HP 5DX Structural Process Test System

Series II will include tamper-proof fasteners

Situation:

Starting with the first Series 11 system (approximately serial number 184), the Main Cabinet will include tamper-proof fasteners for some lead shielded parts. The tamper-proof fasteners will be used on parts that are not protected with safety interlocks, such as the Rotary Axis (Scintillator) Motor Shield. A specific tool (5/32 Security Hex Tool) is required to remove and replace these fasteners. The tool will be included in the "ship kit" with the first few systems. After installing a system, take this tool with you; do not leave it at the customer site. The tool is available from SMO; the part number is:

8710-2683

Always replace tamper-proof fasteners with tamper-proof fasteners; never substitute a non-tamper-proof fastener.

The tamper-proof fasteners are:

10-32 3/8	2940-0307
10-32 5/8	2940-0304
10-32 1 1/2	2940-0305
1/4-20 3/8	2940-0306

DATE: September 1997
