Qt Availability: <http://www.qtsoftware.com/downloads> Patches Applied to Qt can be found in the installation at: `$HPEESOF_DIR/prod/licenses/thirdparty/qt/patches`. You may also contact Brian Buchanan at Agilent Inc. at brian_buchanan@agilent.com for more information.

The HiSIM_HV source code, and all copyrights, trade secrets or other intellectual property rights in and to the source code, is owned by Hiroshima University and/or STARC.

Errata The ADS product may contain references to "HP" or "HPEESOF" such as in file names and directory names. The business entity formerly known as "HP EEsof" is now part of Agilent Technologies and is known as "Agilent EEsof". To avoid broken functionality and to maintain backward compatibility for our customers, we did not change all the names and labels that contain "HP" or "HPEESOF" references.

Warranty The material contained in this document is provided "as is", and is subject to being changed, without notice, in future editions. Further, to the maximum extent permitted by applicable law, Agilent disclaims all warranties, either express or implied, with regard to this documentation and any information contained herein, including but not limited to the implied warranties of merchantability and fitness for a particular purpose. Agilent shall not be liable for errors or for incidental or consequential damages in connection with the furnishing, use, or performance of this document or of any information contained herein. Should Agilent and the user have a separate written agreement with warranty terms covering the material in this document that conflict with these terms, the warranty terms in the separate agreement shall control.

Technology Licenses The hardware and/or software described in this document are furnished under a license and may be used or copied only in accordance with the terms of such license. Portions of this product include the SystemC software licensed under Open Source terms, which are available for download at <http://systemc.org/>. This software is redistributed by Agilent. The Contributors of the SystemC software provide this software "as is" and offer no warranty of any kind, express or implied, including without limitation warranties or conditions or title and non-infringement, and implied warranties or conditions merchantability and fitness for a particular purpose. Contributors shall not be liable for any damages of any kind including without limitation direct, indirect, special, incidental and consequential damages, such as lost profits. Any provisions that differ from this disclaimer are offered by Agilent only.

Restricted Rights Legend U.S. Government Restricted Rights. Software and technical data rights granted to the federal government include only those rights customarily provided to end user customers. Agilent provides this customary commercial license in Software and technical data pursuant to FAR 12.211 (Technical Data) and 12.212 (Computer Software) and, for the Department of Defense, DFARS 252.227-7015 (Technical Data - Commercial Items) and DFARS 227.7202-3 (Rights in Commercial Computer Software or Computer Software Documentation).

About Sensitivity Analysis 7
Sensitivity Analysis Example 10

About Sensitivity Analysis

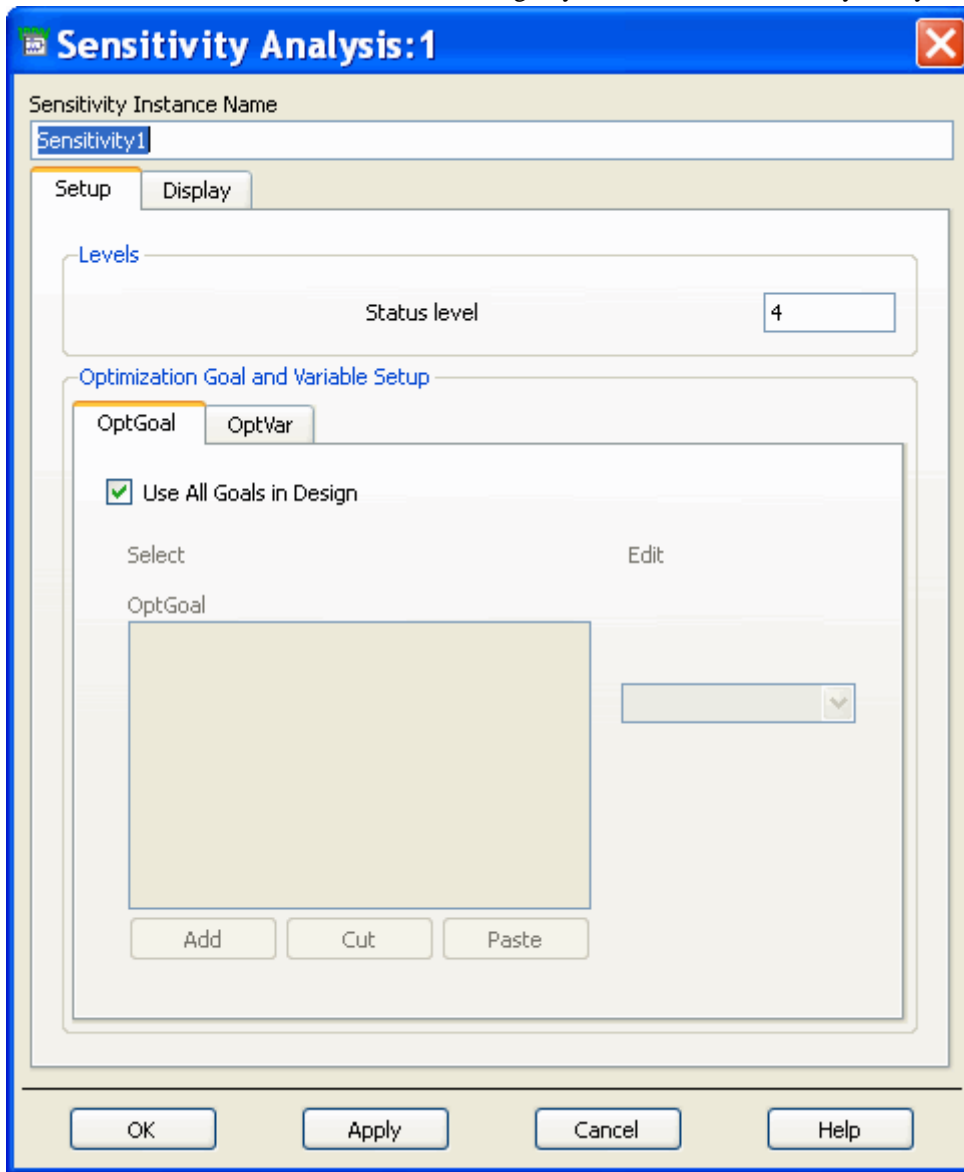

Even though sensitivity is a fundamental element of gradient optimization methods, sensitivity analysis is not a type of optimization.

The prerequisites for sensitivity analysis are the same as for any optimization. You must first have:

- At least one component parameter in your design identified as an optimization variable. You specify details in the Component Parameter dialog box by clicking the **Tune/Opt/Stat/DOE Setup** button. As with any optimization, choose *Enabled*. Choose *Continuous* for Type. The Format field (such as min/max) has no affect with sensitivity analysis. For more information, about specifying component parameters, refer to *Specifying Component Parameters for Optimization* (optstat).
- At least one optimization goal component (*Goal*) placed in the Schematic window. Sensitivity takes into consideration only the goal expression and has no affect on limit line information. For more information, refer to *Setting Optimization Goals* (optstat).

To perform a sensitivity analysis:

1. Place a Sensitivity component in a Schematic window.

Sensitivity analysis comprises a single-point or infinitesimal sensitivity analysis of a design variable. For circuit design, it involves taking partial derivatives of the response with respect to a design variable of interest. It is thought that these numbers can help pinpoint variables that contribute disproportionately to performance variance.

ADS contains other techniques for robust design, including statistical design using both yield analysis and yield optimization. These features are described in *Using Statistical Design* (optstat).

The method used to compute sensitivities is based on finite difference approximation requiring $N+1$ circuit simulations, where N is the number of optimization variables.

By choosing Sensitivity dialog box > Setup tab > OptVar tab (in the Optimization Goal and Variable Setup box), you can specify a subset of all optimization variables within the design.

Results are sent to the Status window for immediate feedback without the need to open the Data Display window, by choosing Sensitivity dialog box > Setup tab > Levels box >

Status level field and entering a proper annotation level. Sensitivity analysis results are also unconditionally sent to the dataset, and this data can be examined in the Data Display window.

See also *Sensitivity Analysis Example* (sensana).

Sensitivities and Normalized Sensitivities

Sensitivities are approximated as follows:

$$S_{P_i} = \frac{\partial R(P_i)}{\partial P_i} \approx \frac{R(P_i^0) - R(P_i^+)}{P_i^0 - P_i^+}$$

where $R(P_i^0)$ is the response evaluated at the nominal point and $R(P_i^+)$ is the response due to a perturbation in the i^{th} parameter.

Note that in ADS, the response R is actually the expression found in the goal(s) given in the Optim (Nominal Optimization) component performing the sensitivity analysis. Additionally, if a goal contains several simulation points, only the point with the highest sensitivity is reported.

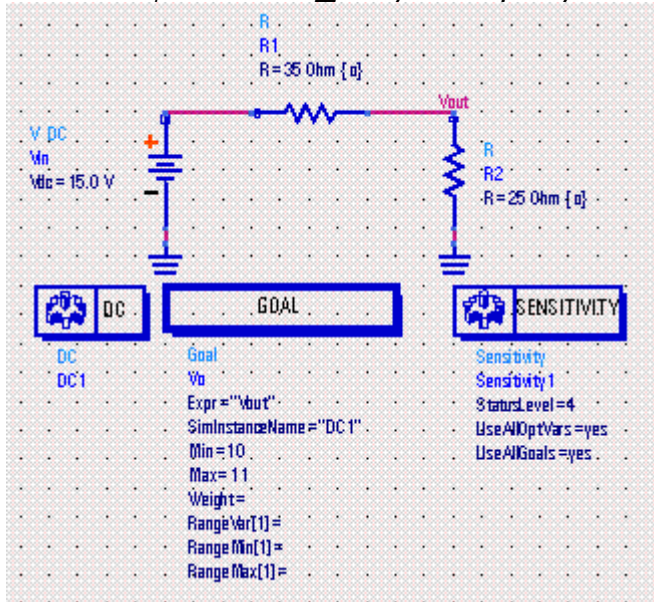

Normalized sensitivities use the approximate gradient (single-point sensitivity) to predict the percentage change in the response due to a 1% change in the design variable. Normalized sensitivity is defined as:

$$S_{N-P_i} = S_{P_i} \left[\frac{P_i^0}{R(P_i^0)} \right] = \left\{ \frac{R(P_i^0) - R(P_i^+)}{R(P_i^0)} \right\} \left/ \left\{ \frac{P_i^0 - P_i^+}{P_i^0} \right\} \right.$$

The sensitivity information is saved in the dataset using the Goal instance name and also Goal LimitLine name. Normalized sensitivities are saved with the name: norm_<goal_instance_name>.

Sensitivity Analysis Example

The following example illustrates the use of sensitivity analysis. This example can be found in *\$HPEESOF_DIR/examples/Tutorial/sensitivity_ex1_wrk*.

The results of this example are shown below.

ANALYTICAL

$$V_o = \frac{V_{in} * R_2}{R_1 + R_2} = \frac{V_{in} * R_2}{R_T}$$

$$S_{R_1}^{V_o} = \frac{-V_{in} * R_2}{R_T^2} = \left. \begin{matrix} -0.10417 \\ V_{in}=15, R_1=35, R_2=25 \end{matrix} \right\}$$

$$S_{R_2}^{V_o} = \frac{V_{in}}{R_T} \left(1 - \frac{R_2}{R_T}\right) = \left. \begin{matrix} 0.14583 \\ V_{in}=15, R_1=35, R_2=25 \end{matrix} \right\}$$

Normalized

$$S_n^{V_o} = S_{R_1}^{V_o} \frac{R_1}{V_o} = \left. \begin{matrix} -0.58333 \\ V_{in}=15, R_1=35, R_2=25 \end{matrix} \right\}$$

$$S_n^{V_o} = S_{R_2}^{V_o} \frac{R_2}{V_o} = \left. \begin{matrix} 0.58333 \\ V_{in}=15, R_1=35, R_2=25 \end{matrix} \right\}$$

SIMULATED

sensVariables	V _o	norm_V _o
R1.R	-0.10417	-0.58333
R2.R	0.14583	0.58333
