Adjust to obtain the maximum waveform with a flat top. The marker is not always centered.

Turn the orange color core clockwise to maximum and adjust the black color core to obtain a maximum waveform. Note that the 10.7 MHz Marker is not always centered because of the ceramic filter used.

Turn the black color core to obtain a maximum waveform and the orange color core to minimize noise. Repeat these two operation if necessary to obtain symmetry.

## HEAD REPLACEMENT AND ADJUSTMENT

**1 Head replacement**

1. Remove the Cassette Tape Player Mechanical Assembly from the main unit.
2. Remove the A portion of the Loading Link. (See Fig. 8.)
3. Remove the 2 screws B in Fig. 8 and remove the Frame Assembly, Cassette Pack Guide and Guide Arm Assembly, and then replace the head.

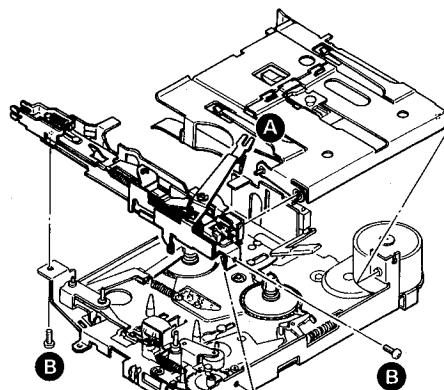

Fig. 8

**2 Head height confirmation**

1. Install the M-300 Head Gauge plate.
  2. Release the Lock Link to allow the head and pinch roller to lift up (in the same state as when playing back).
  3. Check to make sure that the adjustment chip does not contact the tape guide of the head. (See Fig. 9.)
- After the head replacement and height confirmation, clean the head and pinch roller where the tape runs against and then install them.

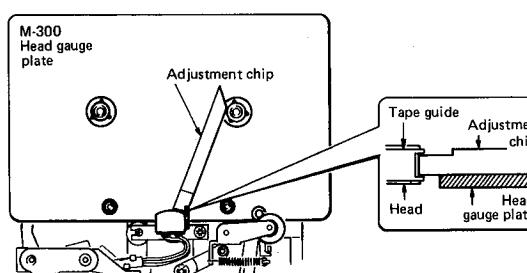

Fig. 9

**3 Azimuth adjustment**

- Adjust the azimuth upon completion of the main unit assembly (with both upper and lower covers installed).
1. Connect the power source (DC14V) to the power supply lead to make the main unit ready to operate.
  2. Connect the dual channel AC VTVM and 2ch oscilloscope to the line output.
  3. Play back the test tape (TCC-153) and adjust the azimuth screw with a philips screwdriver inserted into the azimuth adjustment hole in the upper cover. Adjust so that the same maximum VTVM value is indicated on both Left channel and Right channel and also so that the phase is within  $0^\circ \pm 90^\circ$  while watching the lissajous's waveform.

**SCHEMATIC DIAGRAM NOTES**

The capacitors are provided with the indication of type at the back of the ref. No. Example: C251C, C266M

A: Al. Solid Capacitor

C: Ceramic Capacitor

M: Mylar Capacitor

P: Polypropylene Capacitor

S: Styrol Capacitor

T: Tantalum Electrolytic Capacitor

No indication: Electrolytic Capacitor

In regards to the indication of electrostatic capacity values of the capacitors except the electrolytic capacitor, when the indicated value consists of three digits, the first and second digits indicate the significant figures of electrostatic capacity and the third digits indicates the number of zeros which follow the significant figures. When the value consists of two or one digit, the digits or digit indicates the electrostatic capacity value. (The unit of capacity value is pF.)

Three digits:

Number of zeros which follow the significant digits  
Significant digits of electrostatic capacity

Example:

222 → 2200pF

403 → 40000pF (0.04μF)

Two digits:

Electrostatic capacity value

Example:

33 → 33pF

One digits:

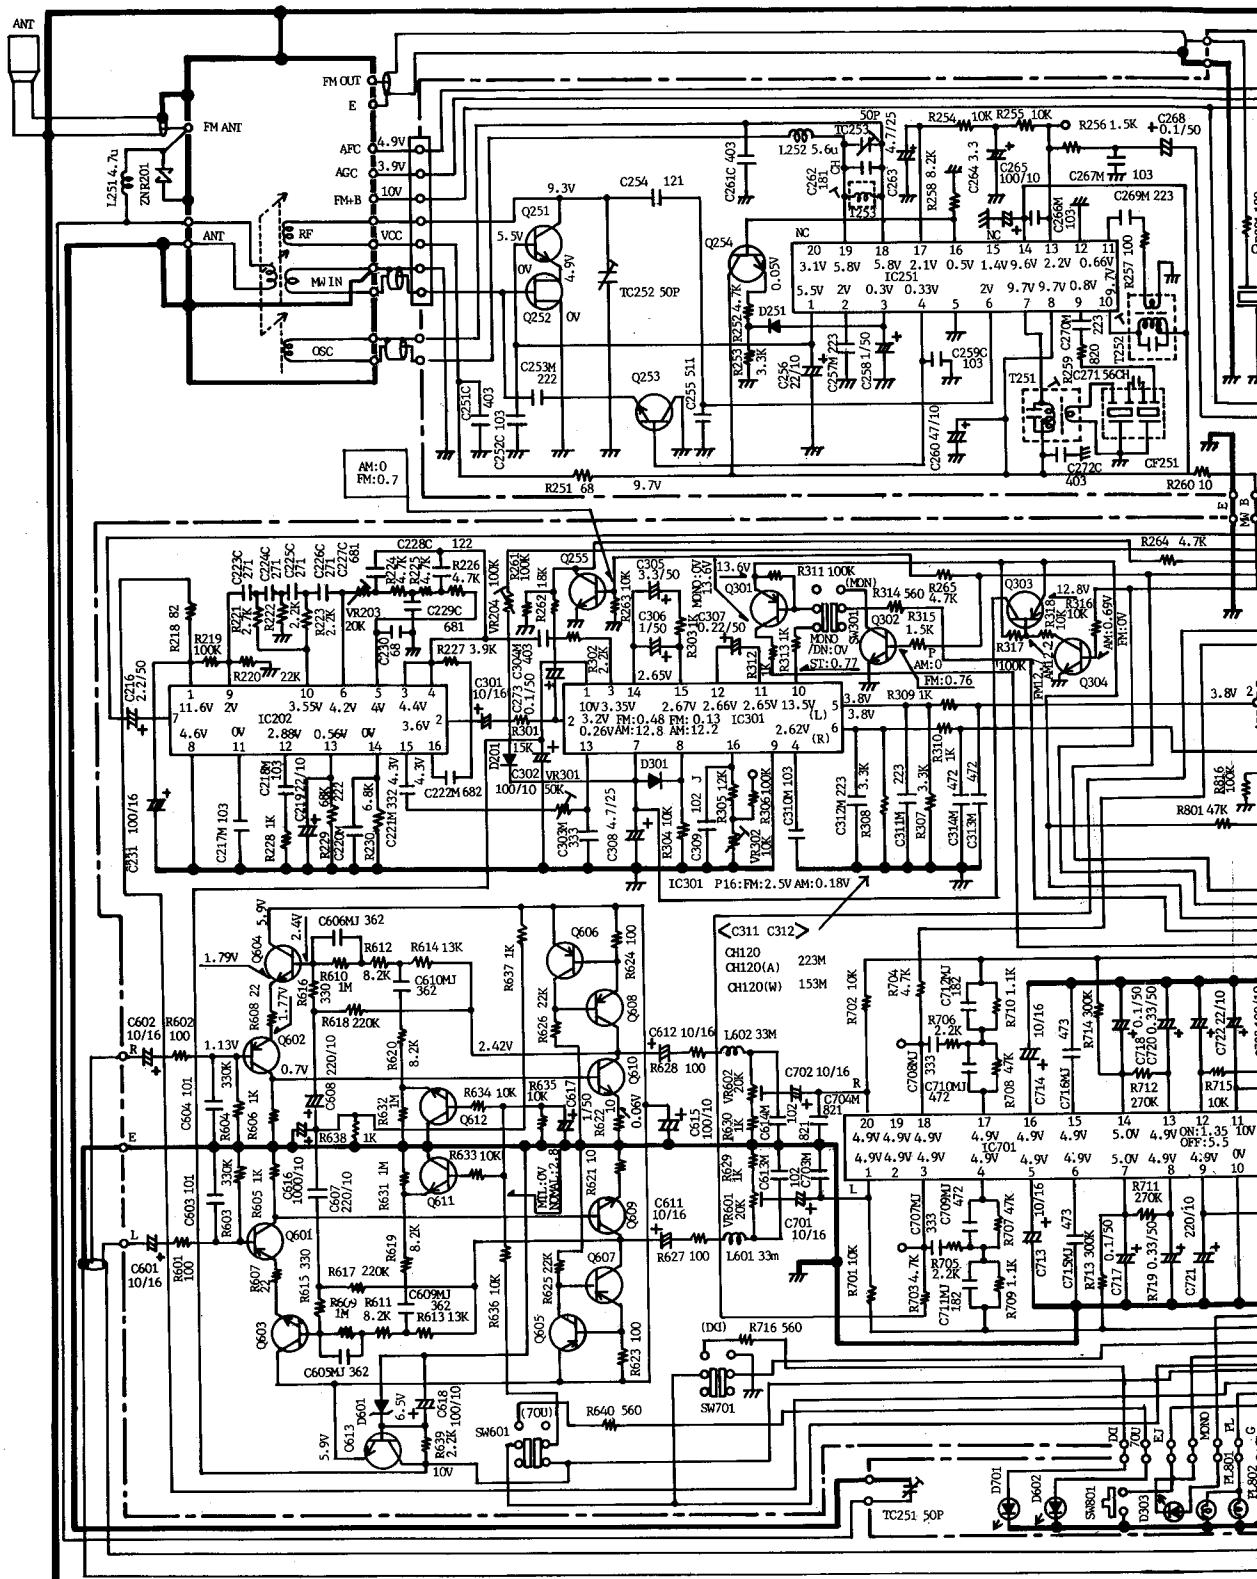

Electrostatic capacity value

Example:

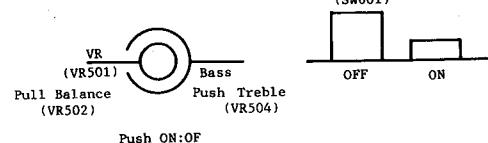

5 → 5pF
