

System-controller mode

Do not attempt to use this mode for programming. This mode allows the Agilent 8702D to control peripherals directly in a stand-alone environment (without an external controller). This mode can only be selected manually from the Agilent 8702D's front panel. It can only be used if no active computer or instrument controller is connected to the system via GPIB. If an attempt is made to set the Agilent 8702D to the system-controller mode when another

controller is connected to the interface, the following message is displayed on the Agilent 8702D's display screen: "CAUTION: ANOTHER SYSTEM CONTROLLER ON HP-IB".

The Agilent 8702D must be set to the system-controller mode in order to access peripherals from the front panel. In this mode, the Agilent 8702D can directly control peripherals (for example, plotters, printers, disk drives, and power meters) and the Agilent 8702D may plot, print, store on disk or perform power meter functions.

Pass-control mode

This mode allows the computer to control the Agilent 8702D via GPIB (as with the talker/listener mode), but also allows the Agilent 8702D to take control of the interface in order to plot, print, or access a disk. During an Agilent 8702D-controlled peripheral operation, the host computer is free to perform other internal tasks (for example, data or display manipulation) while the Agilent 8702D is controlling the bus. After the Agilent 8702D-controlled task is completed, the Agilent 8702D returns control to the system controller.

In pass-control mode, the Agilent 8702D can request control from the system controller and take control of the bus if the controller addresses it to take control. This allows the Agilent 8702D to take control of printers, plotters, and disk drives on an as-needed basis. The Agilent 8702D sets event-status-register bit 1 when it needs control of the interface, and the Agilent 8702D will transfer control back to the system controller at the completion of the operation. It will pass control back to its controller address, specified by ADDR-CONT.

To change the GPIB device mode

- $1 \ \ \, {\rm Press \ the \ LOCAL \ key}.$
- 2 Press SET ADDRESSES.

Making Measurements

This section explains how to organize instrument commands into a measurement sequence. A typical measurement sequence consists of the following steps:

- **1** Setting up the instrument
- 2 Calibrating the test setup
- **3** Connecting the device under test
- 4 Taking the measurement data
- **5** Post-processing the measurement data
- 6 Transferring the measurement data

Step 1. Setting up the instrument

Define the measurement by setting all of the basic measurement parameters. These include:

- sweep type
- frequency span
- sweep time
- number of points (in the data trace)
- RF power level
- type of measurement
- IF averaging
- IF bandwidth

You can quickly set up an entire instrument state, using the save/recall registers and the learn string. The learn string is a summary of the instrument state compacted into a string that the computer reads and retransmits to the analyzer. Refer to "Using the Learn String" on page 2-45.

Step 2. Calibrating the test setup

After you have defined an instrument state, you should perform a measurement calibration. Although it is not required for the measurement of O/E and E/O devices, a measurement calibration is required to obtain useful measurements.

The following list describes several methods to calibrate the analyzer:

- Stop the program and perform a calibration from the analyzer's front panel.
- Use the computer to guide you through the calibration, as discussed in "S11 1-Port Measurement Calibration" on page 2-8 and "Full 2-Port Measurement Calibration" on page 2-13.
- Transfer the calibration data from a previous calibration back into the analyzer, as discussed in "Using Instrument States" on page 2-52.

Step 3. Connecting the device under test

After you connect your test device, you can use the computer to speed up any necessary device adjustments such as limit testing, bandwidth searches, and trace statistics.

Step 4. Taking the measurement data

Measure the device response and set the analyzer to hold the data. This captures the data on the analyzer display.

By using the single-sweep command (SING), you can insure a valid sweep. When you use this command, the analyzer completes all stimulus changes before starting the sweep, and does not release the GPIB hold state until it has displayed the formatted trace. Then when the analyzer completes the sweep, the instrument is put into hold mode, freezing the data. Because single sweep is OPC-compatible, it is easy to determine when the sweep has been completed.

The number-of-groups command (NUMGn) triggers multiple sweeps. It is designed to work the same as the single-sweep command. NUMGn is useful for making a measurement with an averaging factor n (n can be 1 to 999). Both the single-sweep and number-of-groups commands restart averaging.

Writing Programs
Making Measurements

Step 5. Post-processing the measurement data

Figure 1-1 on page 1-21 shows the process functions used to affect the data after you have made an error-corrected measurement. These process functions have parameters that can be adjusted to manipulate the error-corrected data prior to formatting. They do not affect the analyzer's data gathering. The most useful functions are trace statistics, marker searches, electrical-delay offset, time domain, and gating.

After performing and activating a full 2-port measurement calibration, any of the four S-parameters may be viewed without taking a new sweep.

Step 6. Transferring the measurement data

Read your measurement results. All the data-output commands are designed to ensure that the data transmitted reflects the current state of the instrument.

Reading Data

Output queue

Whenever a output-data command is received, the Agilent 8702D puts the data into the output queue (or buffer) where it is held until the system controller outputs the next read command. The queue, however, is only one event long; the next output-data command will overwrite the data already in the queue. Therefore, it is important to read the output queue immediately after every interrogation or data request from the Agilent 8702D.

Command interrogate

All instrument functions can be interrogated to find the current ON/OFF state or value. For instrument state commands, append the question mark character (?) to the command to interrogate the state of the functions. Suppose the operator has changed the power level from the Agilent 8702D's front panel. The computer can ascertain the new power level using the Agilent 8702D's command-interrogate function. If a question mark is appended to the root of a command, the Agilent 8702D will output the value of that function. For instance, POWE 7 DB; sets the source power to 7 dB, and POWE?; outputs the current RF source power at the test port. When the Agilent 8702D receives POWE?;, it prepares to transmit the current RF source power level. This condition illuminates the Agilent 8702D front-panel talk light (T). In this case, the Agilent 8702D transmits the output power level to the controller.

ON/OFF commands can be also be interrogated. The reply is a one (1) if the function is ON or a zero (0) if it is OFF. For example, if a command controls an active function that is underlined on the Agilent 8702D display, interrogating that command yields a one (1) if the command is underlined or a zero (0) if it is not. As another example, there are nine options on the format menu and only one option is underlined at a time. Only the underlined option will return a one (1) when interrogated. For instance, send the command string DUAC?; to the Agilent 8702D. If dual-channel display is switched ON, the Agilent 8702D will return a one (1) to the instrument controller.

Similarly, to determine if phase is being measured and displayed, send the command string PHAS?; to the Agilent 8702D. In this case, the Agilent 8702D will return a one (1) if phase is currently being displayed. Since the command only applies to the active channel, the response to the PHAS?; query depends on which channel is active.

Output syntax

The following three types of data are transmitted by the Agilent 8702D in ASCII format:

- response to interrogation
- certain output commands
- ASCII floating-point (form 4) array transfers

When multiple numbers are sent, the numbers are separated by commas.

Character(s)*	Definition
Sign	– for negative, blank for positive.
3 digits	Digits to the left of the decimal point.
Decimal point	
15 digits	Digits to the right of the decimal point.
E	Exponent notation.
Sign	– for negative, + (or blank) for positive.
Exponent	Two digits for the exponent.

Table 1-3. Form 4 (ASCII) Data-Transfer Character Definitions

* The items in this column are separated by commas and delimited (terminated) with a line feed character (LF).

Marker data

The Agilent 8702D offers several options for outputting trace-related data. Trace information can be read out of the Agilent 8702D in several different formats. Data can be selectively read from the trace using the markers, or the entire trace can be read by the controller. If only specific information is required (such as a single point on the trace or the result of a marker search), the marker output command can be used to read the information.

To read the trace data using the marker, the marker must first be assigned to the desired frequency. This is accomplished using the marker commands. The controller sends a marker command followed by a frequency within the tracedata range. If the actual desired frequency was not sampled, the markers can be set to continuous mode and the desired marker value will be linearly interpolated from the two nearest points. This interpolation can be prevented by putting the markers into discrete mode. Discrete mode allows the marker to only be positioned on a measured trace-data point.

As an alternative, the Agilent 8702D can be programmed to choose the stimulus value by using the MARKER SEARCH function. Maximum, minimum, target value, or bandwidths search can be automatically determined with MARKER SEARCH. To continually update the search, switch the marker tracking ON. The trace-maximum search will remain activated until:

- The search is switched OFF
- The tracking is switched OFF
- All markers are switched OFF

Marker data can be output to a controller with a command to the Agilent 8702D. This set of commands causes the Agilent 8702D to transmit three numbers: marker value 1, marker value 2, and marker stimulus value. In log-magnitude display mode we get the log magnitude at marker 1, zero, and the marker frequency. Refer to "Units as a Function of Display Format" on page 1-16 for a complete listing of all the possibilities for values 1 and 2. The three possibilities for the third parameter are:

- frequency
- time (as in time domain)
- CW time

		OUTPMARK		OUTPFORM		Marker Readout	
Display Format	Marker Mode	Value 1	Value 2	Value 1	Value 2	Value	AUX Value
LOG MAG		dB	†	dB	†	dB	†
PHASE		degrees	†	degrees	†	degrees	†
DELAY		seconds	†	seconds	†	seconds	†
SMITH CHART	LIN MKR	lin mag	degrees	real	imag	lin mag	degrees
	LOG MKR	dB	degrees	real	imag	dB	degrees
	Re/Im	real	imag	real	imag	real	imag
	R + jX	real ohms	imag ohms	real	imag	real ohms	imag ohms

REAL		real	†	real	†	real	†
SWR		SWR	†	SWR	†	SWR	†
SWR		SWR	†	SWR	†	SWR	t

* The marker readout values are the marker values displayed in the upper right-hand corner of the display. They also correspond to the value and auxiliary value associated with the fixed marker.

[†] Value 2 is not significant in this format, though it is included in data transfers.

Array-data formats

The Agilent 8702D can transmit and receive arrays in the Agilent 8702D's internal binary format, as well as four different numeric formats. The current format is set with the FORM command. This command does not affect learn-string transfers, calibration-kit string transfers, or non-array transfers, such as command interrogate, or output marker values. A transmitted array will be output in the current format, and the Agilent 8702D will attempt to read incoming arrays according to the current format. Each data point in an array is a pair of numbers, usually a real/imaginary pair. The number of data points in each array is the same as the number of points in the current sweep.

The five formats are described below:

- 1 The Agilent 8702D's internal binary format, 6 bytes-per-data point. The array is preceded by a four-byte header. The first two bytes represent the string "#A", the standard block header. The second two bytes are an integer representing the number of bytes in the block to follow. FORM 1 is best applied when rapid data transfers, not to be modified by the computer nor interpreted by the user, are required.
- **2** IEEE 32-bit floating-point format, 8 bytes-per-data point. The data is preceded by the same header as in FORM 1. Each number consists of a 1-bit sign, an 8-bit biased exponent, and a 23-bit mantissa. FORM 2 is the format of choice if your computer supports single-precision floating-point numbers.
- **3** IEEE 64-bit floating-point format, 16 bytes-per-data point. The data is preceded by the same header as in FORM 1. Each number consists of a 1-bit sign, an 11-bit biased exponent, and a 52-bit mantissa. This format may be used with double-precision floating-point numbers. No additional precision is available in the Agilent 8702D data, but FORM 3 may be a convenient form for transferring data to your computer.
- **4** ASCII floating-point format. The data is transmitted as ASCII numbers, as described in "Output syntax" on page 1-14. There is no header. The Agilent 8702D uses FORM 4 to transfer data that is not related to array transfers (for example, marker responses and instrument settings).
- **5** PC-DOS 32-bit floating-point format with 4 bytes-per-number, 8 bytes-per-data point. The data is preceded by the same header as in FORM 1. The byte order is reversed to comply with PC-DOS formats. *If you are using a PC-based controller, FORM 5 is the most effective format to use.*

The Agilent 8702D terminates each transmission by asserting the EOI interface line with the last byte transmitted. Table 1-5 on page 1-18 offers a comparative overview of the five array-data formats.

Format Type	Type of Data	Bytes per Data Value	Bytes per Data Pointª	Bytes per 201 Point Trace	Total Bytes with Header
1	Internal Binary	3	6	1206	1210
2	IEEE 32-bit Floating-Point	4	8	1608	1612
3	IEEE 64-bit Floating-Point	8	16	3216	3220
4	ASCII Numbers	24	50	10,050	10,050 ^b
5	PC-DOS 32-bit Floating-Point	4	8	1608	1612

Table 1-5. Agilent 8702D/Option 011 Array-Data Formats

a. There are two data values (real and imaginary) for every data point.

b. No header is used in form 4.

Trace-data transfers

Transferring trace data from the Agilent 8702D using an instrument controller can be divided into three steps:

- 1 allocating an array to receive and store the data
- 2 commanding the Agilent 8702D to transmit the data
- **3** accepting the transferred data

Data residing in the Agilent 8702D is always stored in pairs for each data point (to accommodate real/imaginary pairs). The real value is first, followed by the imaginary value. Hence, the receiving array has to be two elements wide, and as deep as the number of points in the array being transferred. Memory space for the array must be declared before any data can be transferred from the Agilent 8702D to the computer. When reading logarithmic amplitude and phase, save the first value of each data point pair and discard the second value.

As mentioned earlier, the Agilent 8702D can transmit data over GPIB in five different formats. The type of format affects what kind of data array is declared (real or integer), because the format determines what type of data is transferred. "Data Transfer Using Markers" on page 2-18 illustrates an ASCII transfer using Form 4. For more information on the various data formats, refer

to "Array-data formats" on page 1-17. For information on the various types of data that can be obtained (raw data, error-corrected data, etc.), refer to "Data levels" on page 1-22.

Frequency-related arrays

Frequency-related values are calculated for the Agilent 8702D displays. The only data available to the programmer are the start and stop frequencies, or center and span frequencies, of the selected frequency range.

In a linear frequency range, the frequency values can be easily calculated because the trace data points are equally spaced across the trace. Relating the data from a linear frequency sweep to frequency can be done by interrogating the start frequency, the frequency span, and the number of points in the trace.

Given that information, the frequency of point n in a linear-frequency sweep is represented by the equation:

F=Start frequency + (n-1) × Span/(Points-1)

In most cases, this is an easy solution for determining the related frequency value that corresponds with a data point. This technique is illustrated in "Data Transfer Using Markers" on page 2-18.

When using log sweep or a list-frequency sweep, the points are not evenly spaced over the frequency range of the sweep. In these cases, the frequencies can be read directly out of the instrument with the OUTPLIML command. "Data Transfer Using Frequency-Array Information" on page 2-28 demonstrates this technique.

Executing OUTPLIML; reports the limit-test results by transmitting:

- the stimulus point tested
- a number indicating the limit-test results
- the upper test limit at the stimulus point (if available)
- the lower test limit at the stimulus point (if available)

The numbers used to indicate the limit-test results are:

- a negative one (-1) for no test
- a zero (0) for fail
- a positive one (1) for pass

If there are no limits available, the Agilent 8702D transmits zeros.

This data is very useful when testing with limit lines. It provides a method of obtaining accurate frequency-stimulus values to correspond with the trace data. The other limit-related values may be discarded and the stimulus values used with the trace-data points.

Data-Processing Chain

This section describes the manner in which the Agilent 8702D processes measurement data. It includes information on data arrays, common output commands, data levels, the learn string, and the calibration kit string.

Data arrays

Figure 1-1 on page 1-21 shows the different kinds of data available within the instrument:

- raw measured data
- error-corrected data
- formatted data
- trace memory
- calibration coefficients

Trace memory can be directly output to a controller with ${\tt OUTPMEMO}$; , but it cannot be directly transmitted back.

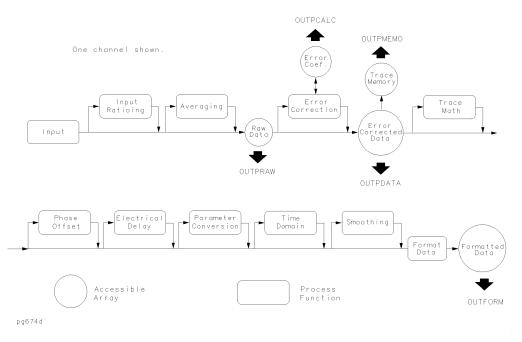

Figure 1-1. The data-processing chain

All the data-output commands are designed to insure that the data transmitted reflects the current state of the instrument:

- OUTPDATA, OUTPRAW, and OUTPFORM will not transmit data until all formatting functions have completed.
- OUTPLIML, OUTPLIMM, and OUTPLIMF will not transmit data until the limit test has occurred (if activated).
- OUTPMARK will activate a marker if a marker is not already selected. It will also insure that any current marker searches have been completed before transmitting data.
- OUTPMSTA insures that the statistics have been calculated for the current trace before transmitting data. If the statistics are not activated, it will activate the statistics long enough to update the current values before deactivating the statistics.

	Writing Programs Data-Processing Chain
•	OUTPMWID insures that a bandwidth search has been executed for the current trace before transmitting data. If the bandwidth-search function is not activated, it will activate the bandwidth-search function long enough to update the current values before switching OFF the bandwidth-search functions.
	Data levels Different levels of data can be read out of the instrument. Refer to the data- processing chain in Figure 1-1 on page 1-21.
	The following list describes the different types of data that are available from the Agilent 8702D.
Raw data	The basic measurement data, reflecting the stimulus parameters, IF averaging, and IF bandwidth. If a full 2-port measurement calibration is activated, there are actually four raw arrays kept: one for each raw S-parameter. The data can be output to a controller with the commands OUTPRAW1, OUTPRAW2, OUTPRAW3, OUTPRAW4. Normally, only raw 1 is available, and it holds the current parameter. If a 2-port measurement calibration is active, the four arrays refer to S_{11} , S_{21} , S_{12} , and S_{22} respectively. This data is represented in real/imaginary pairs.
Error-corrected data	This is the raw data with error-correction applied. The array represents the currently measured parameter, and is stored in real/imaginary pairs. The error-corrected data can be output to a controller with the OUTPDATA; command. The OUTPMEMO; command reads the trace memory, if available. The trace memory also contains error-corrected data. Note that neither raw nor error-corrected data reflect such post-processing functions as electrical-delay offset, trace math, or time-domain gating.
Formatted data	This is the array of data actually being displayed. It reflects all post-processing functions such as electrical delay and time domain. The units of the array output depend on the current display format. Refer to Table 1-4, "Units as a Function of Display Format," on page 1-16 for the various units defined as a function of display format.

Calibration coefficients

The results of a measurement calibration are arrays containing calibration coefficients. These calibration coefficients are then used in the error-correction routines. Each array corresponds to a specific error term in the error model. The *Agilent 8702D User's Guide* details which error coefficients are used for specific calibration types, as well as the arrays those coefficients can be found in. Not all calibration types use all 12 arrays. The data is stored as real/imaginary pairs.

Generally, formatted data is the most useful of the four data levels, because it is the same information the operator sees on the display. However, if post-processing is unnecessary (possibly in cases involving smoothing), error-corrected data may be more desirable. Error-corrected data also affords the user the opportunity to input the data to the Agilent 8702D and apply post-processing at another time.

Learn string and calibration-kit string

The learn string is a summary of the instrument state. It includes all the frontpanel settings, the limit-test tables, and the list-frequency table for the current instrument state. It does not include calibration data or the information stored in the save/recall registers.

The learn string can be output to a controller with the OUTPLEAS; executable, which commands the Agilent 8702D to start transmitting the binary string. The string has a fixed length for a given firmware revision. It can not be more than 3000 bytes in length. The array has the same header as in Form 1.

The calibration kit is a set of key characteristics of the calibration standards used to increase the calibration accuracy. There are default kits for several different connector types. There is also space for a user-defined calibration kit. The command OUTPCALK outputs the currently active calibration kit as a binary string in Form 1. As with the learn string, the calibration-kit string has a fixed length for a given firmware revision. It can not be longer than 1000 bytes.

Controlling Command Execution

Some Agilent 8702D commands require relatively longer execution times due to measurement sweeps or other processes and, occasionally, there is a need to know when certain Agilent 8702D operations have been completed. There is an operation-complete function (OPC) that allows a synchronization of programs with the execution of certain key commands. Table 1-6 on page 1-25 lists all the OPC-compatible commands for the instrument.

Synchronized program execution with OPC command

Issue an OPC; or OPC?; prior to an OPC-compatible command. The status byte or ESR operation-complete bit will then be set after the execution of the OPC-compatible command. For example, issuing OPC; SING; causes the OPC bit to be set when the single sweep is finished. Issuing OPC?; in place of OPC; causes the Agilent 8702D to output a one (1) when the command execution is complete.

Addressing the Agilent 8702D to talk after issuing OPC?; will not cause an addressed to talk without selecting output error, but the Agilent 8702D will halt the computer by not transmitting the one (1) until the command has completed. For example, executing OPC?; PRES;, and then immediately interrogating the Agilent 8702D, causes the bus to halt until the instrument preset is complete and the Agilent 8702D outputs a one (1).

As another example, consider the timing of sweep completion. Send the command string SWET 3 S;OPC?;SING; to the Agilent 8702D. This string sets the Agilent 8702D sweep time to 3 seconds, and then waits for completion of a single sweep to respond with a one (1). The computer is programmed to read the one (1) response from the Agilent 8702D as the completion of the single sweep. The program then waits until the sweep is completed before continuing operation. At this point a valid trace exists and the trace data can be read into the computer.

OPC-compatible commands delay execution of other commands

The Agilent 8702D cannot process other commands while executing OPCcompatible commands. Once a OPC-compatible command is received, the Agilent 8702D reads new commands into the input buffer, but it will not begin the execution of any commands until the completion of the OPC-compatible command. When the 15-character input buffer is full, the Agilent 8702D holds off the bus until it is able to process the commands in the buffer.

Table 1-6. OPC-Compatible Commands

a. The CLASS commands are OPC-compatible if there is only one standard in the class.

Calibrating for Measurements

Measurement calibration over GPIB follows the same command sequence as a calibration from the front panel. Since different cal kits can have a different number of standards in a given class, any automated calibration sequence is valid only for a specific cal kit. Table 1-7 on page 1-27 indicates the relationship between calibration and classes. Table 1-8 on page 1-28 describes the calibration arrays.

To calibrate the instrument

- 1 Select a calibration kit, such as 50 ohm type N (CALKN50; over GPIB). Load a calibration standard definition from disk or enter the coefficients for O/E and E/O measurements.
- **2** Select a calibration type, such as S_{11} 1-port (CALIS111; over GPIB).
- **3** Call each class used by the calibration type, such as FORWARD: OPEN (CLASS11A over GPIB). During a 2-port calibration, the reflection, transmission, and isolation subsequences must be opened before the classes in the subsequence are called, and then closed at the end of each subsequence.
- **4** If a class has more than one standard in it, select a standard from the menu presented (STANA to STANG over GPIB).
- **5** The STANA to STANG commands are all held commands because they trigger a sweep. If a class has only one standard in it, which means that it will trigger a sweep when called, the class command will be held also.
- **6** If, during a calibration, two standards are measured to satisfy one class, the class must be closed with DONE;.
- 7 Declare the calibration done, such as with DONE 1-PORT CAL (SAV1; over GPIB).

Class	Response	Response and Isolation	S11 1-port	S22 1-port	One path 2-port	Full 2-port	TRL*/LRM*	Response and Match E/O	Response and Match O/E

3			E _{RF}	E _{RR}	E _R	E _{RF}	E _{rf}
4			E _{XF}	E _{XF}		E _{XF}	E _{xf}
5			E _{TF}	E		ELF	ELF
6				E _{TF}		E _{tf}	E _{tf}
7						E _{DR}	E _{DR}
8						E _{SR}	E _{sr}
9						E _{rr}	E
10						E _{xr}	E _{XR}
11						E	E
12						E _{tr}	E _{tr}

a. Meaning of first subscript: D=directivity, S=source match, R=reflection tracking, X=crosstalk, L=load match, T=transmission tracking.

b. Meaning of second subscript: F=forward, R=reverse.

c. One path, 2-port cal duplicates arrays 1 to 6 in arrays 7 to 12.

d. Response and isolation corrects for crosstalk and transmission tracking in transmission measurements, and for directivity and reflection tracking in reflection measurements.

Debugging Programs

A GPIB diagnostic feature (debug mode) is available in the GPIB menu. Activating the debug mode causes the analyzer to scroll incoming GPIB commands across the display. Nonprintable characters are represented with an π character. Any time the analyzer receives a syntax error, the commands halt, and a pointer indicates the misunderstood character.

To start debugging mode

- $1 \ \ \, {\rm Press \ the \ LOCAL \ key}.$
- 2 Press HP-IB DIAG ON OFF so that ON its highlighted.

Understanding File Names

Disk files created by the analyzer consist of a state name of up to eight characters, such as FILTER, appended with up to two characters. In LIF format, the file name is FILTERXX. In DOS format, the filename is FILTER.XX. The first appended character is the file type, telling the kind of information in the file. The second appended character is a data index, used to distinguish files of the same type. Data and calibration files are Form 3 data (without a header) which can be read off the disk. The other files are not meant to be decoded. Table 1-9 on page 1-31 lists the appended characters and their meanings.

Table	1-9.	Disk	File	Names
-------	------	------	------	-------

Appended Character 1	Definition	Appended Character 2	Definition
	Instrument state		
G	Graphics	1	Display graphics
		0	Graphics index
D	Error corrected data	1	Channel 1
		2	Channel 2
R	Raw data	1 to 4	Channel 1, raw arrays 1 to 4
		5 to 8	Channel 2, raw arrays 1 to 4
F	Formatted data	1	Channel 1
		2	Channel 2
Μ	Memory trace	1	Channel 1
		2	Channel 2
Р	Instrument state appendix		
С	Cal kit	K	
1	Cal data, channel 1	0	Stimulus state
		1 to 9	Coefficients 1 to 9
		А	Coefficient 10
		В	Coefficient 11
		С	Coefficient 12
2	Cal data, channel 2	0 to C	Same as channel 1

Drawing Graphics on the Display

You can use the Agilent 8702D's screen as a graphics display for showing connection diagrams or custom instructions to an operator. For programming purposes, consider the display as a separate device; it has its own GPIB address. The display's address is configured automatically based on the address of the Agilent 8702D.

The display's default GPIB address is 17. If you change the Agilent 8702D's default address, you can determine the display's new address with the following instructions. If the Agilent 8702D address is an even number, add 1 to the address. If the Agilent 8702D address is an odd number, subtract 1 from the address.

The display accepts a subset of Hewlett-Packard¹ Graphics Language (HP-GL) commands. These commands are documented in Chapter 4, "Graphics Language Reference". Some HP-GL commands are accepted but ignored. These commands are documented in Table 1-10 on page 1-33.

When using the graphics commands, you will need to specify positions on the display. The origin (0, 0) is located in the display's lower left corner.

Graticule:

- length: 350 to 4915
- height: 150 to 3950

Complete Display (includes annotation and softkeys):

- length: 0 to 5850
- height: 0 to 4095

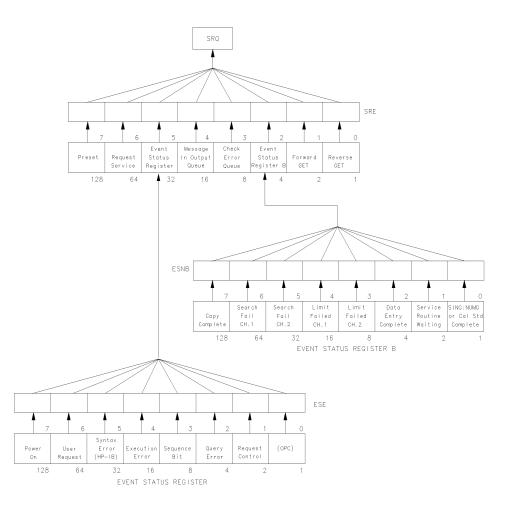

^{1.} Hewlett-Packard and HP are registered trademarks of Hewlett-Packard Company.

Command	Description
IM	Input service request mask
IP	Input P1,P2 scaling points
IW	Input window
OC	Output current pen position
OE	Output error
01	Output identity
OS	Output status
SL	Character slant
SR	Relative character size

Table 1-10. Ignored but Accepted HP-GL Commands

Monitoring the Instrument

Almost every program that you write will need to monitor the Agilent 8702D for its operating status and errors. This includes querying execution or command errors and determining whether or not measurements have been completed. Several status registers and queues are provided to accomplish these tasks. In this section, you'll learn how to enable and read these registers. You'll also learn about reading the error messages in the error queue.

pg6151d

Figure 1-2. Status reporting structure

Writing Programs Monitoring the Instrument

The Status Byte The analyzer has a status-reporting mechanism that reports information about specific analyzer functions and events. The status byte (consisting of summary bits) is the top-level register. Each bit reflects the condition of another register or queue. If a summary bit is set (equals 1), the corresponding register or queue should be read to obtain the status information and clear the condition. Reading the status byte does not affect the state of the summary bits. The summary bits always reflect the condition of the summarized queue or register. The status byte can be read by a serial poll or by using the command OUTPSTAT. When using this command, the sequencing bit can be set by the operator during the execution of a test sequence. OUTPSTAT does not automatically put the instrument in remote mode, thus giving the operator access to the analyzer's front-panel functions.

The status byte:

- summarizes the error queue
- summarizes two event-status registers that monitor specific conditions inside the instrument
- contains a bit that is set when the instrument is issuing a service request (SRQ) over GPIB
- contains a bit that is set when the analyzer has data to transmit over GPIB

Any bit in the status byte can generate a service request

Any bit in the status byte can be selectively enabled to generate a service request (SRQ) when set. Setting a bit in the service-request-enable register with the SREnn; executable enables the corresponding bit in the status byte. The units variable *nn* represents the binary equivalent of the bit in the status byte. For example, SRE24; enables status-byte bits 3 and 4 (since $2^3 + 2^4 = 24$) and disables all the other bits. SRE will not affect the state of the status-register bits.

The status byte summarizes two queues

The status byte also summarizes two queues: the output queue and the error queue. (The error queue is described in "Error Messages" on page 1-39.) When the analyzer outputs information, it puts the information in the output queue where it resides until the controller reads it. The output queue is only one event long. Therefore, the next output request will clear the current data. The summary bit is set whenever there is data in the output queue.

Table 1-11. Bits in the Status Byte

Bit	Definition
0	<i>Waiting for reverse GET.</i> A one path, 2-port measurement calibration is active, and the instrument has stopped, waiting for the operator to connect the device for reverse measurement.
1	<i>Waiting for forward GET.</i> A one path, 2-port measurement calibration is active, and the instrument has stopped, waiting for the operator to connect the device for forward measurement.
2	<i>Check event-status-register B.</i> One of the enabled bits in event status register B has been set.
3	<i>Check error queue.</i> An error has occurred and the message has been placed in the error queue, but has not been read yet.
4	<i>Message in output queue.</i> A command has prepared information to be output, but it has not been read yet.
5	<i>Check event-status register.</i> One of the enabled bits in the event-status register has been set.
6	Request service. One of the enabled status-byte bits is causing an SRQ.
7	Preset. An instrument preset has been executed.

The Event-Status Register and Event-Status-Register B

The event-status register and event-status register B are the other two registers in the status-reporting structure. They are selectively summarized by bits in the status byte via enable registers. The event-status registers consist of latched bits. A latched bit is set at the beginning of a specific trigger condition in the instrument. It can only be cleared by reading the register. The bit will not be reactivated until the condition occurs again. If a bit in one of these two registers is enabled, it is summarized by the summary bit in the status byte. The registers are enabled using the commands ESEnn; and ESNBnn;, both of which work in the same manner as SREnn. The units variable nn represents the binary equivalent of the bit in the status byte.

If a bit in one of the event-status registers is enabled, and therefore, summary bit in the status byte is enabled, an SRQ will be generated. The SRQ will not be cleared until one of the five following conditions transpire:

- 1 The event-status register is read, clearing the latched bit.
- 2 The summary bit in the status byte is disabled.
- **3** The event-status-register bit is disabled.
- 4 The status registers are cleared with the CLES; command.
- **5** An instrument preset is performed.

Service requests generated when there are error messages or when the instrument is waiting for the Group Execute Trigger (GET) command are cleared by:

- reading the errors
- issuing GET (disabling the bits)
- clearing the status registers

Table 1-12. Bits in the Event-Status Register

Bits	Definition
0	<i>Operation complete.</i> A command, for which OPC has been enabled, has completed operation.
1	<i>Request control</i> . The analyzer has been commanded to perform an operation that requires control of a peripheral, and needs control of GPIB. Requires pass-control mode.
2	<i>Query error.</i> The analyzer has been addressed to talk but there is nothing in the output queue to transmit.
3	Sequence bit. A sequence has executed the assert SRQ command.
4	Execution error. A command was received that could not be executed.
5	<i>Syntax error.</i> The incoming GPIB commands contained a syntax error. The syntax error can only be cleared by a device clear or an instrument preset.
6	User request. The operator has pressed a front-panel key or turned the RPG.
7	Power on. A power-on sequence has occurred since the last read of the register.

	Bit	Definition
	0	Single sweep, number of groups, or calibration step complete. A single sweep, group, or calibration step has been completed since the last read of the register.
	1	<i>Service routine waiting or done.</i> An internal service routine has completed operation, or is waiting for an operator response.
	2	<i>Data entry complete.</i> A terminator key has been pressed or a value entered over GPIB since the last read of the register.
	3	Limit failed, Channel 2. Limit test failed on Channel 2.
	4	Limit failed, Channel 1. Limit test failed on Channel 1.
	5	<i>Search failed, Channel 2.</i> A marker search was executed on Channel 2, but the target value was not found.
	6	<i>Search failed, Channel 1.</i> A marker search was executed on Channel 1, but the target value was not found.
	7	Copy Complete. A copy has been completed since the last read of the register.
displayed on Error messag more than 50 appears on t sages in the o queue until t		an error condition is detected in the analyzer, a message is generated, red on the analyzer's display screen, and placed in the error queue. messages consist of an error number followed by an ASCII string no han 50 characters long. The string contains the same message that rs on the analyzer's display. The error queue holds up to 20 error mes- n the order in which they occur. The error messages remain in the error until the errors are read by the system controller using the command CRRO. The OUTPERRO command outputs one error message.
	cycling	ror queue can only be cleared by performing an instrument preset or by g the line power. In order to keep the queue up-to-date, it is important l all of the messages out of the queue each time errors are detected.

Table 1-13. Bits in the Event-Status Register B

Error

Response to IEEE-488 Universal Commands

Abort	The Agilent 8702D responds to the abort message (IFC) by halting all listener, talker, and controller functions.
Device Clear	The Agilent 8702D responds to the device clear commands (DCL, SDC) by clearing the input and output queues, and clearing any GPIB errors. The status registers and the error queue are unaffected.
Local	The Agilent 8702D will go into local mode if: the local command (GTL) is received, the remote line is unasserted, or the front-panel LOCAL key is pressed. Changing the Agilent 8702D's GPIB status from remote to local does not affect any of the front-panel functions or values.
Local Lockout	If the Agilent 8702D receives the local-lockout command (LLO) while it is in remote mode, it will disable the entire front panel except for the line power switch. A local-lockout condition can only be cleared by releasing the remote line, although the local command (GTL) will place the instrument temporarily in local mode.
Parallel Poll	The Agilent 8702D does not respond to parallel-poll configure (PPC) or paral- lel-poll unconfigure (PPU) messages.
Pass Control	If the Agilent 8702D is in pass-control mode, is addressed to talk, and receives the take-control command (TCT) from the system, it will take active control of the bus. If the Agilent 8702D is not requesting control, it will immediately pass control to the system controller's address.
Remote	The Agilent 8702D will go into remote mode when the remote line is asserted and the Agilent 8702D is addressed to listen. While the Agilent 8702D is held in remote mode, all front-panel keys (with the exception of LOCAL) are dis- abled. Changing the Agilent 8702D's GPIB status from remote to local does not affect any front-panel settings or values.

- Serial Poll The Agilent 8702D will respond to a serial poll with its status byte, as defined in the "The Status Byte" on page 1-36. To initiate the serial-poll sequence, address the Agilent 8702D to talk and issue a serial-poll enable command (SPE). Upon receiving this command, the Agilent 8702D will return its status byte. End the sequence by issuing a serial-poll disable command (SPD). A serial poll does not affect the value of the status byte, and it does not set the instrument to remote mode.
- TriggerIn hold mode, the Agilent 8702D responds to device trigger by taking a single
sweep. If a one-path, 2-port measurement calibration is active, the
Agilent 8702D will set the waiting-for-Group-Execute-Trigger bits in the status
byte. If waiting-for-forward-GET is set, the Agilent 8702D will assume the
device is connected for forward measurement and take a sweep when GET is
received. Similarly, if the waiting-for-reverse-GET bit is set, the Agilent 8702D
will assume the device is connected for reverse measurement. The
Agilent 8702D responds only to selected-device trigger (SDT). This means
that it will not respond to group execute-trigger (GET) unless it is addressed
to listen. The Agilent 8702D will not respond to GET if it is not in hold mode.

2

Examples

Programming Examples

The examples documented in this chapter can be found on the disk that was provided with your instrument. The example disk includes versions of these programs for each of the following languages:

- HP BASIC (LIF format)
- Microsoft's QuickBASIC (DOS format)

Microsoft[®] is a U.S. registered trademark of Microsoft Corp.

• Microsoft's QuickC (DOS format)

For the HP BASIC language, examples are written for the Agilent 82335B interface card.

For the QuickBASIC and QuickC languages, examples are provided for both the Agilent 82335B Interface and Command Library card and the National Instruments card.

Preparing Measurement Settings

File Name EXAMP1A.BAS

Description Use the same command sequence used for manually setting up measurements for remotely setting up measurements via GPIB. There is no required order, as long as you set the desired frequency range, number of points, and power level prior to performing a measurement calibration.

This example sets the following parameters:

- reflection log magnitude on channel 1
- reflection phase on channel 2
- dual channel display mode
- frequency range from 100 MHz to 500 MHz

The following is the program's algorithm:

- The system is initialized.
- The analyzer is adjusted to measure return loss on channel 1 and display it in log magnitude.
- The analyzer is adjusted to measure return loss on channel 2 and display the phase.
- The dual-channel display mode is activated.
- The system operator is prompted to enter the frequency range of the measurement.
- The displays are autoscaled.
- The analyzer is released from remote control and the program ends.

This example program initializes the analyzer and the operator is queried for the measurement's start and stop frequencies. The analyzer is set up to display the S_{11} reflection measurement as a function of log magnitude and phase over the selected frequency range. The displays are autoscaled and the program ends.

Verifying Measurement Settings

File Name EXAMP1B.BAS

Description This example shows how to read analyzer settings into your program. Information on the command formats and operations is located in Chapter 1, "Writing Programs". Appending a question mark (?) to a command that sets an analyzer parameter will return the value of that setting from the analyzer to the controller. Parameters that are set as ON or OFF when queried will return a one (1) if active or a zero (0) if OFF. Parameters are returned in ASCII format, Form 4. This format varies in length from 1 to 24 characters-per-value. In cases of marker or other multiple responses, these values are separated by commas.

The following is an outline of the program's processing sequence:

- The system is initialized.
- The number of points in the trace is queried and printed on the controller display.
- The start frequency is queried and printed on the controller display.
- The averaging function state is queried and printed on the controller display.
- The analyzer is released from remote control and the program ends.

The analyzer is preset. The preset values are returned for the number of points, the start frequency, and the state of the averaging function. The analyzer is released from remote control and the program ends.

10 ! This program performs some example gueries of analyzer 20 ! settings. S11 1-Port Measurement Calibration

File Name EXAMP2A.BAS

Description This section shows you how to coordinate a measurement calibration over GPIB. You can use the following sequence for performing either a manual measurement calibration, or a remote measurement calibration via GPIB:

- **1** Select the calibration type.
- 2 Measure the calibration standards.
- **3** Declare the calibration done.

The actual sequence depends on the calibration kit and changes slightly for full 2-port measurement calibrations, which are divided into three calibration sub-sequences.

Calibration Kits

The calibration kit tells the analyzer what standards to expect at each step of the calibration. The set of standards associated with a given calibration is termed a "class". For example, measuring the short during an S₁₁ 1-port measurement calibration is one calibration step. All of the shorts that can be used for this calibration step make up the class, which is called class S11B. For the 7-mm and 3.5-mm cal kits, class S11B uses only one standard. For Type-N cal kits, class S11B contains two standards: male and female shorts.

When doing an S_{11} 1-port measurement calibration, use a 7-mm or 3.5-mm calibration kit. Selecting *SHORT* automatically measures the short because the class contains only one standard. When doing the same calibration in Type-N, selecting *SHORT* brings up a second menu, allowing the operator to select which standard in the class is to be measured. The sex listed refers to the test port. If the test port is female, then the operator selects the female short option.

Doing an S_{11} 1-port measurement calibration over GPIB is very similar. When using a 7-mm or 3.5-mm calibration kit, sending CLASS11B will automatically measure the short. In Type-N, sending CLASS11B brings up the menu with the male and female short options. To select a standard, use STANA or STANB.

The STAN command is appended with the letters A through G, corresponding to the standards listed under softkeys 1 through 7, softkey 1 being the topmost softkey.
 The STAN command is OPC-compatible. A command that calls a class is only OPC-compatible if that class has only one standard in it. If there is more than one standard in a class, the command that calls the class brings up another menu, and there is no need to query it.
 Example This example shows you how to coordinate an S₁₁ 1-port measurement calibration over GPIB, using the Agilent 85032B 50Ω Type-N calibration kit.
 Set up the desired instrument state.

- **2** Run the program.
- **3** Connect the standards as prompted.
- 4 Press ENTER on the controller keyboard to measure the standard.

NOTE

Some computers may have a RETURN hardkey as the activating switch for carriage return/line feed. Throughout this section, the carriage-return/line-feed hardkey is represented by ENTER.

Information on selecting calibration standards can be found in Chapter 1, "Writing Programs".

The following is an outline of the program's processing sequence:

- The system is initialized.
- The appropriate calibration kit is selected.
- The softkey menu is deactivated.
- The S_{11} 1-port measurement calibration sequence is run.
- The S_{11} 1-port measurement calibration data is saved.
- The softkey menu is activated.
- The analyzer is released from remote control and the program ends.

Examples S11 1-Port Measurement Calibration

Running the Program

This program assumes the following test port characteristics:

- 50 ohm
- Type-N connectors
- Female

The prompts appear just above the message line on the analyzer's and the controller's display. Pressing ENTER on the controller continues the program and measures the standard. The program displays a message when the measurement calibration is complete.

Full 2-Port Measurement Calibration

File Name EXAMP2B.BAS

DescriptionThe following example shows how to perform a full 2-port measurement calibration using the Agilent 85032B calibration kit. The main difference between this example and the S_{11} 1-Port Measurement Calibration example is that the full 2-port measurement calibration process allows removal of both the forward- and reverse-error terms, so that all four S-parameters of the device under test can be measured. PORT 1 is a female test port and PORT 2 is a male test port.

The following is an outline of the program's processing sequence:

- The system is initialized.
- The appropriate calibration kit is selected.
- The softkey menu is deactivated.
- The 2-port calibration sequence is run.
- The operator is prompted to choose or skip the isolation calibration.
- The softkey menu is activated.
- The analyzer is released from remote control and the program ends.

Running the Program

The program assumes the following situation:

- test ports are Type-N
- PORT 1 is a female test port
- PORT 2 is a male test port
- Agilent 85032B 50 Ω Type-N calibration kit is used

The prompts appear just above the message line on the analyzer's display, as well as the computer's console. Pressing ENTER on the computer keyboard continues the program and measures the standard. You have the option of omit-

Examples Full 2-Port Measurement Calibration

ting the isolation portion of the measurement calibration. If you perform the isolation portion of the calibration, averaging is automatically employed to insure a valid calibration. The program will display a message when the measurement calibration is complete.

10 ! This program performs a full 2-port measurement calibration. 20 ! It guides the operator through a full 2-port calibration 30 ! using the Agilent 85032B 50 ohm type N calibration kit. 40 ! Data Transfer Using Markers

File Name EXAMP3A.BAS

Description

- There are two methods that can be used to read trace information from the analyzer:
 - selectively, using the trace markers
 - completely, using the trace-data array

If only specific information (such as a single point on the trace or the result of a marker search) is required, the marker output command can be used to read the information.

Trace-Data Formats and Transfers

Refer to Table 1-5, "Agilent 8702D/Option 011 Array-Data Formats," on page 1-18. This table shows the number of bytes required to transfer a 201-point trace in the different formats. As you will see in the first example Form 4, ASCII data is the easiest to transfer, but the most time consuming due to the number of bytes in the trace. If you are using a PC-based controller, a more suitable format would be Form 5. To use any trace data format other than Form 4 (ASCII data) requires some care in transferring the data to the computer. Data types must be matched to read the bytes from the analyzer directly in to the variable array. The computer must be told to stop formatting the incoming data and treat it as a binary-data transfer. All of the other data formats also have a four byte header to deal with. The first two bytes are the ASCII characters "#A" that indicate that a fixed length block transfer follows, and the next two bytes form an integer containing the number of bytes in the block to follow. The header must be read in to separate the header from the rest of the block data to be mapped into an array. "Array-data formats" on page 1-17, discusses the different types of formats and their compositions.

Data may also be transferred from several different locations in the trace-processing chain. These examples will illustrate formatted-data transfers, but other locations in the trace-data processing chains may be accessed. Refer to Figure 5-1 on page 5-4. In this section, an example of each of the data formats will be shown for comparison. A general rule of thumb is to use Form 1 (internal binary format) for traces that are not being utilized for data content. Learn strings, state transfers, and calibration data that are being transferred to a file and back are good examples. Refer to "Data Transfer Using Frequency-Array Information" on page 2-28.

Arrays which will be interpreted or processed within your program should be in Form 2, 3 or 5, whichever is appropriate for your computer. "Data Transfer Using Floating-Point Numbers" on page 2-25 shows how to transfer a trace in these formats.

In "Data Transfer Using ASCII Format" on page 2-22 and "Data Transfer Using Floating-Point Numbers" on page 2-25, the frequency counterpart of each data point in the array is also determined. Many applications generate a frequency and magnitude, or a phase array for the test results. Such data may be required for other data processing applications (such as comparing data from other measurements).

In "Data Transfer Using ASCII Format" on page 2-22, the frequency data is constructed from the frequency span information. Alternatively, it is possible to read the frequencies directly out of the instrument with the OUTPLIML command. OUTPLIML reports the limit-test results by transmitting the stimulus point tested, a number indicating the limit-test results, and then the upper and lower limits at that stimulus point (if available). The number indicating the limit results is a -1 for no test, 0 for fail, and 1 for pass. If there are no limits available, the analyzer transmits zeros. For this example, we delete the limit test information and keep the stimulus information.

In "Data Transfer Using Floating-Point Numbers" on page 2-25, the limit-test array is read into the controller and used to provide the values directly from the analyzer memory. Reading from the limit-test array is convenient, although it outputs the results in ASCII format (Form 4), which may be slow. If there is no other way to obtain the frequency data, this transfer time may be acceptable. Frequency information becomes more difficult to determine when not using the linear sweep mode. Log-frequency sweeps and list-frequency sweeps have quite different values for each data point. For these special cases, the additional time spent reading out the limit test results is an acceptable solution for obtaining the valid frequency information for each data point in the trace. Examples
Data Transfer Using Markers

Example Markers are the simplest form of trace-data transfer. You can position a marker in the following locations on the trace:

- a frequency location
- an actual data point location
- a trace data value

The marker data is always returned in Form 4, ASCII format. Each number is sent as a 24-character string; each character being a digit, sign, or decimal point. In the case of markers, three numbers are sent. The display format determines the values of the marker responses. Refer to Figure 5-1 on page 5-4 for additional information.

The following is an outline of the program's processing sequence:

- The system is initialized.
- The selected frequency span is swept once.
- The marker is activated and placed on the maximum trace value.
- The three marker values (value 1, value 2, and stimulus) are output to the controller and displayed.
- The instrument is returned to local control and the program ends.

Running the Program

Execute the program. After performing an instrument preset, the analyzer switches into the log-magnitude mode and measures the $S_{_{11}}$ reflection values of the device under test.

The three values returned to the controller are:

- 1 reflection, in dB
- **2** a non-significant value
- ${f 3}$ the stimulus frequency at the maximum point

A non-significant value means that the analyzer returned a value that is meaningless in this data format.

Table 5-2 on page 5-5, provides an easy reference for the types of data returned with the various data-format operational modes.

Data Transfer Using ASCII Format

File Name EXAMP3B.BAS

Description

This example shows you how to transfer a trace array from the analyzer using Form 4, an ASCII data transfer.

Table 5-2 on page 5-5 shows the relationship of the two values-per-point that are transferred to the analyzer. When Form 4 is used, each number is sent as a 24-character string (each character represented by a digit, sign, or decimal point). Since there are two numbers-per-point, plus a comma and line-feed, a 201-point transfer in Form 4 takes 10,050 bytes. This form is useful only when input-data formatting is difficult with the instrument controller. Refer to Table 1-5, "Agilent 8702D/Option 011 Array-Data Formats," on page 1-18 for a comparison with the other formats.

Another example is included with the ASCII data transfer. A fairly common requirement is to create frequency-amplitude data pairs from the trace data. No frequency information is included with the trace-data transfer. Relating the data from a linear frequency sweep to frequency can be done by interrogating the analyzer start frequency, the frequency span, and the number of points. Given that information, the frequency of point n in a linear frequency sweep is defined by the equation:

 $F=Start frequency + (n-1) \times Span/(Points-1)$

This example illustrates the technique of generating corresponding frequency data. This is a straight-forward solution for linear uniform sweeps. For other sweep types, frequency data is more difficult to construct and may be best read from the analyzer directly from the limit-test array. See "Data Transfer Using Frequency-Array Information" on page 2-28 for an example of this technique.

The following is an outline of the program's processing sequence:

- The system is initialized.
- The trace-data array is allocated.
- The trace length is set to 11.
- The selected frequency span is swept once.
- The Form 4, ASCII format is set.
- The formatted trace is read from the analyzer.
- The frequency increments between the points are calculated.
- The marker is activated and placed at 30 kHz.
- The instrument is returned to local control and the program ends.

Running the Program

Run the program and watch the controller console. The analyzer will perform an instrument preset. The program will then print out the data values received from the analyzer. The marker is activated and placed at the left-hand edge of the analyzer display. Position the marker with the knob and compare the values read with the active marker with the results printed on the controller console. The data points should agree exactly. Keep in mind that no matter how many digits are displayed, the analyzer is specified to measure:

- magnitude to a resolution of 0.001 dB $\,$
- phase to a resolution of 0.01 degrees
- group delay to a resolution of 0.01 ps

Changing the display format will change the data sent with the OUTPFORM transfer. See Table 1-5, "Agilent 8702D/Option 011 Array-Data Formats," on page 1-18 for a list of the specific data that is provided with each format. The data from OUTPFORM reflects all the post processing such as:

- time domain
- gating
- electrical delay
- trace math
- smoothing

NOTE

Note that if time domain (option 110 only) is deactivated, operation is limited to 201 points in the lowpass mode.

Examples

Data Transfer Using ASCII Format

10 ! This program shows an ASCII format trace data transfer using form 4. 20 ! The data is received as a string of ASCII characters, 24 characters 30 ! per data point and transferred into a real array in the controller. Data Transfer Using Floating-Point Numbers

File Name	EXAMP3C.BAS
	 This example program illustrates data transfer using Form 3 in which data is transmitted in the floating-point formats. Form 2 is nearly identical except for the IEEE 32-bit format of 4 bytes-per-value. Form 5 reverses the order of the bytes to conform with the PC conventions for defining a real number. The block-data formats have a four-byte header. The first two bytes are the ASCII characters #A that indicate that a fixed-length block transfer follows, and the next two bytes form an integer containing the number of bytes in the block to follow. The header must be read in so that data order is maintained. This transfer is more than twice as fast than a Form 4 transfer. With the Form 4 transfer, 10,050 bytes are sent (201 points × 2 values-per-point × 24 bytes-per-value). Using Form 2 to transfer the data, only 1612 bytes are sent (201 points × 2 values-per-point × 4 bytes-per-value). Refer to Table 1-5, "Agilent 8702D/Option 011 Array-Data Formats," on page 1-18 to compare the formats. The following is an outline of the program's processing sequence: The system is initialized. The selected frequency span is swept once. Data-transfer format 3 is set. The headers are read from the trace. The array size is calculated and allocated. The trace data is read in and printed on the controller display. The marker is activated and placed at 30 kHz. The instrument is returned to local control and the program ends.

Examples Data Transfer Using Floating-Point Numbers

Running the Program

Run the program. The computer displays the number of elements and bytes associated with the transfer of the trace, as well as the first 10 data points. Position the marker and examine the data values. Compare the received values with the analyzer's marker values.

10 ! This program shows how to read in a data trace in IEEE 64 bit 20 ! format. The array header is used to determine the length of the 30 ! array and to allocate the array size. 40 ! 50 ! Data Transfer Using Frequency-Array Information

File Name EXAMP3D.BAS

Description This example explains how to use the limit-test array to read the corresponding frequency values for the completed trace array into the controller. The analyzer is set to sweep from 10 MHz to 200 MHz in log-frequency mode with the number of points in the trace set to 11. This makes it very difficult to compute the frequency-point spacing in the trace. The points are equally spaced across the trace, but not equally spaced in relation to frequency (because the frequency span is displayed in a logarithmic scale, as opposed to a linear scale). The limit-test data array may be read from the analyzer to provide the frequency values for each data point. Four values are read for each data point on the analyzer. The test results and limit values are not used in this example, only the frequency values are used. This technique is the only method of obtaining the non-linear frequency data from the analyzer display. The test data and frequencies are printed on the controller display and the marker is enabled to allow the operator to examine the actual locations on the analyzer display.

The following is an outline of the program's processing sequence:

- The system is initialized.
- The integer variables for the header information are defined.
- The number of points in the trace is set to 11.
- The frequency span (10 MHz to 200 MHz) is selected.
- The log-frequency sweep is selected.
- The data-transfer format 3 is set.
- The headers are read from the trace.
- The array size is calculated and allocated.
- The trace data is read in.
- The limit-test array is calculated and allocated.
- The limit-line test array is read in.
- The table header is printed.
- The program cycles through the trace values.
- The trace data and frequency are printed.
- The discrete-marker mode is activated.
- The marker is activated and placed at 10 MHz.
- The instrument is returned to local control and the program ends.

Running the Program

Run the program. Observe the controller display. The corresponding frequency values are shown with the trace-data values. Position the marker and observe the relationship between the frequency values and the point spacing on the trace. Compare the trace-data values on the analyzer with those received by the controller.

Examples

Data Transfer Using Internal Binary Format

File Name EXAMP3E.BAS

Description Form 1 is used for rapid I/O transfer of analyzer data. It contains the least number of bytes-per-trace and does not require reformatting in the analyzer. This format is more difficult to convert into a numeric array in the controller. Analyzer-state information, such as learn strings and calibration arrays, may be easily transferred in this format because data conversion is not required. Recalling an instrument state that has been stored in a file and transferring instrument-state information to the analyzer are excellent applications of a Form 1 data transfer.

The following is an outline of the program's processing sequence:

- The system is initialized.
- The integer variables for the header information are defined.
- The string variable for the header is defined.
- The selected frequency span is swept once.
- The internal-binary format is selected.
- The error-corrected data is output from the analyzer.
- The two data-header characters and the two length bytes are read in.
- The string buffer is allocated for data.
- The trace data is read into the string buffer.
- The analyzer is restored to continuous-sweep mode and queried for command completion.
- The instrument is returned to local control and the program ends.

Running the Program

Run the program. The analyzer is initialized. The header and the number of bytes in the block transfer are printed on the controller display. Once the transfer is complete, the number of bytes in the data string is printed. Compare the two numbers to be sure that the transfer was completed.

```
10 ! This program is an example of a form 1, internal format data
20 ! transfer. The data is stored in a string dimensioned to the
30 ! length of the data being transferred.

Examples Using Error Queue

Using Error Queue

File Name EXAMP4A.BAS

Description The error queue holds up to 20 instrument errors and warnings in the order that they occurred. Each time the analyzer detects an error condition, the analyzer displays a message on the analyzer's display, and puts the error in the error queue. If there are any errors in the queue, bit 3 of the status byte will be set. The errors can be read from the queue with the OUTPERRO command. OUTPERRO causes the analyzer to transmit the error number and message of the oldest error in the queue.

The following is an outline of the program's processing sequence:

- The system is initialized.
- The error-message string is allocated.
- The analyzer is released from remote control.
- The program begins an endless loop to read the error queue.
- The status byte is read with a serial poll.
- The program tests to see if an error is present in the queue.
- The error-queue bit is set.
- The program requests the contents of the error queue.
- The error number and string are read.
- The error messages are printed until there are no more errors in the queue.
- The instrument is returned to local control.
- The controller emits a beep to attract the attention of the operator and resumes searching for errors.

Running the Program

Run the program. The analyzer goes through the preset cycle. Nothing will happen at first. The program is waiting for an error condition to activate the error queue. To cause an error, press a blank softkey. The message CAUTION: INVALID KEY will appear on the analyzer's display. The computer will beep and print two error messages. The first line will be the invalid key error message, and the second line will be the NO ERRORS message. To clear the error queue, you can either loop until the NO ERRORS message is received, or until

the bit in the status register is cleared. In this case, we wait until the status bit in the status register is clear. Note that while the program is running, the analyzer remains in the local mode and the front-panel keys may be accessed.

The error queue will hold up to 20 errors until all the errors are read out or the instrument is preset. It is important to clear the error queue whenever errors are detected. Otherwise, old errors may be mistakenly associated with the current instrument state.

Press SYSTEM and then the unlabeled key several times quickly and watch the display. The number of errors observed should correspond to the number of times you pressed the key.

As another example, press CAL, then the *CALIBRATE MENU* key. Select the *RESPONSE* calibration. Press *DONE: RESPONSE* without performing any calibrations. Note the error message on the analyzer and on the controller display. Push the *THRU* key and then *DONE: RESPONSE*. We are not concerned with the validity of the calibration, just setting a simple calibration on the analyzer. Note that COR is displayed in the upper left-hand section of the graticule. Now, press *START* and \uparrow . This will generate an error because the start frequency has been changed, invalidating the calibration. This error is reported on the controller display as well. A complete list of error messages and their descriptions can be found in "Error Messages" in the *Agilent 8702D Reference* manual.

The program is in an infinite loop waiting for errors to occur. End the program by pressing RESET or BREAK on the controller keyboard.

NOTE

Not all messages displayed by the analyzer are put in the error queue; operator prompts and cautions are not included.

Examples

Using Error Queue

10 ! This program is an example of using the error queue to detect 20 ! errors generated by the analyzer. The status byte is read and 30 ! bit 3 is tested to determine if an error exists. 370 END

Generating Interrupts

File Name EXAMP4B.BAS

Description Interrupts can be generated using the status-reporting mechanism. The status-byte bits can be enabled to generate a service request (SRQ) when set. In turn, the instrument controller can be set up to generate an interrupt on the SRQ and respond to the condition which caused the SRQ.

To generate an SRQ, a bit in the status byte is enabled using the SREn; command. A one (1) in a bit position enables that bit in the status byte. Hence, executing SRE 8; enables an SRQ on bit 3, the check-error queue, since the decimal value 8 equals 00001000 in binary representation. Whenever an error is put into the error queue and bit 3 is set, the SRQ line is asserted, illuminating the (S) indicator in the GPIB status block on the front panel of the analyzer. The only way to clear the SRQ is to disable bit 3, re-enable bit 3, or read out all the errors from the queue.

A bit in the event-status register can be enabled so that it is summarized by bit 5 of the status byte. If any enabled bit in the event-status register is set, bit 5 of the status byte will also be set. For example, executing ESE 66; enables bits 1 and 6 of the event-status register, since in binary, the decimal number 66 equals 01000010. Hence, whenever active control is requested or a front-panel key is pressed, bit 5 of the status byte will be set. Similarly, executing ESNBn; enables bits in event-status-register B so that they will be summarized by bit 2 in the status byte.

To generate an SRQ from an event-status register, enable the desired eventstatus-register bit. Then enable the status byte to generate an SRQ. For instance, executing ESE 32; SRE 32; enables the syntax-error bit. When the syntax-error bit is set, the summary bit in the status byte will be set. This will, in turn, enable an SRQ on bit 5 of the status byte, the summary bit for the event-status register.

Examples Generating Interrupts

The following is an outline of the program's processing sequence:

- The system is initialized.
- The status registers are cleared.
- The event-status register bit 5 is enabled.
- The status-register bit 5 is enabled.
- The interrupt pointer is enabled and points to a subroutine.
- A bad command is sent to the analyzer to generate errors.
- The controller reads a serial-poll byte from GPIB in the event of an interrupt.
- The program tests for an SRQ.
- If the SRQ is not generated by the analyzer, the subroutine stops and displays, SRQ FROM OTHER DEVICE.
- If the SRQ was generated by the analyzer, the program reads the status byte and event-status register.
- If bit 5 in the event-status register is set, program prints, SYNTAX ERROR FROM ANALYZER.
- If bit 5 in the event-status register is NOT set, program prints, SYNTAX ERROR BIT NOT SET.
- The SRQ interrupt is re-enabled on the bus.
- At the finish, the interrupt is deactivated.
- The analyzer is released from remote control and the program ends.

Running the Program

Run the program. The computer will preset the analyzer, then pause for a second or two. After pausing, the program sends an invalid command string, STIP 2GHZ;, to cause a syntax error. This command is intended to be, STOP 2 GHZ;. The computer will display a series of messages from the SRQ-handler routine. The analyzer will display CAUTION: SYNTAX ERROR and the incorrect command, pointing to the first character it did not understand.

The SRQ can be cleared by reading the event-status register and clearing the latched bit, or by clearing the enable registers with the CLES; command. The syntax-error message on the analyzer display can only be cleared by the GPIB Device Clear (DCL) message or Selected Device Clear (SDC) message. Device Clear is not commonly used because it clears every device on the bus. Selected Device Clear can be used to reset the input and output queue and the registers of a specific instrument on the bus. This will also clear all the interrupt definitions.

10 ! This program is an example of using an SRQ based interrupt to 20 ! detect an error condition in the analyzer. In this example, a 30 ! syntax error is generated with an invalid command. The status byte 40 ! is read in and tested. The error queue is read, printed out and 50 ! then cleared. 60 ! 70 ! EXAMP4B 80 1 90 ASSIGN @Nwa TO 716 ! Power Meter Calibration

File Name EXAMP4C.BAS

Description For increased accuracy of the analyzer's PORT 1-output power, a power meter calibration is available. This measurement-accuracy enhancement technique is described in the "Error Messages" section of the *Agilent 8702D Reference* manual. The example described will perform the sample and sweep calibration under GPIB remote control.

The power meter is usually connected to PORT 1 for the forward measurements. Its address must be set correctly and it must be connected to the GPIB. The power meter address can be set by pressing: LOCAL, *SET ADDRESSES, ADDRESS P MTR/HPIB* and using the \uparrow and \downarrow keys or the numeric key pad to complete the process. The appropriate command must be selected for the model number of the power meter being used. Press *POWER MTR: []* until the model being used is displayed between the brackets. The correction factors for the power sensor are entered into the analyzer. All of these steps are explained in the "Error Messages" section of the *Agilent 8702D Reference* manual.

The number of readings-per-point must also be selected before starting. The number of points directly affects the measurement time of the calibration sequence. The power meter must interact with the analyzer for each of the selected points and read the number of values specified for each trace point. Typically, two readings-per-point is considered appropriate. More than two readings-per-point could lead to unacceptable processing time.

To control a power meter calibration via GPIB, the analyzer must be set to pass-control mode. The analyzer must position the local oscillator to a point in the sweep and read the power present at the power meter sensor. For this operation to take place, the system controller must set up the measurement and then pass control to the analyzer to read each data point in the sweep. After reading the data point from the power meter, the analyzer passes control back to the system controller. The analyzer then sets up to measure the next point and again requests control from the system controller. This process continues until the analyzer signals that the entire sweep has been measured point-by-point.

Examples Power Meter Calibration

The following is an outline of the program's processing sequence:

- The system is initialized.
- The number of points in the trace is set.
- The number of readings-per-point is set.
- The frequency span is set.
- The reference channel is measured.
- The power meter-calibration array is allocated.
- The power meter model is chosen.
- The status registers are cleared.
- The request-control summary bit is enabled.
- The pass-control mode is enabled.
- A calibration sweep is taken to begin the sequence.
- The status byte is read until control is requested.
- The computer passes control to the analyzer.
- The display is cleared and the analyzer is set to talker/listener mode.
- The GPIB interface status is read until control is returned.
- The program loops until all the points have been measured.
- The power meter calibration is enabled.
- The calibration data is output to the controller in Form 4, ASCII format.
- The power meter-calibration factors are read into the controller.
- The analyzer is released from remote control and the program ends.

Running the Program

The analyzer is preset and the power meter-calibration routine begins. The analyzer displays the message, WAITING FOR HP-IB CONTROL, when it is requesting control. The system controller display prints, Passing Control, when control is passed to the analyzer. The controller displays, Waiting for request, while the analyzer has control and is reading the power meter.

The interaction of the messages and the movement of the cursor allow observation of the calibration process. Once the calibration is complete, the analyzer displays, POWER METER CAL IS COMPLETE, and the system controller displays, Finished with Power meter Cal.

The power meter-calibration mode (with one sweep of correction data) is enabled and the calibration is switched ON. At the completion of the program, talker/listener mode is restored, the event-status registers are cleared (to halt the status-byte interaction), the power meter correction factors are displayed, the sweep is placed in continuous-sweep mode, the analyzer is released from GPIB control, and the program ends.

10 ! This routine does a power meter cal using pass control. 20 ! A measurement cycle takes place on each point of the trace. The 30 ! point is measured by the power meter and the measured value read 40 ! into the analyzer. The command TAKCS: arms this measurement mode. 50 ! The number of measurements is determined by the number of points in 60 ! the trace, the number of readings per point and an extra measurement 70 ! cycle to release the power meter. 80 ! Control is passed to the analyzer, the point is measured and 90 ! the data is transferred to the analyzer. Control is passed back to 100! the controller and the cycle begins again. Serial poll is used to 110 ! read the status byte of the analyzer and test the logic. 120 ! Using the Learn String

File Name EXAMP5A.BAS

Description This section provides several different examples of performing analyzer system setups.

NOTE

The most efficient option for storing and recalling analyzer states is using the analyzer's internal registers to save the CAL data. Recalling these registers is the fastest solution to restoring analyzer setups. Refer to "Chapter 8, "Saving Data, States, and the Display" in the *Agilent 8702D User's Guide* for detailed information on the analyzer's internal storage registers. In the event that all the registers have been used, the internal disk drive is not used, or if internal memory limitations exist, then these external solutions become viable.

The purpose of this example is to demonstrate several programming options for storing and recalling entire instrument states over GPIB. The examples describe two different processes for storing and recalling instrument states. The first example accomplishes the task using the learn string. The second example involves reading both the learn string and the calibration arrays out of the analyzer and storing them to disk or storing them in the system controller itself.

Using the learn string is a very rapid way of saving the instrument state, but using direct disk access has the advantage of automatically storing calibrations, cal kits, and data along with the instrument state.

A complete analyzer setup requires sending the learn string and a calibration array to set the analyzer parameters. The CAL array may also be placed in the analyzer, just as if a calibration was performed. By sending both sets of data, the analyzer may be quickly setup for a measurement.

Several different measurements may be required in the course of testing a device. An efficient way of performing multiple measurements is to send both the calibration array and the learn string, and then perform the measurements.

Examples Using the Learn String

Example The learn string is a very fast and easy way to read an instrument state. The learn string includes all front-panel settings, the limit table for each channel, and the list-frequency table. It can be read out of the analyzer with the command OUTPLEAS, and input to the analyzer with the command INPULEAS. This array is always transmitted in Form 1, the internal format for the analyzer. It cannot be longer than 3000 bytes. The example for a Form 1 transfer could also have been used. However, the "Using the Learn String" example is the simplest solution for reading the learn string from the analyzer.

The following is an outline of the program's processing sequence:

- The system is initialized.
- The string storage is allocated.
- The learn string is requested.
- The string is read without any processing.
- The analyzer is released from remote control.
- The instrument state is changed by the operator.
- The learn string is sent back to the analyzer.
- The analyzer is released from remote control and the program ends.

Running the Program

Run the program. When the program stops, change the instrument state and press ENTER on the controller. The analyzer will be returned to its original state by sending the learn string to the analyzer.

10 ! This program shows how to retrieve a learn string from the analyzer 20 ! into a string array. The state of the analyzer is then changed and the 30 ! learn string reloaded to return the analyzer to the previous settings. 40 ! 50 ! EXAMP5A 60 ! 70 ASSIGN @Nwa TO 716 ! Assign an I/O path for the analyzer 80 ! 90 CLEAR SCREEN 100 ! Initialize the analyzer ! Generate an IFC (Interface Clear) 110 ABORT 7 120 CLEAR @Nwa ! Examples Reading Calibration Data

Reading Calibration Data

File Name EXAMP5B.BAS

Description

This example demonstrates:

- how to read measurement calibration data out of the analyzer
- how to read it back into the analyzer
- how to determine which calibration is active

The data used to perform measurement-error correction is stored inside the analyzer in one (or more) of twelve calibration-coefficient arrays. Each array is a specific error coefficient, and is stored and transmitted as an error-corrected data array. Each point is a real/imaginary pair, and the number of points in the array is the same as the number of points in the trace. The five array-data formats also apply to the transfer of calibration-coefficient arrays. "Printing, Plotting, or Saving Measurement Results" in the *Agilent 8702D User's Guide* contains information on the storage locations for calibration coefficients and different calibration types.

A computer can read out the error coefficients using the commands OUTPCALC01, OUTPCALC02, ... through, OUTPCALC12. Each calibration type uses only as many arrays as required, beginning with array 1. Hence, it is necessary to know the type of calibration about to be read out. Attempting to read an array not being used in the current calibration causes the REQUESTED DATA NOT CURRENTLY AVAILABLE warning.

A computer can also store calibration coefficients in the analyzer. To do this, declare the type of calibration data about to be stored in the analyzer just as if you were about to perform that calibration. Then, instead of calling up different classes, transfer the calibration coefficients using the INPUCALCnn; commands. The variables nn are a data pair appended to the command representing a calibration number from 01 through 12. When all the coefficients are stored in the analyzer, activate the calibration by issuing the mnemonic SAVC; and trigger a sweep on the analyzer.

This example reads the calibration coefficients into a very large array, from which they can be examined, modified, stored, or put back into the instrument. If the data is to be directly stored on to disk, it is usually more efficient to use Form 1 (analyzer's internal-binary format), and to store each coefficient array as it is read in.

The following is an outline of the program's processing sequence:

- The system is initialized.
- The calibration types and number of arrays are defined.
- The integer variables for reading the headers are defined.
- The calibration type and number of arrays are read by the controller.
- The output is formatted in Form 3.
- The number of points in the trace is read.
- The memory is allocated for the calibration arrays.
- Each calibration array is requested from the analyzer.
- The elements from each calibration array are read in.
- The next calibration array is requested until all the arrays have been read.
- The calibration type is sent to the analyzer.
- Each calibration array is sent.
- The calibration is activated.
- The analyzer is released from remote control and the program ends.

Running the Program

Before executing the program, perform a calibration.

The program is able to detect which type of calibration is active. With that information, it predicts how many arrays to read out. When all the arrays have been sent to the computer, the program prompts the operator. The operator then switches OFF the calibration or performs a completely different calibration on the analyzer and continues the program. The computer reloads the old calibration. The operator should not preset the analyzer because the instrument settings must be the same as those that were present when the calibration was taken.

NOTE

The retransmitted calibration is associated with the current instrument state; the instrument has no way of knowing the original state associated with the calibration data. For this reason, it is recommended that the learn string be used to store the instrument state whenever calibration data is stored. The next example demonstrates how to reload the analyzer state with both the learn string and the calibration arrays.

Examples

Using Instrument States

File Name EXAMP5C.BAS

Description

NOTE

The instrument state may also be stored in the analyzer's internal registers. This is the fastest and most efficient method for toggling between instrument states. This example is for use when the analyzer's internal memory is full, or when there are other internal-memory limitations.

This example demonstrates using both the learn string and the calibration arrays to completely re-program the analyzer state. If you were performing two entirely different measurements on a device and wanted to quickly change between instrument states and perform the measurements, this example program is a potential solution.

The example will request the learn string and a calibration array from the analyzer and store them in a disk file on the system controller. Once the storage is complete, the operator will be prompted to change the state of the analyzer and then reload the state that was previously stored in the disk file. Once the file is created on the disk, the state information can be retrieved from the controller and restored on the analyzer.

NOTE

The disk file can only be created once. Errors will occur if the operator repeatedly tries to recreate the file.

For this example, only a thru response calibration will be performed and transferred. This means only one calibration array will be read from the analyzer and written to the disk file with the instrument state. To work with more elaborate calibrations, additional arrays will need to be defined and trans-

ferred to the disk file. This is not difficult, but requires some additional programming steps which were omitted in the interest of presenting a simple example.

The following is an outline of the program's processing sequence:

- The integers for reading the headers are defined.
- The system is initialized.
- An array is created to hold the learn string.
- The learn string is requested by the controller.
- The number of points in the trace is read.
- The controller allocates an array for the calibration data.
- The calibration data is read into the controller.
- The controller creates and assigns a data file for the calibration array and the learn string.
- The learn string and calibration array are stored in the disk file.
- The operator presses ENTER on the controller to read the calibration data back into the analyzer.
- The learn string is read from the disk file and output to the analyzer.
- The calibration array is read in from the disk file and stored in the analyzer.
- The analyzer is returned to continuous-sweep mode.
- The analyzer is released from remote control and the program ends.

Running the Program

Setup the analyzer and perform a through calibration.

Run the program. The program prompts the operator to change the state of the analyzer and then press ENTER to continue. At this point, the analyzer state is stored on the disk file in the controller. Pressing ENTER will begin the transfer from the disk file to internal arrays within the controller and then on to the analyzer. Once completed, the original state will be restored, the analyzer will be sweeping, the analyzer will be calibrated, and COR will be displayed on the analyzer's display.

Examples

Using Instrument States

Setting a List Frequency Sweep

File Name EXAMP6A.BAS

Description Using List-Frequency Mode

The analyzer normally takes data points spaced at regular intervals across the overall frequency range of the measurement. For example, for a 2 GHz frequency span using 201 points, data will be taken at intervals of 10 MHz. The list-frequency mode allows the operator to select the specific points, or frequency spacing between points, at which measurements are to be made. This mode of operation allows flexibility in setting up tests that insure device performance in an efficient manner. By only sampling specific points, measurement time is reduced. These programs emulate operation from the analyzer's front panel when using list sweeps.

The following two examples illustrate the use of the analyzer's list-frequency mode to perform arbitrary frequency testing. EXAMP6A allows the operator to construct a table of list-frequency segments which is then loaded into the analyzer's list-frequency table. There are a maximum of 30 segments available. Each segment stipulates a start and stop frequency, and the number of data points to be taken over that frequency range. EXAMP6B lets the operator select a specific segment to "zoom-in." A single instrument can be programmed to measure several different devices, each with its own frequency range, using a single calibration. When a specific device is connected, the operator selects the appropriate segment for that device. Note that list-frequency segments can be overlapped, but the total number of points in all the segments must not exceed 1632.

Example The purpose of this example is to show how to create a list-frequency table and transmit it to the analyzer.

The command sequence for entering a list-frequency table imitates the key sequence followed when entering a table from the front panel. There is a command for every key-press.

Editing a segment takes the same steps as the front-panel key sequence, except that the analyzer automatically reorders each edited segment in order of increasing start frequency.

The list-frequency table is also carried as part of the learn string. While the table cannot be modified as part of the learn string, it can be stored and recalled with very little effort by storing and recalling the learn string. Refer to "Data-Processing Chain" on page 1-20 for additional information on using learn strings.

This example takes advantage of the computer's ability to simplify:

- creating a list-frequency table
- editing a list-frequency table

The table is entered and completely edited before being transmitted to the analyzer. To simplify the programming task, options such as entering center frequency, frequency span, or step size are not included.

The list-frequency information may be acquired using the limit-test results array. The actual stimulus points are available as the first element in the array.

The following is an outline of the program's processing sequence:

- The system is initialized.
- The existing list frequencies are edited and cleared.
- The number of segments to be defined is read in.
- An array for the list segments is defined.
- The parameters for each segment are requested.
- If the operator wants to edit, the segment parameters are re-entered.
- The new list is sent to the analyzer.
- The analyzer is released from remote control and the program ends.

Examples Setting a List Frequency Sweep

Running the Program

CAUTION This example program will delete any existing limit lines before entering the new limits. If this is not desired, omit the line(s) that clear the existing limits (in this case, the executable CLEL;). This program begins by presetting the analyzer. The programmer will have to add the necessary command lines to set the analyzer to the specific operating conditions required for testing. The example program will show the limit lines defined, but the limits will always fail without additional analyzer setup.

The program displays the frequency-list table as it is entered. During editing, the displayed table is updated as each line is edited. The table is not reordered. At the completion of editing, the table is entered into the analyzer, and list-frequency mode is switched ON. During editing, pressing ENTER leaves an entry at the old value.

If the analyzer display is within the range of the segments entered, then the number of points-per-segment may be observed on the analyzer's display.

Activate a marker and select the discrete-marker mode to observe the point spacing. Use an exaggerated scale with just a few points to find the list-frequency spacing between points.

```
10 ! This program shows how to enter and edit a list frequency table.
20 ! Any existing table is deleted and a new table is defined and
30 ! edited. This list is then sent to the analyzer. Any number of

Selecting a Single Segment

File Name EXAMP6B.BAS

Description This example program demonstrates how to define a single segment as the operating-frequency range of the analyzer from a table of segments stored in the controller. The program assumes that a list-frequency table has already been entered into the analyzer, either manually, or using the program in "Setting a List Frequency Sweep" on page 2-56.

The program first loads the list-frequency table into the computer by reading the start and stop frequencies of each segment and the number of points for each segment. The segments' parameters are then displayed on the computer screen, and the operator can choose which segment is to be used by the analyzer. Note that only one segment can be chosen at a time.

The following is an outline of the program's processing sequence:

- The system is initialized.
- The list-frequency segment is edited.
- The largest segment number possible is set.
- The highest segment number in use is requested.
- The number of actual segments in use is read in.
- A list-frequency table is defined and the segments are read in to the controller from the analyzer.
- The operator selects one of the segments of the sweep.
- The controller "zooms-in" and sweeps the defined segment.
- The operator ends the program by entering segment number (0).
- The analyzer returns to sweeping all the segments in the table.
- The activation loop is ended and the program ends.

Running the Program

The program will read the parameters for each list-frequency segment from the analyzer, and build a table containing all the segments. The parameters of each segment will be printed on the computer screen.

Examples Selecting a Single Segment

After all the segments are displayed, the program will prompt the operator for a specific segment to be used. Type in the number of the segment, and the analyzer will then "zoom-in" on that segment. The program will continue looping, allowing continuous selection of different segments. To exit the loop, type **0**. This will restore all the segments (with the command ASEG), allowing the analyzer to sweep all of the segments, and the program will terminate.

Setting up Limit Lines

File Name	EXAMP6C.BAS
Description	The purpose of this example is to show how to create a limit-test table and transmit it to the analyzer.
	The command sequence for entering a limit-test table imitates the key sequence followed when entering a table from the analyzer's front panel. There is a command for every key-press. Editing a limit is also the same as the key sequence, but remember that the analyzer automatically reorders the table in order of increasing start frequency.
	The limit-test table is also carried as part of the learn string. While it cannot be modified as part of the learn string, the learn string can be stored and recalled with very little effort. Refer to "Data-Processing Chain" on page 1-20 for details on using learn strings.
	This example takes advantage of the computer's capabilities to simplify creat- ing and editing the table. The table is entered and completely edited before being transmitted to the analyzer. To simplify the programming task, options such as entering offsets are not included.
	This example automates the front-panel operation of entering a limit-test table.
	The following is an outline of the program's processing sequence:
• • • • •	The system is initialized. The limit lines are edited and cleared. The number of limits is requested. The limit table is created. The string array of limit types is created. The operator is prompted to enter the new limit values. The new limit table is sent back to the analyzer. The limit line is activated. The limit test is activated. The analyzer is returned to local control and the program ends.

Examples
Setting up Limit Lines

Running the Program

CAUTIONThis example program will delete any existing limit lines before entering the new limits. If this is not desired, omit the line(s) that clear the existing limits (in this case, the executable CLEL; contained in LINE 190). This program begins by presetting the analyzer. The programmer will have to add the necessary command lines to set the analyzer to the operating conditions required for testing. The example program will show the limit lines defined, but the limits will always fail without additional analyzer setup.

The program displays the limit table as it is entered. During editing, the displayed table is updated as each line is edited. The table is not reordered. At the completion of editing, the table is entered into the analyzer, and limit-testing mode switched ON. The analyzer will rearrange the table in ascending order starting with the lowest start frequency entry.

10 ! This program shows how to create a limit table and send it to the 20 ! analyzer. Performing Pass/Fail Tests

File Name EXAMP6D.BAS

Description The purpose of this example is to demonstrate the use of the limit/search-fail bits in event status register B, to determine whether a device passes the specified limits. Limits can be entered manually, or using the example "Using the Learn String" on page 2-45.

The limit/search-fail bits are set and latched when limit testing or a marker search fails. There are four bits, one for each channel for both limit testing and marker search. Refer to Table 5-2, "Units as a Function of Display Format," on page 5-5 for additional information. Their purpose is to allow the computer to determine whether the test/search executed was successful. They are used in the following sequence:

- 1 Clear event status register B.
- 2 Trigger the limit test or marker search.
- **3** Check the appropriate fail bit.

When using limit testing, the best way to trigger the limit test is to trigger a single sweep. By the time the single sweep command SING; finishes, limit testing will have occurred.

NOTE

If the device is tuned during the sweep, it may be tuned into and then out of limit, causing a limit test to qualify as "passed" when the device is not in fact within the specified limits.

When using marker searches (max, min, target, and widths), outputting marker or bandwidth values automatically triggers any related searches. Therefore, all that is required is to check the fail bit after reading the data.

Examples Performing Pass/Fail Tests

In this example, several consecutive sweeps must qualify as "passing" in order to insure that the limit-test pass was not extraneous due to the device settling or operator tuning during the sweep. Upon running the program, the number of "passed" sweeps for qualification is entered. For very slow sweeps, a small number of sweeps, such as two, are appropriate. For relatively fast sweeps, where the device requires time to settle after tuning, as many sweeps as six or more sweeps may be more appropriate.

A limit-test table can be entered over GPIB. The sequence is very similar to that used in entering a list-frequency table, as shown in "Setting a List Frequency Sweep" on page 2-56. The manual (front-panel entry) sequence is closely followed.

The following is an outline of the program's processing sequence:

- The system is initialized.
- The pass counter is initialized on entry.
- The analyzer takes a sweep.
- The event status register B byte is output and the channel 1 limit is tested.
- If the device fails the first sweep, the operator is prompted to insure it is tuned correctly and the device is measured again.
- Once the device passes, the operator is prompted not to touch the device as testing continues.
- If the device passes the required number of sweeps, the operator is prompted that the device has passed and to connect the next device for testing.
- The program initializes the pass counter and begins to measure the new device.

Running the Program

NOTE

This program assumes a response calibration (thru calibration) or a full 2-port measurement calibration has been performed prior to running the program.

Set up a limit-test table on channel 1 for a specific device either manually, or using the program in "Using the Learn String" on page 2-45.

Run the program, and enter the number of passed sweeps desired for qualification. After entering the qualification number, connect the device. When a sweep passes, the computer beeps. When enough consecutive sweeps qualify the device as "passing," the computer emits a dual-tone beep to attract the attention of the operator, and then prompts for a new device. To test the program's pass/fail accuracy, try causing the device under test to fail by loosening the cables connecting the device under test to the analyzer and running the program again.

Examples

Performing Pass/Fail Tests

10 ! This program demonstrates Pass/Fail tests using limit lines. The 20 ! program uses the latch-on-fail limit bits in event status register 30 ! B to determine if the device performance passes the specified test 40 ! limit lines. It then requires that the device passes for multiple 50 ! consecutive sweeps in order to ensure that the device is static in 60 ! the response and not varying. The operator specifies how many sweeps 70 ! are required to pass the test. 80 1 90 ! EXAMP6D 100 ! 110 ASSIGN @Nwa TO 716 ! Assign an I/O path for the analyzer 120 ! **130 CLEAR SCREEN** 140 ! Operation Using Talker/Listener Mode

File Name EXAMP7A1.BAS

Description The analyzer has three operating modes with respect to GPIB. These modes can be changed by accessing softkeys in the LOCAL menu. System-controller mode is used when no computer is present. This mode allows the analyzer to control the system. The other two modes allow a remote system controller to coordinate certain actions: in talker/listener mode the remote system controller can control the analyzer, as well as coordinate plotting and printing; and in pass-control mode the remote system controller can pass active control to the analyzer so that the analyzer can plot, print, control a power meter, or load/ store to disk. The amount of peripheral interaction is the main difference between talker/listener and pass-control mode.

Example

The commands OUTPPLOT and OUTPPRIN allow talker/listener mode plotting and printing via a one way data path from the analyzer to the plotter or printer. The computer sets up the path by addressing the analyzer to talk, the plotter to listen, and then releases control of the analyzer in order to transfer the data. The analyzer will then make the plot or print. When it is finished, it asserts the End or Identify (EOI) control line on GPIB. The controller detects the presence of EOI and re-asserts control of the GPIB. This example program makes a plot using the talker/listener mode.

NOTE

One of the attributes of the OUTPPLOT command is that the plot can include the current softkey menu. The plotting of the softkeys is enabled with the PSOFTON; command and disabled with the PSOFTOFF; command.

Examples Operation Using Talker/Listener Mode

The following is an outline of the program's processing sequence:

- The system is initialized.
- The selected frequency span is swept once.
- The plot command is sent to the analyzer.
- The analyzer is set to talker mode and the plotter is set to listener mode.
- The plot is spooled to the plotter.
- The analyzer is set to listener mode when the controller detects an EOI from the analyzer.
- The controller puts the analyzer back in continuous-sweep mode.
- The analyzer is returned to local control and the program ends.

Running the Program

If a problem arises with the plotter, such as no pen or paper, the analyzer cannot detect the situation because it only has a one-way path of communication. Therefore, the analyzer attempts to continue plotting until you intervene and abort the plot by pressing the LOCAL key. This key aborts the plot, causes the warning message, CAUTION: PLOT ABORTED, asserts EOI, and frees the computer.

Because of possible peripheral malfunctions, it is generally advisable to use pass-control mode, which allows two way communication between the peripherals and the analyzer.

10 ! This example shows a plot operation under the control of the 20 ! analyzer. The analyzer is commanded to output plot data, the 30 ! plotter is addressed to listen, and the analyzer to talk. The 40 ! controller watches for EOI at the end of the plot sequence and 50 ! then regains control of the HP-IB operations. 60 ! 70 ! EXAMP7A1 80 ! 90 ASSIGN @Nwa TO 716 ! Examples Controlling Peripherals

Controlling Peripherals

File Name EXAMP7A2.BAS

Description If the analyzer is in pass-control mode and it receives a command telling it to plot, print, control a power meter, or store/load to disk, it sets bit 1 in the event-status register to indicate that it requires control of the bus. If the computer then uses the GPIB pass-control command to pass control to the analyzer, the analyzer will take control of the bus and access the peripheral. When the analyzer no longer requires control, it will pass control back to the computer. For a discussion on the pass-control mode, refer to "Pass-control mode" on page 1-9.

In this example, the pass-control mode is used to allow the analyzer to dump a screen display to a printer.

Pass-control mode allows the analyzer to control the printer while sending the screen display to be printed. Once the printer-dump operation is complete, the analyzer passes control back to the controller and the controller continues programming the analyzer. The analyzer requests control from the instrument controller and the controller allows the analyzer to take control of the GPIB and dump the plot. The instrument controller must not interact with the GPIB while this remote analyzer control is taking place.

NOTE

The analyzer assumes that the address of the computer is correctly stored in its GPIB addresses menu under LOCAL, *ADDRESS: CONTROLLER*. If this address is incorrect, control will not return to the computer. Similarly, if control is passed to the analyzer while it is in talker/listener mode, control will not return to the computer.

Control should not be passed to the analyzer before it has set event-statusregister bit 1 making it Request Active Control. If the analyzer receives control before the bit is set, control is passed immediately back to the controller. When the analyzer becomes the active system controller, it is free to address devices to talk and listen as required. The only functions denied the analyzer are the ability to assert the interface clear line (IFC), and the remote line (REN). These are reserved for the master system controller. As the active system controller, the analyzer can send and receive messages from printers, plotters, and disk drives.

The following is an outline of the program's processing sequence:

- The system is initialized.
- The status registers are cleared.
- Bit 1 of ESR request control is set.
- The ESR interrupt for SRQ is enabled.
- The pass-control mode is enabled.
- The data is dumped to the printer.
- The program loops until the SRQ bit is set.
- The status byte is read with a serial poll.
- The program tests for bit 6, SRQ.
- If SRQ is detected, the program tests for pass control (bit 5 of the status byte).
- If the analyzer requests control, the system controller gives the analyzer control of the bus.
- The program loops and waits for the analyzer to complete the print dump.
- The controller reads the GPIB interface status register.
- If bit 6 is active in the controller, control has returned from the analyzer to the controller.
- The status-byte assignments are cleared.
- The analyzer returns to continuous-sweep mode.
- The analyzer is returned to local control and the program ends.

Running the Program

The analyzer will briefly flash the message WAITING FOR CONTROL, before actually receiving control and generating the printer output. The computer will display the Printing from analyzer and waiting for control message.

When the printer output is complete, the analyzer passes control back to the address stored as the controller address under the LOCAL, *SET ADDRESSES* menu. The computer will detect the return of active control and exit the wait loop. The controller will display the message Control returned from analyzer and then release the analyzer from remote control.

Examples Controlling Peripherals

NOTE

Because the program waits for the analyzer's request for control, it can be used to respond to front-panel requests as well. Remove the PRINALL; command from the program and run the program. Nothing will happen until the operator requests a print, plot, or disk access from the front panel of the analyzer. For example, press LOCAL, COPY, *PRINT MONOCHROME*.

Examples Controlling Peripherals

10 ! This example shows a pass-control operation to print the display 20 ! under the analyzer HP-IB control. The controller reads the status 30 ! of the analyzer looking for SRO to indicate that the analyzer is 40 ! requesting control. Once control is passed to the analyzer, the 50 ! controller monitors the status of its interface registers to detect 60 ! when the interface is again the active controller. Printing Via the Serial Port

File Name EXAMP7A3.BAS

Description This program will select the serial port and program the analyzer to copy its display to a printer. There are a number of commands associated with the serial and parallel ports which allow the programmer to configure the output modes, for example the baud rate and the handshake type used by the port and the printer. In this example, the serial port is configured by the program. The interface may also be configured from the analyzer's front-panel keys by pressing LOCAL, *SET ADDRESSES, PRINTER PORT.* This menu allows manual selection of the serial-interface parameters.

Since the GPIB port is not being used for the copy operation, programming of the analyzer and measurement operations may continue once the copy operation has been initiated. An internal spooler in the analyzer's memory provides buffering of the printer operation. In the example which follows, the status byte of the analyzer is checked to determine when the print operation is complete.

- The analyzer is initialized.
- A single sweep is taken and the analyzer is placed in hold mode.
- The status registers are cleared.
- The copy-complete bit is set and enabled.
- The printer operation and communication modes are set.
- The print command is sent.
- The analyzer is released from remote control and placed in continuous-sweep mode.
- The analyzer is polled until the status bit representing copy complete is detected.
- The analyzer is released from remote control and the program ends.

Running the Program

Run the program. The analyzer is initialized, set to single-sweep mode, and a sweep is taken. The program sets the system up to print the analyzer's display to an HP ThinkJet printer connected to the interface. At this time, the analyzer can continue making measurements as the ThinkJet prints the display. When the analyzer display has finished printing, the controller displays the message: DONE, the analyzer is released from GPIB control, and the program ends.

Examples Plotting Data

Plotting Data

File Name EXAMP7B1.BAS

Description Another report-generation technique is to transfer the plotter string to a disk file, and retrieve and plot the disk file at another time. Test time is increased when a plot occurs during the process. It may be more convenient to plot the data at another site or time. One solution to this problem is to capture the plot data using the controller and store it to a disk file. This disk file may then be read from the controller and the contents transferred to a plotter. This next example shows a method of accomplishing this task.

The analyzer is initialized without presetting the analyzer. The data that is in place on the analyzer is not disturbed by the program operation. A large string is dimensioned to hold the plotter commands as they are received from the analyzer. The length of this string depends upon the complexity of the analyzer's display. The analyzer is placed in the single-sweep mode and OPC?; SING; is used to make sure that operation is complete before plotting. The plotting begins with the OUTPPLOT; command.

The string transfer is ended by the controller detecting the EOI line which the analyzer pulls at the end of the transfer. The string transfer terminates and the plot data is now stored in a string in the analyzer.

These strings contain ASCII characters which represent the plotter commands in HP-GL (Hewlett-Packard Graphics Language). A disk file is created and the string is written into the file containing the display-plot commands.

Once the strings are transferred to the disk file, the file pointer is rewound and the data read out into a string for plotting. The string is sent to the plotter which uses the commands to generate a plot.

Examples Plotting Data

The following is an outline of the program's processing sequence:

- The system is initialized.
- The string for plotter commands is defined.
- The frequency span is swept once.
- The plotter output is requested and read into the plot string.
- A plot file is created in the controller.
- The plot string is stored into the disk file.
- The plot string is read from the disk file and sent to the plotter.
- The analyzer returns to continuous-sweep mode.
- The analyzer is returned to local control and the program ends.

Running the Program

The program begins by initializing the analyzer and placing it into singlesweep mode. The plotter commands are captured into strings in the controller. The controller display prompts, Plotter output complete. Press RETURN to store on disk. Pressing ENTER causes the data to be stored to disk. Once this task is complete, the program prompts once more, Plot to file is complete. Press Return to plot. After pressing ENTER again, the string output is sent to the plotter and the plot begins. Once the plot is complete, the program prompts, Plot is complete. End of program., and the analyzer begins sweeping and returns to local control.

10 ! This program shows how to read the plotter output from the analyzer 20 ! and store it in a disk file as an ASCII file. The disk file is then 30 ! read back into the controller and the plot commands sent to a 40 ! plotter to generate the plot of the analyzer display. This allows 50 ! plotting at a different time than data collection. 60 ! 70 ! EXAMP7B1 80 1 90 ASSIGN @Nwa TO 716 ! Assign an I/O path for the analyzer 100 ASSIGN @Plt TO 705 ! Reading Plot Files from Disk

File Name EXAMP7B2.BAS

Description This example program reads and plots files which have been stored on a LIF formatted disk by the Agilent 8702D Option 011. The plots may be sent to either a plotter with autofeed capability, such as the HP 7550B, or an HP-GL/2 compatible printer, such as a LaserJet 4 Series (monochrome) printer or a DeskJet 1200C (color) printer.

NOTE

Sending plots to disk is discussed in the chapter titled "Printing, Plotting, and Saving Measurement Results" in the *Agilent 8702D User's Guide*.

This section provides detailed information on file naming conventions and instructions on printing multiple plots-per-page.

This program requires HP BASIC 6.0 or greater which provides the use of wild cards with the catalog command.

The peripheral GPIB addresses and the hard copy device selection are hard coded and may need to be changed for different systems configurations. Refer to lines 1130 through 1240 in the example program.

This program example provides the form feeds to separate the plots. If the Agilent 8702D Option 011 has been configured to store multiple plots-perpage, this program will generate those plots. A file naming convention has been devised to allow the program to perform several printer-setup functions. These include: initializing the printer for HP-GL/2 at the beginning of a page, configuring the printer to plot multiple plots to the same page, if desired, and then sending a page eject (form feed) to the hardcopy device at the completion of the printing process. The plot file name is made up of four parts. The first three are generated automatically by the Agilent 8702D Option 011 whenever a plot is requested:

- 1 the prefix "PLOT"
- ${f 2}$ a two-digit sequence number in the range of 00 to 31
- **3** a two-letter output-format code to indicate the plot quadrant position:
- LU (Left Upper)
- LL (Left Lower)
- RU (Right Upper)
- RL (Right Lower)
- FP (Full Page)

For example, the first full page plot to a disk would be named "PLOT00FP". The second plot, to be located in the lower-right hand corner of the page would be named "PLOT01RL," and so on.

The fourth part is an optional character. It is used to indicate that the file is part of a multiple-file plot on the same graticule. See "Printing Multiple Measurements Per Page" in the *Agilent 8702D User's Guide*.

For detailed information on plotting to disk and outputting the plot files to a printer/plotter see "Printing, Plotting, and Saving Measurements Results" in the *Agilent 8702D User's Guide*.

The following is an outline of the program's processing sequence:

- Hardcopy device control strings are created.
- The hardcopy output device is defined.
- The disk storing the file names is cataloged.
- Files that match the name specifier in the file name array (Flnm\$) are counted.
- Flnm\$ is dimensioned for the number of files that match the name specifier.
- The file name array is sorted.
- A form feed is sent to the hardcopy device.
- Each of the files in the file name array is processed and sent to the output device.
- The current file name root string is defined.
- If the hardcopy device is a printer, then an HP-GL initialization string is output.
- Each file which matches the file name root string to the hardcopy device is output.
- After a form feed is sent to the hardcopy device, the printing/plotting process begins.

Examples Reading Plot Files from Disk

Running the Program

This program allows you to plot or print as many as four Agilent 8702D Option 011 display dumps (stored on a LIF formatted disk) on one side of a single sheet of paper. Refer to the instructions detailed in the chapter "Printing, Plotting, and Saving Measurement Results," in the *Agilent 8702D User's Guide*.

- 10 ! This example program reads and plots files which have been stored on
- 20 ! a LIF formatted disk by the analyzer. The plots are sent to either a
- 30 ! plotter with auto-feed capability, such as the HP 7550B, or an HP-GL/2
- 40 ! compatible printer, such as the LaserJet 4 series (monochrome) or the

Reading ASCII Instrument Files

File Name EXAMP7C.BAS

Description Another approach to accessing the analyzer's test results is to store the data onto a disk file from the analyzer. This operation generates an ASCII file of the analyzer data in a CITIFILE format. A typical file is generated by the next example and is shown below:

CITIFILE A.01.00 #NA VERSION HP8702D.06.09 NAME DATA VAR FREQ MAG 11 DATA S[1,1] RI SEG_LIST_BEGIN SEG 10000000 20000000 11 SEG LIST END BEGIN 8.30566E-1,-1.36749E-1 8.27392E-1,-1.43676E-1 8.26080E-1,-1.52069E-1 8.25653E-1,-1.60003E-1 8.26385E-1,-1.68029E-1 8.26507E-1.-1.77154E-1 8.26263E-1,-1.87316E-1 8.26721E-1,-1.97265E-1 8.2724E-1,-2.07611E-1 8.28552E-1,-2.19940E-1 8.29620E-1,-2.31109E-1 END

This data file is stored by the analyzer under remote control or manually from the front panel. Refer to "Saving Data, States, and the Display" in the *Agilent 8702D User's Guide* for more details on manual operation. This program performs the same steps that are required to manually store a file from the front panel.

This program stores a file in the same manner as an operator would store a file onto the analyzer's internal disk drive from the front panel.

This example explains the process of storing the data from the analyzer to a file on the internal disk drive. There is also a program to read the data from the file into a data array for further processing or reformatting to another file

type. The internal drive will store in the same format that is present on the disk. A new disk may be formatted in either LIF or DOS. For the example, the assumption has been made that the format transformation has already taken place, and there is a file that can be read record by record, from which data can be retrieved.

The goal of this example is to recover an array of stimulus frequency along with the trace-data values. CITIFILES contain the real and imaginary values of each data point. Some further transformation will be required to obtain magnitude values, for example.

This file contains more information than will be used in this example. The file is accessed and the records read from the file and printed on the controller display to observe the actual file contents. The file pointer is reset and the records are then read and interpreted for their data contents.

The first six records are skipped for this example. The seventh record contains the stimulus-frequency values and the number of points in the trace. These values are read from the record. The frequency increment, or point spacing, is calculated and used later in the frequency-data calculations for a point. Two more records are skipped and the next is the first record representing data values. The data values are read using a loop until the values for the number of points have been recovered from the file. The data values are tabulated and printed out on the controller display.

The following is an outline of the program's processing sequence:

- An I/O path is assigned to the analyzer.
- The system is initialized.
- A string is dimensioned to hold a file record.
- The analyzer operating state is set.
- The internal drive is selected for storage (only ASCII data is stored).
- A file name is entered and the data stored into it.
- The operator is prompted to move the disk to the controller disk drive.
- The disk file is read and the contents displayed.
- The file pointer is rewound.
- The file contents are converted to trace data.
- The frequency and complex-data pair is displayed for each point.
- The analyzer is restored to continuous-sweep mode.
- The analyzer is returned to local control and the program ends.

Examples Reading ASCII Instrument Files

Running the Program

Remove the disk from the analyzer's disk file and place it into the controller disk drive.

The contents of this disk file are shown at the beginning of this section. The file lines are read and then printed on the controller display. The file pointer is reset and the lines are interpreted for their data contents.

The first 6 lines are skipped for this example. The seventh line contains the stimulus frequency values and the number of points in the trace. These values are read from the line. The frequency increment, or point spacing, is calculated and used later to calculate the frequency data for a point. Two more lines are skipped. The next line is the first of the data values. The data values are read in a loop until the number of points have been recovered from the file. The data values are tabulated and printed out on the controller display.

10 ! This program shows how to store an ASCII data file in CITIFILE format 20 ! and retrieve the data with the controller. The disk is written in the 30 ! analyzer system and then moved to the controller disk and the data 40 ! accessed. 50 ! 60 ! EXAMP7C 70 ! 80 ASSIGN @Nwa TO 716 ! Language Reference

Language Reference

This chapter is the reference for all Agilent 8702D programming commands. Commands are listed alphabetically.

Convention	Description
< >	Angle brackets indicate values entered by the programmer.
I	"Or" indicates a choice of one element from a list.
[]	Square brackets indicate that the enclosed items are optional.
{}	When several items are enclosed by braces, one, and only one of these elements must be selected.
<number></number>	A numerical operand.
<integer></integer>	An ASCII string representing an integer. This is defined by the IEEE 488.2 <nr1> format.</nr1>
<string></string>	A character-string operand which must be enclosed by quotes.

Table 3-1. Notation Conventions and Definitions

	AB	
	Measures and dis	splays A/B on the active channel.
Syntax	AB	
	ADDR	
	Sets the GPIB ac	dress for the specified device.
Syntax		SC PERI PLOT POWM PRIN } [? <i><number></number></i>] range from 0 to 30.
	<u>Option</u>	Description
	CONT	Controller GPIB address. The address where control is returned after a pass control.
	DISC	Disk GPIB address.
	PERI	Peripheral GPIB address.
	PLOT	Plotter GPIB address.
	POWM	Power meter GPIB address.
	PRIN	Printer GPIB address.
Query Response	<number></number>	

ALTAB

Places the analyzer in the alternate inputs measurement mode, where inputs A and B are measured on alternate sweeps.

Syntax ALTAB

See Also CHOPAB

	ANAB	
	Enables the analog bus for service use.	
Syntax	$ANAB{? ON OFF}$	
Query Response	{1 0}	
Example	ANABON	
	ANAI	
	Measures and displays the data at the auxiliary input (ANALOG IN).	
Syntax	ANAI[? <number>]</number>	
•	< <i>number></i> can range from 1 to 31.	
	This parameter can only be applied when ANAB is set to on. Do not use the <i><number></number></i> parameter when ANAB is OFF.	
Query Response	<number></number>	
	AR	
	Measures and displays A/R on the active channel.	
Syntax	AR	
	ASEG	
	Uses all segments for list frequency sweep.	
Syntax	ASEG	

ASSS

Asserts the sequence status bit.

Syntax ASSS

ATTP

Selects the amount of attenuation at PORT 1 or 2.

Syntax ATTP{1|2}[?| <*number*>] <*number>* is 0, 10, 20,..., 70 dB.

Query Response <*number>*

AUTO

Autoscales the active channel.

Syntax AUTO

AVERFACT

Sets the averaging factor on the active channel.

Syntax AVERFACT[? | <number>] <number> can range from 0 to 999.

Query Response <number>

	AVERO	
	Turns averaging on and off on the active channel.	
Syntax	AVERO{? ON OFF}	
Example	AVEROON	
Query Response	{l 0}	
	AVERREST	
	Restarts the averaging on the active channel.	
Syntax	AVERREST	
	BACI	
	Sets the background intensity of the display.	
Syntax	BACI[? <i><number></number></i>] <i><number></number></i> can range from 0 to 100.	
Query Response	<number></number>	
	BANDPASS	
	Selects the time domain bandpass mode.	
Syntax	BANDPASS	

BEEP

Controls the warning beeper.

Syntax	BEEP{DONE FAIL WARN}{? ON OFF}	
	<u>Option</u>	Description
	DONE	Controls the warning beeper for completion of functions such as save, done with calibration standard, and data trace saved.
	FAIL	Controls the warning beeper for a limit test failure.
	WARN	Controls the warning beeper for the generation of a warning message.
Query Response	{1 0}	
Example	BEEPDONEON	
	BR	
	Measures and displays B/R on the active channel.	
Syntax	BR	

	С		
	Sets the open capacitance values of an open circuit while it is being defined as a calibration standard.		
Syntax	C{0 1 2 3}[? <number>] Where <number> value can be:</number></number>		
	Option_	Description	<u>Number Value</u>
	0	±10k	10 - 15 F
	1	± 10k	10–27 F/Hz
	2	±10k	$10-36 \text{ F/Hz}^2$
	3	±10k	10-45 F/Hz ³
Query Response	<number></number>		
	CAL1		
	Accepted for compatibility with the Agilent 8510A, where its function is to begin a calibration sequence.		
Syntax	CAL1		
	CALFCALF		
	Sets the power meter calibration factor corrections for the particular sensor used. Sensor B is only valid for the Agilent 438A, which has two input channels.		
Syntax	CALFCALF[? <number>]</number>		
	<i><number></number></i> c	an range from 0 to 20	0%.
Query Response	<number></number>		

CALFFREQ

Selects the frequency for the calibration factor correction.

Syntax CALFFREQ[? | <number>] Where <number> can range from:

Condition	Range
Frequency sweeps	30 kHz to 3 GHz (to 6 GHz for option 006)
Power sweeps	-15 to 20 dBm in range 0, 25 dB maximum in other ranges (-100 to +100 with power meter cal on)
CW time	0 to 24 hours
Frequency sweep (transform on)	±1/frequency step
CW time sweep (transform on)	±1/time step

Query Response <*number>*

CALFSEN

Edits the sensor A or B calibration factor table.

Syntax CALFSEN{A|B}

CALI

Begins a calibration sequence.

Syntax CALI { EORM | FUL2 | OERM | ONE2 | RAI | RESP | S111 | S221 | TRL2 }

Language Reference

<u>Option</u>	Description	
EORM	Begins a response and match measurement calibration fo E/O devices.	
FUL2	Begins a calibration sequence for full 2-port measurement calibration.	
OERM	Begins a response and match measurement calibration fo O/E devices.	
ONE2	Begins a calibration sequence for one-path 2-port.	
RAI	Begins a calibration sequence for response and isolation.	
RESP	Begins a calibration sequence for response.	
S111	Begins a calibration sequence for S11 1-port.	
S221	Begins a calibration sequence for S22 1-port.	
TRL2	Begins a calibration sequence for thru, reflect, line or Lin	
CALIS111	reflect, match (TRL*/LRM*) 2-port.	
	reflect, match (TRL*/LRM*) 2-port.	
CALIS111 CALK Selects a cali		
CALK Selects a cali		
CALK Selects a cali	bration kit.	
CALK Selects a cali CALK{35MD	bration kit. 35MM 7MM N50 N75 USED }	
CALK Selects a cali CALK{35MD Option	bration kit. 35MM 7MM N50 N75 USED} Description	
CALK Selects a cali CALK{35MD Option 35MD	bration kit. 35MM 7MM N50 N75 USED} <u>Description</u> Selects a calibration kit for 3.5 mm (Agilent 85033D).	
CALK Selects a cali CALK { 35MD Option 35MD 35MM	bration kit. 35MM 7MM N50 N75 USED} Description Selects a calibration kit for 3.5 mm (Agilent 85033D). Selects a calibration kit for 3.5 mm (Agilent 85033C).	
CALK Selects a cali CALK { 35MD Option 35MD 35MM 7MM	bration kit. 35MM 7MM N50 N75 USED } Description Selects a calibration kit for 3.5 mm (Agilent 85033D). Selects a calibration kit for 3.5 mm (Agilent 85033C). Selects a calibration kit for 7 mm.	

Example

Syntax

Example

CALN

Turns calibration type to off.

Syntax CALN

CBRI

Adjusts the color brightness of the selected display feature.

Syntax CBRI [? | <number>] <number> can range from 0 to 100.

Query Response <*number>*

	CENT		
	Sets the center stimulus value. If a list frequency segment is being edited, sets the center of the list segment.		
Syntax	CENT[? <number>]</number>		
	< <i>number></i> can ra	nge from:	
	Condition_	Range	
	Frequency sweeps	30 kHz to 3 GHz (to 6 GHz for option 006)	
	Power sweeps	-15 to 20 dBm in range 0, 25 dB maximum in other ranges (-100 to +100 with power meter cal on)	
	CW time	0 to 24 hours	
	Frequency sweep (transform on)	±1/frequency step	
	CW time sweep (transform on)	±1/time step	
Query Response	<number></number>		
	CHAN		

Makes channel 1 or 2 the active channel. OPC compatible.

Syntax $CHAN\{1|2\}$

Example CHAN2

CHOPAB

Places the analyzer in the chop measurement mode. As opposed to ALTAB.

Syntax CHOPAB

CLAD

Class done, modify cal kit, specify class.

Syntax CLAD

CLASS

Calls reflection standard classes during a calibration sequence.

Syntax CLASS{11A | 11B | 11C | 22A | 22B | 22C}

Description If only one standard is in the class, it is measured. If there is more than one, the standard being used must be selected with $STAN\{A | B | C | D | E | F | G\}$. If there is only one standard in the class, these commands are OPC compatible.

<u>Option</u>	Description
11A	S11 1-port, opens.
11B	S11 1-port, shorts.
11C	S11 1-port, loads.
22A	S22 1-port, opens.
22B	S22 1-port, shorts.
22C	S22 1-port, loads.

Example CLASS11A

	CLEA		
	Clears the indicated save/recall registers.		
Syntax	CLEA{1 2 3 4 5}		
Example	CLEA1		
	CLEABIT		
	Clears the specified bit on the GPIO.		
Syntax	CLEABIT[? <number>]</number>		
	< number > can range from 0 to 7.		
Query Response	<number></number>		
	CLEAL		
	Clears the limit line list. Should be preceded by EDITLIML.		
Syntax	CLEAL		
	CLEARALL		
	Clears all the save/recall registers. OPC compatible.		
Syntax	CLEARALL		

CLEAREG

Clears save/recall registers 01 through 31. CLEAREG01 through CLEAREG05 are the same as CLEA1 through CLEA5.

SyntaxCLEAREG[<integer>]<integer> can range from 01 to 31.

Example CLEAREG01

CLEASEQ

Clears the sequence from the internal registers.

Syntax CLEASEQ{1 | 2 | 3 | 4 | 5 | 6}

Example CLEASEQ1

CLEL

Clears the desired list.

Syntax CLEL

Description This could be a frequency list, power loss list, cal sensor list, or limit test list. Should be preceded by EDITLIML, EDITLIST, POWLLIST, CALFSENA, or CALFSENB.

CLES

Clears the status register, the event-status registers, and the enable registers.

Syntax CLES

	CLS
	Clears the status register.
Syntax	CLS
	COAX
	Selects coaxial offsets instead of waveguide while defining a standard during a cal kit modification.
Syntax	COAX
	COEF
	Enters the indicated coefficient for the cal standard. This command follows STDTRECE or STDTSOUR to specify whether it is a source or receiver coefficient.
Syntax	$COEF\{A B C D E F G H I\}$
Example	COEFA

COLO

Selects a display function for color modification.

Syntax COLO{CH1D|CH1M|CH2D|CH2M|GRAT|TEXT|WARN}

Option_	Description
CH1D	Selects the display feature for color modification for channel 1 data and limit lines.
CH1M	Selects the display feature for color modification for channel 1 memory.
CH2D	Selects the display feature for color modification for channel 2 data and limit lines.
CH2M	Selects the display feature for color modification for channel 2 memory.
GRAT	Selects the display feature for color modification for graticule.
TEXT	Selects the display feature for color modification for text.
WARN	Selects the display feature for color modification for warning.

Example COLOWARN

COLOR

Adjusts the color saturation for the selected display feature.

Syntax COLOR[? | *<number>*] *<number>* can range from 0 to 100.

Query Response <*number>*

	CONS			
	Continues th	e paused sequence.		
Syntax	CONS			
	CONT			
	Sets continue	ous sweep trigger mode.		
Syntax	CONT			
	CONV	CONV		
	Converts the S-parameter data.			
Syntax	CONV{1DS	CONV{1DS OFF YREF YTRA ZREF ZTRA}		
	<u>Option</u>	Description		
	1DS	Converts the S-parameter data to inverted.		
	OFF	Converts the S-parameter data to OFF.		
	YREF	Converts the S-parameter data to Y:reflection.		
	YTRA	Converts the S-parameter data to Y:transmission.		
	ZREF	Converts the S-parameter data to Z:reflection.		
	ZTRA	Converts the S-parameter data to Z:transmission.		
Example	CONVZTRA			

COPYFRFT

Copies the file titles into the register titles.

Syntax COPYFRFT

COPYFRRT

Copies save/recall register titles to the disk register titles.

Syntax COPYFRRT

CORI

Turns interpolative error correction on and off.

Syntax CORI { ? | ON | OFF }

Query Response $\{1 \mid 0\}$

CORR

Turns error correction on and off.

Syntax CORR{?|ON|OFF}

Query Response $\{1 \mid 0\}$

	COUC
	Couples and uncouples the stimulus between the channels.
Syntax	$COUC \{? ON OFF \}$
Query Response	{1 0 }
	COUP
	Couples the power when coupled channels is turned OFF, COUCOFF.
Syntax	$COUP{? ON OFF}$
Query Response	{1 0}
	CSWI
	Selects test set continuous switching (ON) or test set hold (OFF) when there is a 2-port calibration active.
Syntax	$CSWI{? ON OFF}$
Description	Continuous switching is allowed only when the power ranges on both attenua- tor ports are set the same. When continuous switching is ON, the analyzer measures all four S-parameters each time before displaying the data for a full 2-port cal measurement. In test set hold mode, the analyzer measures all four S-parameters once and then measures the desired parameter continuously. This is known as a quasi 2-port cal measurement and it is less accurate than a full 2-port calibrated measurement.
Query Response	{1 0}

CWFREQ

Sets the CW frequency for power sweep and CW frequency modes.

Syntax CWFREQ [? | <number>] <number> may be values:

	Condition	Range
	Frequency sweeps	30 kHz to 3 GHz (to 6 GHz for option 006)
	Power sweeps	-15 to 20 dBm in range 0, 25 dB maximum in other ranges (-100 to +100 with power meter cal on)
	CW time	0 to 24 hours
	Frequency sweep (transform on)	±1/frequency step
	CW time sweep (transform on)	±1/time step
Description	While the list freq quency of the cur	uency table segment is being edited, it sets the center fre- rent segment.

Query Response <*number>*

CWTIME

Selects the CW time sweep type.

Syntax CWTIME

	D1DIVD2
	Divides the data in channel 1 by the data in channel 2 and displays the result on channel 2.
Syntax	D1DIVD2{? ON OFF}
Query Response	{l 0}
	DATI
	Stores trace in channel memory. OPC compatible.
Syntax	DATI
	DCONV
	Selects down converter for mixer measurements.
Syntax	DCONV
	DEBU
	Turns the GPIB debug mode on and off.
Syntax	$DEBU{? ON OFF}$
Description	When ON, option 011 scrolls incoming GPIB commands across the display.
Query Response	{l 0}

DECRLOOC

Decrements the sequencing loop counter by 1. NEWSEQ must precede to ensure that a sequence is currently being created or modified.

Syntax DECRLOOC

DEFA

Sets the standards to default definitions.

Syntax DEFA{OPTS | RCOE | SCOE}

<u>Option</u>	Description
OPTS	Optical standards.
RCOE	Receiver coefficients.
SCOE	Source coefficients.

Example DEFAOPTS

DEFC

Sets the default colors for all display features.

Syntax DEFC

DEFLPRINT

Sets the printer to the following default setup conditions:

Parameter	Setting
Print	Monochrome
Auto-feed	On
Print Colors:	
Ch 1 Data	Magenta
Ch 1 Memory	Green
Ch 2 Data	Blue
Ch 2 Memory	Red
Graticule	Cyan
Warning	Black
Text	Black

Table 3-2. Default Printer Settings

Syntax DEFLPRINT

DEFLTCPIO

Sets up the following default state for copy. There is no equivalent front-panel key.

Parameter	Setting
Plotter Type	PLOTTER
Plotter Port	SERIAL
Baud Rate	9600
Handshake	Xon-Xoff
GPIB Address	5

Table 3-3. Plotter Settings

Table 3-4. Printer Settings

Parameter	Setting
Printer Type	DESKJET
Printer Port	PARALLEL
Baud Rate	19200
Handshake	Xon-Xoff
GPIB Address	1
Parallel Port	COPY

Syntax DEFLTCPIO

	DEFS
	Begins standard definition during cal kit modification.
Syntax	DEFS[? <number>]</number>
	<i><number></number></i> is the standard number.
Query Response	<number></number>
	DELA
	Displays the data formatted as group delay.
Syntax	DELA
	DELO
	Turns the delta marker mode OFF.
Syntax	DELO
	DELR
	Makes the indicated marker the delta reference.
Syntax	DELR{1 2 3 4}
Example	DELR1

DELRFIXM

Makes the fixed marker the delta reference.

Syntax DELRFIXM

DEMO

Sets the transform demodulation.

Syntax DEMO{AMPL|OFF|PHAS}

<u>(</u>	<u>Option</u>	Description
7	AMPL	Sets the transform demodulation to amplitude demodulation. Only has an effect with a CW time transform.
C	OFF	Turns the transform demodulation function OFF.
I	PHAS	Sets the transform demodulation to phase demodulation.
Ι	DEMOAMPL	

DFLT

Sets the plotter to the default setup conditions. (Refer to "Default Plotter Settings" on page 3-28.)

Syntax DFLT

Example

ltem	Setting	
Plot Data	On	
Plot Mem	On	
Plot Grat	On	
Plot Text	On	
Plot Mkr	On	
Auto-feed	On	
Scale Plot	Full	
Plot Speed	Fast	
Channel 1		
Pen number for data	2	
Pen number for memory	5	
Pen number for graticule	1	
Pen number for text	7	
Pen number for marker	7	
Channel 2		
Pen number for data	3	
Pen number for memory	6	
Pen number for graticule	1	
Pen number for text	7	
Pen number for marker	7	
Line Type for Data	7	
Line Type for Memory	7	

Table 3-5. Default Plotter Settings

Sets the number of files in the directory at disk initialization.

Syntax DIRS[? | <number>] <number> can range from 8 to 8192.

Query Response <*number>*

DISCUNIT

Specifies which disk in a multiple-disk drive is to be used for disk registers.

Syntax DISCUNIT[? | <number>] <number> can range from 0 to 30.

Query Response <*number>*

DISCVOLU

Specifies which volume of a multiple-volume disk drive (for example, a Winchester) is to be used for disk registers.

Syntax DISCVOLU[? | <number>] <number> can range from 0 to 30.

Query Response <*number>*

	DISM	
	Displays the resp	oonse and stimulus values for all markers that are turned on.
Syntax	$DISM{? ON OFF}$	
Query Response	{1 0}	
Example	DISMON	
	DISP	
	Displays data and	d/or memory on the active channel.
Syntax	DISP{DATA DATM DDM DMM MEMO}	
	<u>Option</u>	Description
	DATA	Displays data only on the active channel.
	DATM	Displays the data and memory on the active channel.
	DDM	Displays data divided by memory (linear division, log subtraction) on the active channel.
	DMM	Displays data minus memory (linear subtraction) on the active channel.
	MEMO	Displays memory only on the active channel.
Example	DISPMEMO	

	DIVI
	Displays data divided by memory (linear division, log subtraction) on the active channel.
Syntax	DIVI
See Also	DISPDDM
	DONE
	Done with a class of standards, during a calibration. Only needed when multi- ple standards are measured to complete the class. OPC compatible.
Syntax	DONE
	DONM
	Done modifying a test sequence.
Syntax	DONM
	DOSEQ
	Begins execution of the selected sequence.
Syntax	DOSEQ{1 2 3 4 5 6}
Example	DOSEQ1

	DOWN
	Decrements the value in the active entry area (down key).
Syntax	DOWN
	DUAC
	Dual channel display.
Syntax	DUAC{? ON OFF}
Query Response	{1 0}
Example	DUACON
	DUPLSEQ[X]SEQ[Y]
	Duplicates sequence X to sequence Y.
Syntax	DUPLSEQ[<x>]SEQ[<y>]</y></x>
	<X $>$ and $<$ Y $>$ can range from 1 to 6.
Example	DUPLSEQ1SEQ6
	EDITDONE
	Done editing list frequency or limit table. OPC compatible.
Syntax	EDITDONE

EDITLIML

Begin editing limit table.

Syntax EDITLIML

EDITLIST

Begin editing list frequency table.

Syntax EDITLIST

ELED

Sets the electrical delay offset.

Syntax ELED[? | <number>] <number> is ±1.0 s

Query Response <*number>*

EMIB

Sends out a beep during a sequence.

Syntax EMIB

Description NEWSEQ must precede to ensure that a sequence is currently being created or modified.

	ENTO	
	Turns the active entry area OFF.	
Syntax	ENTO	
	ESB?	
	Outputs event-status register B.	
Syntax	ESB?	
	ESE	
	Enables the selected event-status register bits to be summarized by bit 5 in the status byte.	
Syntax	ESE[? <number>]</number>	
	<i><number></number></i> is 0 to 255.	
Description	An event-status register bit is enabled when the corresponding bit in the oper- and D is set.	
Query Response	<number></number>	

ESNB

Enables the selected event-status register B bits to be summarized by bit 2 of the status byte. Much like ESE.

 Syntax
 ESNB[? | <number>]

 <number> can range from 0 to 255.

Query Response <*number>*

ESR?

Outputs the value of the event-status register.

Syntax ESR?

EXTD

Selects the external disk as the active storage device. Used with STORSEQ, TITF, PURG, STOR, LOAD, and LOADSEQ.

Syntax EXTD

Option DATA DATO FORM GRAP RAW {1 0} EXTMRAWON	disk. ATOIFORMIGRAPIRAW}{?IONIOFF} Description Stores register error corrected data on disk. Stores register data array only on disk. Stores register formatted trace data on disk. Stores user graphics on disk. Stores raw data arrays on disk.
EXTM { DATAIDA Option_ DATA DATO FORM GRAP RAW {1 0} EXTMRAWON	ATOIFORMIGRAPIRAW}{?IONIOFF} Description Stores register error corrected data on disk. Stores register data array only on disk. Stores register formatted trace data on disk. Stores user graphics on disk.
Option DATA DATO FORM GRAP RAW {1 0} EXTMRAWON	Description Stores register error corrected data on disk. Stores register data array only on disk. Stores register formatted trace data on disk. Stores user graphics on disk.
DATA DATO FORM GRAP RAW {1 0} EXTMRAWON	Stores register error corrected data on disk. Stores register data array only on disk. Stores register formatted trace data on disk. Stores user graphics on disk.
DATO FORM GRAP RAW {1 0} EXTMRAWON	Stores register data array only on disk. Stores register formatted trace data on disk. Stores user graphics on disk.
FORM GRAP RAW {1 0} EXTMRAWON	Stores register formatted trace data on disk. Stores user graphics on disk.
GRAP RAW {1 0} EXTMRAWON	Stores user graphics on disk.
RAW {1 0} EXTMRAWON	
{1 0} EXTMRAWON	Stores raw data arrays on disk.
EXTMRAWON	
EXTT	
Sets the extern	nal trigger mode.
EXTT{HIGH LOW OFF ON POIN}	
Option_	Description
HIGH	Sets the external trigger polarity high.
LOW	Sets the external trigger polarity low.
OFF	Deactivates the external trigger mode. OPC compatible.
ON	Activates the external trigger on sweep mode. OPC compatible.
POIN	Sets the external trigger to auto trigger on point. OPC compatible.
EXTTPOIN	
	Option_ HIGH LOW OFF ON POIN

FIXE

Specifies a fixed load, as opposed to a sliding load, when defining a standard during a cal kit modification.

Syntax FIXE

FOCU

Adjusts display focus.

Syntax FOCU[? | <number>] <number> can range from 0 to 100%.

Query Response <*number>*

FORM

Sets the data format for array transfers in and out of the instrument.

Syntax FORM{1|2|3|4|5}

	<u>Option</u>	Description
	1	Option 011 internal format. Preceded by 4 byte header.
	2	32 bit floating point format. Preceded by 4 byte header.
	3	64 bit floating point format. Preceded by 4 byte header.
	4	ASCII format. No header.
	5	32 bit floating point PC format. Bytes reversed.
Example	FORM1	

	FORMAT	
	Selects the disk format.	
Syntax	FORMAT{DOS LIF}	
	<u>Option</u>	Description
	DOS	Selects DOS as the disk format.
	LIF	Selects LIF as the disk format.
Example	FORMATDOS	
	FREO	
	Frequency blank	. Turns off frequency notation.
Syntax	FREO	
	FREQOFFS	
	Activates the free	quency offset instrument mode. OPC compatible.
Syntax	FREQOFFS { ? ON OFF }	
Query Response	{1 0}	
Example	FREQOFFSON	

FRER

GPIB free run. Acts the same as CONT.

Syntax FRER

FULP

Selects full page plotting, as opposed to plotting in one of the four quadrants.

Syntax FULP

FWD

Selects a forward calibration class during a 2-port calibration sequence.

Syntax	$FWD\{I M T\}$

<u>Option</u>	Description
I	Selects a forward calibration class to isolation, during a 2- port calibration sequence. OPC compatible if there is only one standard in the class.
Μ	Selects a forward calibration class to match, during a 2-port calibration sequence. OPC compatible if there is only one standard in the class.
Т	Selects a forward calibration class to transmission, during a 2-port calibration sequence. OPC compatible if there is only one standard in the class.

Example

FWDT

GATE

Sets the time domain gate time.

 Syntax
 GATE{CENT|SPAN|STAR|STOP}[?| <number>]

<u>Option</u>	Description
CENT	Sets the time domain gate center time.
SPAN	Sets the time domain gate span time.
STAR	Sets the time domain gate start time.
STOP	Sets the time domain gate stop time.

<number> values can be within the following ranges:

Condition	Range
Frequency sweeps	30 kHz to 3 GHz (to 6 GHz for option 006)
Power sweeps	-15 to 20 dBm in range 0, 25 dB maximum in other ranges (-100 to +100 with power meter cal on)
CW time	0 to 24 hours
Frequency sweep (transform on)) ±1/frequency step
CW time sweep (transform on)	±1/time step

Turns the time domain gate on or off.

Syntax GATEO{? | ON | OFF}

Query Response $\{1 \mid 0\}$

Example GATEOON

GATS

Sets the gate shape.

Syntax GATS {MAXI | MINI | NORM | WIDE }

<u>Option</u>	Description
MAXI	Sets the gate shape to maximum.
MINI	Sets the gate shape to minimum.
NORM	Sets the gate shape to normal.
WIDE	Sets the gate shape to wide.

Example GATSMAXI

GOSUB

Invokes a sequence as a subroutine. Used with SEQ.

Syntax GOSUB

	GUIS		
	Initiates the	guided setup feature.	
Syntax	GUIS		
	HARM		
	Sets the harr	nonic measurement mode, option 002 (OPC compatible).	
Syntax	HARM{OFF SEC THIR}		
	<u>Option</u>	Description	
	OFF	Turns OFF harmonic measurement mode.	
	SEC	Measures the second harmonic.	
	THIR	Measures the third harmonic.	
Example	HARMOFF		
	HOLD		
	Puts the swe	ep trigger into hold.	
Syntax	HOLD		
	IDN?		
		identification string: "HEWLETT PACKARD,8702D,0,X.XX", is the firmware revision of the instrument.	
Syntax	IDN?		

Tests the specified input GPIO bit (PARAIN).

Syntax IFBI{HIGH | LOW}

<u>Option</u>	Description
HIGH	Invokes the sequence specified by SEQ.
LOW	Invokes the sequence specified by SEQ.

Example IFBIHIGH

IFBW

Sets the IF bandwidth.

Syntax IFBW[? | <number>] <number> values are 10, 30, 100, 300, 1000, or 3000 Hz.

	IFLC		
	Branches an e	Branches an executing sequence to a new sequence if condition is satisfied.	
Syntax	IFLC{EQZES	EQ NEZESEQ} {1 2 3 4 5 6}	
	<u>Option</u>	Description	
	EQZESEQ	If loop counter equals zero, then do sequence. NEWSEQ must precede to ensure that a sequence is currently being created or modified.	
	NEZESEQ	If loop counter does not equal zero, then do sequence. NEWSEQ must precede to ensure that a sequence is currently being created or modified.	
Example	IFLCEQZESE	Q 1	
	IFLT		
	Branches an e	xecuting sequence to a new sequence if condition is satisfied.	
Syntax	$IFLT{FAILSEQ PASSSEQ} {1 2 3 4 5 6}$		
	<u>Option</u>	Description	
	FAILSEQ	Limit test fails. NEWSEQ must precede to ensure that a sequence is currently being created or modified.	
	PASSSEQ	Limit test passes. NEWSEQ must precede to ensure that a sequence is currently being created or modified.	
Example	IFLTFAILSE	Q 1	

IMAG

Selects the imaginary display format.

Syntax IMAG

INCRLOOC

Increments the sequencing loop counter by 1. NEWSEQ must precede to ensure that a sequence is currently being created or modified.

Syntax INCRLOOC

INDEREFR

Sets the index of refraction value of transmission median.

Syntax INDEREFR[?| <number>] <number> can range from .001 to 500.

	INI		
	Initializes the internal or external disk. All information on the disk will be destroyed.		
Syntax	$INI \{ D E \}$		
	<u>Option</u>	Description	
	D	Initializes the internal disk. All information on the disk will be destroyed.	
	E	Initializes the external disk. All information on the disk will be destroyed. Requires pass control when using the GPIB port.	
Example	INID		
	INPU		
	Inputs a bloc command.	k of binary data in format readout with the corresponding OUTP	
Syntax	INPU{CALR	CALS REC2 SOU2}	
	<u>Option</u>	Description	
	CALR	Disk 1 receiver cal data.	
	CALS	Disk 1 source cal data.	
	REC2	Disk 2 receiver cal data.	
	SOU2	Disk 2 source cal data.	
Example	INPUCALR		

INPUCALC

Inputs individual calibration coefficient arrays.

Syntax INPUCALC{<*integer*>} [<*array*>]

<integer> can range from array 01 to 12. Array can be form 1–form 5. Refer to "Array-data formats" on page 1-17 for information on the array formats.

Description Before sending the array, issue a CALIXXXX command, where XXX specifies the calibration type of the data. Then input the cal arrays. Lastly store the data with SAVC. The instrument goes into hold, displaying uncorrected data: SING completes the process by displaying error corrected data. Refer to "Calibration Arrays" on page 3-77 for the contents of the different arrays.

INPUCALK

Inputs a cal kit read out with OUTPCALK. After the transfer, the data should be saved into the user cal kit area with SAVEUSEK.

 Syntax
 INPUCALK [<array>]

 Array can be form 1 only. Refer to "Array-data formats" on page 1-17 for information on the arrary formats.

INPUDATA

Inputs an error corrected data array, using current format. The instrument stops sweeping, and then formats and displays the data.

Syntax INPUDATA[*<array>*] Array can be form 1–form 5. Refer to "Array-data formats" on page 1-17 for information on the arrary formats.

	INPUFORM		
	Inputs a formatted data array, using current format. The instrument stops sweeping and displays the data.		
Syntax	INPUFORM[<array>]</array>		
	Array can be form 1–form 5. Refer to "Array-data formats" on page 1-17 for information on the arrary formats.		
	INPULEAS		
	Inputs a learn string read out by OUTPLEAS.		
Syntax	INPULEAS[<string>]</string>		
	INPUPMCAL		
	Inputs power meter calibration arrays into the instrument. Values should be entered as $100 \times$ desired source power in dB.		
Syntax	INPUPMCAL{1 2}		
	INPURAW		
	Inputs a raw data array using the current format. See OUTPRAW for the meaning of the arrays. The instrument stops sweeping, error corrects the data, then formats and displays the data.		
Syntax	INPURAW{1 2 3 4}		

INSM

Selects the instrument mode.

INSM{EXSA|EXSM|NETA|TUNR} **Syntax Option Description** Selects the external source, auto instrument mode (OPC EXSA compatible). Selects the external source, manual instrument mode EXSM (OPC compatible). Selects the standard analyzer instrument mode (OPC NETA compatible). Selects the tuned receiver instrument mode (OPC TUNR compatible). Example INSMEXSA INTD Selects the internal disk as the active storage device. Syntax INTD

See Also STORSEQ, TITF, PURG, STOR, LOAD, and LOADSEQ.

	INTE		
	Sets the display intensity.		
Syntax	INTE[? <number>]</number>		
	<i><number></number></i> can ra	ange from 0 to 100% .	
Query Response	<number></number>		
	INTM		
	Selects the intern	al memory as the active storage device.	
Syntax	INTM		
	ISO		
	Isolation subsequence step in a 2-port calibration.		
Syntax	ISO{D L OP}		
	<u>Option</u>	Description	
	D	Done with isolation subsequence in a 2-port calibration. OPC compatible.	
	L	Begins the isolation subsequence step in a 2-port calibration.	
	OP	Begins the isolation subsequence for one path, two port calibration.	
Example	ISOD		

KEY
Sends a keycode, equivalent to actually pressing the key. It does not matter if the front-panel is in remote mode. Refer to "Key codes" on page 5-6 for information on the key codes.
KEY[? <number>]</number>
< number > can range from 1 to 63.
<number></number>
KITD
Calibration kit done: the last step in modifying a cal kit.
KITD
KOR?
Outputs a two byte key code/knob count. If the number is positive, it is a key code. If it is negative, then set bit 15 equal to bit 14. The resulting integer is the knob count, either positive or negative, depending on the direction of turn (negative for clockwise.) There are approximately 120 counts per knob turn.
KOR?
LAB
Enters a label during a cal kit modification.
LAB<0ption> [<string>]</string>

Language Reference

Option_	Description
EFWDM	Enters label for forward match.
EFWDT	Enters label for forward transmission.
ERESI	Enters label for response, response and isolation.
ERESP	Enters label for response.
EREVM	Enters label for reverse match.
REVT	Enters label for reverse transmission.
ES11A	Enters label for S11A (opens).
ES11B	Enters label for S11B (shorts).
ES11C	Enters label for S11C (loads).
ES22A	Enters label for S22A (opens).
ES22B	Enters label for S22B (shorts).
ES22C	Enters label for S22C (loads).
ETLFM	Enters label for TRL, Line, Forward, Match.
ETLFT	Enters label for TRL, Line, Forward, Trans.
ETLRM	Enters label for TRL, Line, Reverse, Match.
ETLRT	Enters label for TRL, Line, Reverse, Trans.
ETRFM	Enters label for TRL, Reflect, Forward, Match.
ETRRM	Enters label for TRL, Reflect, Reverse, Match.
ETTFM	Enters label for TRL, Thru, Forward, Match.
ETTFT	Enters label for TRL, Thru, Forward, Trans.
ETTRM	Enters label for TRL, Thru, Reverse, Match.
ETTRT	Enters label for TRL, Thru, Reverse, Trans.
K	Enters a cal kit label.
S	Enters a standard's label during standard definition.

LEF

Selects a plot in the left upper or lower quadrant.

Syntax	$LEF\{L \mid U\}$	
	Option	Description
	L	Selects a plot in the left lower quadrant.
	U	Selects a plot in the left upper quadrant.
Example	LEFL	

LIM

Sets the limit parameters.

Syntax LIM<option>[? | <number>] <option> values can be:

<u>Option</u>	Description
IAMPO	Enters the limit line amplitude offset.
D	Sets the limit delta value while editing a limit line segment.
L	Sets the lower limit value.
М	Sets the middle limit value.
S	Sets the limit stimulus break point.
U	Sets the upper limit value.

<number> values can range from:

For log magnitude:	$\pm 500 \text{ dB}$
For phase:	± 500 degrees
For Smith chart and polar:	±500 units
For linear magnitude:	±500 units
For SWR:	±500 units

The scale is always positive, and has minimum values of .001 dB, 10e–12 degrees, 10e–15 seconds, and 10 picounits.

LIMILINE

Turns the display of the limit lines on and off.

Syntax LIMILINE { ? | ON | OFF }

Query Response {1 | 0}

Example LIMILINEON

LIMIMAOF

Marker to limit offset. Centers the limit lines about the current marker position using the limit amplitude offset function.

Syntax LIMIMAOF

LIMISTIO

Enters the stimulus offset of the limit lines.

Syntax LIMISTIO[? | <number>]

<number> may be values:

Condition	Range
Frequency sweeps	30 kHz to 3 GHz (to 6 GHz for option 006)
Power sweeps	-15 to 20 dBm in range 0, 25 dB maximum in other ranges $(-100 to +100 with power meter cal on)$
CW time	0 to 24 hours
Frequency sweep (transform on)	±1/frequency step
CW time sweep (transform on)	±1/time step

Query Response <*number>*

LIMITEST

Turns limit testing on and off.

- Syntax LIMITEST{?|ON|OFF}
- **Query Response** $\{1 \mid 0\}$
- **Example** LIMITESTON

	LIMT			
	Sets the limit	t segment value.		
Syntax	LIMT{FL S]	LIMT{FL SL SP}		
	<u>Option</u>	Description		
	FL	Makes the segment a flat line.		
	SL	Makes the segment a sloping line.		
	SP	Makes the segment a single point.		
Example	LIMTFL			
	LIN			
	Sets the linea	ar value.		
Syntax	LIN{FREQ N	м}		
	<u>Option</u>	Description		
	FREQ	Selects a linear frequency sweep.		
	Μ	Selects the linear magnitude display format.		
Example	LINFREQ			

LINT

Enters the plotting line type.

Syntax LINT{DATA|MEMO} [?| <number>]

OptionDescriptionDATAEnters the line type for plotting data.MEMOEnters the line type for plotting memory.<number> can range from 0 to 7.

Query Response <*number>*

LISFREQ

Selects the list frequency sweep mode.

Syntax LISFREQ

LISV

Activates the list values function.

Syntax LISV

Description The next page of values can be called with NEXP. The current page can be plotted or printed, in raster graphics mode, with PLOT or PRINALL. The entire list can be printed, in ASCII text mode, with PRINTALL.

LOAD

Loads the file from disk with the name indicated by the previous TITFn command. The actual file recalled depends on the file title in the file position specified. Requires pass control mode when using the GPIB port.

Syntax LOAD{1 | 2 | 3 | 4 | 5}

<u>Option</u>	Description
1	Loads the file from disk using the file name provided by the preceding TITF1 command.
2	Loads the file from disk using the file name provided by the preceding TITF2 command.
3	Loads the file from disk using the file name provided by the preceding TITF3 command.
4	Loads the file from disk using the file name provided by the preceding TITF4 command.
5	Loads the file from disk using the file name provided by the preceding TITF5 command.

Example LOAD1

LOADRE

Loads cal data from disk with filename indicated by the previous $\tt TITFn$ or <code>READRECTn</code> commands.

Syntax LOADRE{C1|C2|C3|C4|C5|21|22|23|24|25}

<u>Option</u>	Description
C1-C5	Loads cal data from disk into Receiver1.
21-25	Loads cal data from disk into Receiver2.

Example LOADREC1 or LOADRE21

LOADSEQ

Loads the indicated sequence from disk. Requires pass control mode when using the GPIB port.

Syntax	LOADSEQ{1 2 3 4 5 6}	
	<u>Option</u>	Description
	1	Loads sequence 1 from disk.
	2	Loads sequence 2 from disk.
	3	Loads sequence 3 from disk.
	4	Loads sequence 4 from disk.
	5	Loads sequence 5 from disk.
	6	Loads sequence 6 from disk.

Example LOADSEQ1

LOADSO

Loads cal data from disk with filename indicated by the previous TITFn or READSOUTn commands.

Syntax	LOADSO{U1 U2 U3 U4 U5 21 22 23 24 25}	
	Option_	Description
	U1-U5	Loads the cal data from disk into Source1.
	21-25	Loads the cal data from disk into Source2.

Example LOADSOU1 or LOADSO21

	LOG		
	Selects the log value.		
Syntax	LOG{FREQ N	YI}	
	<u>Option</u>	Description	
	FREQ	Selects a log frequency sweep.	
	М	Selects the log magnitude display format.	
Example	LOGFREQ		
	LOOC		
		e of the sequencing loop counter. NEWSEQ must precede to a sequence is currently being created or modified.	
Syntax	LOOC[? <n< td=""><td>number>]</td></n<>	number>]	
	<number> v</number>	alue can range from 0 to 32,760.	
Query Response	<number></number>		
	LOW		
	Sets the low]	pass transform (option 110).	
Syntax	LOW{PIMPU	PSTEP}	
	<u>Option</u>	Description	
	PIMPU	Turns off the low pass impulse transform (option 110).	
	PSTEP	Turns off the low pass step transform (option 110).	
Example	LOWPIMPU		
	0.00		

LRN

DescriptionSame as OUTPLEAS. Outputs the learn string, which contains the entire front
panel state, the limit table, and the list frequency table. It is always in form 1.SyntaxLRN{? | [<string>] }DescriptionSame as INPULEAS. Inputs a learn string read out by OUTPLEAS.SyntaxLRN[<string>]MANTRIG
Sets the external trigger to manual trigger on point. OPC compatible.SyntaxMANTRIG

	MARK	
	Makes the indicat	ed marker active and sets its stimulus.
Syntax	MARK{1 2 3 4 5}[? <number>]</number>	
	<number> values</number>	s may be:
	Condition	Range
	Frequency sweeps	30 kHz to 3 GHz (to 6 GHz for option 006)
	Power sweeps	-15 to 20 dBm in range 0, 25 dB maximum in other ranges (-100 to +100 with power meter cal on)
	CW time	0 to 24 hours
	Frequency sweep (transform on)	±1/frequency step
	CW time sweep (transform on)	±1/time step
Query Response	<number></number>	
	MARKBUCK	
	Places the marker	r on a specific sweep point (bucket).
Syntax	MARKBUCK[? <	number>]
		bucket number, ranging from 0 to number of points n 201 point sweep).
Query Response	<number></number>	

MARKCENT

Enters the marker stimulus as the center stimulus.

Syntax MARKCENT

MARKCONT

Places the markers continuously on the trace, not on discrete sample points.

Syntax MARKCONT

MARKCOUP

Couples the markers between the channels, as opposed to MARKUNCO.

Syntax MARKCOUP

MARKCW

Sets the CW frequency to the marker frequency.

Syntax MARKCW

MARKDELA

Sets electrical length so group delay is zero at the marker stimulus.

Syntax MARKDELA

Places the markers in discrete placement mode.

Syntax MARKDISC

MARKFAUV

Sets the auxiliary value of the fixed marker position. Works in coordination with $\tt MARKFVAL$ and $\tt MARKFSTI.$

Syntax	MARKFAUV[? <number>]</number>	
	<i><number></number></i> can range from:	
	For log magnitude:	±500 dB
	For phase:	±500 degrees
	For Smith chart and polar:	±500 units
	For linear magnitude:	±500 units
	For SWR:	±500 units
	The scale is always positive, degrees, 10e–15 seconds, an	and has minimum values of .001 dB, 10e–12 d 10 picounits.

MARKFSTI

Sets the stimulus position of the fixed marker.

SyntaxMARKFSTI[? | <number>]

<number> values may be:

Condition	Range
Frequency sweeps	30 kHz to 3 GHz (to 6 GHz for option 006)
Power sweeps	-15 to 20 dBm in range 0, 25 dB maximum in other ranges (-100 to +100 with power meter cal on)
CW time	0 to 24 hours
Frequency sweep (transform on)	±1/frequency step
CW time sweep (transform on)	±1/time step

MARKFVAL

Sets the value of the fixed marker position. Refer to Table 5-2, "Units as a Function of Display Format," on page 5-5 for the meaning of value and auxiliary value as a function of display format.

Syntax	MARKFVAL[? <number>]</number>	
	<i><number></number></i> can range from:	
	For log magnitude:	±500 dB
	For phase:	±500 degrees
	For Smith chart and polar:	±500 units
	For linear magnitude:	±500 units
	For SWR:	±500 units
	The scale is always positive, degrees, 10e–15 seconds, ar	and has minimum values of .001 dB, 10e–12 nd 10 picounits.

Query Response <*number>*

MARKMAXI

Places the active marker for trace maximum.

Syntax MARKMAXI

MARKMIDD

During a limit segment edit, makes the marker amplitude the limit segment middle value.

Syntax MARKMIDD

MARKMINI

Places the active marker for trace minimum.

Syntax MARKMINI

MARKOFF

Turns all markers and marker functions OFF.

Syntax MARKOFF

MARKREF

Enters the marker amplitude as the reference value.

Syntax MARKREF

MARKSPAN

Enters the span between the active marker and the delta reference as the sweep span.

Syntax MARKSPAN

MARKSTAR

Enters the marker stimulus as the start stimulus.

Syntax MARKSTAR

	MARKSTIM		
	During a limit segment edit, enters the marker stimulus as the limit stimulus break point.		
Syntax	MARKSTIM		
	MARKSTOP		
	Enters the marker stimulus as the stop stimulus.		
Syntax	MARKSTOP		
	MARKUNCO		
	Uncouples the markers between channels, as opposed to MARKCOUP.		
Syntax	MARKUNCO		
	MARKZERO		
	Places the fixed marker at the active marker position and makes it the delta reference.		
Syntax	MARKZERO		

MAXF

Sets the maximum valid frequency of a standard being defined during a cal kit modification.

SyntaxMAXF[? | <number>]<number> can range from 0 to 1000 GHz.

Query Response <*number>*

MEAS

Measures and display the selected input/parameter on the active channel.

MEAS{A|B|E01|E02|01|02|0E1|0E2|001|002|R}

Syntax

<u>Option</u>	Description
А	Measures and displays input A on the active channel.
В	Measures and displays input B on the active channel.
EO1	Measures and displays E/O transmission parameter as Port 1 \rightarrow Port 2 or B/R.
EO2	Measures and displays E/O transmission parameter as A/R (Option 011 only).
01	Measures and displays optical reflection parameter.
02	Measures and displays optical reflection parameter (Option 011 only).
OE1	Measures and displays O/E transmission parameter as Port 1 \rightarrow Port 2 or B/R.
OE2	Measures and displays O/E transmission parameter as A/R (Option 011 only).
001	Measures and displays O/O transmission parameter.
002	Measures and displays O/O transmission parameter (Option 001 only).
R	Measures and displays input R on the active channel.

	Language Reference MEASTAT
Description	Parameters followed by 1 are measured with Port 1 as the RF output and Port 2 for RF input for standard instruments; Option 011 (delete internal test set) measures as B/R. Parameters followed by a 2 are Option 011 only and are measured as A/R.
Example	MEASA
	MEASTAT
	Turns trace statistics on and off.
Syntax	$MEASTAT{? ON OFF}$
Query Response	{1 0}
Example	MEASTATON

MENU

Activates the selected menu.

 $MENU\{? | ON | OFF \} \{ < option > \}$ **Syntax**

<option> values may be:

<u>Option</u>	Description
$\{ON OFF\}$	Blanks the softkey menu.
AVG	Activates the AVG menu.
CAL	Activates the CAL menu.
COPY	Activates the COPY menu.
DISP	Activates the DISPLAY menu.
FORM	Activates the FORMAT menu.
MARK	Activates the MARKER menu.
MEAS	Activates the MEAS menu.
MRKF	Activates the MARKER FCTN menu.
RECA	Activates the SAVE RECALL menu.
SCAL	Activates the SCALE menu.
SEQU	Activates the SEQ menu.
STIM	Activates the STIMULUS menu.
SYST	Activates the SYSTEM menu.

Query Response $\{1 \mid 0\}$

Example MENUAVG

MINF

Sets the minimum valid frequency of a standard being defined during a cal kit modification.

Syntax MINF[?| <number>] *<number>* can range from 0 to 1000 GHz.

Query Response <number>

	MINU
	Displays data minus memory, the same as DISPDMM.
Syntax	MINU
	MODI1
	Begins the modify cal kit sequence.
Syntax	MODI1
	NEWSEQ
	Begin modifying a sequence.
Syntax	NEWSEQ{1 2 3 4 5 6}
Example	NEWSEQ1
	NEXP
	Displays the next page of the operating parameters list.
Syntax	NEXP
	NOOP
	No operation. OPC compatible.
Syntax	NOOP

NUMG

Activates the number of groups of sweeps. A group is whatever is needed to update the current parameter once. This function restarts averaging if ON. OPC compatible.

Syntax NUMG[? | <number>] <number> can range from 1 to 999.

Query Response <*number>*

NUMR

Sets the number of power meter readings per point used during a power meter calibration.

Syntax NUMR[? | <number>] <number> can range from 1 to 100.

Query Response <*number>*

OFS

Specifies the offset during a cal kit modification.

Syntax $OFS\{D|L|Z\}[?| < number>]$

Option_	Description
D	Specifies the delay offset during a cal kit modification.
L	Specifies the loss offset during a cal kit modification.
Ζ	Specifies the impedance offset during a cal kit modification.

<number> values may be:

Language Reference **OFSO**

<u>Option</u>	<number> value</number>
D	±1 s
L	0 to 1000 T $\Omega/{\rm s}$
Z	$0.1 \text{ to } 500 \Omega$

Query Response <*number>*

OFSO

Sets the optical standard parameter.

Syntax OFSO{INDR|LENG|LOSS|RPOW}

<u>Option</u>	Description
INDR	Sets the index of refraction parameter of the optical standard.
LENG	Sets the offset length parameter of the optical standard.
LOSS	Sets the offset loss parameter of the optical standard.
RPOW	Sets the reflected optical power parameter of the optical standard.

Example OFSOINDR

OMII

Omits the isolation step of a calibration sequence.

Syntax OMII

OPC

Operation complete. Reports the completion of the next command received by setting bit 0 in the event-status register, or by replying to an interrogation if OPC? is issued.

Syntax OPC

OPEP

Presents a list of key operating parameters. NEXP scrolls to the next page of parameters. Requesting a plot or print copies the current page. The current page can be plotted or printed, in raster graphics mode, with PLOT or PRINALL. The entire list can be printed, in ASCII text mode, with PRINTALL.

Syntax OPEP

OUTP

Outputs disk cal data as block of binary data.

Syntax OUTP{CALR|CALS|REC2|SOU2}

<u>Option</u>	Description
CALR	Receiver 1 disk data
CALS	Source 1 disk data.
REC2	Receiver 2 disk data
SOU2	Source 2 disk data.

Example OUTPCALR

	OUTP		
	Outputs to the	he GPIB ports.	
Syntax	OUTP{PLOT	OUTP{PLOT PRIN}	
	<u>Option</u>	Description	
	PLOT	Outputs the plot string to the GPIB ports. Can be directed to a plotter, or read into the computer. PSOFT ON and OFF controls whether the softkeys are included in the plot.	
	PRIN	Outputs to the GPIB port a raster dump of the display, intended for a graphics printer. PSOFT ON and OFF controls whether the softkeys are included in the printout.	
Example	OUTPPLOT		
	OUTPAC Outputs the entry area is	value of the active function, or the last active function if the active	
Syntax	OUTPACTI		
	OUTPAP	PER	
	Outputs the age.	smoothing aperture in stimulus units, rather than as a percent-	
Syntax	OUTPAPER		

OUTPCALC

Outputs the error correction arrays for the active calibration on the active channel. Each array comes out in the current output format. They contain real/imaginary pairs, the same number of pairs as points in the sweep.

Syntax OUTPCALC[<string>]

<string> can range from array 01 to 12.

Table 3-6. Calibration Arrays

Array	Response	Response and Isolation	1-port	2-port ^a	TRL*/LRM*
1	ER or ET	E _x (ED)⊧	E _D	E	E
2		E _T (ER)	Es	E	E
3			E _R	E _{RF}	E _{rf}
4				E _{XF}	E _{XF}
5				ELF	ELF
6				E _{tf}	E _{tf}
7				E _{DR}	E _{DR}
8				E	E _{SR}
9				E _{RR}	E _{RR}
10				E _{xr}	E _{XR}
11				ELR	ELR
12				E _{tr}	E _{TR}

a. One path, 2-port cal duplicates arrays 1 to 6 in arrays 7 to 12.

b. Response and isolation corrects for crosstalk and transmission tracking in transmission measurements, and for directivity and reflection tracking in reflection measurements.

Meaning of first subscript:

- D = directivity
- S = source match
- R = reflection tracking
- X = crosstalk
- L = load match
- T = transmission tracking

Language Reference **OUTPCALK**

Meaning of second subscript:

F = forward

R = reverse

OUTPCALK

Outputs the active calibration kit, as a less than 1000 byte string, in Form 1.

Syntax OUTPCALK

OUTPDATA

Outputs the error corrected data from the active channel in the current format. Refer to Figure 5-1, "Data processing chain," on page 4.

Syntax OUTPDATA

OUTPERRO

Outputs the oldest error message in the error queue. Sends first the error number, and then the error message itself as a string no longer than 50 characters.

Syntax OUTPERRO

OUTPFORM

Outputs the formatted display data array from the active channel in the current format. Refer to Table 5-2, "Units as a Function of Display Format," on page 5-5 for the contents of the array positions as a function of display format.

Syntax OUTPFORM

OUTPICALC

Outputs, over GPIB, the interpolated calibration coefficient arrays for the active calibration on the active channel.

Syntax OUTPICALC[<string>] <string> can range from array 01 to 12.

OUTPIDEN

Outputs the identification string for the analyzer: "HEWLETT PACK-ARD,8702D,0,X.XX" where X.XX is the firmware revision.

Syntax OUTPIDEN

OUTPIPMCAL

Outputs, over GPIB, the interpolated power meter calibration array for channel 1 or channel 2.

Syntax OUTPIPM{CAL1 | CAL2}

Example OUTPIPMCAL1

OUTPKEY

Outputs the key code of the last key pressed. An invalid key is reported with a 63, a knob turn with a -1. Refer to Figure 5-2, "Key codes," on page 6 for the front-panel key codes.

Syntax OUTPKEY

	OUTPLEAS			
	-	learn string, which contains the entire front panel state, the limit e list frequency table. It is always in Form 1.		
Syntax	OUTPLEAS			
	OUTPLIN	Al and the second secon		
	Outputs the	limit test results.		
Syntax	OUTPLIM{F	$OUTPLIM{F L M}$		
	<u>Option</u>	Description		
	F	Outputs the limit test results for each failed point.		
	L	Outputs the limit test results for each point in the sweep. This is a Form 4 transfer.		
	М	Outputs the limit test results at the marker.		
Description	ond is an inte Fourth is the	consist of four fields. First is the stimulus value for the point. Sec- eger indicating test status. Third is the upper limit at that point. If there are no limits at that point, the rth fields are zero. The test status is -1 for no test, 0 for fail, and		

Example OUTPLIMF

OUTPMARK

Outputs the marker values. The first two numbers are the marker response values, and the last is the stimulus value. Refer to Table 5-2, "Units as a Function of Display Format," on page 5-5 for the meaning of the response values as a function of display format.

Syntax OUTPMARK

OUTPMEMO

Outputs the memory trace from the active channel. The data is in real/imaginary pairs, and can be treated the same as data read with the OUTPDATA command.

Syntax OUTPMEMO

OUTPMSTA

Outputs the marker statistics: mean, standard deviation, and peak-to-peak variation, in that order. If statistics is not ON, it is turned ON to generate current values and turned OFF again.

Syntax OUTPMSTA

OUTPMWID

Outputs the marker bandwidth search results: bandwidth, center, and Q, in that order. If widths is not ON, it is turned ON to generate current values and turned OFF again.

Syntax OUTPMWID

OUTPMWIL Outputs the marker bandwidths search results: bandwidth, center, loss, and Q in that order. If widths is not ON, it is turned ON to generate current values and turned OFF again. **Syntax** OUTPMWIL **OUTPPMCAL** Outputs the power meter calibration array for channel 1 or channel 2. Values are sent as 100 times the source power in dB. A default array is used if a power meter calibration sweep, TAKCS, has not been taken. **Syntax** OUTPPM{CAL1 | CAL2 } Example OUTPPMCAL1 **OUTPPRNALL** Prints all list values or operating and marker parameters in text mode to GPIB. Activate desired function with LISV for values or OPEP for operating parameters.

Syntax OUTPPRNALL

OUTPRAW

Outputs the raw measurement data. Refer to Figure 5-1, "Data processing chain," on page 4 for the meaning of the data. Normally, array 1 holds the current parameter. If a 2-port calibration is active, the arrays hold S11, S21, S12, and S22, respectively.

Syntax OUTPRAW{1 | 2 | 3 | 4}

Example OUTPRAW1

OUTPRFFR

Outputs the external source RF frequency. The instrument must be in external source mode, either INSMECSA or INSEXSM.

Syntax OUTPRFFR

OUTPSEQ

Outputs a sequence listing over GPIB.

Syntax OUTPSEQ{1 | 2 | 3 | 4 | 5 | 6}

Example OUTPSEQ1

OUTPSTAT

Outputs the status byte.

Syntax OUTPSTAT

	OUTPTITL
	Outputs the display title.
Syntax	OUTPTITL
	PARAIN
	Specified the input GPIO bit to be used by IFBIHIGH and IFBILOW tests.
Syntax	PARAIN[? <number>]</number>
	< number > can range from 0 to 4.
Query Response	<number></number>
	PARAL
	Selects use of the parallel port: for general purpose I/O or for the copy function.
Syntax	PARAL{? GPIO CPY}
	Values may be:
	GPIO (General Purpose I/O)
	CPY (Copy use)
Query Response	{1 0}

PARAOUT

Programs all GPIO output bits (0 to 255) at once.

Syntax PARAOUT[? | <number>] <number> can range from 0 to 255.

Query Response <*number>*

PAUS

Inserts a pause into a sequence. NEWSEQ must precede to ensure that a sequence is currently being created or modified.

Syntax PAUS

PCB

Same as ADDRCONT. Indicates where control will be passed in pass control mode.

Syntax PCB[? | <number>] <number> can range from 0 to 30.

Query Response <*number>*

PCOL

Selects the color for the indicated display feature.

Syntax PCOL{<option>} [<color>]

Language Reference **PDATA**

<u>Option</u>	Description	
DATA1	Selects the color for channel 1 data.	
DATA2	Selects the color for channel 2 data.	
MEMO1	Selects the color for channel 1 memory.	
MEMO2	Selects the color for channel 2 memory.	
GRAT	Selects the color for the graticule.	
TEXT	Selects the color for the display text.	
WARN	Selects the color for the warning text.	
<i><color></color></i> can be white, cyan, magenta, blue, yellow, green, red, or black.		

PDATA

Selects whether trace data is plotted.

Syntax $PDATA{?|ON|OFF}$

Query Response $\{1 \mid 0\}$

Example PDATAON

PENN

Selects the pen for plotting the indicated display feature.

Syntax PENN{DATA|GRAT|MARK|MEMO|TEXT}[?| <number>]

<u>Option</u>	Description
DATA	Selects the pen for plotting the data trace.
GRAT	Selects the pen for plotting the graticule.
MARK	Selects the pen for plotting the markers and marker text.
MEMO	Selects the pen for plotting the memory trace.
TEXT	Selects the pen for plotting text and user graphics.
< number > can range from 0 to 10.	

Query Response <*number>*

PGRAT

Selects whether the graticule is plotted.

Syntax PGRAT { ? | ON | OFF }

Query Response $\{1 \mid 0\}$

Example PGRATON

	РНАО	
	Sets the phase offset.	
Syntax	Phao[? <number>]</number>	
	$< number > range is \pm 360 degrees.$	
Query Response	<number></number>	
	PHAS	
	Selects the phase display format.	
Syntax	PHAS	
	PLOS	
	Selects the pen speed for plotting.	
Syntax	PLOS{SLOW FAST}	
Example	PLOSFAST	
	PLOT	
	Initiates a plot. Requires pass control mode when using the GPIB port.	
Syntax	PLOT	

PLTHNDSHK

Selects the plotter handshake mode as either Xon-Xoff or DTR-DSR, for serial (RS-232) bus.

Syntax	PLTHNDSHK{? DTR XON}	
Syntax		
	<u>Option</u>	Description
	DTR	Selects the DTR-DSR plotter handshake mode.
	XON	Selects the XON-XOFF plotter handshake mode.
Query Response	{1 0}	
	PLTPRT	
	Sets the plotter p	ort.
Syntax	PLTPRT{HPIB PARA SERI}	
	<u>Option</u>	Description
	HPIB	Sets the plotter port to GPIB.
	PARA	Sets the plotter port to parallel.
	SERI	Sets the plotter port to serial (RS-232).
Example	PLTPRTHPIB	
	PLTPRTDISK	
	Plots measurement results to a disk for later retrieval.	
Syntax	PLTPRTDISK	

	PLTTRAUTF	
	Turns on and off the plotter auto feed.	
Syntax	PLTTRAUTF { ? ON OFF }	
Query Response	{1 0}	
Example	PLTTRAUTFON	
	PLTTRBAUD	
	Sets the plotter baud rate, for serial (RS-232) bus.	
Syntax	PLTTRBAUD[? <number>]</number>	
	<i><number></number></i> can be 1200, 2400, 4800, 9600, or 19200.	
Query Response	<number></number>	
	PLTTRFORF	
	Sends a form feed to the plotter.	
Syntax	PLTTRFORF	
	<number> can be 1200, 2400, 4800, 9600, or 19200. <number> PLTTRFORF</number></number>	

PLTTYP

Selects the plotter type.

Syntax PLTTYP{HPGL|PLTR}

<u>Option</u>	Description
HPGL	Selects HPGL-compatible printer as the plotter type.
PLTR	Selects plotter as the plotter type.

Example PLTTYPHPGL

PMEM

Selects whether memory is plotted.

Syntax PMEM{?|ON|OFF}

Query Response $\{1 \mid 0\}$

Example PMEMON

PMKR

Selects whether markers are plotted.

- Syntax PMKR{?|ON|OFF}
- **Query Response** $\{1 \mid 0\}$

Example PMKRON

	PMTRTTIT	
	Reads power meter/GPIB value into title string. NEWSEQ must precede to ensure that a sequence is currently being created or modified.	
Syntax	PMTRTTIT	
	POIN	
	Sets the number of points in the sweep. If a list frequency segment is being edited, sets the number of points in the segment.	
Syntax	POIN[? <number>]</number>	
	<i><number></number></i> can range from 1 to 1632.	
Query Response	<number></number>	
	POLA	
	Selects the polar display format.	
Syntax	POLA	

POLM

Selects marker readout format for polar display.

Syntax POLM{LIN|LOG|MRI}

<u>Option</u>	Description
LIN	Selects linear markers for polar display.
LOG	Selects log markers for polar display.
MRI	Selects real/imaginary markers for polar display.

Example POLMLIN

PORE

Turn port extensions on and off.

- Syntax PORE{?|ON|OFF}
- **Query Response** $\{1 \mid 0\}$
- **Example** POREON

PORT Set the port extension length for the indicated port or input. Ports 1 and 2 refer to the test set ports. **Syntax** $PORT\{1 \mid 2 \mid A \mid B\}[? \mid <number>]$ Description Option Port 1 1 2 Port 2 Α Input A В Input B <*number*> value is ± 10 s **Query Response** <number> PORTP Selects either coupled or uncoupled for the port powers for a given channel. Syntax PORTP{? | CPLD | UNCPLD} **Query Response** $\{1 \mid 0\}$ POWE Sets the output power level. POWE[?| <number>] Syntax <*number*> can range from -85 to +20 dBm. **Query Response** <number>

POWLFREQ

Selects the frequency for which a power loss correction is entered. This must be followed by POWLLOSS, which sets the value.

Syntax POWLFREQ[? | <number>] <number> values may be:

Condition_	Range
Frequency sweeps	30 kHz to 3 GHz (to 6 GHz for option 006)
Power sweeps	-15 to 20 dBm in range 0, 25 dB maximum in other ranges (-100 to +100 with power meter cal on)
CW time	0 to 24 hours
Frequency sweep (transform on)	±1/frequency step
CW time sweep (transform on)	±1/time step

Query Response <*number>*

POWLLIST

Begins editing a power loss list for a power meter calibration.

Syntax POWLLIST

	POWLLOSS
	Sets the loss value for a particular frequency, POWLFREQ, in the power loss list.
Syntax	POWLLOSS[? <i><number></number></i>] <i><number></number></i> can range from –9900 to 9900 dB.
Query Response	<number></number>
	POWM
	Selects whether the Agilent 436A (ON) or the Agilent 437B/438A (OFF) is to be used as the power meter in service procedures.
Syntax	$POWM{? ON OFF}$
Query Response	{1 0}
Example	POWMON
	POWS
	Selects power sweep, from the sweep type menu.
Syntax	POWS

POWT

Turns power trip OFF which clears a power trip after an overload condition is detected at one of the input ports.

- Syntax POWT { ? | ON | OFF }
- **Query Response** $\{1 \mid 0\}$
- Example POWTON

PRAN

Selects the power range when in manual power range. Used with PWRR and PMAN.

Syntax PRAN{0 | 1 | 2 | 3 | 4 | 5 | 6 | 7}

Example PRAN1

PRES

Presets the analyzer to the factory preset state.

Syntax PRES

PRIC

Selects color print.

Syntax PRIC

PRIN Begins printing the format selected. Requires pass control mode when using the GPIB port. Syntax PRIN{ALL TALL} Option Description ALL Copies the display, in raster graphics mode, to a printer. TALL Prints all list values or operating and marker parameters in ASCII text mode. Example PRINSEQ Begins printing the sequence selected. Requires pass control mode when using the GPIB port. Syntax PRINSEQ(12 3 4 5 6) Example PRINSEQ1 PRIS Selects standard (monochrome) print. Syntax PRIS				
Syntax PRIN{ALL TALL} Option Description ALL Copies the display, in raster graphics mode, to a printer. TALL Prints all list values or operating and marker parameters in ASCII text mode. Example PRINSEQ Begins printing the sequence selected. Requires pass control mode when using the GPIB port. Syntax PRINSEQ[1 2 3 4 5 6] Example PRINSEQ1 PRINSEQ1 PRIS Selects standard (monochrome) print.		PRIN		
Option. Description ALL Copies the display, in raster graphics mode, to a printer. TALL Prints all list values or operating and marker parameters in ASCII text mode. Example PRINALL PRINSEQ Begins printing the sequence selected. Requires pass control mode when using the GPIB port. Syntax PRINSEQ(1 2 3 4 5 6) Example PRINSEQ1 PRIS Selects standard (monochrome) print.				
ALL Copies the display, in raster graphics mode, to a printer. TALL Prints all list values or operating and marker parameters in ASCII text mode. Example PRINALL PRINSEQ Begins printing the sequence selected. Requires pass control mode when using the GPIB port. Syntax PRINSEQ{1 2 3 4 5 6} Example PRINSEQ1 PRINSEQ1 PRINSEQ1	Syntax	PRIN{ALL TALL}		
TALL Prints all list values or operating and marker parameters in ASCII text mode. Example PRINALL PRINSEQ Begins printing the sequence selected. Requires pass control mode when using the GPIB port. Syntax PRINSEQ[1 2 3 4 5 6] Example PRINSEQ1 PRIS Selects standard (monochrome) print.		<u>Option</u>	Description	
ASCII text mode. Example PRINALL PRINSEQ Begins printing the sequence selected. Requires pass control mode when using the GPIB port. Syntax PRINSEQ(1 2 3 4 5 6) Example PRINSEQ1 PRIS Selects standard (monochrome) print.		ALL	Copies the display, in raster graphics mode, to a printer.	
PRINSEQ Begins printing the sequence selected. Requires pass control mode when using the GPIB port. Syntax PRINSEQ[1 2 3 4 5 6] Example PRINSEQ1 PRIS Selects standard (monochrome) print.		TALL	Prints all list values or operating and marker parameters in ASCII text mode.	
Begins printing the sequence selected. Requires pass control mode when using the GPIB port. Syntax PRINSEQ{1 2 3 4 5 6} Example PRINSEQ1 PRIS Selects standard (monochrome) print.	Example	PRINALL		
Begins printing the sequence selected. Requires pass control mode when using the GPIB port. Syntax PRINSEQ{1 2 3 4 5 6} Example PRINSEQ1 PRIS Selects standard (monochrome) print.				
using the GPIB port. Syntax PRINSEQ(1 2 3 4 5 6) Example PRINSEQ1 PRIS Selects standard (monochrome) print.		PRINSEQ		
Example PRINSEQ1 PRIS PRIS Selects standard (monochrome) print.				
PRIS Selects standard (monochrome) print.	Syntax	PRINSEQ{1	2 3 4 5 6}	
Selects standard (monochrome) print.	Example	PRINSEQ1		
Selects standard (monochrome) print.				
		PRIS	PRIS	
Syntax PRIS		Selects stand	Selects standard (monochrome) print.	
	Syntax	PRIS		

PRNHNDSHK

Selects the printer handshake mode as either Xon-Xoff or DTR-DSR, for serial (RS-232) bus.

Syntax	PRNHNDSHK{? D	TR XON}
	<u>Option</u>	Description
	DTR	DTR-DSR
	XON	XON-XOFF

Query Response $\{1 \mid 0\}$

PRNPRT

Sets the printer port.

SyntaxPRNPRT{HPIB|PARA|SERI}OptionDescriptionHPIBSets the printer port to GPIB.PARASets the printer port to parallel.SERISets the printer port to serial (RS-232) bus.ExamplePRNPRTHPIB

	PRNTRAUTF	
	Turns on and off the printer auto feed.	
Syntax	PRNTRAUTF { ? ON OFF}	
Query Response	{1 0}	
Example	PRNTRAUTFON	
	PRNTRBAUD	
	Sets the printer baud rate.	
Syntax	PRNTRBAUD[? <number>]</number>	
	<i><number></number></i> can be 1200, 2400, 4800, 9600, or 19200.	
Query Response	<number></number>	
	PRNTRFORF	
	Sends a form feed to the printer.	
Syntax	PRNTRFORF	

PRNTYP

Selects the printer type.

Syntax $PRNTYP \{ DJ | EP | LJ | PJ | TJ \}$

Option_	Description
DJ	Selects the DeskJet printer as the printer type.
EP	Selects the Epson ESC/P2 printer control language- compatible printer as the printer type.
LJ	Selects the LaserJet printer as the printer type.
PJ	Selects the PaintJet printer as the printer type.
TJ	Selects the ThinkJet printer as the printer type.

Example PRNTYPDJ

PSOFT

Controls whether softkeys are included in the hardcopy print or plot when using one of the following commands: PLOT, PRINALL, OUTPPLOT or OUTP-PRIN.

- Syntax PSOFT { ? | ON | OFF }
- **Query Response** $\{1 \mid 0\}$
- **Example** PSOFTON

	PTEXT	
	Selects whether text is plotted.	
Syntax	<pre>PTEXT{? ON OFF}</pre>	
Query Response	{1 0}	
Example	PTEXTON	
	PTOS	
	Pauses the sequence to be followed by selection one of the six sequences (SEQ).	
Syntax	PTOS	
	PURG	
	Purges the indicated file from disk. Requires pass control mode when using the GPIB port.	
Syntax	PURG{1 2 3 4 5}	
Example	PURG1	
	PWMC	
	Select the type of power meter calibration desired.	
Syntax	$PWMC{EACS OFF ONES}[? < number>]$	

<u>Option</u>	Description
EACS	Selects the type of power meter calibration desired to each sweep.
OFF	Selects the type of power meter calibration desired to OFF.
ONES	Selects the type of power meter calibration desired to one sweep.
< number > can be -100 to 100 dB.	

Query Response <*number>*

PWRLOSS

Selects whether or not to use the power loss table for a power meter calibration.

- Syntax PWRLOSS { ? | ON | OFF }
- **Query Response** $\{1 \mid 0\}$
- **Example** PWRLOSSON

PWRMCAL

Displays the power meter cal menu and sets the drive port cal power.

Syntax PWRMCAL[? | <number>] <number> can be -100 to 100 dB.

Query Response <*number>*

	PWRR		
	Selects the source	e power range auto or manual mode.	
Syntax	PWRR{? PAUTO PMAN}		
Query Response	{1 0}		
Example	PWRR1		
	RAI		
Calls the class for the response and isolation calibra only one standard in class.		r the response and isolation calibration. OPC compatible if d in class.	
Syntax	RAI{ISOL RESP}		
	<u>Option</u>	Description	
	ISOL	Calls the isolation class for the response and isolation calibration.	
	RESP	Calls the response class for the response and isolation calibration.	
Example	RAIISOL		
	RAID		
	Completes the response and isolation cal sequence. OPC compatible.		
Syntax	RAID		

RAMD

Indicates that the response and match cal is done.

Syntax RAMD

RE

Calculates the cal standard values at the frequency of each point in the current sweep and stores it in the trace memory for the active channel.

Syntax RE{CCSTDI|CDSTDI|2DSTDI}

<u>Option</u>	Description
CCSTDI	Calculates receiver coefficient standard and copies into memory.
CDSTDI	Calculates disk Receiver1 standard and copies into memory.
2DSTDI	Calculates disk Receiver2 standard and copies into memory.
RECCSTDI	

Example

READ

Outputs the date/time in string format. There is no front-panel equivalent.

Syntax READ{DATE|TIME}

<u>Option</u>	Description
DATE	Outputs the date in the following string format: DD MMM YYYY.
TIME	Outputs the time in the following string format: HH:MM:SS.

	Language Reference READRECT
Example	READDATE
	READRECT
	Reads up to five receiver cal file titles.
Syntax	READRECT
	READSOUT
	Reads up to five source cal file titles.
Syntax	READSOUT
	REAL
	Selects the real display format.
Syntax	REAL
	RECA
	Recalls the indicated internal register. OPC compatible.
Syntax	RECA{1 2 3 4 5}
Example	RECA1

RECAREG

	Recalls save/recall registers 01 through 31. RECAREG01 through RECAREG05 are the same as RECA1 through RECA5.
Syntax	RECAREG{< <i>integer</i> >}
	<i><integer></integer></i> can range from register 01 to 31.
Example	RECAREG01
	RECO
	Recalls previously saved display colors.
Syntax	RECO
	REFD
	Completes the reflection calibration subsequence of a 2-port calibration. OPC compatible.
Syntax	REFD
	REFL
	Begins the reflection calibration subsequence of a 2-port calibration.
Syntax	REFL

	REFOP		
	Begins the reflection calibration subsequence for one path, two port calibra- tion.		
Syntax	REFOP		
	REFP		
	Enters the reference position.		
Syntax	REFP[? <number>]</number>		
	< number > can range from 0 to 10, where:		
	0 is the bottom of the graticule.		
	10 is the top of the graticule.		
Query Response	<number></number>		
	REFT		
	Recall file titles from disk. Requires pass control mode when using the GPIB port.		
Syntax	REFT		

REFV

Enters the reference line value.

Syntax	REFV[? <number>]</number>		
	<i><number></number></i> can range from:		
	For log magnitude:	±500 dB	
	For phase:	±500 degrees	
	For Smith chart and polar:	±500 units	
	For linear magnitude:	±500 units	
	For SWR:	±500 units	
	The scale is always positive, degrees, 10e–15 seconds, ar	and has minimum values of .001 dB, 10e–12 nd 10 picounits.	
Query Response	<number></number>		
	RESC		

Resumes cal sequence.

Syntax RESC

RESD

Restores the measurement display after viewing the operating parameters or list values.

Syntax RESD

	RESPDO Completes th				
	Completes th	as regnance calibration sequence OPC compatible			
		Completes the response calibration sequence. OPC compatible.			
Syntax	RESPDONE				
	REST				
	Measuremen	ıt restart.			
Syntax	REST				
	REV				
		erse calibration classes, during a full 2-port calibration; OPC com ere is only one standard in the class.			
Syntax	$REV{I M T}$				
	<u>Option</u>	Description			
	I	Isolation			
	М	Match			
	Т	Transmission			
Example	REVI				
	RF				
	Sets RF grea	ter or less than LO in mixer measurements.			
	ć	тт с }			
Syntax	RF{GTLO L				

	<u>Option</u>	Description
	GTLO	Sets RF greater than LO in mixer measurements.
	LTLO	Sets RF less than LO in mixer measurements.
Example	RFGTLO	
	RIG	
	Selects a plot in t	the right upper or lower quadrant.
Syntax	$RIG\{L U\}$	
	<u>Option</u>	Description
	L	Selects a plot in the lower right quadrant.
	U	Selects a plot in the upper right quadrant.
Example	RIGL	
	RSCO	
	Resets colors for	the selected group.
Syntax	RSCO	
	RST	
	Presets the instru	ument. OPC compatible.
Syntax	RST	

	S		
	Selects the S-parameter displayed on the active channel.		
Syntax	S{11 12 21 22}		
	Option_	Description	
	11	Selects the S11 parameter.	
	12	Selects the S12 parameter.	
	21	Selects the S21 parameter.	
	22	Selects the S22 parameter.	
Example	S22		
		egment to the table, during either a list frequency or limit table	
Syntax	edit. SADD		
	SAMC		
		er correction on and off. Sampler correction is only turned off to customer calibration coefficients.	
Syntax	SAMC{? ON	OFF }	
Query Response	{1 0}		
Example	SAMCON		

	SAV	SAV			
	Completes the port calibration sequence. OPC compatible.				
Syntax	SAV{1 2}	SAV{1 2}			
	<u>Option</u>	Description			
	1	Completes the 1-port calibration sequence.			
	2	Completes the 2-port calibration sequence.			
Example	SAV1				
	SAVC				
	Completes th ment. OPC c	ne transfer of error correction coefficients back into the instru- ompatible.			
Syntax	SAVC				
	SAVE				
	Stores the cu compatible.	irrent instrument state in the indicated internal register. OPC			
Syntax	SAVE{1 2 3	3 4 5}			
Example	SAVE1				
	SAVEOP'	ТК			
	Save the curr	rent definitions of optical standards for the Agilent 8702A/B/D.			
Syntax	SAVEOPTK				

	SAVEOPTS	SAVEOPTS			
	Save the current definitions of optical standards for the Agilent 8702D.				
Syntax	SAVEOPTS				
	SAVEREG				
		call registers 01 through 31. SAVEREG01 through the same as SAVE1 through SAVE5.			
Syntax	SAVEREG{< <i>integ</i>	$ger>\}$			
	<i><integer></integer></i> can ra	ange from 01 to 31.			
Example	SAVEREG01				
	SAVEUSEK				
	Stores the active	calibration kit as the user kit.			
Syntax	SAVEUSEK				
	SAVU				
	Selects format fo	or saving to disk.			
Syntax	SAVU{ASCI BINA}				
	<u>Option</u>	Description			
	ASCI	Selects ASCII format for saving to disk. Also known as citifile format.			
	BINA	Selects binary format for saving to disk.			

Example	SAVUASCI	
	SCAL	
	Sets the trace scale factor.	
Syntax	SCAL[? < <i>number</i> >] < <i>number></i> can range from:	
	For log magnitude:	±500 dB
	For phase:	±500 degrees
	For Smith chart and polar:	±500 units
	For linear magnitude:	±500 units
	For SWR:	±500 units
	The scale is always positive degrees, 10e–15 seconds, ar	, and has minimum values of .001 dB, 10e–12 nd 10 picounits.
Query Response	<number></number>	
	SCAP	
	Selects a full plot, or a plot	where the graticule is expanded to P1 and P2.
Syntax	SCAP{FULL GRAT}	
Example	SCAPFULL	
	SDEL	
	During either a list frequence ment.	cy or a limit table edit, deletes the current seg-
Syntax	SDEL	
		2.115

	SDON	SDON		
	During either ing.	a list frequen	cy or a limit table edit, closes a segment after edit-	
Syntax	SDON			
	SEA			
	Places the act	ive marker.		
Syntax	SEA{L MAX I	SEA{L MAX MIN OFF R TARG[? <number>]}</number>		
	<u>Option</u>	<u>Descript</u>	ion	
	L		Places the active marker for search left for next occurrence of the target value.	
	MAX	Places th MARKMA	ne active marker for trace maximum. See also XI.	
	MIN	Places the active marker for trace minimum. See also MARKMINI.		
	OFF	Turns th	Turns the marker search OFF.	
	R		Places the active marker for search right for next occurrence of the target value.	
	TARG	Places th	ne active marker for arbitrary target amplitude.	
	<number> ca</number>	an range from:	:	
	For log magni	tude:	±500 dB	
	For phase:		$\pm 500 \text{ degrees}$	
	For Smith cha	art and polar:	±500 units	
	For linear mag	gnitude:	±500 units	
	For SWR:		±500 units	
	The coole is a	luvova pogitivo	and has minimum values of 001 dB 10a 19	

The scale is always positive, and has minimum values of .001 dB, 10e–12 degrees, 10e-15 seconds, and 10 picounits.

	_				
	SEDI				
	During either a free	During either a frequency or a limit table edit, selects the segment for editing.			
Syntax	SEDI[? <number>]</number>				
	< <i>number></i> can be	e:			
	For cal-power me	eter calibration:	1 to 12		
	For system-limit t	testing:	1 to 18		
	For stimulus men	u:	see below		
	Condition	<u>Range</u>			
	Frequency sweeps	30 kHz to 3 GI	Hz (to 6 GHz for option 006)		
	Power sweeps		n in range 0, 25 dB maximum in other ranges with power meter cal on)		
	CW time	0 to 24 hours			
	Frequency sweep (transform on)	±1/frequency	step		
	CW time sweep (transform on)	±1/time step			
Query Response	<number></number>				
	SELL				
	Selects the learn string revision (LRN) to input to or output from the				
yntax	SELL[? <numb< td=""><td>ber>]</td><td></td></numb<>	ber>]			
	<i><number></number></i> can be	e: 0			
Query Response	<number></number>				
			3-11		

	SEQ		
	Selects sequence 1 through 6.		
Syntax	SEQ{1 2 3 4 5 6}		
Example	SEQ1		
	SEQWAIT		
	Tells the instrument to wait a specified number of seconds during a sequence. NEWSEQ must precede to ensure that a sequence is currently being created or modified.		
Syntax	SEQWAIT[? <number>]</number>		
	<i><number></number></i> can range from 01 to 3000 s.		
Query Response	<number></number>		
	SETBIT		
	Sets the specified bit (0 to 7) on the GPIO.		
Syntax	SETBIT[? <number>]</number>		
	< number > can range from 0 to 7.		
Query Response	<number></number>		

SETDATE

Sets the date in the following format: DD MMM YYYY, where DD is the day and must be 2 digits, MMM is the month and must be three alpha characters (JAN, FEB, MAR, APR, MAY, JUN, JUL, AUG, SEP, OCT, NOV, DEC), and YYYY is the year and must be 4 digits.

Syntax SETDATE [<string>] <string> value is: DD MMM YYYY

SETF

Sets frequency for low pass transform. Not available with Option 110.

Syntax SETF

SETTIME

Sets the time in the following format: HH:MM:SS, where HH is the hour, MM is minutes, SS is seconds, and each must be 2 digits.

Syntax SETTIME [<string>] <string> value is: HH:MM:SS

SETZ

Set the characteristic impedance of the measurement system.

Syntax SETZ[? | <number>] <number> can range from 0.1 to 500Ω.

	SHOM
	Displays the desired softkey menu during a sequence. NEWSEQ must precede to ensure that a sequence is currently being created or modified.
Syntax	SHOM
	SING
	Sets to single sweep. OPC compatible.
Syntax	SING
	SLID
	Sliding load done.
Syntax	SLID
	SLIL
	Specifies the standard as a sliding load during a standard definition as part of a cal kit modification.
Syntax	SLIL
	SLIS
	Sliding load set.
Syntax	SLIS
	3-120

SLOPE

Enters the power slope value.

Syntax SLOPE[? | <number>] <number> can range from -2 to 2 dB/GHz.

Query Response <*number>*

SLOPO

Turns the power slope on and off.

Syntax SLOPO{? | ON | OFF}

Query Response {1 | 0}

Example SLOPOON

SMIC

Selects Smith chart display format.

Syntax SMIC

	SMIM		
	Selects the mark	xer readout format on a Smith chart.	
Syntax	SMIM{GB LIN LOG RI RX}		
	<u>Option</u>	Description	
	GB	Selects the G+jB marker readout format on a Smith chart.	
	LIN	Selects the linear marker readout format on a Smith chart.	
	LOG	Selects the log marker readout format on a Smith chart.	
	RI	Selects the real/imaginary pairs marker readout format on a Smith chart.	
	RX	Selects the R+jX marker readout format on a Smith chart.	
Example	SMIMGB		
	SMOOAPE	R	
	Sets the smooth	ing aperture as a percent of the trace.	
Syntax	SMOOAPER[? < <i>number></i> can :	< <i>number</i> >] range from 0.05 to 20%.	
Query Response	<number></number>		

SMOOO

Turns smoothing on and off.

Syntax $SMOOO{?|ON|OFF}$

Query Response $\{1 \mid 0\}$

Example SMOOOON

SO

Calculates the values for source cal standard and stores it in trace memory for the active channel.

Syntax SO{UCSTDI | UDSTDI | 2DSTDI }

<u>Option</u>	Description
UCSTDI	Calculates the source coefficient standard and copies into memory.
UDSTDI	Calculates disk cal standard and copies into memory.
2DSTDI	Calculates disk cal standard and copies into memory.

Example SOUCSTDI

SOFR

SOFR

Displays the firmware revision on the screen.

Syntax

	SOFT	
	Presses the indicated softkey.	
Syntax	SOFT{1 2 3 4 5 6 7 8}	
Example	SOFT1	
	SOUP	
	Turns the source power on and off.	
Syntax	SOUP{? ON OFF}	
Query Response	{1 0}	
Example	SOUPON	

SPAN

Sets the stimulus span. If a list frequency segment is being edited, sets the span of the segment.

Syntax SPAN[? | <number>]

<number> values may be:

Condition_	Range
Frequency sweeps	30 kHz to 3 GHz (to 6 GHz for option 006)
Power sweeps	-15 to 20 dBm in range 0, 25 dB maximum in other ranges (-100 to +100 with power meter cal on)
CW time	0 to 24 hours
Frequency sweep (transform on)	±1/frequency step
CW time sweep (transform on)	±1/time step

SPEC

Initiates the SPECIFY CLASS part of modifying a cal kit.

Syntax

SPEC{<option>}[<integer>,<integer>,...]

Option_	Description
FWDM	Forward match
FWDT	Forward transmission
RESP	Response
RESI	Resp & Isol, response
REVM	Reverse match
REVT	Reverse transmission
S11A	S11A (opens)
S11B	S11B (shorts)
S11C	S11C (loads)
S22A	S22A (opens)
S22B	S22B (shorts)
S22C	S22C (loads)
TRFM	TRL, Reflect, Forward, Match
TRRM	TRL, Reflect, Reverse, Match
TLFM	TRL, Line, Forward, Match
TLFT	TRL, Line, Forward, Trans
TLRM	TRL, Line, Reverse, Match
TLRT	TRL, Line, Reverse, Trans
TTFM	TRL, Thru, Forward, Match
TTFT	TRL, Thru, Forward, Trans
TTRM	TRL, Thru, Reverse, Match
TTRT	TRL, Thru, Reverse, Trans

<integer> is a standard number.

Description After issuing each command, sends the analyzer a series of standard numbers to be included in the class, separated by commas. When the class is full, sends CLAD to terminate the sequence.

SPEG

Displays the specify gate menu.

Syntax SPEG

SPLD

Turns the split display mode on and off.

Syntax $SPLD{?|ON|OFF}$

Query Response $\{1 \mid 0\}$

Example SPLDON

SRE

Service request enable. A bit set in D enables the corresponding bit in the status byte to generate an SRQ.

Syntax SRE[? | <number>] <number> can range from 0 to 255.

	SSEG		
	Selects the desire	ed segment of the frequency list for a list frequency sweep.	
Syntax	SSEQ[? <number>] <number> can range from 1 to 30.</number></number>		
Query Response	<number></number>		
	ST		
	Sets the frequency stimulus when the time domain transform is on. Results may be viewed using the transform parameter feature. Not available with Option 110.		
Syntax ST{AF OF}			
	<u>Option</u>	Description	
	AF	Sets the start frequency.	
	OF	Sets the stop frequency.	
Example	STAF		

STAN

Selects a standard from a class during a calibration sequence. All of these commands are OPC compatible.

<u>Option</u>	Description
A	Standard listed under softkey 1.
В	Standard listed under softkey 2.
С	Standard listed under softkey 3.
D	Standard listed under softkey 4.
Е	Standard listed under softkey 5.
F	Standard listed under softkey 6.
G	Standard listed under softkey 7.

Description If a class is requested, as in CLASS11A (open, S11 1-port cal), the analyzer will do one of two things. If there is only one standard in the class, it will measure that standard automatically. If there are several standards in the class, then one of the commands must be used to select one, causing it to be measured.

Example STANA

STAR Enters the start stimulus value. If a lisets the start of the segment. Syntax STAR[? <number>] <number> values may be: Condition Range</number></number>	ist frequency segment is being edited,		
Syntax STAR[? <number>] <number> values may be:</number></number>	ist frequency segment is being edited,		
<i><number></number></i> values may be:			
Condition Range			
-			
Frequency sweeps 30 kHz to 3 GHz (to 6 GHz for option 006)		
	range 0, 25 dB maximum in other ranges h power meter cal on)		
CW time 0 to 24 hours			
Frequency sweep (transform on) ±1/frequency step			
CW time sweep (transform on) ±1/time step			
Query Response <number></number>	<number></number>		
STB?			
Outputs the status byte.			
Syntax STB?			
STDD			
Standard done, define standard sequ	ence, while modifying a cal kit.		
Syntax STDD			

STDT

Selects the standard type after the standard number has been entered during a modify cal kit sequence.

SyntaxSTDT {ARBI | DELA | LOAD | OPEN | SHOR }OptionDescriptionARBISelects the standard type of arbitrary impedance.DELASelects the standard type of delay/thru.LOADSelects the standard type of load.OPENSelects the standard type of open.SHORSelects the standard type of short.

Example STDTARBI

STDTFRES

Specifies that a Fresnel optical standard is being defined.

Syntax STDTFRES

STDTOTHR

Specifies that a thru optical standard is being defined.

Syntax STDTOTHR

	STDTRECE
	Specifies that the receiver coefficient cal standard is being defined.
Syntax	STDTRECE
	STDTREFL
	Specifies that a reflector optical standard is being defined.
Syntax	STDTREFL
	STDTSOUR
	Specifies that the source coefficient cal standard is being defined.
Syntax	STDTSOUR
	STDTTHRR
	Specifies that the thru standard used as part of a thru/receiver is being defined; thru/receiver is a cal standard available during calibration of E/O devices.
Syntax	STDTTHRR

STOP

Sets the stimulus stop value. If a list frequency segment is being edited, sets the stop of the segment.

SyntaxSTOP[? | <number>]

<number> values may be

Condition_	Range
Frequency sweeps	30 kHz to 3 GHz (to 6 GHz for option 006)
Power sweeps	-15 to 20 dBm in range 0, 25 dB maximum in other ranges (-100 to +100 with power meter cal on)
CW time	0 to 24 hours
Frequency sweep (transform on)	±1/frequency step
CW time sweep (transform on)	±1/time step

	STOR			
	Stores the indicated file on disk.			
Syntax	STOR{1 2 3 4 5}			
	<u>Option</u>	Description		
	1	Stores the current instrument state to disk using the file name provided by the preceding TITF1 command.		
	2	Stores the current instrument state to disk using the file name provided by the preceding TITF2 command.		
	3	Stores the current instrument state to disk using the file name provided by the preceding TITF3 command.		
	4	Stores the current instrument state to disk using the file name provided by the preceding TITF4 command.		
	5	Stores the current instrument state to disk using the file name provided by the preceding TITF5 command.		
Description	Used with the INTD and EXTD commands to designate the internal or external disk. Requires pass control mode when using the GPIB port.			
Example	STOR1			
	STORSE	STORSEQ		
	Stores the in	Stores the instrument state to the indicated sequence to disk.		
Syntax	STORSEQ{1	STORSEQ{1 2 3 4 5 6}		
Description		Used with the INTD and EXTD commands to designate the internal or external disk. Requires pass control mode when using the GPIB port.		
Example	STORSEQ1			

STPSIZE

While editing a list frequency segment, sets step size.

Syntax STPSIZE[? | <number>]

<number> values may be:

Condition	Range
Frequency sweeps	30 kHz to 3 GHz (to 6 GHz for option 006)
Power sweeps	-15 to 20 dBm in range 0, 25 dB maximum in other ranges $(-100 to +100 with power meter cal on)$
CW time	0 to 24 hours
Frequency sweep (transform on)	±1/frequency step
CW time sweep (transform on)	±1/time step

Query Response <*number>*

SVCO

Saves display colors.

Syntax SVCO

	SWET		
	Sets the sweep time. Sets to 0 for auto sweep time.		
Syntax	SWET[? <number>]</number>		
	< number > can range from 0 to 86,400 s.		
Query Response	<number></number>		
	SWR		
	Selects the SWR display format.		
Syntax	SWR		
	TAKCS		
	Begins a power meter calibration sweep. Requires pass control.		
Syntax	TAKCS		
	TALKLIST		
	Puts the analyzer in talker/listener mode.		
Syntax	TALKLIST		

TERI

Specifies the terminal impedance of an arbitrary impedance standard during a cal kit modification.

Syntax TERI[? | < number >] $< number > can range from 0 to 1 k\Omega.$

Query Response <*number>*

TESS?

Returns a one on the standard analyzer. (The standard analyzer does not recognize external test sets.) For Option 011, returns a one if an Agilent 85046A/ B S-parameter test set is present. Returns a two if an Agilent 85047A S-parameter test set is present.

Syntax TESS?

TIMDTRAN

Turns the time domain transform on and off. Not available with Option 110.

Syntax TIMDTRAN{?|ON|OFF}

Query Response $\{1 \mid 0\}$

Example TIMDTRANON

	TIMESTAM		
	Turns on the clock time for prints and plots.		
Syntax	$TIMESTAM{? ON OFF}$		
Query Response	{1 0}		
Example	TIMESTAMON		
	TINT		
	Adjusts the tint for the selected display feature.		
Syntax	TINT{? <number>]</number>		
	<i><number></number></i> can range from 0 to 100.		
Query Response	<number></number>		
	TITF		
	Titles the indicated file number.		
Syntax	TITF{1 2 3 4 5} [<string>]</string>		
	$\langle string \rangle$ can be a maximum of 10 characters.		
	TITF0		
	Titles the SAVE STATE filename in sequence mode.		
Syntax	TITFO		
	- 100		

TITL

Enters a new CRT title. A maximum of 48 characters (alphanumeric and mathematical symbols) are allowed.

Syntax TITL [*<string>*] *<string>* can be a maximum of 48 characters.

TITP

Titles the plot file.

Syntax TITP

TITR

Titles the indicated internal register.

Syntax TITR{1 | 2 | 3 | 4 | 5} [*<string>*] *<string>* can be a maximum of 10 characters.

TITREG

Titles save/recall registers 01 through 31. TITREG01 through TITREG05 are the same as TITR1 through TITR5.

SyntaxTITREG{<integer>} [<string>]<integer> can range from register 01 to 31.<string> can be a maximum of 10 characters.

	TITSEQ		
	Selects the sequence to be titled.		
Syntax	TITSEQ{1 2 3 4 5 6}		
Example	TITSEQ1		
	_ -		
	TITT		
	Sends the title string. NEWSEQ must precede to ensure that a sequence is currently being created or modified.		
Syntax	ntax TITT{MEM PMTR PERI PRIN}		
	Option_	Description	
	MEM	Sends the title string to trace memory.	
	PMTR	Sends the title string to the power meter address.	
	PERI	Sends the title string to the peripheral address.	
	PRIN	Sends the title string to the printer address.	
Example	TITTMEM		
	TRACK		
	Turns marker search tracking on and off.		
Syntax	TRACK{? ON OFF}		
Query Response	{l 0}		
Example	TRACKON		

TRAD

Completes the transmission calibration subsequence of a 2-port calibration. OPC compatible.

Syntax TRAD

TRAN

Begins the transmission calibration subsequence of a 2-port calibration.

Syntax TRAN

TRAOP

Begins the transmission calibration subsequence for one path, two port calibration.

Syntax TRAOP

TRAP

Displays tranform parameter screen on the instrument display. Not available with Option 110.

Syntax TRAP

	TRAS		
	Sets the transform span when the time domain transform is on. The results may be viewed with the transform parameter feature. Not available with Option 110.		
Syntax	TRAS		
	TRIG		
	GPIB trigger. Puts instrument into hold mode.		
Syntax	TRIG		
	TST?		
	Causes a self test and returns a zero if the test is passed.		
Syntax	TST?		
	TSTIO		
	Defines 3 bits, D0 through D2, on the test set connector I/O for the channel 1 and channel 2 forward or reverse settings. These bits can be set to values of 0 through 7. Be careful that you do not also set a value to ATTP1 and ATTP2 as there is interaction between these commands and they will change the values you have set for D0 through D2 and will couple the channels together. Values for ATTP1 and ATTP2 translate to the values for D0 through D2 as shown in the table below.		
Syntax	TSTIO{FWD REV} [? <number>]<number> can range from 0 to 7.</number></number>		

	ATTP1/ATTP2	D0 - D2	
	0 dB	7	
	10 dB	6	
	20 dB	5	
	30 dB	4	
	40 dB	3	
	50 dB	2	
	60 dB	1	
	70 dB	0	
Query Response	<number></number>		
Example	TSTIOFWD3		
	TSTPP		
	Selects test port 1 or 2 for	non-S-parameter measurements.	
Syntax	TSTPP{1 2}		
Example	TSTPP1		
	TTL		
	Sets the rear panel TEST SEQ BNC output at end of sweep.		
Syntax	TTL{HPULS LPULS OH OL}		

	Language Reference UCONV	
	<u>Option</u>	Description
	HPULS	Sets the rear panel TEST SEQ BNC output normally low, high pulse at end of sweep.
	LPULS	Sets the rear panel TEST SEQ BNC output normally high, low pulse at end of sweep.
	ОН	Sets the rear panel TEST SEQ BNC output continuously high.
	OL	Sets the rear panel \ensuremath{TEST} \ensuremath{SEQ} BNC output continuously low.
Example	TTLHPULS	
	UCONV Selects up conver	rter for mixer measurements.
Syntax	UCONV	
	UP	
	Increments the v	alue in the active entry area (up key).
Syntax	UP	
	USEPASC	
	Puts the analyzer	n pass control mode.
Syntax	USEPASC	

USESENS

Selects the sensor input being used with the Agilent 438A power meter. For the Agilent 436A or 437B, the A sensor is always used.

Syntax USESENS{A | B}

Example USESENSA

VELOFACT

Enters the velocity factor of the transmission medium.

Syntax VELOFACT[? | <number>] <number> can range from 0 to 10.

Query Response <*number>*

VIEM

Displays the measurement trace (ON) or the mixer setup (OFF).

Syntax VIEM{?|ON|OFF}

- **Query Response** $\{1 \mid 0\}$
- Example VIEMON

	VOFF		
	Sets the frequency offset value.		
Syntax	VOFF[? < <i>number></i>] < <i>number></i> can range from 0 to 3 GHz (0 to 6 GHz for Option 006)		
Query Response	<number></number>		
	WAIT		
	Waits for a clean sweep. OPC compatible.		
Syntax	WAIT		
	WAVE		
	Specifies a waveguide standard while defining a standard as part of a cal kit modification.		
Syntax	WAVE		
	WIDT		
	Turns the bandwidth search on and off.		
Syntax	WIDT{? ON OFF}		
Query Response	{1 0}		
Example	WIDTON		

WIDV

Enters the width search parameter.

Syntax	WIDV[? <number>]</number>	
	<i><number></number></i> can range from:	
	For log magnitude:	±500 dB
	For phase:	±500 degrees
	For Smith chart and polar:	±500 units
	For linear magnitude:	±500 units
	For SWR:	±500 units
	The scale is always positive, degrees, 10e–15 seconds, an	and has minimum values of .001 dB, 10e–12 d 10 picounits.

Query Response <*number>*

WIND

Sets the window for the time domain transform. Not available with Option 110.

Syntax WIND{MAXI|MINI|NORM}

<u>Option</u>	Description
MAXI	Sets the window to maximum for the transform.
MINI	Sets the window to minimum for the transform.
NORM	Sets the window to normal for the transform.

Example WINDMAXI

	WINDOW
	Enters arbitrary window for the time domain transform. Not available with Option 110.
Syntax	WINDOW[? <number>]</number>
	<i><number></number></i> value is state-dependent.
Query Response	<number></number>
	WINDUSEM
	Turns the trace memory ON as the window shape. Not available with Option 110.
Syntax	WINDUSEM{? ON OFF}
Query Response	{1 0}
Example	WINDUSEMON
	WRSK
	Enters new softkey labels into the indicated softkey positions.
Syntax	WRSK{1 2 3 4 5 6 7 8} [<string>]</string>
	<i><string></string></i> can be a maximum of 10 characters.

4

Graphics Language Reference

Graphics Language Reference

This chapter is the reference for all display graphics programming commands. Commands are listed alphabetically. Refer to "Drawing Graphics on the Display" on page 1-32 for more information.

Convention	Description	
< >	Angle brackets indicate values entered by the programmer.	
	"Or" indicates a choice of one element from a list.	
[]	Square brackets indicate that the enclosed items are optional.	
{}	When several items are enclosed by braces, one, and only one of these elements must be selected.	
<number></number>	A numerical operand.	
<integer></integer>	An ASCII string representing an integer. This is defined by the IEEE 488.2 <nr1> format.</nr1>	
<string></string>	A character-string operand which must be enclosed by quotes.	

Table 4-1. Notation Conventions and Definitions

AF

AF

PG

Erases the user graphics display.

Syntax

See Also

	CS	
	Turns off the measurement display.	
Syntax	CS	
See Also	RS	
	DF	
	Sets the default values.	
Syntax	DF	
Description	The following table shows the default graphics state set by this command.	

Table 4-2. Default Graphics State

Feature	Description	Equivalent Command
Displayed graphics	erased	AF
Measurement display	off	CS
Pen intensity	normal	SP2
Pen state	ир	PU
Line style	normal	LT1
Label direction	left to right	DI1,0
Point interpretation	absolute	РА
Character size	medium	SI0.25,0.30

DI

Specifies the direction in which characters are lettered.

Syntax DI<run>,<rise>

When the DI and SI instructions are used together, the DI instruction establishes a label's direction and the SI instruction establishes its size. As shown in the following table, text can only be drawn at 90° increments from horizontal. Use the LB command to actually draw the text.

	Text Direction	<run>,<rise></rise></run>
	0 degrees	1,0
	90 degrees	0,1
	180 degrees	-1,0
	270 degrees	0,-1
Example	DI0,1	
See Also	LB, SI	

Table 4-3. Text Options

	LB			
	Writes text on the display starting at the current pen position.			
Syntax	LB <string< th=""><th colspan="3">LB<string><etx></etx></string></th></string<>	LB <string><etx></etx></string>		
Description	end of text (the characte determine he may help you as a heart sy key with the the CHR\$ (3	The label string sent with the command must be terminated with the ASCII end of text (ETX) character. The decimal value of the ETX character is 3 (not the character 3). Refer to the manual for the text editor you are using to determine how to enter the ETX character. The following are some hints that may help you to enter this character. On a PC, the ETX character is displayed as a heart symbol (\blacklozenge) and can sometimes be entered by pressing the control key with the letter "c". If you are programming using HP BASIC, you can use the CHR\$ (3) string to enter the ETX character. This is shown in the example for this command.		
	Use the SI co	Use the SI command to specify the size of the text.		
Example	"LBHello	World!" + CHR\$(3)		
See Also	SI			
	LT			
	Specifies the	e style of line that will be drawn with the PA and PR commands.		
Syntax	LT{0 1 2	3 }		
	<u>Option</u>	Line Style		
	0	solid		
	1	solid		
	2	short dashes		
	3	long dashes		
See Also	PA, PR			

	OP
	Outputs the scaling limits of the display.
Syntax	OP
Description	The X and Y coordinates for two points are returned to the computer. These points represent the extreme limits for drawing on the display. The first point is located at the origin $(0, 0)$ which is the display's lower left corner. The second point is (5850, 4095) which is the display's upper right corner.
Query Response	0,0,5850,4095
	PA
	Draws a line to an absolute point on the display.
Syntax	PA[<x>, <y>,]</y></x>
Description	This command establishes absolute drawing mode and moves the pen to the specified point(s). You can include as many X- and Y-coordinate pairs as needed. Each value must be separated by a comma character. When you include more than one coordinate pair, the pen moves to each point in the order given, using the current up or down pen status. Use the pen up instruction, PU, to move to a point without drawing, or the pen down instruction, PD, to draw to a point.
	The following example draws a small rectangle on the display.
Example	PU;PA100,200;PD;PA200,200,200,300,100,300,100,200;

PD
Places the imaginary pen down.
PD
When the pen is down, text and lines can be drawn using the LB, PA, and PR commands. If these items are not displayed after the PD command is given, make sure that the pen value has not been set to zero using the SP command.
PU
PG
Erases the user graphics display.
PG
AF
PR
Draws a line to a point on the display that is relative to the current pen posi- tion.
PR[<x>, <y>,]</y></x>
This command establishes relative drawing mode and moves the pen to the specified point(s), relative to the current pen position. You can include as many X- and Y-coordinate pairs as needed. Each value must be separated by a comma character. When you include more than one coordinate pair, the pen moves to the first point using the current up or down pen status. This point pen becomes the current pen position for the next coordinate pair. In this manner, the pen moves to each point in the order given.

	Graphics Language Reference PU
	Use the pen up instruction, PU, to move to a point without drawing, or the pen down instruction, PD, to draw to a point.
	As the example for this command shows, negative values can be entered. This example draws a small rectangle on the display.
Example	PU;PA100,200;PD;PR100,0,0,100,-100,0,0,-100;
	PU
	Places the imaginary pen up.
Syntax	PU
Description	When the pen is in the up position, nothing will be drawn when using the LB, PA, and PR commands.
See Also	PD
	RS
	Turns on the measurement display.
Syntax	RS
See Also	CS
	SI
	Sets the size of characters drawn using the LB command.
Syntax	SI <height>,<width></width></height>

Description Use this command to set character height in width in centimeters. Four settings are available as shown in the following table. Alternate settings are not allowed.

When the DI and SI instructions are used together, the DI instruction establishes a label's direction and the SI instruction establishes its size. Use the LB command to actually draw the text.

	Height		Width
	0.16		0.20
	0.25		0.30
	0.33		0.39
	0.41		0.49
See Also	LB, DI		
	SP		
	Selects the inten	sity of the pen.	
Syntax	SP{0 1 2 3}		
	<u>Option</u>	<u>Brightness</u>	
	0	blank	
	1	bright	
	2	normal	
	3	dim	
Description			t and lines are drawn with. When order to change the intensity of dif-

GPIB Requirements 5-2GPIB operational capabilities 5-3Programming Commands by Functional Group 5-7Key Definitions 5-21

Tables and Charts

GPIB Requirements

Table 5-1. GPIB Requirements

Number of Interconnected Devices	15 maximum.
Interconnection Path Maximum Cable Length	20 meters maximum or 2 meters-per-device, whichever is less.
Message Transfer Scheme	Byte serial/bit parallel, a synchronous data transfer using a 3-line handshake system.
Data Rate	Maximum of 1 megabyte-per-second over the specified distances with tri- state drivers. Actual data rate depends on the transfer rate of the slowest device connected to the bus.
Address Capability	Primary addresses: 31 talk, 31 listen. A maximum of 1 talker and 14 listeners can be connected to the interface at any given time.
Multiple-Controller Capability	In systems with more than one controller (like the analyzer system), only one controller can be active at any given time. The active controller can pass control to another controller, but only the system controller can assume unconditional control. Only one <i>system</i> controller is allowed. The system controller is hard-wired to assume bus control after a power failure.

GPIB operational capabilities

On the analyzer's rear panel, next to the GPIB connector, there is a list of GPIB device subsets as defined by the IEEE 488.2 standard. The analyzer has the following capabilities:

SH1	Full-source handshake.
AH1	Full-acceptor handshake.
Τ6	Basic talker, answers serial poll, unaddresses if MLA is issued. No talk-only mode.
L4	Basic listener, unaddresses if MTA is issued. No listen-only mode.
SR1	Complete service request (SRQ) capabilities.
RL1	Complete remote/local capability including local lockout.
PP0	Does not respond to parallel poll.
DC1	Complete device clear.
DT1	Responds to a Group Execute Trigger (GET) in the hold-trigger mode.
C1,C2,C3	System controller capabilities in system-controller mode.
C10	Pass control capabilities in pass-control mode.
E2	Tri-state drivers.
LE0	No extended listener capabilities.
TE0	No extended talker capabilities.

Tables and Charts GPIB Requirements

Table 5-2. Units as a Function of Display Format

a. The marker readout values are the marker values displayed in the upper right-hand corner of the display. They also correspond to the value and auxiliary value associated with the fixed marker.

b. Value 2 is not significant in this format, though it is included in data transfers.

c. To read the OUTPFORM for R + jX data, use the following key presses: FORMAT, *POLAR*, MEAS, *MORE*, *CONVERSION*, *Z REFL*, or the following commands over GPIB: POLAj CONVZREFj.

Tables and Charts **GPIB Requirements**

cg61d

Figure 5-2. Key codes

- Note 1: Key code 63 is invalid key.
- Note 2: OUTPUT; reports a knob turn as a 1.
- Note 3: If the two byte integer sent back from KOR? is negative, it is a knob count. Decode the knob count and direction by setting bit 15 equal to bit 14. A positive result indicates counterclockwise rotation.

Programming Commands by Functional Group

Table 5-3. Programming Commands (1 of 14)

Command	Description		
Averaging			
AVERFACT	Sets the averaging factor on the active channel.		
AVERO	Turns averaging ON and OFF on the active channel.		
AVERREST	Restarts the averaging on the active channel.		
IFBW	Sets the IF bandwidth.		
SMOOAPER	Sets the smoothing aperture as a percent of the trace.		
SM000	Turns smoothing ON and OFF.		
CAL-error correction, ca	libration		
ALTAB	Places the analyzer in the alternate inputs measurement mode, where inputs A and B are measured on alternate sweeps.		
CALI	Begins a calibration sequence.		
CALN	Turns calibration type to off. Calibration: none.		
СНОРАВ	Places the analyzer in the cop measurement mode.		
CLASS	Calls reflection standard class during a calibration sequence.		
CORI	Turns interpolative error correction ON and OFF.		
CORR	Turns error correction ON and OFF.		
CSWI	Selects test set continuous switching (ON) or test set hold (OFF) when there is a 2-port calibration active.		
DONE	Completes a class of standards, during a calibration.		
FWD	Selects a forward calibration class, during a 2-port calibration sequence.		
ISO	Completes an isolation subsequence.		
OMII	Omits the isolation step of a calibration sequence.		
PORE	Turns port extensions ON and OFF.		
PORT	Sets the port extension length for a test port.		
RAI	Calls the response or isolation class for the response and isolation calibration. OPC- compatible if only one standard in class.		
RAID	Completes the response and isolation calibration sequence.		
REFD	Completes the reflection calibration subsequence of a 2-port calibration.		
REFL	Begins the reflection calibration subsequence of a 2-port calibration.		
REFOP	Begins the reflection calibration subsequence for one path, 2-port calibration.		
RESC	Resumes cal sequence.		
RESPDONE	Completes the response calibration sequence.		

Table 5-3. Programming Commands (2 of 14)

Command	Description		
REV	Selects a reverse calibration class, during a 2-port calibration sequence.		
SAV	Completes a 1-port or 2-port calibration sequence.		
SETZ	Sets the characteristic impedance of the measurement system.		
SLID	Sliding load done.		
SLIS	Sliding load set.		
STAN	Selects a standard during a calibration sequence.		
TRAD	Completes the transmission calibration subsequence of a 2-port calibration.		
TRAN	Begins the transmission calibration subsequence of a 2-port calibration. OPC-compatible.		
TRAOP	Begins the transmission calibration subsequence for one path, 2-port calibration.		
VELOFACT	Enters the velocity factor of the transmission medium.		
	CAL-calibration kits		
С	Selects open capacitance values of an open circuit while it is being defined as a calibration standard.		
CALK	Selects a default calibration kit.		
CLAD	Class done, modify calibration kit, specify class.		
COAX	Selects coaxial offsets instead of waveguide while defining a standard during a calibration kit modification.		
DEFS	Begins standard definition during calibration kit modification.		
FIXE	Specifies a fixed load, as opposed to a sliding load, when defining a standard during a calibration kit modification.		
KITD	Calibration kit done: the last step in modifying a calibration kit.		
LAB	Enters a label during a cal kit modification.		
MAXF	Sets the maximum valid frequency of a standard being defined during a calibration ki modification.		
MINF	Sets the minimum valid frequency of a standard being defined during a calibration kit modification.		
MODI1	Begins the modify calibration kit sequence.		
OFS	Specifies an offset value for a standard being defined during a calibration kit modification.		
SAVEUSEK	Stores the active calibration kit as the user kit.		
SLIL	Specifies the standard as a sliding load during a standard definition as part of a cal kit modification.		
SPEC	Initiates a class for modifying a calibration kit.		
STDD	Standard done, defines standard sequence, while modifying a calibration kit.		
STDT	Selects the standard after the standard number has been entered during a modify calibration kit sequence.		

Specifies the terminal impedance of an arbitrary impedance standard during a	
Specifies the terminal impedance of an arbitrary impedance standard during a calibration kit modification.	
Specifies a waveguide standard while defining a standard as part of a calibration kit modification.	
CAL-power meter calibration	
Sets the calibration factor.	
Selects the frequency for the calibration factor correction.	
Edits the sensor A or sensor B calibration factor table.	
Clears the desired list.	
Done editing list frequency or limit table.	
Sets the number of power meter readings per point used during a power meter calibration.	
Selects the frequency for which a power loss correction is entered. This must be followed by a POWLLOSS command, which sets the value.	
Begins editing a power loss list for a power meter calibration.	
Sets the loss value for a particular frequency, POWLFREQ, in the power loss list.	
Selects the type of power meter calibration desired.	
Selects whether or not to use the power loss table for a power meter calibration.	
Displays the power meter calibration menu and sets the drive port calibration power	
Adds a new segment to the table during either a list frequency or limit table edit.	
Deletes the current segment during either a list frequency or a limit table edit.	
Closes a segment after editing during either a list frequency or a limit table edit.	
Selects a segment for editing during either a frequency or a limit table edit.	
Begins a power meter calibration sweep. Requires pass control.	
Selects the sensor input being used with the Agilent 438A power meter. For the Agilent 436A or 437B, the A sensor is always used.	
CHANNEL	
Makes channel 1 or channel 2 the active channel.	
Sets the printer default setup conditions.	
Sets the plotter default setup conditions.	
Selects full page plotting, as opposed to plotting in one of the four quadrants.	
Selects a plot in the left lower or upper quadrant.	
Enters the line type for plotting data or memory.	
Activates the list values function.	
Displays the next page of the operating parameters list.	
Presents a list of key operating parameters.	

Table 5-3. Programming Commands (3 of 14)

Table 5-3. Programming Commands (4 of 14)

Command	Description	
OUTP	Outputs to the GPIB ports. Can be directed to a plotter, or read into the computer.	
PCOL	Selects the color for the indicated feature.	
PDATA	Selects whether trace data is plotted.	
PENN	Selects the pen for plotting the indicated display feature.	
PGRAT	Selects whether the graticule is plotted.	
PLOS	Selects the pen speed for plotting.	
PLOT	Initiates a plot. Requires pass control mode when using the GPIB port.	
PLTTRAUTF	Turns the plotter auto feed on or off.	
PLTTRFORF	Sends a form feed to the plotter.	
PMEM	Selects whether memory is plotted.	
PMKR	Selects whether markers are plotted.	
PRIC	Selects color print.	
PRIN	Begins printing the format selected. Requires pass control mode when using the GPIB port.	
PRIS	Selects standard (monochrome) print.	
PRNTRAUTF	Turns the printer auto feed on or off.	
PRNTRFORF	Sends a form feed to the printer.	
PTEXT	Selects whether text is plotted.	
RESD	Restores the measurement display after viewing the operating parameters or list values.	
RIG	Selects a plot in the right lower or upper quadrant.	
SCAP	Selects a full plot, or a plot where graticule is expanded to P1 and P2.	
	DISPLAY	
BACI	Sets the background intensity of the display.	
BEEP	Turns sound on or off for completion of functions.	
CBRI	Adjusts the color brightness of the selected display feature.	
COLO	Selects a display feature for color modification.	
COLOR	Adjusts the color saturation for the selected display feature.	
D1DIVD2	Divides the data in channel 1 by the data in channel 2 and displays the result on channel 2.	
DATI	Stores trace in channel memory.	
DEFC	Sets the default colors for all display features.	
DISP	Displays data and/or memory on the active channel.	
DUAC	Turns dual channel display on or off.	
FOCU	Adjusts display focus.	
FREO	Turns frequency notation off, frequency blank.	
INTE	Sets the display intensity.	

Command	Description		
RECO	Recalls previously saved display colors.		
RSCO	Resets colors for the selected group.		
SPLD	Turns the split display mode on or off.		
SVCO	Saves display colors.		
TINT	Adjusts the tint for the selected display feature.		
TITL	Enters a new CRT title.		
	Entry of Data		
DOWN	Decrements the value in the active entry area (down key).		
ENTO	Turns the active entry area off.		
UP	Increments the value in the active entry area (up key).		
	Format of Display		
DELA	Displays the data formatted as group delay.		
IMAG	Selects the imaginary display format.		
LIN	Selects the linear value.		
LOG	Selects the log value.		
PHAS	Selects the phase display format.		
POLA	Selects the polar display format.		
REAL	Selects the real display format.		
SMIC	Selects Smith chart display format.		
SWR	Selects the SWR display format.		
	Graphics		
INPUDATA	Accepts error-corrected data.		
	Input of Data		
INPUCALC	Inputs individual calibration coefficient arrays.		
INPUCALK	Inputs a cal kit read out with OUTPCALK.		
INPUDATA	Inputs error corrected data array using current format.		
INPUFORM	Inputs a formatted data array using current format.		
INPULEAS	Inputs a learn string read out by OUTPLEAS.		
INPUPMCAL	Inputs power meter cal array into the instrument.		
INPURAW	Inputs a raw data array using current format.		
	Interface Bus, Printing, and Plotting Control		
ADDR	Plotter GPIB address.		
DEBU	Turns the GPIB debug mode on or off.		
DISCUNIT	Specifies which disk in a multiple-disk drive is to be used for disk registers.		
DISCVOLU	Specifies which volume of a multiple-volume disk drive is to be used for disk registers.		
PARAL	Selects use of the parallel port for general purpose I/O or for the copy function.		

Table 5-3. Programming Commands (5 of 14)

Table 5-3. Programming Commands (6 of 14)

Command	Description		
PLTHNDSHK	Selects the plotter handshake mode as either Xon-Xoff or DTR-DSR, for serial (RS-232) bus.		
PLTPRT	Sets the plotter port.		
PLTTRAUTF	Turns on and off the plotter auto feed.		
PLTTRBAUD	Sets the plotter baud rate, for serial (RS-232) bus.		
PLTTRFORF	Sends a form feed to the plotter.		
PLTTYP	Selects the plotter type.		
POWM	Selects whether the Agilent 436A (on) or the Agilent 437B/438A (off) is to be used as the power meter in service procedures.		
PRNHNDSHK	Selects the printer handshake mode as either Xon-Xoff or DTR-DSR, for serial (RS-232) bus.		
PRNPRT	Sets the printer port.		
PRNTRAUTF	Turns on and off the printer auto feed.		
PRNTRBAUD	Sets the printer baud rate.		
PRNTRFORF	Sends a form feed to the printer.		
PRNTYP	Selects the printer type.		
TALKLIST	Puts the analyzer in talker listener mode.		
USEPASC	Puts the analyzer in pass control mode.		
	Measurement Functions		
AB	Measures and displays A/B on the active channel.		
ANAI	Measures and displays the data at the auxiliary input (ANALOG IN).		
AR	Measures and displays A/R on the active channel.		
BR	Measures and displays B/R on the active channel.		
CONV	Converts S-parameter data.		
MEAS	Measures and displays the selected input on the active channel.		
S	Selects S-parameter displayed on the active channel.		
TSTPP	Selects test port 1 or 2 for non-S-parameter measurements.		
	MENU (stimulus)		
ASEG	Uses all segments for list frequency sweep.		
ATTP	Selects the amount of attenuation of port 1 or port 2 (option 011 with test set only).		
CENT	Sets the center stimulus value.		
CLEL	Clears the desired list.		
CONT	Sets continuous sweep trigger mode.		
COUC	Couples and uncouples the stimulus between the channels.		
COUP	Couples the power when coupled channels is turned off.		

Command	Description	
CWFREQ	Sets the CW frequency for power sweep and CW frequency modes. While the list frequency table segment is being edited, it sets the center frequency of the current	
	segment.	
CWTIME	Selects the CW time sweep type.	
EDITDONE	Done editing list frequency or limit table.	
EDITLIST	Begins editing list frequency table.	
EXTT	Sets the external trigger mode.	
HOLD	Puts the sweep trigger into hold.	
LIN	Selects a linear frequency sweep.	
LISFREQ	Selects the list frequency sweep mode.	
LOG	Selects a log frequency sweep.	
MANTRIG	Sets the external trigger to manual trigger on point.	
NUMG	Activates the number of groups of sweeps. A group is whatever is needed to update the current parameter once.	
POIN	Sets the number of points in the sweep. If a list frequency segment is being edited, sets the number of points in the segment.	
PORTP	Selects either coupled or uncoupled for the port powers for a given channel.	
POWE	Sets the output power level.	
POWS	Selects power sweep, from the sweep type menu.	
POWT	Turns power trip off, which clears a power trip after an overload condition is detected	
	at one of the input ports.	
PRAN	Selects the power range when in manual power range. Used with PWRR and PMAN.	
PWRR	Selects the source power range auto or manual mode.	
REST	Measurement restart.	
SADD	Adds a new segment to the table.	
SDEL	Deletes the current segment.	
SDON	Closes a segment after editing.	
SEDI	Selects the segment for editing.	
SING	Sets to single sweep.	
SLOPE	Enters the power slope value.	
SLOPO	Turns the power slope on and off.	
SOUP	Turns the source power on or off.	
SPAN	Sets the stimulus span. If a list frequency segment is being edited, sets the span of the segment.	
SSEG	Selects the desired segment of the frequency list for a list frequency sweep.	
STAR	Enters the start stimulus value. If a list frequency segment is being edited, sets the start of the segment.	

Table 5-3. Programming Commands (7 of 14)

Table 5-3. Programming Command	S ((8 of 14)
--------------------------------	-----	-----------

Command	Description	
STOP	Sets the stimulus stop value. If a list frequency segment is being edited, sets the stop of the segment.	
STPSIZE	Sets the step size.	
SWET	Sets the sweep time. Sets to 0 for auto sweep time.	
	Markers	
DELO	Turns the delta marker mode off.	
DELR	Makes the indicated marker the delta reference.	
DELRFIXM	Fixed marker.	
DISM	Displays the response and stimulus values for all markers that are turned on.	
MARK	Makes the indicated marker active and sets its stimulus.	
MARKCONT	Places the markers continuously on the trace, not on discrete sample points.	
MARKCOUP	Couples the markers between the channels.	
MARKDISC	Places the markers in discrete placement mode.	
MARKFAUV	Sets the auxiliary value of the fixed marker position. Works in coordination with MARKFVAL and MARKFSTI.	
MARKFSTI	Sets the stimulus position of the fixed marker.	
MARKFVAL	Sets the value of the fixed marker position.	
MARKOFF	Turns all markers and marker functions off.	
MARKUNCO	Uncouples the markers between channels.	
MARKZERO	Places the fixed marker at the active marker position and makes it the delta reference.	
POLM	Selects the marker readout format for polar display.	
SMIM	Selects the marker readout format on a Smith chart.	
	Marker Functions	
MARKCENT	Enters the marker stimulus as the center stimulus.	
MARKDELA	Sets electrical length so group delay is zero at the marker stimulus.	
MARKREF	Enters the marker amplitude as the reference value.	
MARKSPAN	Enters the span between the active marker and the delta reference as the sweep span.	
MARKSTAR	Enters the marker stimulus as the start stimulus.	
MARKSTOP	Enters the marker stimulus as the stop stimulus.	
MEASTAT	Turns trace statistics on and off.	
SEA	Places the active marker.	
TRACK	Turns marker search tracking on and off.	
WIDT	Turns the bandwidth search on and off.	
WIDV	Enters the widths search parameter.	
	Output Functions	
OUTMEMO	Outputs the memory trace from the active channel.	
OUTP	Outputs to the GPIB ports.	

Command	Description	
OUTPACTI	Outputs the value of the active function, or the last active function if the active area is OFF.	
OUTPCALC	Outputs the error coefficient array for the active calibration on the active channel. Each array comes out in the current output format.	
OUTPCALK	Outputs the active calibration kit as a less than 1000 byte string in form 1.	
OUTPDATA	Outputs the error corrected data from the active channel in the current format.	
OUTPERRO	Outputs the oldest error message in the error queue.	
OUTPFORM	Outputs the formatted display data array from the active channel in the current forma	
OUTPICALC	Outputs, over GPIB, interpolated calibration coefficient array for the active calibration on the active channel.	
OUTPIDEN	Outputs the identification string for the analyzer.	
OUTPIPMCAL	Outputs, over GPIB, the interpolated power meter calibration array for channel 1 or channel 2.	
OUTPKEY	Outputs the key code of the last key pressed.	
OUTPLEAS	Outputs the learn string, which contains the entire front panel state, the limit table, and the list frequency table, in form 1.	
OUTPLIM	Outputs the limit test results.	
OUTPMARK	Outputs the marker values.	
OUTPMWID	Outputs the marker bandwidth search results: bandwidth, center, and Q, in that order	
OUTPMWIL	Outputs the marker bandwidth search results: bandwidth, center, loss, and Q, in that order.	
OUTPMSTA	Outputs the marker statistics: mean, standard deviation, and peak-to-peak deviation, in that order.	
OUTPPMCAL	Outputs the power meter calibration array for channel 1 or channel 2. Values are sent as 100 times the source power in dB.	
OUTPPRNALL	Prints all list values or operating and marker parameters in text mode to GPIB.	
OUTPRAW	Outputs the raw measurement data.	
OUTPRFFR	Outputs the external source RF frequency, when in external source instrument mode.	
OUTPSEQ	Outputs a sequence listing over GPIB.	
OUTPSTAT	Outputs the status byte.	
OUTPTITL	Outputs the display title.	
READ	Outputs the date/time in string format.	
	Output Formats	
FORM	Sets the data format for array transfers in and out of the instrument.	
	Save and Recall Registers	
CLEA	Clears the indicated save/recall registers.	
CLEARALL	Clears all the save/recall registers.	

Table 5-3. Programming Commands (9 of 14)

Table 5-3. Programming Commands (10 of 14)

Command	Description
CLEAREG	Clears save/recall registers 01 through 31.
RECA	Recalls the indicated internal register.
RECAREG	Recalls save/recall registers 01 through 31.
SAVE	Stores the current instrument state in the indicated internal register.
SAVEREG	Saves to save/recall registers 01 through 31.
TITFO	Titles the SAVE STATE filename in sequence mode.
TITP	Titles the plot file.
TITR	Titles the indicated internal register.
TITREG	Titles save/recall registers 01 through 31.
	Menu Control
MENU	Activates the selected menu.
	Miscellaneous
COPYFRFT	Copies file titles defined by TITF into register titles.
COPYFRRT	Copies register titles defined by TITR into file titles.
DEFLTCPIO	Sets up a default state for copy.
EXTT	Sets the external trigger mode.
IDN?	Outputs the identification string.
KEY	Sends a key code, equivalent to actually pressing the key.
KOR?	Outputs a two byte key code/knob count.
MARKBUCK	Places the marker on a specific sweep point (bucket).
OPC	Operation complete. Reports the completion of the next command received by setting bit 0 in the event-status register, or by replying to an interrogation if OPC? is issued.
PRES	Presets the analyzer to the factory preset state.
PSOFT	Controls whether softkeys are included in the hardcopy print or plot.
SAMC	Turns sampler correction on and off. Sampler correction is only turned off to take data for customer calibration coefficients.
SELL	Selects the learn string revision (LRN) to input to or output from the analyzer.
SOFR	Displays the firmware revision on the screen.
TESS?	Returns a one on the standard analyzer.
WAIT	Waits for a clean sweep.
	Save and Recall Disk Files
DIRS	Sets the number of files in the directory at disk initialization.
EXTD	Selects the external disk as the active storage device.
EXTM	Stores data on disk.
FORMAT	Selects the disk format.
INI	Initializes the internal or external disk. All information on the disk will be destroyed.
INTD	Selects the internal disk as the active storage device.

Command	Description	
INTM	Selects the internal memory as the active storage device.	
LOAD	Loads the file from disk with the name indicated by the previous TITF command. The actual file recalled depends on the file title in the file position specified.	
PURG	Purges the indicated file from disk. Requires pass control mode when using the GPIB port.	
REFT	Recalls file titles from disk. Requires pass control mode when using the GPIB port.	
SAVU	Selects format for saving to disk.	
STOR	Stores the indicated file on disk. Used with the INTD and EXTD commands to designate the internal or external disk.	
TITF	Titles the indicated file numbers.	
TITFO	Titles the SAVE STATE filename in sequence mode.	
TITP	Titles the plot file.	
	Scale Ref	
AUTO	Auto scales the active channel.	
ELED	Sets the electrical delay offset.	
MARKDELA	Sets electrical length so group delay is zero at the marker stimulus.	
MARKREF	Enters the marker amplitude as the reference value.	
PHAO	Sets the phase offset.	
REFP	Enters the reference position. 0 is the bottom, 10 is the top of the graticule.	
REFV	Enters the reference line value.	
SCAL	Sets the trace scale factor.	
	Seq-sequencing	
ADDR	Sets the GPIB address for the specified device.	
ASSS	Asserts the sequence status bit.	
CLEABIT	Clears the specified bit on the GPIO.	
CLEASEQ	Clears the sequence from the internal registers.	
CONS	Continues the paused sequence.	
DECRLOOC	Decrements the sequencing loop counter by 1. NEWSEQ must precede to ensure that a sequence is currently being created or modified.	
DONM	Done modifying a test sequence.	
DOSEQ	Begins execution of the selected sequence.	
DUPLSEQ <x>SEQ<y></y></x>	Duplicates sequence X to sequence Y.	
EMIB	Sends out a beep during a sequence. NEWSEQ must precede to ensure that a sequence is currently being created or modified.	
GOSUB	Invokes a sequence as a subroutine.	
IFBI	Tests the specified input GPIO bit (PARAIN).	

Table 5-3. Programming Commands (11 of 14)

Table 5-3. Programming Commands (12 of 14)

Command	Description	
IFLC	Branches an executing sequence to a new sequence if condition is satisfied. NEWSEQ must precede to ensure that a sequence is currently being created or modified.	
IFLT	Branches an executing sequence to a new sequence if condition is satisfied. NEWSEQ must precede to ensure that a sequence is currently being created or modified.	
INCRLOOC	Increments the sequencing loop counter by 1. NEWSEQ must precede to ensure that a sequence is currently being created or modified.	
LOADSEQ	Loads the indicated sequence from disk. Requires pass control mode when using the GPIB port.	
LOOC	Sets the value of the sequencing loop counter. NEWSEQ must precede to ensure that a sequence is currently being created or modified.	
MARKCW	Sets the CW frequency to the marker frequency.	
NEWSEQ	Begins modifying a sequence.	
PARAIN	Specifies the input GPIO bit to be used by the IFBI test.	
PARAOUT	Programs all GPIO output bits (0 to 255) at once.	
PAUS	Inserts a pause into a sequence. NEWSEQ must precede to ensure that a sequence is currently being created or modified.	
PMTRTTIT	Reads power meter/GPIB value into title string. NEWSEQ must precede to ensure that a sequence is currently being created or modified.	
PRINSEQ	Begins printing the sequence selected. Requires pass control mode when using the GPIB port.	
PTOS	Pauses the sequence to be followed by selection one of the six sequences.	
SEQ	Selects sequence 1 through 6.	
SEQWAIT	Tells the instrument to wait a specified number of seconds during a sequence. NEWSEQ must precede to ensure that a sequence is currently being created or modified.	
SETBIT	Sets the specified bit (0 to 7) on the GPIO.	
SHOM	Displays the desired softkey menu during a sequence. NEWSEQ must precede to ensure that a sequence is currently being created or modified.	
STORSEQ	Stores the instrument state to the indicated sequence to disk. Used with the INTD and EXTD commands to designate the internal or external disk. Requires pass control mode when using the GPIB port.	
TITSEQ	Selects the sequence to be titled.	
TITT	Sends the title string. NEWSEQ must precede to ensure that a sequence is currently being created or modified.	
TSTIO	Defines 3 bits, D0 through D2, on the test set connector I/O for the channel 1 and channel 2 forward or reverse settings.	
TTL	Sets the rear panel "TEST SEQ" BNC output at end of sweep.	
	Softkeys	
SOFT	Presses the indicated softkey.	

Command	Description	
WRSK	Enters new softkey labels into the indicated softkey positions.	
	Status Reporting	
CLES	Clears the status byte.	
ESB?	Outputs event-status register B.	
ESE	Enables the selected event-status register bits to be summarized by bit 5 of the status	
	byte.	
ESNB	Enables the selected event-status register B bits to be summarized by bit 2 of the	
	status byte.	
ESR?	Outputs the value of the event-status register.	
OUTPSTAT	Outputs the status byte.	
SRE	Service request enable.	
	Stimulus	
CENT	Sets the center stimulus value. If a list frequency segment is being edited, sets the center of the list segment.	
SPAN	Sets the stimulus span. If a list frequency segment is being edited, sets the span of th segment.	
STAR	Enters the start stimulus value. If a list frequency segment is being edited, sets the	
	start of the segment.	
STOP	Sets the stimulus stop value. If a list frequency segment is being edited, sets the stop	
	of the segment.	
	System	
ANAB	Enables the analog bus for service use.	
DCONV	Selects down converter for mixer measurements.	
FREQOFFS	Activates the frequency offset instrument mode.	
HARM	Sets the harmonic measurement mode (option 002).	
INSM	Selects the instrument mode.	
RF	Sets RF greater or less than LO for mixer measurement.	
SETDATE	Sets the date in the following format: DD MMM YYYY, where DD is the day and must be 2 digits, MMM is the month and must be three alpha characters, and YYYY is the year and must be 4 digits.	
SETTIME	Sets the time in the following format: HH:MM:SS, where HH is the hour, MM is minutes, SS is seconds, and each must be 2 digits.	
TIMESTAM	Turns on the clock time for prints and plots.	
UCONV	Selects up converter for mixer measurements.	
VIEM	Displays the measurement trace (ON) or the mixer setup (OFF).	
VOFF	Sets the frequency offset value.	
	System-limit testing	
BEEP	Controls the warning beeper for a limit test failure.	

Table 5-3. Programming Commands (13 of 14)

Table 5-3. Programming Comm	ands	(14 of 14)
-----------------------------	------	------------

Command	Description	
CLEAL	Clears the desired list.	
EDITDONE	Done editing list frequency or limit line table.	
EDITLIML	Begins editing limit table.	
LIM	Sets the limits for limit lines.	
LIMILINE	Turns the display of the limit lines on and off.	
LIMIMAOF	Marker to limit offset. Centers the limit lines about the current marker position using the limit amplitude offset function.	
LIMISTIO	Enters the stimulus offset of the limit lines.	
LIMITEST	Turns limit testing on and off.	
LIMT	Sets the limit segment value.	
MARKMIDD	Makes the marker amplitude the limit segment middle value, during a limit segment edit.	
MARKSTIM	During a limit segment edit, enters the marker stimulus as the limit stimulus break point.	
SADD	Adds a new segment to the table, during either a list frequency or limit line table edit.	
SDEL	Deletes the current segment, during either a list frequency or limit line table edit.	
SDON	Closes a segment after editing, during either a list frequency or limit line table edit.	
SEDI	Selects the segment for editing, during either a list frequency or limit line table edit.	
	System-transform	
BANDPASS	Selects the time domain bandpass mode.	
DEMO	Controls transform demodulation.	
GATE	Sets the time domain gate time.	
GATEO	Turns the time domain gate on or off.	
GATS	Sets the gate shape.	
LOW	Turns ON the low pass transform (option 010).	
SETF	Sets frequency for low pass transform (option 010).	
SPEG	Displays the specify gate menu.	
TIMDTRAN	Turns the option 010 (time domain) transform on and off.	
WIND	Sets the window for a transform.	
WINDOW	Enters arbitrary window.	
WINDUSEM	Turns the trace memory on as the window shape.	

Key Definitions

The following table lists the softkey functions alphabetically, and the equivalent programming command.

Softkey	Equivalent Programming Command
\downarrow	DOWN
Δ MODE MENU	
Δ MODE OFF	DELO
Δ REF= 1	DELR1
Δ REF= 2	DELR2
Δ REF= 3	DELR3
Δ REF= 4	DELR4
Δ REF= Δ FIXED MKR	DELRFIXM
1/S	CONVIDS
A	MEASA
A/B	AB
A/R	AR
ACTIVE ENTRY	
ACTIVE MKR MAGNITUDE	_
ADD	SADD
ADDRESS: 8702	
ADDRESS: CONTROLLER	ADDRCONT
ADDRESS: DISK	ADDRDISC
ADDRESS: P MTR/HPIB	ADDRPOWM
ADJUST DISPLAY	
ADJUSTMENT TESTS	
ALC ON off	
ALL SEGS SWEEP	ASEG

Table 5-4. Keys versus Programming Commands (1 of 22)

Softkey	Equivalent Programming Command
ALTERNATE A AND B	ALTAB
AMPLITUDE OFFSET	LIMIAMPO
ANALOG BUS on OFF	ANAB
ANALOG IN Aux Input	ANAI
ARBITRARY IMPEDANCE	STDTARBI
ASCII	SAVUASCI
ASSERT SRO	ASSS
AUTO FEED ON off (Plotter)	PLTTRAUTFON or PLTTRAUTFOFF
AUTO FEED ON off (Printer)	PRNTRAUTFON or PRNTRAUTOFF
AUTO SCALE	AUTO
AVERAGING FACTOR	AVERFACT
AVERAGING on OFF	AVERON or AVEROFF
AVERAGING RESTART	AVERREST
AVG	MENUAVG
В	MEASB
B/R	BR
BACKGROUND INTENSITY	BACI
BACK SPACE	
BANDPASS	BANDPASS
BEEP DONE ON off	BEEPDONEON or BEEPDONEOFF
BEEP FAIL on OFF	BEEPFAILON or BEEPFAILOFF
BEEP WARN on OFF	BEEPWARNON or BEEPWARNOFF
BRIGHTNESS	CBRI
CO	CO
C1	C1
C2	C2
С3	C3
CAL	MENUCAL
CAL FACTOR	CALFCALF
CAL FACTOR SENSOR A	CALFSENA
CAL FACTOR SENSOR B	CALFSENB
CAL KIT: 3.5mmC	CALK35MM
CAL KIT: 3.5mmD	CALK35MD
CAL KIT: 7mm	CALK7MM

Table 5-4. Keys versus Programming Commands (2 of 22)

Softkey	Equivalent Programming Command

abort message (IFC), 1-40 access key, front-panel, 5-42 active channel, 3-12 address capability, 5-2 controller, 3-3 default, 1-3 See GPIB system controller, 1-3 adjust brightness, 3-11 color. 3-17 tint, 3-138 AF, display graphics command, 4-2 AH1 (full-acceptor handshake), 5-3 analog bus, 3-4 analvzer array-data formats, 1-17 calibration, 1-11 control of peripherals, 1-8 arrav data formats, 1-17 of data, 1-20 related to frequency, 1-19 transfers data format, 3-37 ASCII format for data transfer, 2-22 format for saving, 3-114 reading files, 2-94 assert sequence, 3-5 averaging factor, 1-11, 3-5 setting parameters, 1-10

B

background intensity, 3-6 bandwidth search, 1-11 setting parameters, 1-10 basic talker (T6), 5-3 baud rate plotter, 3-90 printer, 3-100 beeper on done, 3-7 binary data input, 3-46 data transfer, 2-32 save format, 3-114 bits in the event-status register, 1-38 bits in the event-status register B, 1-39 bits in the status byte, 1-37

С

C1,C2,C3 (system controller capabilities), 5-3 C10 (pass control capabilities), 5-3 calibrating for measurements, 1-26 the test setup, 1-11 calibration arrays, 1-27 class relationships, 1-27 coefficients, 1-20, 1-23 full 2-port, 2-13 kit, 3-10 kit string, 1-23 kit string and learn string, 1-23 power meter, 2-41, 3-102 reading data, 2-48 S11 1-port, 2-8 start sequence, 3-9 type off, 3-11 capability, GPIB interface, 1-5 capturing display data, 1-11 chain for data processing, 1-20 citifile save format, 3-114 class done, 3-13 clear device, 1-40 interface buffer, 1-4 list, 3-14 register, 3-14 sequence, 3-15 CLEAR command, 1-4 codes for termination of command, 1-5 coefficients, calibration, 1-23 command by functional group, 5-7 controlling execution, 1-24 interrogate, 1-13 **OPC-compatible**, 1-25 terminator codes, 1-5 to key cross reference, 5-21

communication mode, selecting, 1-7 connecting the device under test, 1-11 controller address, 3-3 controlling command execution, 1-24 peripherals, 2-76 copy display, 3-82, 3-88, 3-98 correction interpolative, 3-19 cross reference of key function to GPIB command, 5-21 CRT. *See* display CS, display graphics command, 4-3

D

data array, formats, 1-17 arrays, 1-20 calibration, 2-48 capturing, 1-11 character definitions transfer, 1-14 error-corrected, 1-12 formats and transfers, 2-18 include with disk files, 3-36 levels, 1-22 marker, 1-15 output commands, 1-21 plotting, 2-83 processing chain, 1-20 rate, 5-2 reading, 1-13 taking, 1-11 data transfer, 1-12 ASCII format, 2-22 floating-point numbers, 2-25 frequency-array information, 2-28 internal binary format, 2-32 markers, 2-18 trace, 1-18 date, 3-119 DC1 (complete device clear), 5-3 DCL (device clear) command, 1-40 debug mode, 1-29, 3-22 decibels terminator code, 1-4 default address, 1-3 calibration kits, 3-10 colors, 3-23

graphics state, 4-3 plotter setup, 3-27 printer settings, 3-24 defining the instrument state, 1-10 delay, 3-33 set to mkr, 3-63 delete segment, 3-115 delta reference, 3-26 demodulation off. 3-27 DeskJet printer, 3-101 device clear, 1-40 clear (DC1), 5-3 connection, 1-11 trigger, 1-41 device mode changing, 1-9 selecting, 1-8 DF, display graphics command, 4-3 DI, display graphics command, 4-4 directory size, LIF, 3-29 disabling the front panel, 1-40 disk file names. 1-30 format, 3-38 load file, 3-58 display address, 1-3 capturing data, 1-11 data, 3-30 focus, 3-37 format, units, 5-6 graphics, 1-32 graphics commands, 4-2-4-9 intensity, 3-50 measurement, 4-3 softkeys blanked, 1-3 writing text to, 4-5 does not respond to parallel poll (PPO), 5-3 done modifying sequence, 3-31 with class, 3-31 with isolation, 3-50 with reflection. 3-107 with transmission, 3-141 DOS format, 3-38 down converter, 3-22 DT1 (responds to a group execute trigger), 5-3 DTR/DSR handshake mode, 3-99 dual channels, 3-32 duplicate sequence, 3-32

Е

E2 (tri-state drivers), 5-3 edit limit table, 3-33 list frequency table, 3-33 power loss range, 3-96 entry off, 3-34 Epson ESC/P2 printer, 3-101 error message, syntax, 1-4 output, 1-39 queue, 1-36, 2-34 error-corrected data, 1-12, 1-20, 1-22 event-status register, 1-9, 1-37-1-38, 3-34 event-status register B, 1-39 examples, programming, 2-2-2-98 execution of commands, 1-24 extended listener capabilities (LEO), 5-3 external trigger, 3-36

F

femtoseconds terminator code, 1-4 file names, disk, 1-30 fixed load, 3-37 marker, 3-27 flat line type, 3-56 floating-point numbers, data transfer, 2-25 form 1-5 format, 1-17 form 4 data-transfer characters, 1-14 formats array-data, 1-17 disk, 3-38 transfers of trace-data, 2-18 formatted data, 1-20, 1-22 forward calibration class, 3-39 frequency notation, 3-38 offset value, 3-146 frequency list mode example program, 2-56 frequency span, setting parameters, 1-10 frequency-array, data transfer, 2-28

frequency-related arrays, 1-19 front panel access keys, 5-42 lockout, 1-3 full 2-port measurement calibration, 2-13 full-acceptor handshake (AH1), 5-3 full-source handshake (SH1), 5-3

G

generating interrupts, 2-37 GET (group execute trigger) command, 1-41 gigahertz terminator code, 1-4 **GPIB**, 1-8 address capability, 5-2 address, changing from front panel, 1-7 changing the device mode, 1-9 command to key cross reference, 5-21 data rate, 5-2 debug mode, 1-29 hold state, 1-11 interface capabilities, 1-5 measurement calibration, 1-26 message transfer scheme, 5-2 meta-messages, 1-40 multiple-controller capability, 5-2 operational capabilities, 5-3 requirements, 5-2 status lights, 1-3 GPIO clear bit, 3-14 input bit, 3-84 graphics character size, 4-8 display, 1-32 drawing to x,y, 4-6 erase display, 4-7 imaginary pen, 4-7-4-8 label display, 4-5 language reference, 4-2 line type, 4-5 measurement display, 4-3 output scaling limits, 4-6 pen setting, 4-9 plot relative, 4-7 state default, 4-3 text labels, 4-4 turning on display, 4-8

user display, 4-2 group execute trigger command (GET), 1-41 group execute trigger response (DT1), 5-3 GTL (local) command, 1-40

Η

halting all modes and functions, 1-40 handshake modes, 3-99 plotter, 3-89 printer, 3-99 harmonic mode off, 3-42 hertz terminator code, 1-4 hold state, GPIB, 1-11 HP-GL character size, 4-8 commands accepted but ignored, 1-33 default state set, 4-3 drawing to x,y, 4-6 imaginary pen, 4-7-4-8 label display, 4-5 line type, 4-5 measurement display, 4-3 output scaling limits, 4-6 pen setting, 4-9 plot relative, 4-7 text labels, 4-4 turning on display, 4-8 user display, 4-7 user graphics display, 4-2

I

IEEE-488 universal commands, 1-40 IF averaging, setting parameters, 1-10 IF bandwidth, setting parameters, 1-10 IFC (abort message), 1-40 increment loop counter, 3-45 initializing a disk, 3-46 the instrument, 1-4 instrument files, reading, 2-94 setup, 1-10 instrument state, 1-12 defining, 1-10 summary, 1-23 using, 2-52 intensity, background, 3-6 interface buffer, clearing, 1-4 capabilities, GPIB, 1-5 internal binary format, data transfer, 2-32 interpolative correction, 3-19 interrogate command, 1-13 interrupts, generating, 2-37

K

key codes, 5-6 definitions, 5-21 to GPIB command, 5-21 kilohertz terminator code, 1-4

L

label class, 3-51 labeling text, 4-4 LaserJet printer, 3-101 LB, display graphics command, 4-5 LE0 (no extended listener capabilities), 5-3 learn string, 1-10, 1-23, 2-45 levels of data, 1-22 LIF directory size, 3-29 format, 3-38 limit line stimulus offset, 3-55 limit lines, setting, 2-65 limit table, edit, 3-33 limit test beeper, 3-7 limit testing, 1-11 lin mag, 3-56 list frequency sweep, setting, 2-56 list frequency table, editing, 3-33 list values, 3-57 clearing, 3-14 printing, 3-98 listen mode, 1-3 list-frequency mode example program, 2-56 LLO (local lockout) command, 1-40 local command (GTL), 1-40 local lockout command (LLO), 1-40 log value, selecting, 3-60

loop counter, incrementing, 3-45 low pass step, 3-60 LT, display graphics command, 4-5

Μ

marker arbitrary target amplitude, 3-116 bandwidth search, 3-146 CW frequency, 3-63 data, 1-15 limit offset, 3-54 middle segment, 3-66 parameters, printing, 3-98 range, 3-62 search left, 3-116 search off, 3-116 search right, 3-116 stimulus segment, 3-68 trace maximum, 3-116 trace minimum, 3-116 width, 3-147 zero, 3-68 markers continuous, 3-63 coupled, 3-63 discrete, 3-64 for data transfer, 2-18 off, 3-67 uncoupled, 3-68 measurement calibration, 1-26 data, 1-11 data post-processing, 1-12 process, 1-10 restart, 3-110 sequence, 1-10 settings, preparing, 2-4 settings, verifying, 2-6 turning off the display, 4-3 type, setting, 1-10 megahertz terminator code, 1-4 memory, non-volatile, 1-3 message transfer scheme, 5-2 meta-messages, 1-40 microseconds terminator code, 1-4 milliseconds terminator code, 1-4 modes

pass-control, 1-9 talker/listener, 1-8 modifying cal kit, 3-72 colors, 3-17 sequence, 3-72 monitoring the instrument, 1-34 multiple sweeps, 1-11 multiple-controller capability, 5-2

Ν

nanoseconds terminator code, 1-4 new sequence, 3-72 next page, 3-72 no extended talker capabilities (TEO), 5-3 non-volatile memory, 1-3 notation conventions, 4-2 number of points, setting parameters, 1-10 number-of-groups command, 1-11

0

OP, display graphics command, 4-6 OPC commands, 1-24–1-25 open capacitance values, 3-8 operating parameters, 3-75 operational capabilities for GPIB, 5-3 output data command, 1-13, 1-21 of errors, 1-39 plot string, 3-76 queue, 1-13, 1-36 syntax, 1-14

Р

PA, display graphics command, 4-6 PaintJet printer, 3-101 parallel poll configuring, 1-40 non response (PPO), 5-3 parser, resetting, 1-4 pass control, 3-144 capabilities (C10), 5-3 mode, 1-8-1-9, 1-40 pass/fail test, performing, 2-69 pause to select sequence, 3-102

PD, display graphics command, 4-7 pen number, data, 3-87 performing pass/fail tests, 2-69 peripherals, controlling, 2-76 PG, display graphics command, 4-7 phase offset, 3-88 picoseconds terminator code, 1-4 plot files, reading from disk, 2-86 markers, 3-91 quadrant, 3-111 speed, 3-88 string, output, 3-76 text, 3-102 plotter baud rate, 3-90 default setup, 3-27 disk, 3-89 handshake, 3-89 parallel port, 3-89 settings, 3-25 type, 3-91 plotting data, 2-83 points, specifying, 3-92 port attenuator, 3-5 extensions, 3-94 post-processing the measurement data, 1-12 power level, setting parameters, 1-10 ranges, 3-97 slope, 3-121 sweep, 3-96 trip, 3-97 power loss editing the range, 3-96 table, 3-103 power meter cal factor. 3-8 calibration, 2-41, 3-102 title string, 3-92 PPC (parallel-poll configure) command, 1-40 PPO (does not respond to parallel poll), 5-3 PPU (parallel-poll unconfigure) command, 1 - 40PR, display graphics command, 4-7 preparing measurement settings, 2-4 PRESET key, 1-4

print color. 3-97 sequence, 3-98 printer baud rate, 3-100 handshake, 3-99 settings, 3-25 printing via the serial port, 2-80 processing after taking measurement data, 1-12 data chain, 1-20 of measurement, 1-10 programming commands, 5-7 display graphics, 4-2-4-9 key-function cross reference, 5-21 programming examples, 2-2-2-98 PU, display graphics command, 4-8 purge file, 3-102

Q

queue outputting, 1-13 summarizing, 1-36

R

raw data, 1-22 measured, 1-20 reading ASCII instrument files, 2-94 calibration data, 2-48 data, 1-13 plot files from disk, 2-86 recalling colors, 3-107 register, 3-106 sequence, 3-59 reference line value, 3-109 reference position, 3-108 set to mkr, 3-67 reflection, 3-13 registers, clearing, 3-14 remote mode, 1-3, 1-40 remote programming, 1-8 remote/local capability (RL1), 5-3 resetting colors, 3-111

the parser, 1-4 response cal done, 3-110 restart averaging, 1-11, 3-6 restore display, 3-109 RF power level, setting parameters, 1-10 RL1 (complete remote/local capability), 5-3 RS, display graphics command, 4-8 RST programming command, 1-4

S

S11 1-port measurement calibration, 2-8 save cal kit, 3-114 colors, 3-135 format, 3-114 register, 3-114 sequence, 3-134 save/recall register, 1-10 SDC (device clear) command, 1-40 SDT (selected-device trigger) command, 1-41 second harmonic measurement, 3-42 seconds terminator code, 1-4 segment add, 3-112 delete, 3-115 edit done, 3-32 selection, 2-61 selected-device trigger command (SDT), 1-41 selecting calibration kits, 3-10 communication mode, 1-7 GPIB device mode, 1-8 single segment, 2-61 standards, 3-129 sensor calibration factor table, 3-9 input selection, 3-145 sequence wait, 3-118 serial poll, 1-41 serial port, printing, 2-80 serial-poll disable command (SPD), 1-41 serial-poll enable command (SPE), 1-41 service request (SRQ), 1-3, 1-36 service request capabilities (SR1), 5-3 setting limit lines, 2-65 list frequency sweeps, 2-56

parameters, 1-10 up the instrument, 1-10 up the system, 2-45 SH1 (full-source handshake), 5-3 SI, display graphics command, 4-8 single segment, selecting, 2-61single-sweep command, 1-11 sliding load, 3-120 sloping line type, 3-56 Smith chart markers, 3-121 softkey functions, 5-42 source power on/off, 3-124 SP, display graphics command, 4-9 S-parameters, 3-112 SPD (serial-poll disable) command, 1-41 SPE (serial-poll enable) command, 1-41 specify class, 3-126 points, 3-92 split display, 3-127 SR1 (service request capabilities), 5-3 standard definition, 3-26 type, 3-131 states, using, 2-52 status byte, 1-36-1-37 **GPIB**, 1-3 reporting, 1-34 step down, 3-32 up. 3-144 steps of a measurement, 1-10–1-12 storage, disk, 3-35, 3-134 string for calibration kit, 1-23 sweep time, setting parameters, 1-10 sweep type, setting parameters, 1-10 svntax error message, 1-4 for output, 1-14 system controller address, 1-3 capabilities (C1,C2,C3), 5-3 mode, 1-8 system setup, 2-45

Index

Т

T6 (basic talker), 5-3 take cal sweep, 3-136 take-control command (TCT), 1-40 taking the measurement data, 1-11 talk/listen mode, 1-3, 1-8, 2-73, 3-136 TCT (take-control) command, 1-40 TE0 (no extended talker capabilities), 5-3 terminal impedance, 3-137 terminator codes, 1-4-1-5 test setup calibration, 1-11 text labeling, 4-4 writing to display, 4-5 ThinkJet printer, 3-101 third harmonic measurement, 3-42 time, 3-119 specifying, 3-136 stamp, 3-138 time domain gate, 3-40 title disk file, 3-138 register, 3-139 string to trace memory, 3-140 trace data formats and transfers, 2-18 data transfers, 1-18 memory, 1-20 statistics, 1-11 transferring the measurement data, 1-12 transfers of trace-data, 1-18, 2-18 transform, 3-137 trigger continuous, 3-18 device, 1-41 number of groups, 3-73 single, 3-120 tri-state drivers (E2), 5-3 type of measurement, setting, 1-10

U

units and terminators, 1-4 universal commands, 1-40 user-defined cal kit, 3-10 saving, 3-114 using error queue, 2-34 instrument states, 2-52 the learn string, 2-45

V

velocity factor, 3-145 verifying measurement settings, 2-6 volts terminator code, 1-4

W

waiting-for-group-execute-trigger, 1-41 waiting-for-reverse-get bit, 1-41 warning beeper, 3-7 window, setting, 3-147

Х

Xon/Xoff handshake mode, 3-99
