About Installing the Upgrade Kit

IMPORTANT Option 014 can only be installed on analyzers with the option combinations listed below as "Products affected". If your analyzer does not have the proper options (as listed below), it will be necessary to install those options BEFORE installing this option (Option 014).

Products affected	E8362B; without Option UNL or 016 E8362B; Option UNL E8362B; Options UNL and 016
Installation to be performed by	Agilent service center or personnel qualified by Agilent
Estimated installation time	2.0 hours
Estimated adjustment time	0.5 hours
Estimated full instrument calibration time	4.5 hours

Description of Option 014

An Option 014 analyzer can be configured to measure high-power devices and devices that require high dynamic range.

For a high-power measurement, external amplifiers and high power attenuators or isolators can be added to complete the test setup. In this configuration, test-port output-power up to 1 Watt (+30 dBm) can be applied to the device under test (DUT). Additionally, there is an external reference input that allows the external amplifier's frequency response and drift to be ratioed out.

For high dynamic range measurements, front panel jumpers are configured to reverse the signal path through one of the couplers. This allows for a 15 dB improvement in transmitted signal sensitivity in one direction only. These jumpers can also be configured on both ports, allowing the user to perform high dynamic range measurements in both the forward and reverse directions.

Items Included in the Upgrade Kit

Installation Procedure for the Upgrade Kit

The network analyzer must be in proper working condition prior to installing this option. Any necessary repairs must be made before proceeding with this installation.

WARNING **This installation requires the removal of the analyzer's protective outer covers. The analyzer must be powered down and disconnected from the mains supply before performing this procedure.**

Electrostatic Discharge Protection

Protection against electrostatic discharge (ESD) is essential while removing or connecting cables or assemblies within the network analyzer.

Static electricity can build up on your body and can easily damage sensitive internal circuit elements when discharged. Static discharges too small to be felt can cause permanent damage. To prevent damage to the instrument:

- *always* wear a grounded wrist strap having a 1 MΩ resistor in series with it when handling components and assemblies.
- *always* use a grounded, conductive table mat while working on the instrument.
- *always* wear a heel strap when working in an area with a conductive floor. If you are uncertain about the conductivity of your floor, wear a heel strap.
- *always* ground yourself before you clean, inspect, or make a connection to a static-sensitive device or test port. You can, for example, grasp the grounded outer shell of the test port or cable connector briefly.

Figure 1 shows a typical ESD protection setup using a grounded mat and wrist strap. Refer to "Tools and Equipment Required for the Installation" on page 8 for part numbers.

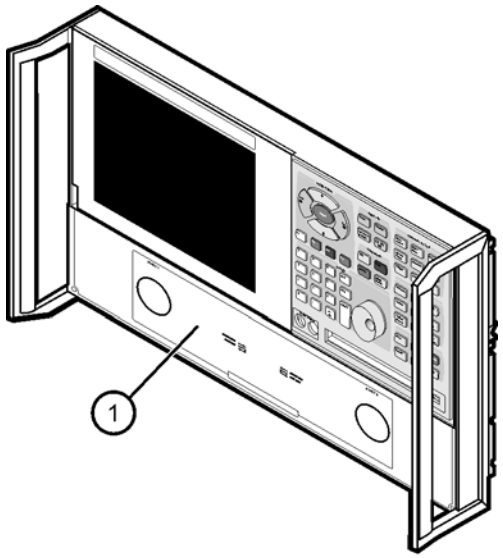
Step 7. Replace the Lower Front Panel Overlay

NOTE The new parts referenced in this procedure are listed in Table 1 on page 5.

Refer to Figure 12 for this procedure.

1. From the back side of the front panel, use a blunt object in one of the cutouts in the lower frame to push the overlay (item ①) and separate it from the front panel.
2. From the front side of the front panel, pull off the overlay completely and discard it.
3. Remove any adhesive remaining on the front panel.
4. Remove the protective backing from the new front panel overlay (item ①). Make sure you select the proper overlay for your analyzer. There are three overlays provided:
   - One for Option 014 only:
     The port SOURCE OUT labels read 40 VDC and the port RCVR IN labels read 15 VDC.
   - One for Option UNL/014:
     The port SOURCE OUT labels read 0 VDC and the port RCVR IN labels read 15 VDC.
   - One for Option UNL/014/016:
     The port SOURCE OUT labels read 0 VDC and the port RCVR IN labels read 0 VDC.
5. Starting from either the left or right side, *loosely* place the overlay in the recess on the lower front panel, ensuring that it fits tightly against the recess edges.
6. Once the overlay is in place, press it firmly onto the frame to secure it.

Figure 12 Lower Front Panel Overlay Replacement



Step 8. Reinstall the Front Panel Assembly and Install the Front Panel Jumpers

CAUTION Before installing the front panel assembly onto the analyzer, lift and support the front of the analyzer chassis.

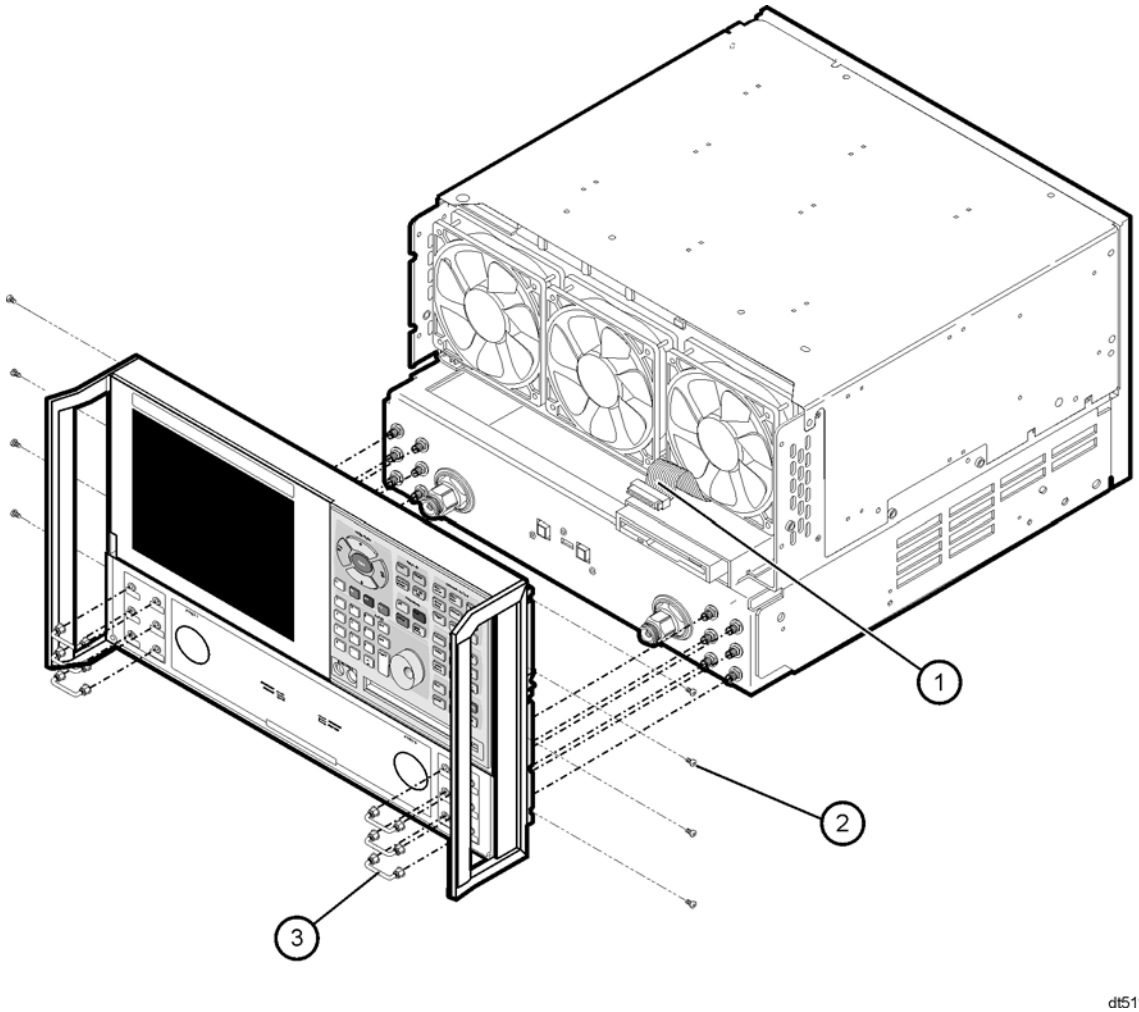
2. Reconnect the ribbon cable (item ①) to the A3 front panel interface board.
3. Slide the front panel over the test port connectors being careful to align the power switch and floppy disk drive to their corresponding front panel cutouts. Ensure that the ribbon cable (item ①) is located below the fan to prevent it from being damaged by the fan blades.
4. With a T-10 TORX driver, install the eight screws (item ②) in the sides of the frame.
5. Install the six semirigid jumpers (item ③) on the front panel, and tighten to 10-in lbs.

Figure 13 Front Panel Assembly Reinstallation



Step 9. Reinstall the Outer Cover

CAUTION This procedure is best performed with the analyzer resting on its front handles in the vertical position. *Do not place the analyzer on its front panel without the handles*. This will damage the front panel assemblies.

Refer to Figure 14 for this procedure.

1. Slide the cover over the analyzer frame.
2. With a T-20 TORX driver, install the four rear panel feet (item ①) by installing the center screws (item ②).

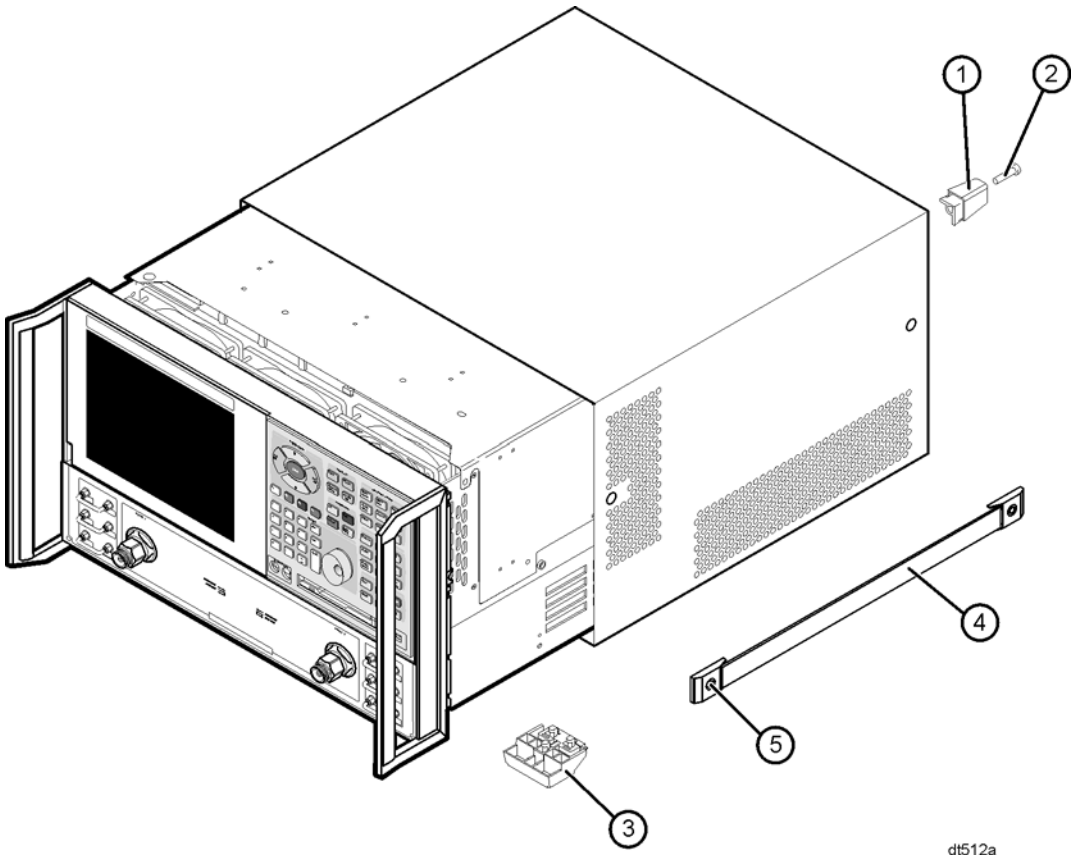
Figure 14 Outer Cover Reinstallation



Step 10. Enable Option 014

Procedure Requirements

- The analyzer must be powered up and operating to perform this procedure.
- The Network Analyzer program must be running.
- A mouse is required.

Enable Option 014

2. Verify that "014" is listed after "Options:" in the display.
3. Click OK when done.

NOTE If Option 014 has not been enabled, perform "Enable Option 014" again. If the option is still not enabled, contact Agilent Technologies. Refer to "Contacting Agilent" on page 3.

Step 12. Perform Post-Upgrade Adjustments and Calibration

Adjustments

The following adjustments must be made due to the hardware changes of the analyzer.

- source calibration
- receiver calibration

These adjustments are described in the PNA service guide and in the PNA on-line HELP. A list of equipment required to perform these adjustments can be found at "Equipment Required for Post-Upgrade Adjustments" on page 8.

Calibration

The analyzer should now operate and phase lock over its entire frequency range.

NOTE If you experience difficulty with the basic functioning of the analyzer, contact Agilent. Refer to "Contacting Agilent" on page 3.

- Although the analyzer functions, its performance relative to its specifications has not been verified.
- It is recommended that a full instrument calibration be performed using the PNA performance test software.
- Refer to the analyzer's service guide for information on the performance test software.
