

SWEEP GENERATOR KIT

The nevest and one of the most interesting family of Seathkits. A sweep generator brings to the service shop or experimenter the most essential instrument for properly aligning televisin and FW receivers. This Beathkit completely covers the entire FM and TW bands 2 Megacysles to 250 Megacysles. The unit is 1107 60 or power transformer operated. Uses two 507 tubes, two 50% tubes and a 605 rectifier. An electronic sweep circuit is incorporated using both triodes of a 606 to allow a range of 0 to over 10 Megacysles.

A selector switch allows either frequency modulated or R.F. signals to be

A selector switch allows either frequency modulated or R.F. signals to be used. An interesting new type of ministure high frequency socket is used with terminals spaced extremely wide for easy assembly. The panel incorporates a large easily read calibrated scale and the assembled unit is easily adjusted by

beating against a known radio station.

A sawtooth horizontal sweeping voltage is provided for the oscilloscope assuring that the trace will always be synchronized. A phasing control is in-

assuring that the trace will always be synchronized. A phasing control is included to correct for phase shift.

The onlis are ready assembled and precision adjusted to exact frequency.

As in all Heathsite, the best of parts are supplied, Mallory metal cased filter
condenser (60 MTD of filter compared to an average of 16 MTD), zero coefficient
ceramic condensers for high frequency, all punched and formed parts, grey crackle
cabinet, 5 tubes, test leads, etc. Better get it built now and

SURPLUS TRANSFORMERS

Most surplus power transformers are of very high quality and if properly identified will give long trouble free service.

Many, however, are not marked sufficiently to allow identification. After establishing continuity with an observer, a few volte of AC applied to the most likely vinding will allow the other windings to be measured with an AC voltaster, A comparison of these will identify the high voltage and filement windings. 110 Volta AC can then be applied to the identified primary and the actual outputs measured. The outputs will read 5 to 105 higher than actual value no load is applied. If the wire used in winding the transformer can be measured, the apprays of each filement winding can be established from the following chart.

In general, a winding under load which supplies rated voltage is not overloaded. Excessive drop of voltage is always an indication of fraving too much current. In average transfogmer construction, it is usual to provide 50 milliamperes of high voltage for every ampere of working tube filament. (Exclusive of rectifier filament.) (I.E. 6.) at 4 Amps would give a 200 MA high voltage winding.)

PUSH PULL AMPLIFIER KIT

\$1495

Shipping weight 20 lbs.

Accessories Available

12" high quality PM speaker matches the emplifier..\$6.95 Mahogany speaker cabinet size 142"x142"x8" for above speak or.....\$8.75 The shipping weight of 20 pounds for the Beathkit Amplifier proves that the transformers used are quality conservatively rated parts.

The real surprise is when it is connected to an PM tuner or new long playing record player. The reproduction is truly superby You hear the breath of the singer and the colorful harmonies of the musical instruments.

Many of the components of this Heathkit are surplus and when they are gone, there will be a considerable increase in price--better order one now.

Peah pull circuit with one presspatage and phase inverter stage.

Response with for - 1 db. between 35 cycles and 13,000 cycles. One plate with all tubes, purched changing values and tode controls, do: 110V 60 cy transformer operated.
