## Solution/Action:

Observe the following procedure when discharging the second anode.

- 1. Make sure that the instrument's power cord is connected to the instrument and to a grounded mains receptacle.
- 2. Connect a 34111A High Voltage Probe to a DMM. Attach the probe's alligator clip to the instrument chassis.
- 3. Insert the probe tip underneath the rubber protective cap of the second anode connector and make contact with the second anode.
- 4. Maintain contact for at least 30 seconds. The DMM should read less than 5 volts (5mV with the probe division).
- 5. Complete the discharge by directly grounding the second anode.
