Displays

The FM/AM-1200A incorporates a combination of analog meters and a digital vacuum fluorescent display (VFD) to present UUT and instrument operating parameters. The use of both types of displays makes it convenient to operate the instrument in all types of lighting conditions.

Signal Generator

The FM/AM-1200A signal generator is capable of generating modulated or unmodulated signals within a range of 250 kHz to 999.9999 MHz at an output level that is adjustable from -127 to -20 dBm. The generator may be AM or FM modulated by internal modulation sources or by an external source applied through a front panel connector. The internal modulation sources include a 1 kHz fixed audio source and a variable frequency function generator. Additional signaling sources include: 2-tone, 5/6-tone, DCS, IMTS and pulsed audio.

Receiver

The FM/AM-1200A receiver is a sensitive 2 μ V triple conversion receiver capable of monitoring AM, FM and SSB carriers within a range of 100 kHz to 999.9999 MHz. Signals may be received "off-the-air" using an external antenna or by direct connection to the T/R port. Measurement resources available in the receiver include: RF frequency error, RF power, audio frequency error, modulation and oscilloscope.

Duplex Generator

In duplex mode, the FM/AM-1200A has the capability of generating and receiving simultaneously with a frequency offset from 0 to ± 49.99 MHz in 10 kHz steps. The instrument can be operated in any of three duplex modes:

- Duplex testing using separate transmit/receive lines.
- Duplex testing using one common transmit/receive line.
- "Off-the-air" duplex testing.

Oscilloscope

The FM/AM-1200A includes a 1 MHz oscilloscope capable of monitoring the instantaneous modulation characteristics of AM or FM modulated carriers. A residual mode allows the user to display the residual distortion or noise of the UUT, as received at the SINAD input port.
