# System Library

The System Library consists of non-surface-mount amplifiers, mixers, and filters, power dividers and switches and surface-mount (SMT) amplifiers, crystals, filters, and mixers representing 1273 parts. The library directory structure and the components for each type are detailed in the following sections.

For non-surface-mount library components, refer to these sections:

- *Amplifiers* (vcsys)
- *Filters* (vcsys)
- *Mixers* (vcsys)
- *Power Dividers* (vcsys)
- *Switches* (vcsys)

For surface-mount system library components, refer to these sections:

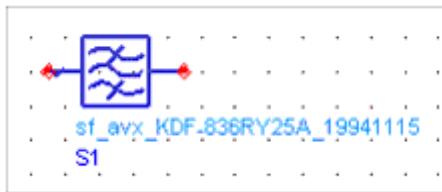

- "*SMT Amplifiers*" (vcsys)
- "*SMT Crystals*" (vcsys)
- "*SMT Filters*" (vcsys)
- "*SMT Mixers*" (vcsys)

# Amplifiers

## Schematic Design

This section describes the schematic design of the non-surface-mount system library amplifier components and describes the underlying model for each type of component.

[Amplifier Schematic Component Example](#) shows how a amplifier component appears when placed into the Schematic design window. The schematic symbol artwork is derived from the standard 2-port GAIN1 symbol. The annotation consists of the component name and the default component ID prefix (in this case, S). No component parameters are displayed. The *label* field appearing at the top of the component parameter dialog box contains the selected component label. The *description* field below the label field reads *Nonlinear Model*.

### [Amplifier Schematic Component Example](#)

The amplifier component is an alias application of the standard S2D file-based data component. No schematic design subnetwork is associated with the component. The standard component name S2D is replaced by the selected amplifier library component name; for example, va\_qb\_QB-102\_19930601.

The S2D data file contains small-signal S-parameters, gain compression characteristics and, in some cases, noise figure or noise parameter data. The file is installed in the same library group subdirectory as the associated component.

The amplifier library components are suitable for placement in any RF/Analog schematic.

## Data

The Amplifier Library consists of nonlinear and linear models representing 357 amplifiers from 6 manufacturers. The models were extracted from linear and nonlinear measurements performed by the manufacturers.

**Note**

The library itself is a binary file named *AmplifierLibrary.library* which can be found in *\$HPEESOF\_DIR/ComponentLibs/models* .

The amplifier library groups available for selection from the Schematic windows are:

- [Agilent Technologies Amplifiers](#)
- [Mini-Circuits Amplifiers](#)
- [NEC Amplifiers](#)
- [Q-bit Amplifiers](#)
- [TriQuint Amplifiers](#)
- [Watkins-Johnson Amplifiers](#)

## Agilent Technologies Amplifiers

For modeling specifications, see [Schematic Design](#).

The Agilent Technologies Amplifiers include 89 components, representing individual parts. The naming convention for these components is *va\_hp\_<part number>* .

## TriQuint Amplifiers

For modeling specifications, see [Schematic Design](#).

The TriQuint Amplifiers include a single component, representing an individual amplifier. The naming convention for this component is va\_tqs\_<part number> .

Component Name	Description
va_tqs_TQ9111D_19930601	TriQuint TQ9111D, 1.0-8.0 GHz, Po1dBC=18dBm, NF=5dB, Model features SP, 1dBC, IP3

## Watkins-Johnson Amplifiers

For modeling specifications, see [Schematic Design](#).

The Watkins-Johnson Amplifiers includes 150 components, representing individual parts. The naming convention for these components is va\_wj\_<part number> .

Several components refer to the same Watkins-Johnson part number at different operating conditions (Vcc). The affected component names employ an additional suffix to indicate the Vcc operating voltage associated with the corresponding model. An example of such an component is va\_wj\_A70-3\_12V, which employs a model characterized using Vcc=12V.

# Filters for Vendor Component Libraries

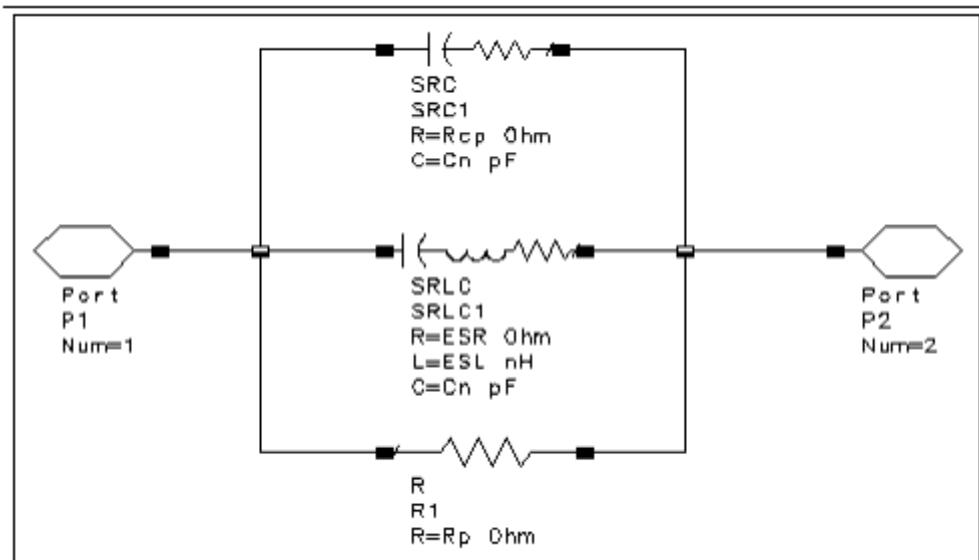

## - System Library

For more information on filters, refer to *Filters for System Models* (ccsys).

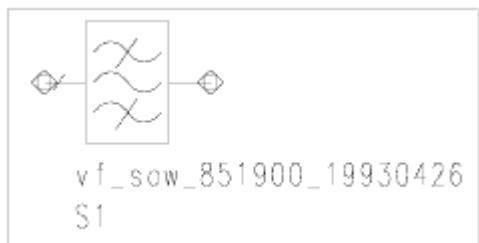

### Schematic Design

This section describes the schematic design of the non-surface-mount system library filter components and describes the underlying model for each type of component.

*Filter Schematic Component Example* (ccsys) shows how a system filter component appears when placed into the Schematic design window. The schematic symbol artwork is derived from the standard 2-port LPFB, HPFB and BPFB symbols. The annotation consists of the component name, the default component ID prefix (in this case, S). No component parameters are displayed.

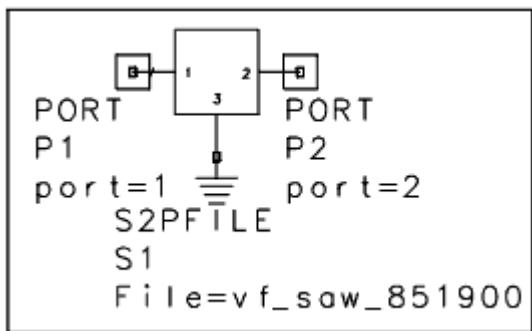

### Filter Schematic Component Example

The *label* field appearing at the top of the component parameter dialog box contains the selected component label. The *description* field below the label field reads *Linear Model*.

The filter component represents a parametric subnetwork schematic design. An example of such a design subnetwork is shown in *Filter Schematic Design Subnetwork Example* (ccsys).

### **Filter Schematic Design Subnetwork Example**

The subnetwork is comprised of a S2P file-based component. The S2P is simply an alias application of a standard 2-port file-based data component S2P. The standard component name of the S2P component is replaced by the selected filter library component name; for example, vf\_saw\_851900\_19930426.

The S2P data file contains small-signal S-parameters. The file is installed in the same library group subdirectory as the associated component.

The filter library components are suitable for placement in any RF/Analog schematic.

## **Data**

The Filter library consists of linear models representing 146 filters from 3 manufacturers. The models were extracted from data provided by these manufacturers.

### **Note**

The library itself is a binary file named *FilterLibrary.library* which can be found in *\$HPEESOF\_DIR/ComponentLibs/models* .

The filter library groups available for selection from the Schematic window are:

- *Mini-Circuits Filters* (ccsys)
- *RF Monolithics Filters* (ccsys)
- *Sawtek Filters* (ccsys)

## Mini-Circuits Filters

For modeling specifications, see *Schematic Design* (ccsys).

The Mini-Circuits Filters include 51 components, representing individual parts. The naming convention for these components is vf\_mc\_<part number> .

# Mixers

## Schematic Design

This section describes the schematic design of the non-surface-mount system library mixer components and describes the underlying model for each type of component.

[Mixer Schematic Component Example](#) shows how a mixer component appears when placed into the Schematic design window. The schematic symbol artwork is derived from the standard 2-port MIX symbol. The annotation consists of the component name, the default component ID prefix (in this case, S), and the component parameters.

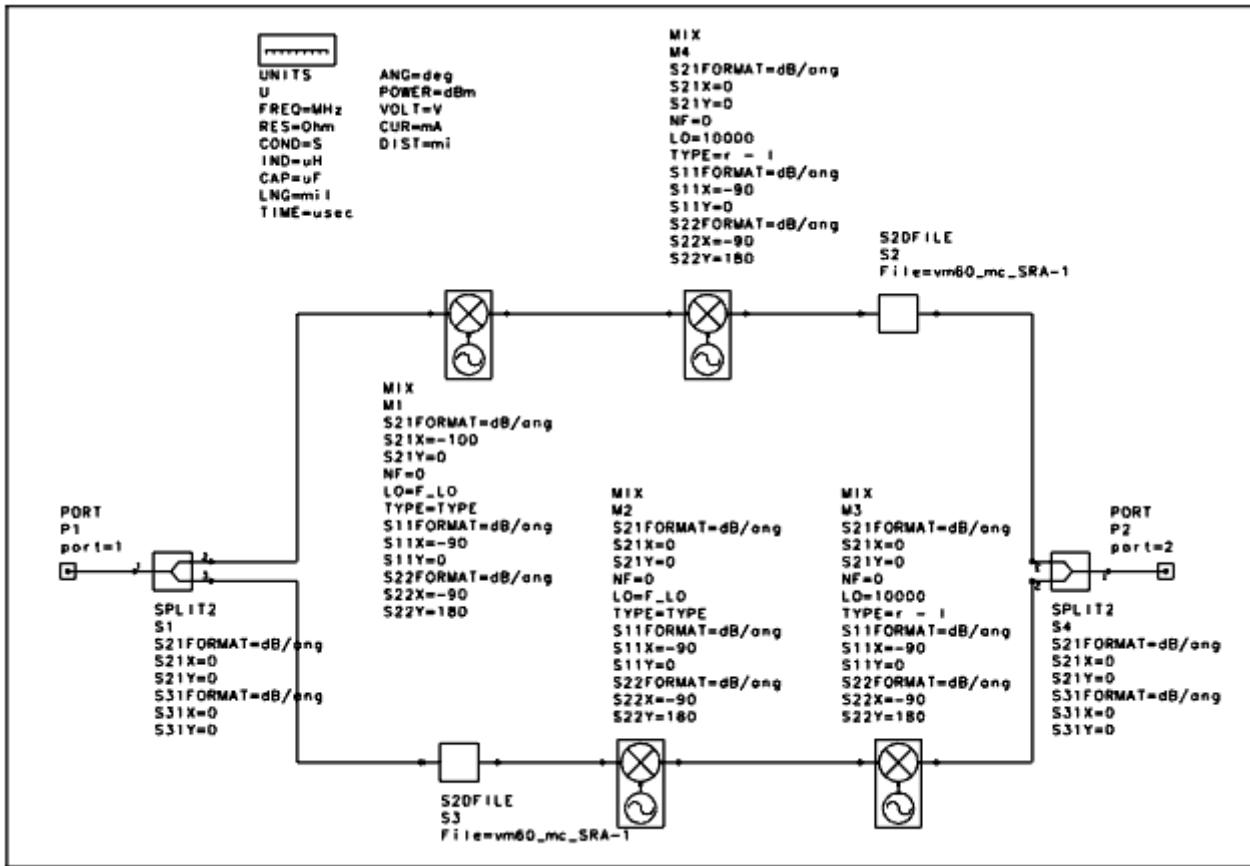

### [Mixer Schematic Component Example](#)

Two component parameters are displayed:

- F\_LO denotes the local oscillator frequency in user frequency units and can be assigned to any real value; its default assignment is 100.0
- TYPE denotes the mixer type and is assigned to one of the enumerated constants r + I, I - r, or r - I; its default assignment is r + I

These parameters are set in the component parameter dialog box. The *label* field appearing at the top of the component parameter dialog box contains the selected component label. The *description* field below the label field reads *Nonlinear Model*.

The mixer component represents a parametric subnetwork schematic design. An example of such a design subnetwork is shown in [Mixer Schematic Design Subnetwork Example](#).

### Mixer Schematic Design Subnetwork Example

The subnetwork is comprised of 2 RF branches, connected in parallel by SPLIT2 components. The lower branch, consisting of an S2D file-based component followed by 2 MIX components, is used to model the forward transmission and RF port reflection characteristics of the mixer. The second MIX component, with the ID M3, is placed to model the Spurious responses. The value of the parameter LO in M3 varies:

- If the parameter FREQ in the UNITS component is MHz, LO has a value 10,000
- If the parameter FREQ in the UNITS component is GHz, LO has a value 10

The upper branch consists of two MIX components followed by an S2D component and is used to model the IF port reflection characteristics of the mixer. The reverse transmission is set to 0. The MIX component M4 is similar to M3.

The same model data file is referenced by both S2D component placements. As a minimum, the file contains small-signal S-parameter data for the mixer, but this can be accompanied by noise data, gain compression characteristics and an intermodulation table (IMT), according to the amount of data that the manufacturer has supplied. The model features attributable to the selected mixer component are summarized in the associated component label. The S2D file is physically located in the same directory as the subnetwork design file.

The formal parameters, F\_LO and TYPE, are used to define the MIX components when

Advanced Design System 2011.01 - Vendor Component Libraries - System Library  
placed in the subnetwork. Local Oscillator power is not a parameter; the model data is characterized at a single LO power chosen by the manufacturer. This power is specified in the component label associated with the selected mixer component.

The mixer library components are suitable for placement in any RF/Analog schematic.

## Data

The Mixer Library consists of nonlinear models representing 142 mixers from 3 manufacturers. The models were extracted from data provided by these manufacturers.

### Note

The library itself is a binary file named *MixerLibrary.library* which can be found in *\$HPEESOF\_DIR/ComponentLibs/models* .

The mixer library groups available for selection from the Schematic window are:

# Power Dividers

## Schematic Design

This section describes the schematic design of the non-surface-mount system library power divider components and describes the underlying model for each type of component.

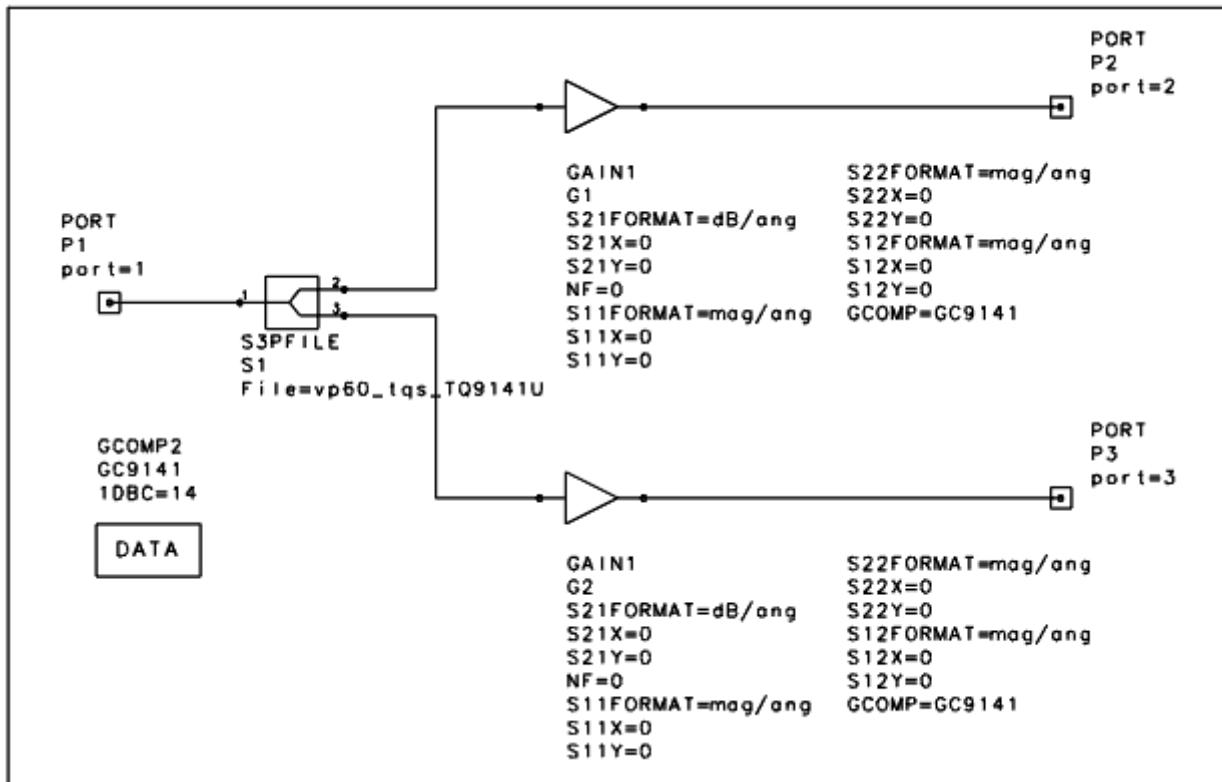

[Power Divider Schematic Component Example](#) shows how a power divider component appears when placed into the Schematic design window. The schematic symbol artwork is derived from the standard 3-port SPLIT2 symbol. The annotation consists of the component name, the default component ID prefix (in this case, S). No component parameters are displayed.

**Power Divider Schematic Component Example**

The *label* field appearing at the top of the component parameter dialog box the selected component label. The *description* field below the label field reads Nonlinear Model.

The power divider component represents a parametric subnetwork schematic design. An example of such a design subnetwork is shown in [Power Divider Schematic Design Subnetwork Example](#). We use the component shown in this figure internally.

#### Power Divider Schematic Design Subnetwork Example

The subnetwork is comprised of a S3P data component, followed by a GAIN1 component at each of the two output ports. The data file characterizes the small-signal S-parameters of the power divider and is physically located in the same directory as the subnetwork design file. The GCOMP data associated with each GAIN1 component is used to model the gain compression characteristics of the power divider. The subnetwork has no formal parameters.

The power divider library components are suitable for placement in any RF/Analog schematic.

## Data

The Power Divider Library consists of nonlinear models representing 2 dividers from a single manufacturer. The models were extracted from data provided by the manufacturer.

### Note

The library itself is a binary file named *PowerDividerLibrary.library* which can be found in *\$HPEESOF\_DIR/ComponentLibs/models*.

The power divider library group available for selection from the Schematic window is:

- [TriQuint Power Dividers](#)

## TriQuint Power Dividers

For modeling specifications, see [Schematic Design](#).

The TriQuint Power Dividers include 2 components, representing individual power dividers. The naming convention for these components is vp\_tqs\_<part number> .

Component Name	Description
vp_tqs_TQ9141D_19930601	PWRD
vp_tqs_TQ9141U_19930601	PWRD

# SMT Amplifiers

The SMT Amplifier Library consists of amplifiers representing 112 surface mount amplifiers from 5 manufacturers. The models were extracted from data provided by these manufacturers.

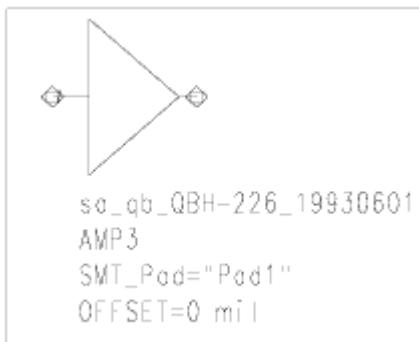

The SMT amplifier library groups available for selection from the Schematic and Layout windows are:

- [Agilent Technologies SMT Amplifiers](#)
- [NEC SMT Amplifiers](#)
- [Q-bit SMT Amplifiers](#)
- [TriQuint SMT Amplifiers](#)
- [Watkins-Johnson SMT Amplifiers](#)

## Schematic Design

This section describes the schematic design of the SMT amplifier library components and specifies the simulation model that is incorporated in the design.

[SMT Amplifier Schematic Component Example](#) shows how an SMT amplifier component appears when placed into the Schematic design window. The schematic symbol artwork is derived from the standard 2-port GAIN1 symbol. The annotation consists of the component name and the default component ID prefix (in this case, S). No component parameters are displayed.

### SMT Amplifier Schematic Component Example

Two parameters, SMTPAD and OFFSET, are listed in the component parameter dialog box. These parameters are suppressed from the schematic display and are used for layout artwork generation only. The *label* field appearing at the top of the component parameter dialog box contains the selected component label. The *description* field below the label

**Note**

Some components with package artwork of type SOT143 have two SMTPAD parameters: the first one is for pin 1 and the second one for the other pins.

The SMT amplifier component is simply an alias application of the standard S2D file-based data component. No schematic design subnetwork is associated with the component. The standard component name S2D is replaced by the selected SMT amplifier Library component name; for example, sa\_qb\_QBH-226\_19930601.

The S2D data file small-signal S-parameters, gain compression characteristics and, in some cases, noise figure or noise parameter data. The file is installed in the same library group subdirectory as the associated component.

The SMT amplifier library components are suitable for placement in any RF/Analog schematic.

## Watkins-Johnson SMT Amplifiers

For modeling specifications, see [Schematic Design](#).

The Watkins-Johnson SMT Amplifiers include 140 components, representing individual parts. The naming convention for these components is sa\_wj\_<part number> . Several components refer to the same Watkins-Johnson part number at different operating conditions (Vcc). The affected component names employ an additional suffix to indicate the Vcc operating voltage associated with the corresponding model. For example, sa\_wj\_SMA70-3\_12V , employs a model characterized using Vcc = 12V.

# SMT Crystals

**Note**

The SMT Crystal Library consists of 439 discrete-value linear models representing 2 manufacturers. The models were extracted from data provided by these manufacturers. The library itself is a binary file named *SMT\_CrystalLibrary.library* which can be found in *\$HPEESOF\_DIR/ComponentLibs/models*.

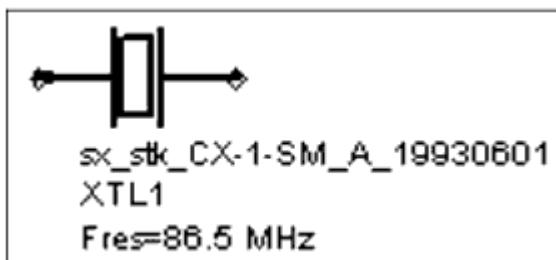

The SMT crystal library groups available for selection from the Schematic and Layout windows are:

- [Statek CX-1-SM Series SMT Crystals](#)
- [Statek CX-1HG-SM Series SMT Crystals](#)
- [Statek CX-3V-SM Series SMT Crystals](#)
- [Statek CX-4V-SM Series SMT Crystals](#)
- [TeleQuartz Group CS4 Series SMT Crystals](#)
- [TeleQuartz Group CS10 Series SMT Crystals](#)
- [TeleQuartz Group CS12 Series SMT Crystals](#)
- [TeleQuartz Group CS20 Series SMT Crystals](#)

## Schematic Design

This section describes the schematic design of the SMT crystal library components and specifies the simulation models that are incorporated in the design.

[SMT Crystal Schematic Component Example](#) shows how an SMT crystal component appears when placed into the Schematic design window. The schematic symbol artwork is derived from the standard 2-port XTAL1 symbol. The annotation consists of the Component Name, the default component ID prefix (in this case, XTL), and the component parameter, Fres.

[SMT Crystal Schematic Component Example](#)

**Note**

Fres is in units of frequency. Therefore, you should confirm that the correct unit is applied.

Each crystal library component represents a single model from a single manufacturer. In the component Parameters dialog box, the Value Type option button for the Fres parameter contains options for *Real*, *Variable*, *Unconstrained Opt*, *Constrained Opt*, *Uniform Yield*, *xxppm*, *Uniform YldOpt*, *xxppm*, where:  
*xx* stands for the parts per million probability distribution of frequency

**Important**

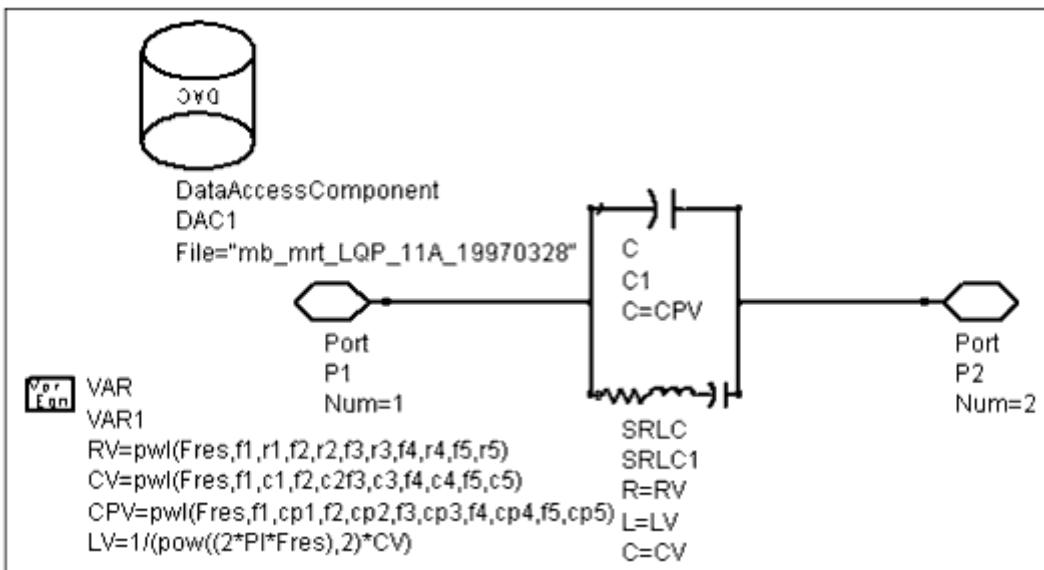

The *Variable* assignment of Fres should be within the range described in the component Parameters dialog box.

This tolerance is converted to% tolerance within the AEL. For example, the CSL\_J095\_02\_H\_19930601 component Fres parameter has the Value Type options:

- Real
- Variable
- Constrained Opt/Yld
- Uniform Yld, 100ppm
- Uniform Yld/Opt, 100ppm

Two additional parameters, SMTPAD and OFFSET, are contained in the component parameter dialog box. These parameters are suppressed from the schematic display and are used for layout artwork generation only. The label field appearing at the top of the component parameter dialog box contains the selected component label. The description field below the label field reads *Linear Passive Model* .

The SMT crystal component represents a parametric subnetwork schematic design. An example of such a design subnetwork is shown in [SMT Crystal Schematic Design Subnetwork Example](#).

### SMT Crystal Schematic Design Subnetwork Example

The subnetwork is comprised of a SRLC component and a parallel CAP component. The parameters describing SRLC and CAP are dependent on the resonant frequency of the crystal. The variation of RV, CV, and CPV with frequency are represented by piecewise linear curves in the design file. LV is calculated as the inductance that combined with CV causes resonance at Fres. The single formal parameter of the subnetwork, Fres, serves as an argument to the piecewise linear function used in the design file.

The SMT crystal library design subnetworks are designed for placement in RF/Analog schematics.

## Statek CX-1-SM Series SMT Crystals

For modeling specifications, see [Schematic Design](#).

The Statek CX-1-SM Series SMT Crystals are third overtone mode AT crystals. The frequency range covered by these crystals is 50 MHz to 125 MHz.

The Statek CX-1-SM Series SMT Crystals include 3 components, representing 3 resonant frequency tolerances. The naming convention for these components is *sx\_stk\_CX-1-SM <resonant frequency tolerance>*\_ where:

resonant frequency tolerance = A ( $\pm 0.01\%$ ), B ( $\pm 0.1\%$ ), or C ( $\pm 1.0\%$ )  
 case dimensions (length  $\times$  width) are: 335 mil  $\times$  160 mil

 **Note**

The SMT pad component in the layout drawing does not completely cover the T-shaped solder lead. You can add an additional SMT pad component to compensate for this extra notch.

Component Name	Description

## Statek CX-1HG-SM Series SMT Crystals

For modeling specifications, see [Schematic Design](#).

The Statek CX-1HG-SM Series SMT Crystals are fundamental mode AT crystals used in Pierce oscillators. The frequency range covered by these crystals is 8 MHz to 40 MHz.

The Statek CX-1HG-SM Series SMT Crystals include 3 components, representing 3

## Statek CX-4V-SM Series SMT Crystals

For modeling specifications, see [Schematic Design](#).

The Statek CX-4V-SM Series SMT Crystal is used as a one-second time base on potable terminals. The resonant frequency of this crystal is 32.768 KHz.

The Statek CX-4V-SM Series SMT Crystals include 3 components, representing 3 resonant frequency tolerances. The naming convention for these components is *sx\_stk\_CX-4V-SM <resonant frequency tolerance>*\_

where:

resonant frequency tolerance = A ( $\pm 0.003\%$ ), B ( $\pm 0.01\%$ ), or C ( $\pm 0.1\%$ )

case dimensions (length  $\times$  width) are:

210 mil  $\times$  85 mil

The model for the Statek CX-4V-SM Series SMT Crystals is different from the model given

in the section [Schematic Design](#) in that the resonant frequency is not a user-definable parameter but instead is fixed at 32.768 KHz.

 **Note**

The SMT pad component in the layout drawing does not completely cover the T-shaped solder lead. You can add an additional SMT pad component to compensate for this extra notch.

## TeleQuartz Group CS12 Series SMT Crystals

For modeling specifications, see [Schematic Design](#).

The TeleQuartz Group CS12 crystals are used for wireless communications applications. The TeleQuartz Group CS12 Series SMT Crystals include 100 components, representing 4 types, 4 overtone numbers, 5 resonant frequency tolerances, and 12 frequency ranges. The naming convention for these components is *sx\_tqz\_CS12<type><overtone number><resonant frequency tolerance><frequency range designator>*

where:

type = TQ7, TQ8, TQ9, and TQ27

overtone number = 1 (fundamental), 3 (third overtone), 5 (fifth overtone), or 7 (seventh overtone)

resonant frequency tolerance code =

- 01 ( $\pm 100$ ppm  $\Delta f/f$  @ 23°C)
- 02 ( $\pm 50$ ppm  $\Delta f/f$  @ 23°C)
- 03 ( $\pm 20$ ppm  $\Delta f/f$  @ 23°C)
- 05 ( $\pm 10$ ppm  $\Delta f/f$  @ 23°C)
- 07 ( $\pm 5$ ppm  $\Delta f/f$  @ 23°C)

frequency range designator code =

A (3.5 - 17.5 MHz), B (5 - 17.5 MHz), C (6 - 17.5 MHz), D (10 - 17.5 MHz), E (8 - 45 MHz), F (10 - 45 MHz), G (30 - 90 MHz), H (90.001 - 150 MHz), J (150.001 - 210 MHz), K (10 - 23 MHz), M (11 - 23 MHz), N (20 - 45 MHz)

The case dimensions (length × width × can height) are

TQ7: 8.0 mm × 6.8 mm × 8.8 mm

TQ8: 8.0 mm × 6.8 mm × 8.0 mm

TQ9: 8.0 mm × 6.8 mm × 6.0 mm

TQ27: 8.0 mm × 6.8 mm × 5.1 mm

## TeleQuartz Group CS20 Series SMT Crystals

For modeling specifications, see [Schematic Design](#).

The TeleQuartz Group CS20 crystals are used for wireless communications applications. The TeleQuartz Group CS20 Series SMT Crystals include 130 components, representing 3 types, 4 overtone numbers, 5 resonant frequency tolerances, and 19 frequency ranges. The naming convention for these components is *sx\_tqz\_CS20<type><overtone number><resonant frequency tolerance><frequency range designator>*

where:

type = TQ3, TQ4, TQ6, TQ23, and TQ24

overtone number = 1 (fundamental), 3 (third overtone), 5 (fifth overtone), or 7 (seventh overtone)

resonant frequency tolerance code =

01 ( $\pm 100\text{ppm } \Delta f/f @ 23^\circ\text{C}$ )

02 ( $\pm 50\text{ppm } \Delta f/f @ 23^\circ\text{C}$ )

03 ( $\pm 20\text{ppm } \Delta f/f @ 23^\circ\text{C}$ )

05 ( $\pm 10\text{ppm } \Delta f/f @ 23^\circ\text{C}$ )

07 ( $\pm 5\text{ppm } \Delta f/f @ 23^\circ\text{C}$ )

frequency range designator code =

A (4 - 8 MHz), B (4.3 - 8 MHz), C (6 - 8 MHz), D (2 - 11.5 MHz), E (2.3 - 11.5 MHz), F (4.3 - 11.5 MHz), G (6 - 11.5 MHz), H (5 - 17 MHz), J (6 - 17 MHz), K (8 - 23 MHz), L (11 - 23 MHz), M (4 - 45 MHz), N (4.3 - 45 MHz), P (6 - 45 MHz), Q (6.5 - 45 MHz), R (20 - 45 MHz), S (40 - 90 MHz for type TQ24), S (30 - 90 MHz for all other types), T (90.001 - 150 MHz), or V (150.001 - 210 MHz)

case dimensions (length × width × can height) are

TQ3: 18.0 mm × 11.0 mm × 13.5 mm

# SMT Filters

The SMT Filter Library consists of linear models representing 16 surface mount filters from a single manufacturer. The models were extracted from data provided by this manufacturer.

## Note

The library itself is a binary file named *SMT\_FilterLibrary.library* which can be found in *\$HPEESOF\_DIR/ComponentLibs/models*.

The SMT filter library group available for selection from the Schematic and Layout windows is:

- [AVX/Kyocera SMT Filters](#)

## AVX/Kyocera SMT Filters

### Schematic Design

This section describes the schematic design of the SMT filter library components and specifies the simulation models that are incorporated in the design.

[SMT Filter Schematic Instance Example](#) shows how an SMT filter component appears when placed into the Schematic design window. The schematic symbol artwork is derived from the standard 2-port BPFB symbol. The annotation consists of the component name, the default component ID prefix (in this case, S). No component parameters are displayed.

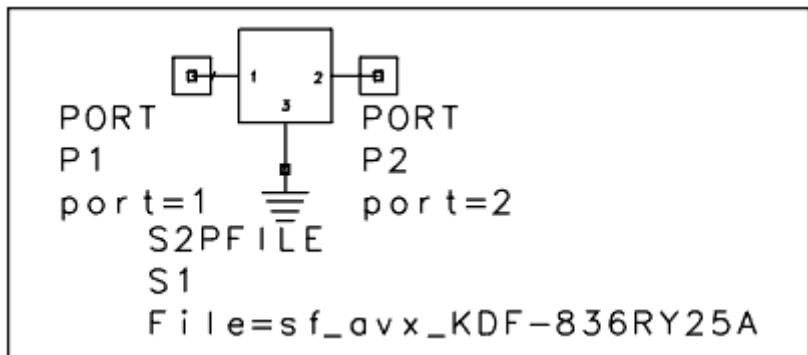

### SMT Filter Schematic Instance Example

Two additional parameters, SMTPAD and OFFSET are contained in the component parameter dialog box. In some components, 3 parameters (SMTPAD1, SMTPAD2 and OFFSET) are contained.

These parameters are suppressed from the schematic display and are used for layout artwork generation only. The *label* field appearing at the top of the component parameter dialog box contains the selected component label. The *description* field below the label

field reads *Linear Model*.

The SMT filter component represents a parametric subnetwork schematic design. An example of such a design subnetwork is shown in [SMT Filter Schematic Design Subnetwork Example](#).

#### [SMT Filter Schematic Design Subnetwork Example](#)

The subnetwork is comprised of a S2P file-based component. The S2PFILE is simply an alias application of a standard 2-port file-based data \_\_ component S2P. The standard component name of the S2P element is replaced by the selected filter library component name; for example, sf\_avx\_KDF-836RY25A\_19941115.

The S2P data file contains small-signal S-parameters. The file is installed in the same library group subdirectory as the associated component.

The SMT filter library components are suitable for placement in any RF/Analog schematic.

# Switches

## Schematic Design

This section describes the schematic design of the non-surface-mount system library switch components and describes the underlying model for each type of component. [Switch Schematic Component Example](#) shows how a switch component appears when placed into the Schematic design window. The schematic symbol artwork is derived from the standard 2-port 2PORT symbol. The annotation consists of the component name and the default component ID prefix (in this case, S), and the component parameters.

### [Switch Schematic Component Example](#)

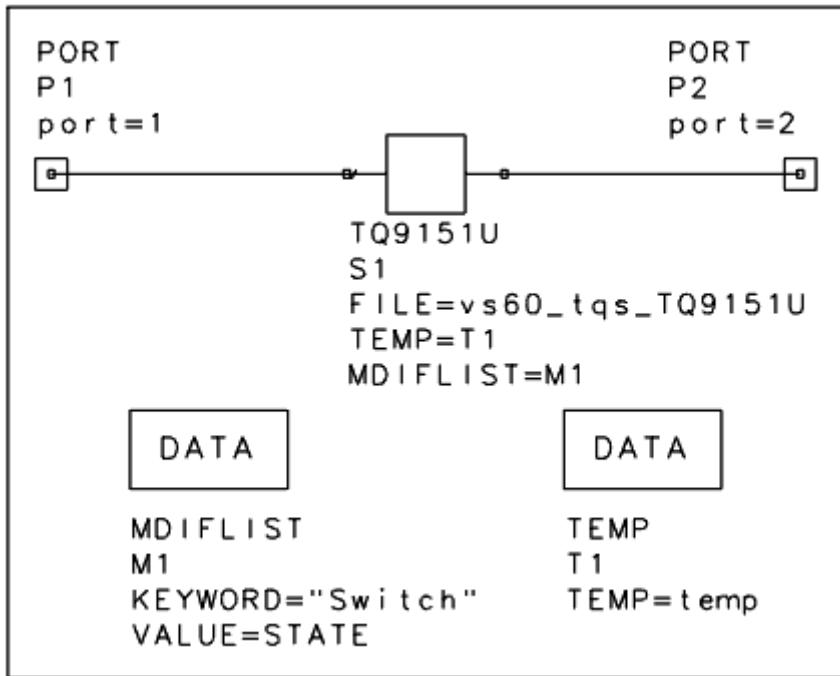

Two component parameters are displayed:

- STATE denotes the state of the switch, and is assigned to one of the enumerated constants On or Off; its default assignment is On.
- TEMP, denotes the temperature of the switch, a standard convention for linear components in Omnisys; it's default assignment is TEMP=\*.

These parameters are set in the component parameter dialog box. The *label* field appearing at the top of the component parameter dialog box the selected component label. The *description* field below the label field reads *Linear Model* .

The Switch component represents a parametric subnetwork schematic design. An example of such a design subnetwork is shown in [Switch Schematic Design Subnetwork Example](#).

The subnetwork is comprised of a S2D file-based component. The S2D model data file is indexed by an MDIFLIST variable with keyword Switch and value equal to the subnetwork parameter STATE. The file small-signal S-parameter data for both On and Off states. The S2D file is physically located in the same directory as the subnetwork design file.

The switch library components are suitable for placement in any RF/Analog schematic.
