SERVICE MANUAL

HF TRANSCEIVER

IC-737

Icom Inc.

INTRODUCTION

This service manual describes the latest service information for the **IC-737** HF TRANSCEIVER at the time of publication.

VERSION NO.	VERSION	SYMBOL
#02	Other	OTH
#03	France	FRA

To upgrade quality, all electrical or mechanical parts and internal circuits are subject to change without notice or obligation.

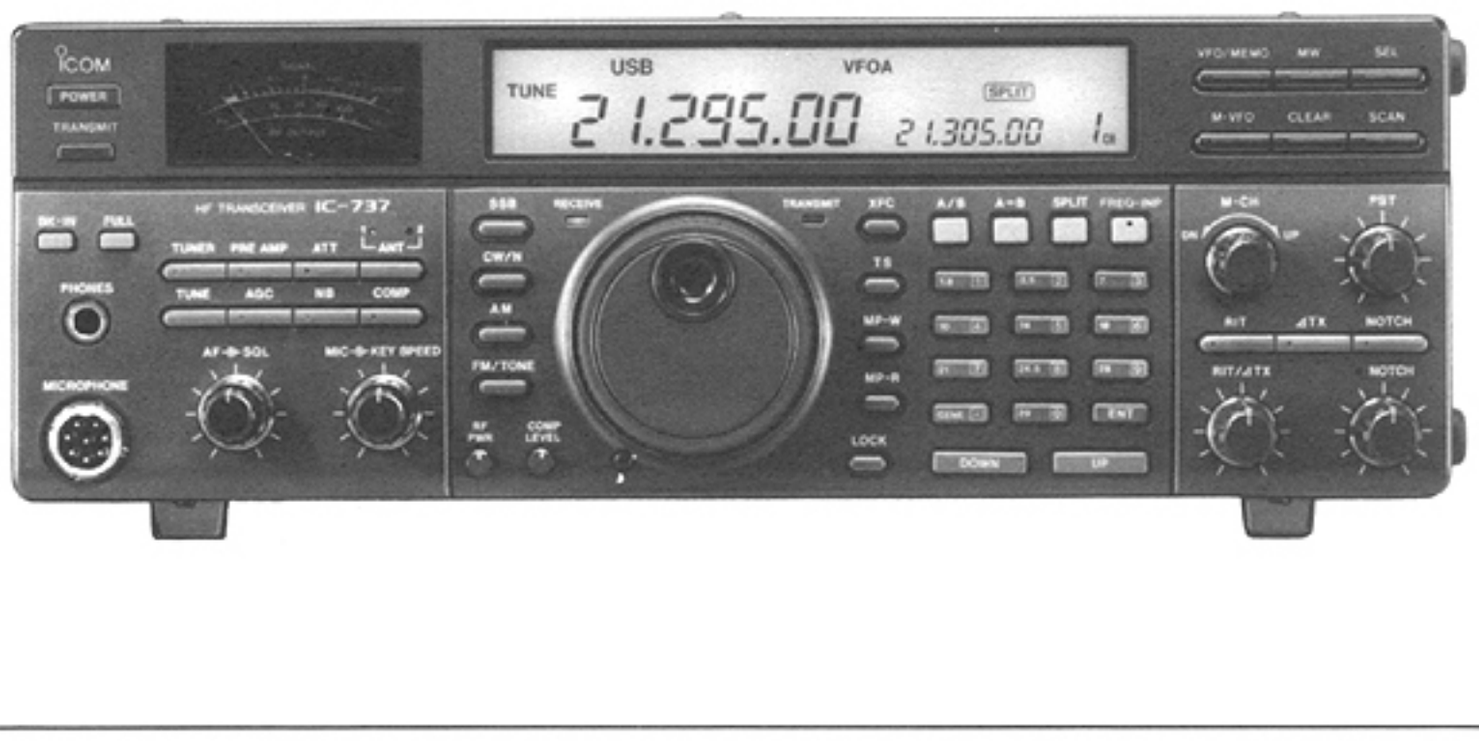
DANGER

NEVER connect the transceiver to an AC outlet or to a DC power supply that uses more than 16 V. This will ruin the transceiver.

DO NOT expose the transceiver to rain, snow or any liquids.

DO NOT reverse the polarities of the power supply when connecting the transceiver.

DO NOT apply an RF signal of more than 20 dBm (100 mW) to the antenna connector. This could damage the transceiver's front end.



ORDERING PARTS

Be sure to include the following four points when ordering replacement parts:

1. 10-digit order numbers
2. Component part number and name
3. Equipment model name and unit name
4. Quantity required

<SAMPLE ORDER>

1790000050	IC	ND487C1-3R	IC-737	MAIN UNIT	5 pieces
8810002260	Screw	FH B0 M3 × 6	IC-737	Chassis	10 pieces

Addresses are provided on the inside back cover for your convenience.

REPAIR NOTES

1. Make sure a problem is internal before disassembling the transceiver.
2. **DO NOT** open the transceiver until the transceiver is disconnected from its power source.
3. **DO NOT** force any of the variable components. Turn them slowly and smoothly.
4. **DO NOT** short any circuits or electronic parts. An insulated tuning tool **MUST** be used for all adjustments.
5. **DO NOT** keep power ON for a long time when the transceiver is defective.
6. **DO NOT** transmit power into a signal generator or a sweep generator.
7. **ALWAYS** connect a 50 dB to 60 dB attenuator between the transceiver and a deviation meter or spectrum analyzer when using such test equipment.
8. **READ** the instructions of test equipment thoroughly before connecting equipment to the transceiver.

TABLE OF CONTENTS

SECTION 1 SPECIFICATIONS

GENERAL

- Frequency coverage : Receive 500 kHz-29.995 MHz
  Transmit 1.800-1.99999 MHz 3.500-4.000 MHz
  7.000-7.300 MHz 10.100-10.150 MHz
  14.000-14.350 MHz 18.069-18.168 MHz
  21.000-21.450 MHz 24.890-24.990 MHz
  28.000-29.700 MHz
- Mode : SSB, CW, AM, FM
- Number of memory channels : 101
- Antenna impedance : 50 Ω nominal
- Usable temperature range : −10 °C to +60 °C (+14 °F to +140 °F)
- Frequency stability : Less than ±200 Hz from 1 min. to 60 min. after power ON
  Less than ±30 Hz/hr. after one hour at +25 °C (+77 °F)
  Temperature fluctuations (0 °C to +50 °C; +32 °F to +122 °F) less than ±350 Hz
- Power supply requirement : 13.8 V DC±15 % (20 A)
- Current drain (at 13.8 V DC) : Transmit 20 A
  Receive squelched 1.6 A
  max. audio output 2.1 A
- Dimensions : 330 (W) × 111 (H) × 285 (D) mm
  13.0 (W) × 4.4 (H) × 11.2 (D) in
  (Projections not included)
- Weight : 8.05 kg (17.7 lb)

TRANSMITTER

- Output power : SSB, CW, FM 10-100 W
  AM 10-40 W
  (continuously adjustable)
- Spurious emissions : Less than −50 dB
- Carrier suppression : More than 40 dB
- Unwanted sideband suppression : More than 50 dB
- Microphone impedance : 600 Ω

RECEIVER

- Receive system : Triple-conversion superheterodyne
- Intermediate frequency :

MODE	1st	2nd	3rd
SSB	69.0115 MHz	9.0115 MHz	455 kHz
CW	69.0106 MHz	9.0106 MHz	455 kHz
AM, FM	69.0100 MHz	9.0100 MHz	455 kHz

- Sensitivity (Preamp ON) : SSB, CW (10 dB S/N) 1.8-29.995 MHz Less than 0.16 µV
  AM (10 dB S/N) 0.5-1.8 MHz Less than 13.0 µV
  1.8-29.995 MHz Less than 2.0 µV
  FM (12 dB SINAD) 28-29.7 MHz Less than 0.5 µV
- Squelch sensitivity (Threshold) : SSB Less than 5.6 µV
  FM Less than 0.3 µV
- Selectivity : SSB, CW More than 2.1 kHz/−6 dB Less than 4.0 kHz/−60 dB
  AM More than 6.0 kHz/−6 dB Less than 20.0 kHz/−40 dB
  FM More than 12.0 kHz/−6 dB Less than 30.0 kHz/−50 dB
- Spurious and image rejection ratio : More than 70 dB
- Audio output power : More than 2.6 W with an 8 Ω load
- RIT variable range : ±1.25 kHz or ±2.5 kHz selectable

ANTENNA TUNER

- Matching impedance range : 16.7-150 Ω unbalanced (less than VSWR 3 : 1)
- Minimum operating input : 8 W
- Waiting time for band changing (typical) : Less than 3 sec.
- Tuning time (typical) : Less than 7 sec.
- Tuning accuracy : VSWR 1.5 : 1 or less
- Insertion loss (after tuning) : Less than 1.0 dB

All stated specifications are approximate and subject to change without notice or obligation.

SECTION 2 DISASSEMBLY INSTRUCTIONS

2-1 REMOVING THE PA BLOCK

1. Remove 19 screws (black, 8 mm) as shown in Fig. 1, to remove top and bottom covers.

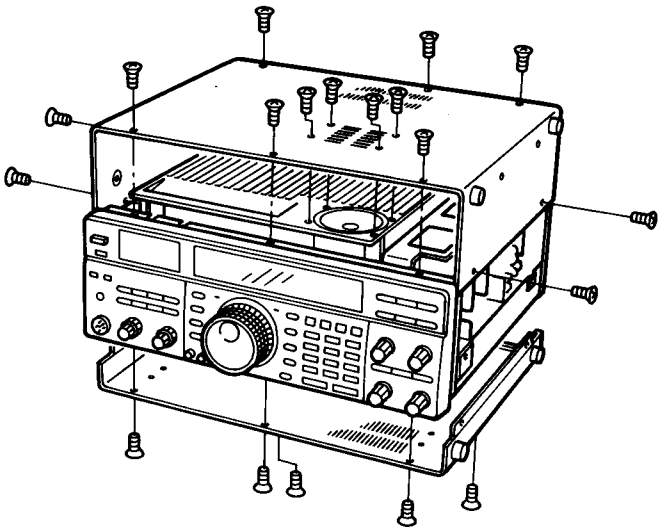


Fig. 1

2. Remove 3 screws Ⓐ, 4 screws Ⓑ and 2 screws Ⓒ as shown in Fig. 2.
3. Unplug 1 coaxial cable (J11), 4 connectors (J6, J13, J32 and J34) from the MAIN unit as shown in Fig. 6 (p. 2-3).
4. Unplug 1 coaxial cable (J20) from the CTRL unit as shown in Fig. 6 (p. 2-3).

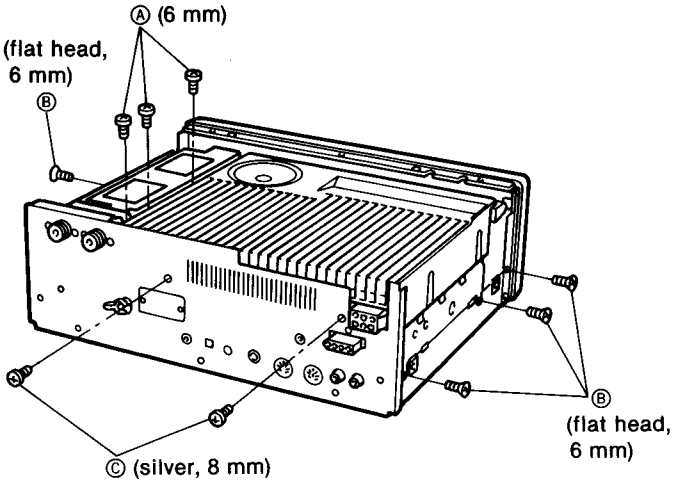

Fig. 2

5. Pull the front panel forward.
6. Unplug 3 connectors (6-pin connector from P13, 3-pin connector from Q1 and 4-pin connector from J2) as shown in Fig. 3.
7. Remove the PA block as shown in Fig. 3.

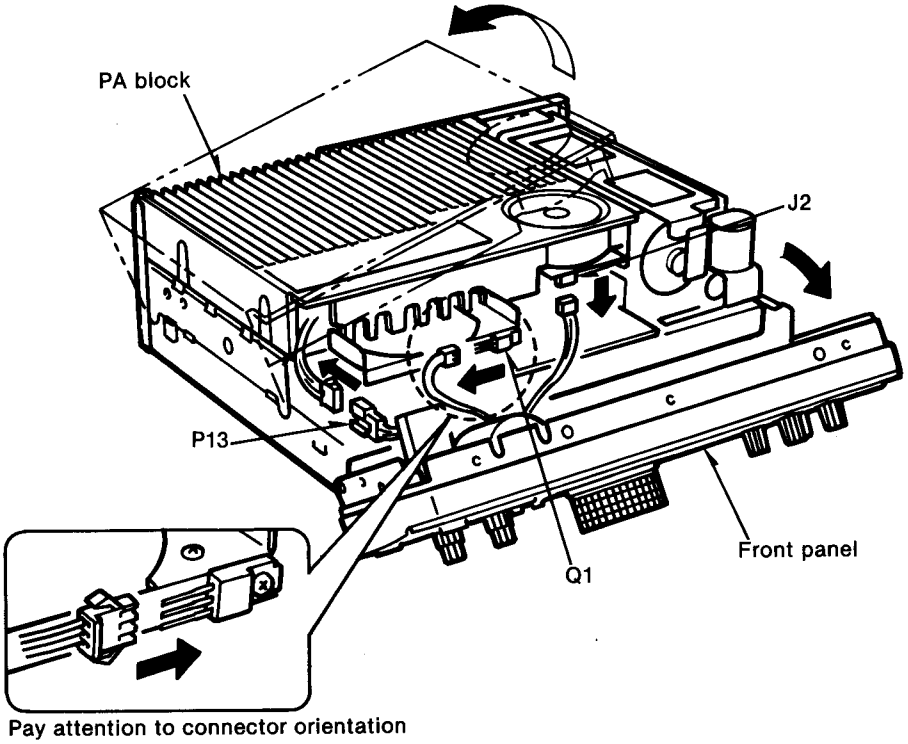

Fig. 3

2-2 REMOVING THE ANTENNA TUNER

1. Remove 3 screws Ⓓ and 6 screws Ⓔ as shown in Fig. 4.
2. Unplug 1 coaxial cable (J19) and 4 connectos (J7, J15, J16 and J17) from the CTRL unit as shown in Fig. 6. (p. 2-3).

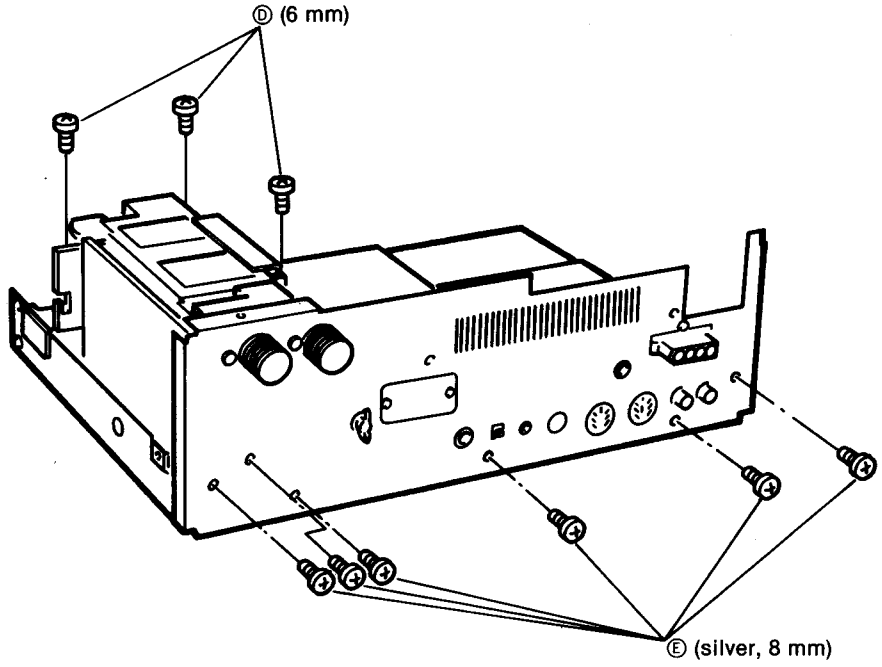

Fig. 4

3. Shiht the rear panel backward and remove the antenna tuner as shown in Fig. 5.

SECTION 4 CIRCUIT DESCRIPTION

4-1 RECEIVER CIRCUITS

4-1-1 RF SWITCHING CIRCUIT (ANT-SW AND MAIN UNITS)

The RF switching circuit leads receive signals to bandpass filters from an antenna connector while receiving. While transmitting, this circuit leads the signals from the RF power amplifier to the antenna connector. This circuit includes a 20 dB RF attenuator circuit to prevent distortion from very strong signals.

RF signals from an antenna connector, switched by the [ANT] switch, pass through the transmit/receive switching relay (RL1) and low-pass filter (L1, L2, C1–C5), and are then applied to the MAIN unit via P2 (MAIN unit: J12).

The signals from the ANT-SW unit are either bypassed or are attenuated at the 20 dB attenuator (R102, RL1). There are no non-linear components from the antenna connector to the attenuator in this circuit construction. Therefore the attenuator effectively prevents distortion caused by strong signals. The signals are then applied to RF filters.

4-1-2 RF BANDPASS FILTER CIRCUIT (MAIN UNIT)

RF bandpass filters pass only the desired band signals and suppress any undesired band signals.

The RF circuit has 7 RF bandpass filters (BPF) for signals above 1.6 MHz and 1 low-pass filter (LPF) for signals below 1.6 MHz. The signals pass through the low-pass or one of the bandpass filters depending on their frequencies.

(1) 0.5–1.6 MHz

There is no diode at the low-pass filter (L38, L39, C148–C150) entrance so as to prevent distortion from very strong signals. The filtered signals bypass a preamplifier through a bypass switch (Q12) and are then applied to the 1st mixer circuit (Q13, Q14).

(2) 1.6–30.0 MHz

These signals pass through a high-pass filter (L42, L43, C143–C146) to suppress strong signals below 1.6 MHz, such as from broadcasting stations. The filtered signals are applied to one of 7 bandpass filters depending on their frequencies and are then applied to the preamplifier circuit.

USED RF FILTER

BAND	CONTROL SIGNAL	ENTRANCE DIODE	BAND	CONTROL SIGNAL	ENTRANCE DIODE
0.5–1.6 MHz	B0	–	8–11 MHz	B4	D44
1.6–2 MHz	B1	D38	11–15 MHz	B5	D46
2–4 MHz	B2	D40	15–22 MHz	B6	D48
4–8 MHz	B3	D42	22–30 MHz	B7	D50

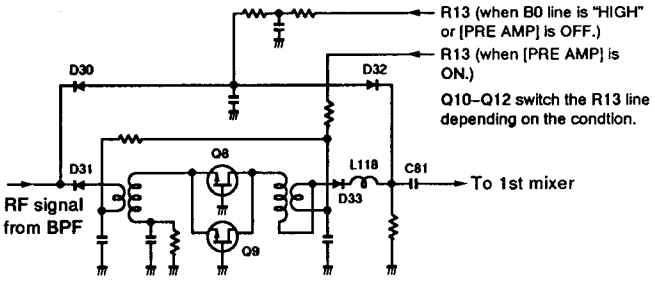
4-1-3 PREAMPLIFIER CIRCUIT (MAIN UNIT)

The preamplifier circuit uses two 2SK937s to obtain 10 dB gain over a wideband frequency range. When the [PRE AMP] switch on the front panel is turned ON, the signals above 1.6 MHz are applied to the preamplifier circuit.

Q8 and Q9 are connected in parallel to easily match the impedance to 50 Ω. Q10 and Q11 switch the signals from a bandpass filter, either to be bypassed, or to be applied to the preamplifier, depending on the [PRE AMP] switch condition.

Amplified or bypassed signals are applied to the 1st mixer circuit (Q13, Q14).

PREAMP CIRCUIT



4-1-4 1ST MIXER CIRCUIT (MAIN UNIT)

The 1st mixer circuit mixes the receive signals with the 1st LO signal to convert the receive signal frequencies to a 69 MHz 1st IF.

The signals from the preamplifier circuit, or signals which bypass the preamplifier, pass through a low-pass filter. This low-pass filter suppresses signals above 30 MHz to eliminate direct receiving of signals at 69 MHz and image interference at 140 MHz. The signals are then applied to the 1st mixer (Q13, Q14).

The 1st LO signal (69.0600–99.0115 MHz) enters the MAIN unit from the PLL unit via J5. The LO signal is amplified at Q4, filtered by a low-pass filter, and then, applied to the 1st mixer. The low-pass filter uses a ring core inductor to prevent leakage of 1st LO signals. The output level from Q4 is approx. 15 dBm.

The 1st mixer (Q13, Q14) uses two 2SK937s to produce high level mixing with a high intercept point.

EXACT 1ST IF FREQUENCY

MODE	FREQUENCY (MHz)
SSB	69.0115
CW	69.0106
AM, FM	69.0100

4-1-5 1ST IF CIRCUIT (MAIN UNIT)

The 1st IF circuit filters and amplifies the 1st IF signals. The 1st IF signals from the 1st mixer circuit are applied to MCF (Monolithic Crystal Filter; FI1) to suppress out-of-band signals. The filtered signals are applied to the 1st IF amplifier (Q15). AGC voltage is supplied to the 2nd gate of Q15.

4-1-6 2ND MIXER CIRCUIT (MAIN UNIT)

The 2nd mixer circuit mixes the amplified 1st IF signals and 2nd LO signal (60.00 MHz) to convert the 1st IF to a 2nd IF.

The amplified 1st IF signals from Q15 are converted to 9 MHz 2nd IF signals at the 2nd mixer (IC1). IC1 is a DBM (Double Balanced Mixer). The DBM uses a coil with a glass-type core to treat the LO signal at a 0 dBm level.

The 2nd IF signals are applied to FI2 to suppress undesired signals such as the 2nd LO signal, and are then applied to the noise blanker gate (D5–D8).

EXACT 2ND IF FREQUENCY

MODE	FREQUENCY (MHz)
SSB	9.0115
CW	9.0106
AM, FM	9.0100

4-1-7 NOISE BLANKER CIRCUIT (MAIN UNIT)

The noise blanker circuit detects pulse type noise, and turns OFF the signal line when noise appears.

The 2nd IF signals from FI2 are applied to the noise blanker gate (D5–D8). A portion of the signals from FI2 are amplified at the noise amplifiers (Q16, IC2, Q74), then detected at the noise detector (D12, D13). The detected signal from the noise detector is applied to the noise blanker switch (Q19).

A portion of the detected signal from the noise detector is applied to the noise AGC circuit (Q17, Q18, C60, R43, R47) to control the bias voltage of the noise amplifier (IC2 pins 1, 2).

The threshold level of the noise blanker switch (Q19) is set at 0.9 V. When the detected voltage exceeds the threshold level, Q20 outputs a blanking signal to close the noise blanker gate (D5–D8), depending on the pulse noise period.

When the operating frequency is changed, the "DNB" signal line becomes "LOW," turning Q20 ON through D14. In this case, the noise blanker gate prevents PLL click noise.

4-1-8 2ND IF CIRCUIT (MAIN UNIT)

The 2nd IF circuit amplifies and filters the 2nd IF signals.

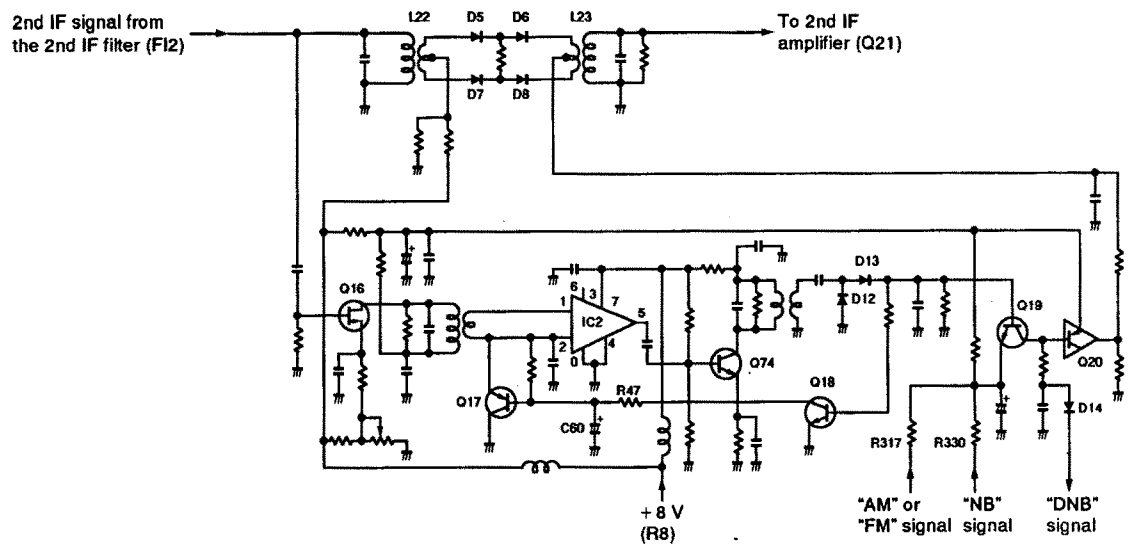
The signals passed through the noise gate (D5–D8) are amplified at Q21. The Loose tuning circuit (L24, C47) matches the signals to the 2nd IF filters.

When SSB or CW mode is selected, the signals pass through FI3 (FL-30). When an optional CW narrow filter is installed and CW-N mode is selected, the signals pass through the CW narrow filter. When AM mode is selected, the signals bypass the 2nd IF filter. When FM mode is selected, the signals are applied to the FMAM unit via the FIF signal line.

The filters are selected with mode selecting signals (SSB•CW, AM, CW-N) and the "T8" voltage line.

Signals from the filters are applied to the 3rd mixer (IC7) through D63.

NOISE BLANKER CIRCUIT



4-1-9 3RD MIXER AND 3RD IF CIRCUITS (MAIN UNIT)

The 3rd mixer circuit mixes the filtered 2nd IF signals and the 3rd LO signal to convert the 2nd IF to a 3rd IF.

The 2nd IF signals from D63 are converted to a 455 kHz 3rd IF signal at the 3rd mixer (IC7). The 3rd IF signal is applied to FI4 (for AM mode) or FI5 (for SSB and CW mode). The filters are selected by the mode selecting signals. The filtered signal is amplified at Q27, Q28 and Q29 to obtain a detectable level.

A rapid time constant of AGC is used for Q27 to prevent rising edge distortion of receive signals. A thermistor (R419), connected to the gate of Q28, improves the temperature characteristics of the receiver gain. R138 adjusts the receiver gain. Q76 mutes the IF signal from Q28 until the R8 voltage line becomes 8 V DC. This prevents unwanted signal reception, especially during CW full break-in operation.

Output signals from Q28 are applied to the SSB/CW detector. Output signals from Q29 are shared between the AM detector and AGC detector.

4-1-10 BFO CIRCUIT (MAIN UNIT)

A 9 MHz signal oscillated at the BFO circuit (Q31, X1) is buffer-amplified at Q42 and applied to the balanced modulator (IC6) for transmission, and to a product detector (IC5) after mixing with the 3rd LO signal at IC12 for receive demodulation.

In USB mode, the "USB" signal line becomes "HIGH," turning D69 ON. The frequency is then adjusted with C294 to set the USB carrier point.

During CW transmission, the "CW" signal line becomes "HIGH," turning D68 ON. The frequency is then adjusted with L83 to set the CW transmit carrier point.

In LSB mode, the "LSB" signal line becomes "HIGH," turning D67 ON. The frequency is then adjusted with L82 to set the LSB carrier point.

During CW reception, R8 voltage turns Q33 ON, then switching diodes (D67–D69) are turned OFF. The frequency is fixed by coils (L81–L83) and capacitors (C294, C230).

BFO FREQUENCY IN EACH MODE

MODE	FREQUENCY (MHz)
USB	9.0130
CW (Tx)	9.0106
LSB	9.0100
CW (Rx)	9.0098
AM, FM	NO OUTPUT

4-1-11 PBT CIRCUIT (MAIN UNIT)

The PBT (PassBand Tuning) circuit shifts the 3rd IF within ±1.5 kHz. As a result, the 3rd IF is shifted from the center frequency of the 3rd IF filter (FI5). This means the 3rd IF signal does not pass through the center of the 3rd IF filter because the passband width is fixed in the 2nd IF filter. Therefore, the overlap of the 2nd and 3rd IF filters appears to be narrowed.

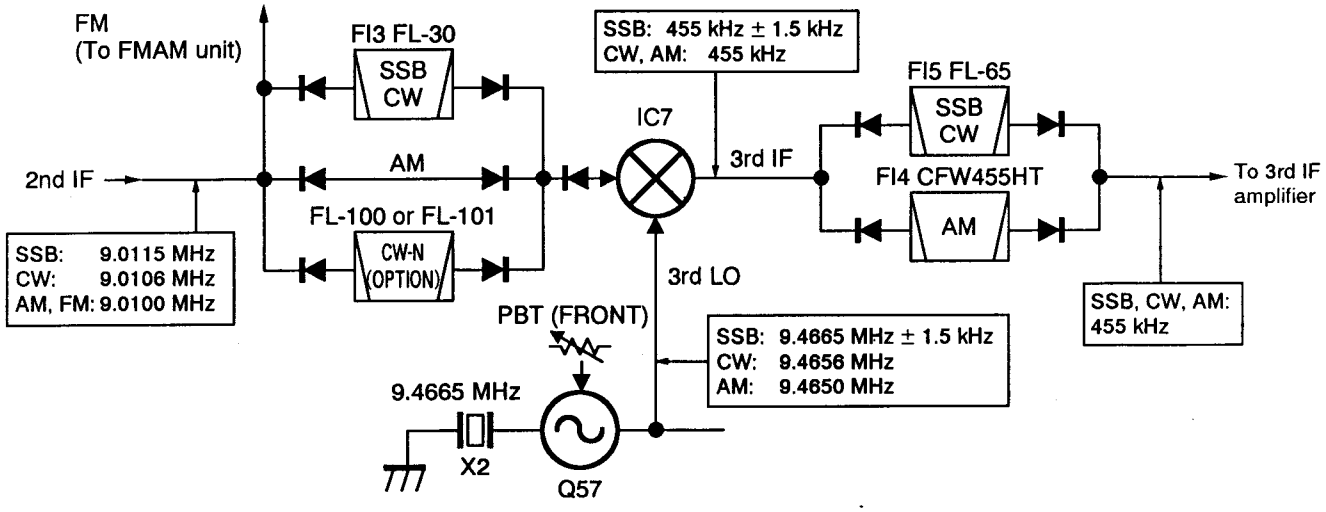
Since the BFO frequency is also shifted the same value as the 3rd IF shift, frequency is corrected at the detector.

The 3rd LO signal to IC7 is produced by Q57 and X2. In SSB mode, the signal is shifted within ±1.5 kHz by D101 variable voltage which is controlled by the [PBT] control. Therefore, the 3rd LO signal is shifted to activate the PBT.

In AM mode, D101 variable voltage is replaced with a preset voltage by Q62 and 9.4650 MHz is output regardless of the [PBT] control location.

In CW mode, D101 variable voltage is replaced with a preset voltage by Q60 and 9.4656 MHz is output regardless of the [PBT] control location.

PBT CIRCUIT



4-1-12 SSB/CW DEMODULATOR CIRCUITS (MAIN UNIT)

In SSB or CW mode, the 3rd IF signal from the IF amplifier (Q28) is mixed with the BFO signal from IC12 at the product detector (IC5) to demodulate the 3rd IF signal into an AF signal. The detected signal (AF) from IC5 (pin 3) is applied to the AF input mode selector switch (IC8).

4-1-13 AM DEMODULATOR CIRCUITS (MAIN UNIT)

In AM mode, the 3rd IF signal from the buffer amplifier (Q29) passes through C121 and is detected at D62. The detected signal (AF) is then applied to the AF input mode selector switch (IC8).

4-1-14 FM DEMODULATOR CIRCUIT (FMAM UNIT)

In FM mode, the 2nd IF signal, just before passing the 2nd IF filter, is applied to the FMAM unit via D52. The passed signal is applied to the FM IF IC where the IF signal is converted into the 3rd IF signal and is then converted into an AF signal.

X1 and X2 on the FMAM unit are used for the 3rd local oscillator and quadrature detector, respectively.

The detected signal (AF) is then applied to the AF input mode selector switch (IC8) on the MAIN unit.

4-1-15 AF INPUT MODE SELECTOR SWITCH (MAIN UNIT)

The AF signal from one of the detector circuits is applied to the AF input mode selector switch (IC8). IC8 consists of 4 analog switches which are selected with a mode signal and the squelch control signal. The AF signal is output from IC8 (pins 1, 4, 11) and then applied to the AF notch circuit.

4-1-16 AGC CIRCUIT (MAIN UNIT)

The AGC (Automatic Gain Control) circuit reduces IF amplifier gain to keep the audio output at a constant level.

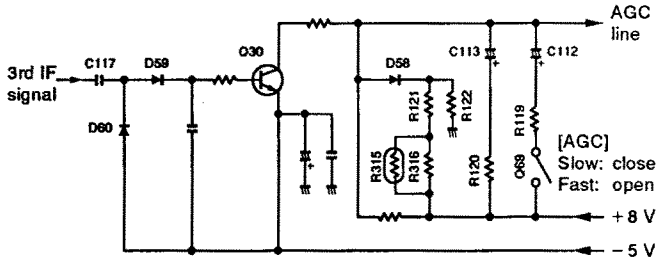
The receiver gain is determined by the voltage on the AGC line (Q30, collector). The voltage is usually set by D58 and the resistance ratio of R121, R122, R315 and R316.

The 3rd IF signal from the buffer amplifier (Q29) is detected at the AGC detector (D59, D60) and is then applied to the DC amplifier (Q30). − 5 V is applied to the Q30 emitter to activate the AGC line on the minus voltage.

When receiving strong signals, the detected voltage increases and the voltage of the AGC line decreases via the DC amplifier (Q30). As the AGC line is used for the bias voltage of the IF amplifiers (Q15, Q21, Q27), IF amplifier gain is decreased.

When the strong signal disappears, the AGC line voltage is released by C113 and R120 while fast AGC is set. When slow AGC is set, C112 and R119 are connected in parallel to obtain a slow AGC release time.

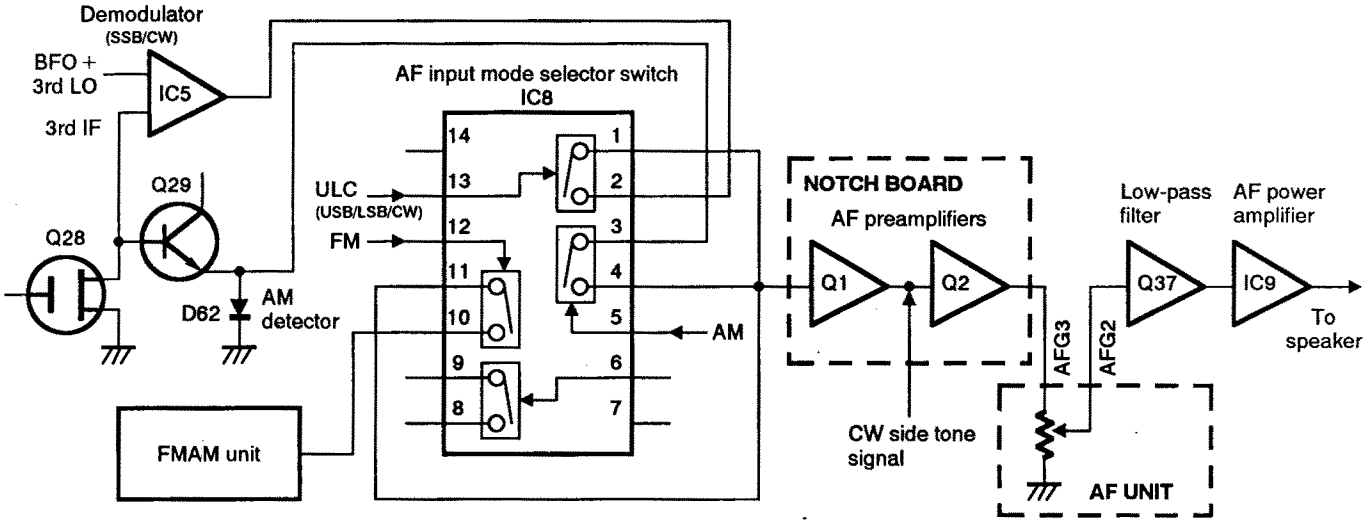
AGC CIRCUIT



4-1-17 S-METER CIRCUIT (MAIN UNIT)

The S-meter circuit indicates the relative received signal strength while receiving by utilizing the AGC voltage which is changed depending on the received signal strength.

AF CIRCUIT



The AGC bias voltage (time constant line) is applied to a differential amplifier (IC4 pin 6) where the difference between the bias and reference voltages is detected.

The resulting S-meter signal passes through the meter switching circuit (IC8) and is then applied to the S/RF meter on the front panel. The reference voltage is adjusted with R116. IC8 (pins 8 and 9) are shorted inside the IC while receiving.

The FM S-meter signal from the FMAM unit is applied to the meter switching circuit (IC8 pin 9) via the "FSM" signal line. The signal is also applied to the squelch circuit (IC4 pin 2).

4-1-18 SQUELCH CIRCUIT (MAIN UNIT)

The squelch circuit mutes audio output when the S-meter signal is lower than the [SQL] control setting level.

The S-meter signal (SSB, CW, AM) from IC4 (pin 7) is applied to the comparator (IC4 pin 2) through D56 to be compared with the threshold level set by the [SQL] control.

In FM mode, the 3rd IF signal is amplified and detected at IC2 and D3/D4, respectively, in the FMAM unit. The detected signal (S-meter signal) is then applied to the comparator (IC4 pin 2).

When the S-meter signal is lower than the threshold level, the comparator becomes "HIGH" and Q32 turns OFF to deactivate the AF input mode selector switch (IC8 pins 5, 12, 13). This cuts AF output OFF. This signal is then applied to Q34, turning OFF the [RX] indicator, and is also applied to the [MICROPHONE] connector (pin 4) and [ACC(1)] connector (pin 6).

4-1-19 AF NOTCH CIRCUIT (NOTCH BOARD)

The notch circuit attenuates the specified audio frequency to increase intelligibility from desired signals.

The AF signal from the AF input mode selector switch (IC8) is applied to the AF notch circuit via an analog switch (IC2). IC2 and IC3 are analog switches which either select the AF signal to the notch circuit or bypass the notch circuit.

The signal is then applied to an active bandpass filter (IC1a), which has very narrow width characteristics, to pick up the interference frequency in reverse phase. The resulting signal is mixed with the original signal at R8 to obtain approx. 20 dB attenuation of the interference frequency components.

The center frequency can be adjusted with the [NOTCH] control. IC1b functions as a buffer amplifier.

4-1-20 AF AMPLIFIER CIRCUIT (NOTCH BOARD AND MAIN UNIT)

The AF amplifier amplifies the AF input signal to a suitable driving level for the speaker.

The AF signal from the AF notch circuit is applied to the AF preamplifiers (NOTCH board Q1, Q2). The CW side tone signal is applied to Q2.

The amplified signal is applied to the [AF] control (R1 on the AF unit) and then to the 2.8 kHz cut-off active low-pass filter (Q37). The AF signal output from Q37 is power-amplified at IC9 to drive the speaker.

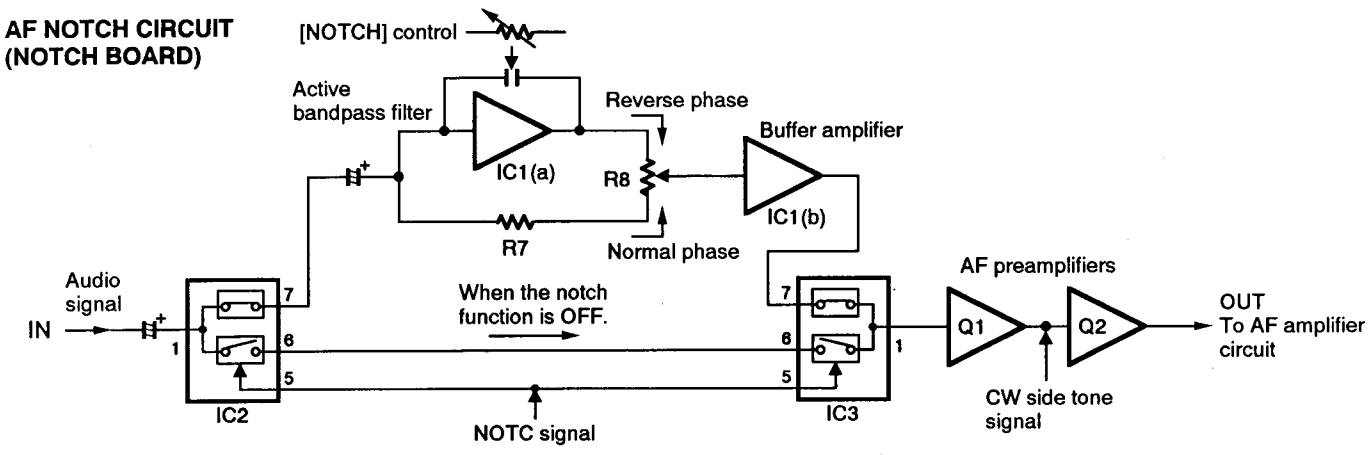
4-2 TRANSMITTER CIRCUITS

4-2-1 MICROPHONE AMPLIFIER CIRCUIT (MIC AMP BOARD AND AF UNIT)

The microphone amplifier circuit amplifies the microphone input signals and outputs the amplified signal to the balanced modulator and FMAM unit. The speech compressor circuit is included in this circuit.

Audio signals from the [MICROPHONE] connector are amplified at Q1 (MIC AMP board) and then Q2 (AF unit). The amplified signals are then adjusted at the [MIC] control and amplified again at Q1 (AF unit). External modulation input from the [ACC(1)] socket (pin 4) is also applied to Q1 via R5 (AF unit). The microphone bias voltage is supplied from this circuit.

When the speech compressor is ON, the gain of Q2 increases and the diode limiter (AF unit D1, D2) is activated. The compression level is set by R17 (DISPLAY unit).



4-2-2 BALANCED MODULATOR (MAIN UNIT)

The balanced modulator converts the AF signal from the microphone amplifier to a 9 MHz IF signal with a BFO signal.

Output signals from the microphone amplifier and the CW keying signal are applied to the balanced modulator (IC6 pin 5). The BFO signal, buffer-amplified at Q42, is applied to IC6 (pin 7) as a carrier signal.

IC6 is a double balanced mixer IC and outputs a double side band (DSB) signal with − 40 dB carrier suppression.

R177 and R179 adjust the balanced level of IC6 for maximum carrier suppression. In CW mode, the CW keying signal upsets the balance to create a carrier signal.

4-2-3 FM AND AM MODULATION CIRCUITS (FMAM UNIT)

The microphone signals from the AF unit enter the FMAM unit via P2 (FMI2 line) and are then amplified at Q11 and the limiter amplifier/low-pass filter (IC5a/b).

In FM mode, the microphone signals are applied to the modulator circuit (D8) via R42. The modulation circuit changes the reactance of the FM local oscillator (Q1, X3) to obtain FM modulation. The modulated signal is amplified at IC3 and IC4 and is then applied to the transmitter IF circuit (MAIN unit Q22).

In AM mode, the microphone signals are applied to the local oscillator amplifier (IC4) via R44 as bias voltages to obtain AM modulation.

4-2-4 CW KEYING CIRCUIT (MAIN UNIT)

The CW keyer is connected to Q38. When the CW key is closed, 8 V is output from Q38 and this voltage controls break-in operation, the side tone signal and the transmit signal.

The 8 V from Q38 is applied via D93 to the balanced modulator (IC6) to unbalance the IC6 input bias voltage and create a carrier signal. R241 determines the transmit delay timing.

(1) BREAK-IN

When the [BK-IN] switch (S3 in the DISPLAY unit) is pushed IN, the IC-737 is automatically set to the transmission condition by CW keying. The 8 V from Q38 is applied to Q52 base via Q26. When the key is closed, Q52 grounds the SEND line for transmitting.

The transmit release delay time is determined by C252, R245 and the [DELAY] control (R244). When the [FULL] switch (S4 in the DISPLAY unit) is pushed IN, R425 is connected in parallel to obtain faster release time.

(2) SIDE TONE

When the CW key is closed, the side tone circuit (Q40) oscillates and sends the signal to the AF circuit.

Normally, D91 is ON, and C249 is connected to the Q40 collector so that no oscillation occurs. When the CW key is closed, the 8 V from Q38 via D92 give D91 reverse bias to disconnect C249 from Q40. Q40 then oscillates with 800 Hz as a side tone signal. R268 prevents side tone click noise.

(3) KEYING

Keying is controlled at 2 points in the IC-737. The balanced mixer (IC6) stops the carrier output by recovering the balance of the input bias voltage. D35, located at the 2nd IF mixer (IC1) input, cuts the signal line.

C251, R240 and R241 determine the voltage wave form to IC6 (pin 5) to make the keying wave form.

(4) ELECTRONIC KEYER (ELEKEY UNIT)

When a paddle is connected to the [KEY] jack and the [ELEKEY] switch (MAIN unit S2) is pushed IN, a "DOT" or "DASH" signal is applied to the electronic keyer IC (IC1).

The CW keying speed is adjusted with the [KEY SPEED] control (AF unit R2). The ratio of DOT:SPACE:DASH (keying weight) can be adjusted from 1:1:3 to 1.8:1:3.8 with R8.

IC1 outputs the keying signal in adjusted CW keying speed and weight, and the keying signal is then applied to Q38 in the MAIN unit.

4-2-5 IF AMPLIFIER (MAIN UNIT)

The SSB/CW 9 MHz IF signal passes through the FI3 (FL-30) to suppress the unwanted sideband signal, then the signal is applied to a transmit IF amplifier (Q22). The optional CW narrow filter is not used in transmitting.

The amplified signal from Q22 is mixed with the 2nd LO signal and converted to a 69 MHz IF signal at IC1. IC1 is used in receiving and transmitting. The FM/AM signal from the FMAM unit is also amplified at Q22 and is then applied to IC1.

The 69 MHz IF signal is amplified at the IF amplifier (Q7) and is then converted to the displayed frequency at the balanced mixer (Q2, Q3) with the 1st LO signal.

The gates of the IF amplifiers (Q7, Q22) are controlled by ALC bias voltage from the ALC circuit. A thermistor (R89), connected to the gate of Q22, improves the temperature characteristics of the transmitter gain. R85 adjusts the total transmitter gain.

4-2-6 RF CIRCUIT (MAIN AND PA UNITS)

The displayed frequency signal converted at the balanced mixer (Q2, Q3 in MAIN unit) is applied to the bandpass filter (L2, L3, C4–C7, C415) where unwanted LO signal emission is reduced. The filtered signal is amplified at Q1, and is then applied to the PA unit via the attenuator.

The signals from the MAIN unit are amplified at the predrive amplifier (Q1), drive amplifier (Q2, Q3) and power amplifier (Q5, Q6) in the PA unit to obtain a stable 100 W of RF output power.

The predrive amplifier is a class A amplifier with a Vcc of 13.8 V. The drive amplifier is a class AB push-pull amplifier with a Vcc of 13.8 V. D1 controls bias voltage to the drive amplifier.

The impedance of the signal from the drive amplifier is converted at L4, then the signal is applied to the power amplifier (Q5, Q6). The power amplifier is a class AB push-pull amplifier and amplifies the input signal to 100 W. D2 and D3 control bias voltage to the power amplifier. The signal from the power amplifier is applied to one of the low-pass filters.

4-2-7 LOW-PASS FILTER CIRCUIT (FILTER UNIT)

The low-pass filter circuit consists of 6 Chebyschev low-pass filters to suppress the higher harmonic components. The signal from the power amplifier (Q5, Q6) is applied to one of the low-pass filters (depending on its frequency). The filter switching voltage from the PLL unit (J7) passes through the MAIN unit and is applied to the FILTER unit via P2.

The filtered signal passes through the SWR detector circuit (L27) and is then applied to one of 2 antenna connectors via the antenna tuner circuit.

4-2-8 ALC CIRCUIT (MAIN UNIT)

The ALC (Automatic Level Control) circuit controls the gain of IF amplifiers in order for the IC-737 to output a constant RF power set by the [RF PWR] control even when the supplied voltage shifts, etc.

The RF power signal level is detected at D1 (FILTER unit) and applied to the MAIN unit as the "FOR" voltage.

The "FOR" voltage from the FILTER unit is applied to IC11 (pin 2) in the MAIN unit. The "POC" voltage, set by the [RF PWR] control (R16 on the DISPLAY unit), is applied to IC11 (pin 3) as the reference voltage.

When the "FOR" voltage exceeds the "POC" voltage, ALC bias voltage from IC11 (pin 1) controls the IF amplifiers (Q7, Q22). This adjusts the output power to the determined level by the [RF PWR] control until the "FOR" and "POC" voltages are equalized.

In AM mode, IC11 operates as an averaging ALC amplifier with C51 in the FMAM unit. Q54 turns ON and the "POC" voltage is shifted for 40 W AM output power (maximum) through R207.

The ALC bias voltage from IC11 (pin 1) is also applied to the inversion-amplifier (IC11 pin 6) to control the intensity of the [TX] indicator via R202 and D77, indicating the ALC level.

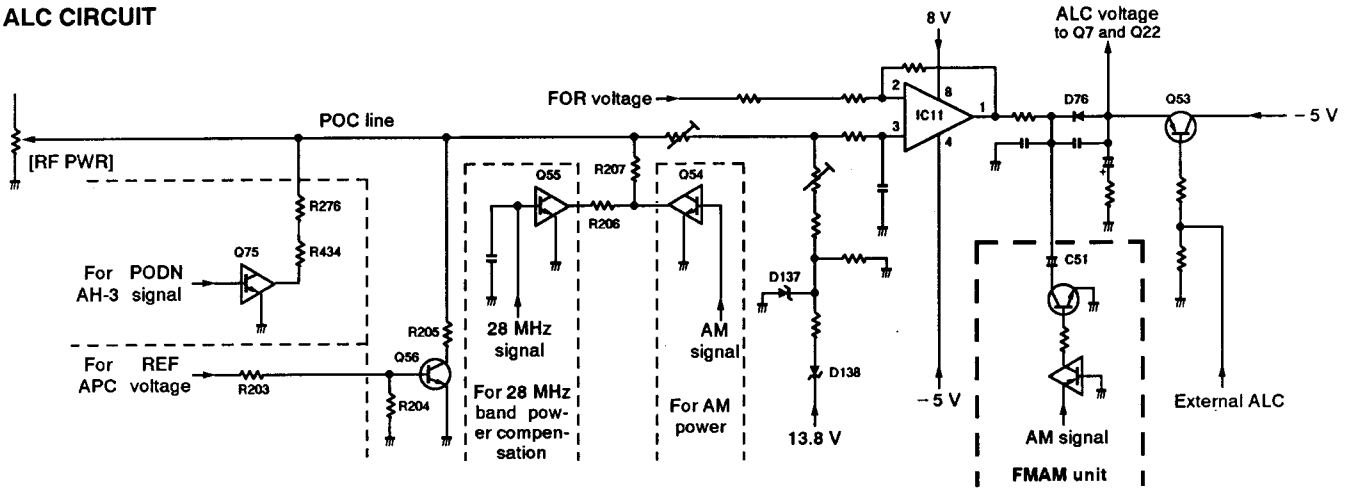
An external ALC input from the [ALC] jack is applied to the buffer amplifier (Q53). External ALC operation is identical to that of the internal ALC.

4-2-9 APC CIRCUIT (MAIN UNIT)

The APC (Automatic Power Control) circuit protects the power amplifiers on the PA unit from high SWR and excessive current.

The reflected wave signal appears and increases on the antenna connector when the antenna is mismatched. D2 of the SWR detector circuit (L27, D1, D2) in the FILTER unit detects the signal and applies it to Q56 in the MAIN unit as the "REF" signal.

ALC CIRCUIT



When the "REF" signal level increases, Q56 decreases the POC line voltage via R205. The POC line voltage is applied to IC11 to activate the ALC.

For the IC APC, the power transistor current is obtained by detecting the voltages ("ICH" and "ICL") which appear at both terminals of a 0.012 Ω resistor (R26 on the PA unit). The detected voltage is applied to the differential amplifier (IC10 pins 5, 6). When the current of the final transistors is more than 22 A, IC10 controls the ALC line via D73 to prevent excessive current flow.

Q55 is used for power reduction to prevent excessive current flow, when transmitting on the 28 MHz band, using the ALC line.

During tuning an antenna with an optional AH-3, the "PODN" signal turns Q75 ON. As a result, the "POC" voltage is shifted for 12 W output power.

4-2-10 TEMPERATURE PROTECTION CIRCUIT (PA UNIT)

A cooling fan (MF1) is activated while transmitting or if the temperature of Q5 or Q6 exceeds the preset value.

While transmitting, Q7 and Q8 are turned ON and provide a voltage to MF1 via R29. Thermistor R32 detects the temperature of Q5. If the Q5 temperature is more than 50℃ (122 ℉), R32 keeps turning Q7 and Q8 ON to rotate the cooling fan even when the transceiver condition has changed from transmitting to receiving.

A thermal switch (S1) is thermally-connected to Q6. When the Q6 temperature exceeds 90℃ (194 ℉), S1 is turned ON and provides a voltage for high speed rotation to MF1 via R28.

4-2-11 RF METER CIRCUIT (MAIN UNIT)

The "FOR" voltage from the FILTER unit is applied to the Po meter amplifier (IC10 pin 3). The amplified voltage is output from IC10 (pin 1) and then applied to the meter. R186 adjusts the meter sensitivity and R189 and C261 are used for RF meter peak power hold.

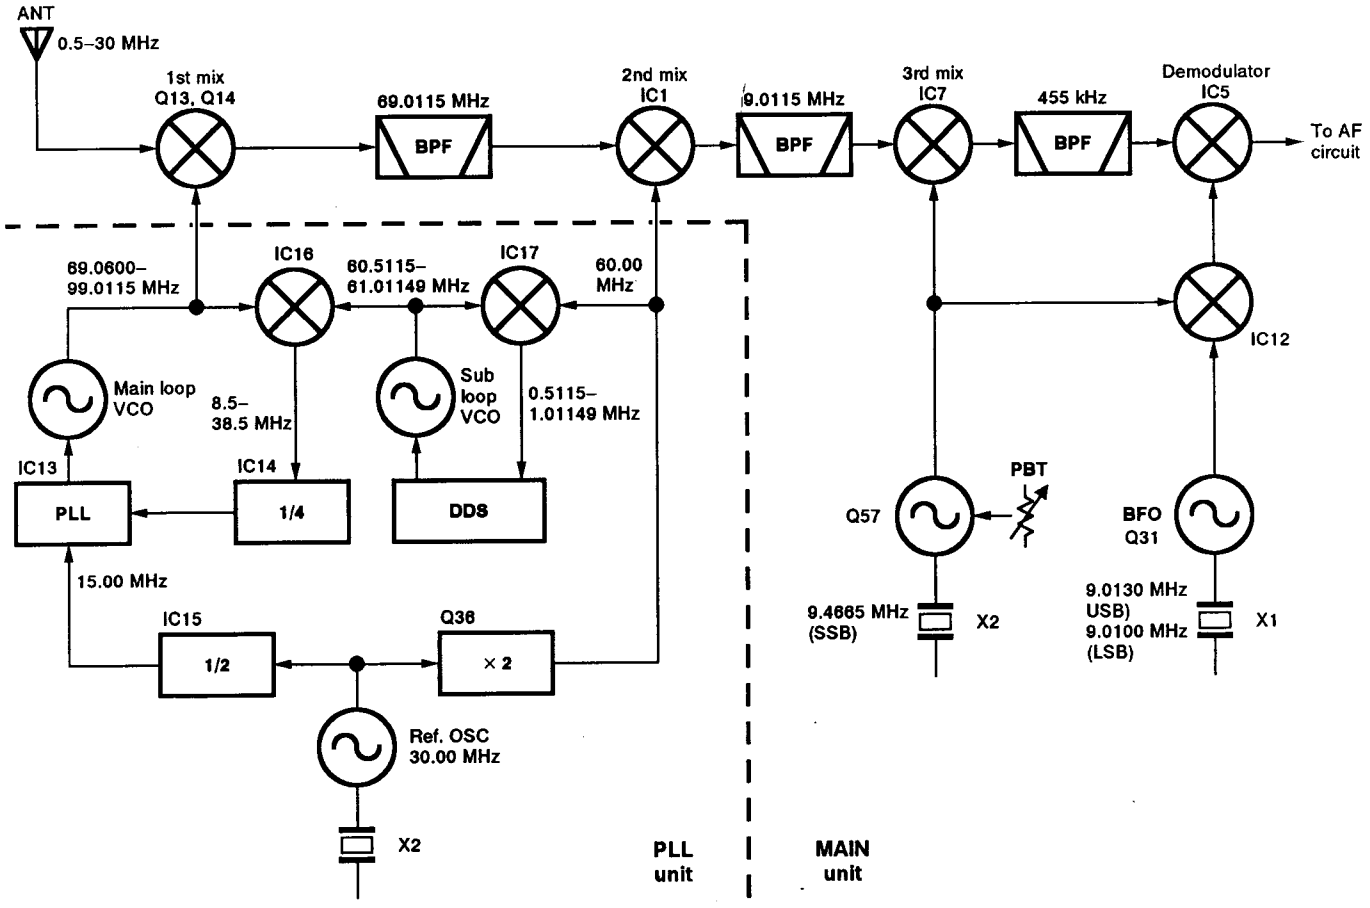
4-3 PLL CIRCUITS

4-3-1 GENERAL DESCRIPTION

The PLL unit generates a 1st LO signal (69.0600–99.0115 MHz variable) and a 2nd LO signal (60.00 MHz fixed is used for the MAIN unit). The IC-737 uses a dual loop PLL system.

The main loop PLL contains 4 VCO circuits for all HF band coverage within 500 kHz steps. The sub loop PLL employs the DDS (Direct Digital Synthesizer) system which ensures a rapid lockup time and high quality frequency oscillation for 500 kHz coverage within 10 Hz steps.

FREQUENCY CONSTRUCTION



4-3-2 1ST LO PLL CIRCUIT (PLL UNIT AND DDS BOARD)

The 1st LO circuit employs a dual loop PLL system. One of four VCO oscillation signals (main loop) is mixed with the signals from the sub loop PLL at IC16 and the resulting signal is divided by 4 at IC14 and then applied to the PLL IC (IC13). The signal is then divided by a programmable divider and compared with the reference frequency in IC13. The phase detected signal is converted to lock voltage at the active loop filter (Q12–Q14) and is then fed back to a VCO circuit to control the oscillation frequency.

In the sub loop PLL, the programmable dividing and phase detection are performed by digital processing in the DDS board. The sub loop, therefore, ensures that a high speed and a high quality signal can be generated. Meanwhile, the main loop PLL generates 500 kHz steps – this means high speed PLL can be accomplished – and 10 Hz steps are processed by the DDS. The quality of the dual loop PLL circuit is determined by the sub loop PLL.

4-3-3 MAIN LOOP CIRCUIT (PLL UNIT)

One of four VCO circuits is switched by the VCO switching signal ("VCO1"–"VCO4"). The oscillated signal is buffer-amplified at Q23 and Q46 and then applied to the mixer (IC16 pin 7). The sub loop PLL output signal is also applied to the mixer (IC16 pin 5).

The mixed signals are amplified at Q27 and then applied to the low-pass filter (L23–L25, C92, C93, C99–C103). The filtered signal is amplified at Q26 and then divided by 4 at IC14. Then the signal is applied to the PLL IC (IC13).

The signal is divided at the programmable divider section in IC13 and is then phase detected at the phase comparator section with the 125 kHz reference frequency. The phase detected signal is output from pin 17 and is then converted to a DC voltage (lock voltage) by the active loop filter (Q12–Q14). The lock voltage is applied to the varactor diodes (D48, D50, D52, D54) in the VCO circuits to change the capacitance of these diodes and control the oscillation frequency.

The VCO oscillating signal is then buffer-amplified at the buffer amplifiers (Q23, Q24) and is then applied to the MAIN unit as a 1st LO signal.

4-3-4 SUB LOOP CIRCUIT (PLL UNIT AND DDS BOARD)

The oscillated signal at the sub loop VCO (Q29, 60.5115–61.01149 MHz) is amplified at the buffer amplifier (Q30) and is then applied to the mixer (IC17 pin 5). The 60.00 MHz signal is also applied to this mixer (IC17 pin 7).

The mixed signal (0.5115–1.01149 MHz) passes through the low-pass filter (L32, C126) and is amplified at Q32. The signal is then applied to the DDS board.

The DDS board outputs pulse-type signals. The signals are applied to the loop filter (R133, R134, C114, C115, L42) to be converted to a DC voltage (lock voltage). The lock voltage is applied to the varactor diode (D56) to change the capacitance of this diode and control the sub loop VCO oscillation frequency.

4-3-5 REFERENCE OSCILLATOR CIRCUIT (PLL UNIT)

The reference oscillator circuit consists of Q33 and X2. 30.00 MHz reference frequency is oscillated to produce a 2nd LO signal and PLL reference frequency.

The reference frequency is buffer-amplified at Q34 and is then divided by 2 at IC15. The 15.00 MHz frequency is divided by 120 at the PLL IC (IC13) to obtain the 125 kHz PLL reference frequency.

The 30.00 MHz reference frequency is multiplied by 2 at Q36 to obtain the 2nd LO signal. The resulting 60.00 MHz signal is filtered at the bandpass filter and is then applied to a sub loop mixer (IC17) and to the MAIN unit via P4 as the 2nd LO signal.

4-4 LOGIC CIRCUITS

4-4-1 BAND SELECTION DATA (PLL UNIT)

To select the correct bandpass filter, low-pass filter and VCOs on the MAIN and PLL units, the CPU outputs the following band selection data from the I/O expander (IC23) depending on the displayed frequency.

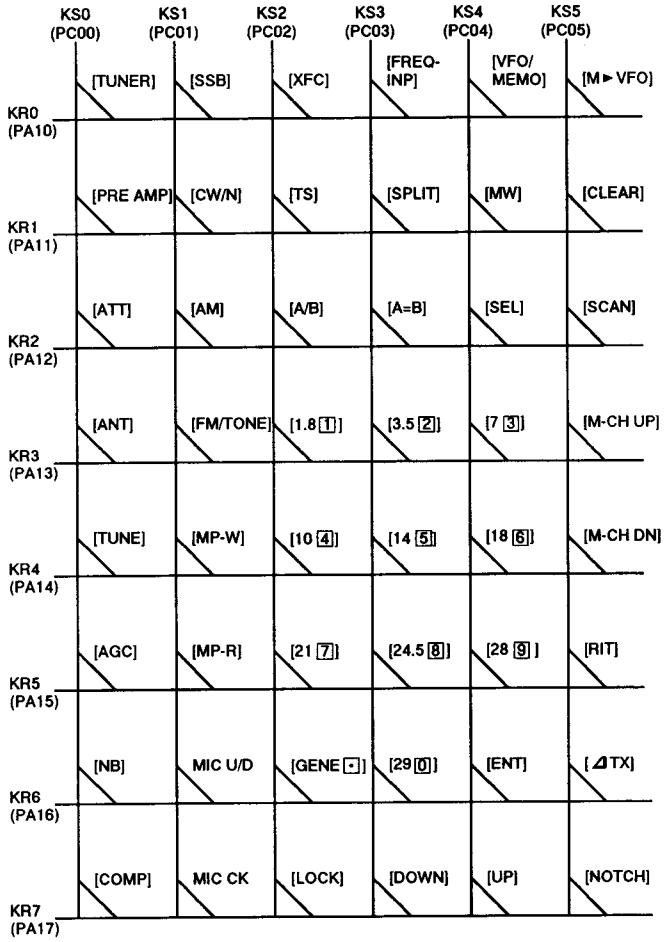
BAND SELECTION DATA

FREQUENCY (MHz)	BPF	BAND VOLTAGE	LPF	VCO
0.5–1.59999	B0	7.4 V	L1	VCO1
1.6–1.99999	B1			
2.0–3.99999	B2	6.1 V	L2	
4.0–7.99999	B3	5.1 V	L3	
8.0–10.99999	B4	0.0 V	L4	VCO2
11.0–14.99999	B5	4.1 V		
15.0–21.99999	B6	3.2 V	L5	VCO3
22.0–29.99500	B7	2.2 V	L6	VCO4

4-4-2 RIT CONTROL (LOGIC UNIT)

The [RIT] control shifts a voltage to shift the receive frequency. The voltage is applied to IC8 (pin 4). IC8 is an A/D converter which outputs 8-bit serial data corresponding to analog input voltage. The resulting serial data is applied to the I/O interface (IC6) port PB00.

4-4-3 KEY MATRIX (SW, M-CH AND LOGIC UNITS)



4-4-4 CPU (LOGIC UNIT)

The CPU (IC3) contains an 8-bit CMOS CPU with a 12.288 MHz clock for rapid operation. The CPU controls the operating frequency, mode, function display, etc. The memory contents such as memory channel information are stored in the RAM IC chip (IC5) using a lithium backup battery which has a normal life of more than 5 years.

The Icom CI-V network system allows the IC-737 to be remotely controlled by a personal computer using an RS-232C I/O port.

4-4-5 I/O INTERFACE PORT ALLOCATIONS (LOGIC UNIT: IC6)

• INPUT PORTS

PORT NAME	PIN NUMBER	DESCRIPTION
KR0–KR7 (PA10–PA17)	23–19, 17–15	Input ports for return signals of the key matrix.
DIDN, DIUP (PC16, PC17)	29, 28	Input ports for up/down signal of the main dial.
DITS (PC15)	30	Input port for rapid rotation of the main dial.
DIQ1–DIQ5 (PC10–PC14)	32–35, 31	Input ports for 5-bit data of the main dial.
ADDT (PB00)	47	Input port for serial data of the [RIT] control.
IKEY (PB01)	48	Input port for the internal antenna tuner. This port becomes "LOW" while tuning.
EKEY (PB02)	49	Input port for the external antenna tuner (AH-3). This port becomes "LOW" when the antenna cannot be tuned.
CONNECT (PB03)	50	Input port for connection of the external antenna tuner. This port becomes "HIGH" when an external antenna tuner (AH-3) is connected.
SQLS (PB04)	52	Input port for the squelch signal. This port becomes "LOW" when the squelch is open.
TRC (PB05)	53	Input port for transmit/receive switching signal. This port becomes "HIGH" while transmitting.
CBUS (PB06)	55	Input port for busy signal of the CI-V bus line. This port becomes "HIGH" when the bus line is busy.

• **OUTPUT PORTS**

PORT NAME	PIN NUMBER	DESCRIPTION
STEN (PC07)	4	Outputs a strobe enable signal.
KS0–KS6 (PC00–PC06)	9–11, 13, 8, 7, 5	Output strobe signals for the key matrix and output expanders.
$\overline{\text{CRES}}$ (PB11)	37	Outputs a reset signal for the CI-V bus latch.
PODN (PB12)	38	Outputs a control signal for setting the tuning output power of the AH-3.
CSEN (PB13)	39	Outputs a control signal for tuning transmission.
$\overline{\text{ESTART}}$ (PB14)	40	Outputs a control signal for the external antenna tuner (AH-3).
$\overline{\text{ISTART}}$ (PB15)	42	Outputs a control signal for turning the internal antenna tuner ON.
$\overline{\text{ADCS}}$ (PB16)	43	Outputs an enable signal for the output expanders.
ADCK (PB17)	44	Outputs a clock signal for the output expanders.
NLDA (PA07)	71	Outputs a band signal for future use.
28M (PA06)	72	Outputs a 28 MHz band signal for the ALC circuit.
$\overline{\text{PLEN}}$ (PA05)	73	Outputs an enable signal for the PLL and DDS data.
DSTB (PA04)	74	Outputs a strobe signal for DDS.
PSTB (PA03)	75	Outputs a strobe signal for the main loop PLL.
$\overline{\text{INH}}$ (PA02)	76	Outputs an inhibit signal for the LCD drivers and output expanders.
LCE1, LCE2 (PA00, PA01)	78, 77	Output enable signals for the LCD drivers.

4-5 ANTENNA TUNER CIRCUITS

4-5-1 MATCHING CIRCUIT (TUNE UNIT)

The matching circuit is a T-network. Using 2 motors, the matching circuit obtains rapid overall tuning speed.

Using relays (RL1–RL6), the BPF selector signal (B2–B7) from the PLL unit grounds one of the taps of L1–L4. After selecting the coils, 2 motors (TUNER unit MF1, MF2) adjust C1 and C2 using the output of a motor control circuit to obtain a low SWR (Standing Wave Ratio).

4-5-2 DETECTOR CIRCUIT (CTRL UNIT)

The antenna tuner has 3 detector circuits: an SWR detector, a resistance component detector and a reactance component detector.

Forward and reflected power are picked up by L1, detected by D1 and D2, and then amplified at IC1a/b. The amplified voltages are applied to the SWR board. The SWR board outputs a signal according to the ratio of forward power to reflected power. The signal is compared with the reference voltage at IC6a to detect SWR exceeding 3:1.

Resistance components are picked up by L12 and detected by D8 and D9. D8 outputs negative voltage and D9 outputs positive voltage. Output voltage of the resistance component detector is added to the voltage output from D8 and D9. When antenna impedance is higher than 50 Ω, output voltage is negative; when lower than 50 Ω, positive.

Reactance components are picked up by comparing the phases of the RF current and RF voltage. The RF current is detected by L10 and R36. RF voltage is detected by C17–C19. Both detector voltages are buffer-amplified at Q1, Q2, Q25 and Q26, and are then applied to the phase comparator (IC3, IC5). The output signal of IC5 is detected at D6 and D7. When the RF current phase leads the voltage phase, the detected voltage is negative; when the current lags the voltage, the detected voltage is positive.

4-5-3 MOTOR CONTROL CIRCUIT (CTRL UNIT)

The antenna tuner CPU (IC10) controls the tuning motors and memorizes the best preset position on each band. The memory contents are stored in the CPU using a lithium backup battery which has a normal life of more than 5 years.

The output signal of the resistance detector is compared with a reference voltage (V_{REF}) at IC6 (pins 5 and 6), and applied to the A/D converter section (IC10, pin 19). The CPU outputs an RC1 or RC2 signal to the motor driver (IC9) to drive the motor (TUNER unit MF2) in the matching circuit. These signals become a pulse signal just around the preset position for precise and rapid tuning. To detect C2 rotation, voltage from the variable resistor (VR-E unit R1) is applied to the CPU.

The output signal of the reactance detector is compared with the reference voltage (V_{REF}) at IC6 (pins 12 and 13), and applied to the A/D converter section (IC10, pin 18). The CPU outputs a ϕ C1 or ϕ C2 signal to the motor driver (IC9) to drive the motor (TUNER unit MF1) in the matching circuit. To detect C1 rotation, a voltage from the variable resistor (VR-D unit R1) is applied to the CPU.

The reset circuit halts the CPU while the motor is not controlled. When the operating band is changed, the band signal comparator (IC13) outputs a "LOW" signal to a reset control circuit. The reset control circuit turns the CPU ON, setting C1 and C2 on the TUNE unit to their preset positions.

When the antenna tuner cannot tune from a previously memorized preset position, a re-try function is activated. The re-try function tunes C1 and C2 from end to end 3 times.

4-5-4 ANTENNA TUNER CPU PORT ALLOCATIONS

• INPUT PORTS

PORT NAME	PIN NUMBER	DESCRIPTION
ϕ PV	16	Input port for the detection of C1 position.
RPV	17	Input port for the detection of C2 position.
ϕ	18	Input port for the reactance detection voltage. This voltage becomes $V_{REF}/2$ when the antenna is matched.
R	19	Input port for the resistance detection voltage. This voltage becomes $V_{REF}/2$ when the antenna is matched.
WR	23	Input port for the WRITE mode signal.
SET	24	Input port for the SET signal.
PWRS	26	Detects the power voltage. When the signal is "LOW," the CPU is backed up.
B1–B3	29–27	These are input ports for the 3-bit band signal from the PLL unit.
SEND	30	Inputs transmit/receive switching signals. This port becomes "LOW" while transmitting.
SWR	31	Detects an SWR signal. When the SWR exceeds 3, this port becomes "HIGH."
TUNR	32	Detects a tuner switch signal. The signal is "HIGH" when the [TUNER] switch is turned ON.
RESET	34	Inputs a reset signal. This port becomes "HIGH" at the beginning of transmission or when the operating band is changed.

• OUTPUT PORTS

PORT NAME	PIN NUMBER	DESCRIPTION
WAIT	6	Outputs a control signal for the [TUNE] indicator. This port becomes "HIGH" while tuning or pre-setting. This port becomes "HIGH" and "LOW" alternately when the antenna tuner cannot tune the antenna with the re-try function.
b1–b3	10–8	These are output ports for the current 3-bit band signal of the antenna tuner.
ϕ C1, ϕ C2	12, 11	Output control signals for MF1.
RC1, RC2	14, 13	Output control signals for MF2.
V_{REF}	20	Outputs a reference voltage for the resistance and reactance detectors.
WAKE	25	Outputs a control signal for the reset circuit. This port becomes "HIGH" while the CPU clock is oscillated.
TUN	39	Outputs a tuner switch signal. The signal is "HIGH" when the TUNR port is "HIGH."

4-6 REGULATOR CIRCUITS

Either +8 V, +5 V or −5 V DC is supplied from a corresponding regulator circuit. +8 V, +5 V and −5 V DC are regulated at the following circuits using 13.8 V DC.

(1) +5 V REGULATOR (LOGIC UNIT)

+5 V DC is provided by a three-terminal voltage regulator (IC2).

(2) +8 V REGULATOR (MAIN UNIT)

+8 V DC is provided by a three-terminal voltage regulator (IC14).

(3) −5 V REGULATOR (PLL UNIT)

IC6 generates a negative pulse-type voltage by converting the DC input to AC voltages (approx. 6.7 kHz) as a multi-vibrator. The voltage is rectified at D8 and D9, regulated by a Zener diode (D10) and C12, and is then applied to the MAIN and CTRL units.

SECTION 5 ADJUSTMENT PROCEDURES

5-1 PREPARATION BEFORE SERVICING

■ REQUIRED TEST EQUIPMENT

EQUIPMENT	GRADE AND RANGE	EQUIPMENT	GRADE AND RANGE
DC power supply	Output voltage : 13.8 V DC Current capacity : 30 A or more	AC millivoltmeter	Measuring range : 10 mV–10 V
		DC voltmeter	Input impedance : 50 kΩ/DC or better
RF power meter (terminated type)	Measuring range : 10–200 W Frequency range : 1.8–30 MHz Impedance : 50 Ω SWR : Less than 1.2 : 1	Ammeter	Measurement capability: 1 A and 30 A
		Audio generator	Frequency range : 300–3000Hz Output level : 1–500 mV
Frequency counter	Frequency range : 0.1–100 MHz Frequency accuracy: ± 1 ppm or better Sensitivity : 100 mV or better	Attenuator	Power attenuation : 50 or 60 dB Capacity : 150 W or more
		Spectrum analyzer	Frequency range : At least 90 MHz Spectrum bandwidth: ±100 kHz or more
RF voltmeter	Frequency range : 0.1–100 MHz Measuring range : 0.01–10 V	FM deviation meter	Frequency range : At least 30 MHz Measuring range : 0 to ±10 kHz
Digital multimeter	Input impedance : 10 MΩ/DC or better	Modulation analyzer	Frequency range : At least 30 MHz Measuring range : 0–100%
Standard signal generator (SSG)	Frequency range : 0.1–100 MHz Output level : 0.1 µV–32 mV (–127 to –17 dBm)	External speaker	Impedance : 8 Ω Max. input power : 5 W
Distortion meter	Frequency range : 1 kHz ±10% Measuring range : 1–100%	Terminator	Resistance : 50 and 150 Ω Capacity : 150 W or more
Oscilloscope	Frequency range : DC–20 MHz Measuring range : 0.01–10 V		

CW: Clockwise CCW: Counterclockwise

TOTAL GAIN	1	• Displayed frequency: 14.10000 MHz • Mode : USB • [PRE AMP] switch : OFF • Connect the SSG to the [ANT 1] connector and set as: Frequency : 14.1015 MHz Level : 1.0 mV* (− 47 dBm) Modulation : OFF • Receiving	Rear panel	Connect the AC milli-voltmeter to the [EXT SP] jack with an 8 Ω load.	1.0 V (0 dB)	Front panel	[AF] control
	2	• Set the SSG as: Level : OFF			32 mV (− 30 dB)	MAIN	R138
S-METER	1	• Displayed frequency: 14.10000 MHz • Mode : USB • [PRE AMP] switch : OFF • Connect the SSG to the [ANT 1] connector and set as: Frequency : 14.1000 MHz Level : 50 µV* (− 73 dBm) Modulation : OFF • Receiving	Front panel	S-METER	S9	MAIN	R110
	2	• Set the SSG as: Level : 50 mV* (− 13 dBm)			S9 + 60 dB		R116
	3	Repeat steps 1 and 2 several times.					
FM S-METER		NOTE: Be sure that R14 in the FMAM unit is turned max. counterclockwise.					
NOISE BLANKER	1	• Displayed frequency: 14.10000 MHz • Mode : USB • [NB] switch : OFF • [PRE AMP] switch : ON • Receiving • Connect the SSG to the [ANT 1] connector and set as: Frequency : 14.1000 MHz Level : 3.2 µV* (− 97 dBm) Modulation : OFF • Apply the following signal to the SSG's output.  	MAIN	Connect the oscilloscope to the cathode of D13.	Adjust for maximum waveform on the oscilloscope.	MAIN	L25, L26
	2	• [NB] switch : ON • Set the SSG as: Level : 10 µV* (− 87 dBm) Modulation : OFF • Apply the same signal as shown above.			The noise must be blanked.		Verify
BEEP TONE		NOTE: Be sure that R321 in the MAIN unit is set at center.					
DIMMER	1	• Receiving	DISPLAY	Connect the DC voltmeter to a soldering point of the DS1 lead wire (LAMP+).	11.0 V DC	AF	R18

* This output level of the standard signal generator (SSG) is indicated as SSG's open circuit.

RECEIVER ADJUSTMENT (CONTINUED)

ADJUSTMENT		ADJUSTMENT CONDITIONS	MEASUREMENT		VALUE	ADJUSTMENT POINT	
			UNIT	LOCATION		UNIT	ADJUST
NOTCH	1	• Displayed frequency: 14.10000 MHz • Mode : AM • [PRE AMP] switch : OFF • [NB] switch : OFF • [NOTCH] switch : ON • [NOTCH] control : Max. CW • Connect the SSG to the [ANT 1] connector and set as: Frequency : 14.1000 MHz Level : 1.0 mV* (−47 dBm) Modulation : 30% AM/3 kHz • Receiving	Rear panel	Connect the AC milli-voltmeter to the [EXT SP] jack with an 8 Ω load.	Minimum voltage	Front panel	[NOTC] control
					Minimum voltage	NOTCH	R8
	2	• Set the SSG as: Modulation : 30% AM/500 Hz			Confirm that the minimum voltage point exits while rotating the [NOTCH] control to counterclockwise.		Verify

* This output level of the standard signal generator (SSG) is indicated as SSG's open circuit.

5-4 TRANSMITTER ADJUSTMENT

ADJUSTMENT		ADJUSTMENT CONDITIONS	MEASUREMENT		VALUE	ADJUSTMENT POINT	
			UNIT	LOCATION		UNIT	ADJUST
IDLING CURRENT Ⓐ For drive transistors	1	• Displayed frequency: 14.10000 MHz • Mode : CW • [TRANSMIT] switch : IN • [KEY] jack : No connection • [RF PWR] control : Max. CW • [ANT] switch : ANT 1 • [TUNER] switch : OFF	PA	Unsolder W14 and connect the ammeter to the unsoldering points.	100 mA	PA	R8
Ⓑ For final transistors	2	• Re-solder W14.		Unsolder R26 and connect the ammeter to the unsoldering points.	300 mA		R19
	3	After adjustment, re-solder W14 and R26.					
SWR DETECTOR	1	• Displayed frequency: 14.10000 MHz • Mode : USB • [RF PWR] control : Max. CW • [ANT] switch : ANT 1 • Connect the jumper wire between R87 (MAIN unit) and a ground.	Rear panel	Connect the RF power meter to the [ANT 1] connector.	100 W	Front panel	[MIC] control
	2	• Connect the audio generator to the [MICROPHONE] connector and set as: Level : 10 mV Frequency : 1.5 kHz • Transmitting	MAIN	Connect the DC voltmeter to J6 (pin 6).	Minimum	FILTER	C54
	3	After adjustment, remove the jumper wire from R87.					
TRANSMIT GAIN	1	• Displayed frequency: 14.10000 MHz • Mode : USB • [RF PWR] control : Max. CW • R85, R210 (MAIN unit): Max. CW • R194 (MAIN unit) : Max. CCW	Rear panel	Connect the RF power meter to the [ANT 1] connector.	50 W	Front panel	[MIC] control
	2	• [ANT] switch : ANT 1 • Connect the audio generator to the [MICROPHONE] connector and set as: Level : 3 mV Frequency : 1.5 kHz • Transmitting			Maximum	MAIN	L37, L17, L16, L14, L7
	3	• [MIC] control : Center			50 W		R85
		NOTE: Adjust the [MIC] control to keep the output power at 50W for each adjustment.					
CW DELAY TIME	1	• Displayed frequency: 14.10000 MHz • Mode : CW • [TRANSMIT] switch : ON (IN) • [RF PWR] control : Max. CCW • [KEY SPEED] control: Max. CW • [ELEKEY] switch : ON (IN) • Connect a keyer to the [KEY] jack and key down.	MAIN	Connect the oscilloscope to J11 and the key or paddle.	Adjust as follows:  	MAIN	R241

• PA AND FILTER UNITS

OUTPUT POWER	1	• Displayed frequency: 28.50000 MHz • Mode : CW • [TRANSMIT] switch : ON (IN) • [TUNER] switch : OFF • [RF PWR] control : Max. CW • [ELEKEY] switch : OFF (OUT) • Connect a keyer to the [KEY] jack and key down.	Rear panel	Connect the RF power meter to the [ANT 1] connector.	100 W	MAIN	R210
	2	• Mode : AM			40 W		R208
	3	• Mode : CW • [RF PWR] control : Max. CCW			5–15 W		Verify
	4	Repeat steps 1–3 several times.					
Ic APC	1	• Displayed frequency: 14.10000 MHz • Mode : CW • [TRANSMIT] switch : ON (IN) • [TUNER] switch : OFF • [RF PWR] control : Max. CW • Connect the jumper wire between J6 (pin 5, MAIN unit) and a ground. • Connect a keyer to the [KEY] jack and key down.	Rear panel	Connect the ammeter between the DC power supply and IC-737.	22 A	MAIN	R194
	2	After adjustment, remove the jumper wire from J6 (pin 5).					
Po METER	1	• Displayed frequency: 14.10000 MHz • Mode : CW • [TRANSMIT] switch : ON (IN) • [RF PWR] control : Max. CW • Connect a keyer to the [KEY] jack and key down.	Front panel	S-METER	100%	MAIN	R186
CARRIER SUPPRES-SION	1	• Displayed frequency: 14.10000 MHz • Mode : USB and LSB • [MIC] control : Max. CCW • Apply no signal to the [MICROPHONE] connector. • Transmitting	Rear panel	Connect the spectrum analyzer to the [ANT 1] connector via the attenuator.	Minimum carrier level (Less than – 50 dB)	MAIN	R177, R179 (Alternate adjust-ment)
KEYING WEIGHT		NOTE: Be sure that R8 in the ELEKEY unit is turned max. counterclockwise.					
FM•AM OSC FREQUENCY	1	• Displayed frequency: 29.10000 MHz • Mode : FM • R26 (FMAM unit) : Max. CW • R47 (FMAM unit) : Max. CCW • Transmitting	FMAM	Connect the frequency counter to the cathode of D1.	9.01000 MHz	FMAM	L3

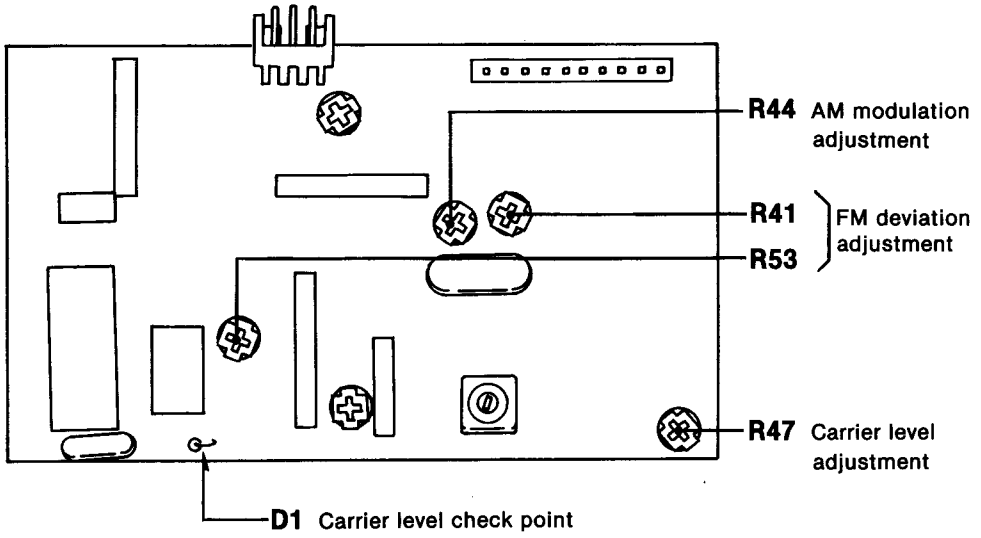
TRANSMITTER ADJUSTMENT (CONTINUED)

ADJUSTMENT		ADJUSTMENT CONDITIONS	MEASUREMENT		VALUE	ADJUSTMENT POINT	
			UNIT	LOCATION		UNIT	ADJUST
FM DEVIATION	1	• Displayed frequency: 29.10000 MHz • Mode : FM • [MIC] control : Max. CW • Connect the audio generator to the [MICROPHONE] connector and set as: Level : 10 mV Frequency : 1 kHz • Set the FM deviation meter as: HPF : 50 Hz LPF : 20 kHz De-emphasis : OFF Detector : (P – P)/2 • Transmitting	FMAM	Connect the FM deviation meter to the [ANT 1] connector via the attenuator.	± 4.8 kHz	FMAM	R41
	2	• [MIC] control : Center • Set the audio generator as: Level : 1 mV			± 3.5 kHz		R53
	3	Repeat steps 1 and 2 several times.					
CARRIER LEVEL	1	• Displayed frequency: 29.10000 MHz • Mode : FM • R26 (FMAM unit) : Center • Transmitting	FMAM	Connect the oscilloscope to the cathode of D1.	350 mVp-p	FMAM	R47
AM MODU-LATION	1	• Displayed frequency: 29.10000 MHz • Mode : AM • R44 (FMAM unit) : Center • [MIC] control : Max. CW • Connect the audio generator to the [MICROPHONE] connector and set as: Level : 1 mV Frequency : 1 kHz • Transmitting	FMAM	Connect the modulation analyzer to the [ANT 1] connector via the attenuator.	Maximum level	Audio generator output frequency	
	2				70% modulation	FMAM	R44

• FMAM UNIT



5-5 ANTENNA TUNER ADJUSTMENT

ADJUSTMENT		ADJUSTMENT CONDITIONS	MEASUREMENT		VALUE	ADJUSTMENT POINT	
			UNIT	LOCATION		UNIT	ADJUST
REFERENCE VOLTAGE	1	• Displayed frequency: 14.10000 MHz • Mode : USB • Disconnect J4 and J5 (CTRL unit). • Connect the jumper wire between R151 (CTRL unit) and a ground. • De-solder W8 (CTRL unit). • Connect the power meter or 50 Ω dummy load to J1. • Transmitting	CTRL	Connect the digital multimeter or oscilloscope to W26.	4.6–5.0 V DC	CTRL	Verify
	2			Connect the digital multimeter or oscilloscope to R64.	Half the value of the W26 voltage. (Step 1 above)		R61
	3			Connect the digital multimeter or oscilloscope to R54.	Half the value of the W26 voltage. (Step 1 above)		R51
	4	• Mode : CW • C17, R24 (CTRL unit) : Center  • [TRANSMIT] switch : ON (IN) • [RF PWR] control : Max. CW • Connect a keyer to the [KEY] jack and key down.		Connect the digital multimeter or oscilloscope to R64.	Half the value of the W26 voltage. (Step 1 above)		C38
	5			Connect the digital multimeter or oscilloscope to R54.	Half the value of the W26 voltage. (Step 1 above)		C17, R24
		NOTE: Keep the presettings of the jumper wire at R151, P1, P2, W8 and the 50 Ω resistor until the following adjustment is completed.					
SWR DETECTOR	1	• Displayed frequency: 1.91000 MHz • Mode : CW • [TRANSMIT] switch : ON (IN) • [RF PWR] control : Max. CW • Connect a keyer to the [KEY] jack and key down.	CTRL	Connect the digital multimeter or oscilloscope to J14.	Minimum voltage	CTRL	C11
	2	• Terminate J1 (CTRL unit) with a 150 Ω load. (SWR3 dummy load)		Connect the digital multimeter or oscilloscope to R32.	Adjust R27 volume to the point where the voltage just changes from 5 V to 0 V.		R27
	3	After adjustment, remove the jumper wire from R151. Re-plug P1 and P2. Re-solder W8. Remove the 150 Ω resistor.
