Parts and Service Office
80 Crossways Park West, Woodbury, N.Y. 11797
1112-ADP303 500 Printed in Japan

SPECIFICATIONS

Output Level/Output Impedance	
MAIN L/R, CENTER, SURROUND L/R	
1 KHz, 0 dB INPUT	0~3.5 V / 500 Ω
SUBWOOFER	
50 Hz, 0 dB INPUT	0~9 V / 500 Ω
Input Impedance (RF, COAXIAL)	75 Ω

Frequency Response	
MAIN L/R, CENTER, SURROUND L/R (LARGE)	
20 Hz-20 KHz	±0.5 dB

Total Harmonic Distortion	
MAIN L/R, CENTER, SURROUND L/R (1 KHz)	0.01% or less
SUBWOOFER (50 Hz)	0.1% or less
Signal to Noise Ratio (IHF-A)	98 dB
Channel Separation (1 KHz)	80 dB
Power Consumption	30 W
AC OUTLET : UNSWITCHED	200 W max.
Dimensions (W/H/D)	17-3/8 in x 3-3/8 in x 11 in 441 mm x 85 mm x 279 mm(MAX)
Weight	9.4 lbs. (4.2 kg.)

Filter Characteristics

MAIN L/R, CENTER, SURROUND L/R (SMALL)	
H.P.F.	fc=100 Hz, 12 dB/oct.
SUBWOOFER	
L.P.F.	fc=100 Hz, 24 dB/oct.

Specifications and components are subject to change without notice. Overall performance will be maintained or improved.

Note : "RESET" operation is necessary to initialize the microprocessor (QL01) after every repair.
 "RESET" procedures is follow.

Short "B-RST" terminals on the side-B of PCB (P604) for a couple of seconds.

ELECTROSTATICALLY SENSITIVE (ES) DEVICES

Some semiconductor (solid state) devices can be damaged easily by static electricity. Such components commonly are called Electrostatically Sensitive (ES) Devices. Examples of typical ES devices are integrated circuits and some field effect transistors and semiconductor "chip" components. The following techniques should be used to help reduce the incidence of component damage caused by static electricity.

1. Immediately before handling any semiconductor component or semiconductor-equipped assembly, drain off any electrostatic charge on your body by touching a known earth ground. Alternatively, obtain and wear a commercially available discharging wrist strap device, which should be removed for potential shock reasons prior to applying power to the unit under test.
2. After removing an electrical assembly equipped with ES devices, place the assembly on a conductive surface such as aluminum foil, to prevent electrostatic charge buildup or exposure of the assembly.
3. Use only a grounded-tip soldering iron to solder or unsolder ES devices.
4. Use only an anti-static solder removal device. Some solder removal devices not classified as "anti-static" can generate electrical charges sufficient to damage ES devices.
5. Do not use freon-propelled chemicals. These can generate electrical charge sufficient to damage ES devices.
6. Do not remove a replacement ES device from its protective package until immediately before you are ready to install it. (Most replacement ES devices are packaged with leads electrically shorted together by conductive foam, aluminum foil or comparable conductive material.)
7. Immediately before removing the protective material from the leads of a replacement ES device, touch the protective material to the chassis or circuit assembly into which the device will be installed.

CAUTION: Be sure no power is applied to the chassis or circuit, and observe all other safety precautions.

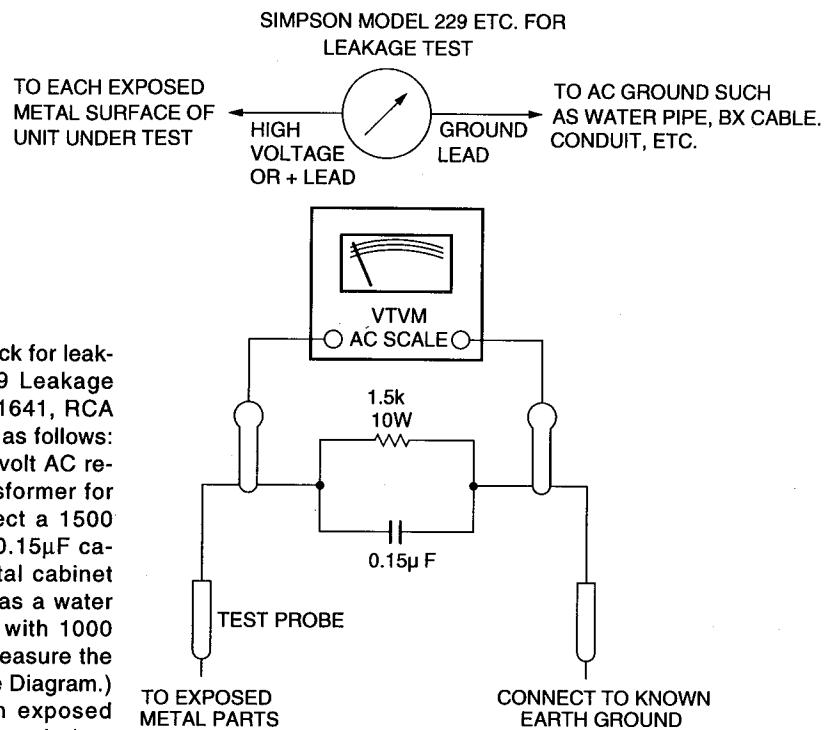

8. Minimize bodily motions when handling unpackaged replacement ES devices. (Otherwise harmless motion such as the brushing together of your clothes fabric or the lifting of your foot from a carpeted floor can generate static electricity sufficient to damage an ES device.)

LEAKAGE TEST (FOR SERVICE ENGINEERS IN THE U.S.A.)

Before returning the unit to the user, perform the following safety checks:

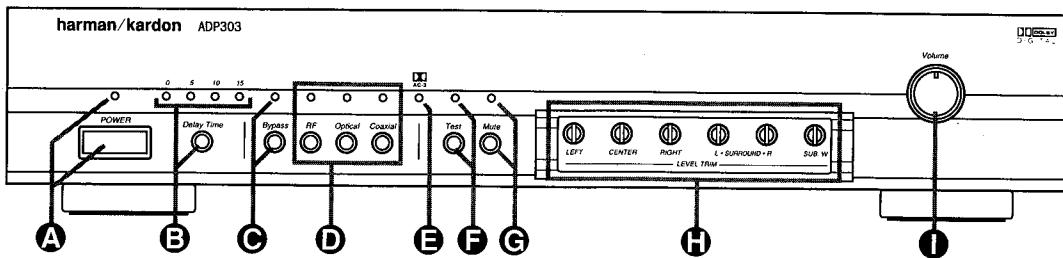

1. Inspect all lead dress to make certain that leads are not pinched or that hardware is not lodged between the chassis and other metal parts in the unit.
2. Be sure that any protective devices such as nonmetallic control knobs, insulating fishpapers, cabinet backs, adjustment and compartment covers or shields, isolation resistor-capacity networks, mechanical insulators, etc. Which were removed for servicing are properly reinstalled.
3. Be sure that no shock hazard exists; check for leakage current using Simpson Model 229 Leakage Tester, standard equipment item No. 21641, RCA Model WT540A or use alternate method as follows: Plug the power cord directly into a 120-volt AC receptacle (do not use an Isolation Transformer for this test). Using two clip leads, connect a 1500 Ohm, 10-watt resistor paralleled by a 0.15 μ F capacitor, in series with all exposed metal cabinet parts and a known earth ground, such as a water pipe or conduit. Use a VTVM or VOM with 1000 Ohms per volt, or higher sensitivity to measure the AC voltage drop across the resistor. (See Diagram.) Move the resistor connection to each exposed metal part having a return path to the chassis (antenna, metal, cabinet, screw heads, knobs and control shafts, escutcheon, etc.) and measure the AC voltage drop across the resistor. (This test should be performed with the power switch in both the On and Off positions.)

A reading of 0.35 volt RMS or more is excessive and indicates a potential shock hazard which must be corrected before returning the unit to the owner.

CONTROLS AND FUNCTIONS

Front Panel Controls

**A Power Switch**

Push this switch once to turn it on. Press it again to turn the unit off. An indicator above the power switch will illuminate when the unit is turned on.

B Delay Time Button and Indicators

Press this button to set the delay time for the surround channels. Each press of the button changes the delay time by 5 milliseconds. The delay time range is from no delay to 15 milliseconds. The indicator LEDs above the Delay Time button indicate the delay setting.

C Bypass Input Selector Button Indicator

Press this button to remove the ADP303 from the circuit when it is installed between a preamp and amplifiers. An indicator LED above the button will light to indicate the BYPASS mode.

D Digital Source Selectors

Press one of these buttons to select the digital input source. An indicator above the buttons will illuminate to confirm the selections.

E AC-3 Indicator

This LED will illuminate when a digital source is selected and the decoder has successfully locked to the incoming digital signal.

F Test Button and Indicator

This button activates the test signal that is used when adjusting output levels. When the button is tapped once the test noise will circulate between the speakers at a two (2) second interval. When you press and hold the button for a few seconds the test noise will circulate for five (5) seconds at each speaker. The red indicator above the button will illuminate when the test noise is present to remind you that the audio output has momentarily been changed. Press the button at any time when the noise is heard to cancel the test.

Note: The test signal noise is not available when the ADP303 is in the BYPASS mode. The test signal does not circulate to the subwoofer in any mode.

It is suggested that the five second test noise be used for initial adjustment of the output levels, and the shorter two second circulation be used as a final brief check after adjustments have been made.

G Mute Button and Indicator

Press this button to momentarily silence the audio output of the ADP303. Press it again to resume normal operation. An indicator light above the button will illuminate when the MUTE button is engaged to remind you that the unit is turned on, but silenced. The MUTE function will not work when the ADP303 is in the BYPASS mode.

H Level Trim Controls

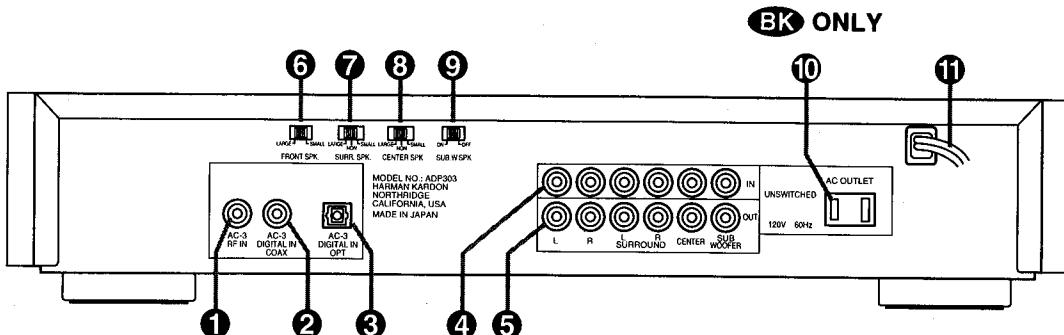

These controls are used to adjust the audio output level of each individual channel. Use the small Allen wrench supplied with the ADP303 to remove the cover when adjustment of the level trims is required.

I Volume Control

This knob adjusts the master volume level of the ADP303's output. Turn it clockwise to increase the volume and counterclockwise to decrease the volume.

When the ADP303 is used in a system where the receiver/amplifier (such as the AVR80) has a "6 Channel Direct" input, the volume should be set to the "12 o'clock" position.

Rear Panel Connections

① AC-3 RF IN Jack

Connect the AC-3 RF Output jack of a compatible Laser Disc player here.

② AC-3 Digital IN - Coax Jack

These terminals are for connection to the coax data AC-3 output of future AC-3 digital products such as DVD, DSS and HDTV.

③ AC-3 Digital IN - Optical Jack

These terminals are for connection to the optical data AC-3 output of future AC-3 digital products such as DVD, DSS and HDTV. To avoid dust contamination, leave the protective cap inserted unless the jack is in use.

IMPORTANT NOTE: These input jacks are for AC-3 digital signals only. Do not connect standard audio outputs or the PCM digital output of an LV or CD player to these AC-3 Input Jacks.

④ 6 Channel Input Jacks

When the ADP303 is used with an external preamplifier, an outboard surround processor or any AV receiver with PREAMP-OUT/MAIN-INPUT jacks, connect these jacks to the outputs of the preamp or processor.

⑤ 6 Channel Output Jacks

These jacks deliver the outputs of the AC-3 decoder or pass through the inputs from a conventional AV receiver when the ADP303 is in the BYPASS mode. Depending on your application, they will either be connected to the "6 Channel Direct" inputs of products such as the AVR80 or directly to external power amplifiers.

⑥ Front SPK Switch

This switch determines if low frequency signals are sent to the front left/right speakers. The factory default "Small" sends them to the subwoofer output only, while "Large" sends a full range signal to the front left/right speakers.

⑦ Surr SPK Switch

This switch determines if low frequency signals are sent to the surround speakers. The factory default, "Small," sends them to the subwoofer output only, while "Large" sends a full range signal to the surround speakers. Select "none" if you will not use surround speakers and to route surround audio to the front left/right speakers.

⑧ Center SPK Switch

This switch determines if low frequency signals are sent to the center speaker. The factory default, "Small," sends them to the subwoofer output only, while "Large" send a full range signal to the center speaker. Select "none" if you will not use a center speaker and to route center channel audio to the front left/right speakers.

⑨ Subwoofer switch

This switch, in conjunction with the other "SPK" switches, directs the output of low frequency (LFE) signals. If a subwoofer is used, select "ON" to send all system sound below 100 Hz to the subwoofer output. If the "OFF" position is used, the LFE output will be directed to either the front left/right or center speaker outputs, depending on the position of switches ⑥ and ⑧.

Caution: When you want to change settings of any of these switches, ⑥⑦⑧⑨ you must turn the power switch off and back on in order to effect the changes you want.

⑩ AC Outlet (Unswitched)

This unswitched outlet will supply power to any device in your system as long as the ADP303 is connected to AC power, even when the ADP303's power switch is in the off position.

The maximum power this outlet can supply is 200 watts.

⑪ Power cable

Connect the power cable to an unswitched AC power outlet. Plug into a household AC power outlet.

TECHNICAL DESCRIPTION

This product is a "Dolby Digital (AC-3)" decoder. By connecting this product with a Dolby digital compatible component, such as a LD player with AC-3RF output, DVD player or DBS tuner, it will be capable of 5.1 CH (Front L/R, Rear L/R, Center and Sub-woofer) play.

This product is composed approximately of 5 blocks including the AC-3 decoder block (P604), DAC & crossover block (PD04), power supply block (P804), volume control block (PV04) and front key input block (PU04).

Signal path

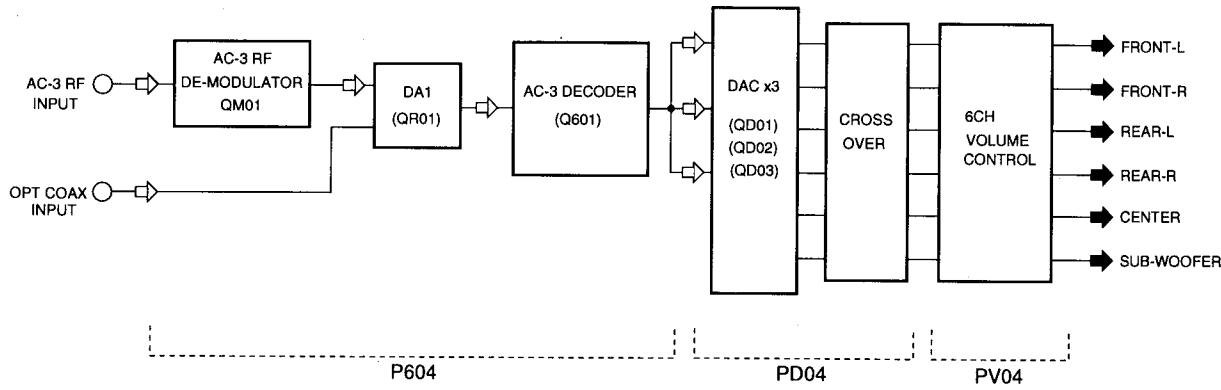

Figure 1

SIGNAL AND CIRCUIT DESCRIPTION

AC-3 RF

This signal is based on the Dolby Digital format for LaserDiscs, and contains the AC-3 signal inserted in one of the analog audio channels of LD. See diagram below (Figure 2).

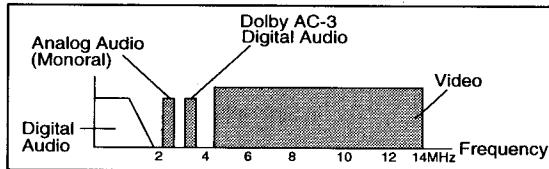

Figure 2

This signal is supplied from LD player with AC-3 RF output.

OPT/COAX (AC-3/PCM input)

This signal is based on an additional format for transmitting the AC-3 data through the conventional digital audio interface (SPDIF). This SPDIF contains the compressed data for AC-3, instead of PCM Audio data. Similarly to the case of ROM data, whether the data is audio or non-audio is identified according to the status in the signal. This signal can be output from a DVD player, etc.

AC-3 RF modulator

This circuit extracts the AC-3 data band from the RF signal output from a LD player using a BPF and converts the extracted data into the digital signal in the SPDSK format by means of QPSK modulation.

DAI (Digital Audio Interface) receiver

This circuit extracts various clock and data signals from the signal input in the SPDSK format.

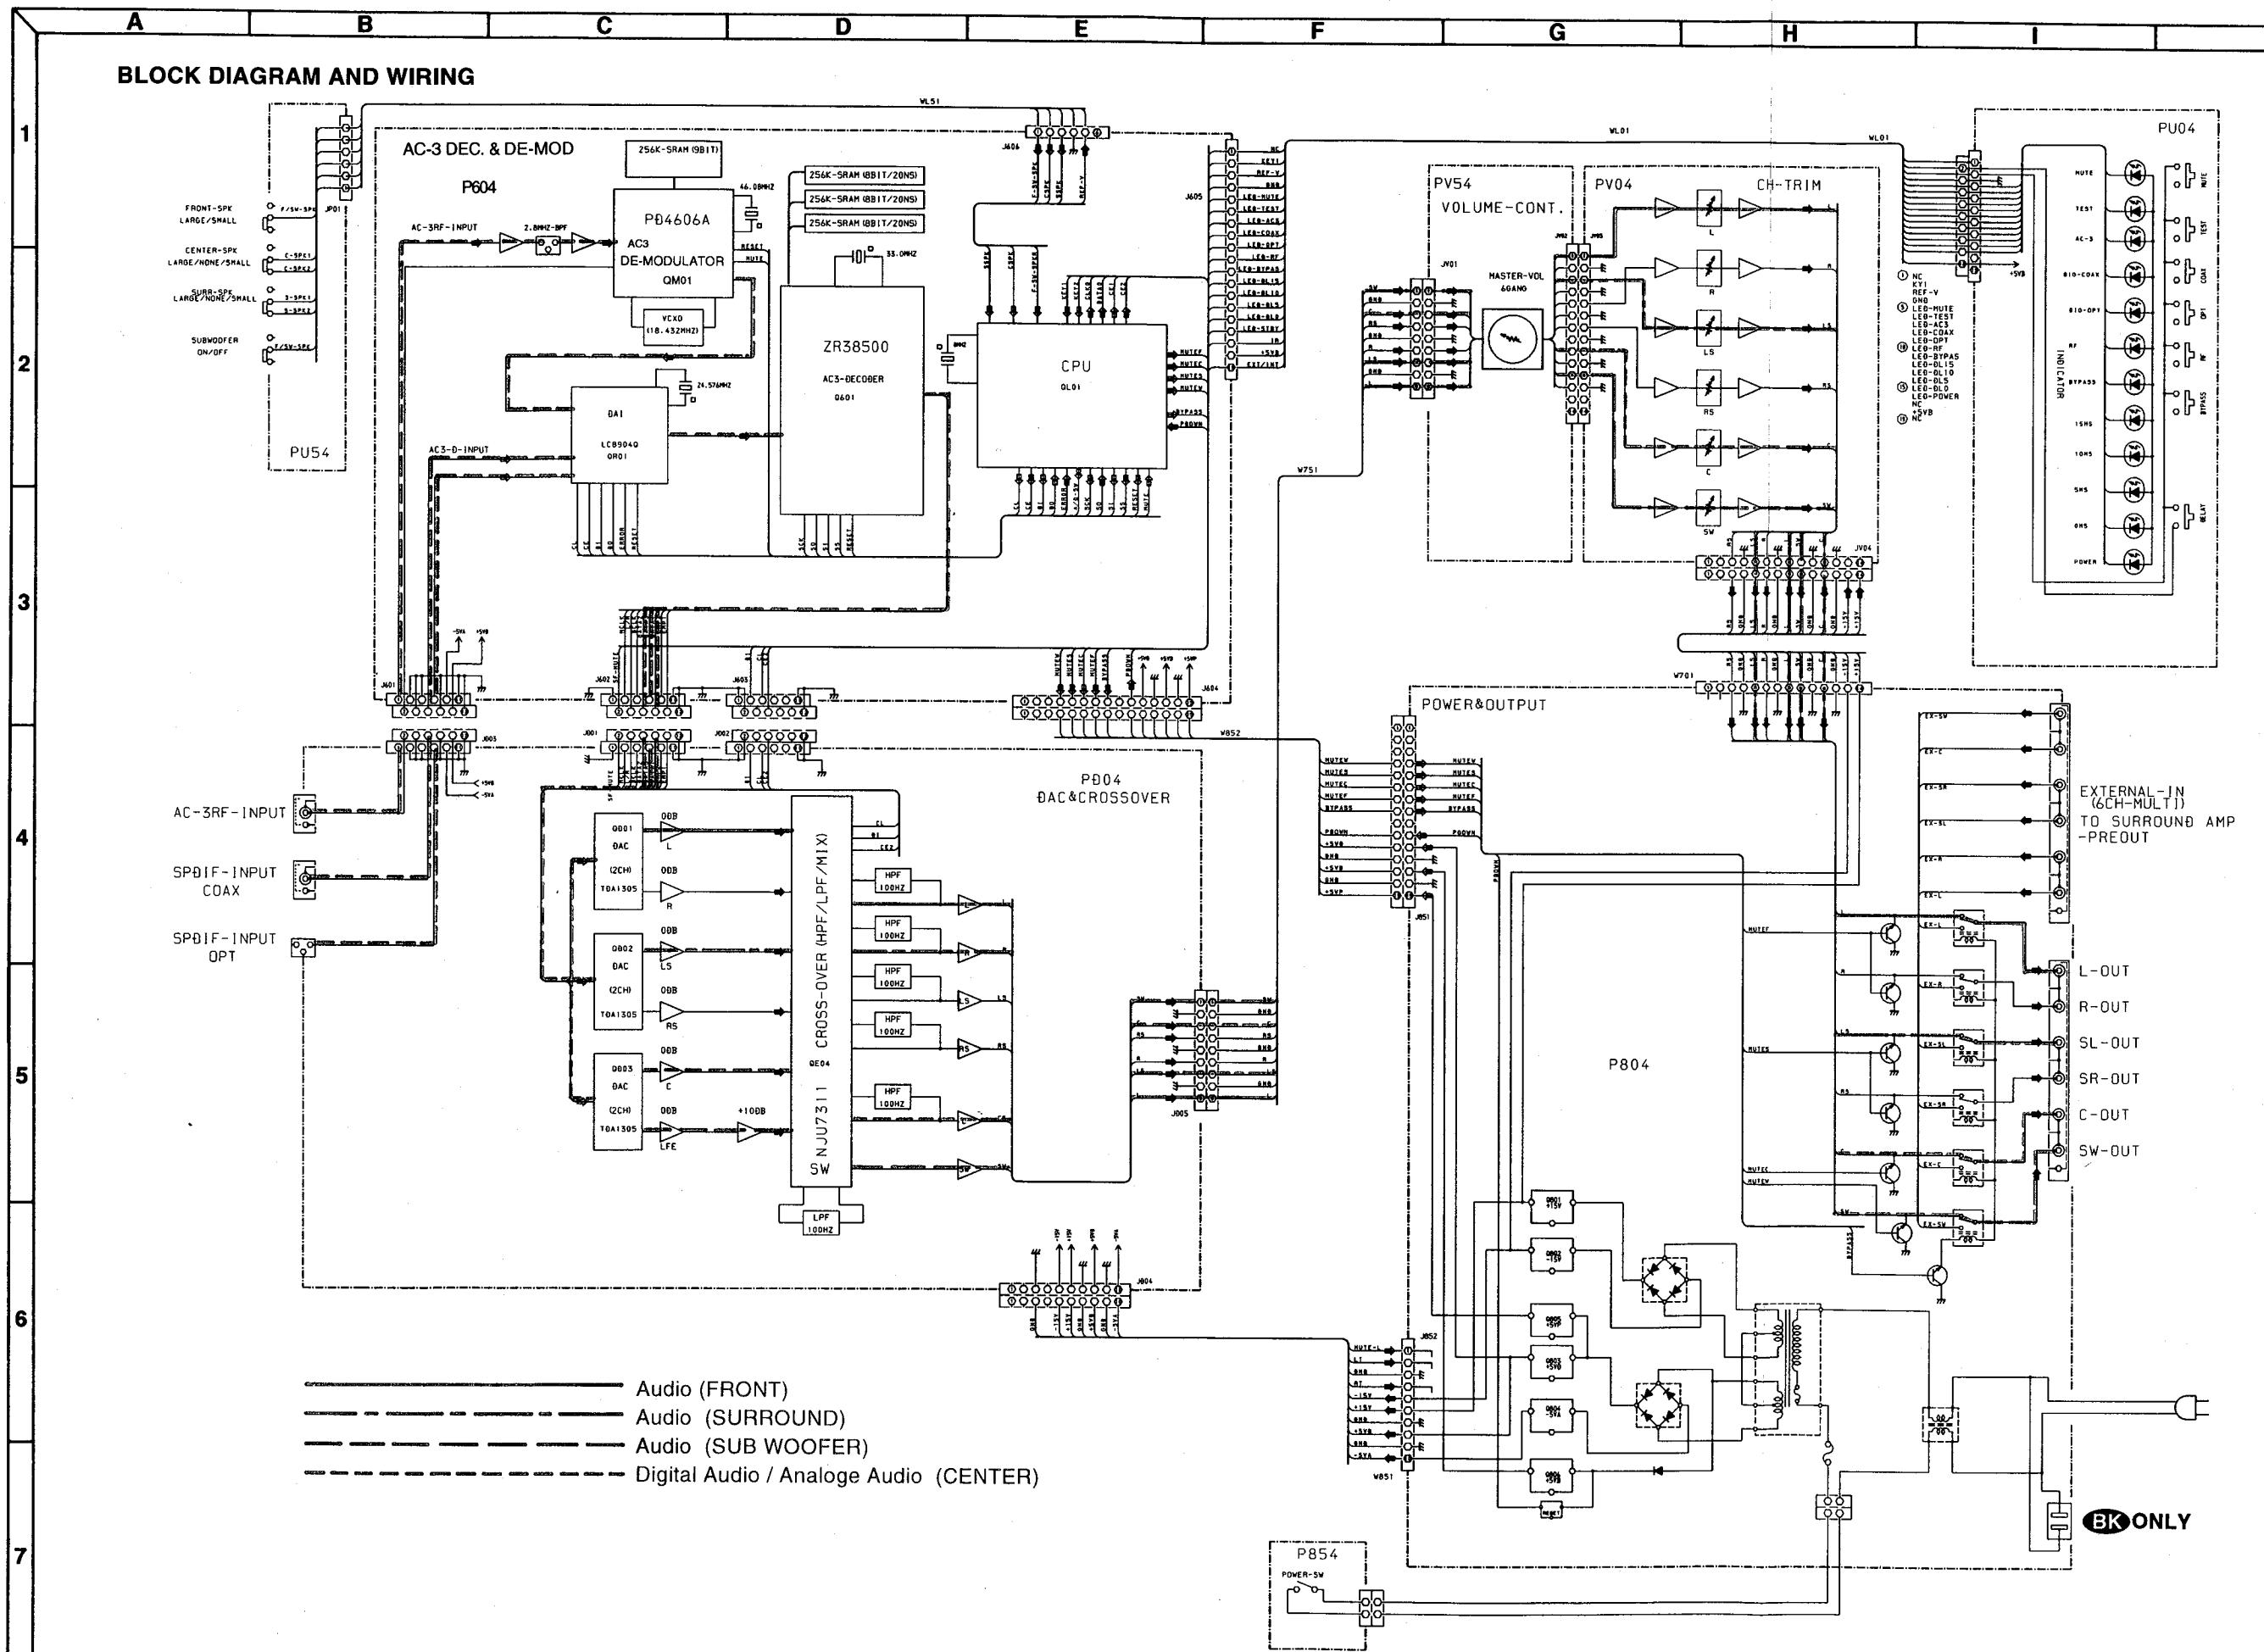

AC-3 decoder DSP

This circuit generates the 6-channel data (Front L/R, Rear L/R, Center and LFE) based on the data output from the DAI, and outputs the 6-channel data to the DAC as 3 sets of 2-channel data.

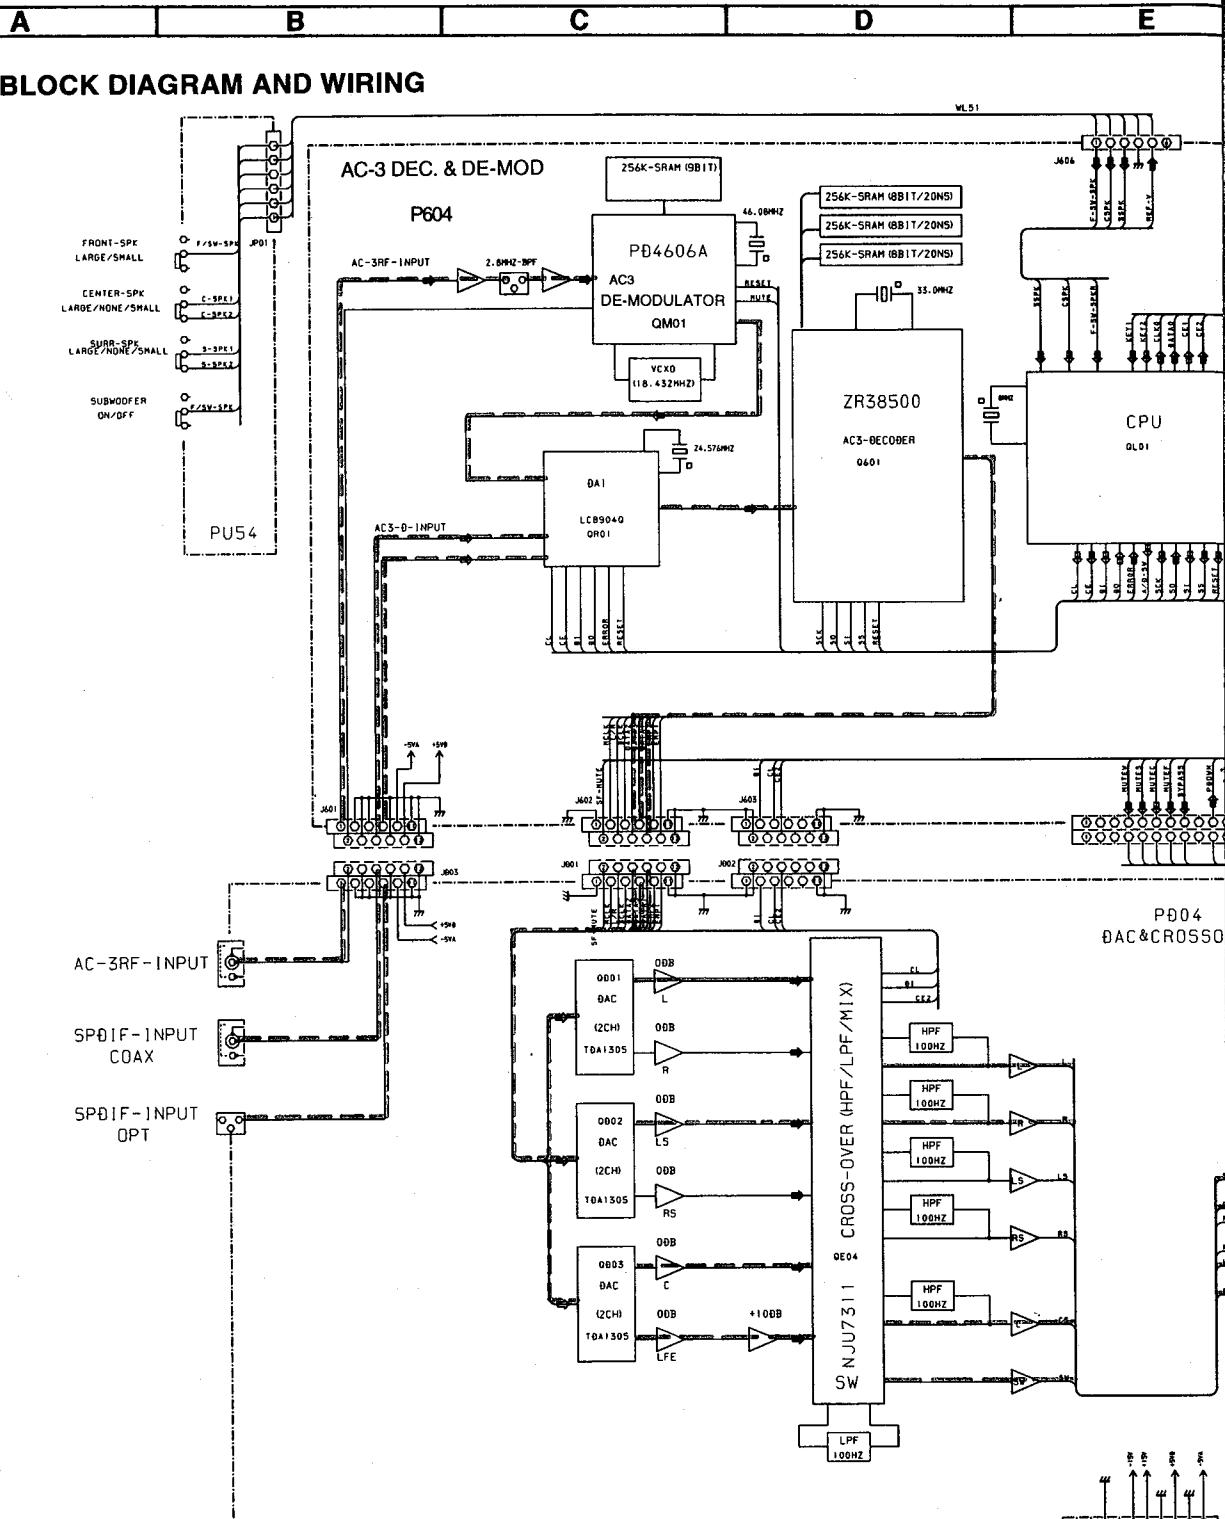

Crossover

This circuit consists of 100Hz HPF for each channel, 100Hz LPF for sub-woofer channel, and mixing for sub-woofer output.

Depending on the speaker mode setting, these circuit combinations will change.

DISASSEMBLY PROCEDURES

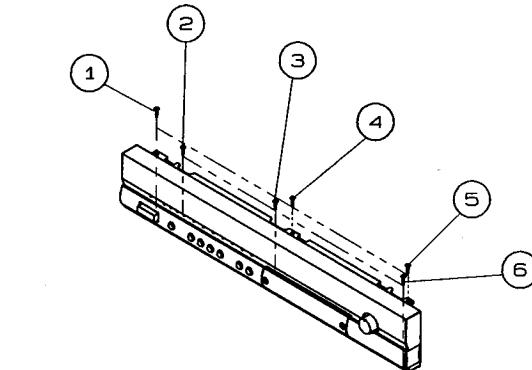

1. Removing the top cover
Remove the screws ① ~ ⑤

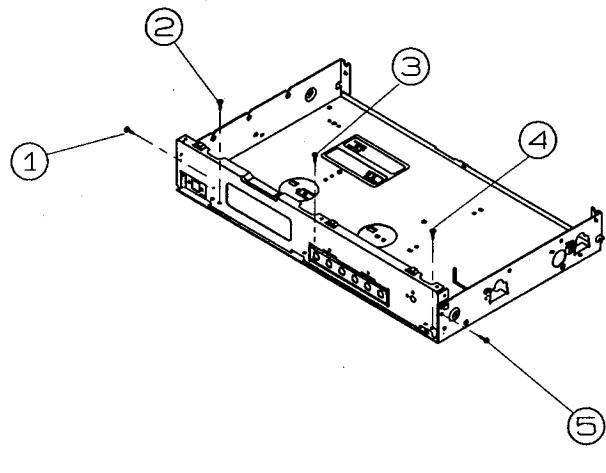

3. Removing the rear panel
Remove the screws ① ~ ⑯

2. Removing the front panel
Remove the screws ① ~ ⑥

4. Removing the front metal chassis
Remove the screws ① ~ ⑤

Removing the main PCB (P804)

1. Remove the screw of rear side (x4) and the transformer back side screw (x1) of the main PCB.
2. PCB supports hook open of the main PCB front side.
3. Remove the Main PCB.

Removing the Dolby ac-3 PCB block (P604) (PD04)

1. Remove the screw of rear side(x4) and the front side of the screw (x1) on the Dolby ac-3 PCB block.
2. PCB support hook open of PCB front side of the Dolby ac-3 PCB block.
3. Remove the Dolby ac-3 PCB block.

Removing the front panel and function selector PCB (PU04)

1. Remove the master volume knob. (012B)
2. Remove the front panel fixed screw of the Upper side (x3) and lower side (x3).
3. Remove the front panel.
4. Remove the screw (x6) of the selector PCB fixed.
5. Remove the front selector PCB.

Removing the front volume PCB block (PV06)

1. Remove front panel and trim knob (x6). (015B)
2. Removing the nut master volume and trim volume of the fixed.
3. Remove the Front volume PCB block.

DISASSEMBLY PROCEDURES

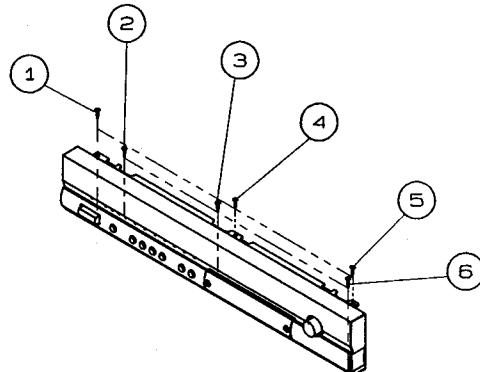

1. Removing the top cover

Remove the screws ① ~ ⑤

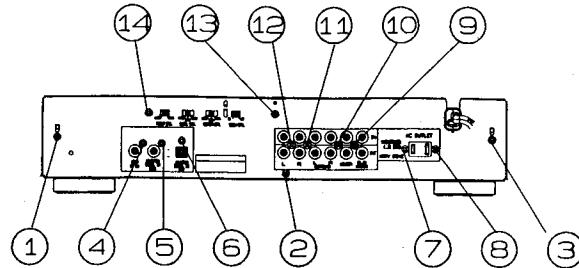

2. Removing the front panel

Remove the screws ① ~ ⑥

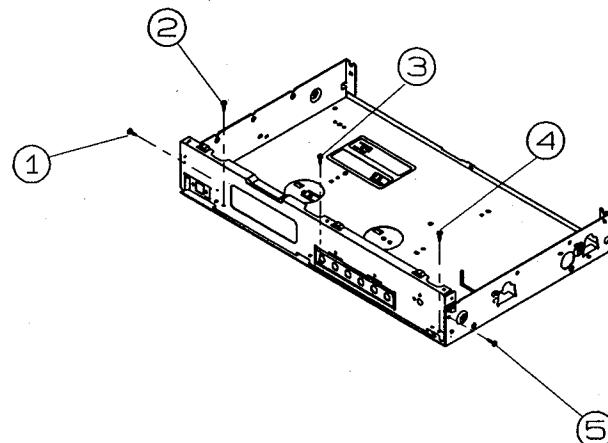

3. Removing the rear panel

Remove the screws ① ~ ⑯

4. Removing the front metal chassis

Remove the screws ① ~ ⑤

Removing the main PCB (P804)

1. Remove the screw of rear side (x4) and the transformer back side screw (x1) of the main PCB.
2. PCB supports hook open of the main PCB front side.
3. Remove the Main PCB.

Removing the Dolby ac-3 PCB block (P604) (PD04)

1. Remove the screw of rear side(x4) and the front side of the screw (x1) on the Dolby ac-3 PCB block.
2. PCB support hook open of PCB front side of the Dolby ac-3 PCB block.
3. Remove the Dolby ac-3 PCB block.

Removing the front panel and function selector PCB (PU04)

1. Remove the master volume knob. (012B)
2. Remove the front panel fixed screw of the Upper side (x3) and lower side (x3).
3. Remove the front panel.
4. Remove the screw (x6) of the selector PCB fixed.
5. Remove the front selector PCB.

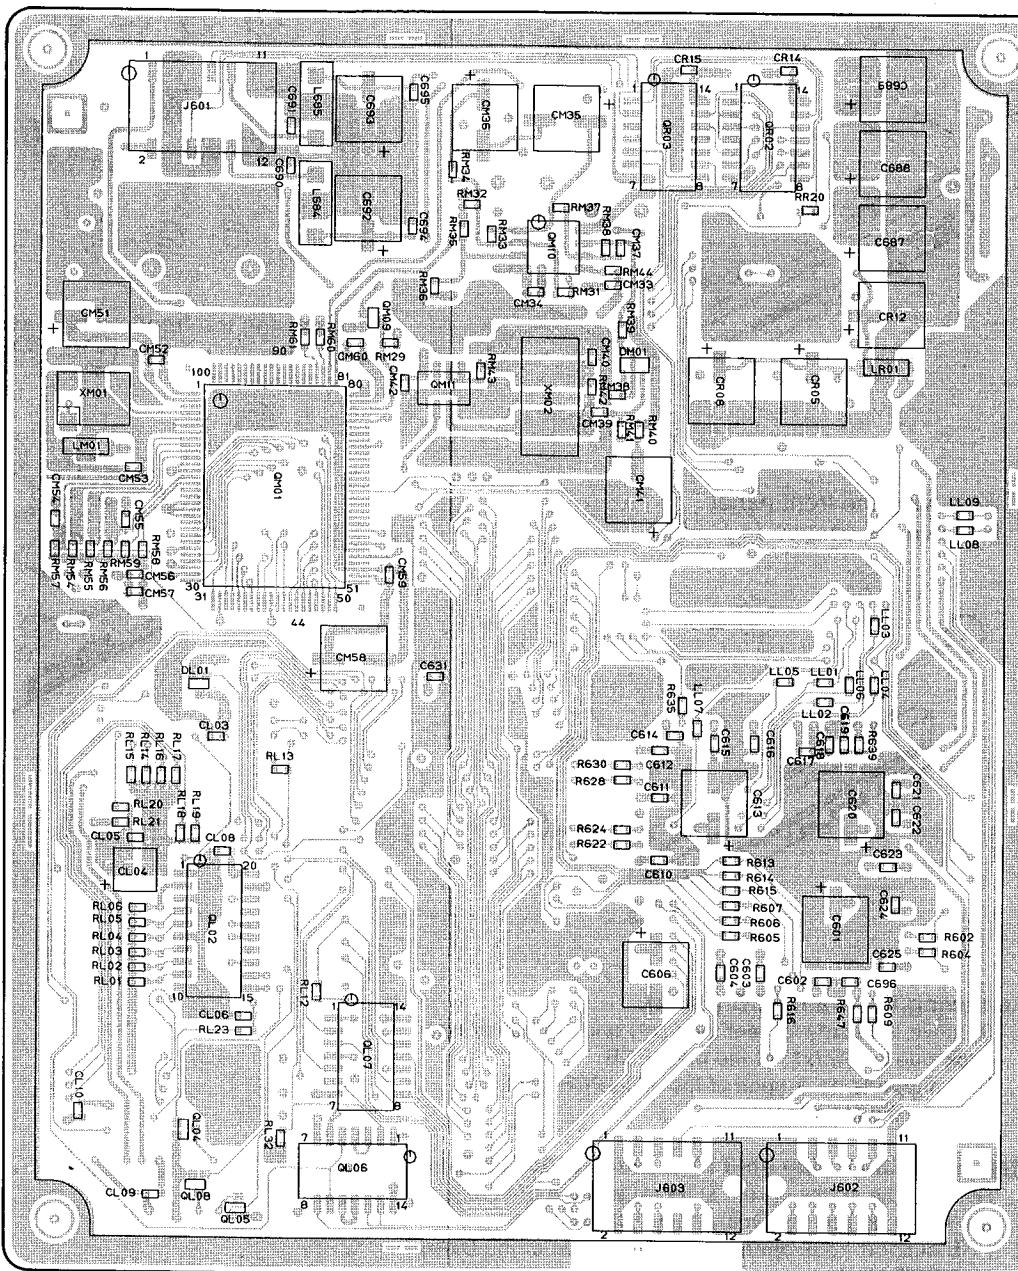

Removing the front volume PCB block (PV06)

1. Remove front panel and trim knob (x6). (015B)
2. Removing the nut master volume and trim volume of the fixed.
3. Remove the Front volume PCB block.

IC BLOCK DIAGRAMS

QR01 : LC8904Q DIGITAL AUDIO I/F

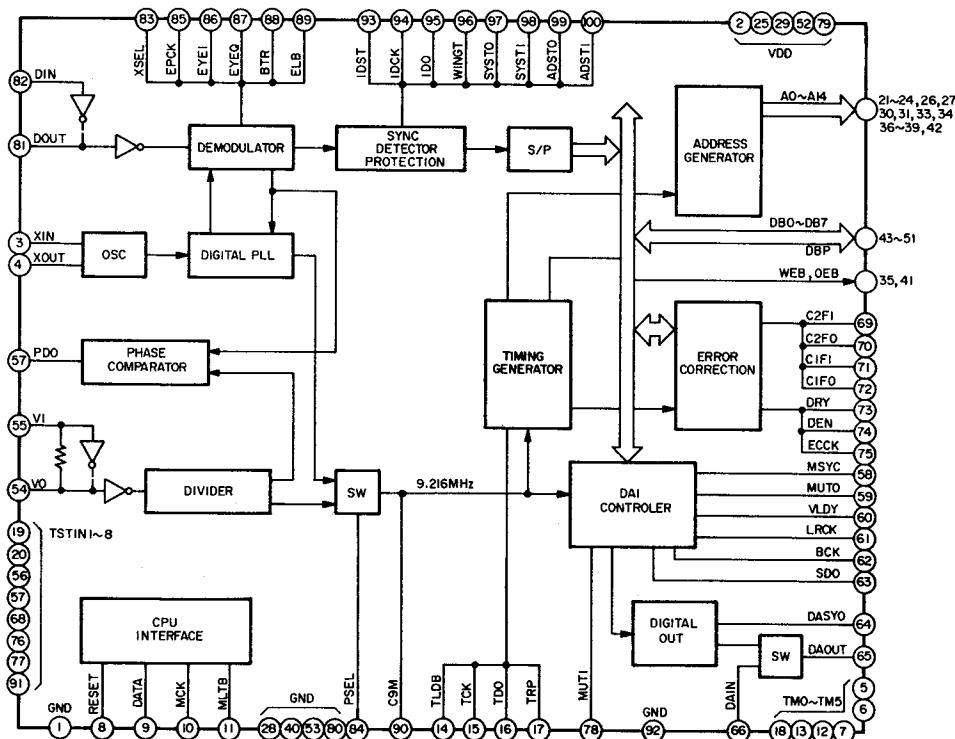

QM01 TERMINAL FUNCTIONS

Pin No.	Pin Name	I/O	Pin Function
1	GND	-	Ground (0 V).
2	VDD	-	Power supply (+5 V).
3	XOUT	0	X'tal oscillator output.
4	XIN	I	X'tal oscillator input.
5	TM0	I	IC test mode setting terminal. Usually no connection.
6	TM1	I	IC test mode setting terminal. Usually no connection.
7	TM2	I	IC test mode setting terminal. Usually no connection.
8	RESET	I	System reset terminal. Reset with "L". Goes "H" temporarily after power is turned ON.
9	DATA	I	Serial data input from CPU. (LSB first)
10	MCK	I	Serial clock input from CPU. Data is latched at the positive-going edge of the clock.
11	ML TB	I	CPU input latch. Latches the serial data (8 bits at a time) from the CPU into a register.
12	TM3	I	IC test mode setting terminal. Usually no connection.
13	TM4	I	IC test mode setting terminal. Usually no connection.
14	TLDB	I	Tag code load signal. "L" loads tag code in a 16-bit shift register.
15	TCK	I	Tag code output clock. Data is output at the positive-going edge of the clock.
16	TDO	0	Tag code serial data output. (MSB first)
17	TRP	0	Tag code update signal. Goes "H" when no error is found in the tag codes after the correction operation of each block.
18	TM5	I	IC test mode setting terminal. Usually no connection.
19	TSTIN1	I	IC test terminal. Usually no connection.
20	TSTIN2	I	IC test terminal. Usually no connection.
21	A0	0	External RAM address output. Address 0 (LSB).
22	A1	0	External RAM address output. Address 1.
23	A2	0	External RAM address output. Address 2.
24	A3	0	External RAM address output. Address 3.
25	VDD	-	Power supply (+5 V).
26	A4	0	External RAM address output. Address 4.
27	A5	0	External RAM address output. Address 5.
28	GND	-	Ground (0 V).
29	VDD	-	Power supply (+5 V).
30	A6	0	External RAM address output. Address 6.
31	A7	0	External RAM address output. Address 7.
32	GND	-	Ground (0 V).
33	A12	0	External RAM address output. Address 12.
34	A14	0	External RAM address output. Address 14 (MSB).
35	WEB	0	External RAM write enable output. "L" active.
36	A13	0	External RAM address output. Address 13.
37	A8	0	External RAM address output. Address 8.
38	A9	0	External RAM address output. Address 9.
39	A11	0	External RAM address output. Address 11.
40	GND	-	Ground (0 V).
41	OEB	0	External RAM output enable output. "L" active.
42	A10	0	External RAM address output. Address 10.
43	DBP	I/O	External RAM data terminal. For use as the erasure pointer.
44	DB7	I/O	External RAM data terminal. Data path 7.
45	DB6	I/O	External RAM data terminal. Data path 6.
46	DB5	I/O	External RAM data terminal. Data path 5.
47	DB4	I/O	External RAM data terminal. Data path 4.
48	DB3	I/O	External RAM data terminal. Data path 3.
49	DB2	I/O	External RAM data terminal. Data path 2.
50	DB1	I/O	External RAM data terminal. Data path 1.
51	DB0	I/O	External RAM data terminal. Data path 0.
52	VDD	-	Power supply (+5 V).
53	GND	-	Ground (0 V).
54	V0	0	VCXO output.
55	V1	I	VCXO input.
56	TSTIN3	I	IC test terminal. Usually no connection.
57	PDO	0	Phase comparator output (3-state).
58	MSYC	0	"H" with AC-3 sync signal. For use in monitoring.
59	MUTO	0	Muting output. "H" for muting. Goes "H" when "MUTI = H" or the AC-3 signal is out of sync.
60	VLDY	0	Validity flag output. "L" indicate correct data and "H" indicates a possibility of error.
61	LRCK	0	L/R channel switching clock. 48 kHz. "H" for L CH.
62	BCK	0	Bit clock. 3.072 MHz.
63	SDO	0	Serial data output.
64	DASYO	0	Digital output preamble B identification signal.

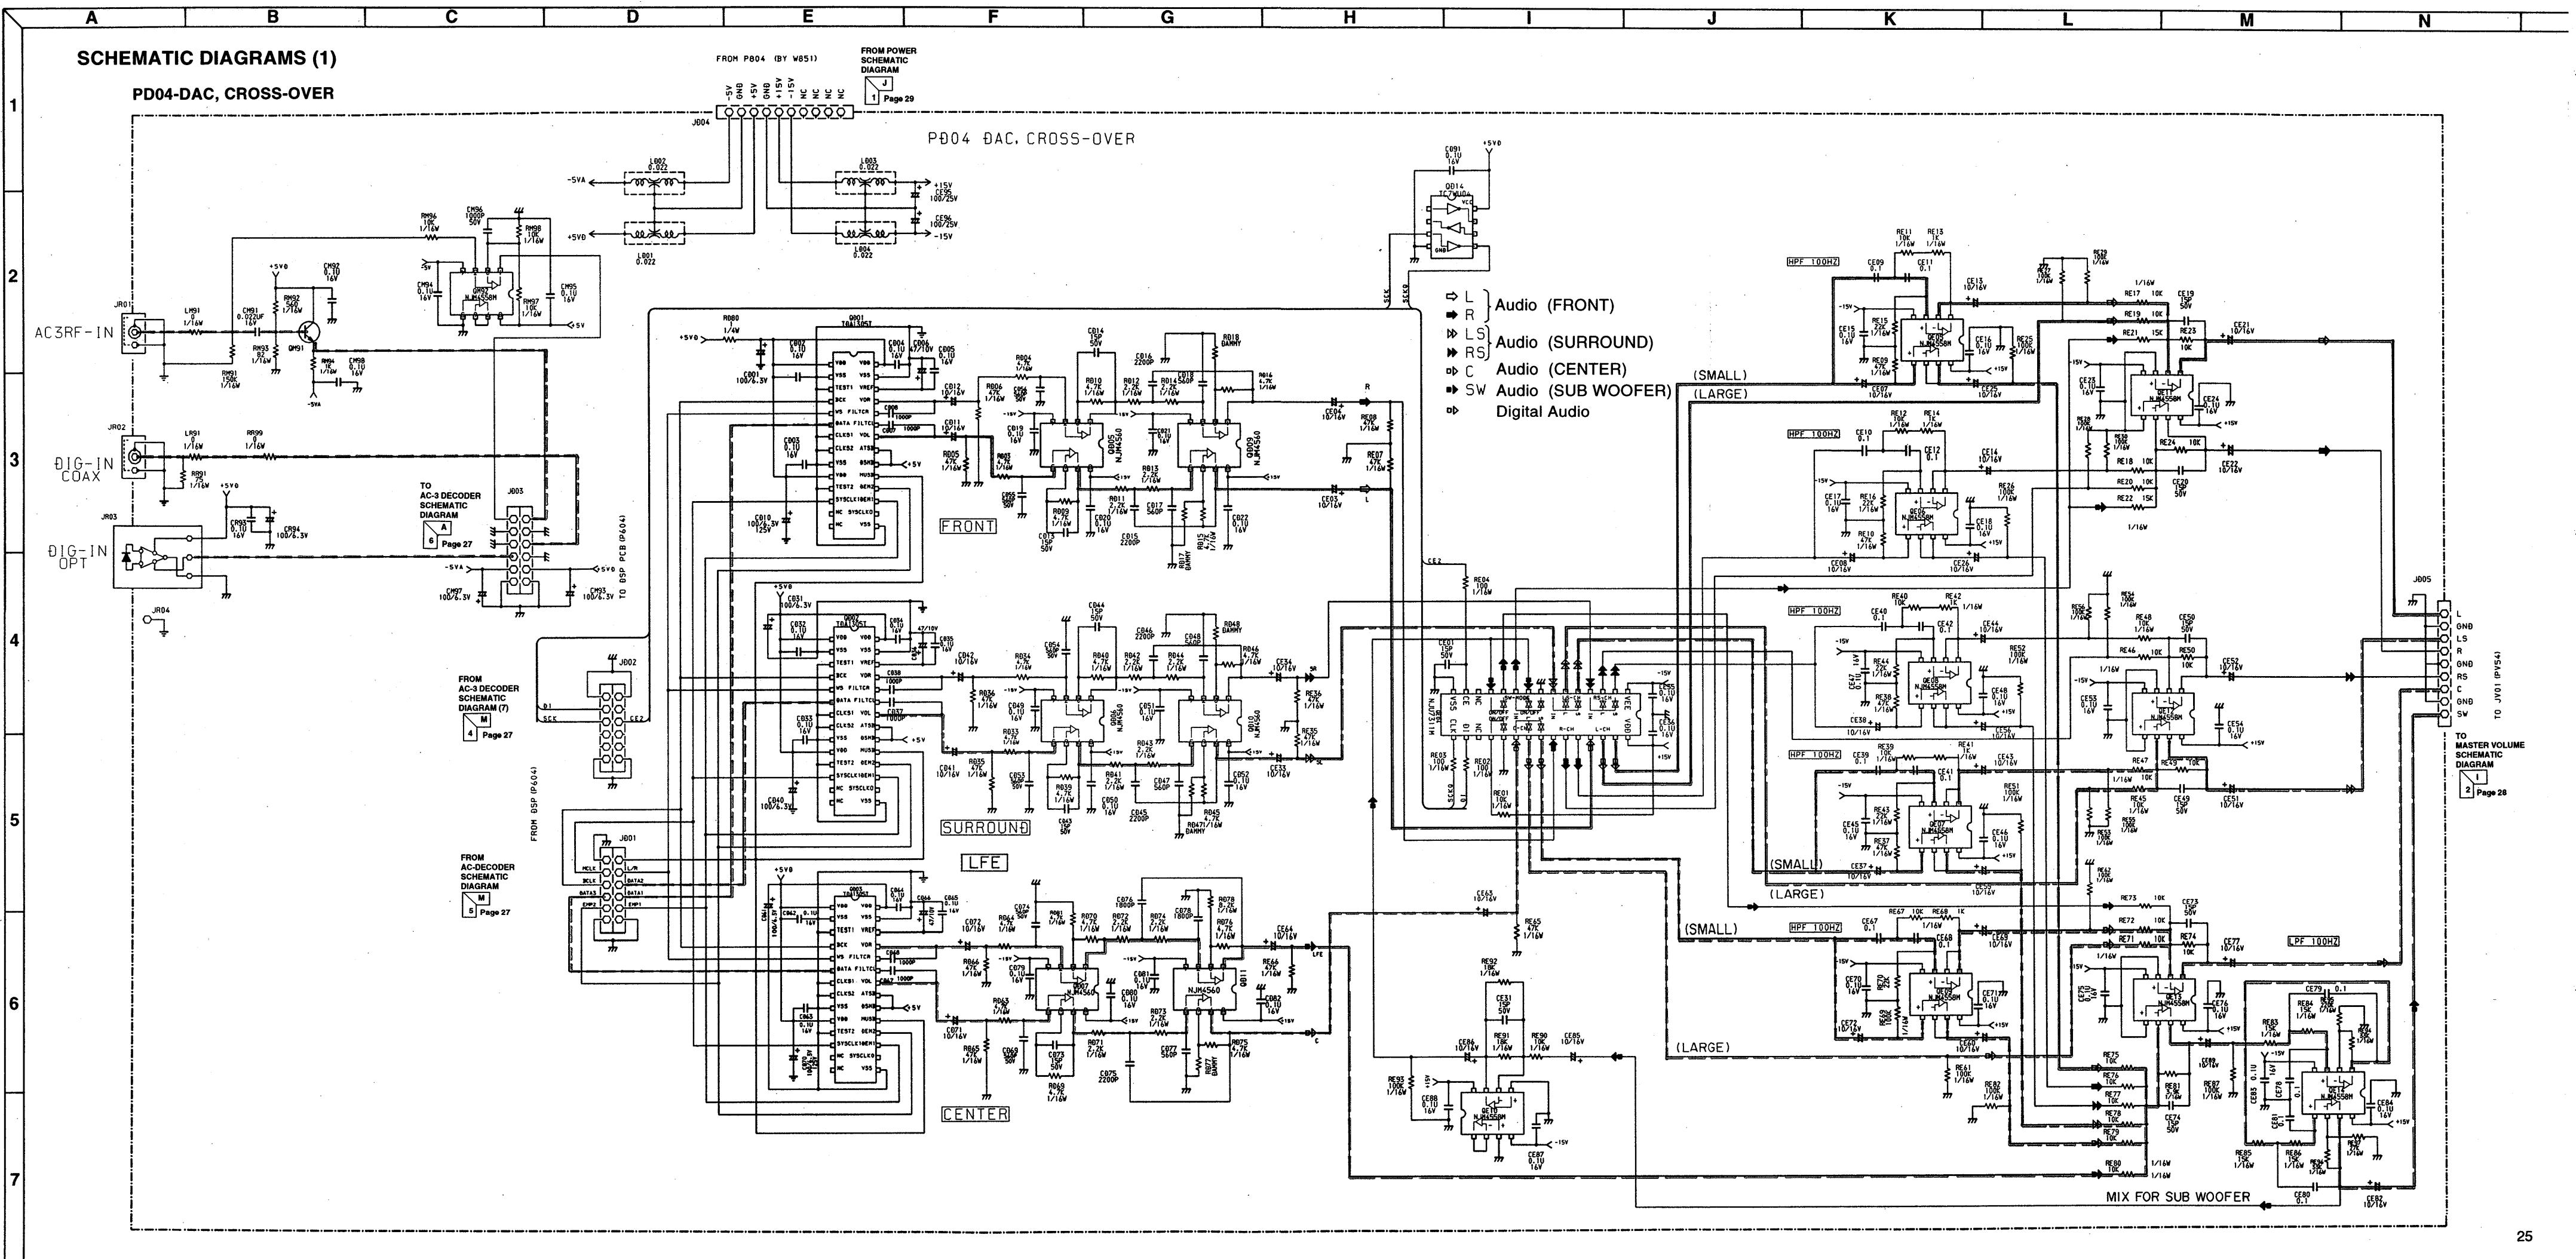

Pin No.	Pin Name	I/O	Pin Function
65	DAOUT	0	Digital output.
66	DAIN	I	Digital audio interface signal input. The digital output which has been processed inside the IC or the signal from "DAIN" is selected according to the internal register setting and output at "DAOUT".
67	TSTIN4	I	IC test terminal. Usually no connection.
68	TSTIN5	I	IC test terminal. Usually no connection.
69	C2F1	0	C2 correction error state indication. Output indicating where correction completed or not.
70	C2F0	0	C2 correction error state indication. Output indicating the number of errors in C2.
71	C1F1	0	C1 correction error state indication. Output indicating whether an error is present or not in C1.
72	C1F0	0	C1 correction error state indication. Output indicating the number of errors in C1.
73	DRY	0	Error corrector monitoring signal.
74	DEN	0	Error corrector monitoring signal.
75	ECCK	0	Error corrector clock. 576 kHz.
76	TSTIN6	I	IC test terminal. Usually no connection.
77	TSTIN7	I	IC test terminal. Usually no connection.
78	MUT1	I	Muting input. "H" for muting.
79	VDD	-	Power supply (+5 V).
80	GND	-	Ground (0 V).
81	DOUT	0	QPSK inverted output.
82	DIN	I	QPSK signal input.
83	XSEL	I	X'tal select signal. "H" for using it.
84	PSEL	I	PLL select signal. "H" for using it.
85	ECLK	0	QPSK eye pattern clock. 288 kHz.
86	EYE1	0	Eye pattern output: Phase I.
87	EYEQ	0	Eye pattern output: Phase Q.
88	BTR	0	N.C.
89	ELB	0	N.C.
90	C9M	0	9.216 MHz
91	TSTIN8	I	IC test terminal. Usually no connection.
92	GND	-	Ground (0 V).
93	IDST	0	ID start position indication signal.
94	IDCK	0	ID signal sampling clock. Data changes at the negative-positive edge of the clock. 576kHz.
95	IDO	0	ID data output (MSB first).
96	WINGT	0	Goes "L" during search for the sync signal of the correction block.
97	SYSR0	0	Indicates the sync signal lock status of the correction block.
98	SYST1	0	Indicates the sync signal lock status of the correction block.
99	ADST0	0	Indicates the ID address continuity status of the correction block.
100	ADST1	0	Indicates the ID address continuity status of the correction block.
