

# Agilent ESA-E Series Spectrum Analyzers GSM with EDGE Measurement Personality

Technical Overview with Self-Guided Demonstration

# Option BAH – GSM/GPRS Option 252 – EDGE Upgrade to GSM/GPRS

Quickly and accurately test your next-gen transmitter in the lab, in the field, or on the manufacturing line with the EDGE upgrade to the GSM measurement personality on the ESA-E Series spectrum analyzer.

# **Key Features**

- One-button automated GSM/GPRS/EDGE measurements
- Polar vector and constellation displays for GSM and EDGE
- Phase error, magnitude error and EVM vs. time plots to isolate error mechanisms
- Multi-slot measurement capability
- Cable fault location capability
- Automatic carrier frequency and band selection
- Built-in context sensitive help
- Specified performance after 5 minute warm-up time

# Test Your EDGE Enabled GSM and GPRS Transmitter Quickly, Easily and Accurately

With increased demand for wireless data services, like Internet connectivity and multimedia. service providers are beginning to widely deploy EDGE (Enhanced Data Rates for GSM Evolution). This enhances the popular GSM (Global System for Mobile Communications) cellular standard, by introducing a new modulation scheme that allows theoretically higher data rates in the same frequency spectrum. This solution is attractive to service providers because it allows them to provide value to customers without having to purchase additional licenses for 3G deployment.

The Agilent ESA-E Series offers mid-performance spectrum analysis up to 26.5GHz<sup>1</sup>, combining powerful one-button measurements and the industry's most versatile feature set in a rugged, portable, affordable package. Expand the ESA to include GSM and EDGE measurement capability by ordering the EDGE upgrade (Option 252) to the GSM/GPRS measurement personality (Option BAH).

## For R&D bench

For design purposes, the ESA provides a more affordable alternative to the PSA Series high performance spectrum analyzer. The PSA offers industry leading accuracy and dynamic range, with the ESA offering great value on a general-purpose spectrum analysis platform.

## Manufacturing

For manufacturing needs, the E4406A, a vector signal analyzer is an affordable solution for the fastest throughput in high volume production applications. For bench repair in the rework loop, the ESA is a great general-purpose tool for in-depth trouble-shooting and fault diagnosis.

## **Field installation and maintenance**

For installation and maintenance, the ESA provides one-button standards compliant measurements in a rugged portable package. With pass/fail functionality and best in class general-purpose spectrum analysis, the ESA will ensure that you meet your performance goals accurately, easily and quickly in the most demanding environmental conditions.

#### **ESA E-Series spectrum analyzer**

One-button measurements and the industry's most versatile feature set in a rugged, portable, affordable package.

Figure 1. GSM and EDGE features.

<sup>1. 325</sup> GHz with external mixing.

# Demonstration Preparation

All demonstrations use the ESA-E Series and the ESG vector signal generator (E4438C). The keystrokes surrounded by [] indicate hard keys, while key names surrounded by  $\{\}$  indicate soft keys located on the right edge of the display.

#### To perform the following demonstrations, you will need:

| Product type:                     | Model number:      | Required options <sup>1</sup> :  |
|-----------------------------------|--------------------|--|
| ESA-E Series<br>spectrum analyzer | E4402B/04B/05B/07B | Available via COM express<br>analyzer configuration,<br>B7D – DSP and fast ADC hardware,<br>B7E <sup>2</sup> – RF communications HW,<br>1D5 – high stability frequency reference,<br>1D6 – time gating |
| ESG vector signal generator       | E4438C             | 001 or 002 – baseband generator,<br>402 – TDMA personalities   |

Since EDGE is essentially spectrum and time-slot compatible with GSM, most of the same transmitter measurements are required – some differ only in terms of specified limits. Whenever a measurement is specific to either standard, it will be prefixed by the appropriate name.

#### Connect the hardware as follows:

- 1. Using a 50  $\Omega$  RF cable, connect the RF Output 50  $\Omega$  port on the ESG to the RF INPUT 50  $\Omega$  port on the ESA as shown in figure 2.
- 2. Using a second 50  $\Omega$  RF cable, connect the 10 MHz OUT on the ESG to the EXT REF IN  $^3$  on the ESA-series spectrum analyzer.
- 3. Using a third short 50  $\Omega$  RF cable, connect the 10 MHz OUT jack on the digital demodulation board to the 10MHz REF IN on the RF deck.
- 4. Using a fourth 50  $\Omega$  RF cable, connect the EVENT 1 out from the ESG to the Gate Trig/Ext Trig Input of the ESA.

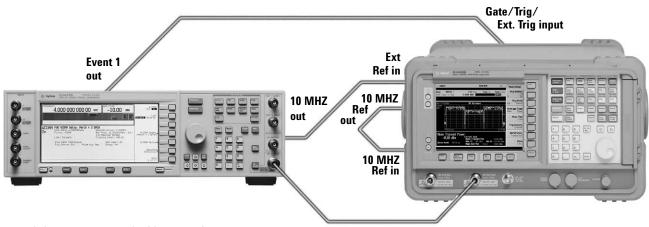

Figure 2. Connection diagram for GSM and EDGE measurements.

<sup>1.</sup> Please see page 13 for recommended configurations and measurement dependencies.

<sup>2.</sup> RF communications hardware (ID 117 or higher required for RF burst carrier triggering on EDGE signals).

The ID number can be found by pressing [System] {Mode 1 of 3} {Show Hardware} on the ESA.

<sup>3.</sup> The ESA has the flexibility to use an internal frequency reference or an external one ranging from 1 to 30 MHz.

# Switch to the GSM with EDGE measurement personality

Spectrum analyzers can make many different types of measurements. The GSM with EDGE measurement personality, one of many modes that the ESA-E Series can be operated in, makes a cost-effective way to expand the capability of an essential engineering tool.

#### Setup a GSM signal for analysis

The ESA has built-in frequency plans for all major GSM bands. You can manually setup a measurement or have the ESA locate the strongest GSM/EDGE signal to automatically set the RF channel frequency, absolute RF channel number (ARFCN) and band.

A cost-effective way to expand the capability of an essential engineering tool.

## Monitor band or spectrum

The performance of a transmitter is critical in a number of areas. Inchannel performance refers to the link quality seen by a specific user. Out of channel measurements determine how much interference the user causes other GSM and EDGE users sharing a band. The default starting measurement, monitor band & monitor spectrum allows an engineer to quickly determine if there are any interfering signals within the transmission and reception bands or channels. The built-in AM and FM demodulation functionality on the ESA allows one to identify interfering signals that may be the result of AM/FM transmitters.

# Instructions on ESA

# **GMSK and EDGE power** versus time

Output power is a fundamental transmitter characteristic and is linked directly to range. GSM and EDGE systems have to ensure that each link is maintained sufficiently with a minimum of power. This ensures that overall system interference is kept to a minimum and battery life is maximized. Additionally, in GSM and EDGE systems, transmitters must ramp their power up and down within a strictly defined time division multiple access structure, to prevent adjacent time-slot interference, loss of data at the beginning of the burst or unnecessary spectral splatter. Because of these considerations, standards specify that the envelope of a burst in the time domain fit a tightly prescribed mask.

The ESA has one-button measurements to allow measurement of the constant RF envelope of a GSM burst or the EDGE envelope, which exhibits amplitude modulation due to its modulation format. The applied masks are all standards compliant with pass/fail functionality for quick and easy verification of performance.

The measurement has flexible views with a:

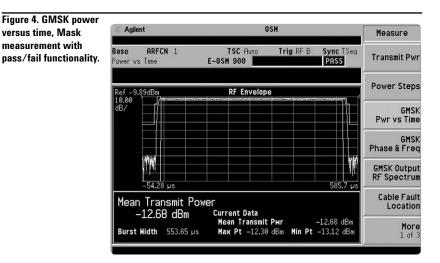

- 'Monitor mode' which allows you to quickly visualize relative time-slot positioning
- 'Rise and Fall' view which allows you to analyze the performance of the burst modulator
- "On Burst" which allows you to focus on the modulated part of the burst to identify errors like amplitude droop due to amplifier thermal effects and modulation problems

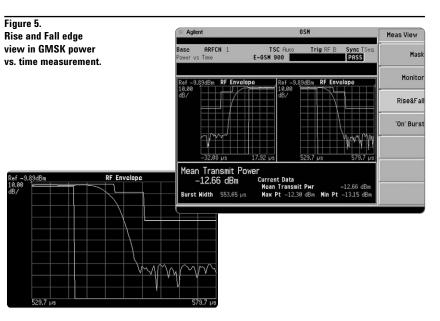

All of these views can be zoomed for an even closer analysis.

#### Instructions on ESA **Keystrokes** Measure power versus time mask (Figure 4) [MEASURE] {GMSK Pwr vs. Time} View the rising and falling parts of the burst and [View/Trace] {Rise and Fall} then zoom on just the falling parts of the burst [Next Window] [Zoom] (Figure 5).

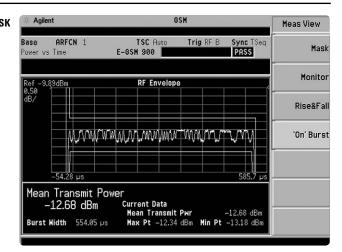

View the "on part" of the burst (Figure 6).

[View/Trace] {On Burst}

# Now make a multi-slot measurement on an EDGE signal

Conventional GSM mobiles use a single time-slot on the uplink and downlink. With the advent of GPRS and EDGE, multiple users are allowed to transmit on multiple time-slots at varying power levels. These time-slots need not be contiguous. Consequently, it has become necessary to be able to perform flexible multi-slot power vs. time measurement to analyze a whole frame.

The ESA has multiple triggering schemes for this measurement: default, RF burst triggering <sup>1</sup> for "off the air" operation, external triggering for when the device under test has an output trigger signal, and a frame trigger. The frame trigger is an internally generated trigger signal corresponding to the frame rate of GSM and EDGE.

# **Modulation quality**

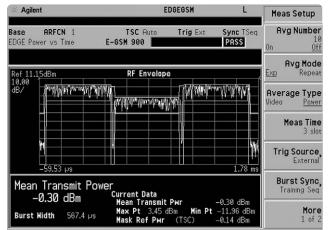

The major difference between GSM and EDGE is the modulation scheme used. GSM uses a GMSK modulation scheme, which is a constant amplitude scheme that transmits information in differential phase shifts. Here, a phase and frequency error will tell vou a lot about the modulation accuracy of the transmitter. For EDGE, the modulation scheme is a 3pi/8 rotated, 8 PSK. This is a nonconstant amplitude modulation scheme. Consequently a useful indication of modulation quality has to take into account the amplitude variations, as well as phase. The EDGE error vector magnitude (EVM) measurement is the modulation quality metric required. Modulation quality translates directly to voice quality and data rates. Good voice quality and higher data rates are a key differentiator that will increase subscription and promote retention of existing wireless customers. It is hence a metric that needs to be monitored carefully.

# **EDGE EVM**

The EDGE upgrade to the GSM/GPRS measurement personality allows measurements of EDGE EVM and all related metrics. This measurement provides an I/Q constellation diagram, error vector magnitude (EVM) in RMS and peak, as well as magnitude error versus time, phase error versus time, and EVM versus time in a quad-view display. These additional views are invaluable in design, allowing one to view modulation quality while troubleshooting a design and isolate sources of impairments.

User-editable pass/fail functionality exists allowing one to test modulation quality according to standards requirements or specific needs.

# Easily identify sources of impairments with the quad view display.

When integrating a communications system, many signals (digital, baseband, IF, and RF) are present. The close proximity of the components is an invitation to cross-talk and can lead to unwanted signals in the signal output. This interfering signal is usually too small to be seen in the frequency domain, however, the EVM displays have the capability to easily highlight the presence of such interference. The interfering signal causes the amplitude or phase of the transmitted signal to be different each time the signal passes through the same state. PM interference, for example causes a variation of the phase around the ideal symbol reference point.

The measurement passes, but a poor modulation quality could mean that customers have to put up with a lower data rate service that has more redundancy in terms of error correction. A poor EVM dominated by a poor magnitude error would have pointed to problems in the amplifier, perhaps due to compression. One could use the power suite measurement to investigate this further.

### **GMSK** phase and frequency error

Phase and frequency error are the equivalent modulation accuracy measurement for GSM systems. Like EVM, this metric can reveal a lot about a transmitter's performance. The GMSK modulation scheme used in GSM is more robust than the 3pi/8 rotated 8 PSK used in EDGE. Regardless, a poor phase error metric means a likely reduction in the ability of a receiver to correctly demodulate a signal. With degrading modulation quality, the range at which a cell phone can operate reduces. A poor frequency error could mean that a receiver will not be able to synchronously demodulate a signal or the transmitter could interfere with other users.

The ESA has a one-button phase and frequency error test, with a constellation display and phase error vs. time plot for further analysis.

error with ESA.

# **GMSK and EDGE output RF** spectrum (ORFS)

A key test of whether a transmitter is a good spectral citizen is the output RF spectrum measurement (ORFS). Modulation causes a carrier to spread spectrally, and this test ensures that this spreading does not interfere with other users on adjacent channels. This measurement is equivalent to the adjacent channel power measurement for CDMA systems with multiple channels being considered in this case.

During the power vs. time measurement, a burst that ramps up too fast will be evident, however, there will be no violation of a mask. The test that will quantitatively indicate the existence of a problem is the spectrum due to switching on the ORFS measurement. The ESA can also make an ORFS measurement due to modulation and wideband noise. There are three methods with different views on the ESA. The first is the multi-offset method, which measures multiple offsets as defined by the standard; the single offset mode, which can be regarded as an examine mode, where the power of the modulated signal at a single offset from the carrier frequency is calculated; then there is the swept mode.

In this case, a measurement is made in the frequency domain where the analyzer sweeps the range as opposed to stepping through the defined frequency offsets. For output RF spectrum due to modulation, the measurement uses time gated spectrum analysis with the gate turned on only for the desired portion of the burst. This way, the ORFS can be shown in an entirely graphical format.

#### Instructions on ESA

## **Cable fault location**

For field service, antenna feed-line and cable faults are responsible for a large percentage of failures at a site. In many cases, service providers will benchmark SWR performance when the antenna network is first installed. Tests done at a later date can be compared to the benchmark results and degradation can be seen, if it exists. This allows the provider to spot a potential problem and fix it before it becomes a total failure for the sector or site. Once it is determined that SWR has degraded and there is a potential problem, a distance to fault measurement can be made to determine how far away the fault is.

The ESA has a built-in cable fault location personality that works with the tracking generator to help in cable fault detection. The personality has several industry standard cables built-in with their parameters like velocity factor and cable loss. These can also be customized by the user if they have cables with unique parameters.

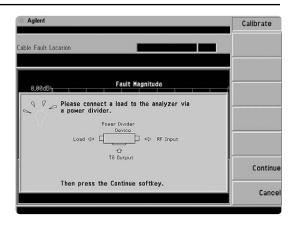

| Instructions on ESA                              | Keystrokes                                     |

The fault location personality allows you to easily locate the fault distance and the severity of the fault.

# Key Features and Benefits of the ESA-E Series Spectrum Analyzer

Multi-functional ESA E-Series spectrum analyzer meets more than just your GSM, GPRS and EDGE test needs.

#### Easy to use - GSM, GPRS and EDGE measurements made simple

- · One-button standards compliant GSM/GPRS and EDGE measurements
- Pass/fail functionality with limit testing
- Built-in help key for quick reference without manuals
- · Band and channel specific monitor spectrum mode
- Automatic frequency tuning plans for all major standards
- Multiple triggering and synchronization modes
- AM/FM demodulation tune and listen for quick signal identification

#### With spectrum analysis - Maximize measurement capability and confidence

- Best in class ± 0.4 dB overall amplitude accuracy
- Best in class –133 dBc/Hz (1MHz) wide offset phase noise for great ORFS dynamic range
- Best in class 108 dB third order dynamic range
- 1 Hz digital resolution bandwidth that is up to 220 times faster than analog resolution bandwidths
- Continuous automatic background alignment to guarantee performance

#### **Upgradeable** – Ready for other applications

- Versatile card cage architecture for hardware expansion
- Instrument firmware and software upgrades available on the web
- · Wide bandwidth digital demodulation platform
- Choose the performance you need, when you need it, and upgrade in the future

#### PC connected – Easy analysis of transmitter performance data

- Store measurement results in spreadsheet format using the built-in floppy disk drive or transfer data directly to your PC with IntuiLink software<sup>1</sup>
- BenchLink Web Remote software enables remote control of an ESA-E over the Internet
- Industry standard SCPI programmable instrument language for remote control
- GPIB (Option A4H), RS-232 (Option 1AX) interface available

#### Fast – Finish your job quicker

- Five minute warm-up time for full accuracy
- Forty-five measurement updates per second for higher probability of intercept and real-time response

**Portable** – Sophisticated measurement performance anywhere

- Rugged case, water resistant front panel
- Snap-on battery (E1779A) or 12 Vdc adapter (Option A5D)
- Carrying/operating/transit case (Option AYT/AYU/AXT)

<sup>1.</sup> For more information about IntuiLink software visit our web site at: www.agilent.com/find/intuilink

Ideal for R&D, manufacturing, installation, maintenance and depot repair.

# R&D

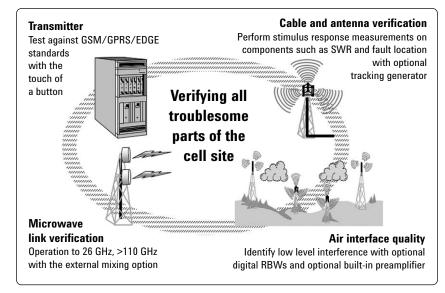

- Affordable spectrum and vector modulation analysis on every engineers bench
- Configurable measurement routines
- Unparalleled flexibility with ten measurement personalities to address any measurement need
- Spurious testing to 26.5 GHz and external mixing capability to 325 GHz

# Manufacturing

- Complete measurement suite for cost effective alternative in production final test
- Flexible troubleshooting tool for engineering root cause analysis in production rework
- Built-in help with SCPI commands and SCPI debugging capabilities for easy programming reference

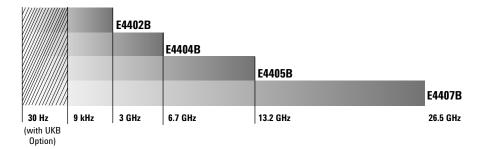

# **Field service**

- Fast accurate whole cell site optimization
- Cable fault location capability
- One-button standards compliant go/no testing
- Rugged, portable tool for field repair
- All weather use

 RF communications hardware (ID 117 or higher required for RF burst carrier triggering on EDGE signals). The ID number can be found by pressing [System] {Mode 1 of 3} {Show Hardware} on the ESA.

# **Specifications**

# GSM measurement personality (Option BAH) and EDGE upgrade to GSM measurement personality (Option 252)

The following specifications apply to the E4402B model only. For more detailed specifications on the E4404B, E4405B and E4407B, please see the ESA-E Series specifications guide.

Unless otherwise noted, all specifications are with RF input range auto, default GSM measurement settings, and in the in-band frequency range. Option 1D6 and Option B72 are required.

## In band frequency ranges<sup>1</sup>

| GSM 900, P-GSM bands | 890 to 915 MHz, 935 to 960 MHz     |
|----------------------|------------------------------------|
| GSM 900, E-GSM bands | 880 to 915 MHz, 925 to 960 MHz     |
| GSM 900, R-GSM bands | 876 to 915 MHz, 921 to 960 MHz     |
| DCS 1800 bands       | 1710 to 1785 MHz, 1805 to 1880 MHz |
| PCS 1900 bands       | 1850 to 1910 MHz, 1930 to 1990 MHz |

#### Alternate frequency ranges<sup>2</sup>

| GSM 450 bands | 450.4 to 457.6 MHz, 460.4 to 467.6 MHz |
|---------------|--|
| GSM 480 bands | 478.8 to 486 MHz, 488.8 to 496 MHz     |
| GSM 850 bands | 824 to 849 MHz, 869 to 894 MHz         |

#### **Transmit power measurement (GSM and EDGE)** (requires *Option B7D or AYX*). **Range at RF Input 30 to -60 dBm**

| Option 120 (dB) | 67.1    | 69.6    | 72.5    | 72.7    |  |

#### **Phase and frequency error measurement (GSM)** (requires Option 1D5, B7D, and B7E)

| Carrier power range at RF input  | 30 to -23 dBm; 30 to -55 dBm, nominal |
|----------------------------------|---------------------------------------|
| Preamp on (Option 1DS)           | 30 to -40 dBm, 30 to -72 dBm, nominal |
| Phase error                      |                                       |
| Range                            | 0 to 180°                             |
| Displayed resolution             | 0.01°                                 |
| Accuracy (Averages ≥10)          |                                       |
| Peak                             | ±2.1° ; ±1.5°, typical                |
| RMS                              | ±1.1°; ±0.6°, typical                 |
| Frequency error <sup>2</sup>     |                                       |
| Initial frequency error range    | ±100 kHz                              |
| Accuracy                         |                                       |
| (Avg. Type = Mean, Averages ≥10) | ±10 Hz; ±5 Hz, typical                |
| I/Q offset range                 | -10 to -46 dBc                        |
| Burst sync time uncertainty      | ±0.1 bit                              |

## Error vector magnitude (EVM) measurement (EDGE)

(requires Option 1D5, B7D, and B7E)<sup>3</sup>

| Carrier power range at RF Input | 30 to -23 dBm; 30 to -55 dBm, nominal |
|---------------------------------|---------------------------------------|
| Preamp on (Option 1DS)          | 30 to -40 dBm, 30 to -72 dBm, nominal |
| EVM                             |                                       |
| Operating range                 | 0 to 25% nominal                      |
| Floor (RMS)                     | 0.8% (nominal)                        |
| Accuracy EVM range 1% to 10%    | ±0.75 % (nominal)                     |
| Frequency error <sup>2</sup>    |                                       |
| Accuracy                        | ±5 Hz, nominal                        |
| I/Q origin offset               | -20 to -45 dBc                        |
|                                 |                                       |

<sup>1.</sup> Previously available GSM measurements options for ESA specified dynamic range for CW signals only. These specifications apply for GSM and EDGE signals.

<sup>2.</sup> Excludes frequency reference error.

<sup>3.</sup> RF communications hardware (ID 117 or higher required for RF burst carrier triggering on EDGE signals). The ID number can be found by pressing [System] {Mode 1 of 3} {Show Hardware} on the ESA.

#### www.agilent.com/find/open

Agilent Open simplifies the process of connecting and programming test systems to help engineers design, validate and manufacture electronic products. Agilent offers open connectivity for a broad range of systemready instruments, open industry software, PC-standard I/O and global support, which are combined to more easily integrate test system development.

#### Agilent Technologies' Test and Measurement Support, Services, and Assistance

Agilent Technologies aims to maximize the value you receive, while minimizing your risk and problems. We strive to ensure that you get the test and measurement capabilities you paid for and obtain the support you need. Our extensive support resources and services can help you choose the right Agilent products for your applications and apply them successfully. Every instrument and system we sell has a global warranty. Two concepts underlie Agilent's overall support policy: "Our Promise" and "Your Advantage."

#### **Our Promise**

Our Promise means your Agilent test and measurement equipment will meet its advertised performance and functionality. When you are choosing new equipment, we will help you with product information, including realistic performance specifications and practical recommendations from experienced test engineers. When you receive your new Agilent equipment, we can help verify that it works properly and help with initial product operation.

#### Your Advantage

Your Advantage means that Agilent offers a wide range of additional expert test and measurement services, which you can purchase according to your unique technical and business needs. Solve problems efficiently and gain a competitive edge by contracting with us for calibration, extra-cost upgrades, out-of-warranty repairs, and onsite education and training, as well as design, system integration, project management, and other professional engineering services. Experienced Agilent engineers and technicians worldwide can help you maximize your productivity, optimize the return on investment of your Agilent instruments and systems, and obtain dependable measurement accuracy for the life of those products.
