

The **|||||EzSet™** Remote Control.

A true breakthrough in home theater convenience, Harman Kardon's exclusive, patented EzSet remote is the first remote that automatically analyzes and sets speaker levels for multichannel-system calibration.

Precise, Foolproof Calibration

Setting speaker levels in a multichannel home theater system is one of the most critical adjustments required for proper surround sound reproduction. To create a seamless 360-degree sound field with precise imaging, it is essential that speaker levels be accurately matched to each other at the listening position. Only then can correct surround sound performance be achieved.

EzSet takes the guesswork out of level matching. By automating the speaker level-matching process, the EzSet remote makes speaker calibration accurate and virtually foolproof, for maximum sonic benefits.

In addition, the EzSet remote includes programming and macro capabilities that provide users with the means to readily control a complete home entertainment system from a single device.

How It Works

Once the receiver's Master Volume Control is set to a nominal "-10dB" reference point, EzSet takes over. Pressing a single button* starts the test-tone sequence in the receiver, while a precision electret condenser microphone in the remote measures the output level. Proprietary software compares the SPL level to a reference and sends IR commands to the receiver, which adjusts the output to reference level. The procedure repeats for all speakers in the system: the test tone is sent, the level read, and the output adjusted so that each speaker position has the same level. Within two minutes, all speakers are adjusted. The test tone will circulate one more time through the speakers to confirm the settings and to fine-tune, if necessary.

EzSet brings a new level of convenience and accuracy to home theater enjoyment.

Visit the Harman Kardon Web site at www.harmankardon.com.

* 7.1-channel receivers also require the user to press the "5" or "7" key to specify the number of speakers in use. The LCD version of the EzSet remote, supplied with the DPR 1001, DPR 2001 and AVR 7200, requires the user to follow the instructions that appear in the LCD display.
