

Specifications Guide

Agilent Technologies E4406A VSA Transmitter Tester

This manual provides documentation for the following instrument:

E4406A (7 MHz to 4 GHz)

Agilent Technologies

Manufacturing Part Numbers: E4406-90283

Supersedes: E4406-90271

Printed in USA

July 2005

© Copyright 2001-2005 Agilent Technologies, Inc.

The information in this document is subject to change without notice.

Agilent Technologies makes no warranty of any kind with regard to this material, including but not limited to, the implied warranties of merchantability and fitness for a particular purpose. Agilent Technologies shall not be liable for errors contained herein or for incidental or consequential damages in connection with the furnishing, performance, or use of this material.

Where to Find the Latest Information

Documentation is updated periodically. For the latest information about Agilent VSA transmitter tester, including firmware upgrades and application information, see:

1 Transmitter Tester Specifications

Definitions and Requirements

The distinction among specifications, typical performance, and nominal values are described as follows.

Definitions

- Specifications describe the performance of parameters covered by the product warranty (temperature = 0 to 55 °C, unless otherwise noted).
- Typical describes additional product performance information that is not covered by the product warranty. It is performance beyond specification that 80 % of the units exhibit with a 95 % confidence level over the temperature range 20 to 30 °C. Typical performance does not include measurement uncertainty.
- Nominal values indicate expected performance, or describe product performance that is useful in the application of the product, but is not covered by the product warranty.

The following conditions must be met for the analyzer to meet its specifications.

Conditions Required to Meet Specifications

- The analyzer is within its calibration cycle.
- At least 2 hours of storage at a constant temperature, within the operating temperature range.
- At least 1 hour after the instrument is turned on.
- If Auto Align Alert is selected, an Align All Now must be run when the alignment error message occurs, or

If Auto Align On is selected, it must have been turned on at least 5 minutes, or If Auto Align Off is selected, Align All Now must be run:

- If more than 24 hours has expired, or
- Any time the ambient temperature changes more than 3 °C.

CAUTION: Changing the instrument mode clears any alignment error message. Align All Now must still be performed.

CAUTION:

Changing the instrument mode clears any alignment error message. Align All Now must still be performed.

Certification

Agilent Technologies certifies that this product met its published specifications at the time of shipment from the factory. Agilent Technologies further certifies that its calibration measurements are traceable to the United States National Institute of Standards and Technology, to the extent allowed by the Institute's calibration facility, and to the calibration facilities of other International Standards Organization members.

Frequency

	Specifications	Supplemental Information
Frequency Range (RF Input)	7 MHz to 314 MHz	
Frequency Range (Baseband I and Q Inputs)	329 MHz to 4 GHz 0 Hz to 5 MHz	

	Specifications	Supplemental Information
Frequency Spans (Baseband IQ Inputs)	5 Hz to 5 MHz 10 Hz to 10 MHz	Baseband I or Q Inputs Composite I/Q

	Specifications	Supplemental Information
Frequency Setting Resolution	1 Hz	

	Specifications	Supplemental Information
Frequency Reference		
Accuracy	$\pm[(\text{time since last adjustment} \times \text{aging rate}) + \text{temperature stability} + \text{calibration accuracy}]^a$	
Initial calibration accuracy	$\pm 5 \times 10^{-8}$	
Settability	$\pm 2 \times 10^{-9}$	
Aging rate		
During any 24 hours, following 24-hour warmup		$\pm 5 \times 10^{-10}$, (nominal)
Per year		$\pm 1 \times 10^{-7}$, (nominal)
Temperature stability	$\pm 5 \times 10^{-8}$ variation from frequency at +25 °C over the temperature range of 0 to +55 °C	
Warm-up time		1 hour, (nominal)
Within 10 minutes after turn-on		$\pm 1 \times 10^{-7}$ (relative to measurement after 1 hour)
Within 20 minutes after turn-on		$\pm 1 \times 10^{-8}$ (relative to measurement after 1 hour)
Within 15 minutes at ambient temperature of +25 ±3 °C		$\pm 5 \times 10^{-8}$, relative to the frequency at the previous turn-off time (powered for at least 72 hours prior to removing power for 24 hours)

	Specifications		
Stability	7 to 678.59 MHz	678.6 to 1678.59 MHz	1678.60 to 4000 MHz
RMS residual FM 3.3 ms data acquisition time, 3 kHz pre-ADC bandwidth	≤4.0 Hz	≤8.0 Hz	≤16.0 Hz

a. Initial calibration accuracy depends on how accurately the frequency standard was adjusted to 10 MHz.

	Specifications	Supplemental Information
Noise Sidebands (RF Input) ^{ab}		
673.6 MHz		
Offset 100 Hz	≤-85 dBc/Hz	
Offset 1 kHz	≤-92 dBc/Hz	
Offset 10 kHz	≤-102 dBc/Hz	
Offset 100 kHz	≤-131 dBc/Hz	
Offset 600 kHz	≤-138 dBc/Hz	
Offset 1.2 MHz	≤-141 dBc/Hz	
Offset 6.0 MHz	≤-145 dBc/Hz	
Offset 10.0 MHz	≤-145 dBc/Hz	
960 MHz		
Offset 100 Hz	≤-81 dBc/Hz	
Offset 1 kHz	≤-87 dBc/Hz	
Offset 10 kHz	≤-96 dBc/Hz	
Offset 100 kHz	≤-125 dBc/Hz	
Offset 600 kHz	≤-136 dBc/Hz	
Offset 1.2 MHz	≤-140 dBc/Hz	
Offset 6.0 MHz	≤-146 dBc/Hz	
Offset 10.0 MHz	≤-146 dBc/Hz	

- a. Noise sidebands and spurious responses may be affected by the quality of the external reference when an external reference is used.
- b. Offsets <1 MHz measured with RF Input ≥ -2 dBm; Offsets ≥ 1 MHz measured with RF Input >+12 dBm.

	Specifications	Supplemental Information
1990 MHz		
Offset 100 Hz	≤ -75 dBc/Hz	
Offset 1 kHz	≤ -82 dBc/Hz	
Offset 10 kHz	≤ -86 dBc/Hz	
Offset 100 kHz	≤ -118 dBc/Hz	
Offset 600 kHz	≤ -132 dBc/Hz	
Offset 1.2 MHz	≤ -137 dBc/Hz	
Offset 6.0 MHz	≤ -141 dBc/Hz	
Offset 10.0 MHz	≤ -141 dBc/Hz	
Noise Sidebands^a (Baseband IQ Inputs)		
0 to 5 MHz		
Offset 1 kHz		≤ -120 dBc/Hz (typical) ^b
Offset 10 kHz		≤ -133 dBc/Hz (typical) ^b
Offset 100 kHz		≤ -134 dBc/Hz (typical) ^b
Offset 1.0 MHz		≤ -135 dBc/Hz (nominal)
Offset 5.0 MHz		≤ -135 dBc/Hz (nominal)

a. No DC offset applied

b. Agilent measures 100% of Option B7C Baseband IQ assemblies in the factory process. More than 80% of instruments exceed this "typical" specification

	Specifications	Supplemental Information
<p>Spurious Responses (RF Input)^a -10 dBm at input mixer,^b Manual ADC range</p> <p>Input CW frequency from 700 MHz to < 793 MHz 3kHz ≤ offset ≤ 50 MHz</p> <p>Input CW frequency from 793 MHz to 1678.6 MHz 3kHz ≤ offset ≤ 150 MHz Except for 2 x input frequency - 964.2 MHz</p> <p>Input CW frequency from > 1678.6 MHz to < 2200 MHz 3kHz ≤ offset ≤ 150 MHz</p> <p>Input CW frequency from 2200 MHz to 3700 MHz 3kHz ≤ offset ≤ 1200 MHz Except for offsets of -160.7 MHz, -482.1 MHz, and -642.8 MHz</p> <p>Input CW frequency from > 3700 MHz to 4000 MHz 3kHz ≤ offset ≤ 150 MHz</p> <p>Spurious Responses^{cd} (Baseband IQ Inputs)</p> <p>Full Scale input level, +13 dBm range</p>	<p>≤-59 dBc</p> <p>≤-59 dBc</p> <p>≤-53 dBc</p> <p>≤-53 dBc</p> <p>≤-53 dBc</p>	<p>≤-80 dBc (typical)^e</p>

- a. Noise sidebands and spurious responses may be affected by the quality of the external reference when an external reference is used.
- b. Mixer power level (dBm) = input power (dBm) – input attenuation (dB).
- c. Noise sidebands and spurious responses may be affected by the quality of the external reference when an external reference is used.
- d. No DC offset applied
- e. Agilent measures 100% of Option B7C Baseband IQ assemblies in the factory process. More than 80% of instruments exceed this "typical" specification

	Specifications	Supplemental Information
Residual Responses (RF Input) 50 Ω Input terminated, 0 dB input attenuation, +18 dB ADC gain 20 MHz to 2 GHz 2 GHz to 4 GHz Residual Responses^a (Baseband IQ Inputs) 50 Ω Input terminated 0 to 5 MHz	≤ -85 dBm ≤ -80 dBm	≤ -90 dBm (typical) ^b

	Specifications	Supplemental Information
Spurious Sidebands^a (Baseband IQ Inputs) > 1 kHz Offset		≤ -80 dBc (typical) ^b

a. No DC offset applied.

b. Agilent measures 100% of Option B7C Baseband IQ assemblies in the factory process. More than 80% of instruments exceed this "typical" specification.

Amplitude

	Specifications	Supplemental Information
RF Input Maximum measurement power Maximum safe dc voltage Maximum safe input power Baseband IQ Inputs Input Ranges 50 Ω Input Z Input Ranges 600 Ω, 1 M Ω Input Z Maximum safe input voltage	+30 dBm (1 W) ±26 Vdc +35 dBm (3.16 W) -5 to +13 dBm in four ranges of 6 dB steps: -5 dBm, +1 dBm, +7 dBm, +13 dBm -18 to 0 dBV in four ranges of 6 dB steps: -18 dBV, -12 dBV, -6 dBV, 0 dBV ±5 V (DC + AC)	

	Specifications	Supplemental Information
Input Attenuator (RF Input) Range Step size Accuracy at 50 MHz	0 to +40 dB 1 dB steps ±0.3 dB relative to 10 dB attenuation	

	Specifications	Supplemental Information
1st LO Emission from RF Input $f_{\text{emission}} = \text{Center Freq.} \pm 321.4 \text{ MHz}$		$\leq (-23 \text{ dBm} - \text{Input Attenuation}),$ (nominal)

	Specifications		Supplemental Information
Third-order Intermodulation Distortion (RF Input) Input power $\leq +27$ dBm Pre-ADC Filter ON Tone separation ≥ 5 MHz 50 MHz to 4 GHz Tone separation ≥ 50 kHz 30 MHz to 4 GHz	Distortion ^a	TOI ^b	TOI
	<-56 dBc	+18 dBm	+23 dBm (typical)
	<-54 dBc	+17 dBm	+21 dBm (typical)

	Specifications	Supplemental Information
Harmonic Distortion (Baseband IQ Inputs) For one CW input signal 0 to -10 dB below Range		≤ -63 dBc (typical) ^c

	Specifications	Supplemental Information
1 dB Gain Compression Pre-ADC Filter ON Total power at input mixer ^d 1 tone 2 tones, separation ≥ 3 MHz 2 tones, separation ≥ 40 MHz	0 dBm +2 dBm +5 dBm	+6 dBm, (typical) +10 dBm, (typical)

- Computed from measured TOI, using the equation: Distortion (in dBc) = 2[mixer tone level (in dBm) – TOI]
- TOI= third order intercept. The TOI is given by the mixer tone level (in dBm) minus (distortion/2) where distortion is the relative level of the distortion tones in dBc. The measurement is made with two -10 dBm tones at the input mixer.
- Agilent measures 100% of Option B7C Baseband IQ assemblies in the factory process. More than 80% of instruments exceed this "typical" specification
- Mixer power level (dBm) = input power (dBm) – input attenuation (dB).

	Specifications	Supplemental Information
Absolute Power Measurement Accuracy (Baseband IQ Inputs) Input Impedance = 50 Ω, all ranges Input Impedance = 600 Ω, all ranges 0 to 1 MHz 1 MHz to 5 MHz Input Impedance = 1 M Ω, all ranges Unbalanced Balanced 0 to 1 MHz 1 MHz to 5 MHz		$\leq \pm 0.6$ dB (typical) ^a $\leq \pm 0.6$ dB (typical) ^a $\leq \pm 2.0$ dB (typical) ^a ± 0.7 dB, (nominal) ± 0.6 dB, (nominal) ± 2.0 dB, (nominal)

	Specifications	Supplemental Information
Amplitude Accuracy (–2 dBm) Relative to –2 dBm at the Input Mixer ^b (RF Input) Power level at the mixer, no averaging –2 dBm to –78 dBm ^c –78 dBm to –88 dBm ^d –88 dBm to –98 dBm ^d Power level at the mixer, with 10 averages –78 dBm to –88 dBm ^d –88 dBm to –98 dBm ^d	± 0.25 dB ± 0.70 dB ± 1.20 dB	ADC range is set to AUTO. ± 0.15 dB, (typical) ± 0.40 dB, (typical) ± 0.80 dB, (typical) ± 0.25 dB, (nominal) ± 0.35 dB, (nominal)

- a. Agilent measures 100% of Option B7C Baseband IQ assemblies in the factory process. More than 80% of instruments exceed this "typical" specification
- b. Mixer power level (dBm) = input power (dBm) – input attenuation (dB).
- c. Uncertainty due to amplitude linearity. Does not include uncertainty due to noise.
- d. Uncertainty due to amplitude linearity and noise (1 Hz resolution bandwidth)

	Specifications	Supplemental Information
Amplitude Accuracy (-12 dBm) Relative to -12 dBm at the Input Mixer ^a (RF Input) Power level at the mixer, no averaging -12 dBm to -62 dBm ^b	±0.15 dB	±0.10 dB, (typical)

	Specifications	Supplemental Information
Amplitude Linearity (Baseband IQ Inputs) 0 to -35 dB below Range -35 to -55 dB below Range		±0.17 dB (typical) ^c ±1.0 dB (typical) ^c

- a. Mixer power level (dBm) = input power (dBm) – input attenuation (dB).
- b. Uncertainty due to amplitude linearity. Does not include uncertainty due to noise.
- c. Agilent measures 100% of Option B7C Baseband IQ assemblies in the factory process. More than 80% of instruments exceed this "typical" specification

	Specifications	Supplemental Information
<p>Displayed Average Noise Level (RF Input) Input terminated in 50 Ω, 0 dB attenuation, 1 kHz RBW, 10 kHz span, +24 dB ADC gain</p> <p>7 MHz to 20 MHz 20 MHz to 2000 MHz 2000 MHz to 2700 MHz 2700 MHz to 4000 MHz</p> <p>Displayed Average Noise Level^a (Baseband IQ Inputs) Input terminated in 50 Ω, 50 Ω input impedance, 1 kHz RBW</p> <p>1 kHz to 5 MHz +13 dBm Range +7 dBm Range +1 dBm Range -5 dBm Range</p>	<p>-103 dBm -106 dBm -103 dBm -98 dBm</p>	<p>-111 dBm, (typical) -111 dBm, (typical) -108 dBm, (typical) -104 dBm, (typical)</p> <p>-100 dBm, (typical)^b -105 dBm, (typical)^b -108 dBm, (typical)^b -110 dBm, (typical)^b</p>

	Specifications	Supplemental Information
<p>DC Offset (Baseband IQ Inputs)</p> <p>After Auto-Zero</p> <p>Compensation for Customer DC offset</p> <p>Offset Accuracy</p>		<p>-55 dB below Range, (typical)^b</p> <p>$\leq \pm 2.0$ V DC (typical)^b</p> <p>$\pm 2.0\%$ of Range, (nominal)</p>

- a. No DC offset applied.
- b. Agilent measures 100% of Option B7C Baseband IQ assemblies in the factory process. More than 80% of instruments exceed this "typical" specification

	Specifications	Supplemental Information
Channel Match (Baseband IQ Inputs) Amplitude match 0 to 5.0 MHz Phase match 0 to 5.0 MHz		± 0.25 dB (typical) ^a ± 2.0 degrees (typical) ^a

	Specifications	Supplemental Information
Crosstalk (Baseband IQ Inputs) Input Impedance = 50 Ω Input Impedance = 600 Ω		< -60 dB (typical) ^a < -52 dB (typical) ^a

	Specifications	Supplemental Information
Common Mode Rejection (Baseband IQ Inputs) 600 Ω Balanced Inputs 0 to 0.5 MHz > 0.5 MHz to 5.0 MHz		< -50 dB (typical) ^a < -35 dB (typical) ^a

a. Agilent measures 100% of Option B7C Baseband IQ assemblies in the factory process. More than 80% of instruments exceed this "typical" specification

Measurements

These specifications apply to the measurements available in the Basic or Service Modes.

	Specifications	Supplemental Information
Spectrum Measurement		
Range at RF Input		
Maximum:	+30 dBm (1 W)	
Minimum:	Displayed Avg Noise Level	
Range at IQ Input		
Maximum (50 Ω Input):	+13 dBm (20 mW)	
Maximum (600 Ω, 1 M Ω Input):	0 dBV	
Minimum:	Displayed Avg Noise Level	
Span Range (RF Input)	10 Hz to 10 MHz	Maximum is 15 MHz in Service Mode 1, 1.5, 2, 3, 5, 7.5, 10 sequence or arbitrary user-definable
Span Range (Composite I/Q Input)	10 Hz to 10 MHz	1, 1.5, 2, 3, 5, 7.5, 10 sequence or arbitrary user-definable
Span Range (Baseband I or Q Only Inputs)	10 Hz to 5 MHz	1, 1.5, 2, 3, 5, 7.5, 10 sequence or arbitrary user-definable
Capture time		267 ns to 40 s 8 points to 65536 points Coupled to span and resolution bandwidth
Resolution BW ranges		
Overall (Manual):	100 MHz to 3 MHz	1, 1.5, 2, 3, 5, 7.5, 10 sequence or arbitrary user-definable
Pre-FFT filter		
Type:	Gaussian, Flat	
BW:	Auto, Manual 1 Hz to 10 MHz	
FFT window:	Flat Top; (high amplitude accuracy); Uniform: Hanning; Hamming; Gaussian; Blackman; Blackman-Harris; Kaiser-Bessel 70, 90, 110	
Averaging		
Avg number:	1 to 10,000	
Avg mode:	Exponential, Repeat	
Avg type:	Power Avg (RMS), Log-Power Avg (Video), Voltage Avg, Maximum, Minimum	

	Specifications	Supplemental Information
Spectrum Measurement		
Displays (RF Input)	Spectrum, Linear Spectrum, I/Q waveform, I/Q Polar, Spectrum & I/Q waveform, Adjacent Channel Power, Power Stat CCDF	Service Mode also has RF Envelope and Quad-View
Displays (Baseband IQ Inputs)	Spectrum, Linear Spectrum, I/Q waveform, I/Q Polar, Spectrum & I/Q waveform, Power Stat CCDF	
Y-axis display		
Dynamic range:	10 divisions × scale/div	
Log scale/div range:	0.1 to 20 dB	
Log scale/div increment:	0.01 dB	
Voltage scale/div range:	1 nV to 20 V	
Controls:	Scale/Div, Ref Value, and Ref Position	Allows expanded views of portions of the trace data
Markers	Normal, Delta, Band power, Noise	
Measurement resolution		
Displayed:	0.01 dB	
Remote query:	0.001 dB	
Trigger (RF Input)		
Source:	Free Run (immediate), Video (IF envelope), RF Burst (wideband), External Front Input, External Rear Input, Frame Timer, Line	
Delay, Holdoff, & Auto:		See Trigger Specifications on page 28 .
Trigger (Baseband IQ Inputs)		
Source:	Free Run (immediate), Video (IQ envelope), External Front Input, External Rear Input, Frame Timer, Line	
Delay, Holdoff, & Auto:		See Trigger Specifications on page 28 .

	Specifications	Supplemental Information
Waveform Measurement		
Range (RF Input)		
Maximum:	+30 dBm (1 W)	
Minimum:	Displayed average noise level	
Range (IQ Input)		
Maximum (50 Ω Input):	+13 dBm (20 mW)	
Maximum (600 Ω, 1 M Ω Input):	1 Volt	
Minimum:	Displayed Avg Noise Level	
Sweep time range		
RBW ≤ 7.5 MHz:	10 μs to 200 ms	Minimum with decimation = 1 Maximum with decimation = 4
RBW ≤ 1 MHz:	10 μs to 400 ms	
RBW ≤ 100 kHz:	10 μs to 2 s	
RBW ≤ 10 kHz:	10 μs to 20 s	
Time record length		2 to >900 k points, (nominal)
Resolution bandwidth		1, 1.5, 2, 3, 5, 7.5, 10 sequence or arbitrary user-definable
Gaussian filter:	10 Hz to 8 MHz	
Flat filter:	10 Hz to 10 MHz	
Averaging		
Avg Number:	1 to 10,000	
Avg Mode:	Exponential, Repeat	
Avg Type:	Power Avg (RMS), Log-power Avg (Video), Maximum, Minimum	
Displays (RF Input)	Signal Envelope, I/Q waveform, I/Q Polar	
Displays (Baseband IQ Inputs)	Signal Envelope, Linear Envelope, I/Q waveform, I & Q waveform, I/Q Polar	
Y-axis display		
Dynamic range:	10 divisions x scale/div	
Log scale/div range:	0.1 to 20 dB	
Log scale/div increment:	0.01 dB	
Voltage scale/div range:	1 nV to 20 V	
Controls:	Scale/Div, Ref Value, and Ref Position	Allows expanded views of portions of the trace data.
X-axis display		
Range:	10 divisions x scale/div	
Controls:	Scale/Div, Ref Value, and Ref Position	Allows expanded views of portions of the trace data.
Polar Display		
Controls		
Voltage scale/div range:	1 nV to 20 V	
I and Q Origin	±250 V	

	Specifications	Supplemental Information
Waveform Measurement		
Markers	Normal, Delta, Band Power	
Measurement resolution		
Displayed:	0.01 dB	
Remote query:	0.001 dB	
Trigger (RF Input)

2 Regulatory Information

Safety Warnings and Cautions

- WARNING** **Warning denotes a hazard. It calls attention to a procedure which, if not correctly performed or adhered to, could result in injury or loss of life. Do not proceed beyond a warning note until the indicated conditions are fully understood and met.**
- CAUTION** **Caution denotes a hazard. It calls attention to a procedure that, if not correctly performed or adhered to, could result in damage to or destruction of the instrument. Do not proceed beyond a caution sign until the indicated conditions are fully understood and met.**
- WARNING** **This is a Safety Class 1 Product (provided with a protective earthing ground incorporated in the power cord). The mains plug shall only be inserted in a socket outlet provided with a protected earth contact. Any interruption of the protective conductor inside or outside of the product is likely to make the product dangerous. Intentional interruption is prohibited.**
- WARNING** **The power cord is connected to internal capacitors that may remain live for 5 seconds after disconnecting the plug from its power supply.**

International Regulatory Information

CAUTION This product is designed for use in Installation Category II and Pollution Degree 2 per IEC 1010 and 664 respectively.

NOTE This product has been designed and tested in accordance with IEC Publication 1010, Safety Requirements for Electronic Measuring Apparatus, and has been supplied in a safe condition. The instruction documentation contains information and warnings which must be followed by the user to ensure safe operation and to maintain the product in a safe condition.

The CE mark is a registered trademark of the European Community (if accompanied by a year, it is the year when the design was proven).

The CSA mark is the Canadian Standards Association safety mark.

ISM 1-A

This is a symbol of an Industrial Scientific and Medical Group 1 Class A product. (CISPR 11, Clause 4)

This product complies with the WEEE Directive (2002/96/EC) marking requirements. The affixed label indicates that you must not discard this electrical/ electronic product in domestic household waste.

Product Category: With reference to the equipment types in the WEEE Directive Annex I, this product is classed as a "Monitoring and Control instrumentation" product.

Do not dispose in domestic household waste.

To return unwanted products, contact your local Agilent office, or see www.agilent.com/environment/product/ for more information.

Compliance with German Noise Requirements

This is to declare that this instrument is in conformance with the German Regulation on Noise Declaration for Machines (Laermangabe nach der Maschinenlaermrrordnung - 3.GSGV Deutschland).

Acoustic Noise Emission/Geraeuschemission	
LpA <70 dB Operator position Normal position per ISO 7779	LpA <70 dB am Arbeitsplatz normaler Betrieb nach DIN 45635 t.19

Declaration of Conformity

A copy of the Manufacturer's EU Declaration of Conformity for this instrument can be obtained by contacting your local Agilent Technologies sales representative.

4 GSM/EDGE Specifications

Measurement	Specifications	Supplemental Information
EDGE Error Vector Magnitude (EVM)		3π/8 shifted 8PSK modulation
		Specifications based on 3GPP essential conformance requirements, and are based on 200 bursts.
Carrier Power Range at RF Input		-45 dBm (nominal)
EVM		
Range ^a		0 to 25 % (nominal)
Floor (RMS)	0.5 %	0.3 % (typical)
Accuracy ^b (RMS)	±0.5 %	Power range at RF input from +27 to -12 dBm
EVM range 1 % to 11 %		
Frequency Error	±1 Hz + tfa ^c	
IQ Origin Offset Range ^a	-20 to -45 dBc	
Trigger to T0 Time Offset		
Relative Offset Accuracy		±5.0 ns (nominal)

- a. The range specification applies when the Burst Sync is set to Training Sequence.
- b. The accuracy specification applies when the EVM to be measured is well above the measurement floor. When the EVM does not greatly exceed the floor, the errors due to the floor add to the accuracy errors. The errors due to the floor are noise-like and add incoherently with the UUT EVM. The errors depend on the EVM of the UUT and the floor as follows: $\text{floorerror} = \sqrt{\text{EVMUUT}^2 + \text{EVMsa}^2} - \text{EVMUUT}$, where EVMUUT is the EVM of the UUT in percent, and EVMsa is the EVM floor of the analyzer in percent. For example, if the EVM of the UUT is 3%, and the floor 0.5%, the error due to the floor is 0.04%. The total reading can be, at its maximum, EVMUUT + floorerror + accyerror, when the accyerror and floorerror are both at their maximums. The minimum reading that would be within the specifications would occur when the floor is near zero and the accuracy error is at its negative limit; in this case the reading could be as low as EVMUUT - accyerror.
- c. tfa = transmitter frequency × frequency reference accuracy

Measurement	Specifications	Supplemental Information
<p>Power vs. Time and EDGE Power vs. Time</p> <p>Minimum carrier power at RF Input for GSM and EDGE</p> <p>Absolute power accuracy for in-band signal (excluding mismatch error)^a</p> <p style="padding-left: 20px;">18 to 30°C</p> <p style="padding-left: 20px;">0 to 55°C</p> <p>Power ramp relative accuracy</p> <p style="padding-left: 20px;">RF Input Range = Auto^b</p> <p style="padding-left: 20px;">+6 dB to noise^{bc}</p> <p style="padding-left: 20px;">Mixer Level ≤ -12 dBm^b</p> <p style="padding-left: 20px;">+6 dB to noise^{bc}</p> <p>Measurement floor</p> <p>Time resolution</p> <p>Burst to mask uncertainty</p>	<p style="text-align: center;">-0.11 ± 0.60 dB</p> <p style="text-align: center;">-0.11 ± 0.90 dB</p> <p style="text-align: center;">±0.26 dB</p> <p style="text-align: center;">±0.26 dB</p> <p style="text-align: center;">200 ns</p> <p style="text-align: center;">±0.2 bit (approx ±0.7 μs)</p>	<p>GMSK modulation (GSM) 3π/8 shifted 8PSK modulation (EDGE)</p> <p>Measures mean transmitted RF carrier power during the useful part of the burst (GSM method) and the power vs. time ramping. 510 kHz RBW</p> <p style="text-align: center;">-30 dBm (nominal)</p> <p style="text-align: center;">-0.11 ± 0.40 dB (typical)</p> <p>Referenced to mean transmitted power</p> <p style="text-align: center;">-81 dBm + Input Attenuation (nominal)</p>

- a. The power versus time measurement uses a resolution bandwidth of about 510 kHz. This is not wide enough to pass all the transmitter power unattenuated, leading the consistent error shown in addition to the uncertainty. A wider RBW would allow smaller errors in the carrier measurement, but would allow more noise to reduce the dynamic range of the low-level measurements. The measurement floor will change by $10 \times \log(\text{RBW}/510\text{kHz})$. The average amplitude error will be about $-0.11\text{dB} \times ((510\text{kHz}/\text{RBW})^2)$. Therefore, the consistent part of the amplitude error can be eliminated by using a wider RBW.
- b. Using auto setting of RF Input range optimizes the dynamic range of analysis, but the scale fidelity is poorer at the relatively high mixer levels chosen. Because of this, manually setting the input attenuator so that the mixer level (RF Input power minus Input Attenuation) is lower can improve the relative accuracy of power ramp measurements as shown.
- c. The relative error specification does not change as the levels approach the noise floor, except for the effect of the noise power itself. If the mixer level is not high enough to make the contribution of the measurement floor negligible, the noise of the analyzer will add power to the signal being measured, resulting in an error. That error is a function of the signal (carrier power) to noise (measurement floor) ratio (SN), in decibels. The function is $\text{error} = 10 \times \log(1 + 10^{-\text{SN}/10})$. For example, if the mixer level is 26.4 dB above the measurement floor, the error due to adding the noise of the analyzer to the UUT is only 0.01 dB.

1.8 MHz	78.4 dB	80.4 dB (95%) ^j

a. The uncertainty in the RF power ratio reported by ORFS has many components. This specification does not include the effects of added power in the measurements due to dynamic range limitations, but does include

the following errors: detection linearity, RF and IF flatness, uncertainty in the bandwidth of the RBW filter, and compression due to high drive levels in the front end.

- b. ORFS due to switching has very small theoretical errors. But Agilent has been unable to verify this computed accuracy, therefore it is listed as nominal and is not warranted.
- c. Maximum dynamic range requires RF input power above -2 dBm for offsets of 1.2 MHz and below. For offsets of 1.8 MHz and above, the required RF input power for maximum dynamic range is $+6$ dBm for GSM signals and $+5$ dBm for EDGE signals
- d. ORFS standards call for the use of a 5-pole, sync-tuned filter; this and the following footnotes review the instrument's conformance to that standard. Offset frequencies can be measured by using either the FFT method or the direct time method. By default, the FFT method is used for offsets of 400 kHz and below, and the direct time method is used for offsets above 400 kHz. The FFT method is slower and has lower dynamic range than the direct time method.
- e. The FFT method uses an exact 5-pole sync-tuned RBW filter, implemented in software.
- f. The direct time method uses digital Gaussian RBW filters whose noise bandwidth (the measure of importance to "spectrum due to modulation") is within $\pm 0.5\%$ of the noise bandwidth of an ideal 5-pole sync-tuned filter. However, the Gaussian filters do not match the 5-pole standard behavior at offsets of 400 kHz and less, because they have *lower* leakage of the carrier into the filter. The lower leakage of the Gaussian filters provides a superior measurement because the leakage of the carrier masks the ORFS due to the UUT, so that less masking lets the test be more sensitive to variations in the UUT spectral splatter. But this superior measurement gives a result that does not conform with ORFS standards. Therefore, the default method for offsets of 400 kHz and below is the FFT method.
- g. The dynamic range for offsets at and below 400 kHz is not directly observable because the signal spectrum obscures the result. These dynamic range specifications are computed from phase noise observations.
- h. Offsets of 1.8 MHz and higher use 100 kHz analysis bandwidths.
- i. The impulse bandwidth (the measure of importance to "spectrum due to switching transients") of the filter used in the direct time method is 0.8% less than the impulse bandwidth of an ideal 5-pole sync-tuned filter, with a tolerance of $\pm 0.5\%$. Unlike the case with spectrum due to modulation, the shape of the filter response (Gaussian vs sync-tuned) does not affect the results due to carrier leakage, so the only parameter of the filter that matters to the results is the impulse bandwidth. There is a mean error of -0.07 dB due to the impulse bandwidth of the filter, which is compensated in the measurement of ORFS due to switching. By comparison, an analog RBW filter with a $\pm 10\%$ width tolerance would cause a maximum amplitude uncertainty of 0.9 dB.
- j. Dynamic ranges for ORFS due to switching marked as "95%" are derived from 95th percentile observations with 95% confidence during a pilot run whose size was statistically significant. A guardband is added to the results to account for measurement uncertainty in the measurement of the components of ORFS due to switching and environmental changes over the 18-30 °C temperature.

- a. Autorange is *not* continuous with each measurement acquisition; it will run only once immediately following a measurement restart, initiated either by pressing the **Restart** hardkey, or by sending the GPIB command `INIT:IMM`. This behavior was chosen to maintain best measurement speed, but it requires caution when input power levels change. If the input signal power changes, the analyzer will not readjust the input attenuators for optimal dynamic range unless a measurement restart is initiated. For example, if a sequence of power measurements is made, beginning with a maximum power level that is large enough to require non-zero input attenuation, it is advisable to do a measurement restart to automatically set a lower input attenuator value to maintain optimal dynamic range for approximately every 3 dB the input signal power level is reduced, or smaller, depending upon how precisely dynamic range needs to be optimized. Conversely, if the input signal power increases to a high enough level, input overloading will occur if the input attenuators are not readjusted by doing a measurement restart.

- a. Those tolerances marked as 95 % are derived from 95th percentile observations with 95 % confidence.
- b. Those tolerances marked as 100 % are derived from 100 % limit tested observations. Only the 100 % limit tested observations are covered by the product warranty.
- c. The computation of the instrument tolerance intervals shown includes the uncertainty of the tracing of calibration references to national standards. It is added, in a root-sum-square fashion, to the observed performance of the instrument.
- d. This table is intended for users in the manufacturing environment, and as such, the tolerance limits have been computed for temperatures of the ambient air near the analyzer of 25 to 35 °C.

- e. Most of the tolerance limits in this table are derived from measurements made of standard instrument specifications, rather than direct observations.
- f. Tolerance limits are computed for a CPICH code domain power of -10 dB relative to total signal power.
- g. The frequency references of the DUT and the test equipment must be locked together to meet this tolerance interval.
- h. These measurements are obtained by utilizing the code domain power function or general instrument capability. The tolerance limits given represent instrument capabilities.
- i. The tolerance interval is based on the largest signal power being -35 dBm at the mixer.
- j. The OBW measurement errors are dominated by the noise-like nature of the signal. The errors decline in proportion to the square root of the number of averages. The tolerance interval shown is for ten averages.
- k. The tolerance interval shown is for the peak absolute power of a CW-like spurious signal. The standards for SEM measurements are ambiguous as of this writing; the tolerance interval shown is based on Agilent's interpretation of the current standards and is subject to change.
- l. EVM tolerances apply with signals having EVMs within ± 2.5 % of the required 17.5 % EVM limit.

- a. Absolute power accuracy includes all error sources for in-band signals except mismatch errors and repeatability due to incomplete averaging. It applies when the mixer level is high enough that measurement floor contribution is negligible. If the mixer level is not high enough to make the contribution of the measurement floor negligible, the noise of the analyzer will add power to the signal being measured, resulting in an error. That error is a function of the signal (channel power) to noise (measurement floor) ratio, SN, in decibels. The function is $\text{error} = 10 \cdot \log(1 + 10^{-(\text{SN}/10)})$. For example, if the mixer level is 26.4 dB above the measurement floor, the error due to adding the analyzer's noise to the UUT is only 0.01 dB.
- b. Agilent measures 100% of Option B7C baseband IQ assemblies in the factory process. More than 80% of instruments exceed this "typical" specification.

Measurement	Specifications	Supplemental Information
Adjacent Channel Power Ratio (ACPR; ACLR)^a

BTS	5 MHz	±0.93 dB
BTS	10 MHz	±0.82 dB
BTS	5 MHz	±0.39 dB
Dynamic Range		
Offset Frequency		
5 MHz		
10 MHz		

- a. Most versions of adjacent channel power measurements use negative numbers, in units of dBc, to refer to the power in an adjacent channel relative to the power in a main channel, in accordance with ITU standards. The standards for W-CDMA analysis include ACLR, a positive number represented in dB units. In order to be consistent with other kinds of ACP measurements, this measurement and its specifications will use negative dBc results, and refer to them as ACPR, instead of positive dB results referred to as ACLR. The ACLR can be determined from the ACPR reported by merely reversing the sign.
- b. The accuracy of the Adjacent Channel Power Ratio will depend on the mixer drive level and whether the distortion products from the analyzer are coherent with those in the UUT. Except for the “noncoherent case” described in footnote f, the specifications apply even in the worst case condition of coherent analyzer and UUT distortion products. For ACPR levels other than those in this specifications table, the optimum mixer drive level for accuracy is approximately $-27 \text{ dBm} - (\text{ACPR}/3)$, where the ACPR is given in (negative) decibels.
- c. In order to meet this specified accuracy when measuring mobile station (MS) or user equipment (UE) within 3 dB of the required -33 dBc ACPR, the mixer level (ML) must be optimized for accuracy. This optimum mixer level is -15 dBm , so the input attenuation must be set as close as possible to the average input power $- (-15 \text{ dBm})$. For example, if the average input power is -6 dBm , set the attenuation to 9 dB. This specification applies for the normal 3.5 dB peak-to-average ratio of a single code. Note that, if the mixer level is set to optimize dynamic range instead of accuracy, accuracy errors are nominally doubled.
- d. ACPR accuracy at 10 MHz offset is warranted when RF Input Range is set to Auto.
- e. To meet this specified accuracy, the mixer level must be optimized for accuracy when measuring Node-B of the Base Transmission Station (BTS) within 3 dB of the required -45 dBc ACPR. This optimum mixer level is -11 dBm , so the input attenuation must be set as close as possible to the average input power $- (-11 \text{ dBm})$. For example, if the average input power is -6 dBm , set the attenuation to 5 dB. This specification applies for the normal 10 dB peak-to-average ratio (at 0.01 % probability) for Test Model 1. Note that, if the mixer level is set to optimize dynamic range instead of accuracy, accuracy errors are nominally doubled.
- f. Accuracy can be excellent even at low ACPR levels assuming that the user sets the mixer level to optimize the dynamic range, and assuming that the analyzer and UUT distortions are incoherent. When the errors from the UUT and the analyzer are incoherent, optimizing dynamic range is equivalent to minimizing the

contribution of analyzer noise and distortion to accuracy, though the higher mixer level increases the display scale fidelity errors. This incoherent addition case is commonly used in the industry and can be useful for comparison of analysis equipment, but this incoherent addition model is often not justified.

g. The average input power level should be at least 0 dBm and RF Input Range should be set to Auto

- a. The Complementary Cumulative Distribution Function (CCDF) is a reformatting of a histogram of the power envelope. The width of the amplitude bins used by the histogram is the histogram resolution. The resolution of the CCDF will be the same as the width of those bins.
- b. Agilent measures 100% of Option B7C baseband IQ assemblies in the factory process. More than 80% of instruments exceed this “typical” specification.

Measurement	Specifications	Supplemental Information
Intermodulation Minimum Carrier Power at RF Input		-20 dBm (nominal)

Measurement	Specifications	Supplemental Information
Occupied Bandwidth Minimum carrier power at RF Input Frequency Resolution Frequency Accuracy	100 Hz	-20 dBm (nominal) $\frac{1.4\%}{\sqrt{N_{\text{avg}}}}$ (nominal) ^a

- a. The errors in Occupied Bandwidth measurement are due mostly to the noisiness of any measurement of a noise-like signal, such as the W-CDMA signal. The observed standard deviation of the OBW measurement is 60 kHz, so with 1000 averages, the standard deviation should be about 2 kHz, or 0.05 %. The frequency errors due to the FFT processing are computed to be 0.028 % with the RBW (30 kHz) used.

Display = Rel Peak Pwr ^h	±0.25 dB	

- a. The dynamic range specification is the ratio of the channel power to the power in the offset and region specified. The dynamic range depends on the measurement settings, such as peak power or integrated power. This specification is derived from other analyzer performance limitations such as third-order intermodulation, DANL and phase noise. Dynamic range specifications are based on default measurement settings, with detector set to average, and depend on the mixer level. Mixer level is defined to be the input power minus the input attenuation.
- b. Default measurement settings include 30 kHz RBW. This dynamic range specification applies for the optimum mixer level, which is about -9dBm.
- c. Default measurement settings include 1200 kHz RBW. This dynamic range specification applies for a mixer level of 0dBm. Higher mixer levels can give up to 5 dB better dynamic range, but at the expense of compression in the input mixer, which reduces accuracy. The compression behavior of the input mixer is specified in the PSA Specifications Guide; the levels into the mixer are nominally 8 dB lower in this application when the center frequency is 2 GHz.
- d. The sensitivity is specified with 0 dB input attenuation. It represents the noise limitations of the analyzer. It is tested without an input signal.
- e. The sensitivity at this offset is specified in the default 30 kHz RBW.
- f. The sensitivity for this region is specified in the default 1200 kHz bandwidth.
- g. The absolute accuracy is a measure of the total power at the offsets. It applies for spectrum emission levels in the regions that are well above the dynamic range limitation.
- h. The relative accuracy is a measure of the ratio of the power at the offset to the main channel power. It applies for spectrum emission levels in the offsets that are well above the dynamic range limitation.

- a. This table is intended for users in the manufacturing environment, and as such, the tolerance limits have been computed for temperatures of the ambient air near the analyzer of 25 to 35 °C.
- b. All specifications given are derived from 95th percentile observations with 95 % confidence.
- c. Predefined test models under the Symbol Boundary menu are recommended for RF input power levels below -55 dBm. At low signal-to-noise ratios the auto channel ID algorithm may not correctly detect an active code channel as turned on. The predefined test model bypasses the auto channel ID algorithm.
- d. Nominal operating range. Accuracy specification applies when mixer level (RF input power minus attenuation) is between -20 and -10 dBm.

- e. A code channel power measurement made on a specific spreading code includes all power that projects onto that code. This power is primarily made up from the intended signal power that was spread using that code, but also includes that part of the SCH power (when present) that also projects onto the code being measured. The reason for this addition is that the SCH power is spread using a gold code, which is not orthogonal to the code being measured. The increase in decibels due to this SCH leakage effect is given by the following formula:

$$\text{SCH leakage effect} = 10 \log (10^{S/10}/(10F) + 10^{C/10}) - C$$

Where:

S = Relative SCH power in dB (during the first 10 % of each timeslot)

F = Spreading factor of the code channel being measured

C = Ideal relative code channel power in dB (excluding SCH energy)

For example, consider a composite signal comprising the SCH set to -10 dB during the first 10 % of each slot, and a DPCH at spreading factor 128 set to -28 dB. Performing a code channel power measurement on the DPCH will return a nominal code channel power measurement of -27.79 dB. The SCH leakage effect of 0.21 dB should not be considered as a measurement error but rather the expected consequence of the non-orthogonal SCH projecting energy onto the code used by the DPCH.

In order to calculate the ideal code channel power C from a code channel power measurement M that includes SCH energy, the following formula can be used:

$$C = 10 \log (10^{M/10} - 10^{S/10}/(10F))$$

Therefore a code channel power measurement M = -27.79 dB at spreading factor 128 of a signal including a relative SCH power of -10 dB indicates an ideal code channel power of -28 dB

- f. The SCH leakage effect due to its being spread by a gold code not orthogonal to the symbol power being measured will add additional power to the measured result during the portion of the slot where SCH power is present. When SCH power is present, the accuracy specification excludes the noise-like contribution of the SCH power.

- a. The accuracy specification applies when the EVM to be measured is well above the measurement floor. When the EVM does not greatly exceed the floor, the errors due to the floor add to the accuracy errors. The errors due to the floor are noise-like and add incoherently with the UUT EVM. The errors depend on the EVM of the UUT and the floor as follows: $\text{error} = \sqrt{\text{EVMUUT}^2 + \text{EVMsa}^2} - \text{EVMUUT}$, where EVMUUT is the EVM of the UUT in percent, and EVMsa is the EVM floor of the analyzer in percent. For example, if the EVM of the UUT is 7 %, and the floor is 2.5 %, the error due to the floor is 0.43 %. The total error can cause a reading as high as EVMUUT + floorerror + accyerror, or as low as EVMUUT – accyerror, where floorerror is the result of the error computation due to the floor, and accyerror is the specified accuracy.
- b. tfa = transmitter frequency × frequency reference accuracy

The errors depend on the EVM of the UUT and the floor as follows: $\text{error} = \sqrt{\text{EVMUUT}^2 + \text{EVMsa}^2} \text{EVMUUT}$, where EVMUUT is the EVM of the UUT in percent, and EVMsa is the EVM floor of the analyzer in percent. For example, if the EVM of the UUT is 7 %, and the floor is 2.5 %, the error due to the floor is 0.43 %. The total error can cause a reading as high as $\text{EVMUUT} + \text{floorerror} + \text{accyerror}$, or as low as $\text{EVMUUT} - \text{accyerror}$, where floorerror is the result of the error computation due to the floor, and accyerror is the specified accuracy.
- e. $\text{tfa} = \text{transmitter frequency} \times \text{frequency reference accuracy}$

Range Control		RF Input Autorange ^a Manually set Max Total Pwr Manually set Input Atten

- a. Autorange is *not* continuous with each measurement acquisition; it will run only once immediately following a measurement restart, initiated either by pressing the **Restart** hardkey, or by sending the GPIB command `INIT:IMM`. This behavior was chosen to maintain best measurement speed, but it requires caution when input power levels change. If the input signal power changes, the analyzer will not readjust the input attenuators for optimal dynamic range unless a measurement restart is initiated. For example, if a sequence of power measurements is made, beginning with a maximum power level that is large enough to require non-zero input attenuation, it is advisable to do a measurement restart to automatically set a lower input attenuator value to maintain optimal dynamic range for approximately every 3 dB the input signal power level is reduced, or smaller, depending upon how precisely dynamic range needs to be optimized. Conversely, if the input signal power increases to a high enough level, input overloading will occur if the input attenuators are not readjusted by doing a measurement restart.

Measurement	Specifications	Supplemental Information
Time Offset Absolute frame offset accuracy Relative frameoffset accuracy ^f Relative offset accuracy (for STTD diff mode)	±150 ns ±1.25 ns	±5.0 ns (nominal)

- a. This table is intended for users in the manufacturing environment, and as such, the tolerance limits have been computed for temperatures of the ambient air near the analyzer of 25 to 35 °C.
- b. All specifications given are derived from 95th percentile observations with 95 % confidence.
- c. All specifications given are derived from 95th percentile observations with 95 % confidence.
- d. Predefined test models under the Symbol Boundary menu are recommended for RF input power levels below -55 dBm. At low signal-to-noise ratios the auto channel ID algorithm may not correctly detect an active code channel as turned on. The predefined test model bypasses the auto channel ID algorithm.
- e. The accuracy specification applies when the EVM to be measured is well above the measurement floor. When the EVM does not greatly exceed the floor, the errors due to the floor add to the accuracy errors. The errors due to the floor are noise-like and add incoherently with the UUT EVM. The errors depend on the EVM of the UUT and the floor as follows: $\text{error} = \sqrt{\text{EVMUUT}^2 + \text{EVMsa}^2} \text{EVMUUT}$, where EVMUUT is the EVM of the UUT in percent, and EVMsa is the EVM floor of the analyzer in percent. For example, if the EVM of the UUT is 7 %, and the floor is 2.5 %, the error due to the floor is 0.43 %. The total error can cause a reading as high as $\text{EVMUUT} + \text{floorerror} + \text{accyerror}$, or as low as $\text{EVMUUT} - \text{accyerror}$, where floorerror is the result of the error computation due to the floor, and accyerror is the specified accuracy.
- f. $\text{tfa} = \text{transmitter frequency} \times \text{frequency reference accuracy}$
- g. The accuracy specification applies when the measured signal is the combination of CPICH (antenna-1) and CPICH (antenna-2), and where the power level of each CPICH is -3 dB relative to the total power of the combined signal. Further, the range of the measurement over which the accuracy specification applies is a maximum offset of ±0.5 chips.

10 1xEV-DV Specifications

Test model signal for 1xEV-DV

3GPP2 defines the test model signal as 9 active channels for a cdma2000 forward link. However, it doesn't cover 1xEV-DV requirements. This means that we need to define the test signal with an appropriate configuration for our specifications in Code Domain and Mod Accuracy. For the 1xEV-DV 8PSK/16QAM modulation code signal, we define the test model signal with the following table.

Table Test Model Definition for 1xEV-DV:

	Walsh	Code#	N	Power	
				Linear	dB
Pilot	64	0	1	0.200	-7.0
Paging	64	1	1	0.338	-4.7
Sync	64	32	1	0.085	-10.7
F-FCH	64	8	1	0.169	-7.7

Band Class 2	917 to 960 MHz	TACS band
Band Class 3	832 to 869 MHz	JTACS band
Band Class 4	1840 to 1870 MHz	Korean PCS band
Band Class 6	2110 to 2170 MHz	IMT-2000 band
Band Class 8	1805 to 1880 MHz	1800 MHz band
Band Class 9	925 to 960 MHz	900 MHz band

Measurement	Specifications	Supplemental Information
Alternative Frequency Ranges^b (Access Network Only)		
Band Class 5	421 to 430 MHz 460 to 470 MHz 489 to 494 MHz	NMT-450 bands
Band Class 7	746 to 764 MHz	North American 700 MHz Cellular band

- a. Frequency ranges over which all specifications apply.
- b. Frequency ranges with tuning plans but degraded specifications for absolute power accuracy. The degradation should be nominally ± 0.30 dB.

General

Measurement	Specifications	Supplemental Information
Trigger Trigger source Trigger delay, level, and slope Trigger delay Range: Repeatability: Resolution: External trigger inputs Level: Impedance: Range Control	-100 to +500 ms ±33 ns 33 ns	RF burst (wideband), Video (IF envelope), Ext Front, Ext Rear. Actual available choices are dependent on measurement. Each trigger source has a separate set of these parameters. -5 V to +5 V, (nominal) 10 kΩ, nominal RF Input Autorange ^a Manually set Max Total Pwr Manually set Input Atten

- a. Autorange is *not* continuous with each measurement acquisition; it will run only once immediately following a measurement restart, initiated either by pressing the **Restart** hardkey, or by sending the GPIB command `INIT:IMM`. This behavior was chosen to maintain best measurement speed, but it requires caution when input power levels change.

If the input signal power changes, the analyzer will not readjust the input attenuators for optimal dynamic range unless a measurement restart is initiated. For example, if a sequence of power measurements is made, beginning with a maximum power level that is large enough to require non-zero input attenuation, it is advisable to do a measurement restart to automatically set a lower input attenuator value to maintain optimal dynamic range for approximately every 3 dB the input signal power level is reduced, or smaller, depending upon how precisely dynamic range needs to be optimized. Conversely, if the input signal power increases to a high enough level, input overloading will occur if the input attenuators are not readjusted by doing a measurement restart.
