LEAKAGE TEST (FOR SERVICE ENGINEERS IN THE U.S.A.)

Before returning the unit to the user, perform the following safety checks:

1. Inspect all lead dress to make certain that leads are not pinched or that hardware is not lodged between the chassis and other metal parts in the unit.
2. Be sure that any protective devices such as nonmetallic control knobs, insulating fishpapers, cabinet backs, adjustment and compartment covers or shields, isolation resistor-capacity networks, mechanical insulators, etc. which were removed for servicing are properly reinstalled.
3. Be sure that no shock hazard exists; check for leakage current using Simpson Model 229 Leakage Tester, standard equipment item No. 21641, RCA Model WT540A or use alternate method as follows: Plug the power cord directly into a 120-volt AC receptacle (do not use an Isolation Transformer for this test). Using two clip leads, connect a 1500 Ohm, 10-watt resistor paralleled by a 0.15 μ F capacitor, in series with all exposed metal cabinet parts and a known earth ground, such as a water pipe or conduit. Use a VTVM or VOM with 1000 Ohms per volt, or higher sensitivity to measure the AC voltage drop across the resistor (see diagram). Move the resistor connection to each exposed metal part having a return path to the chassis (antenna, metal, cabinet, screw heads, knobs and control shafts, escutcheon, etc.) and measure the AC voltage drop across the resistor. (This test should be performed with the power switch in both the On and Off positions.)

SIMPSON MODEL 229 ETC. FOR LEAKAGE TEST

A reading of 0.35 volt RMS or more is excessive and indicates a potential shock hazard which must be corrected before returning the unit to the owner.

DISASSEMBLY PROCEDURES

[1] CABINET TOP (131) REMOVAL

Remove 8 screws (A) and then remove the Cabinet Top (131).

[2] FRONT PANEL ASSEMBLY (AA) REMOVAL

1. Remove the Cabinet Top (131), referring to the previous step [1].
2. Remove 5 screws (B) and then remove the Front Panel Assembly (AA).

[3] CABINET BOTTOM (AC) REMOVAL

Remove 11 screws (C) and 2 washers (203), then remove the Cabinet Bottom (AC).

[4] MAIN P. C. BOARD (PCB-1) REMOVAL

1. Remove the Cabinet Top (131), referring to the previous step [1].
2. Remove 6 screws (G), then remove the Auto On/Off P.C. Board from the chassis.
3. Open the lid of connector (CN202) on the Auto On/Off P.C. Board (PCB-6), then disconnect lead wires (W202 and W203) from Main P.C. Board (PCB-1). Also open the lid of connector (CN403) on the Power Supply P.C. Board (PCB-2), then disconnect lead wires (JL403) from the Main P.C. Board (PCB-1).
4. Unsolder the lead wires (JL511, JL512, JL513 and JL514) from reference points (LCN511, LCN512, LCN513 and LCN514) on the Speaker P. C. Board (PCB-3).
5. Unsolder the lead wires (JL515, JL516, JL518, JL519 and JL527) from reference points (LCN515, LCN516, LCN518, LCN519 and LCN527) on the Power Supply P. C. Board (PCB-2). Also unsolder the lead wires (W201) from reference points (TM101, TM102 and TM103) on the Main P. C. Board (PCB-1).
6. Remove 1 screw (H), then remove Posistor (PT1) from HeatSink (181).
7. Remove 7 screws (D) and 2 spacers (198), then remove the Main P. C. Board (PCB-1) with HeatSink (181) from the chassis.

[5] POWER SUPPLY P.C. BOARD (PCB-2) REMOVAL

1. Remove 6 screws (G), then remove the Auto On/Off P.C. Board from the chassis.
2. Disconnect the connector with lead wire (CW221) from connector (CN221) on Auto On/Off P.C. Board (PCB-6).
3. Open the lid of connector (CN403) on the Power Supply P.C. Board (PCB-2), then disconnect lead wires (JL403) from the Main P.C. Board (PCB-1).
4. Disconnect the connector with lead wire (CW220) from connector (CN220) on the Led P.C. Board (PCB-7).
5. Unsolder the lead wires (JL515, JL516, JL518, JL519, JL524, JL525 and JL527) from reference points (LCN515, LCN516, LCN518, LCN519, LCN524, LCN525 and LCN527) on the Power Supply P. C. Board (PCB-2). Also unsolder the lead wires (JL522 and JL523) from reference points (TM104).

6. Remove 1 screw (H), then remove Posistor (PT1) from HeatSink (181).
7. Remove 5 screws (E), then remove the Power Supply P. C. Board (PCB-2) from the chassis.

[6] AUTO ON/OFF P.C. BOARD (PCB-6) REMOVAL

1. Remove the Cabinet Top (131), referring to the previous step [1].
2. Remove 6 screws (G), then remove the Auto On/Off P.C. Board from the chassis.
3. Open the lid of connector (CN202) on the Auto On/Off P. C. Board (PCB-6), then disconnect lead wires (W202 and W203) from Main P. C. Board (PCB-1).
4. Unsolder the lead wires (W201) from reference points (TM101, TM102 and TM103) on the Main P. C. Board (PCB-1).
5. Disconnect the connector with lead wire (CW205) from connector (CN205) on Led P. C. Board (PCB-7).
6. Disconnect the connector with lead wire (CW221) from connector (CN221) on Auto On/Off P. C. Board (PCB-6).

[7] LED P.C. BOARD (PCB-7) REMOVAL

1. Disconnect the connector with lead wire (CW205, CW206 AND CW220) from connector (CN205, CN206 and CN220) on Led P. C. Board (PCB-7).
2. Remove 2 screws (I), then remove the Led P. C. Board (PCB-7) from the chassis.

PROTECTION CIRCUIT

When the power switch is turned on, there will be no sound for about 8 seconds. This is the normal operation of the "Turn-on muting protection circuit" which protects the speaker systems from turn-on transients. After about 8 seconds, the amplifier will operate. It is suggested that the preamplifier volume control be set to a low level during the turn-on period. It is also advisable to turn on all other high fidelity components in the system before turning on the power amplifier. When a short circuit or a load of less than 2 ohms is placed across the speaker terminals for more than 4 milliseconds (4/1000 of a second), the protection circuit will activate and the amplifier will be muted for about 8 seconds. The muting will turn off and the amplifier will begin operating again after 8 seconds.

When the temperature of the internal heatsink rises too high, the protection circuit will activate and the amplifier will be muted. When the unit cools off, the amplifier will automatically become operational. However, unlike the turn-on and short circuit protection, the temperature protections may not restore operation in only 8 seconds because of the time required for the unit to cool off.

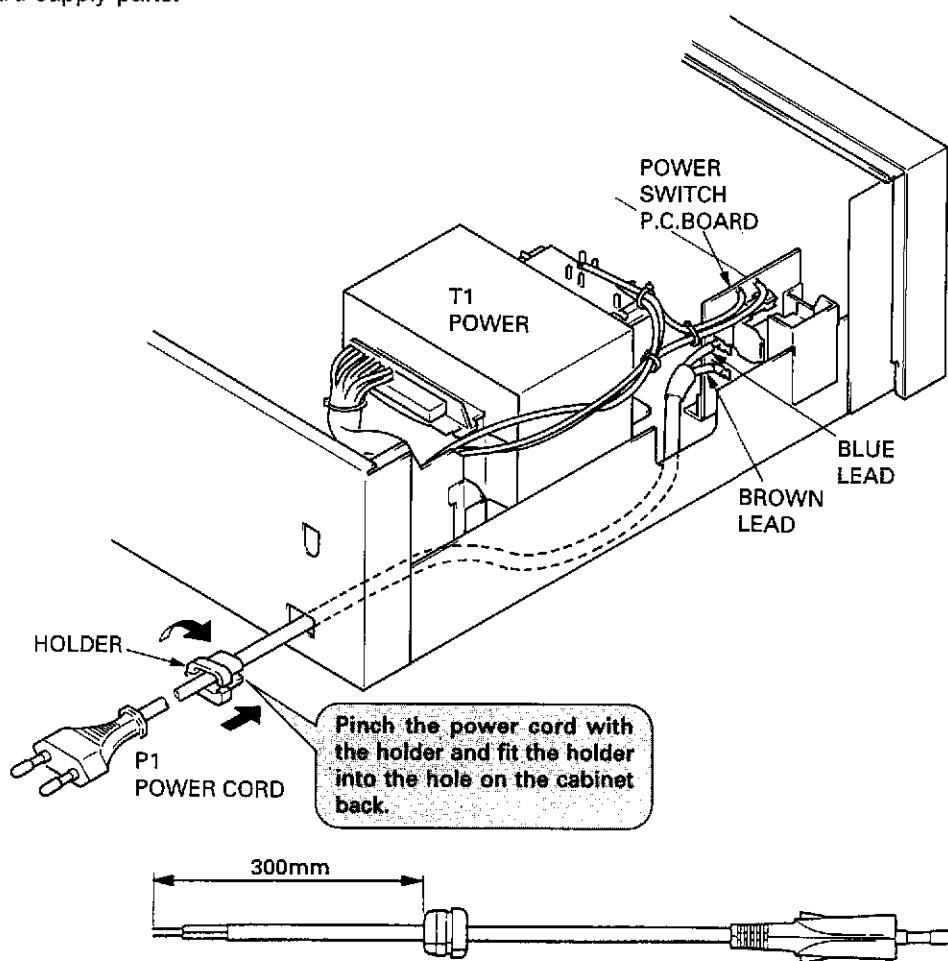

While you are connecting your power amplifier to the rest of your high fidelity system, please unplug the power cords of not only the power amplifier but all the components from the AC outlet.

AUTO-STANDBY FEATURE OPERATION

The PA2200 has a unique ability to sense when it is not receiving a music signal and it can automatically switch into a "Standby" mode. When this happens, the power amplifier circuitry completely shuts off and the front panel power indicator color changes from green (for "On") to amber (for "Standby"). When the amplifier again receives a music signal, it will return to the "On" state. The Auto-Standby feature instantly switches the amplifier "On", and switches it to "Standby" approximately 2 minutes after the incoming music signal stops. The 2 minute time before switching to "Standby" is to prevent the amplifier from unnecessarily switching between modes during use, or while the user is changing inputs or selecting software. This feature allows leaving the amplifier power switch in the "On" position when the amplifier is not in use. This can be a benefit in many systems and installations where the amplifier is not located within reach or is in another room. The "Auto-Standby" feature is also defeatable, for those customers that prefer the amplifier to behave in a conventional way. The "Auto-Standby" defeat switch is set in the "Off" position at the factory.

POWER CORD REPLACEMENT (FOR SERVICE ENGINEERS OTHER THAN NORTH AMERICA)

In order to prevent fire or shock hazard when replacing the power cord, follow the procedure below to replace the parts with the standard supply parts.

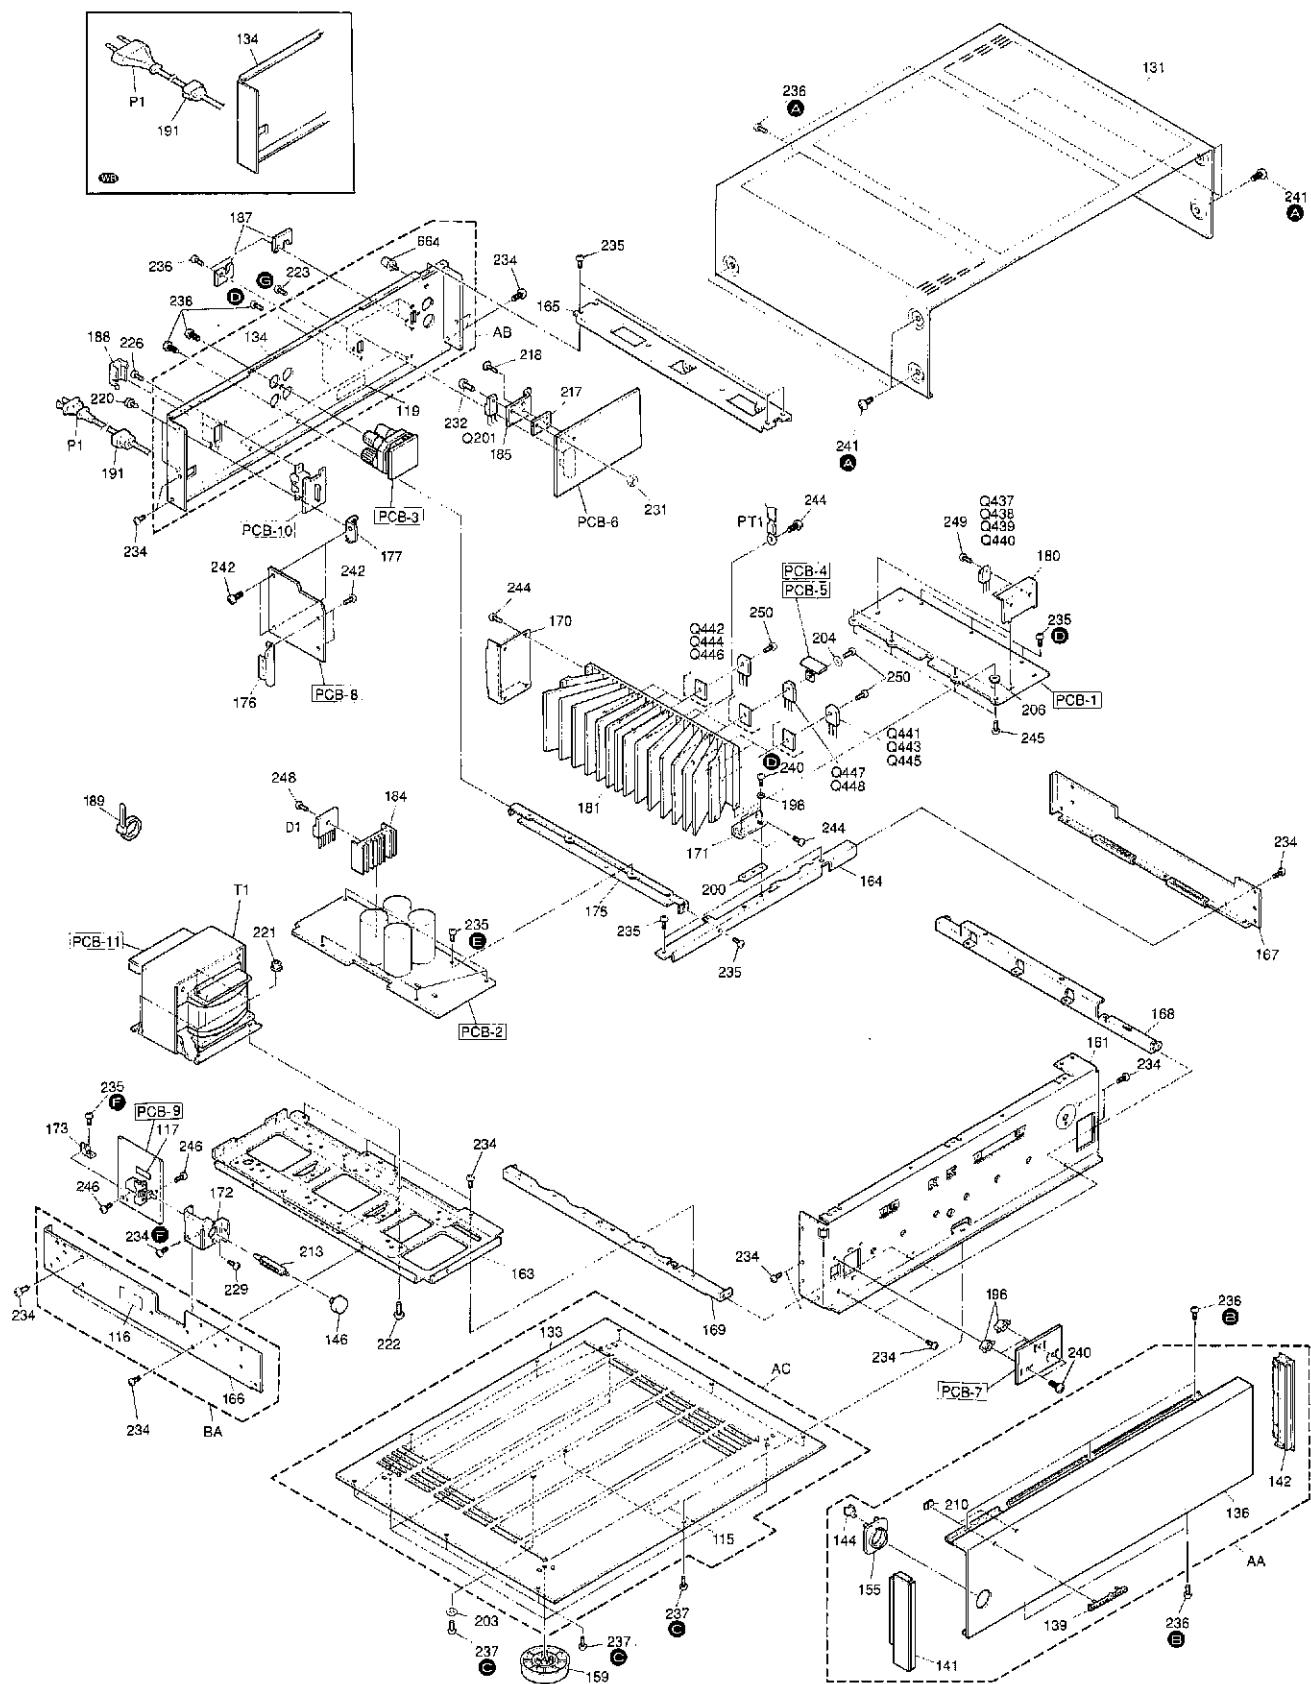

BRIDGED MONO OPERATION

This feature permits both amplifier channels to drive one 8Ω loudspeaker. To operate the amplifier in this way, set the $8\Omega/4\Omega$ switch in the 4Ω position, set the "Bridged Mono" switch in the "On" position and connect the amplifier's Left (Mono +) speaker terminal to the loudspeaker's "+" wire and the amplifier's Right (Mono -) speaker terminal to the loudspeaker's "-" wire.

Please note: The amplifier is not designed to drive a 4Ω speaker in the Bridged Mono mode.

ALIGNMENT PROCEDURES**Conditions:**

Make the adjustment at a room temperature of 77F (25C).

DC BALANCE ADJUSTMENT

Step	Connection Equipments	Adjustment	For
1	Connect the Digital Volt Meter to TP405 and TP407.	VR401	0 ±10 mV
2	Connect the Digital Volt Meter to TP406 and TP407.	VR402	0 ±10 mV

IDLING CURRENT ADJUSTMENT

Step	Connection Equipments	Adjustment	For
1	Connect the Digital Volt Meter to TP401 and TP403.	VR401	33 mV
2	Connect the Digital Volt Meter to TP402 and TP404.	VR402	33 mV

DC BALANCE CONFIRMATION

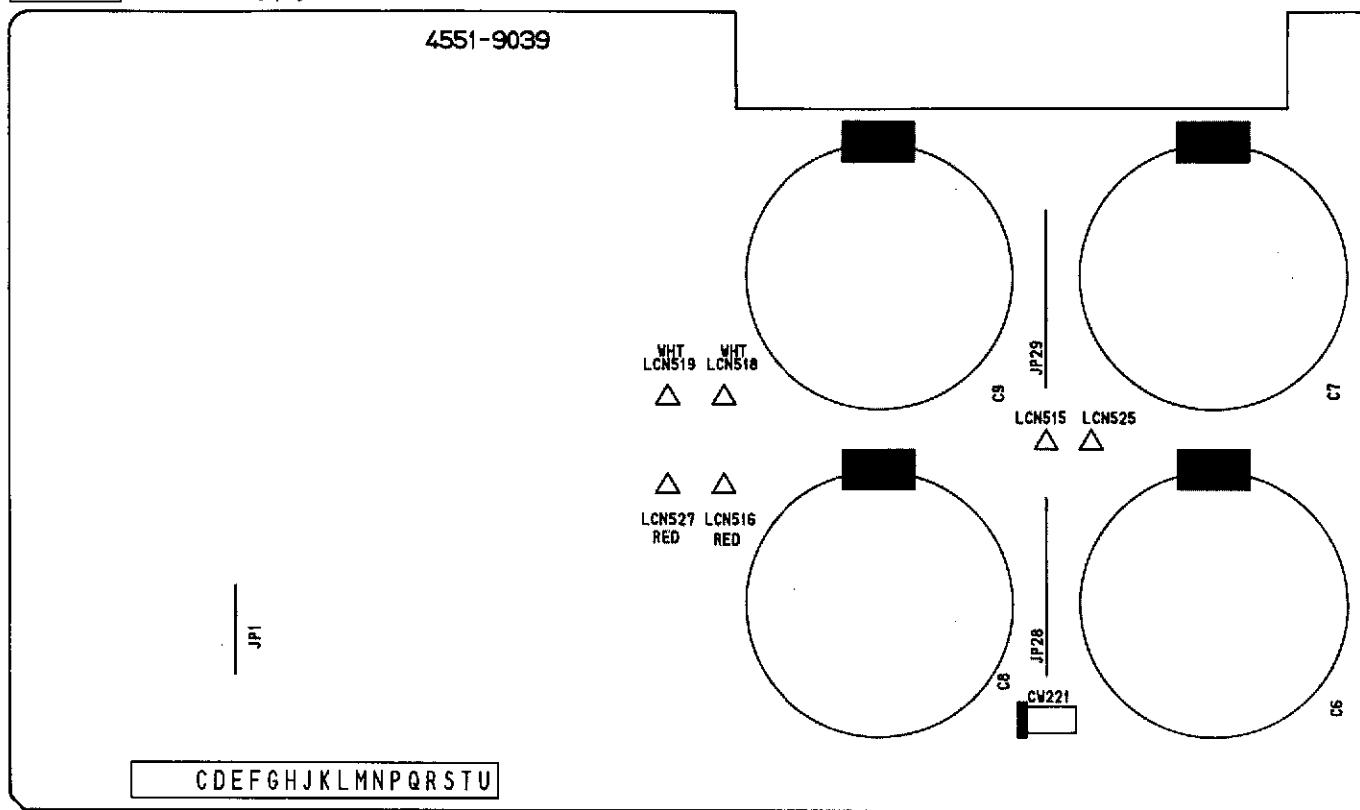

Set the Speaker Operating Mode switch to the "4Ω" position.

Step	Connection Equipments	For
1	Connect the Digital Volt Meter to TP405 and TP407.	0 ±60 mV
2	Connect the Digital Volt Meter to TP406 and TP407.	0 ±60 mV

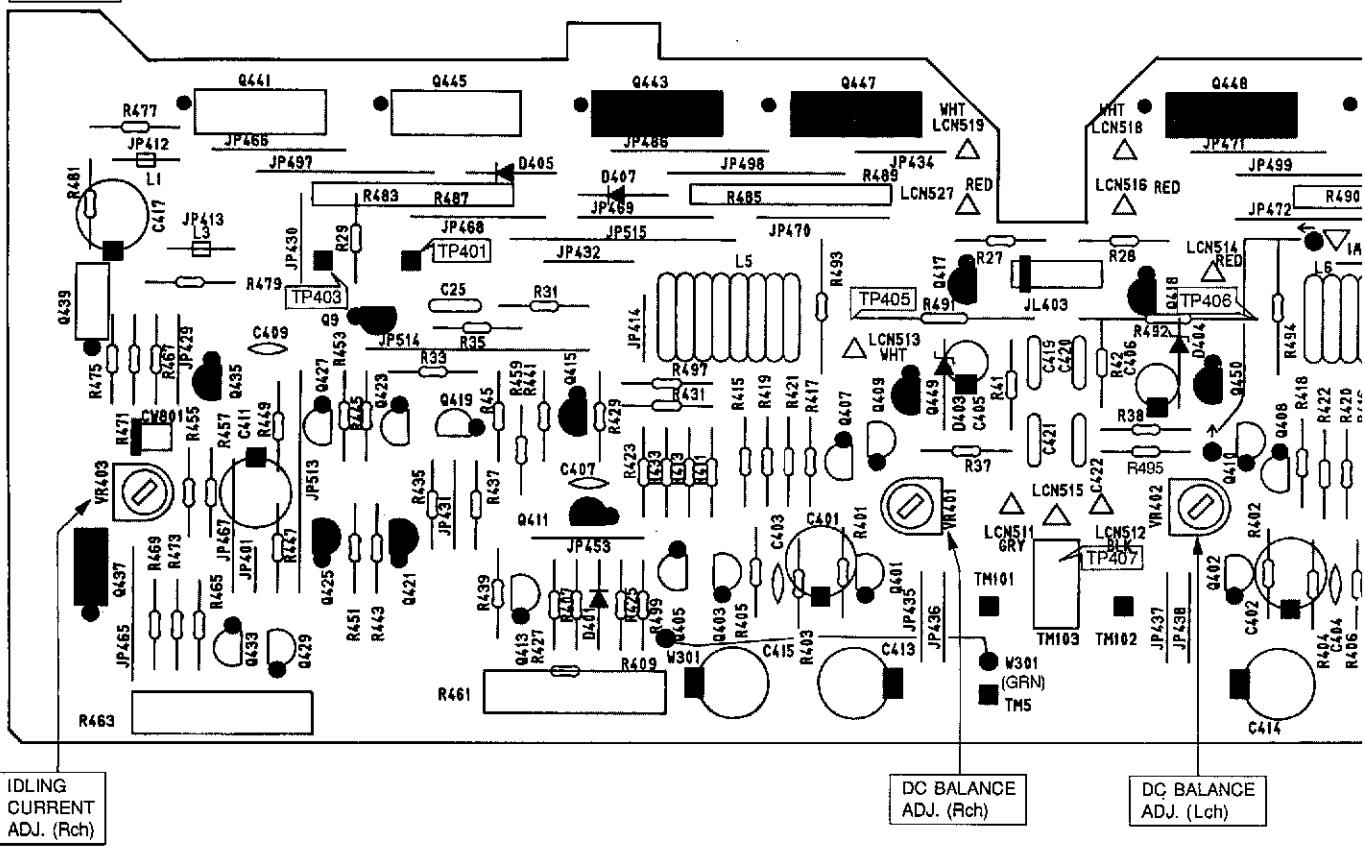

After the above adjustment, leave the unit with its power on for longer than 15 minutes and then repeat the same adjustment.

ALIGNMENT PROCEDURES

■ Conditions:

Make the adjustment at a room temperature of 77F (25C).

■ DC BALANCE ADJUSTMENT

Step	Connection Equipments	Adjustment	For
1	Connect the Digital Volt Meter to TP405 and TP407.	VR401	-60 ±10 mV
2	Connect the Digital Volt Meter to TP406 and TP407.	VR402	-60 ±10 mV

■ IDLING CURRENT ADJUSTMENT

Step	Connection Equipments	Adjustment	For
1	Connect the Digital Volt Meter to TP401 and TP403.	VR403	40 mV
2	Connect the Digital Volt Meter to TP402 and TP404.	VR404	40 mV

■ DC BALANCE CONFIRMATION

Set the Speaker Operating Mode switch to the "4Ω" position.

Step	Connection Equipments	For
1	Connect the Digital Volt Meter to TP405 and TP407.	0 ±60 mV
2	Connect the Digital Volt Meter to TP406 and TP407.	0 ±60 mV

- After the above adjustment, leave the unit with its power on for longer than 15 minutes and then repeat the same adjustment.

SCHEMATIC DIAGR

**TO AUTO ON/OFF
P.C. BOARD (PCB-4)**

This circuit diagram illustrates a power supply stage with the following key components and connections:

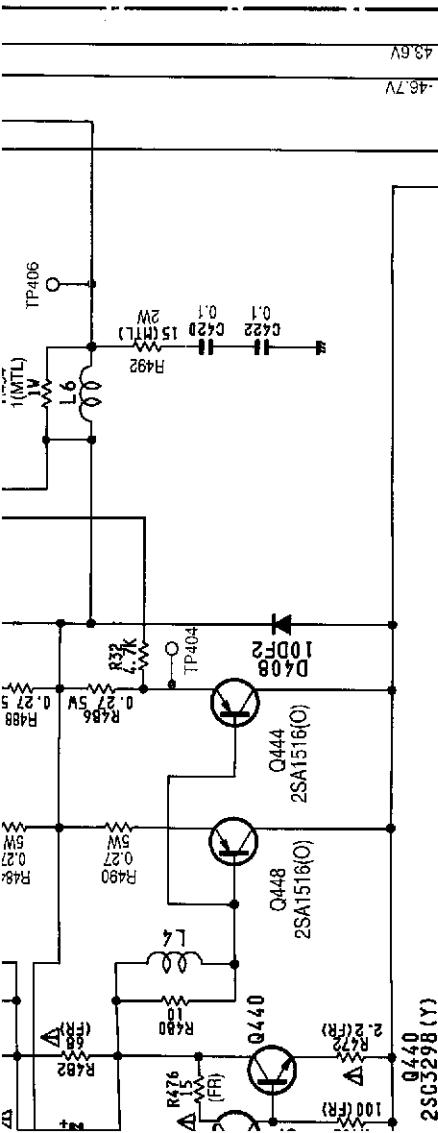

- Power Input:** The circuit is powered by a 4.7V source connected to node R39.
- Regulation Stage:** A 2SC1740S(S) transistor (Q3) is used as a voltage-controlled voltage source. Its collector is connected to node R39 through a 330kΩ resistor (R5). The base is connected to node R10 via a 100kΩ resistor (R10) and a -4.4V bias source. The emitter is connected to ground through a 2.2MΩ resistor (R8).
- Current Mirror:** A 2SA933S(S) transistor (Q2) is connected in series with the collector of Q3. Its collector is connected to node R39 through a 330kΩ resistor (R5). The base is connected to node R10 via a 100kΩ resistor (R10) and a -4.4V bias source. The emitter is connected to ground through a 2.2MΩ resistor (R8).
- Output Voltages:** The output voltages are regulated by two 2SC1740S(S) transistors (Q1 and Q7). Transistor Q1 is connected between node R39 and node R15. Transistor Q7 is connected between node R15 and ground. Both transistors receive a 5.0V bias from node C11.
- Protection and Control:**
 - A 2SC1740S(S) transistor (Q4) is used for protection, connected between node R13 and ground.
 - The circuit includes a "PROTECT" terminal connected to node R13.
 - A "MUTE" terminal is connected to node R10.
 - ICW220 and ICW221 integrated circuits are used for control logic.
 - Resistors R11, R12, and R13 provide biasing for the protection and control stages.
- Output:** The final output voltage is 4.7V, measured across R39.

This circuit diagram illustrates a power supply section with the following key components and connections:

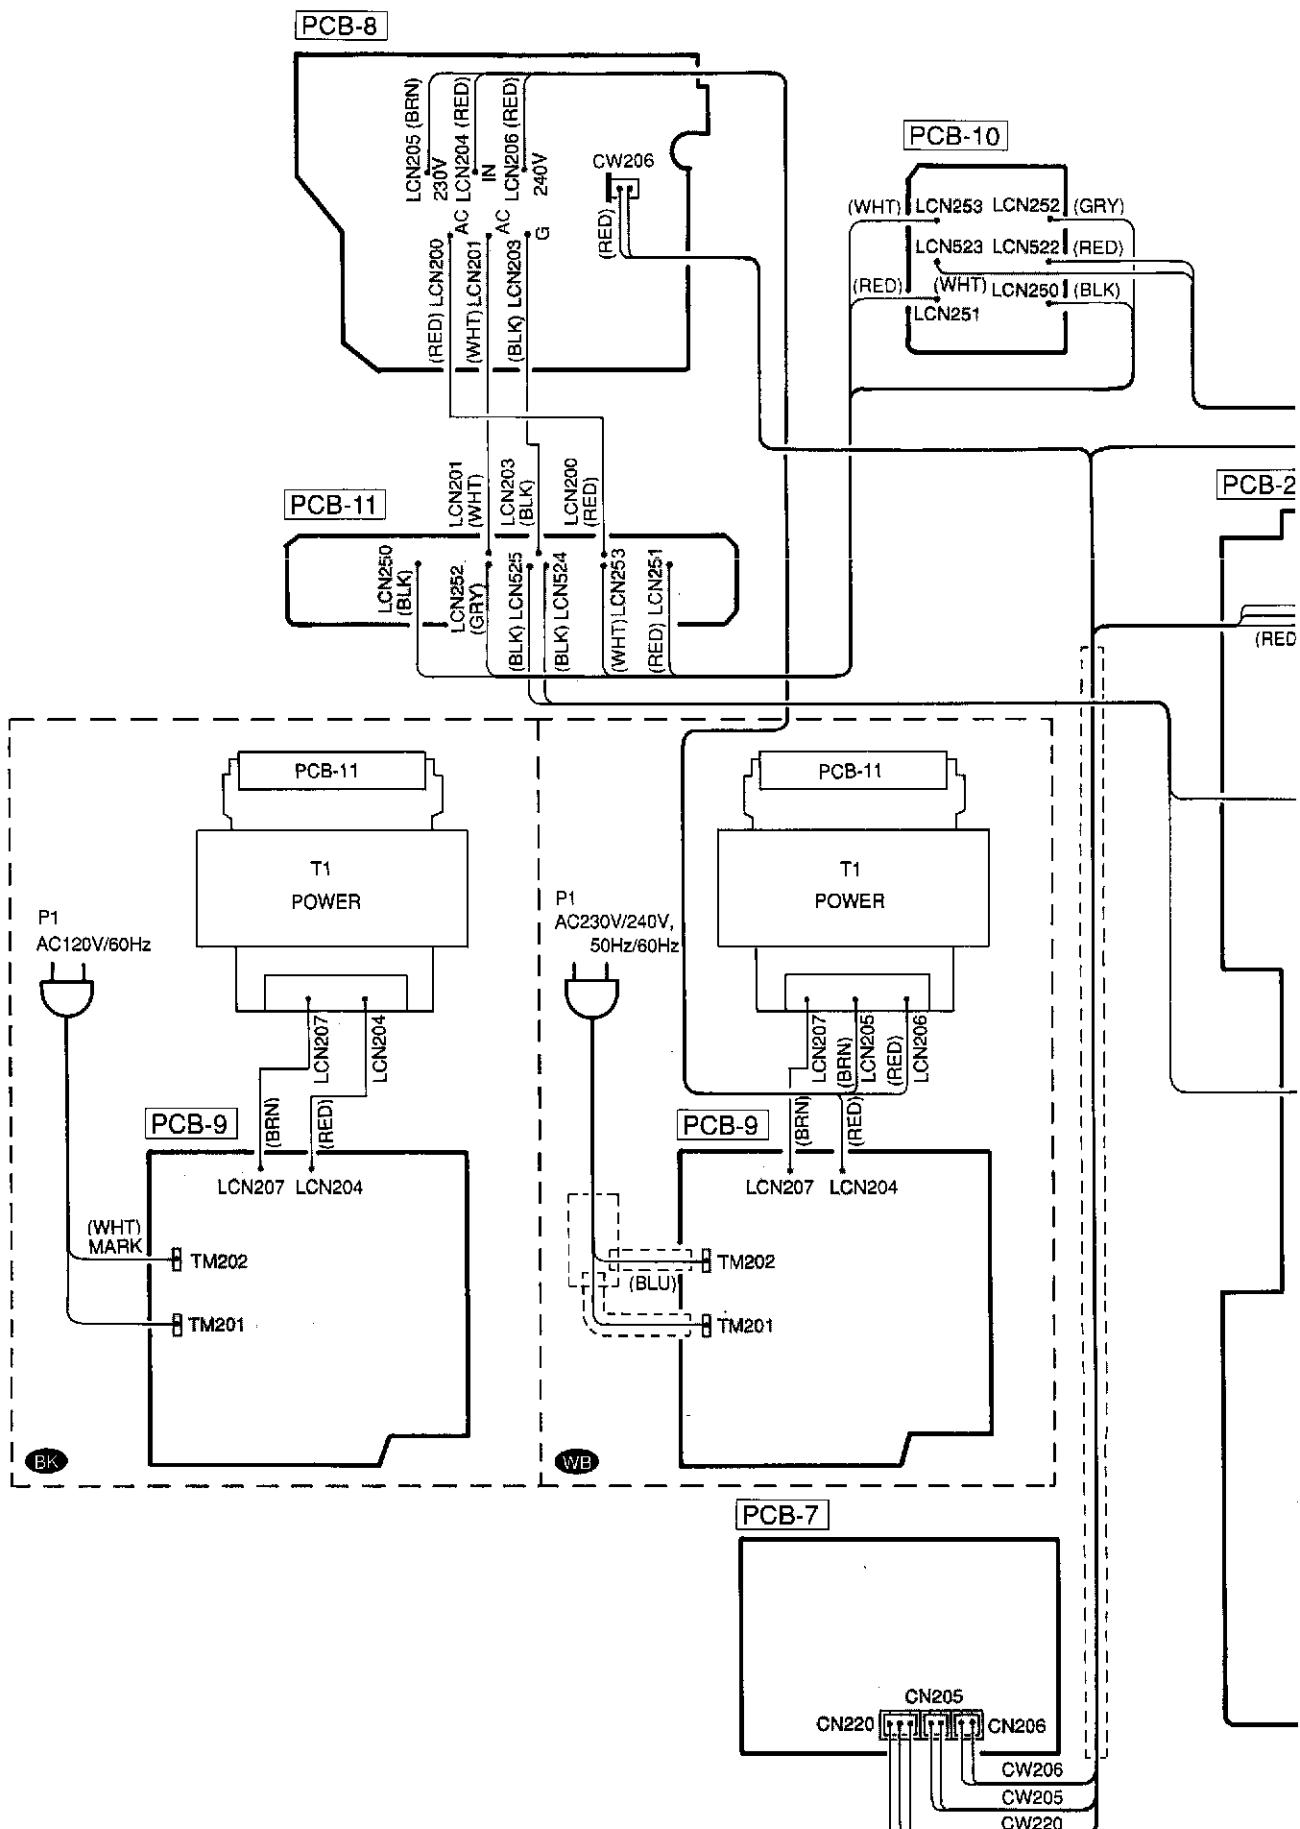

- Power Input:** The circuit is powered by a 5V AC input, indicated by a circle with a plus sign.
- Protection Circuits:** A "PROTECT" circuit is connected between the AC input and ground. It includes a 100K resistor (R227) and a 100K zener diode (Zener 1.7V) in series with the AC line. A 100K resistor (R10) is connected between the AC line and the base of transistor Q2 (2SA933SS(S)).
- Regulation Stage:** Transistor Q2 (2SA933SS(S)) is connected as a common-emitter stage. Its collector is connected to a 330K resistor (R5). The collector voltage is -0.5V. The base of Q2 is connected to the collector of transistor Q3 (2SC1740S(S)), which is also connected as a common-emitter stage. Its collector voltage is -5.0V.
- Voltage Reference:** A reference voltage of -4.4V is generated through a 100K resistor (R10) and a 100K zener diode (Zener 1.7V).
- Output Voltages:** The circuit generates several output voltages:
 - 4.4V (from R10/Zener)
 - 5.0V (from Q3 collector)
 - 0.5V (from Q2 collector)
 - 0V (from the ground rail)
 - 5.0V (from the collector of Q1)
 - 46.6V (from the collector of Q8)
 - 47.0V (from the collector of Q15)
 - 50V (from the collector of Q7)
 - 52V (from the collector of Q5)
 - 54V (from the collector of Q4)
 - 55V (from the collector of Q13)
 - 56V (from the collector of Q12)
 - 57V (from the collector of Q11)
 - 58V (from the collector of Q10)
 - 59V (from the collector of Q9)
 - 60V (from the collector of Q8)
 - 61V (from the collector of Q7)
 - 62V (from the collector of Q6)
 - 63V (from the collector of Q5)
